Seleccionable si la Operación de emergencia está configurada en Alarma y llamada de emergencia, el tipo de sistema es DVRS y el tipo de señal es ASTRO.

Tanto el suscriptor como la consola

Seleccionable si la Operación de emergencia está configurada en Alarma y llamada de emergencia, el tipo de sistema es DVRS y el tipo de señal es ASTRO.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.22.4.2

Reinicio de emergencia del micrófono activo

Este campo permite que el audio del micrófono activo se retransmita presionando el botón de emergencia durante una emergencia.

Solo se accede: Cuando el campo [Tipo de emergencia en la página 338](#) está configurado en **Alarma y llamada**, y cuando el campo Tipo de sistema está configurado en **DVRS**, y cuando el campo Tipo de voz/señal de Rx y Tipo de voz/señal de Tx está configurado en **ASTRO**, y cuando el radio admite el modelo/opción.

10.23

Perfiles de emergencia de troncalización

Los **Perfiles de emergencia de troncalización** le permiten ver o modificar la funcionalidad del modo de emergencia de troncalización.

Las transmisiones de emergencia tienen muchas configuraciones programadas posibles. Se puede crear una variedad de perfiles de emergencia. Los Tipos de protocolo de comunicaciones de troncalización **ASTRO 25** y **Tipo II** pueden realizar transmisiones en modo de emergencia.

10.23.1

General

Esta sección permiten ver o modificar las funciones Emergencia de troncalización para Perfiles de emergencia de troncalización individuales.

Los Tipos de protocolo de comunicaciones de troncalización **ASTRO 25** y **Tipo II** pueden realizar transmisiones en modo de emergencia.

NOTA:

Las funciones y configuraciones de [Emergencia en general en la página 330](#) se aplican a estos perfiles.

Los Perfiles de troncalización de emergencia se seleccionan desde el campo Selección de perfil de emergencia de la Personalidad de troncalización.

La funcionalidad del Modo de emergencia se inicia con un radio configurado o puede iniciarla el usuario.

10.23.1.1

Nombre de perfiles de emergencia

Este campo permite crear nombres reconocibles para el Perfil de emergencia de troncalización actual.

Los Perfiles de troncalización de emergencia se seleccionan desde el campo Selección de perfil de emergencia de la Personalidad de troncalización.

NOTA:

Ejemplos: EMT-001, #500, Electric1, # A5.

Se pueden usar caracteres, números, espacios y caracteres especiales.

Se pueden utilizar hasta 14 caracteres.

10.23.1.2

Funcionamiento de emergencia

En este campo se selecciona la funcionalidad deseada del radio que se produce cuando se inicia el modo Emergencia.

Esta selección se aplica al Perfil de emergencia de troncalización actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Solo alarma

Al oprimir el botón Emergencia transmite un Paquete de alarma de emergencia al despachador. Se reintentará enviar un paquete de alarma de emergencia hasta que se recibe una confirmación o hasta que se agota el número de intentos especificado por el Contador de reintentos. El tipo de confirmación que se espera se rige por el campo **Se requiere confirmación de consola**.

Solo llamada

Al oprimir el botón Emergencia el radio inicia el Modo de llamada de emergencia. En este modo, las solicitudes de PTT y las transmisiones de voz desde el usuario o el radio se marcan como de emergencia, y el usuario o el radio obtiene prioridad en nivel de emergencia en el Grupo de conversación de troncalización actual.

Alarma y llamada

Al oprimir el botón Emergencia, una vez que la secuencia de alarma de emergencia se ha confirmado o se han agotado los reintentos, el radio ingresa en el modo de llamada de emergencia.

10.23.1.3

Contador de reintentos

Este campo selecciona cuántas veces se transmite la Alarma de emergencia cuando una confirmación "Ack" de una transmisión de emergencia exitosa no se ha recibido.

NOTA:

Para una llamada normal de troncalización, si el radio no logra enviar la transmisión, el radio vuelve a intentarla para una secuencia de Datos de la señal de entrada (ISD) antes de salir. Para las alarmas de emergencia, el radio vuelve a reintentar la comunicación para la cantidad de secuencias ISD que se seleccionan para este contador.

Esta selección se aplica al Perfil de emergencia de troncalización actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 144: Rango

Mínimo	Máximo	Incrementos
1	255	1

NOTA:

Cuando se establece en **Infinito**, el número de reintentos es ilimitado.

10.23.1.4

Se requiere confirmación de consola

Este campo hace que se requiera una confirmación adicional de consola ("confirmación de consola").

Al enviar una alarma de emergencia, el radio exige siempre una confirmación por parte del equipo de red fija (FNE). Esta función requiere una confirmación adicional desde la aplicación de despacho. Recibir una confirmación del FNE garantiza que el sitio actual del radio ha recibido el paquete de alarma de emergencia. La recepción de una confirmación de consola asegura que la aplicación de despacho esté mostrando la condición de emergencia al despachador. Una vez que se recibe la confirmación de la consola, el radio emite un tono de alerta de cuatro bips. Esta selección se aplica al Perfil de emergencia de troncalización actual.

IMPORTANTE:

Esta función se debe desactivar para que las opciones **Emergencia de micrófono de uso frecuente** o **Emergencia mediante silencio de audio** funcionen correctamente.

Solo se accede: Cuando el campo Funcionamiento de emergencia está establecido en **Solo alarma** o **Alarma y llamada** y cuando el radio admite modelos y opciones diferentes.

10.23.1.5

Respuesta de emergencia

En este campo se selecciona el canal/tipo de canal deseado para la transmisión (táctico o no táctico) que el radio utiliza cuando funciona en el modo Emergencia.

Esta selección se aplica al Perfil de emergencia de troncalización actual.

**IMPORTANTE:**

Si se ingresa el modo Emergencia desde un Grupo de anuncios o una Reagrupación dinámica, el Grupo de conversación de inversión de respuesta de emergencia (de la Personalidad de troncalización a la que hace referencia este Perfil de emergencia de troncalización) se utiliza para estas transmisiones, ya sea que este campo esté configurado en Emergencia **Táctica** o **Invertir** de emergencia no táctica.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Táctico

Las alarmas de emergencia y las llamadas de emergencia se transmiten en el canal/grupo de conversación seleccionado actualmente en el radio.

Esto también se conoce como Emergencia táctica.

**ADVERTENCIA:**

La opción Táctica no funciona si el canal de troncalización actual del radio tiene el campo Modo de transmisión establecido en **TG/AG desactivado**.

Revertir (no táctica)

Las alarmas de emergencia y las llamadas de emergencia se transmiten en un canal específico. Este canal está determinado por la selección del campo Tipo de reversión de emergencia de la Personalidad de troncalización que hace referencia a este perfil de emergencia de troncalización.

**NOTA:**

Esto también se conoce como Emergencia no táctica.

10.23.1.6

Revertir ID de PTT

Este campo hace que el Grupo de conversación de inversión de respuesta de emergencia de la Personalidad de troncalización que hace referencia a este Perfil de emergencia de troncalización utilice el Tipo de conversación "PTT-ID" mientras se encuentra en modo Emergencia.

Esta selección se aplica al Perfil de emergencia de troncalización actual.

Cuando está desactivado y mientras opera en el modo de llamada de emergencia, si la personalidad de troncalización que hace referencia a este perfil de emergencia está usando el tipo de conversación "Transmisión", el radio fuerza el tipo de conversación "ID de PTT". Esta selección se aplica al perfil de emergencia de troncalización actual del grupo de anuncios seleccionado de esta personalidad.

**NOTA:**

Esta función también se conoce como "ID de PTT predeterminada".

**ADVERTENCIA:**

Esta función se aplica solo cuando el campo Respuesta de emergencia se configura en **Invertir**.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.23.1.7

Salida de emergencia en el Cambio de canal

Este campo permite que el radio salga del estado de emergencia en el cambio de modo.

10.23.1.8

Activación de Hombre caído

En este campo se activa la operación Hombre caído del modo Emergencia para el Perfil de emergencia de troncalización actual.

Solo se accede: Cuando el campo Activador de hombre caído no está configurado en **Desactivado**, cuando el campo Nivel de capacidad de configuración de Hombre caído está configurado en **Por perfil de emergencia** y cuando el radio admite modelos y opciones diferentes.

10.23.1.9

Modo de transmisión automático de emergencia

En este campo se selecciona una operación de transmisión de modo Emergencia adicional y específica para el Perfil de emergencia de troncalización actual.

Tanto la función Micrófono activo de emergencia como la función Audio silencioso de micrófono activo están disponibles.

**ADVERTENCIA:**

Cuando esta función no se encuentra desactivada, la funcionalidad seleccionada anula o mejora la funcionalidad de emergencia descrita para la selección del campo "Alarma y llamada" de la **Operación de emergencia**.

Solo se accede: Para modelos de radio con versión del software R16.00.00 o superior, cuando el campo [Funcionamiento de emergencia en la página 351](#) está configurado en **Alarma y llamada**; y

cuando el campo [Se requiere confirmación de consola en la página 352](#) está **Desactivado**, y

cuando el campo [Revertir ID de PTT en la página 353](#) está **Activado**.

Se admiten las siguientes selecciones:

Desactivado

No se encuentra seleccionada ninguna funcionalidad de transmisión automática adicional.

Emergencia de mic de uso frecuente

Una vez que se ha iniciado el modo de emergencia presionando el botón de emergencia y, luego, una vez que se ha recibido una confirmación de la alarma de emergencia en el radio (desde el despachador/consola) o se han agotado todos los reintentos de alarma, la Emergencia de mic de uso frecuente hace que el radio se active automáticamente y transmita una llamada de emergencia. El radio transmite con su micrófono abierto de manera automática durante el tiempo seleccionado por el campo **Período de Tx de micrófono activo**. El radio está entonces en Modo de llamada de emergencia normal. Esto también se conoce como Emergencia con transmisión de mensaje.

Cuando el campo Pulsación larga para emergencia no está configurado en **0**, el Modo de llamada de emergencia finaliza con una pulsación larga del botón de emergencia.

**NOTA:**

Esto también se conoce como "Emergencia con transmisión de mensaje de troncalización".

**ADVERTENCIA:**

Otra pulsación del botón de emergencia no reinicia otra transmisión del micrófono de emergencia activo. Debe salirse del modo de emergencia y luego reiniciarlo para que ocurra nuevamente la transmisión de micrófono activo de "encendido automático".

Para salir del modo de emergencia se debe realizar una Pulsación de larga duración del botón Emergencia o apagar el radio.

Emergencia mediante silenciar audio

Una vez que se ha iniciado el modo de emergencia al oprimir el botón de emergencia y luego, una vez que el radio ha recibido una confirmación de la alarma de emergencia (del despachador/ consola), o se han agotado todos los intentos de alarma, el radio se enciende automáticamente en el modo de emergencia con su micrófono aún silenciado/cerrado. Esta transmisión continúa durante el tiempo especificado en el campo Período de Tx para silenciar audio. El radio está entonces en Modo de llamada de emergencia normal.

Cuando el campo Pulsación larga para emergencia no está configurado en **0**, el Modo de llamada de emergencia finaliza con una pulsación larga del botón de emergencia.

IMPORTANTE:

Disponible para las comunicaciones de troncalización ASTRO 25 SOLAMENTE

10.23.1.10

Período de Tx de micrófono activo

En este campo se selecciona la cantidad de tiempo en que el radio se enciende/transmite automáticamente durante la operación "Emergencia de micrófono de uso frecuente".

Selecciona una operación de transmisión de modo de emergencia específica para el Perfil de emergencia de troncalización actual.

Solo se accede: Cuando el campo Modo de transmisión automático de emergencia está establecido en **Emergencia de mic de uso frecuente**, cuando el campo Funcionamiento de emergencia está establecido en **Alarma y llamada**, cuando el campo Revertir ID de PTT está **Activado**, cuando el campo Se requiere confirmación de consola está **Desactivado** y cuando el radio admite modelos y opciones diferentes.

IMPORTANTE:

La versión anterior del codeplug debe utilizar los siguientes parámetros:

Mesa 145: Rango

Mínimo	Máximo	Incremento
10 segundos	120 segundos	10 segundos

IMPORTANTE:

Esto se aplica a la versión de codeplug 19.00.00 y posteriores:

Mesa 146: Rango

Mínimo	Máximo	Incremento
1 segundo	120 segundos	10 segundos

10.23.1.11

Período de Tx para silenciar audio

En este campo se selecciona la cantidad de tiempo que el radio se enciende/transmite automáticamente (con el micrófono silenciado/cerrado) durante la operación de **Emergencia mediante silencio de audio**.

Selecciona una operación de transmisión de modo de emergencia específica para el Perfil de emergencia de troncalización actual.

Solo se accede: Cuando el campo Modo de transmisión automático de emergencia está establecido en **Emergencia mediante silencio de audio**, cuando el campo Funcionamiento de emergencia está establecido en **Alarma y llamada**, cuando el campo Revertir ID de PTT está **Activado**, cuando el

campo Se requiere confirmación de consola está **Desactivado** y cuando el radio admite modelos y opciones diferentes.

Mesa 147: Rango

Mínimo	Máximo
1 seg	5 s

10.23.1.12

Encuéntreme de emergencia

La función Encuéntreme de emergencia proporciona una indicación que le notifica cuando alguien en su entorno tiene una activación de emergencia.

Cuando esta función está activada, puede realizar las siguientes acciones:

- Transmitir una baliza de Bluetooth de bajo consumo (BLE) cada dos segundos mientras el radio está en la función de emergencia.
- Recibir balizas de emergencia y ver la notificación Baliza recibida.
- Recibir un tono de alerta cuando se recibe una baliza en los últimos diez segundos.
- Ingresar en la opción de menú para ver todas las balizas de recepción.
- Descartar la notificación para dejar de recibir los tonos y la visualización.

Para activar la función Encuéntreme de emergencia, debe activar los campos **Activación de transmisión** y **Activación de recepción** en la sección Encuéntreme de emergencia del perfil de emergencia de troncalización.

10.23.1.13

Activación de transmisión

Cuando este campo está activado, el radio puede transmitir la baliza Encuéntreme de emergencia durante una emergencia.

La transmisión de la baliza de emergencia se activa a través de la función de emergencia, como presionar el switch o el botón de emergencia, y la alerta de caída (hombre caído) de emergencia. Cuando entra en emergencia, no se requiere ninguna acción adicional. Cuando el radio entra en el modo de emergencia, la conexión Bluetooth se activa automáticamente y se envían las balizas. Las balizas de emergencia se envían cada dos segundos mientras el radio está en modo de emergencia.

Para obtener más información sobre la función Encuéntreme de emergencia, consulte [Encuéntreme de emergencia en la página 356](#).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.23.1.14

Activación de recepción

Cuando este campo está activado, el radio recibe la baliza Encuéntreme de emergencia durante una emergencia.

Cuando cambia a un canal en el que está activada la recepción de baliza, la conexión Bluetooth se activa automáticamente. Cuando recibe una baliza de emergencia, el radio reproduce un tono y muestra *Baliza recibida* en la pantalla superior y en el widget de control de radio de la pantalla frontal. El radio sigue emitiendo un tono cada diez segundos mientras recibe balizas de forma activa.

Si el receptor descarta la notificación o si no se reciben balizas durante cuatro minutos, la notificación Baliza recibida desaparece. Si hay varias balizas disponibles, la pantalla muestra el ID o alias del dispositivo que entra a la emergencia en último lugar.

Para obtener más información sobre la función Encuéntreme de emergencia, consulte [Encuéntreme de emergencia en la página 356](#).

**NOTA:**

En los radios APX estándar con pantalla frontal, puede utilizar el menú para ver el ID de radio del radio transmisor y el nivel del indicador de intensidad de señal recibida (RSSI) de Bluetooth.

En los radios APX NEXT, puede descartar la baliza si presiona **DESCARTAR** en la notificación. También puede ver la lista de remitentes si presiona **DETALLES**.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.23.1.15

Activación remota de emergencia

Este campo selecciona la funcionalidad específica de la función Activación de emergencia remota para el conjunto Perfil de emergencia actual. Esta función permitirá que un radio de origen (codificación) active la función de emergencia en un radio de destino (decodificación) a través de la comunicación por el aire como si el usuario de destino presionara el botón Emergencia.

Este campo solo es válido cuando el radio es compatible con el modelo o la opción de funcionamiento convencional APCO 25 o de troncalización APCO 25.

Se admiten las siguientes selecciones:**Desactivado**

No está seleccionada la funcionalidad de Activación remota de emergencia.

Solo codificación

Un radio solo puede iniciar comunicaciones remotas de emergencia a un radio de destino.

Solo decodificación

Un radio solo puede recibir comunicaciones remotas de emergencia de un radio de origen y, tras decodificar las comunicaciones, el radio iniciará inmediatamente la función de emergencia.

Codificación y decodificación

A un radio se le permite tanto iniciar comunicaciones remotas de emergencia a un radio de destino como recibir comunicaciones remotas de emergencia de un radio de origen.

**NOTA:**

Este campo está desactivado de forma predeterminada.

10.23.2

Lista de tonos de emergencia

Esta sección permite ver o modificar las funciones de Tono de alerta y Activador del modo de emergencia para Perfiles de emergencia de troncalización individuales.

**NOTA:**

Las funciones y configuraciones de [Emergencia en general en la página 330](#) se aplican a estos perfiles.

Los Perfiles de troncalización de emergencia se seleccionan desde el campo Selección de perfil de emergencia de la Personalidad de troncalización.

La funcionalidad del Modo de emergencia se inicia con un radio configurado o puede iniciarla el usuario.

10.23.2.1

Activador

En este campo se selecciona la condición o el activador que inicia el Modo de emergencia en el Perfil de emergencia de troncalización actual.

Según el tipo de tono de emergencia seleccionado, el volumen mínimo de tono, el período de tono y el enrutamiento de audio también se pueden configurar en el mismo registro/fila de la Lista de tonos de emergencia.

Solo se accede: Cuando el campo Activador de hombre caído no está establecido en **Desactivado**, cuando el campo Activador de tono de emergencia de hombre caído está establecido en **Activado** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Hombre caído

Una condición de Hombre caído inicia el Modo de emergencia en el Perfil de emergencia de troncalización actual.

Se aplica solo: Cuando el campo Habilidad de hombre caído está **Activado** en el perfil de emergencia de troncalización actual.

10.23.2.2

Tono

En este campo se selecciona el tipo de Tono de alerta que se reproduce cuando la transmisión del Modo de emergencia ha comenzado a través de la selección del Activador correspondiente.

Esta selección se aplica al Perfil de emergencia de troncalización actual.

Solo se accede: Cuando el campo Activador de hombre caído no está establecido en **Desactivado**, cuando el campo Activador de tono de emergencia de hombre caído está **Activado** y cuando el radio admite modelos y opciones diferentes.

Tono de emergencia heredado

Se utiliza el tono de emergencia de legado y los niveles de audio.

Tono de emergencia crítica

El tono de alerta de emergencia crítica se reproduce. También se debe definir el Volumen mínimo de tono, el Período de tono y el Enrutamiento de audio.

10.23.2.3

Volumen mínimo de tono

En este campo se selecciona el nivel de audio mínimo para que suene el Tono de alerta del modo Emergencia correspondiente.

Si el valor es más alto que el nivel de volumen actual del radio, entonces se utiliza este valor; de otro modo, se utiliza el nivel de volumen actual del radio. Esta función se aplica al Perfil de emergencia de troncalización actual.

Solo se accede: Cuando el campo Tono está establecido en **Tono de emergencia crítica** y cuando el radio admite modelos y opciones diferentes.

Mesa 148: Rango

Mínimo	Máximo	Incrementos
0	255	1

10.23.2.4

Período de tono

En este campo se selecciona si el Tono de alerta del modo Emergencia especificado será un tono temporal o un tono repetitivo.

Puede determinar el temporizador periódico del tono repetitivo.

Esta función se aplica al Perfil de emergencia de troncalización actual.

Solo se accede: Cuando el campo Tono está establecido en **Tono de emergencia crítica** y cuando el radio admite modelos y opciones diferentes.

NOTA:

Cuando se establece en **0 = Una vez** (tiempo cero), el tono de alerta especificado en el campo Tono suena solo una vez mientras el Modo emergencia está activo.

Mesa 149: Rango

Mínimo	Máximo	Incrementos
5	255	1

10.23.2.5

Enrutamiento de audio

En este campo se selecciona el enrutamiento del Tono de alerta y el audio entrante a un altavoz específico cuando comienza una transmisión de modo Emergencia con la selección del activador correspondiente.

Esta selección se aplica al Perfil de emergencia de troncalización actual.

Solo se accede: Cuando el campo Tono está establecido en **Tono de emergencia crítica**, cuando el campo Período de tono no está configurado en **Una vez** y cuando el radio admite modelos y opciones diferentes.

Enrutamiento de audio normal

El tono de alerta y cualquier audio entrante se enrutan según las selecciones de enrutamiento de audio de altavoz actuales del radio.

Enrutamiento de audio de altavoz interno

El tono de alerta y cualquier audio entrante se enrutan al altavoz interno del radio, sin importar el accesorio externo que esté conectado o la selección de Enrutamiento de audio de altavoz actual del canal.

10.23.3

Opciones de compatibilidad de emergencia

Esta sección está diseñada para la interoperabilidad con sistemas Harris.

Permite controlar la cancelación de la Llamada de emergencia (por parte del usuario, la consola o ambos) y reiniciar el micrófono activo.

NOTA:

Las funciones y configuraciones de [Emergencia en general en la página 330](#) se aplican a estos perfiles.

Los Perfiles de troncalización de emergencia se seleccionan desde el campo Selección de perfil de emergencia de la Personalidad de troncalización.

La funcionalidad del Modo de emergencia se inicia con un radio configurado o puede iniciarla el usuario.

10.23.3.1

Control de salida de emergencia

Este campo permite configurar el radio para que el usuario, la consola, o ambos puedan salir del modo de emergencia.

Se admiten las siguientes selecciones:

Solo el suscriptor

Valor predeterminado

Solo la consola

Seleccionable si el campo Operación de emergencia está configurado en **Solo llamada** o **Alarma y llamada de emergencia**, en el sistema de troncalización P25 y las Funciones de propiedad de Motorola están desactivadas.

Tanto el suscriptor como la consola

Seleccionable si el campo Operación de emergencia está configurado en **Solo llamada** o **Alarma y llamada de emergencia**, en el sistema de troncalización P25 y las Funciones de propiedad de Motorola están desactivadas.

Supervisor

Seleccionable si el campo Operación de emergencia está configurado en **Solo llamada** o **Alarma y llamada** en el sistema de troncalización P25, las Funciones de propiedad de Motorola están desactivadas y la Selección de perfil de DVRS es **DVRS desactivado**. En el caso del Radio dual, la Selección de radio está configurado como **Radio autónomo** o **Radio principal**.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.23.3.2

Reinicio de emergencia del micrófono activo

Este campo permite que el audio del micrófono activo se retransmita al presionar el botón de emergencia durante una emergencia.

Solo se accede: Cuando el campo [Tipo de emergencia en la página 338](#) está configurado en **Solo llamada**, **Alarma y llamada** y cuando el campo Modo de transmisión automática de emergencia está configurado en **Emergencia de micrófono activo**, y cuando el campo Tipo de sistema está configurado en **ASTRO 25**, y cuando el campo Funciones de propiedad de Motorola está desactivado, y cuando el radio admite el modelo/opción.

10.24

Datos en general

Esta sección permite ver o modificar la configuración de datos que se aplica a todos Perfiles de datos.

Los Perfiles de datos se definen para comunicar los datos de radio a través de canales convencionales o de troncalización, o comunicar datos de radio a través de una red de banda ancha de LTE.

**IMPORTANTE:**

Los perfiles de datos se seleccionan en el campo Selección de perfil de datos del sistema de troncalización o en el campo Selección de perfil de datos del sistema convencional.

Para las comunicaciones convencionales, los perfiles de datos se aplican solo para sistemas convencionales que tengan el campo Tipo de sistema configurado en **ASTRO**.

Para las comunicaciones de troncalización, los perfiles de datos se aplican solo para Sistemas de troncalización que tienen su campo Tipo de sistema configurado en **ASTRO 25**.

10.24.1

General

Esta sección permite ver o modificar la configuración de datos que se aplica a todos Perfiles de datos.

IMPORTANTE:

Los perfiles de datos se seleccionan en el campo Selección de perfil de datos del Sistema de troncalización o en el campo Selección de perfil de datos del Sistema convencional.

Para las comunicaciones convencionales, los perfiles de datos se aplican solo para sistemas convencionales que tengan el campo Tipo de sistema configurado en **ASTRO**.

Para las comunicaciones de troncalización, los perfiles de datos se aplican solo para Sistemas de troncalización que tienen su campo Tipo de sistema configurado en **ASTRO 25**.

10.24.1.1

Traps SNMP

Cuando se selecciona este campo, habilita la generación de capturas del Protocolo simple de administración de red (SNMP) a través del enlace en serie.

Esta función se aplica a todos los perfiles de datos.

Cuando no se selecciona, el radio no genera capturas a menos que se lo solicite con la Base de datos de información de administración (MIB) del registro de capturas.

10.24.1.2

Tono de alerta de desactivación de contexto

En este campo se activa el radio para que emita un tono de alarma cuando la sesión de datos haya finalizado.

Una sesión de datos se considera activa una vez que se establezcan las comunicaciones de datos. Esta función se aplica a todos los perfiles de datos.

10.24.1.3

Eco ICMP

En este campo se activa el radio para evitar una confirmación de vuelta (Ack) cuando se ha recibido la solicitud (ping) de eco del Protocolo de mensajes de control de Internet (ICMP).

En el caso de los radios APX NEXT y APX N70, esta función solo se aplica a los datos de radio móvil terrestre (LMR).

Esta función se aplica a todos los perfiles de datos.

10.24.1.4

Tipo 1 de asignación de dirección IP del par

En este campo se selecciona el método de asignación de Dirección de protocolo de Internet (IP) asignado al extremo de Unidad de suscriptor (SU) del enlace 1 en serie.

Esta función se aplica en todos los casos, excepto en los sistemas convencionales que tienen un perfil de datos seleccionado. Cuando un Sistema convencional tiene seleccionado un Perfil de datos, el

Sistema convencional usa la Dirección IP del par definida en el campo Dirección IP del par del perfil de datos.

**NOTA:**

Cuando asigne una dirección IP, asegúrese de que esta no tenga conflictos con otra dirección IP o subred utilizadas por el radio. Los dispositivos externos tales como Wi-Fi, un módem de datos externo y un Si500 pueden asignar direcciones IP a algunas interfaces. Si hay conflictos de direcciones IP o subredes en uso, no se garantiza que las funciones de datos funcionen de modo fiable.

La subred 169. 254. X. X. está reservada para la función Clonación de zona a zona. Por lo tanto, ninguna dirección IP puede comenzar con 169. 254. X. X.; de lo contrario, este campo no será válido.

Se admiten las siguientes selecciones:

Dinámico

El radio asigna la Dirección IP del par a la Computadora móvil (MC) luego de establecer un enlace en serie.

Estática

La MC inserta una dirección IP para usarla luego de establecer el enlace en serie. Esta selección solo se aplica para enlaces en serie basados en RS-232/PPP.

10.24.1.5

Pantalla de contenido de TMS directa

Este campo permite que el radio acceda directamente a su bandeja de entrada del servicio de mensajería de texto (TMS) y vea de inmediato el contenido del mensaje de texto sin su interacción.

Esta función se aplica a todos los perfiles de datos.

**NOTA:**

El icono **Sin leer** de la pantalla se elimina, ya que el contenido del mensaje de texto ya se mostró.

Cuando el radio está en este estado de la pantalla y se recibe otro mensaje de texto entrante, la pantalla se actualiza para mostrar el último mensaje entrante. Aún tiene la capacidad de navegar a otros mensajes en la bandeja de entrada del radio.

Este estado sale cuando hay un cambio de modo, cuando se inicia otra función de configuración de menú o cuando se presiona el botón **Inicio** o se selecciona el menú programable **Salir**.

Cuando está desactivado, debe seguir los procedimientos de TMS estándar para acceder a los mensajes de texto en la bandeja de entrada del radio.

10.24.1.6

Subred de radio interna

Este campo permite definir la subred de radio interna (los primeros tres octetos) de la Dirección de protocolo de Internet (IP) que se utiliza cuando se enciende el radio para establecer comunicaciones internas entre el radio y la Tarjeta opcional.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Esta selección se aplica a las comunicaciones de banda ancha.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten los siguientes valores:

- Los tres octetos de esta subred de dirección IP deben estar dentro del rango 193.0.0 a 207.255.255 inclusive.
- Esta subred de dirección IP no puede ser igual que los tres primeros octetos de las demás direcciones IP definidas para el radio. De lo contrario, la aplicación considera que este valor no es válido.
- Valor predeterminado de esta subred = 199.0.0

10.24.1.7

Informes de medición del sensor

Este campo permite que el radio procese los mensajes de Datos del sensor.

Esto es necesario cuando el radio intercambia información de los Datos del sensor con un Servidor de datos del sensor dentro de una infraestructura de comunicaciones Convencional y de Troncalización. Esta función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.24.1.8

Activación reconocida de informes de eventos de arma disparada

Esta función permite que los eventos de un arma disparada se transmitan en el canal de control.

Solo se accede: Cuando el radio admite diferentes modelos y opciones, y cuando el campo Informes de medición del sensor está activado.

10.24.2

LTE

La sección Evolución a largo plazo (LTE) le permite ver o definir la funcionalidad de LTE.

Estas configuraciones se aplican a todos los Tipos de perfil de datos de **Banda ancha**, Perfiles de datos.

IMPORTANTE:

Los perfiles de datos se seleccionan en el campo Selección de perfil de datos del Sistema de troncalización o en el campo Selección de perfil de datos del Sistema convencional.

Para las comunicaciones convencionales, los perfiles de datos se aplican solo para sistemas convencionales que tengan el campo Tipo de sistema configurado en **ASTRO**.

Para las comunicaciones de troncalización, los perfiles de datos se aplican solo para Sistemas de troncalización que tienen su campo Tipo de sistema configurado en **ASTRO 25**.

10.24.2.1

Umbral de tiempo de fuera de rango de LTE

En este campo se selecciona el tiempo que se considera que una señal de banda ancha de LTE está pérdida antes de determinar que el radio está fuera del rango de cobertura de LTE.

ADVERTENCIA:

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Esta selección se aplica a todos los perfiles de datos del Tipo de perfil de datos de "Banda ancha". El tiempo está expresado en segundos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Esta selección solo está disponible en la vista de Experto (consulte la Vista del codeplug).

Mesa 150: Rango

Mínimo	Máximo
60 (segundos)	3600 (segundos)

10.24.2.2

Datos en roaming.

Los datos en roaming permiten al usuario activar los datos del usuario (no conectados) durante el roaming.

10.24.2.3

Nombre del punto de acceso

Este campo permite definir nombres reconocibles que el radio utiliza para una conexión LTE clase 3.

ADVERTENCIA:

Solo el Personal de servicio calificado debe modificar el valor de este campo, a pedido del operador LTE. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

ADVERTENCIA:

Este valor solo debe ser modificado por los técnicos de campo si lo solicita el operador de LTE.

Esta selección se aplica a todos los perfiles de datos del Tipo de perfil de datos de “Banda ancha”.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Esta selección solo está disponible en la vista de Experto (consulte la Vista del codeplug).

10.24.3

Wi-Fi

Esta sección permite ver o modificar la configuración de Wi-Fi que se aplica a todos perfiles de datos.

IMPORTANTE:

Los perfiles de datos se seleccionan en el campo Selección de perfil de datos del Sistema de troncalización o en el campo Selección de perfil de datos del Sistema convencional.

Para las comunicaciones convencionales, los perfiles de datos se aplican solo para sistemas convencionales que tengan el campo Tipo de sistema configurado en **ASTRO**.

Para las comunicaciones de troncalización, los perfiles de datos se aplican solo para Sistemas de troncalización que tienen su campo Tipo de sistema configurado en **ASTRO 25**.

Por razones de seguridad, se permiten la asignación de plantillas y la importación de archivos *.csv si ingresa las contraseñas correctas de cada entrada de red en la tabla de Wi-Fi. También debe ingresar las contraseñas correctas en la aplicación independiente para las tareas Clonar/ Clonación exprés y Programación por lote.

10.24.3.1

Wi-Fi Enable

Este campo especifica si la conexión Wi-Fi está activada o desactivada en el radio.

Esta función se aplica a todos los perfiles de datos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.24.3.2

Permitir control del usuario

Este campo permite al usuario controlar el Wi-Fi.

Esta función se aplica a todos los perfiles de datos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.24.3.3

Prioridad de red

En este campo se describe la prioridad de las redes Wi-Fi disponibles.

Cuanto más bajo es el número, mayor es la prioridad.

Solo se accede: Cuando el campo [Wi-Fi Enable en la página 364](#) está **Activado** y cuando el radio admite modelos y opciones diferentes.

Mesa 151: Rango

Mínimo	Máximo	Incrementos
1	255	1

10.24.3.4

SSID de red

Este campo especifica el nombre de red (SSID) de una red Wi-Fi en la lista de redes configuradas.

**NOTA:**

El SSID no se puede guardar si se deja en blanco o vacía.

El SSID debe tener caracteres ASCII y no se aceptan SSID duplicados.

Solo se accede: Cuando el campo [Wi-Fi Enable en la página 364](#) está **Activado** y cuando el radio admite modelos y opciones diferentes.

10.24.3.5

Tipo de seguridad

En este campo se especifica el protocolo de seguridad que se utiliza para la conexión Wi-Fi.

Se admiten las siguientes selecciones:

- **NINGUNA**
- **WEP**
- **WPA2/WPA**

Solo se accede: Cuando el campo [Wi-Fi Enable en la página 364](#) está **Activado** y cuando el radio admite modelos y opciones diferentes.

10.24.3.6

Contraseña de red encriptada

La contraseña de 63 caracteres para la red Wi-Fi.

**NOTA:**

Para Tipo de seguridad **WEP**, la contraseña tendrá 5 caracteres o 13 caracteres de longitud. Para cada otro tipo, la contraseña será de al menos 8 caracteres y no puede dejarse en blanco o nulo. Para todos los tipos de seguridad, se permite ASCII.

La unidad del suscriptor (SU) es compatible con la configuración de clave WEP en modo ASCII solo para la seguridad de WEP. Por lo tanto, la configuración ASCII WEP40 (clave de 5 caracteres, como “abcde”) o WEP104 (clave de 13 caracteres, como “1234567890123”) es compatible en la SU. La SU no es compatible con la configuración de claves hexadecimales WEP.

Solo se accede: Cuando el campo [Wi-Fi Enable en la página 364](#) está **Activado**, el [Tipo de seguridad en la página 365](#) es un valor distinto de **Ninguno**, y el radio admite modelos y opciones diferentes.

10.24.4

Lista NAT

Esta sección permite ver o definir hasta 16 conjuntos de reglas estáticas de Traducción de direcciones de red (NAT) basadas en el puerto para la Lista NAT.

Estos ajustes se aplican para todos los [Perfiles de datos en la página 376](#) de troncalización o para todos los [Perfiles de datos en la página 376](#) convencionales, cuando el campo Activación de NAT de Perfiles de datos está **Activado**.

**IMPORTANTE:**

Cuando se activa alguna de las 5 funciones siguientes, una de las 16 reglas NAT posibles (registro/fila) es utilizada por RadioCentral:

- Servicio de mensaje de texto (TMS)
- Servicio de registro automático (ARS); consulte el campo Modo ARS
- [Activación de ubicación en la página 120](#)
- Regeneración de clave por el aire (OTAR); consulte el campo Activar OTAR

Los perfiles de datos se seleccionan en el campo Selección de perfil de datos del Sistema de troncalización o en el campo Selección de perfil de datos del Sistema convencional.

Para las comunicaciones convencionales, los perfiles de datos se aplican solo para sistemas convencionales que tengan el campo Tipo de sistema configurado en **ASTRO**.

Para las comunicaciones de troncalización, los perfiles de datos se aplican solo para Sistemas de troncalización que tienen su campo Tipo de sistema configurado en **ASTRO 25**.

10.24.4.1

Puerto LAN

En este campo se selecciona el puerto de Red de área local (LAN) para la regla actual de Traducción de dirección de red (NAT) (registro/fila) de la Lista NAT.

Ejemplo: La NAT estática puede reenviar todas las solicitudes externas que entran al puerto 90 del radio hacia el puerto 80 de la Computadora móvil (MC). En este ejemplo, la dirección IP de NAT estática sería la Dirección IP de la MC, el puerto LAN sería el puerto (80) de la MC y el puerto WAN sería el puerto externo del radio (90).

Se aplica solo:

- Para todos los perfiles de datos de troncalización
- Para todos los Perfiles de datos convencionales cuando el campo Activación de NAT de los perfiles de datos está **Activado**.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 152: Rango

Mínimo	Máximo
1	65535

ADVERTENCIA:

El Administrador de radio no considera válido el valor predeterminado de "0" y debe definirse correctamente.

10.24.4.2

Dirección IP NAT estática

En este campo se selecciona la Dirección de protocolo de Internet (IP) de Red de área local (LAN) de Traducción de dirección de red (NAT) que proporciona un mapeo entre las direcciones IP de la aplicación interna o la Computadora móvil (MC) y las direcciones IP asignadas por el sistema.

Esta selección se aplica para la regla de NAT (registro/fila) actual de la Lista NAT.

Ejemplo: La NAT estática puede reenviar todas las solicitudes externas que entran al puerto 90 del radio hacia el puerto 80 de la MC. En este ejemplo, la dirección IP de NAT estática sería la Dirección IP de la MC, el puerto LAN sería el puerto (80) de la MC y el puerto WAN sería el puerto externo del radio (90).

Se aplica solo:

- Para todos los perfiles de datos de troncalización
- Para todos los perfiles de datos convencionales cuando el campo Activación de NAT de perfiles de datos está **Activado**.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

NOTA:

Cada octeto de la dirección IP debe ser entre: [0-223]. [0-255]. [0-255]. [0-255]

ADVERTENCIA:

El administrador de radio considera como no válido el valor predeterminado 0.0.0.0 y debe definirse correctamente.

10.24.4.3

Puerto WAN

En este campo se selecciona el puerto de Red de área amplia (WAN) para la regla actual de Traducción de dirección de red (NAT) (registro/fila) de la Lista NAT.

Ejemplo: La NAT estática puede reenviar todas las solicitudes externas que entran al puerto 90 del radio hacia el puerto 80 de la computadora móvil. En este ejemplo, la dirección IP de NAT estática sería la Dirección IP de la MC, el puerto LAN sería el puerto (80) de la MC y el puerto WAN sería el puerto externo del radio (90).

Se aplica solo:

- Para todos los perfiles de datos de troncalización
- Para todos los perfiles de datos convencionales cuando el campo Activación de NAT de perfiles de datos está **Activado**.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 153: Rango

Mínimo	Máximo
1	65535

ADVERTENCIA:

El Administrador de radio no considera válido el valor predeterminado de “0” y debe definirse correctamente.

10.24.5

Configuración del protocolo de datos

Esta sección permite ver o modificar la configuración relacionada con los Algoritmos de compresión de encabezado del Protocolo de Internet (IP).

Estas selecciones se aplican a todos los perfiles de datos.

IMPORTANTE:

Los perfiles de datos se seleccionan en el campo Selección de perfil de datos del Sistema de troncalización o en el campo Selección de perfil de datos del Sistema convencional.

Para las comunicaciones convencionales, los perfiles de datos se aplican solo para sistemas convencionales que tengan el campo Tipo de sistema configurado en **ASTRO**.

Para las comunicaciones de troncalización, los perfiles de datos se aplican solo para Sistemas de troncalización que tienen su campo Tipo de sistema configurado en **ASTRO 25**.

ADVERTENCIA:

Estos ajustes se deben modificar solo cuando el Personal de servicio calificado lo considere necesario. Si no se configura de manera precisa, la Configuración del protocolo de datos podría degradar gravemente el rendimiento del radio o del sistema.

10.24.5.1

Número máximo de contextos de compresión del encabezado no TCP IP

En este campo se selecciona el número máximo de contextos de compresión de encabezados IP distinto de TCP (Protocolo de control de transmisión, protocolo de Internet) permitidos por suscriptor.

Las directrices están en conformidad con el documento RFC2507 creado y mantenido por el IETF (Grupo de trabajo de ingeniería de Internet). El documento RFC2507 describe los estándares para los Algoritmos de compresión de encabezado del IP. Esta selección se aplica a todos Perfiles de datos.

ADVERTENCIA:

Este campo solo debe modificarse cuando el Personal de servicio calificado lo considere necesario. Si no se configura de manera precisa, la Configuración del protocolo de datos podría degradar gravemente el rendimiento del radio o del sistema.

Mesa 154: Rango

Mínimo	Máximo
0	16

10.24.5.2

Número máximo de encabezados comprimidos entre encabezados completos

En este campo se selecciona el número máximo de encabezados IP distinto de TCP (Protocolo de control de transmisión, protocolo de Internet) que se envían entre encabezados completos.

Las directrices están en conformidad con el documento RFC2507 creado y mantenido por el IETF (Grupo de trabajo de ingeniería de Internet). El documento RFC2507 describe los estándares para los Algoritmos de compresión de encabezado del IP. Esta selección se aplica a todos Perfiles de datos.

**ADVERTENCIA:**

Este campo solo debe modificarse cuando el Personal de servicio calificado lo considere necesario. Si no se configura de manera precisa, la Configuración del protocolo de datos podría degradar gravemente el rendimiento del radio o del sistema.

Mesa 155: Rango

Mínimo	Máximo	Incrementos
0	4080	16

10.24.5.3

Tamaño máximo de encabezado permitido para la compresión

En este campo se selecciona el tamaño máximo del encabezado que se puede usar para la compresión del encabezado.

Las directrices están en conformidad con el documento RFC2507 creado y mantenido por el IETF (Grupo de trabajo de ingeniería de Internet). El documento RFC2507 describe los estándares para los Algoritmos de compresión del encabezado del IP (Protocolo de Internet). Esta selección se aplica a todos Perfiles de datos.

**ADVERTENCIA:**

Este campo solo debe modificarse cuando el Personal de servicio calificado lo considere necesario. Si no se configura de manera precisa, la Configuración del protocolo de datos podría degradar gravemente el rendimiento del radio o del sistema.

Mesa 156: Rango

Mínimo	Máximo
60	255

10.24.5.4

Tiempo máximo entre encabezados completos

En este campo se selecciona el tiempo máximo entre contextos de compresión de encabezados completos.

Los encabezados distintos de TCP comprimidos podrían no enviarse luego de que esta cantidad de tiempo haya expirado después de enviar el último encabezado completo. Las directrices están en conformidad con el documento RFC2507 creado y mantenido por el IETF (Grupo de trabajo de ingeniería de Internet). El documento RFC2507 describe los estándares para los Algoritmos de

compresión del encabezado del IP (Protocolo de Internet). Esta selección se aplica a todos Perfiles de datos. El tiempo está expresado en segundos.

**ADVERTENCIA:**

Este campo solo debe modificarse cuando el Personal de servicio calificado lo considere necesario. Si no se configura de manera precisa, la Configuración del protocolo de datos podría degradar gravemente el rendimiento del radio o del sistema.

Mesa 157: Rango

Mínimo	Máximo	Incrementos
0 (segundos)	1275 (segundos)	5 (segundos)

10.24.5.5

Tiempo de configuración máximo para acceso de canal controlado

En este campo se selecciona el tiempo necesario para acceder al canal de datos en paquete para acceder a canales controlados para transmisión de datos de entrada.

El radio utiliza este campo para determinar si la duración del acceso al canal de paquete de datos puede retrasar la transmisión más allá del tiempo requerido. De ser así, los procedimientos de acceso al canal controlado no se inician. Esta selección se aplica a todos Perfiles de datos. El tiempo está expresado en milisegundos.

**ADVERTENCIA:**

Este campo solo debe modificarse cuando el Personal de servicio calificado lo considere necesario. Si no se configura de manera precisa, la Configuración del protocolo de datos podría degradar gravemente el rendimiento del radio o del sistema.

Mesa 158: Rango

Mínimo	Máximo
0 (ms)	65535 (ms)

10.24.5.6

Variación de la fuente a tiempo

En este campo se selecciona la cantidad de tiempo (microranuras) antes y después de la micro ranura cero durante la cual las dos fuentes de reloj que generan el tiempo de transmisión amplia sincronizado se encuentran desalineados.

Todo este período se considera una ventana de vulnerabilidad durante la cual las transmisiones amplias sincronizadas podrían contener información defectuosa o confusa. Todas las transmisiones amplias sincronizadas que se reciben durante este período son ignoradas por el DSP (Procesador de señal digital) y, como resultado, no se utilizan para establecer ni mantener sincronización con la hora del sistema. Esta selección se aplica a todos Perfiles de datos.

**ADVERTENCIA:**

Este campo solo debe modificarse cuando el Personal de servicio calificado lo considere necesario. Si no se configura de manera precisa, la Configuración del protocolo de datos podría degradar gravemente el rendimiento del radio o del sistema.

Mesa 159: Rango

Mínimo	Máximo	Incrementos
0 (microranuras)	268 (microranuras)	2 (microranuras)

NOTA:

Una microranura es igual a 7,5 milisegundos.

10.24.6

Configuración de puerto

En esta sección, el usuario puede ver o definir configuraciones que se utilizarán en la transferencia de claves entre un Cargador de variables de clave (KVL) y un radio. Estas configuraciones se aplican a todos los Perfiles de datos.

IMPORTANTE:

Los perfiles de datos se seleccionan en el campo Selección de perfil de datos del Sistema de troncalización o en el campo Selección de perfil de datos del Sistema convencional.

Para las comunicaciones de troncalización, los perfiles de datos se aplican solo para Sistemas de troncalización que tienen su campo Tipo de sistema configurado en **ASTRO 25**.

10.24.6.1

Puerto UDP de autenticación

En este campo se selecciona el número de puerto del Protocolo de datagramas del usuario (UDP) para el puerto utilizado para comunicarse con el Cargador de variables de clave (KVL).

Un KVL se utiliza para suministrarle Claves de autenticación al radio. Esta función se aplica a Sistemas de de troncalización APCO P25 (ASTRO 25).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 160: Rango

Mínimo	Máximo
49152	65535

10.24.6.2

Puerto UDP del informe de ubicación fija de P25

En este campo se selecciona el número de puerto del Protocolo de datagramas del usuario (UDP) para el Servidor de ubicación al que el radio escucha y transmite datos de Informe de ubicación fija de P25.

Esta función se aplica para Sistemas de troncalización ASTRO P25 (APCO P25).

ADVERTENCIA:

Esta selección solo es válida cuando no es igual al valor del Puerto UDP de autenticación, Puerto LAN, Puerto WAN, Puerto de destino PAD, Puerto OTAR del suscriptor, Puerto UDP KMF, o el Puerto del servidor KMF/OTAR (64414) y cuando no es igual a los valores de Puerto UDP reservados que utiliza cualquier otro servicio, de la siguiente forma:

- 0161 Aplicación de agente SNMP: OBTENER/ESTABLECER
- 0162 Agente SNMP: traps informados
- 4000 Puerto de bucle de circuito UDP (para pruebas internas)
- 4001 Aplicación de servicios de posición dentro de la plataforma central global
- 4002 Aplicación de diagnóstico: que se espera que gestione diagnósticos entregados desde componentes internos del radio hacia una computadora móvil.
- 4003 Aplicación del sistema: ofrece servicios para acceder a los recursos internos de la unidad del suscriptor, por ejemplo, claves, pantallas, comunicaciones, etc.
- 4004 Un número de puerto "proxy" que inicia la aplicación del sistema en nombre de una aplicación de terceros que se ejecuta en un dispositivo periférico no compatible con IP.
- 4005 Servidor PN (ARS)
- 4006 Servidor de protocolo de configuración dinámica de host (DHCP)
- 4007 APCO Servicio de mensajería de texto
- 4011 Respuesta de la solicitud de diagnóstico UDP
- 4012 Transmisión amplia de diagnóstico UDP
- 4050 Aplicación OTAR
- 49223 Envío/recepción de mensajes de autenticación de usuario

Solo se accede: Cuando el campo Activación de ubicación esté activado, el campo Informe de ubicación fija de P25 esté activado y el radio admita diferentes modelos y opciones.

Mesa 161: Rango

Mínimo	Máximo
1	65535

10.24.6.3

Puerto UDP de informes de medición del sensor

En este campo se selecciona el número de puerto del Protocolo de datagramas del usuario (UDP) para el Servidor de datos del sensor al que escucha el radio y al que transmite los datos de los Informes del sensor.

Este campo se aplica tanto para la infraestructura de comunicaciones convencionales como de troncalización.

NOTA:

Este campo se aplicará cuando [Informes de medición del sensor en la página 363](#) esté activado.

El valor del Puerto del UDP de los Informes de administración del sensor no debe ser igual al valor de ninguno de estos campos (configurable por RadioCentral): Puerto LAN, puerto WAN, puerto UDP de autenticación, puerto UDP del informe de ubicación fija de P25, puerto TCP de programación inalámbrica, número de puerto, puerto OTAR del abonado, puerto UDP KMF y puerto de destino PAD.

Mesa 162: Rango

Mínimo	Máximo
49625	65535

Solo se accede: Cuando el radio admite diferentes modelos/opciones, y cuando el campo Informes de medición del sensor está activado.

10.24.6.4

Puerto UDP de carga de claves KVL

Este campo le permite ingresar el número de puerto del Protocolo de datagramas del usuario (UDP) para la carga de claves del Cargador de variables de clave (KVL).

**ADVERTENCIA:**

El valor del puerto UDP de carga de claves KVL no debe ser igual a ninguno de los siguientes campos:

- Puerto LAN en la página 366
- Puerto WAN en la página 367
- Puerto UDP de autenticación en la página 371
- Puerto UDP del informe de ubicación fija de P25 en la página 371
- Puerto TCP de programación inalámbrica
- Número de puerto en la página 401
- Puerto OTAR de suscriptor en la página 329
- Puerto UDP KMF en la página 328
- Puerto de destino PAD en la página 387
- Puerto UDP de informes de medición del sensor en la página 372

Mesa 163: Rango

Mínimo	Máximo	Incremento
49152	65535	1

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está establecido **Software**, cuando el campo [Fuente de carga de claves en la página 302](#) está establecido en **KVL solamente** y cuando el radio admite diferentes modelos/opciones.

10.25

Lista de usuarios de datos

Esta sección permite ver o definir el Servicio de registro automático y que se seleccionen los nombres de usuario de autenticación de usuario e ID de unidad cuando se necesiten las credenciales de inicio de sesión del servidor alternativo.

Además, los ID de radio de destino (consulte Sistema convencional - ASTRO - ID individuales y Sistema de troncalización - ASTRO 25 - ID de unidades) también pueden definirse para la selección.

Estos nombres de usuario e ID de unidades/radios se utilizan para aplicaciones relacionadas con datos como Mensajería de texto.

**NOTA:**

Los nombres de usuario predeterminados y los valores de ID de unidad pueden programarse.

Los perfiles de datos se pueden seleccionar en el campo Selección de perfil de datos del sistema de troncalización.

Los perfiles de datos se pueden seleccionar en el campo Selección de perfil de datos del sistema convencional.

La pulsación del botón Usuario y la selección del menú Usuario permiten al usuario iniciar sesión en un servidor específico del Servicio de registro automático o en un servidor UNS (Servicios de red unificados) de Autenticación de usuario con la combinación de nombre de usuario, PIN/contraseña e ID de unidad de inicio de sesión de usuario correcta. Los nombres de usuario, los PIN y los ID de unidad también se pueden ingresar manualmente desde el teclado del radio.

10.25.1**Nombre de usuario de datos**

Esta campo permite ver o definir el Servicio de registro automático y que se seleccionen los nombres de usuario de autenticación de usuario e ID de unidad cuando se necesiten las credenciales de inicio de sesión del servidor alternativo

Además, los ID de radio de destino (consulte Sistema convencional - ASTRO - ID individuales y Sistema de troncalización - ASTRO 25 - ID de unidades) también pueden definirse para la selección. Estos nombres de usuario e ID de unidades/radios se utilizan para aplicaciones relacionadas con datos como Mensajería de texto.

**NOTA:**

Los nombres de usuario predeterminados y los valores de ID de unidad pueden programarse.

Los perfiles de datos se pueden seleccionar en el campo Selección de perfil de datos del sistema de troncalización.

Los perfiles de datos se pueden seleccionar en el campo Selección de perfil de datos del sistema convencional.

La pulsación del botón Usuario y la selección del menú Usuario permiten al usuario iniciar sesión en un servidor específico del Servicio de registro automático o en un servidor UNS (Servicios de red unificados) de Autenticación de usuario con la combinación de nombre de usuario, PIN/contraseña e ID de unidad de inicio de sesión de usuario correcta. Los nombres de usuario, los PIN y los ID de unidad también se pueden ingresar manualmente desde el teclado del radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

**NOTA:**

Ejemplos: EMT-001, #500, DATAUSER 1, # A5

En los nombres de usuario se pueden usar los caracteres de la A (a) a la Z (z), del 0 al 9, -, *, #, &, \$, /, +, % y espacios.

Se pueden utilizar hasta 40 caracteres.

El número mínimo de los registros de listas es 1 hasta un máximo de 100.

10.26

Conjunto Lista de mensajes de texto rápido

El conjunto **Lista de mensajes de texto rápido** permite al usuario ver o definir los Mensajes de texto rápido/de consulta que poseen contenido de Servicio de mensaje de texto requeridos con frecuencia. Entonces, usted puede seleccionar desde la lista de Mensajes de texto rápido/de consulta y transmitir fácilmente un mensaje con un esfuerzo mínimo. Una vez seleccionados, el usuario del radio puede editar los Mensajes de texto rápido/de consulta antes de la transmisión (siempre que el Servicio de mensajería de texto se configure en **Ilimitado**). Las ediciones solo se aplican a esa transmisión. El original se mantiene tal como se define en la Lista de mensajes de texto rápido. Una Consulta de TMS (Servicio de mensajería de texto) permite al usuario del radio especificar la información en una plantilla de consulta de formato previo y enviarla como un mensaje a un Servidor de consulta. Luego, el servidor responde con un mensaje de texto que contiene la información solicitada.

Solo se accede: cuando el Servicio de consulta TMS solo está disponible con la Autenticación de usuario de Factor único o Factor doble y el modo SmartMessage configurado en **LMR**.

NOTA:

La función TMS se activa según el Sistema de troncalización o el Sistema convencional.

El usuario del radio accede a la mensajería de texto con la pulsación de botón Servicio de mensajería de texto o la selección de menú Servicio de mensajería de texto.

La pulsación del botón Texto rápido de TMS y Consulta TMS permite al usuario del radio acceder a las funciones Texto rápido y Mensaje de consulta.

Se admite el siguiente campo:

10.26.1

Mensaje de texto rápido

Este campo permite ver o definir los Mensajes de texto rápido/de consulta que poseen contenido de Servicio de mensaje de texto requeridos con frecuencia.

Entonces, usted puede seleccionar desde la lista de Mensajes de texto rápido/de consulta y transmitir fácilmente un mensaje con un esfuerzo mínimo.

Una vez seleccionado, puede editar Mensajes de texto rápido/de consulta antes de la transmisión (siempre y cuando el Servicio de mensajería de texto esté configurado en **Ilimitado**). Las ediciones solo se aplican a esa transmisión. El original permanece según lo definido. Una Consulta TMS permite al usuario especificar información en la plantilla de consulta de formato previo y enviar esta información como mensaje a un Servidor de consulta. A continuación, el servidor responde con un mensaje de texto que contiene la información solicitada.

Solo se accede: Cuando el radio admite modelos y opciones diferentes y cuando el servicio Consulta TMS solo está disponible mediante autenticación del usuario de uno o dos factores.

NOTA:

La función Servicio de mensajería de texto se activa según [Sistema de troncalización](#) o [Sistema convencional en la página 415](#).

Puede acceder a la opción Mensajería de texto con la pulsación del botón [Servicio de mensajería de texto](#), o la selección del menú [Servicio de mensajería de texto en la página 225](#).

La pulsación del botón [Texto rápido TMS en la página 195](#) y [Consulta TMS en la página 195](#) permite acceder directamente a las funciones Texto rápido y Mensaje de consulta. Los nombres de usuario predeterminados y los valores de ID de unidad pueden programarse.

10.27

Perfiles de datos

La opción **Perfiles de datos** permite definir perfiles de datos individuales para distintos tipos y requisitos de comunicaciones de datos.

En última instancia, los Perfiles de datos se definen para comunicar los datos de radio a través de canales convencionales o de troncalización, o comunicar datos de radio a través de una red de Banda ancha de LTE.

**IMPORTANTE:**

Las funciones y selecciones de Datos en general se aplican a todos los perfiles de datos.

Según la selección del Tipo del perfil de datos, los Perfiles de datos se seleccionan en el campo Selección de perfil de datos del Sistema de troncalización o en el campo Selección de perfil de datos del Sistema convencional.

Para las comunicaciones convencionales, los perfiles de datos se aplican solo para sistemas convencionales que tengan el campo Tipo de sistema configurado en **ASTRO**.

Para las comunicaciones de troncalización, los perfiles de datos se aplican solo para Sistemas de troncalización que tienen su campo Tipo de sistema configurado en **ASTRO 25**.

10.27.1

General

Esta sección permite ver o modificar la configuración de datos para los perfiles de datos individuales.

**NOTA:**

Los perfiles de datos se seleccionan en el campo Selección de perfil de datos del Sistema de troncalización o en el campo Selección de perfil de datos del Sistema convencional.

Para las comunicaciones convencionales, los perfiles de datos se aplican solo para sistemas convencionales que tengan el campo Tipo de sistema configurado en **ASTRO**.

Para las comunicaciones de troncalización, los perfiles de datos se aplican solo para Sistemas de troncalización que tienen su campo Tipo de sistema configurado en **ASTRO 25**.

10.27.1.1

Nombre del perfil de datos

Este campo permite crear un nombre reconocible para el Perfil de datos actual.

Los perfiles de datos se seleccionan en el campo Selección de perfil de datos del Sistema de troncalización o en el campo Selección de perfil de datos del Sistema convencional.

Están disponibles las siguientes selecciones:

- Se pueden usar caracteres, números, espacios y caracteres especiales.
- Se pueden utilizar hasta 14 caracteres.
- **Ejemplos:** EMT-001, #500, Eléctrico1, # A5
- Consulte también: Validación de datos del campo de nombres.

10.27.1.2

Tipo del perfil de datos

En este campo se seleccionan las capacidades de comunicaciones de datos del radio para el Perfil de datos actual.

Los perfiles de datos se seleccionan en el campo Selección de perfil de datos del Sistema de troncalización o en el campo Selección de perfil de datos del Sistema convencional.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Están disponibles las siguientes selecciones:

Convencional

El radio envía y recibe datos (y voz) solo a través de un sistema FNE (Equipo de red fija) convencional ASTRO.

Troncalización

El radio envía y recibe datos (y voz) solo a través de un sistema IV&D (Voz y datos integrados) troncalizado ASTRO 25.

Solo banda ancha

El radio envía y recibe datos solo a través de una red de datos de banda ancha LTE (las operaciones de voz continúan a través del sistema convencional ASTRO o troncalizado ASTRO 25).

Convencional y banda ancha

El radio puede enviar y recibir datos a través de un sistema FNE convencional ASTRO o una red de datos de banda ancha LTE (las operaciones de voz continúan a través del sistema FNE convencional ASTRO). Cuando ambos sistemas o redes están disponibles para las transmisiones de datos, se le da prioridad a la red LTE.

ADVERTENCIA:

Quando se selecciona, el campo Modo de datos por paquete se debe establecer en "FNE".

Troncalización y banda ancha

El radio puede enviar y recibir datos a través de un sistema IV&D troncalizado ASTRO 25 o una red de datos de banda ancha LTE (las operaciones de voz continúan a través del sistema troncalizado ASTRO 25). Cuando ambos sistemas o redes están disponibles para las transmisiones de datos, se le da prioridad a la red LTE.

10.27.1.3

Temporizador del intervalo de reposo en fila

En este campo se selecciona la cantidad de tiempo que un datagrama IP (Protocolo de Internet) permanece en fila en el radio.

Esta programación determina durante cuánto tiempo pueden esperar los datos en el radio sin transmitirse, antes de que los datos se depuren de la fila. Cuando los datos se envíen desde una Computadora móvil (MC) al radio, en ocasiones el radio recibe los datos más rápido de lo que puede enviarlos, y los datos deben esperar en la fila del radio. Esta selección se aplica al Perfil de datos actual. El tiempo está expresado en segundos.

Solo se accede: Cuando el campo [Tipo del perfil de datos en la página 376](#) no está configurado como **Solo banda ancha** y cuando el radio admite modelos y opciones diferentes.

Mesa 164: Rango

Mínimo	Máximo
15 segundos	120 segundos

10.27.1.4

Interrupción de datos por Rx de voz

En este campo se activa una transmisión de voz (Rx) recibida para interrumpir una comunicación de datos.

La comunicación de datos se interrumpe siempre que el radio perciba una transmisión de voz entrante apropiada. Esta función se aplica solo al Perfil de datos de troncalización actual.

Solo se accede: Cuando el [Tipo del perfil de datos en la página 376](#) está configurado en **Troncalización** o **Troncalización y banda ancha** y el radio admite modelos y opciones diferentes.

IMPORTANTE:

Si el radio está configurado como Rastreo de monitor de prioridad (consulte Tipo de rastreo), solo la actividad de voz del grupo de conversación seleccionado interrumpe la comunicación de datos.

10.27.1.5

Interrupción de datos de voz recibidos durante rastreo prioritario

En este campo se activa una transmisión de voz recibida (Rx) para interrumpir una comunicación de datos cuando el radio está en rastreo de monitor de prioridad y está recibiendo la actividad del miembro de prioridad.

Solo se accede: Cuando el [Tipo del perfil de datos en la página 376](#) está configurado en **Troncalización** o **Troncalización y banda ancha** y [Interrupción de datos por Rx de voz en la página 377](#) está activado.

10.27.1.6

Transmisión amplia limitada

Este campo activa el radio para enrutar datagramas de transmisión amplia limitada desde la Computadora móvil (MC) de manera inalámbrica.

La función se aplica al Perfil de datos actual.

Cuando está desactivado, se bloquea el envío por el aire de los datagramas de transmisión amplia desde la MC.

Solo se accede: Cuando el campo [Tipo del perfil de datos en la página 376](#) no está configurado como **Solo banda ancha** y cuando el radio admite modelos y opciones diferentes.

10.27.1.7

Datos del intersistema

Este campo permite que un radio intente automáticamente la activación de contexto mientras hace roaming en un Sistema de troncalización externo.

Facilita el acceso a los servicios de datos (como, por ejemplo, Ubicación y OTAR) en ese sistema (consulte también Roaming inter-WACN). Esto se aplica solo a sistemas ASTRO 25 con conexión ISSI 8000 que funcionan dentro de una Red empresarial del cliente (CEN) combinada (sistema extranjero + nacional). Esta selección se aplica al Perfil de datos de troncalización actual.

IMPORTANTE:

Si la activación de contexto se realiza correctamente en el Sistema de troncalización extranjero, el radio generalmente puede acceder a todos los servicios de datos disponibles en ese sistema. No responde a las transmisiones amplias de datos en todo el sistema.

Solo se accede: Cuando el campo [Tipo del perfil de datos en la página 376](#) está configurado como **Troncalización** o **Troncalización y banda ancha** y el radio admite modelos y opciones diferentes.

10.27.1.8

Tiempo de interrupción aleatoria

En este campo se activa el radio para calcular un valor de interrupción aleatorio entre 0 (cero) y el Tiempo de interrupción de activación de contexto que se utiliza durante la activación de contexto del sistema.

Esta función se aplica solo al Perfil de datos de troncalización actual. Cuando se desactiva, se utiliza el valor Tiempo de interrupción de activación de contexto.

Solo se accede: Cuando el [Tipo del perfil de datos en la página 376](#) está configurado en **Troncalización** o **Troncalización y banda ancha**.

10.27.1.9

Tiempo de interrupción de activación de contexto

En este campo se selecciona la cantidad máxima de tiempo que el radio puede interrumpir los intentos de activación de contexto del sistema.

El temporizador comienza luego de la primera solicitud rechazada de activación de contexto. El campo Tiempo de postergación aleatorio puede definir cómo se utiliza este valor. La selección del Modo de interrupción de activación de contexto puede determinar cuándo se utiliza este valor. Esta selección solo se aplica al Perfil de datos de troncalización actual. El tiempo está expresado en minutos.

Solo se accede: Cuando el [Tipo del perfil de datos en la página 376](#) está configurado en **Troncalización** o **Troncalización y banda ancha**.

Mesa 165: Rango

Desactivado	Mínimo	Máximo
0 - Desactivado	1 min	60 min

10.27.1.10

Versión de registro del paquete de datos

En este campo se selecciona entre dos versiones del Protocolo de convergencia dependiente de la subred (SNDCP) para los datos de entrada.

Esta selección solo se aplica al Perfil de datos de troncalización actual.

Solo se accede: Cuando el [Tipo del perfil de datos en la página 376](#) está configurado en **Troncalización** o **Troncalización y banda ancha**.

Están disponibles las siguientes selecciones:

SNDCPv1

SNDCP Versión 1 permite que los mensajes de registro de datos por paquete se intercambien con un sistema ASTRO 25 anterior a 7.3. Esta selección no es válida si el siguiente escenario es verdadero: El Tipo de perfil de datos está configurado como **Troncalización** o **Troncalización y banda ancha** y la selección de Lista de puertos de datos mejorados no está configurada como **Desactivada**.

SNDCPv3

SNDCP Versión 3 permite que los mensajes de registro de datos por paquete se intercambien con un sistema ASTRO 25 7.3 o superior.

10.27.1.11

Habilitación de compresión del encabezado de IP

En este campo se activa el radio para realizar una transferencia más eficaz de mensajes mediante la reducción de la cantidad relativamente elevada de usuarios de datos activos por canal de paquete de datos.

Los encabezados excedentes UDP (Protocolo de datagramas del usuario)/IP (Protocolo de Internet) se comprimen antes de su transmisión a su destino. Esta selección solo se aplica al Perfil de datos de troncalización actual.

ADVERTENCIA:

Esta función no es compatible con Asegurar/borrar conexión configurada como **Encriptar**.

Solo se accede: Cuando el campo [Tipo del perfil de datos en la página 376](#) está configurado como **Troncalización** o **Troncalización y banda ancha** y el campo [Versión de registro del paquete de datos en la página 379](#) está configurado como **SNDCPv3**.

10.27.2

Funciones

Esta sección permite ver o modificar la configuración de datos para los perfiles de datos individuales.

NOTA:

Los perfiles de datos se seleccionan en el campo Selección de perfil de datos del Sistema de troncalización o en el campo Selección de perfil de datos del Sistema convencional.

Para las comunicaciones convencionales, los perfiles de datos se aplican solo para sistemas convencionales que tengan el campo Tipo de sistema configurado en **ASTRO**.

Para las comunicaciones de troncalización, los perfiles de datos se aplican solo para Sistemas de troncalización que tienen su campo Tipo de sistema configurado en **ASTRO 25**.

10.27.2.1

Datos de terminal

En este campo se activa la Computadora móvil (MC) para transmitir o recibir datos en paquete de manera inalámbrica.

Esta función se aplica al Perfil de datos actual.

Al estar desactivada, la Computadora móvil aún puede comunicarse con aplicaciones de datos internos del radio; estas aplicaciones aún pueden comunicarse por el aire.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.27.2.2

Modo de interrupción de activación de contexto

En este campo se seleccionan las condiciones en cuanto a cuándo el radio utiliza el Tiempo de interrupción de activación de contexto.

El temporizador y este modo Interrupción seleccionado limita las solicitudes del radio para la activación de contexto del sistema. La programación del campo Tiempo de postergación aleatorio determina cómo el Sistema de troncalización actual utiliza el Tiempo de interrupción de activación de contexto. Esta selección se aplica al Perfil de datos actual.

Están disponibles las siguientes selecciones:

Interrupción siempre

El radio utiliza el Tiempo de interrupción de activación de contexto: intento fallido en la activación de contexto del sistema inicial, error en el contexto o pérdida de contexto debido a un comando de desactivación recibido por el sistema y se requiere reactivación.

Retener en caso de falla

El radio utiliza el Tiempo de interrupción de activación de contexto solo una vez que se produce un error en la activación de contexto del sistema.

10.27.2.3

Cronómetro largo de reintento

En este campo se selecciona la cantidad de tiempo que espera el radio después de que fallan todos los reintentos de registro con el Servidor de registro automático.

En el radio hay un total de cinco intentos de registro con código rígido (no se pueden modificar): el inicial y cuatro reintentos. El temporizador comienza luego de que se transmite el cuarto intento. Esta selección se aplica al Perfil de datos actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Están disponibles las siguientes selecciones:

NOTA:

cuando se configura en **0-Desactivado**, el radio ya no logra que el registro del Servidor se produzca en 0 (cero minutos)

Mesa 166: Rango

Mínimo	Máximo	Incrementos
5 (minutos)	300 (minutos)	1 (minuto)

Mesa 167: Rango

Desactivado	Mínimo	Máximo
4 - Desactivado	5 minutos	300 minutos

10.27.2.4

Cronómetro corto de reintento

En este campo se selecciona la cantidad de tiempo entre el Número de reintentos.

En ocasiones, los reintentos son necesarios para ciertos procedimientos de aplicación de datos. Esta selección se aplica al Perfil de datos actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 168: Rango

Mínimo	Máximo	Incrementos
5 segundos	90 segundos	5 segundos

10.27.2.5

Número de intentos

En este campo se selecciona la cantidad de intentos que el radio efectúa (hasta realizarlo correctamente) para ciertos procedimientos de aplicación de datos.

La cantidad de tiempo que el radio espera entre estos intentos se determina mediante el campo [Cronómetro corto de reintento en la página 381](#). Esta selección se aplica al Perfil de datos actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 169: Rango

Mínimo	Máximo
1	10

10.27.2.6

Modo ARS

En este campo se selecciona el modo Servicio de registro automático (ARS) para el Perfil de datos actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Están disponibles las siguientes selecciones:

Desactivado

El modo ARS está desactivado.

Servidor

Use esta programación cuando se esté utilizando un ARS en el sistema. Esta selección es aplicable tanto al servidor heredado Notificación de presencia (PN) de ARS y al servidor de Autenticación de usuario.

Sin servidor

Use esta programación cuando se necesiten servicios de resolución de nombres y no haya un ARS disponible. Esta selección es solo válida: cuando el Tipo de perfil de datos es **Convencional** o **Convencional y banda ancha**, y cuando el campo Modo de datos por paquete no está configurado en **FNE**.

Servidor mejorado

Permite el registro de ARS mejorado que solo es compatible con la versión de software 5.1 de UNS o superior.

10.27.2.7

Dirección del servidor de registro automático

Este campo permite definir la dirección IP (Protocolo de Internet) del Servidor de registro automático (ARS) para el Perfil de datos actual.

Solo se accede: Cuando el campo [Modo ARS en la página 382](#) está configurado en **Servidor** y cuando el radio admite modelos y opciones diferentes.

Las selecciones son válidas cuando se cumple lo siguiente:

- Los cuatro octetos deben estar en el rango: [1-223] . [0-255] . [0-255] . [0-255]
- La dirección IP no puede ser la dirección de transmisión amplia: 255.255.255.255

Además, la dirección IP debe ser una dirección válida Clase A, B o C:

- La dirección IP se considera Clase A cuando el octeto 1 se encuentra entre 0-127; por lo tanto, el ID de red es este primer octeto:
 - Cuando la dirección IP es Clase A, esta puede ser 1.0.0.1 a 126.255.255.254
 - Cuando la dirección IP es Clase A, entonces esta no puede ser 0.xxx.xxx.xxx ni xxx.255.255.255 ni xxx.0.0.0 ni 127.xxx.xxx.xxx
- **La dirección IP se considera Clase B cuando el octeto 1 se encuentra entre 128 y 191; por lo tanto, el ID de red son los primeros 2 octetos:**
 - cuando la dirección IP es Clase B, entonces esta puede ser de 128.1.0.1 a 191.255.255.254
 - cuando la dirección IP es Clase B, esta no puede ser 128.0.xxx.xxx ni xxx.xxx.255.255 ni xxx.xxx.0.0
- **La dirección IP se considera Clase C cuando el octeto 1 se encuentra entre 192 y 223; por lo tanto, el ID de red son los primeros 3 octetos:**
 - cuando la dirección IP es Clase C, esta puede ser de 192.0.1.1 a 223.255.255.254

- cuando la dirección IP es Clase C, esta no puede ser 192.0.0.xxx ni xxx.xxx.xxx.255 ni xxx.xxx.xxx.0

10.27.2.8

Registro de ubicación directo

Este campo permite que el radio se registre directamente en un Servidor de ubicación fija que sea compatible con el formato de datos de Informe de ubicación fija de P25 (Project 25) (consulte también Informe de ubicación fija de P25).

El radio notifica al Servidor de ubicación fija a través de un mensaje de LRRP (Protocolo de respuesta/solicitud de ubicación) sobre su disponibilidad y luego se registra en el servidor. Esta función se aplica al Perfil de datos actual.

Solo se accede: Cuando el campo Activación de ubicación esté activado, el campo Informe de ubicación fija de P25 esté activado, el campo [Modo ARS en la página 382](#) no esté configurado en **Servidor** y el radio admite modelos y opciones diferentes.

10.27.2.9

Dirección IP del servidor de ubicación

Este campo permite definir la Dirección IP (Protocolo de Internet) del Servidor de ubicación fija en la cual se registrará directamente el radio cuando no haya disponible un servidor de ARS (Servidor de registro automático) o un servidor de UNS (Servicios de red unificados) (consulte también Registro de ubicación fija directo).

Esta función se aplica al Perfil de datos actual.

NOTA:

Cuando asigne una dirección IP, asegúrese de que esta no tenga conflictos con otra dirección IP o subred utilizadas por el radio. Los dispositivos externos tales como Wi-Fi, un módem de datos externo y un Si500 pueden asignar direcciones IP a algunas interfaces. Si hay conflictos de direcciones IP o subredes en uso, no se garantiza que las funciones de datos funcionen de modo fiable.

La subred 169. 254. X. X. está reservada para la Clonación de zona a zona. Por lo tanto, ninguna dirección IP puede comenzar con 169. 254. X. X, de lo contrario, este campo no será válido.

Solo se accede: Cuando los siguientes campos están activados: Activación de ubicación, Informe de ubicación fija de P25 y Registro de ubicación directo. El campo [Modo ARS en la página 382](#) no está configurado como **Servidor**. El radio admite modelos y opciones diferentes.

Las selecciones son válidas cuando se cumple lo siguiente:

- Los cuatro octetos deben estar en el rango: [1-223] . [0-255] . [0-255] . [0-255], y
- esta dirección IP no puede ser la Dirección de transmisión amplia limitada: 255.255.255.255

Y, esta dirección IP:

- No puede ser completamente igual que la Dirección 1 de IP de suscriptor; y
- No puede ser completamente igual que la Dirección IP de suscriptor; y
- No puede ser completamente igual que la Dirección IP de interfaz aérea de suscriptor; y
- No puede ser igual a la Dirección IP del suscriptor de Bluetooth o la Dirección IP del suscriptor de Bluetooth; y
- No puede ser igual a la dirección base de red PAN de Bluetooth y
- No puede ser completamente igual a la Subred de radio interna en cualquier Perfil de datos.
- No puede ser igual a la dirección IP del enlace en serie 1 y a la dirección IP del enlace en serie 2.

Además, la dirección IP debe ser una dirección válida de Clase A, B o C:

- **La dirección IP se considera Clase A cuando el octeto 1 se encuentra entre 0-127; por lo tanto, el ID de red es este primer octeto:**
 - cuando la dirección IP es Clase A, esta puede ser 1.0.0.1 a 126.255.255.254
 - cuando la dirección IP es clase A, entonces esta no puede ser 0.xxx.xxx.xxx o xxx.255.255.255 o xxx.0.0.0 o 127.xxx.xxx.xxx
- **La dirección IP se considera Clase B cuando el octeto 1 se encuentra entre 128 y 191; por lo tanto, el ID de red son los primeros 2 octetos:**
 - cuando la dirección IP es Clase B, esta puede ser 128.1.0.1 a 191.255.255.254
 - cuando la dirección IP es Clase B, esta no puede ser 128.0.xxx.xxx ni xxx.xxx.255.255 ni xxx.xxx.0.0
- **La dirección IP se considera Clase C cuando el octeto 1 se encuentra entre 192 y 223; por lo tanto, el ID de red son los primeros 3 octetos:**
 - cuando la dirección IP es Clase C, esta puede ser de 192.0.1.1 a 223.255.255.254
 - cuando la dirección IP es Clase C, esta no puede ser 192.0.0.xxx ni xxx.xxx.xxx.255 ni xxx.xxx.xxx.0

10.27.2.10

Modo PAD

En este campo, se selecciona el modo de operación de la aplicación Armador/desarmador de protocolo (PAD).

La [Dirección de destino PAD en la página 387](#) y la [Puerto de destino PAD en la página 387](#) deben estar definidas cuando este campo no está **Desactivado**. Esta selección se aplica al Perfil de datos actual.

ADVERTENCIA:

Cuando el [Tipo del perfil de datos en la página 376](#) es **Solo banda ancha** o **Convencional y banda ancha** o **Troncalización y banda ancha**, este campo se debe configurar en **Desactivado**. De lo contrario, la aplicación considera esta selección como no válida.

Se admiten las siguientes selecciones:

Desactivado

No se utiliza el Modo PAD.

Continuo

Se utiliza para dispositivos/aplicaciones que deben transmitir datos por paquetes de cierta duración fija cada vez.

Oración

Utilizado para enviar datos por paquete en ciertos caracteres de inicio y finalización (como una oración en datos de GPS). La Secuencia de inicio PAD y la Secuencia de detención PAD se deben definir.

Inmediato

Una transferencia de datos sin procesar donde todos los datos (sin importar el tamaño) se transmiten tal como son.

10.27.2.11

Secuencia de inicio PAD

Este campo permite ingresar la Secuencia de inicio para el modo Armador/desarmador de protocolo (PAD) de **Oración**.

La Aplicación PAD utiliza esta entrada para detectar el inicio de la Oración en los datos al hacer coincidir esta secuencia de valores de bytes. La [Secuencia de detención PAD en la página 385](#) y de Inicio deben definirse para el Modo PAD de la "Oración". Esta selección se aplica al Perfil de datos actual.

Solo se accede: Cuando el campo [Modo PAD en la página 384](#) está configurado en **Oración**.

Se admiten las siguientes selecciones:

- Las entradas deben ser hexadecimales (de 0 a 9 y A a F)
- Las entradas deben tener un número par de caracteres
- Las entradas deben tener:
 - un mínimo de 2 caracteres
 - un máximo de 18 caracteres

10.27.2.12

Secuencia de detención PAD

Este campo permite ingresar la Secuencia de detención para el modo Armador/desarmador de protocolo (PAD) de **Oración**.

La Aplicación de red PAD utiliza esta entrada para detectar la detención de la Oración en los datos al hacer coincidir esta secuencia de valores de bytes. La [Secuencia de inicio PAD en la página 384](#) y la Secuencia de detención deben definirse para el modo PAD "Oración". Esta selección se aplica al Perfil de datos actual.

Solo se accede: Cuando el campo [Modo PAD en la página 384](#) está configurado en **Oración**.

Se admiten las siguientes selecciones:

- Las entradas deben ser hexadecimales (de 0 a 9 y A a F)
- Las entradas deben tener un número par de caracteres
- Las entradas deben tener:
 - un mínimo de 2 caracteres
 - un máximo de 18 caracteres

10.27.2.13

Secuencia de escape PAD

Este campo permite ingresar la Secuencia de escape para el modo Armador/desarmador de protocolo (PAD) de **Oración**.

Esta secuencia de byte opcional se utiliza para 'escapar' u omitir la detección de cualquier secuencia de inicio y detención si ocurriesen como parte de datos regulares, para que no se confundan con Inicio o detención de oración. Esta selección se aplica al Perfil de datos actual.

Solo se accede: Cuando el campo [Modo PAD en la página 384](#) está configurado en **Oración**.

Se admiten las siguientes selecciones:

- Las entradas deben ser hexadecimales (de 0 a 9 y A a F)
- Las entradas deben tener un número par de caracteres
- Las entradas deben tener entre:
 - un mínimo de 0 caracteres
 - un máximo de 10 caracteres

10.27.2.14

Tiempo de espera inactivo de recepción de PAD

En este campo se selecciona el valor de tiempo de espera utilizado en los modos Armado/desarmador de protocolo (PAD) **Continuo** y de **Oración**.

En **Continuo Modo PAD en la página 384**, este tiempo de espera se usa para activar la transmisión de los datos recopilados por la aplicación PAD, incluso si no alcanzó el umbral de memoria intermedia máxima. Esta selección se aplica al Perfil de datos actual. El tiempo está expresado en milisegundos.

Solo se accede: Cuando el campo **Modo PAD en la página 384** está configurado en **Oración** o **Continuo**.

Mesa 170: Rango

Mínimo	Máximo
0 (ms) (0 = desactivado)	15 000 (ms)

10.27.2.15

Valor de inhibición de transmisión PAD

En este campo se selecciona la cantidad de tiempo que una transmisión de un fragmento de datos (enviados desde la aplicación Armador/desarmador de protocolo [PAD]) se retrasa desde la transmisión del fragmento de datos anterior, por lo tanto, lo que espacia de manera uniforme estas transmisiones (control de flujo).

Por lo tanto, la aplicación PAD solo puede enviar (como máximo) un fragmento de datos durante este tiempo. Este periodo se usa para retrasar las transmisiones en todos los Modos de PAD. Esta selección se aplica al Perfil de datos actual.

Solo se accede: Cuando el campo **Modo PAD en la página 384** no esté configurado en **Desactivado**.

Mesa 171: Rango

Mínimo	Máximo
0 (ms) (0 = desactivado)	15 000 (ms)

10.27.2.16

Umbral de memoria intermedia máxima

En este campo se selecciona el umbral de memoria intermedia máxima (en bytes) que se utiliza para activar transmisiones en el modo PAD "Continuo".

Esta selección representa la extensión de los datos recopilados en el modo PAD "Continuo" antes de que se envíen los datos. Tan pronto como se alcanza este umbral de memoria intermedia máxima, la aplicación PAD envía la memoria intermedia (solo aplicable en Modo continuo). Esta selección se aplica al Perfil de datos actual.

Solo se accede: Cuando el campo **Modo PAD en la página 384** está configurado en **Oración** o **Continuo**.

Mesa 172: Rango

Mínimo	Máximo
1 byte	3000 bytes

10.27.2.17

Dirección de destino PAD

Este campo permite ingresar la Dirección IP de destino (extremo remoto) para la aplicación PAD (Armador/desarmador de protocolo).

Esta entrada representa la parte de la dirección en la combinación dirección-puerto que compone el destino (final remoto) para el paquete de datos generado por la aplicación PAD. Esta selección se aplica al Perfil de datos actual.

Solo se accede: Cuando el campo [Modo PAD en la página 384](#) no esté configurado en **Desactivado**.

**NOTA:**

La dirección IP puede ser cualquier dirección válida ingresada en el formato decimal con puntos.

10.27.2.18

Puerto de destino PAD

Este campo permite ingresar el Puerto IP de destino (extremo remoto) para la aplicación PAD (Armador/desarmador de protocolo).

Esta entrada representa la parte del puerto en la combinación dirección-puerto que compone el destino (final remoto) para el paquete de datos generado por la aplicación PAD. Esta selección se aplica al Perfil de datos actual.

Solo se accede: Cuando el campo [Modo PAD en la página 384](#) no esté configurado en **Desactivado**.

Mesa 173: Rango

Mínimo	Máximo
1	65535

**IMPORTANTE:**

El valor predeterminado de "0" es una entrada no válida. Cuando este campo es aplicable, el valor debe cambiarse a una entrada válida.

10.27.3

ID de grupo de troncalización

Esta sección le permite ver o modificar los ID del 1 al 8 de grupo de datos de Interfaz inalámbrica común (CAI) de ASTRO 25.

Estos ID de grupo se utilizan para la decodificación de direcciones correspondientes solo a la recepción de datos.

**NOTA:**

Los Grupos de datos permiten que la radio reciba mensajes de datos de grupos enviados a estos ID de grupo de datos, y paquetes de transmisión amplia enviados al ID PARA TODAS LAS LLAMADAS del radio (IP = 255 . 255 . 255 . 255). Estas selecciones se aplican solo para el Perfil de datos de troncalización actual.

**IMPORTANTE:**

Los Perfiles de datos se pueden seleccionar en el campo Selección de perfil de datos del Sistema de troncalización.

Para las comunicaciones de troncalización, los perfiles de datos se aplican solo para Sistemas de troncalización que tienen su campo Tipo de sistema configurado en **ASTRO 25**.

10.27.3.1

ID grupo de datos ASTRO 25

En este campo se selecciona (en formato decimal o hexadecimal) el ID de grupo de datos de la Interfaz de aire común (CAI) ASTRO 25 para el registro o la fila actuales (1 a 8).

Este ID de grupo se utiliza para la decodificación de direcciones correspondientes solo a la recepción de datos. Los Grupos de datos permiten que el radio reciba mensajes de datos en grupo enviados a estos ID de grupo de datos, y para recibir paquetes de difusión al ID PARA TODAS LAS LLAMADAS del radio (IP = 255.255.255.255). Esta selección solo se aplica al Perfil de datos de troncalización actual.

**IMPORTANTE:**

6777215 (0xFFFFF hex) es el ID DE TODAS LAS LLAMADAS; este ID podría no ser ingresado porque ya existe en el radio.

Solo se accede: Cuando el [Tipo del perfil de datos en la página 376](#) está configurado en **Troncalización o Troncalización y banda ancha**.

Mesa 174: Rango

Mínimo	Máximo
10000000 (989680 hex)	16777214 (FFFFFE hex)

10.27.4

Banda ancha

Esta sección permite ver o definir la funcionalidad LTE (Evolución a largo plazo). Estos ajustes se aplican solo para perfiles de datos individuales.

**IMPORTANTE:**

Los perfiles de datos se seleccionan en el campo Selección de perfil de datos del sistema de troncalización.

Para las comunicaciones de troncalización, los perfiles de datos se aplican solo para Sistemas de troncalización que tienen su campo Tipo de sistema configurado en **ASTRO 25**.

La banda ancha de LTE es otra solución de infraestructura inalámbrica de datos para aplicaciones y servicios de datos de radio móvil terrestre (LMR). La función Banda ancha de LTE puede aumentar significativamente la capacidad y la velocidad de los datos de aplicación inalámbrica para la Programación por el aire (OTAP) del radio. La Banda ancha de LTE también se puede utilizar para aplicaciones de datos y servicios de datos como, por ejemplo, Servicio de mensajería de texto (TMS), Ubicación de GPS, Servicio de registro automático (ARS) y Regeneración de clave inalámbrica (OTAR). Las interfaces de banda ancha con infraestructura de telefonía celular estándar proporcionan conexiones inalámbricas, de alta velocidad y basadas en dirección IP. El encryption seguro de datos de banda ancha del radio se logra con tecnologías de Red privada virtual (VPN) programadas. Las comunicaciones de voz por radio no se pueden lograr con banda ancha LTE; por lo tanto, las comunicaciones por voz digitales sí continúan a través de la infraestructura de radio móvil terrestre (LMR) de ASTRO convencional o de troncalización de ASTRO 25.

**ADVERTENCIA:**

Los radios compatibles con LTE no admiten dispositivos Bluetooth disponibles comercialmente (COTS). Sin embargo, el Tipo de emparejamiento Bluetooth del emparejamiento patentado de Motorola de baja frecuencia (LF MPP) se puede realizar en canales habilitados con banda ancha de LTE.

**NOTA:**

LTE actualmente solo está disponible para los radios portátiles APX 7000L.

10.27.4.1

Activación de LTE

Habilita la operación de datos de banda ancha de LTE (evolución a largo plazo) para el Perfil de datos actual.

**ADVERTENCIA:**

Cuando el campo [Tipo del perfil de datos en la página 376](#) está configurado como **Convencional y banda ancha**, **Troncalización y banda ancha** o **Solo banda ancha**, este campo debe estar **Activado**. De lo contrario, RadioCentral considera esta selección como no válida.

Solo se accede: Cuando el campo [Tipo del perfil de datos en la página 376](#) está configurado como **Solo banda ancha** o **Convencional y banda ancha** o **Troncalización y banda ancha** y el radio admite diferentes modelos y opciones.

10.27.4.2

Nombre de host del gateway de SmartConnect

El nombre de host de SmartConnect define la ubicación del gateway de SmartConnect en la forma de un nombre de host de dominio calificado (FQDN).

La cantidad máxima de caracteres ASCII es 63.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.27.4.3

Número de puerto del gateway TLS de SmartConnect

Este campo le permite seleccionar el número de puerto TLS que se utiliza en la función SmartConnect.

El número de puerto del gateway TLS de SmartConnect debe ser exclusivo para cualquier otro puerto configurable en la aplicación.

Mesa 175: Rango

Predeterminado	Mínimo	Máximo	Incrementos
49665	1	65535	1

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.27.5

Seguridad de capa de red

Esta sección permite ver o modificar las configuraciones de datos para establecer comunicaciones de datos con encryption seguro y para comunicaciones de datos con encryption seguro a través de una red privada virtual (VPN).

Consulte también [Función de banda ancha de LTE](#).

Estas configuraciones se aplican a los perfiles de datos individuales.

**NOTA:**

Los perfiles de datos se seleccionan en el campo Selección de perfil de datos del Sistema de troncalización o en el campo Selección de perfil de datos del Sistema convencional.

Para las comunicaciones convencionales, los perfiles de datos se aplican solo para sistemas convencionales que tengan el campo Tipo de sistema configurado en **ASTRO**.

Para las comunicaciones de troncalización, los perfiles de datos se aplican solo para Sistemas de troncalización que tienen su campo Tipo de sistema configurado en **ASTRO 25**.

10.27.5.1**Conexión segura/sin encriptar**

En este campo se selecciona el encryption seguro o el encryption no seguro que se debe utilizar para los Datos por paquete que se transmiten y reciben.

Los Datos por paquete con encryption seguro se transmiten dentro de la Capa de la red (Capa tres) del Modelo de siete capas de Interconexión de sistemas abiertos (OSI) para comunicaciones en capas. Esta función se aplica solo al Perfil de datos de troncalización actual.

Solo se accede: cuando [Operación segura en la página 301](#) se establece en **Hardware** o **Software**, y cuando el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) está activado;

y

cuando el [Tipo del perfil de datos en la página 376](#) se configura en **Troncalización** o **Troncalización y banda ancha**, y el radio admite modelos/opciones diferentes.

Están disponibles las siguientes selecciones:

Borrar

Conecta o realiza la transmisión de Datos por paquete APCO 25 de troncalización en forma normal (clara/no encriptada).

Encriptación

Conecta o realiza las transmisiones encriptadas de Datos por paquete APCO 25 de troncalización.

**ADVERTENCIA:**

Solo tiene validez cuando el campo Activación de compresión del encabezado de IP está desactivado y todos los registros de Modo de funcionamiento DAC no están configurados como **Acceso a canal controlado**.

10.27.5.2**Selección de perfil KMF**

Selecciona el Perfil KMF seguro para asociarse con el Perfil de datos de troncalización actual.

El paquete de datos con cifrado seguro se transmite dentro de la capa de la red (Capa tres) del modelo OSI (Interconexión de sistemas abiertos) de siete capas para comunicaciones en capas.

ADVERTENCIA:

Este campo no es válido cuando el campo Dirección IP de KMF del Asegurar perfil de KMF seleccionado no está configurado como 0.0.0.0

IMPORTANTE:

Cuando este campo no está configurado como **Desactivado**, el campo [Selección de clave en la página 391](#) para el perfil de datos actual solo puede seleccionar claves desde la Lista de referencias de claves de Encryption de hardware seguro de este Perfil KMF seguro que se seleccionó.

La aplicación en realidad apunta a las claves de la Lista de clave de encryption para esta selección. Las claves individuales de la Lista de referencias de clave de encriptación de hardware seguro hacen referencia a las claves de la Lista de clave de encriptación del campo Referencia de la clave de encryption. Cuando ASTRO OTAR está activado, cualquier clave que se seleccione primero se debe definir en la Lista de referencias de clave de encriptación para hardware seguro.

Cuando este campo está configurado en "**Desactivado**", el valor [Selección de clave en la página 391](#) para el perfil de datos actual se elige directamente de la Lista de claves de encriptación de la ventana Asegurar amplitud.

Solo se accede: Cuando el [Tipo del perfil de datos en la página 376](#) está configurado como **Troncalización** o **Troncalización y banda ancha**, el campo [Conexión segura/sin encriptar en la página 390](#) es aplicable y se configura como **Encriptar**, y el radio admite modelos y opciones diferentes.

Están disponibles las siguientes selecciones:

Desactivado

Consultar el anterior aviso importante.

Examinar

Opciones disponibles de Asegurar perfiles de KMF: las selecciones de Asegurar perfil de KMF se aplican solo cuando el campo Activación de OTAR de Encriptación en general está activado y el campo Activación de ASTRO OTAR de Encriptación en general está activado.

10.27.5.3

Selección de clave

En este campo se selecciona la clave de encryption seguro que se debe utilizar para los Datos por paquete que se transmiten y reciben.

Los Datos por paquete con encryption seguro se transmiten dentro de la Capa de la red (Capa tres) del Modelo de siete capas de Interconexión de sistemas abiertos (OSI) para comunicaciones en capas. Esta selección se aplica al Perfil de datos de troncalización actual.

IMPORTANTE:

Cuando el campo Selección de perfil de ASTRO OTAR no se configura en **Desactivado**, la opción Datos de perfil solo puede seleccionar claves desde la Lista de referencias de clave de encryption para hardware seguro de este Perfil de ASTRO OTAR seguro que se seleccionó.

La aplicación está apuntando a las Claves de la Lista de clave de encryption para esta selección; las claves individuales de la Lista de referencias de clave de encryption seguro hacen referencia a las claves de la Lista de clave de encryption en el campo Referencia clave de encryption. Por lo tanto, cuando el campo Índice de perfil de ASTRO OTAR está activado, cualquier clave seleccionada primero se debe definir en la Lista de referencias de clave de encryption seguro. Están disponibles las claves del perfil de ASTRO OTAR con el campo de lista de claves independientes activado.

Cuando el campo Selección de perfil de ASTRO OTAR se configura en **Desactivado**, este valor del Perfil de datos actual se elige directamente en la Lista de clave de encryption de la ventana Asegurar amplitud.

Solo se accede: Cuando el [Tipo del perfil de datos en la página 376](#) está configurado como **Troncalización** o **Troncalización y banda ancha**, el campo [Conexión segura/sin encriptar en la página 390](#) es aplicable y se configura como **Encriptar**, y el radio admite modelos y opciones diferentes.

Están disponibles las siguientes selecciones:

Tecla sec 1

Consultar el anterior aviso importante.

Examinar

Selecciones de encryption en general disponibles

10.27.5.4

Dirección de gateway encriptada

Este campo permite ingresar la Dirección de destino del Protocolo de Internet versión 4 (IPv4) del gateway de datos por paquete encriptado.

Esta función se aplica solo al Perfil de datos de troncalización actual.

Solo se accede: Cuando el [Tipo del perfil de datos en la página 376](#) está configurado como **Troncalización** o **Troncalización y banda ancha**, el campo [Conexión segura/sin encriptar en la página 390](#) es aplicable y se configura como **Encriptar**, y el radio admite modelos y opciones diferentes.

Las selecciones son válidas cuando se cumple lo siguiente:

- Los cuatro octetos deben estar en el rango: [1-223] . [0-255] . [0-255] . [0-255]
- Esta dirección IP no puede ser la Dirección de transmisión amplia limitada: 225255255255

La dirección IP debe ser una dirección válida Clase A, B o C:

- La dirección IP se considera Clase A en estas circunstancias:
 - El Octeto 1 se establece entre 0 y 127; el ID de red es entonces este primer octeto.
 - Cuando la dirección IP es Clase A, esta puede ser 1.0.0.0 a 126.255.255.255
 - La dirección IP no puede ser 0.xxx.xxx.xxx o 127.xxx.xxx.xxx
- La dirección IP se considera Clase B en estas circunstancias:
 - El Octeto 1 se establece entre 128 y 191; el ID de red es entonces los primeros dos octetos.

- La dirección IP puede ser 128.0.0.0 a 191.255.255.255
- La dirección IP no puede ser x.x.255.255
- La dirección IP se considera Clase C en estas circunstancias:
 - El Octeto 1 se establece entre 192 y 223; el ID de red es entonces los primeros dos octetos.
 - Cuando la dirección IP es Clase C, esta puede ser 192.0.0.0 a 223.255.255.255
 - La dirección IP no puede ser x.x.x.255

10.27.5.5

Permitir la Rx de datos de paquete no encriptados

Este campo permite la recepción de paquetes de datos claros (no cifrados), incluso cuando se ha seleccionado la conexión **Segura** en el campo Asegurar/borrar conexión de datos en paquete.

Esta función se aplica solo al Perfil de datos de troncalización actual.

Solo se accede: Cuando el [Tipo del perfil de datos en la página 376](#) está configurado como **Troncalización** o **Troncalización y banda ancha**, el [Conexión segura/sin encriptar en la página 390](#) es aplicable y se configura como **Encriptar**, y el radio admite modelos y opciones diferentes.

10.27.5.6

Conexión segura/no encriptada de VPN

En este campo se selecciona el encryption seguro o ningún encryption seguro para los datos de Banda ancha de LTE que se transmiten y reciben a través de una Red privada virtual (VPN).

NOTA:

Luego de la autenticación mediante una clave segura durante las negociaciones de Intercambio de claves de Internet (IKE) (consulte [Selección de clave de VPN en la página 393](#)), los datos de banda ancha tienen encryption seguro con protocolos de Seguridad de protocolo de Internet (IPsec) y se transmiten en la red LTE a través de un túnel de VPN seguro que conecta el radio a un gateway VPN que reside en la Red empresarial del cliente (CEN). Esta función se aplica al Perfil de datos actual.

Solo se accede: Cuando Operación segura está configurado como **Hardware**, el campo [Tipo del perfil de datos en la página 376](#) está configurado como **Solo banda ancha** o **Convencional y banda ancha** o **Troncalización y banda ancha** y el radio admite modelos y opciones diferentes.

Están disponibles las siguientes selecciones:

Borrar

Conecta o realiza la transmisión de datos de Banda ancha de LTE en forma normal (clara/no encriptada).

Encriptación

Conecta o realiza la transmisión de datos de Banda ancha de LTE con encryption.

10.27.5.7

Selección de clave de VPN

En este campo se selecciona la clave de encryption seguro que se utilizará en la fase de autenticación del protocolo IKE (Intercambio de claves de Internet) mientras se establece un túnel seguro con el gateway de la Red privada virtual (VPN).

Esta no es la clave que se utilizará para asegurar el túnel hacia el gateway VPN, ya que esas claves derivan de la sesión que forman parte del IKE estándar. Esta selección se aplica al encryption seguro para las comunicaciones de datos de banda ancha de LTE y solo para el perfil de datos actual.

IMPORTANTE:

Esta clave debe ser una clave AES-256 de Estándar de encryption avanzado para que esta función esté disponible. De lo contrario, se mostrará un mensaje de error cuando se intente establecer el túnel con el gateway VPN. El valor de selección de clave de VPN del perfil de datos actual se elige directamente desde la Lista de clave de encryption de la ventana Encryption en general.

Solo se accede: Cuando Operación segura está configurado como **Hardware**, el campo [Tipo del perfil de datos en la página 376](#) está configurado como **Solo banda ancha** o **Convencional y banda ancha** o **Troncalización y banda ancha**, el campo [Conexión segura/no encriptada de VPN en la página 393](#) está configurado como **Encriptar** y el radio admite modelos y opciones diferentes.

10.27.5.8

Dirección IP del gateway VPN

Este campo permite ingresar la Dirección de destino del Protocolo de Internet versión 4 (IPv4) del gateway de la Red privada virtual (VPN) que reside en la Red empresarial del cliente (CEN).

Esta selección se aplica al encryption seguro para las comunicaciones de datos de banda ancha de LTE y solo para el perfil de datos actual.

NOTA:

Cuando asigne una dirección IP, asegúrese de que esta no tenga conflictos con otra dirección IP o subred utilizadas por el radio. Los dispositivos externos tales como Wi-Fi, un módem de datos externo y un Si500 pueden asignar direcciones IP a algunas interfaces. Si hay conflictos de direcciones IP o subredes en uso, no se garantiza que las funciones de datos funcionen de modo fiable.

La subred 169. 254. X. X. está reservada para la función Clonación de zona a zona. Por lo tanto, ninguna dirección IP puede comenzar con 169. 254. X. X.; de lo contrario, este campo no será válido.

Solo se accede: Cuando Operación segura está configurado como **Hardware**, el campo [Tipo del perfil de datos en la página 376](#) está configurado como **Solo banda ancha** o **Convencional y banda ancha** o **Troncalización y banda ancha**, el campo [Conexión segura/no encriptada de VPN en la página 393](#) está configurado como **Encriptar**, y el radio admite modelos y opciones diferentes.

Las selecciones son válidas cuando se cumple lo siguiente:

- Los cuatro octetos deben estar en el rango: [1-223] . [0-255] . [0-255] . [0-255]
- El valor predeterminado de esta Dirección IP = 0.0.0.0 y debe definirse.

La dirección IP debe ser una dirección válida Clase A, B o C:

- La dirección IP se considera Clase A en estas circunstancias:
 - El Octeto 1 se establece entre 0 y 127; el ID de red es entonces este primer octeto.
 - Cuando la dirección IP es Clase A, esta puede ser 1.0.0.1 a 126.255.255.254
 - La dirección IP no puede ser 0.xxx.xxx.xxx o 127.xxx.xxx.xxx
- La dirección IP se considera Clase B en estas circunstancias:
 - El Octeto 1 se establece entre 128 y 191; el ID de red es entonces los primeros dos octetos.
 - Cuando la dirección IP es Clase B, esta puede ser 128.1.1.0 a 191.255.255.254
- La dirección IP se considera Clase C en estas circunstancias:
 - El Octeto 1 se establece entre 192 y 223; el ID de red es entonces los primeros dos octetos.

- Cuando la dirección IP es Clase C, esta puede ser 192.0.1.1 a 223.255.255.254
- La dirección IP no puede ser x.x.x.0 o x.x.x.255

10.27.5.9

Tiempo de retransmisión de mensaje de VPN

En este campo se selecciona el intento de retransmisión del mensaje de la Red privada virtual (VPN) y el intervalo de reintento.

Consulte [Intentos de retransmisión de mensaje de VPN en la página 395](#).

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Esta selección se aplica al encryption seguro para las comunicaciones de datos de banda ancha de LTE y solo para el perfil de datos actual.

Solo se accede: Cuando Operación segura está configurado como **Hardware**, el campo [Tipo del perfil de datos en la página 376](#) está configurado como **Solo banda ancha** o **Convencional y banda ancha** o **Troncalización y banda ancha**, el campo [Conexión segura/no encriptada de VPN en la página 393](#) está configurado como **Encriptar** y el radio admite modelos y opciones diferentes.

Mesa 176: Rango

Mínimo	Máximo	Incrementos
10 (segundos)	60 (segundos)	1 (segundo)

10.27.5.10

Intentos de retransmisión de mensaje de VPN

En este campo se selecciona la cantidad máxima de veces que se retransmite un mensaje de Red privada virtual (VPN) en intervalos antes de considerar que el extremo remoto no responde.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Estos intentos continúan hasta que se recibe un reconocimiento que confirme que la recepción de la transmisión fue correcta o hasta que se alcance el número de intentos seleccionado. Esta selección se aplica al encryption seguro para las comunicaciones de datos de banda ancha de LTE y solo para el perfil de datos actual.

Solo se accede: Cuando Operación segura está configurado como **Hardware**, el campo [Tipo del perfil de datos en la página 376](#) está configurado como **Solo banda ancha** o **Convencional y banda ancha** o **Troncalización y banda ancha**, el campo [Conexión segura/no encriptada de VPN en la página 393](#) está configurado como **Encriptar** y el radio admite modelos y opciones diferentes.

Mesa 177: Rango

Mínimo	Máximo
2	10

10.27.5.11

Intervalo de detección de puntos inactivos de VPN

En este campo se selecciona la cantidad máxima de tiempo inactivo antes de determinar que se ha perdido la conexión de la Red privada virtual (VPN).

ADVERTENCIA:

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Esta selección se aplica al encryption seguro para las comunicaciones de datos de banda ancha de LTE y solo para el perfil de datos actual. El tiempo está expresado en minutos.

Solo se accede: Cuando Operación segura está configurado como **Hardware**, el campo [Tipo del perfil de datos en la página 376](#) está configurado como **Solo banda ancha** o **Convencional y banda ancha** o **Troncalización y banda ancha**, el campo [Conexión segura/no encriptada de VPN en la página 393](#) está configurado como **Encriptar**, y el radio admite modelos y opciones diferentes.

Mesa 178: Rango

Mínimo	Máximo	Incrementos
5 (minutos)	60 (minutos)	1 (minuto)

10.27.5.12

Margen de regeneración de clave de VPN

En este campo se selecciona el tiempo antes de que finalice la conexión de Red privada virtual (VPN) o el canal de clave antes de intentar renegociar una conexión/regeneración de clave.

Consulte [Intentos de reactivación de VPN en la página 396](#).

ADVERTENCIA:

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Esta selección se aplica al encryption seguro para las comunicaciones de datos de banda ancha de LTE y solo para el perfil de datos actual. El tiempo está expresado en minutos.

Solo se accede: Cuando Operación segura está configurado como **Hardware**, el campo [Tipo del perfil de datos en la página 376](#) está configurado como **Solo banda ancha** o **Convencional y banda ancha** o **Troncalización y banda ancha**, el campo [Conexión segura/no encriptada de VPN en la página 393](#) está configurado como **Encriptar** y el radio admite modelos y opciones diferentes.

NOTA:

Esta función solo está disponible en la Vista experta (consulte Vista codeplug).

Mesa 179: Rango

Mínimo	Máximo	Incrementos
1 (minuto)	9 (minutos)	1 (minuto)

10.27.5.13

Intentos de reactivación de VPN

En este campo se selecciona la cantidad de intentos para negociar una conexión de Red privada virtual (VPN), o un reemplazo para una, antes de renunciar.

Consulte [Margen de regeneración de clave de VPN en la página 396](#).

ADVERTENCIA:

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Esta selección se aplica al encryption seguro para las comunicaciones de datos de banda ancha de LTE y solo para el perfil de datos actual.

Solo se accede: Cuando Operación segura está configurado como **Hardware**, el campo [Tipo del perfil de datos en la página 376](#) está configurado como **Solo banda ancha** o **Convencional y banda ancha** o **Troncalización y banda ancha**, el campo [Conexión segura/no encriptada de VPN en la página 393](#) está configurado como **Encriptar** y el radio admite modelos y opciones diferentes.

NOTA:

Esta función solo está disponible en la Vista experta (consulte Vista codeplug).

Mesa 180: Rango

Mínimo	Máximo

10.27.6

Lista de omisión

Esta sección permite ver y modificar la dirección de origen, la dirección de destino, o ambas, del Protocolo de Internet versión 4 (IPv4) de los paquetes de datos que deben omitir el procesamiento seguro.

La función Lista de omisión solo se aplica a los Tipos de perfil de datos de **Troncalización**, **Solo banda ancha** y **Troncalización y banda ancha**, en los que los perfiles están definidos para comunicar datos del radio a través de los canales de troncalización o para comunicar datos de radio a través de una red de Banda ancha LTE.

Solo se accede: Cuando el radio admite modelos y opciones diferentes, y

- cuando el [Tipo del perfil de datos en la página 376](#) se configure en **Troncalización**, cuando el campo [Conexión segura/sin encriptar en la página 390](#) se configure en **Seguro** o
- Cuando el tipo del perfil de datos se configure en **Solo banda ancha** o **Convencional y banda ancha** y cuando el campo [Conexión segura/no encriptada de VPN en la página 393](#) se configure en **Seguro** o
- Cuando el Tipo del perfil de datos está configurado en **Troncalización y banda ancha**, y cuando el campo Asegurar/Borrar Conexión se configure en **Asegurar** o cuando el campo Asegurar/Borrar Conexión VPN está configurado en **Asegurar**.

10.27.6.1

Dirección IP

Este campo permite definir las direcciones del Protocolo de Internet de omisión versión 4 (IPv4) para el Perfil de datos actual.

Las direcciones IP de omisión se designan para paquetes de datos que pueden omitir el procesamiento seguro. Se pueden crear varias Direcciones IP de omisión (registro/filas) para la lista de omisión/tabla de cada Perfil de datos.

**NOTA:**

Cuando asigne una dirección IP, asegúrese de que esta no tenga conflictos con otra dirección IP o subred utilizadas por el radio. Los dispositivos externos tales como Wi-Fi, un módem de datos externo y un Si500 pueden asignar direcciones IP a algunas interfaces. Si hay conflictos de direcciones IP o subredes en uso, no se garantiza que las funciones de datos funcionen de modo fiable.

La subred 169. 254. X. X. está reservada para la función Clonación de zona a zona. Por lo tanto, ninguna dirección IP puede comenzar con 169. 254. X. X.; de lo contrario, este campo no será válido.

Solo se accede: cuando el radio admite modelos/opciones diferentes y

- El [Tipo del perfil de datos en la página 376](#) se configure en **Troncalización**, cuando el campo [Conexión segura/sin encriptar en la página 390](#) se configure en **Seguro** o
- El se configure en **Solo banda ancha** o **Convencional y banda ancha** y cuando el campo [Conexión segura/no encriptada de VPN en la página 393](#) se configure en **Seguro** o
- El [Tipo del perfil de datos en la página 376](#) se configure en **Troncalización y banda ancha** y el campo [Conexión segura/sin encriptar en la página 390](#) se configure en **Seguro** o el campo [Conexión segura/no encriptada de VPN en la página 393](#) se configure en **Seguro**.

Las selecciones son válidas cuando se cumple lo siguiente:

- Los cuatro octetos deben estar en el rango: [1-223]. [0-255]. [0-255]. [0-255]
- Esta dirección IP puede ser la Dirección de transmisión amplia limitada: 255.255.255.255
- La dirección IP debe ser una dirección válida Clase A, B o C:
 - La dirección IP se considera Clase A cuando:
 - + El Octeto 1 se establece entre 0 y 127; el ID de red es entonces este primer octeto.
 - + La dirección IP puede ser 1.0.0.0 a 126.255.255.255
 - + La Dirección IP no puede ser 0. XXX. XXX. XXX o 127. XXX. XXX. XXX
 - La Dirección IP se considera Clase B cuando el octeto 1 se encuentra entre 128 y 191; el ID de red se conforma entonces de los primeros 2 octetos.
 - + Cuando la dirección IP es Clase B, esta puede ser 128.0.0.0 a 191.255.255.255
 - La Dirección IP se considera Clase C cuando el octeto 1 se encuentra entre 192 y 223; por lo tanto, el ID de red son los primeros 3 octetos.
 - + Cuando la dirección IP es Clase C, esta puede ser 192.0.0.0 a 223.255.255.255

10.27.6.2

Tipo de dirección

En este campo se selecciona el Tipo de dirección IP de omisión para la Dirección IP de omisión actual (registro/fila).

Las direcciones IP de omisión se designan para paquetes de datos que pueden omitir el procesamiento seguro. Se pueden crear varias Direcciones IP de omisión (registro/filas) dentro de la lista de omisión/tabla de cada Perfil de datos.

Solo se accede: cuando el radio admite modelos/opciones diferentes y:

- El [Tipo del perfil de datos en la página 376](#) se configure en **Troncalización**, cuando el campo [Conexión segura/sin encriptar en la página 390](#) se configure en **Seguro** o

- El se configure en **Solo banda ancha** o **Convencional y banda ancha** y cuando el campo [Conexión segura/no encriptada de VPN en la página 393](#) se configure en **Seguro** o
- El [Tipo del perfil de datos en la página 376](#) se configure en **Troncalización y banda ancha** y el campo [Conexión segura/sin encriptar en la página 390](#) se configure en **Seguro** o el campo [Conexión segura/no encriptada de VPN en la página 393](#) se configure en **Seguro**.

Se admiten las siguientes selecciones:

Origen

Permite que la Dirección IP de omisión actual (registro/fila) no necesite encryption seguro cuando reciba paquetes de datos. Por lo tanto, los paquetes de datos pueden recibirse en el modo Borrado no cifrado.

Destino

Permite que la Dirección IP de omisión actual (registro/fila) no necesite encryption seguro cuando transmita paquetes de datos. Por lo tanto, los paquetes de datos pueden transmitirse en el modo Borrado no cifrado.

Ambos

Permite que la Dirección IP de omisión actual (registro/fila) no necesite encryption seguro cuando reciba y transmita paquetes de datos. Por lo tanto, los paquetes de datos pueden recibirse y transmitirse en el modo Borrado no cifrado.

10.27.7

Datos mejorados

Esta sección le permite ver o modificar la funcionalidad de los Datos mejorados.

NOTA:

Los datos mejorados proporcionan un canal de comunicaciones de datos de entrada TDMA (acceso múltiple por división de tiempo) P25 Fase 2, el cual ofrece una gran capacidad y mejor confiabilidad en comparación con un canal de datos FDMA (acceso múltiple por división de frecuencia) Fase 1.

IMPORTANTE:

Los procedimientos de datos mejorados solo se aplican a mensajes de entrada cortos (radio a infraestructura), como las actualizaciones de ubicación de GPS, a través de ranuras reservadas que son asignadas por el equipo de red fija (FNE). Estas configuraciones se aplican solo a Perfiles de datos individuales usados para comunicaciones de troncalización.

IMPORTANTE:

Para las comunicaciones de troncalización, los perfiles de datos se aplican solo para Sistemas de troncalización que tienen su campo Tipo de sistema configurado en **ASTRO 25**.

Los perfiles de datos se seleccionan en el campo Selección de perfil de datos del sistema de troncalización.

10.27.7.1

Selección de lista de puertos

Este campo permite seleccionar la Lista de puertos de datos mejorados pertinente que se utilizará con el Perfil de datos actual.

NOTA:

Los nombres que aparecen para la selección están definidos en el campo Alias de lista de puertos.

Solo se accede: Cuando el [Tipo del perfil de datos en la página 376](#) está configurado en **Troncalización** o **Troncalización y banda ancha** y el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

- Desactivado
- Buscar (Listas de puertos de datos mejorados disponibles)

10.27.7.2

Permitir datos mejorados en el canal de datos clásico

Este campo permite que un datagrama de entrada destinado a uno de los puertos de Datos mejorados programados se envíe a través de un canal de datos clásicos de P25.

Se produce cuando un canal de datos mejorado no está disponible o cuando el radio ya se encuentra en un canal de datos P25 Classic. Esta función se aplica al Perfil de datos actual.

Cuando esta opción está desactivada, el datagrama se descarta cuando:

- El radio ya se encuentra en un canal de datos P25 Classic y el datagrama entrante de datos mejorados se fuerza a través de un canal de datos mejorados, o
- un canal de datos no está disponible

Solo se accede: Cuando el [Tipo del perfil de datos en la página 376](#) está configurado como **Troncalización** o **Troncalización y banda ancha**, la [Selección de lista de puertos en la página 399](#) no está **Desactivada** y el radio admite modelos y opciones diferentes.

10.27.7.3

Temporizador Dwell en fila de datos mejorados

En este campo se selecciona la cantidad de tiempo que se permite a un datagrama de datos mejorados esperar en la fila del radio sin estar transmitiendo, antes de que el datagrama se depure de la fila.

NOTA:

Cuando los datos proceden de una aplicación interna o se envían desde una computadora móvil (MC) al radio, a veces el radio recibe los datos más rápido de lo que puede enviarlos. Entonces los datos deben esperar en la fila del radio. Esta selección se aplica al Perfil de datos actual. El tiempo está expresado en segundos.

Solo se accede: Cuando el [Tipo del perfil de datos en la página 376](#) está configurado como **Troncalización** o **Troncalización y banda ancha**, la [Selección de lista de puertos en la página 399](#) no está **Desactivada** y el radio admite modelos y opciones diferentes.

Mesa 181: Rango

Mínimo	Máximo	Incrementos
5 segundos	120 segundos	1 segundo

10.27.7.4

Enviar datos durante tiempo de espera de emergencia

Activa el envío de datos durante el estado de tiempo de espera de emergencia.

10.27.8

Activación/desactivación de datos ATAK

Este campo activa o desactiva los datos ATAK de la aplicación ATAK en el radio.

10.28

Lista de puertos de datos mejorados

La **Lista de puertos de datos mejorados** permite ver o definir las listas de los puertos de destinos UDP (Protocolo de datagramas de usuario) para las cuales se permite la transmisión de Datos mejorados. Se permiten hasta veinte listas de puertos de datos mejorados.

**NOTA:**

Una vez definida, se puede seleccionar una lista de puertos de datos mejorados según cada perfil de datos desde el campo Selección de lista de puertos.

10.28.1

Alias de lista de puertos

Este campo permite definir nombres reconocibles para la Lista de puertos de datos mejorados actual.

Una vez definido, se puede seleccionar una Lista de puertos de datos mejorados por [Perfiles de datos en la página 376](#) desde el campo [Selección de lista de puertos en la página 399](#).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

**NOTA:**

Ejemplos: GPS 5, Lista de puertos 1, Datos mejorados #14

Se pueden usar caracteres, números, espacios y caracteres especiales.

Se pueden utilizar hasta 14 caracteres.

10.28.2

Número de puerto

En este campo se selecciona un número de puerto de destino UDP (Protocolo de datagramas del usuario) para un puerto asociado con el envío de Datos mejorados para el registro o la fila de la Lista de puertos de datos mejorados actual.

Una vez definido, se puede seleccionar una Lista de puertos de datos mejorados por [Perfiles de datos en la página 376](#) desde el campo [Selección de lista de puertos en la página 399](#).

**ADVERTENCIA:**

Esta selección es solo válida:

Cuando el valor es único para cada registro/fila de la Lista de puertos de datos mejorados; y

Cuando no es igual al valor del [Puerto UDP de autenticación en la página 371](#), [Puerto OTAR de suscriptor en la página 329](#) o [Puerto UDP KMF en la página 328](#).

Cuando no es igual al valor de un puerto usado por otro servicio: **4005** (Servidor PN [ARS]), **4007** (Servicio de mensajería de texto), **4000** (Puerto de bucle de UDP), **64414** (Servidor KMF [OTAR]), **162** (Agente de SNMP [Protocolo simple de administración de red]), **49223** (Autenticación de usuario) y **49165** (Autenticación del radio).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Mesa 182: Rango

Mínimo	Máximo	Incrementos
1	65535	1

10.29

Amplitud convencional

Esta sección le permite ver o definir la funcionalidad que se aplica según la amplitud del radio a todas las personalidades convencionales.

Esta funcionalidad no se aplica mientras opera en el modo de comunicaciones de troncalización.

10.29.1

General

Esta sección permite visualizar o definir la funcionalidad básica de amplitud del radio que se aplica solo al modo Comunicaciones convencionales.

10.29.1.1

Tipo de monitor

En este campo se selecciona cómo el radio reactiva el audio cuando se presiona el botón Monitor. El Monitor silencioso, también llamado anulación de PL, le permite monitorear el canal antes de transmitir.

Esta selección se aplica a comunicaciones convencionales.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Silencioso

Desactiva PL o DPL

Silenciador abierto

Desactiva el silenciador que desilencia el altavoz del radio de cualquier señal de operador actual en el canal sin importar la intensidad de la señal. Si no se encuentra una señal de operador presente, entonces el radio se desilencia ante el ruido.

10.29.1.2

Permitir frecuencia directa

Este campo permite que los parámetros Directa/comunicación directa se definan individualmente para todos los perfiles de Opciones de frecuencia.

Tras desactivarse, todos los parámetros Directa/comunicación directa vuelven a la configuración de los campos de parámetros Rx para la funcionalidad Directa/comunicación directa. Esta función se aplica en base a la amplitud de radio solo mientras opera en modo de comunicaciones convencionales.

NOTA:

El campo Directo/Comunicación directa de personalidad convencional activa o desactiva el Modo directo/comunicación directa por Opciones de frecuencia de personalidad convencional.

Puede seleccionar el modo Directo/comunicación directa mediante la pulsación del botón, la selección del switch Directo/comunicación directa, o del menú Directo/comunicación directa.

10.29.1.3

Tono de activación de seguro

Este campo hace que el radio emita un tono de alerta cada vez que la función "Monitor" se encuentra bloqueada (vea la función Tipo de monitor).

Al oprimir el botón Monitor para el tiempo de habilitación de seguro se bloquea la función Monitor; este tono de alerta indica que ha ocurrido un bloqueo. Una vez que "Monitor" está bloqueado, puede

presionar el botón Monitor nuevamente para cancelar el modo de bloqueo. Esta función también se aplica para comunicaciones convencionales.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.29.1.4

Tiempo de habilitación del seguro

En este campo se selecciona la cantidad de tiempo que debe presionar el botón Monitor para que la función **Monitor** permanezca bloqueada continuamente.

Cuando se alcanza este umbral de tiempo, puede soltar el botón Monitor y el modo "Monitor" permanecerá activo. Si no se alcanza este umbral de tiempo, al soltar el botón Monitor, el Modo monitor finaliza (no se produce el bloqueo) y el radio vuelve al funcionamiento normal. Una vez que "Monitor" está bloqueado, puede presionar el botón Monitor nuevamente para cancelar el modo de bloqueo. Esta función también se aplica para comunicaciones convencionales.

Consulte la selección [Tipo de monitor en la página 402](#) para obtener más información.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

NOTA:

Cuando se configura en Desactivado, no hay ningún temporizador - 0 (cero segundos). "Monitor" se bloquea inmediatamente con una pulsación del botón Monitor.

Mesa 183: Rango

Mínimo	Máximo	Incrementos
0.5 s	6 s	0.5 s

10.29.2

Funciones

Esta sección permite visualizar o modificar la funcionalidad que se puede aplicar a todas las Personalidades convencionales.

10.29.2.1

Cronómetro de tecla rápida PTT inteligente

En este campo se selecciona la cantidad máxima de tiempo entre las pulsaciones del botón PTT que determina qué tan rápido debe presionar el botón PTT para efectuar una pulsación de la Tecla rápida.

Una Tecla rápida (doble presión) del botón PTT puede anular el Tipo de PTT inteligente y la selección de **Inhibición de Tx** encendida para una Personalidad convencional elegida, lo que permite que el radio transmita cuando el canal actual esté ocupado (consulte también Temporizador de reintento de PTT inteligente).

Mesa 184: Rango

Mínimo	Máximo	Incrementos
100 ms	5000 ms	100 ms

10.29.2.2

Cronómetro de reintento PTT inteligente

En este campo se selecciona la cantidad de tiempo en el cual el radio prueba un canal vacío (sin operador).

Este temporizador se usa cuando se escoge una de las selecciones de Tipo de PTT inteligente e **Inhibición de Tx encendida** para una Personalidad convencional. Cuando se oprime el botón PTT y este tiempo de muestreo determina que el canal actual está ocupado, el radio emite automáticamente un todo de alerta continuo hasta que se libera el botón PTT.

IMPORTANTE:

El campo Anulación de tecla rápida es una función de anulación que le permite transmitir sin importar el tipo de PTT inteligente seleccionado actualmente, la regla de "Inhibición" de Tx. Consulte también Temporizador de tecla rápida PTT inteligente.

Mesa 185: Rango

Mínimo	Máximo	Incrementos
0 ms	5000 ms	25 ms

10.29.2.3

Número de estado de intentos

En este campo se selecciona la cantidad máxima de veces que el radio intenta enviar un Estado definido de RadioCentral.

El radio continúa con estos intentos hasta que recibe un reconocimiento que confirma la recepción exitosa de la transmisión de estado o hasta que se alcanza la cantidad seleccionada de intentos de estados. Consulte también Salida automática de estado. Esta selección se aplica a todos los Sistemas convencionales.

Mesa 186: Rango

Mínimo	Máximo
1 intento	14 intentos

10.29.3

Conjunto ID de grupo ASTRO

El conjunto **ID de grupo ASTRO** permite que el usuario visualice o modifique la funcionalidad que puede aplicar a todos los sistemas convencionales tipo ASTRO y, por lo tanto, a todas las personalidades convencionales que cuentan con la funcionalidad del sistema ASTRO.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admite el siguiente campo:

10.29.3.1

ID de grupo

En este campo se selecciona (en formato decimal o hexadecimal) el ID del grupo de datos de Interfaz de aire común (CAI) utilizado solo al decodificar direcciones en la recepción de datos.

Este número de ID de grupo asocia al radio con un grupo de datos específico para direccionamiento de grupo de mensajes de datos. Cuando se transmiten datos por el radio, no se utiliza el ID de grupo de datos. Esta selección se aplica a el ID de grupo actual (registro/fila) que se aplica a Sistemas convencionales tipo ASTRO.

10.29.4

Datos ASTRO

Esta sección permite visualizar o modificar la funcionalidad que puede aplicar a todos los Sistemas convencionales tipo ASTRO y, por lo tanto, a todas las Personalidades convencionales que tienen la funcionalidad del sistema ASTRO.

**NOTA:**

Para obtener más detalles acerca de la operación de acceso a canales de datos, consulte la Descripción operacional de Interfaz de aire común APCO 25 para canales de comunicación convencional.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.29.4.1

Intentos de Tx máximos de datos CAI

En este campo se selecciona la cantidad máxima de veces que el radio intenta enviar una transmisión de paquete de datos de Interfaz inalámbrica común (CAI).

El radio continúa con estos intentos hasta que recibe una confirmación de la recepción correcta de la transmisión, o hasta que se alcanza la cantidad seleccionada de intentos de Tx.

**NOTA:**

Esta selección se aplica a todos los Sistemas convencionales tipo ASTRO.

Mesa 187: Rango

Mínimo	Máximo	Incremento
2 intentos	10 intentos	1 intento

10.29.4.2

Cronómetro de respuesta de datos CAI

En este campo se selecciona la cantidad de tiempo durante el cual el radio espera la confirmación de una transmisión exitosa de Interfaz de aire común (CAI) antes de enviar nuevamente otro paquete de datos CAI.

**NOTA:**

Esta selección se aplica a todos los Sistemas convencionales tipo ASTRO.

Mesa 188: Rango

Mínimo	Máximo	Incrementos
100 ms	5000 ms	100 ms

10.29.4.3

Cronómetro de respuesta mínima de datos CAI

En este campo se selecciona la cantidad mínima de tiempo que el radio espera el envío de la confirmación de un Interfaz inalámbrica común (CAI) a través del canal.

Este parámetro debe ser ligeramente mayor que el Retardo de carga útil de datos del Control de la red de radio (RNC) hacia el radio. Esta selección se aplica a todos los Sistemas convencionales tipo ASTRO.

**IMPORTANTE:**

No intente cambiar esta configuración sin verificar primero la carga útil particular de su sistema.

Mesa 189: Rango

Mínimo	Máximo	Incrementos
50 ms	2000 ms	50 ms

10.29.4.4

Tamaño máximo del paquete

Este campo selecciona la cantidad máxima de bytes que se pueden transportar en un solo paquete de datos de Interfaz inalámbrica común (CAI). Esta selección se aplica a todos los Sistemas convencionales tipo ASTRO.

Mesa 190: Rango

Mínimo	Máximo	Incrementos
16 bytes	512 bytes	16 bytes

10.29.4.5

Período de búsqueda de sincronización de marco

En este campo se selecciona la cantidad de tiempo que el radio espera para escuchar una secuencia de sincronización de marco. Una secuencia de sincronización de trama en el canal indica que existe actividad en un canal.

Si una secuencia de sincronización de trama no se detecta dentro de este tiempo, el radio supone que el canal está en reposo y luego transmite el siguiente paquete de Interfaz por aire común (CAI) en fila para transmisión. Esta selección se aplica a todos los Sistemas convencionales tipo ASTRO. El tiempo está expresado en milisegundos.

**IMPORTANTE:**

Este valor se debe configurar al máximo sobre la duración del paquete de datos por el aire. Ejemplo: Para un tamaño máximo de un paquete CAI de 512 bytes, este valor se debe configurar en 750 ms. Para un funcionamiento correcto en un canal con voz ASTRO presente, debido al tamaño de la trama de voz ASTRO, este valor se debe configurar por sobre los 200 ms.

Mesa 191: Rango

Mínimo	Máximo	Incrementos
0 ms	5000 ms	50 ms

10.29.4.6

Rango aleatorio corto de Tx

En este campo se selecciona la cantidad máxima de tiempo que el radio espera para transmitir una vez que se ha recibido la primera secuencia de sincronización de marco calificada que indica que el canal está libre.

El radio verifica aleatoriamente el estado de acceso al canal según su tiempo máximo de espera. Esta selección se aplica a todos los Sistemas convencionales tipo ASTRO. El tiempo está expresado en milisegundos.

IMPORTANTE:

Al aumentar este valor se reduce la posibilidad de colisión con otros radios que intentan transmitir datos (aproveche el canal), pero también aumenta la tardanza en el acceso al canal.

Mesa 192: Rango

Mínimo	Máximo	Incrementos
50 ms	500 ms	50 ms

10.29.4.7

Rango aleatorio largo de Tx

En este campo se selecciona la cantidad máxima de tiempo que el radio espera antes de verificar nuevamente el estado de un canal una vez que se recibe un símbolo de estado de canal ocupado.

Una vez que se recibe un estado de canal despejado, el radio puede transmitir el siguiente paquete de Interfaz de aire común (CAI) en fila para transmisión. El radio verifica aleatoriamente el estado de acceso al canal según su tiempo máximo de espera. Esta selección se aplica a todos los Sistemas convencionales tipo ASTRO. El tiempo está expresado en milisegundos.

Mesa 193: Rango

Mínimo	Máximo	Incrementos
50 ms	5000 ms	50 ms

10.29.4.8

Rango aleatorio de respuesta Tx

En este campo se selecciona la cantidad máxima de tiempo que el radio espera antes de verificar nuevamente el estado de un canal una vez que se recibe un símbolo de estado de canal ocupado.

Esta selección se aplica solo a confirmaciones de Interfaz de aire común (CAI). Una vez que se recibe un estado de canal despejado, el radio puede transmitir la siguiente confirmación de Interfaz de aire común (CAI) en fila para transmisión. El radio verifica aleatoriamente el estado de acceso al canal según su tiempo máximo de espera. Esta selección se aplica a todos los Sistemas convencionales tipo ASTRO. El tiempo está expresado en milisegundos.

IMPORTANTE:

Al aumentar este valor se reduce la posibilidad de conflicto con otros radios que intentan transmitir datos (aproveche el canal), pero también aumenta la tardanza en el acceso al canal.

Mesa 194: Rango

Mínimo	Máximo	Incrementos
50 ms	1000 ms	50 ms

10.29.4.9

Paciencia limitada de Tx

En este campo se selecciona la cantidad máxima de tiempo durante el cual el radio intenta transmitir un paquete de datos de Interfaz de aire común (CAI).

Una vez que se cumple el tiempo, el radio deja de intentar transmitir. Esta selección se aplica a todos los Sistemas convencionales tipo ASTRO. El tiempo está expresado en segundos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

**NOTA:**

Cuando se configura en **Infinito**, no se utiliza ningún temporizador, por lo que no hay límite de tiempo de transmisión.

Mesa 195: Rango

Mínimo	Máximo	Incrementos
2 segundos	255 segundos	1 seg

10.29.4.10

Profundidad de caché ARP

En este campo se selecciona la cantidad de entradas que se almacenan en la Tabla de protocolo de resolución de direcciones (ARP) del radio.

La Tabla de ARP del radio es una memoria caché que almacena asignaciones entre direcciones IP e ID individuales. La Profundidad de caché de ARP permite que el radio sea más eficaz cuando su número seleccionado por RadioCentral es igual a la cantidad esperada de dispositivos (con dirección IP única) con los que se comunica el radio. Esta selección se aplica a todos los Sistemas convencionales tipo ASTRO.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 196: Rango

Mínimo	Máximo
0	50

**NOTA:**

La selección de una Profundidad de caché de "0" indica que ninguna dirección IP se puede poner en una caché; por lo que desactiva efectivamente la caché de ARP.

10.29.4.11

Tiempo de caché de ARP

En este campo se selecciona el tiempo que se almacenan las entradas de la memoria caché en la Profundidad de caché de ARP. Si todos los dispositivos de comunicación de una red tienen direcciones IP estáticas/fijas, se recomienda configurar este Tiempo de caché como **Infinito** (tiempo de caché infinito), esto permite que las entradas de la memoria caché de ARP permanezcan en la memoria caché de manera continua.

Si el Tiempo de caché de ARP no está configurado como **Infinito**, las entradas de la memoria caché de ARP se depuran cuando vence este temporizador. Esta selección se aplica a todos los Sistemas convencionales tipo ASTRO. El tiempo está expresado en horas.

Solo se accede: Cuando el radio admite modelos y opciones diferentes, cuando el campo Profundidad de caché ARP no se ha establecido en **0**.

**NOTA:**

Cuando se configura en Infinito, las entradas de la memoria caché de ARP permanecen en memoria caché de forma indefinida.

Mesa 197: Rango

Mínimo	Máximo	Incrementos
1 hora	24 horas	1 hora

10.29.4.12

ID de cliente convencional (hex)

Este campo selecciona un número válido de “ID del sistema” de Clave avanzada convencional (ACK) (consulte el Informe de clave del sistema), que permite el comando de Operación de servicios tácticos: inhibición.

Solo se puede seleccionar un “ID del sistema” de ACK cuando el ACK está cargado en RadioCentral. Los ACK se cargan en RadioCentral a través del puerto USB de la computadora con dispositivos clave insertados en un lector de dispositivos de clave con puerto USB. Esta selección se aplica en los radios en general para todos los Sistemas convencionales ASTRO.

**ADVERTENCIA:**

Una vez que el campo Operación de servicios tácticos es **Decodificar** o **Decodificar y codificar**, y la Acción de decodificación de la Anulación de inhibición del radio está **Desactivada**, este campo debe contener un número de ACK válido.

Una vez que se ingresó un número ACK válido, puede producirse una escritura de codeplug en el radio solo cuando ese ACK está cargado actualmente en RadioCentral (consulte Informe de claves del sistema).

Solo se accede: Cuando el campo Activación de la inhibición táctica está **activado** y cuando el radio admite distintos modelos y opciones, y una vez que se ha ingresado un número de ACK válido en este campo y se ha guardado, este valor no se puede modificar a menos que su número de ACK esté cargado en RadioCentral (consulte Informe de claves del sistema).

Se admite la siguiente selección:

- El valor predeterminado de fábrica es **0000**.

10.30

Lista de alias de estado convencional

La **Lista de alias de estado convencional** le permite ver o definir Estados convencionales.

Su estado solo puede ser transmitido de una unidad de radio a un despachador (unidad base). Su estado hace un uso más eficiente del canal comparado con la transmisión de voz. Esta función se aplica solo cuando se opera en modos de comunicación convencionales.

**NOTA:**

Los alias de estado deben estar configurados de manera idéntica, (o con el mismo significado) en el despachador y las unidades de radio. Esto significa que el alias de estado 1 desde la unidad de despacho debe ser idéntico a (o tener el mismo significado de) el alias de estado 1 de la unidad de radio.

Los mensajes de MDC, DVRS y ASTRO se activan de forma individual por [Sistema convencional en la página 415](#) desde el campo [Estado en la página 419](#).

Luego, puede activar la función Estado con la pulsación del botón Estado, la pulsación del botón Estado directo o la selección del menú Estado (consulte también [Número de estado de intentos en la página 404](#) y [Salida automática de estado en la página 238](#)).

10.30.1

Número de alias de estado

En este campo se selecciona un número único para el Estado actual (registro/fila).

El número es emparejado entre los radios que transmiten y reciben, este emparejamiento determina el Texto de alias de estado que aparece en la pantalla del radio receptor.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.30.2

Texto de alias de estado

Este campo permite definir nombres reconocibles para el estado actual (registro/fila).

El [Número de alias de estado en la página 410](#) se empareja entre los radios que transmiten y reciben, y este emparejamiento determina el Texto de alias de estado que aparece en la pantalla del radio receptor.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

**NOTA:**

Ejemplos: MESSAGE-5, #510, Electric1

Se pueden usar caracteres, números, espacios y caracteres especiales.

Es posible usar un total de 14 caracteres.

Consulte también: [Validación de datos del campo Nombre de CPS](#)

10.31

Lista de ID del repetidor

La **Lista de ID de repetidor** le permite ver o definir los ID para tener acceso a los repetidores mientras opera en el modo de comunicaciones convencional.

Esto solo se cumple cuando uno o ambos campos Tipo de código de acceso al repetidor de la Personalidad convencional están configurados en **MDC** para cualquier Personalidad convencional individual.

**NOTA:**

Los ID de repetidor se seleccionan para usarse en los campos de ID del repetidor de MDC de Personalidad convencional.

10.31.1

ID del repetidor

En este campo se selecciona el ID del repetidor (registro/fila) que transmite el radio para obtener acceso al repetidor de un canal de comunicaciones convencionales.

Los ID del repetidor se deben seleccionar para usarlos con canales específicos convencionales en los campos ID del repetidor de MDC para personalidad convencional. Un Código de acceso al repetidor (RAC) permite que el radio tenga acceso a repetidores específicos.

**IMPORTANTE:**

Esto solo se cumple cuando uno o ambos de los campos Tipo de código de acceso (Botón 1/PTT de acceso al repetidor) y Tipo de código (Botón 2/PTT de acceso al repetidor) de acceso al repetidor de la Personalidad convencional se configuran en **MDC** para cualquier [Personalidad convencional en la página 429](#) individual.

Mesa 198: Rango

Mínimo	Máximo	Incrementos
1	9999	1

10.31.2

Tono (Hz)

Selecciona el Tono único (frecuencia) que transmite el radio para obtener acceso al repetidor a un canal de comunicaciones convencionales.

Los tonos únicos (frecuencias) deben seleccionarse para su uso con canales convencionales específicos desde los campos de frecuencia de Tono único de personalidad convencional. Cada Código de acceso al repetidor (RAC) permite que el radio tenga acceso a repetidores específicos.

**IMPORTANTE:**

Esto solo se cumple cuando uno o ambos campos Tipo de código de acceso al repetidor de la personalidad convencional están configurados en **Tono único** para cualquier [Personalidad convencional en la página 429](#) individual dentro de la sección RAC (personalidad convencional).

Mesa 199: Rango

Mínimo	Máximo	Incrementos
300 Hz	3000 Hz	0,1 Hz

10.32

Lista de grupos de conversación ASTRO

La **Lista de grupo de conversación ASTRO** permite definir la funcionalidad que se aplica a miembros individuales del grupo de conversación dentro de la Lista de grupo de conversación ASTRO actual. Los Grupos de conversación ASTRO solo se usan con las Personalidades convencionales que usan los Sistemas convencionales de tipo ASTRO.

**NOTA:**

Una Lista de grupo de conversación puede hacer referencia a una Personalidad convencional con el campo Lista de grupo de conversación.

Una vez que la Lista de grupo de conversación se selecciona para una personalidad, entonces es posible seleccionar un Grupo de conversación predeterminado para la misma personalidad desde el campo ID de grupo de conversación ASTRO de Opción de frecuencia.

Según la opción de campo Tipo de selección de la Personalidad convencional, el usuario podrá acceder a una Lista completa de grupo de conversación o a un solo Grupo de conversación compactado en ese canal.

10.32.1

General

Esta sección permite definir la funcionalidad para las Listas de grupos de conversación ASTRO individuales, así como para los Miembros del grupo de conversación dentro de cada lista.

Los Grupos de conversación ASTRO solo se usan con las Personalidades convencionales que usan los Sistemas convencionales de tipo ASTRO. Los miembros de la Lista de grupo de conversación ASTRO están disponibles para operaciones de llamada selectiva o alerta de llamada. Según la opción de campo Tipo de selección de la Personalidad convencional, el usuario podrá

acceder a una Lista completa de grupo de conversación o a un solo Grupo de conversación compactado en ese canal.

**NOTA:**

Una Lista de grupo de conversación puede hacer referencia a una Personalidad convencional con el campo Lista de grupo de conversación. Una vez que la Lista de grupo de conversación se selecciona para una personalidad, un grupo de conversación predeterminado se puede seleccionar para la misma personalidad desde el campo Grupo de conversación ASTRO de la opción del canal.

10.32.1.1

Nombre de lista del grupo de conversación ASTRO

Este campo le permite crear nombres reconocibles para la Lista de grupos de conversación ASTRO actual.

La Lista de Grupo de conversación ASTRO se selecciona para su uso desde el campo Lista de Grupo de conversación de personalidad convencional.

**NOTA:**

Se pueden usar caracteres, números, espacios y caracteres especiales.

Se pueden utilizar hasta 14 caracteres.

10.32.1.2

Alias de grupo de conversación

Este campo permite que la información de Texto de Alias de grupo de conversación aparezca en la pantalla del radio.

Esta función se aplica para la Lista de grupos de conversación ASTRO.

El Alias de grupo de conversación permite que el nombre del usuario reconocible aparezca cuando se está desplazando a través de la Lista de grupo de conversación ASTRO.

Cuando está desactivado, el ID del grupo de conversación aparece en la pantalla del radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.32.1.3

Índice de perfil de ASTRO OTAR

En este campo se selecciona el Perfil de KMF seguro y el que se utilizarán en la Lista del grupo de conversación ASTRO actual.

**IMPORTANTE:**

Cuando este campo no está configurado como **Desactivado**, el campo de Selección de clave para la Lista del grupo de conversación ASTRO solo puede seleccionar claves de la Lista de referencias de claves de encryption protegidas de hardware de este Perfil de KMF seguro y seleccionados

Tenga en cuenta que, en realidad, el de RadioCentral está señalando las claves de la Lista de claves de encryption para esta selección; las claves individuales de la Lista de referencias de claves de encryption de hardware seguras/ hacen referencia a las claves de la Lista de claves de encryption del campo Referencia de claves de encryption/. Por lo tanto, cualquier clave seleccionada cuando el campo no está configurado como **Desactivado** debe definirse primero en la Lista de referencias de claves de encryption de hardware seguro .

Cuando este campo está configurado como **Desactivado** o no se aplica (color gris), se elige el valor del campo de Selección de clave directamente desde la Lista de claves de encryption de la ventana de encriptación en general

Solo se accede: cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software**, y [Estándar de encryption avanzado \(AES256\) en la página 302](#) está activado; y cuando el campo [Activación de OTAR en la página 303](#) está activado, cuando el campo [Activación de ASTRO OTAR en la página 304](#) está activado y cuando el radio admite diferentes modelos y opciones.

10.32.2

Lista de grupo de conversación

Esta sección permite definir la funcionalidad de los miembros individuales del grupo de conversación de la Lista del grupo de conversación ASTRO actual.

Los Grupos de conversación ASTRO solo se usan con las Personalidades convencionales que usan los Sistemas convencionales de tipo ASTRO.

NOTA:

Una Lista de grupo de conversación puede hacer referencia a una Personalidad convencional con el campo Lista de grupo de conversación. Una vez que la Lista de grupo de conversación se selecciona para una personalidad, entonces es posible seleccionar un Grupo de conversación predeterminado para la misma personalidad desde el campo ID de grupo de conversación ASTRO de Opción de frecuencia.

Según la opción de campo Tipo de selección de la Personalidad convencional, el usuario podrá acceder a una Lista completa de grupo de conversación o a un solo Grupo de conversación compactado en ese canal.

10.32.2.1

Alias de grupo de conversación

Este campo permite que la información de Texto de Alias de grupo de conversación aparezca en la pantalla del radio.

Esta función se aplica para la Lista de grupos de conversación ASTRO.

El Alias de grupo de conversación permite que el nombre del usuario reconocible aparezca cuando se está desplazando a través de la Lista de grupo de conversación ASTRO.

Cuando está desactivado, el ID del grupo de conversación aparece en la pantalla del radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.32.2.2

ID de grupo de conversación

En este campo se selecciona (en formato decimal o hexadecimal) un número de identificación única para el grupo de conversación actual.

Esta selección se aplica para el grupo de conversación (registro/fila) actual del [Lista de grupos de conversación ASTRO en la página 411](#) actual.

Mesa 200: Rango

Mínimo	Máximo
0	65535

IMPORTANTE:

EL grupo de conversación "65535" (FFFF Hex) es un grupo de conversación "Todo llamada" de amplitud de sistema. Todos los demás grupos de conversación desilencian una transmisión del Grupo de conversación "65535" y un grupo de conversación configurado en "65535" desilencia cualquier ID de Grupo de conversación.

El grupo de conversación "0" es un grupo de conversación de "Solo recepción" de amplitud de sistema que recibe las transmisiones de "Todo llamada" enviadas en el grupo de conversación "65535". El Grupo de conversación "0" también recibe transmisiones de Llamada selectiva enviadas al ID Individual de un usuario particular de ASTRO. Esta condición solo es posible cuando la Regla de desilenciación de Rx ASTRO de un canal/personalidad que tiene este ID de grupo de conversación seleccionado está configurada en **Silenciador selectivo**.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.32.2.3

Voz Protegida/Enlace Abierto

En este campo se selecciona el modo de Transmisión para el grupo de conversación actual.

Esta selección se aplica para el grupo de conversación (registro/fila) actual del [Lista de grupos de conversación ASTRO en la página 411](#) actual.

Se admiten las siguientes selecciones:

Seleccionar

Permite activar o desactivar las comunicaciones encriptadas seguras.

NOTA:

Ya sea con la pulsación del botón Selección de Tx segura o el switch de alternación Selección de Tx segura o la selección del menú Seguro permite al usuario alterar entre las comunicaciones seguras y sin encryption para ese canal.

Borrar

Relaciona u obliga al canal a operar comunicaciones convencionales normales (no protegidas).

Encriptación

Conecta o activa el canal en la operación encriptada segura.

Solo se accede: cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software**.

10.32.2.4

Selección de clave

Este campo selecciona la clave de encryption seguro que se utilizará en el modo de encryption seguro para el grupo de conversación (registro/fila) actual.

Esta selección se aplica para el grupo de conversación actual de la personalidad de troncalización actual.

IMPORTANTE:

Cuando el campo [Índice de perfil de ASTRO OTAR en la página 412](#) no está Desactivado para la Lista de grupo de conversación de ASTRO actual, este valor de Selección de clave se elige de la [Lista de referencias de clave de encryption de hardware seguro en la página 321](#) del Perfil KMF seguro seleccionado en el campo Índice de perfil KMF.

ADVERTENCIA:

Tenga en cuenta que la RadioCentral está apuntando a las Claves de la [Lista de clave de encryption en la página 317](#) para esta selección; las Claves individuales de la Lista de referencias de clave de encryption de hardware hacen referencia a las claves de la Lista de claves de encryption desde la [Referencia de clave de encryption en la página 322](#). Por lo tanto, cualquier clave seleccionada cuando OTAR de ASTRO está activado, debe definirse primero en la Lista de referencias de clave de encryption para hardware seguro.

Cuando el campo Índice de Perfil KMF está Desactivado o no se aplica (aparece en color gris) a la Lista de grupo de conversación de ASTRO actual, este valor de Selección de clave es tomado directamente de la Lista de claves de encryption seguro.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software**, y cuando el campo [Voz Protegida/Enlace Abierto en la página 414](#) está configurado en **Seguro** o **Seleccionar**, y cuando el radio admite el modelo/opción.

10.33

Sistema convencional

Los **Sistemas convencionales** permiten ver o definir Sistemas de señalización individuales.

Los tipos de sistema de señalización incluyen: **ASTRO**, **MDC**, **DVRS** y **Quik-Call II**. Los sistemas de señalización individuales se seleccionan para uso con las Personalidades convencionales.

NOTA:

Los Sistemas convencionales se seleccionan para uso en el campo Sistema de ASTRO de Personalidad convencional o el campo Sistema sin ASTRO.

10.33.1

General

La sección **General** permite ver o definir la funcionalidad básica para los sistemas de señalización de las comunicaciones convencionales individuales.

NOTA:

Los campos que son compatibles dependen del valor establecido para Tipo de sistema.

Los Sistemas convencionales se seleccionan para uso en el campo Sistema de ASTRO de Personalidad convencional o el campo Sistema sin ASTRO.

10.33.1.1

Sistema ASTRO o DVRS

Los siguientes campos son compatibles cuando Tipo de sistema está establecido en **ASTRO** o **DVRS**:

10.33.1.1.1

Nombre del Sistema convencional

Este campo permite crear nombres reconocibles para el Sistema convencional actual.

Los Sistemas convencionales se seleccionan para uso en el campo Sistema de ASTRO de Personalidad convencional o el campo Sistema sin ASTRO.

**NOTA:**

Ejemplos: Byrne004, Power03, #510

Se pueden usar caracteres, números, espacios y caracteres especiales.

Se pueden utilizar hasta 14 caracteres.

10.33.1.1.2

Tipo de sistema

Este campo le permite seleccionar el Tipo de sistema deseado para el Sistema convencional actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

- ASTRO
- MDC
- DVRS
- DTMF
- Quik-Call II
- Un solo tono

**NOTA:**

Estas selecciones dependen del modelo u opción.

10.33.1.1.3

Número de grupo de sistema

Este campo le permite definir un número de Grupo de sistema para un Sistema de ASTRO convencional no definido en el codeplug actual.

El número de grupo del sistema proporciona una forma de agrupar de manera lógica varios sistemas convencionales en el codeplug que realmente son el mismo sistema por el aire.

**IMPORTANTE:**

Esta selección solo se aplica cuando el campo Nombre del sistema está programado como **Personalizado** para el registro/fila actual. Por lo tanto, esta selección corresponde a un Sistema de ASTRO convencional en el campo. Esta selección se aplica a la configuración de ID de llamada actual (registro/fila) del Contacto actual en la Lista de llamadas unificada. Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 674](#).

Solo se accede: Cuando el campo Tipo de sistema está configurado como **Personalizado** o cuando el radio admite distintos modelos y opciones.

10.33.1.1.4

Tiempo de desconexión del grupo de conversación de amplitud del sistema

En este campo se selecciona la cantidad de tiempo que el radio espera cuando ha finalizado una llamada de grupo de conversación del sistema en general.

Durante este tiempo de espera, se usa el ID de grupo de conversación 65535 (FFFF Hex) para todas las llamadas de grupo de conversación de ASTRO. Esta selección se aplica mientras funciona en el Sistema convencional de ASTRO. El tiempo está expresado en segundos.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

- Desactivado
- 12 horas
- 24 horas

NOTA:

El tiempo se expresa en segundos.

10.33.1.1.5

Longitud del preámbulo

En este campo se selecciona la cantidad de tiempo que determina el número mínimo de paquetes de preámbulo de sincronización de bit que se envía al comienzo de todas las transmisiones de ASTRO.

Estos paquetes permiten transmitir y recibir radios para sincronizarse entre sí antes de una transmisión de Sistemas ASTRO. La cantidad de tiempo es igual a esta configuración de longitud de preámbulo multiplicada por 0,2083 milisegundos (ms). Esta selección se aplica mientras funciona en el Sistema convencional de ASTRO.

IMPORTANTE:

Cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Advanced Digital Privacy (ADP)**, el radio transmite un mínimo de 50 milisegundos de preámbulo debido a las demoras que se pueden encontrar cuando se encripta el flujo de datos.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO** o **DVRS**.

Mesa 201: Rango

Mínimo	Máximo
0	1275

10.33.1.1.6

Paciencia limitada

En este campo se selecciona la cantidad de tiempo que el radio espera de manera formal que el tráfico de canal se despeje.

Algunos ejemplos de transmisiones que usan este valor: Alertas de llamada, Llamadas selectivas, Mensajes, Estados y Transmisiones de emergencia. Esta selección se aplica al Sistema convencional actual. En el caso de emergencia, el radio espera formalmente que los reintentos informales caduquen.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO**, **DVRS** o **MDC**.

NOTA:

Cuando se configura en Infinito, no se utiliza ningún temporizador, por lo que hay un período de espera infinito.

Mesa 202: Rango

Mínimo	Máximo	Incrementos
1 s	255 s	1

10.33.1.1.7

Selección de perfil de emergencia

Este campo permite que seleccione el perfil de emergencia convencional adecuado para usar con el sistema convencional actual.

Puede iniciar el modo Emergencia con la pulsación del botón Emergencia.

**NOTA:**

Los nombres que aparecen en la selección están definidos en el campo Nombre del perfil de emergencia.

Solo acceso: Cuando el campo Tipo de sistema está configurado en **DVRS** o **MDC** o (cuando el campo Tipo de sistema se configura en **ASTRO**, y cuando el campo Sistema de interfaz de sitio remoto está desactivado).

Se admiten las siguientes selecciones:

- Tx de emergencia desactivada
- Perfiles de emergencia convencionales disponibles.

10.33.1.1.8

Selección de perfil de datos

Este campo permite seleccionar el Perfil de datos adecuado para usar con el Sistema convencional ASTRO o DVRS actual.

**ADVERTENCIA:**

Para el Tipo de sistema **DVRS**, un Perfil de datos solo es válido cuando Tipo de perfil de datos se configura en **Troncalización**, y cuando Interrupción de datos por Rx de voz está **Activado**, y cuando Transmisión amplia limitada está en **Desactivado**, y cuando Activación de compresión del encabezado de IP está en **Desactivado**, y cuando Datos de terminal está **Desactivado**, y cuando el modo PAD se configura en **Desactivado**, y cuando todas las entradas de la Lista de DAC tienen el modo Operación se configura en **APCO 25 clásico**, y cuando Asegurar/borrar conexión (Paquete de datos APCO 25) se configura en **Borrar** o **Asegurar**, y cuando Selección de lista de puertos se establece en **Desactivado**.

Cuando el campo Radio dual - Selección de radio está configurado en **Radio secundario** y el campo Activar TX de radio secundario está **Desactivado**, este campo debe configurarse en **Datos desactivados** para que se considere válido.

**IMPORTANTE:**

Los Sistemas convencionales ASTRO y DVRS se seleccionan para utilizar en el campo Sistema de ASTRO de la Personalidad convencional.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **DVRS** o (cuando el campo Tipo de sistema está definido en **ASTRO** y cuando el campo Sistema de interfaz de sitio remoto está desactivado).

Se admiten las siguientes selecciones:

- Datos desactivados
- Perfiles de datos disponibles

10.33.2

Funciones

Esta sección permite ver o definir una funcionalidad básica para Sistemas de señalización de ASTRO individuales.

**NOTA:**

Los Sistemas convencionales se seleccionan para uso en el campo Sistema de ASTRO de Personalidad convencional o el campo Sistema sin ASTRO.

10.33.2.1

Inhibición de radio

Este campo permite al radio recibir una señal de inhibición remota mientras funciona en el Sistema convencional actual.

Esta señal de inhibición es un comando de apagado enviado desde la unidad del despachador. Después de recibir este comando, el radio transmite una confirmación rápida al equipo de despacho. Luego, el radio ingresa a un estado inactivo durante el cual el audio de recepción se silencia y la ruta de audio de transmisión se bloquea. Mientras está inhibida, todos los controles de usuario están inoperativos; el modo Rastreo se detiene en el modo/canal en funcionamiento que recibió el comando y se apagan todos los LED del radio.

**IMPORTANTE:**

Para descartar el estado de inhibición del radio, envíe un comando de inhibición o rehaga el proceso de lectura/escritura del radio.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **DVRS** o **MDC** (cuando el campo Tipo de sistema está definido en **ASTRO** y cuando el campo Sistema de interfaz de sitio remoto está desactivado).

10.33.2.2

Verificación de radio

Este campo permite al radio decodificar y responder automáticamente a una Verificación de radio.

Las verificaciones de radio permiten que un despachador revise el estado del radio (encendido o apagado), siempre y cuando el radio esté dentro del rango del sistema. Esta función se aplica al Sistema convencional actual.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **DVRS** o **MDC** (cuando el campo Tipo de sistema está definido en **ASTRO** y cuando el campo Sistema de interfaz de sitio remoto está desactivado).

10.33.2.3

Estado

En este campo se activa la función Estado para el Sistema convencional actual.

La función Estado permite seleccionar y transmitir un Estado específico desde la ventana Lista de alias de estado programada. Puede activar la función Estado con la pulsación del botón Estado, una pulsación del botón Estado directo o una selección del menú Estado (consulte también Número de intentos de estado y Salida automática de estado).

Solo se accede: Cuando el radio admite modelos y opciones diferentes y (cuando el campo Tipo de sistema está definido en **DVRS** o **MDC**) o (cuando el campo Tipo de sistema está configurado en **ASTRO** y cuando el campo Sistema de interfaz de sitio remoto está **Desactivado**).

10.33.2.4

Solicitud de estado

Este campo permite al radio responder en forma automática a una interrogación de estado remoto con el último estado realizado. Esta función se aplica al Sistema convencional actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes y cuando el campo Estado está activado y (cuando el campo Tipo de sistema está definido en **DVRS** o **MDC**) o (cuando el campo Tipo de sistema está configurado en **ASTRO** y cuando el campo Sistema de interfaz de sitio remoto está desactivado).

10.33.2.5

Indicador de Rx de alarma de emergencia

Este campo selecciona el tipo de notificación que el usuario escucha y ve cuando se recibe una alarma de emergencia de otro radio.

Esta función también debe activarse (cuando corresponda) para el Sistema MDC individual o el Sistema ASTRO desde el campo Indicador de Rx de alarma de emergencia o para el Sistema de troncalización desde el campo Indicador de Rx de alarma de emergencia. Esta selección se aplica mientras se opera en Modo emergencia, tanto para comunicaciones convencionales como de troncalización.

**IMPORTANTE:**

El tiempo del indicador de Rx de alarma de emergencia es de 10 segundos. Durante estos 10 segundos, el usuario puede desactivar el indicador mediante la pulsación de cualquiera de los botones del radio, excepto **volumen** y **luz**.

Una vez que ha borrado el indicador o este se borra, los reintentos de enviar alarmas de emergencia desde el mismo ID primario de MDC o ID individual del sistema ASTRO se ignoran durante los próximos 20 segundos.

Las alarmas de emergencia no se detectan mientras el radio se encuentra en Modo de rastreo.

Las alarmas de emergencia no se detectan mientras el radio se encuentra activo en un canal de voz.

Se admiten las siguientes selecciones:

Sin indicación

No se escuchan ni se ven alertas.

Solo alerta

Suena una alerta de audio.

Solo pantalla

Aparece una alerta visual. La alerta visual se aplica solo para modelos de radio con pantalla.

Alertar y mostrar

Suena una alerta de audio y aparece una alerta visual. La alerta visual se aplica solo para modelos de radio con pantalla.

**NOTA:**

Para las selecciones **Solo alerta** y **Alerta y pantalla**, se cumplen las siguientes condiciones: Cuando el radio detecta una Alarma de emergencia, **EA-RCVD** (Alarma de emergencia recibida) aparece en la pantalla del radio. Cuando el radio detecta una baliza Encuéntreme de emergencia, aparece **BCON RX** (Baliza Encuéntreme de emergencia recibida) en la pantalla del radio.

EA-RCVD aparece alternadamente con el ID primario de MDC, el ID individual del sistema ASTRO, o el ID de unidad de troncalización del radio que envió la Alarma de emergencia y continúa durante diez segundos. La restitución invertida/el ID de la persona que llama también es posible.

10.33.2.6

Activación de POP25

Este campo permite que el radio reciba comunicaciones de Programación mediante 25 (POP25) mientras se opera en el Sistema ASTRO convencional.

POP25 también se denomina OTAP (Programación por el aire).

**IMPORTANTE:**

Para que se logre POP25 en un sistema ASTRO, una Clave convencional avanzada (ACK) o una Clave avanzada de sistema (ASK) con acceso a OTAP/POP25 se debe cargar en RadioCentral.

Solo se accede: cuando el campo [Operación segura en la página 301](#) se configura en **Hardware**, cuando el campo Tipo de sistema se configura en **ASTRO**, y cuando se ha seleccionado un Perfil de datos al que se hace referencia para el sistema actual, cuando el campo Sistema de interfaz de sitio remoto está desactivado, y cuando el radio admite modelos/opciones diferentes.

10.33.2.7

Registro de datos CAI

Este campo permite al radio registrar en la parte de datos de la infraestructura del Equipo de red fija (FNE); también se conoce al FNE como "El sistema".

La parte del sistema luego envía al radio una respuesta o una confirmación de registro de datos de Interfaz de aire común (CAI), lo que confirma el registro. Los eventos de radio que desencadenan este registro incluyen: encendido del radio, cambio de modo, salida de rastreo y apagado del radio. Esta función se aplica al Sistema convencional actual.

**ADVERTENCIA:**

Este campo ya no es válido si se produce una de las siguientes situaciones:

- Cuando el Tipo de sistema se establece en **ASTRO**, cuando el Tipo de perfil de datos del perfil de datos al que se hace referencia es **Solo banda ancha** y cuando este campo está configurado en **Activado**.
- Cuando el Tipo de sistema se establece en **ASTRO**, cuando el Tipo de perfil de datos del perfil de datos al que se hace referencia es **Convencional y banda ancha** y cuando este campo está configurado en **Desactivado**.

**IMPORTANTE:**

El radio solo intenta un Registro de datos de CAI cuando hay una función de datos en la personalidad o el canal seleccionado del radio.

Las funciones de datos del radio solo están disponibles cuando el radio se registra exitosamente en el sistema y, luego, cuando el radio recibe de regreso una confirmación de registro exitoso desde el sistema.

Solo se accede: Cuando el campo Tipo de sistema está configurado como **ASTRO**, cuando el campo Sistema de interfaz de sitio remoto está desactivado y cuando el radio admite modelos y opciones diferentes.

10.33.2.8

Enviar la ubicación al par/en el PTT

El sistema ASTRO permite que un radio transmisor codifique sus coordenadas de ubicación en las transmisiones de voz ASTRO de manera similar al ID de PTT (consulte también Mostrar ubicación fija del par).

**ADVERTENCIA:**

El modo ARS debe configurarse en **Servidor mejorado** en el registro del Perfil de datos para evitar el Informe de campos no válidos cuando el Tipo de sistema es DVRS.

**IMPORTANTE:**

En el sistema ASTRO, las transmisiones de voz entre radios son compatibles con las coordenadas de ubicación en el flujo de voz; es decir, las Páginas convencionales y las Llamadas selectivas son compatibles con Mostrar ubicación fija del par. Sin embargo, DVRS, el modo Teléfono y otras funciones dependientes de la infraestructura no son compatibles con Mostrar ubicación fija del par. En el sistema DVRS, la transmisión de voz del radio a la infraestructura es compatible con la codificación de las coordenadas de ubicación en el flujo de voz.

Si las coordenadas de ubicación no se pueden obtener en el receptor GPS del radio (ya sea debido a que la señal de GPS se interrumpe en alguna forma, o a que Activación de ubicación seleccionable por el usuario está activada y el usuario ha desactivado la función GPS con el botón Ubicación o la selección del menú Ubicación), el radio codifica las coordenadas de ubicación que se almacenaron por última vez en la transmisión de voz.

Si el intervalo de actualización desde las coordenadas de ubicación almacenadas por última vez supera un temporizador interno, entonces el radio marca las coordenadas de ubicación en la transmisión de voz como “caducadas”; si no hay coordenadas de ubicación almacenadas, el radio envía el flujo de voz sin ningún dato de ubicación.

Solo se accede: Cuando el radio admite modelos y opciones diferentes, cuando el campo Tipo de sistema está configurado en **ASTRO**, cuando el campo Tipo de sistema se ha configurado en **DVRS** y Modo ARS es **Servidor mejorado** en su perfil de datos y cuando el campo Activación de ubicación está activado.

10.33.2.9

Servicio de mensajería de texto

En este campo se selecciona el modo Mensajería de texto para el Sistema ASTRO convencional actual.

**ADVERTENCIA:**

Cuando se usa el Servicio de mensajería de texto mientras está en Búsqueda de datos y la Duración del preámbulo de búsqueda de datos aumenta o disminuye a partir del valor predeterminado, es necesario aumentar o disminuir el Cronómetro corto de reintento, según corresponda. Por ejemplo, en el Modo de funcionamiento de datos directos (consulte Modo de datos por paquete), si el valor de Duración del preámbulo de búsqueda de datos aumenta a 30 (del valor predeterminado 20), el Cronómetro corto de reintento debe aumentarse a 25 segundos (del valor predeterminado 15). Por cada 10 unidades que se agregan para Duración del preámbulo de búsqueda de datos, el Cronómetro corto de reintento debe aumentarse en 10 segundos.

**IMPORTANTE:**

Puede acceder a Mensajería de texto con la pulsación de botón Servicio de mensajería de texto o la selección del menú Servicio de mensajería de texto.

Puede acceder a Mensajería de texto rápida con la pulsación del botón Texto rápido de TMS.

Puede acceder Mensajería de consulta con la pulsación del botón Consulta TMS.

Solo se accede: cuando el campo Tipo de sistema está configurado en **ASTRO**, y cuando se ha seleccionado un Perfil de datos válido al que se hace referencia para el sistema actual, cuando la Selección de perfil de datos no está configurada en **Datos desactivados**, el modo SmartMessage se configura en **LMR**, y cuando el radio admite modelos/opciones diferentes.

Se admiten las siguientes selecciones:

Ninguno

La función está desactivada.

Solo lista

Permite seleccionar solamente los Mensajes de texto en la Lista de mensajes de texto rápido que se programa.

Ilimitado

Le permite seleccionar desde Mensajes de texto rápidos e ingresar mensajes de texto propios desde el teclado del radio.

ADVERTENCIA:

Esta selección solo está disponible en radios que tengan un teclado o micrófono del teclado.

NOTA:

Esta selección no se aplica a radios APX N70.

10.33.2.10

Servicio de mensajería de texto grupal

En este campo se selecciona el modo Mensajería de texto grupal para el Sistema ASTRO o DVRS convencional actual.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO** o **DVRS** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Desactivado

No se recibirán mensajes de texto grupales.

Decodificación completa

Se recibirán mensajes de texto grupales.

10.33.2.11

Llamada selectiva/restablecimiento de llamada entrante

En este campo se selecciona una excepción de desilenciar programada o manual para la Regla de apertura de Rx ASTRO de Personalidad convencional programada y una excepción de desilenciar programada o manual para alertas de llamada cuando el usuario activa Silencio de voz de canal (consulte la función Activación de alerta de usuario de llamada entrante de Personalidad convencional).

El tiempo de excepción (programado o manual) se conoce como Estado de liberación del silenciador. Para las dos selecciones programadas siguientes, el campo Tiempo de restablecimiento automático

determina parcialmente cuánto tiempo continúa el Estado de liberación del silenciador. Esta selección se aplica al Sistema convencional actual.

**NOTA:**

Los Sistemas convencionales ASTRO y DVRS se seleccionan para utilizar en el campo Sistema de ASTRO de la Personalidad convencional.

**IMPORTANTE:**

Para las alertas de llamada, el Estado de liberación del silenciador comienza cuando la función Habilitación de alerta de usuario de llamada entrante de silencio de voz está activa y el radio se ha desilenciado.

Para las llamadas del sistema ASTRO cuando la función Alerta de usuario de llamada entrante de Silencio de voz no está activa, el Estado de liberación del silenciador comienza cuando se cumple la Regla de apertura de Rx ASTRO de la personalidad y se desilencia el radio. Cuando el usuario activa la función Alerta de usuario de llamada entrante de Silencio de voz, el Estado de liberación del silenciador se aplica solo a Alertas de llamada. Esto es efectivo debido a que la función Silencio de voz solo permite activar el sonido del radio para las alertas de llamada.

Solo acceso:

- Cuando el campo Tipo de sistema se configura en **DVRS**.
- Cuando el campo Tipo de sistema está configurado en **ASTRO** y cuando el campo Sistema de interfaz de sitio remoto está desactivado.

Se admiten las siguientes selecciones:

Llamada selectiva: Para las dos selecciones programadas, mientras se ejecuta el Tiempo de restablecimiento automático, cuando se presiona el botón PTT, el temporizador se detiene y reinicia; cuando se suelta el botón PTT, el temporizador vuelve a comenzar (desde cero), lo que extiende aún más el Estado de liberación del silenciador.

Manual

- Para móvil: Actualmente esta selección no se aplica a las Llamadas selectivas.
- Para portátiles: Oprimir el botón "Monitor" finaliza el Estado de liberación del silenciador.

Auto

Si el cronómetro expira sin importar si el radio se silenció o no, el Estado de liberación del silenciador finaliza y se requieren nuevamente las Reglas de apertura de Rx de ASTRO del radio para desilenciar cualquier transmisión futura.

Automático con portador

Si el radio se desilencia cuando el cronómetro expira (debido a la anulación del portador), este permanece desilenciado hasta que cae el portador. Cuando cae el portador y el radio se silencia, el cronómetro se reinicia y vuelve a correr en efecto, lo que extiende nuevamente el Estado de liberación del silenciador. Si el radio permanece silenciado por un período completo (sin ninguna anulación de portador), el Estado de liberación del silenciador finaliza y se requieren nuevamente las Reglas de desilenciación de Rx de ASTRO para desilenciar cualquier transmisión futura.

Alerta de llamada**Manual**

Los siguientes dos métodos manuales de finalizar el Estado de liberación del silenciador también se aplican al usuario cuando se selecciona "Auto" o "Auto c/portadora".

- Cuando la función Habilitación de alerta de usuario de llamada entrante de silencio de voz está activada, al oprimir el botón Silencio de voz, o seleccionar el menú Silencio de voz se desactiva Silencio de voz y finaliza el Estado de liberación del silenciador.
- Oprimir el botón PTT finaliza el Estado de liberación del silenciador.

Auto

Si el cronómetro expira sin importar si el radio se silenció o no, el Estado de liberación del silenciador finaliza y se requieren nuevamente las reglas de Alerta de usuario de llamada entrante de silencio de voz activada para desilenciar cualquier transmisión futura.

Automático con portador

Si el radio se desilencia cuando el cronómetro expira (debido a la anulación del portador), este permanece desilenciado hasta que cae el portador. Cuando cae el portador y el radio se silencia, el cronómetro se reinicia y vuelve a correr en efecto, lo que extiende nuevamente el Estado de liberación del silenciador. Si el radio permanece silenciado por un período completo (sin ninguna anulación de portador), el Estado de liberación del silenciador finaliza y se requieren nuevamente las reglas de Habilitación de alerta de usuario de llamada entrante para desilenciar cualquier transmisión futura.

10.33.2.12

Tiempo de restablecimiento automático

En este campo se selecciona la cantidad de tiempo que se utiliza durante la excepción de activar sonido a la Regla de activar sonido de Rx ASTRO o Tipo activar sonido sin ASTRO programados; y selecciona la cantidad de tiempo que se emplea durante la excepción de activar sonido para las Alertas de llamada cuando el usuario activa el Silencio de voz para el canal (consulte el campo Activación de alerta de usuario de llamada entrante de ASTRO o Activación de alerta de usuario de llamada entrante sin ASTRO).

El tiempo de excepción se conoce como Estado de liberación del silenciador. Este temporizador solo corresponde a las dos selecciones programadas Llamada selectiva/restablecimiento de llamada entrante. Esta selección se aplica al Sistema convencional actual. El tiempo está expresado en segundos.

Solo se accede: Cuando el campo Seleccionar llamada/restablecimiento de llamada entrante no está establecido en **Manual**, cuando el campo Tipo de sistema se ha configurado en **DVRS, MDC, DTMF, Quik-Call II** o **ASTRO** y cuando el campo Sistema de interfaz de sitio remoto está desactivado.

Mesa 203: Rango

Mínimo	Máximo
0 s	255 s

10.33.2.13

Modo de radio remoto

Este campo permite que el radio decodifique un comando de Monitor remoto o Rastreo de radio para el Sistema de convencional actual.

**NOTA:**

El LED de Tx del radio se ilumina en rojo fijo, lo que indica que el radio transmite en este modo de monitor remoto.

El usuario puede salir de un modo Monitor remoto con el cambio manual del canal o mediante el apagado del radio.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO** o **MDC** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Desactivado

El Modo de radio remoto no está disponible.

Rastreo del radio (No es posible para MDC)

El radio se activa automáticamente y envía un portador sin modular, lo que permite encontrar un radio perdido o robado. El radio se activa durante el tiempo seleccionado por el Tiempo base de Tx.

Monitor remoto

El radio se activa automáticamente para transmitir audio. Esto es especialmente útil en una situación de emergencia de hombre caído. El radio se activa durante el tiempo seleccionado por el Tiempo base de Tx.

10.33.2.14

Tiempo base de Tx

En este campo se selecciona la cantidad de tiempo que el radio permanece activo después de que se ha recibido un comando de Modo de radio remoto.

Esta selección se aplica al Sistema convencional actual. El tiempo está expresado en segundos.

Solo acceso: Cuando el campo Tipo de sistema está establecido en **ASTRO** o **MDC**, cuando el campo Modo de radio remoto está establecido en **Rastreamiento del radio** o **Monitor remoto** y cuando el radio admite modelos y opciones diferentes.

Mesa 204: Rango

Mínimo	Máximo	Incrementos
10 s	120 s	10 s

10.33.2.15

Tipo de alias de radio inalámbrico

En este campo se configura la codificación (transmisión) y la decodificación (recepción) de la función Alias del radio inalámbrico (OTA).

**ADVERTENCIA:**

Si el radio recibe ID duplicados, no podrá mostrar el alias hasta que se elimine la duplicación. Cuando se escribe el codeplug en un radio, la lista de llamadas vuelve a su estado original y todas las actualizaciones de alias OTA se pierden.

**IMPORTANTE:**

Si la actualización del alias OTA no apareció en la pantalla, el usuario debe actualizar la lista de llamadas del radio en RadioCentral o en el administrador de aprovisionamiento.

Se admiten las siguientes selecciones:

Desactivado

El radio no transmite ni recibe datos de alias del radio.

Solo anteriores

Los datos de alias del radio solo se transmiten antes de la voz.

**ADVERTENCIA:**

Esta selección solo es válida cuando el campo [Tipo de voz/señal de Tx en la página 434](#) está establecido en **ASTRO** y cuando el Sistema convencional al que se hace referencia no es DVRS.

Solo posteriores

Los datos de alias del radio solo se transmiten después de la voz.

**ADVERTENCIA:**

Esta selección solo es válida cuando el campo Tipo de voz/señal de Tx está establecido en **ASTRO** y cuando el Sistema convencional al que se hace referencia no es DVRS.

Anterior y posterior

Los datos de alias del radio se transmiten antes y después de la voz.

**ADVERTENCIA:**

Esta selección solo es válida cuando el campo Tipo de voz/señal de Tx está establecido en **ASTRO** y cuando el Sistema convencional al que se hace referencia no es DVRS.

Solo decodificación

Los datos de alias del radio reciben datos sin limitaciones.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.33.2.16

Activación de actualización de alias de radio OTA

Este campo permite que el sistema actual actualice el alias del radio.

Solo se accede: cuando la Activación del ID de radio está activada, y cuando [Tipo de voz/señal de Rx en la página 431](#) no está en **Sin ASTRO**, y [Sistema ASTRO en la página 460](#) hace referencia a un sistema DVRS, y cuando [Tipo de alias de radio inalámbrico en la página 426](#) no está **Desactivado**, y cuando el radio admite modelos/opciones diferentes.

10.33.2.17

Selección de lista de la disposición del personal

Este campo permite seleccionar una lista de disposición del personal para utilizarla mientras opera un Sistema convencional.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO** o **DVRS** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

- Desactivado
- Disposición del personal disponible

10.33.2.18

Calificar alarma de emergencia de Rx

Si este campo está activado, el radio no puede recibir alarmas de emergencia de comunicaciones de datos de Motorola (MDC) cuando la transmisión entrante se califica como línea privada (PL) o línea privada digital (DPL). Esta calificación significa que la transmisión entrante coincide con el Tipo de silenciador RX/TA y el Código de silenciador RX/TA de la personalidad convencional.

Cuando corresponda, también debe activar esta función en el campo **Indicador de Rx de alarma de emergencia**. Esta selección se aplica al sistema convencional de MDC.

**IMPORTANTE:**

Si este campo está activado y la señal entrante falla la calificación PL o DPL, las alarmas de emergencia no se detectan.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **MDC** y el campo Indicador de Rx de alarma de emergencia está activado.

10.33.2.19

Servicio de mensajería de texto

En este campo se selecciona el modo Mensajería de texto para el Sistema ASTRO convencional actual.

**ADVERTENCIA:**

Cuando se usa el Servicio de mensajería de texto mientras está en Búsqueda de datos y la Duración del preámbulo de búsqueda de datos aumenta o disminuye a partir del valor predeterminado, es necesario aumentar o disminuir el Cronómetro corto de reintento, según corresponda. Por ejemplo, en el Modo de funcionamiento de datos directos (consulte Modo de datos por paquete), si el valor de Duración del preámbulo de búsqueda de datos aumenta a 30 (del valor predeterminado 20), el Cronómetro corto de reintento debe aumentarse a 25 segundos (del valor predeterminado 15). Por cada 10 unidades que se agregan para Duración del preámbulo de búsqueda de datos, el Cronómetro corto de reintento debe aumentarse en 10 segundos.

**IMPORTANTE:**

Puede acceder a Mensajería de texto con la pulsación de botón Servicio de mensajería de texto o la selección del menú Servicio de mensajería de texto.

Puede acceder a Mensajería de texto rápida con la pulsación del botón Texto rápido de TMS.

Puede acceder Mensajería de consulta con la pulsación del botón Consulta TMS.

Solo se accede: cuando el campo Tipo de sistema está configurado en **ASTRO**, y cuando se ha seleccionado un Perfil de datos válido al que se hace referencia para el sistema actual, cuando la Selección de perfil de datos no está configurada en **Datos desactivados**, el modo SmartMessage se configura en **LMR**, y cuando el radio admite modelos/opciones diferentes.

Se admiten las siguientes selecciones:

Ninguno

La función está desactivada.

Solo lista

Permite seleccionar solamente los Mensajes de texto en la Lista de mensajes de texto rápido que se programa.

Ilimitado

Le permite seleccionar desde Mensajes de texto rápidos e ingresar mensajes de texto propios desde el teclado del radio.

**ADVERTENCIA:**

Esta selección solo está disponible en radios que tengan un teclado o micrófono del teclado.

**NOTA:**

Esta selección no se aplica a radios APX N70.

10.33.3

Quik-Call II

Esta sección permite ver o definir la funcionalidad Tono de Quik-Call II (QCII) para los Sistemas convencionales QCII individuales.

**NOTA:**

Los sistemas convencionales Quik-Call II se seleccionan para usarse en el campo Sistema sin ASTRO de la Personalidad convencional.

Solo se accede: Cuando el campo Tipo de sistema está configurado como **Quik-Call II** y cuando el radio admite modelos y opciones diferentes.

10.33.3.1

Decodificación QCII

Esta función hace referencia al sistema Quick-Call II (QCII) disponible que coexistirá con las comunicaciones de datos de Motorola (MDC) seleccionadas. Esta función permite decodificar y codificar QCII, y codificar o decodificar MDC en el mismo canal.

Si esta función está activada, puede seleccionar el formato de llamada. También permite seleccionar los diferentes tonos disponibles en la Señalización de tono digital en Analógico.

NOTA:

Esta función no se puede activar con Recuperación instantánea.

10.34

Personalidad convencional

La ventana **Personalidad convencional** permite crear y eliminar Personalidades convencionales, así como definir Personalidades convencionales individuales. Los dos modos de comunicación del radio son troncalización y convencional.

Los tipos de personalidades convencionales incluyen **ASTRO**, **DVRS**, **Modo mixto**, **MDC**, **Quik-Call II** y **Sin señalización**.

NOTA:

Cuando las funciones de personalidades convencionales se hayan definido de manera única, cada personalidad se puede asignar a la posición deseada del selector de canal del radio. Esto se hace en la página Canales de asignación de canal de zona.

10.34.1

General

Esta sección le permite ver o definir la funcionalidad para Personalidades convencionales individuales.

NOTA:

Cuando las funciones de personalidades convencionales se hayan definido de manera única, cada personalidad se puede asignar a la posición deseada del selector de canal del radio. Esto se hace en la página Canales de asignación de canal de zona.

10.34.1.1

Nombre de personalidad convencional

Este campo permite definir un nombre reconocible para la Personalidad convencional actual.

NOTA:

Ejemplos: Fire005, Electric1, #510.

Se pueden usar caracteres, números, espacios y caracteres especiales.

Se pueden utilizar hasta 14 caracteres.

10.34.1.2

Tipo de personalidad convencional

Este campo muestra el tipo que se seleccionó cuando se creó la personalidad.

Los tipos de personalidades convencionales incluyen **ASTRO**, **DVRS**, **Modo mixto**, **MDC**, **Quik-Call II** y **Sin señalización**.

10.34.1.3

AGC de RF avanzado

En este campo se selecciona el tipo de Control automático de ganancia (AGC) de la Frecuencia de recepción (RF) que se aplica a la Personalidad convencional actual.

Se admiten las siguientes selecciones:

Desactivado

Incluso cuando está **Desactivado**, el radio usa una forma básica de AGC incorporado al receptor del radio. Esta protección incorporada ayuda a evitar la saturación de la señal y del receptor que puede dañar los componentes del radio.

Estándar

Activa una forma avanzada de AGC de RF, que busca evitar la interferencia de intermodulación (IM) mediante la detección y la remoción de toda interferencia recibida causada por fuentes externas.

Mejorado

Activa el radio para usar esquemas adicionales a fin de disminuir la interferencia de IM, lo que limpia la señal.

Inteligente

Permite que el radio utilice un esquema único para mejorar la inmunidad a la interferencia cuando está cerca de estaciones base de fase 2 de transmisión Simulcast lineal y APCO. La opción inteligente es mutuamente excluyente con la casilla de verificación de protección de banda ancha.

IMPORTANTE:

El ACG de RF avanzado **Estándar** y **Mejorado** pueden degradar el rendimiento de los canales que no experimentan una interferencia de IM. Por lo tanto, solo se deben activar estas selecciones en canales con problemas de interferencia de IM.

10.34.2

Opciones de Rx

Esta sección permite ver o definir funcionalidad que solo tiene que ver con el modo de recepción (Rx) del radio para las Personalidades convencionales individuales.

NOTA:

Cuando las funciones de personalidades convencionales se hayan definido de manera única, cada personalidad se puede asignar a la posición deseada del selector de canal del radio. Esto se hace en la página Canales de asignación de canal de zona.

10.34.2.1

Personalidad de solo recepción

Este campo hace que el radio no tenga capacidad de transmisión mientras funciona en la Personalidad convencional actual.

En esta personalidad solo se permitirá la recepción de llamadas.

NOTA:

Si la función Clonación de zona crea la personalidad, la personalidad no puede ser Personalidad de solo recepción.

Solo se accede: cuando la función Clonación de zona no crea la personalidad.

10.34.2.2

Tipo de voz/señal de Rx

En este campo se selecciona el modo Señalización cuando se recibe (Rx) voz para la Personalidad convencional actual.

**ADVERTENCIA:**

Cuando el campo Sistema de interfaz de sitio remoto (RSI) en el Sistema convencional mencionado está **Activado**, este campo debe configurarse en **ASTRO**; de lo contrario, RadioCentral considera que el valor de este campo no es válido.

Cuando el campo Audio plano analógico está **Activado**, este campo debe configurarse en **Sin ASTRO**; de lo contrario, RadioCentral considera que el valor de este campo no es válido.

Cuando el campo [Activación de rastreo de voto combinado en la página 479](#) está **Activado**, este campo debe configurarse en **Sin ASTRO** o **ASTRO**; de lo contrario, RadioCentral considera que el valor de este campo no es válido.

Se admiten las siguientes selecciones:

No ASTRO

Solo se reciben señales de tipo analógica sin ASTRO.

Se debe seleccionar un Tipo de sistema **MDC** o **QCII** en el Tipo de señalización Sin ASTRO y, a continuación, se debe seleccionar Sistema Sin ASTRO.

Modo mixto

Se pueden recibir señales analógicas ASTRO y Sin ASTRO.

Los sistemas convencionales ASTRO se deben seleccionar en el campo Sistema ASTRO y el Tipo de sistema **MDC** o **QCII** se debe seleccionar en Tipo de señalización No ASTRO y, luego, seleccionar Sistema No ASTRO.

**IMPORTANTE:**

Las comunicaciones ASTRO tienen prioridad por sobre la recepción de comunicaciones de Tipo de señalización Sin ASTRO.

ASTRO

Solo se reciben señales digitales ASTRO.

Se debe seleccionar ASTRO - Sistemas convencionales en el campo [Sistema ASTRO en la página 460](#).

10.34.2.3

Tipo de desilenciar/silenciar

En este campo se selecciona la regla que determina cuando un radio abre y cierra su altavoz para recibir audio para la Personalidad convencional actual.

La regla Desilenciar/silenciar se aplica solo cuando PL es el [Tipo de silenciador de Rx/TA en la página 446](#) seleccionado para el canal convencional actual.

**NOTA:**

Al desilenciar se abre el altavoz del radio para audio de recepción. Al silenciar se cierra el altavoz del radio para audio de recepción.

Se admiten las siguientes selecciones:

Estándar

Para desilenciar en la detección de código de Línea privada (PL) adecuado y para silenciar en la pérdida de código PL adecuado.

Desilenciar, Silenciar estándar

Para desilenciar en la detección de código de PL adecuado y detección del silenciador de la portadora y para silenciar en la pérdida de código de PL adecuado.

Desilenciar, Silenciar

Para desilenciar en la detección de código PL adecuado y detección del silenciador de la portadora y para silenciar en la pérdida de código PL adecuado o pérdida de detección de silenciador de la portadora.

**NOTA:**

Adecuado se refiere a la existencia de una coincidencia de código entre el [Código PL de Tx en la página 456](#) del radio que transmite y el [Código PL Rx/TA en la página 449](#) del radio que recibe. El [Tipo de silenciador Tx en la página 454](#) del radio que transmite y el Tipo de silenciador de Rx/TA del radio que recibe también deben coincidir; es decir, TPL de Tx para TPL de Rx, o bien DPL de Tx para DPL de Rx.

10.34.2.4

Retraso de desilenciación de Rx

En este campo se selecciona la cantidad de tiempo que el radio permanece silenciado cuando se ha detectado el silenciador de la portadora para la Personalidad convencional actual.

A veces, este retraso es necesario para permitir la llegada silenciosa de los datos de señalización. El tiempo está expresado en milisegundos.

Mesa 205: Rango

Mínimo	Máximo
0 ms	2150 ms

10.34.2.5

Silenciador (afinar tono)

En este campo se selecciona el valor que se combina con el valor del silenciador maestro que determina el umbral de silenciador de la portadora general para la Personalidad convencional actual.

Mientras más alto este número, más ajustado el umbral del silenciador. Un umbral más ajustado hace que se necesite una señal de portadora más fuerte para que el altavoz del radio se desilencie. Esto ayuda a reducir la interferencia.

Solo se accede: Cuando el campo Silenciador por personalidad está **Activado**.

Mesa 206: Rango

Mínimo	Máximo
0	15

10.34.2.6

LED ocupado

En este campo se activa el LED amarillo para indicar la presencia de una portadora (canal ocupado) para la Personalidad convencional actual.

10.34.2.7

Desénfasis de Rx

Este campo permite anular el énfasis de recepción (Rx) para la Personalidad convencional actual.

**NOTA:**

El desénfasis revierte una señal con énfasis previo cuando la recibe el radio.

El filtro de audio de énfasis de transmisión ([Énfasis previo de transmisión en la página 435](#)) aumenta la relación señal-ruido para frecuencias más altas. En palabras simples, el “ruido” de la frecuencia más baja se reduce y la “voz” de la frecuencia más alta se incrementa.

10.34.2.8

HearClear

Este campo se selecciona para mejorar la claridad del audio mediante la aplicación de un algoritmo de compresión/expansión a las señales transmitidas y recibidas, respectivamente.

Esta función se aplica a la Personalidad convencional actual.

**IMPORTANTE:**

Con compresión-extensión, el rango dinámico del audio de la transmisión se comprime y, luego, se expande a su nivel original en el audio de recepción. Por lo tanto, compresión-extensión debe activarse para los radios de transmisión y recepción o se obtendrá como resultado audio distorsionado. Debido a que el algoritmo de compresión/expansión está activo en el audio de transmisión y recepción, la expansión del audio sin comprimir o la compresión del audio sin expandirlo posteriormente generarán como resultado una salida de sonido no natural. La ruta de audio al despachador también debe someterse a compresión-extensión.

Esta función se aplica solo para señales analógicas.

Solo se accede: Cuando el campo [Tipo de voz/señal de Rx en la página 431](#) está configurado en **No ASTRO** o **Modo mixto**, cuando el Sistema convencional al que se hace referencia que está seleccionado en el campo Sistema ASTRO no es un tipo de sistema DVRS, y cuando el campo Activación de hardware del DVRS está **Desactivado**.

Se admiten las siguientes selecciones:

Desactivado

No se aplica cancelación o compresión de audio a las señales de transmisión/recepción.

Solo compresión

La compresión se aplica a audio de transmisión y recepción (consulte Nota importante).

Solo cancelación de ruido

La cancelación de ruido se aplica al audio de recepción.

Compresión-extensión y cancelación de ruido

Compresión-extensión se aplica a ambas señales, de transmisión y recepción (consulte el Aviso importante) y la cancelación de ruido se aplica al audio de recepción.

**NOTA:**

La configuración de **Solo cancelación de ruido** y **Compresión y cancelación de ruido** solo se puede aplicar si todas las frecuencias de la personalidad actual están en el rango de 900 MHz.

10.34.2.9

Activación de Rx simultáneos

Cuando este campo se activa junto con el campo [Activación de Rx concurrente](#) en Radio en general, puede controlar la Rx simultánea según la personalidad, en lugar de la amplitud del radio.

NOTA:

Este campo está activado de forma predeterminada.

Solo se accede: Cuando el campo Activación de Rx simultánea en Radio en general está activado.

10.34.3

Opciones de Tx

Esta sección permite ver o definir la funcionalidad que solo tiene que ver con el modo de transmisión (Tx) del radio para las Personalidades convencionales individuales.

NOTA:

Cuando las funciones de personalidades convencionales se hayan definido de manera única, cada personalidad se puede asignar a la posición deseada del selector de canal del radio. Esto se hace en la página Canales de asignación de canal de zona.

Solo se accede: Cuando el campo Personalidad de solo recepción está **Desactivado**.

10.34.3.1

Tipo de voz/señal de Tx

En este campo se selecciona el modo Señalización de transmisión de voz (Tx) que se aplica cuando el campo Tipo de voz/señal de Rx para la personalidad convencional actual está configurada en **modo Mixto**.

IMPORTANTE:

Cuando el campo [Tipo de voz/señal de Rx en la página 431](#) se configura en **Sin ASTRO** o en modo **ASTRO**, esta selección debe seguir exactamente la selección Tipo de voz/señal de Rx para la Personalidad convencional para que RadioCentral la considere válida.

Este campo permanece accesible incluso cuando el campo [Personalidad de solo recepción en la página 430](#) de esta personalidad está **Activado**, ya que esta personalidad seguirá siendo capaz de iniciar el Modo emergencia cuando el [Tipo de inversión de emergencia en la página 463](#) está establecido en **Revertir canal**, las asignaciones de [Zona de inversión de emergencia en la página 464](#) y [Canal revertidor de emergencia en la página 464](#) se definen para esta personalidad.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

ASTRO

Solo se transmiten señales digitales de Sistema de ASTRO.

No ASTRO

Se transmiten señales analógicas.

NOTA:

Según la versión RadioCentral en uso o la capacidad del radio, es posible que la operación del modo Teléfono no esté disponible en el modo **ASTRO**.

10.34.3.2

Temporizador de tiempo de espera

En este campo se selecciona la cantidad de tiempo que espera el radio para transmitir.

Cuando este cronómetro expira, el radio deja de transmitir automáticamente y se emite un tono de alerta constante mientras se mantiene oprimido el botón PTT. Para continuar la transmisión, el botón PTT debe soltarse y el radio vuelve a transmitir. Esta función se aplica a la Personalidad convencional actual. El tiempo está expresado en segundos.

Solo se accede: Cuando el campo [Personalidad de solo recepción en la página 430](#) está configurado en **Desactivado** y (si el campo [Tipo de voz/señal de Rx en la página 431](#) está configurado en **ASTRO**, entonces el campo Sistema de interfaz de sitio remoto en el Sistema convencional al que se hace referencia debe estar **Desactivado**).

**NOTA:**

Cuando se establece en **Infinito**, no se utiliza ningún temporizador para radios que no sean APX4000XH; por lo tanto, hay un tiempo de conversación infinito. Esta selección no es válida para radios APX4000XH.

Mesa 207: Rango (para radios que no son APX4000XH)

Mínimo	Máximo	Incrementos
15 s	465 s	15 s

Mesa 208: Rango (para radios APX4000XH)

Mínimo	Máximo	Incrementos
15 s	60 s	15 s

10.34.3.3

Énfasis previo de transmisión

Este campo permite el filtro de audio de énfasis previo de transmisión (Tx) para la Personalidad convencional actual.

**NOTA:**

El énfasis previo aumenta la relación de señal a ruido para las frecuencias más altas, es decir, se reduce el ruido de las frecuencias más bajas y se incrementa la voz de las frecuencias más altas.

**NOTA:**

[Desénfasis de Rx en la página 433](#) revierte una señal con énfasis previo cuando la recibe el radio.

**ADVERTENCIA:**

Cuando esta función está activada, se vuelve no válida cuando el campo Audio plano analógico también está **Activado**. Por lo tanto, no es posible activar ambas funciones en la misma personalidad.

Solo se accede: Cuando el campo [Personalidad de solo recepción en la página 430](#) está **Desactivado**.

10.34.3.4

Ráfaga invertida/código de apagado

En este campo se activa la transmisión de Ráfaga invertida de Línea privada de tono (TPL) o el Código de apagado de Línea privada digital (DPL) cuando el radio deja de transmitir.

Esto se basa en el [Tipo de silenciador Tx en la página 454](#) (TPL o DPL) seleccionado para la Personalidad convencional actual.

**NOTA:**

Ambas funciones transmiten un tono subaudible que hace que el radio receptor silencie su altavoz antes de que se detecte una pérdida de portador. Al silenciar el altavoz se elimina el ruido indeseado (cola del silenciador) durante la pérdida de detección del operador.

Solo se accede: Cuando el campo [Personalidad de solo recepción en la página 430](#) está **Desactivado**.

10.34.3.5

Nivel de potencia de transmisión

En este campo se selecciona el nivel de potencia de la radio para transmitir mientras funciona en la Personalidad convencional actual.

**NOTA:**

La pulsación del botón Baja potencia de Tx, el switch de alternación Baja potencia de Tx y la selección de menú Potencia son más importantes que este ajuste cuando el usuario realiza la selección.

Durante el Modo emergencia el radio transmite automáticamente a alta potencia.

Solo se accede: Cuando el campo [Personalidad de solo recepción en la página 430](#) está **Desactivado**.

Se admiten las siguientes selecciones:

Bajo

Se usa para comunicaciones cercanas y para evitar que el radio transmita en otros grupos geográficos que funcionan en la misma frecuencia.

Alto

Se usa cuando se necesita una señal más fuerte para extender las distancias de las transmisiones.

10.34.3.6

Alimentación adaptativa

En este campo se activa el radio para usar un nivel de funcionamiento de potencia media si el informe de intensidad de la señal de la estación del despachador indica una señal recibida potente.

El radio siempre transmite inicialmente con potencia completa. Cuando deja de transmitir, el radio busca un mensaje de datos de la estación. Si la estación informa que la última recepción fue fuerte, el radio cambia automáticamente a una configuración de potencia media. Esta función se aplica cuando se opera en modo Señalización ASTRO y cuando está en la Personalidad convencional actual.

**NOTA:**

La alimentación adaptativa solo está disponible en canales de Tx de ASTRO.

Solo se accede: (Cuando el radio admite modelos y opciones diferentes, y cuando el campo [Nivel de potencia de transmisión en la página 436](#) está establecido en **Alto**), (cuando el campo [Tipo de voz/señal de Rx en la página 431](#) está establecido en **Modo mixto**) o (cuando el campo Tipo de voz/señal de Rx es **ASTRO** y cuando el campo Sistema de interfaz de sitio remoto del Sistema convencional al que se hace referencia está **Desactivado**).

10.34.4

Opciones de frecuencia

Esta sección permite ver o definir muchas configuraciones de transmisión, recepción y Directo/ comunicación directa convencionales en perfiles únicos para la Personalidad convencional actual.

**IMPORTANTE:**

Si [Activación de rastreo de voto combinado en la página 479](#) está **Activado** para la personalidad actual, entonces todos los registros/filas de Opciones de frecuencia asociados con la personalidad actual se usan para formar la lista Rastreo de votación. El número máximo de opciones de frecuencia se limita a 15.

**NOTA:**

Cuando las funciones de personalidades convencionales se hayan definido de manera única, cada personalidad se puede asignar a la posición deseada del selector de canal del radio. Esto se logra en la sección [Canales en la página 678](#) de [Asignación de canal de zonas en la página 676](#).

Si la personalidad se crea mediante la función Clonación de zona, la Lista de opciones de frecuencia solo puede contener un registro.

10.34.4.1

Frecuencia de interferencia LTE presente

La activación de este campo hace que la RadioCentral sepa que esta tabla de Opciones de frecuencia contiene una o más frecuencias de 700 MHz en esta personalidad o este canal que no tiene Banda ancha LTE activada.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Debido a que LTE también funciona en la banda de 700 MHz, es posible que haya una interferencia de frecuencia perjudicial para las comunicaciones de radio. Esta función se aplica para todos los perfiles de Opciones de frecuencia (registro/filas) de la Personalidad convencional actual.

Cuando esta personalidad/canal tiene banda ancha LTE activa, esta función debe estar establecida en **Desactivado**; de lo contrario, se invalida.

**NOTA:**

Un canal convencional tiene LTE activada cuando el Sistema convencional ASTRO al que se hace referencia de la personalidad tiene un perfil de datos al que se hace referencia que posee una selección de Tipo del perfil de datos igual a **Convencional y banda ancha** o **Solo banda ancha** y cuando la fuente de banda ancha del perfil de datos es **Módem de LTE interno**.

**NOTA:**

Es posible seleccionar los perfiles de Opción de frecuencia desde la página [Canales de asignación de canal de zona](#); primero, la personalidad se selecciona en el campo Personalidad y el perfil Opciones de frecuencia se selecciona en el campo Opciones de frecuencia.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.34.4.2

Nombre de opciones de frecuencia

Este campo permite modificar el nombre predeterminado asignado por RadioCentral para las Opciones de frecuencia.

NOTA:

Ejemplos: Frequencies004, Power03, #510

Se pueden usar caracteres, números, espacios y caracteres especiales.

Se admiten hasta 14 caracteres.

10.34.4.3

Frecuencia de Rx/TA

En este campo se selecciona la frecuencia designada para recibir la señal del operador de una comunicación de radio y, opcionalmente, para transmitir la señal del operador mientras Directo/ comunicación directa está activado en el canal.

Esta selección se aplica solo para el perfil de Opciones de frecuencia actual (registro/fila) de la Personalidad convencional actual.

ADVERTENCIA:

Tamaño de 6,25 kHz para la banda de frecuencia de 800 MHz:

A partir de la versión R09.01.00, cuando la [Desviación de Tx/espaciamiento de canal en la página 442](#) es **2,5 kHz/12,5 kHz**, RadioCentral, permite un tamaño de 6,25 kHz para frecuencias convencionales en la banda de frecuencia de 800 MHz para cumplir con la normativa legal en ciertos países (sin FCC); sin embargo, tenga en cuenta que dos radios que operan en canales adyacentes separados solo por 6,25 kHz pueden experimentar un fenómeno de conversación cruzada no deseado.

NOTA:

Es posible seleccionar los perfiles de Opciones de frecuencia para usarlos en la página Canales en Asignación de canal de zona; primero, la personalidad se selecciona en el campo [Personalidad en la página 679](#) y, luego, el perfil Opciones de frecuencia se selecciona en el campo [Opción de frecuencia convencional en la página 681](#).

IMPORTANTE:

(Aplicable a la señalización ASTRO)

Cuando [Directo/Comunicación directa en la página 440](#) está **Activado** para este perfil de Opciones de frecuencia y el campo [Permitir frecuencia directa en la página 402](#) está **Activado**, el ID de red directa se puede modificar para cada perfil de Opciones de frecuencia. Cuando el usuario inicia el modo Directo/comunicación directa, el radio entonces transmite y recibe en la Frecuencia directa en vez de la Frecuencia de Rx/TA.

Cuando Directo/comunicación directa está **Activado** para este perfil de Opciones de frecuencia y el campo Frecuencia directa está **Desactivado**, se utilizan las configuraciones de Frecuencia de Rx/TA y [ID de Red de Rx en la página 443](#) cuando el usuario inicia el modo Directo/comunicación directa.

La funcionalidad Directo/comunicación directa debe estar **Activada** en un perfil Opciones de frecuencia a fin de estar disponible para un canal de radio. Puede seleccionar el modo Directo/comunicación directa presionando el botón [Comunicación directa/Directo en la página 194](#), seleccionando el switch [Comunicación directa/Directo en la página 207](#) o el menú [Directo/Comunicación directa en la página 218](#).

IMPORTANTE:

aplicable a la señalización Sin ASTRO (MDC, DTMF, Quik-Call II y Un tono)

Cuando Directo/Comunicación directa está **Activado** para este perfil de Opciones de frecuencia y el campo Frecuencia directa está **Activado**, los parámetros de Directo/Comunicación directa se pueden modificar para cada perfil de Opciones de frecuencia. Cuando el usuario inicia el Modo directo/comunicación directa, el radio transmite y recibe en Frecuencia directa con estos parámetros de frecuencia.

Cuando Directo/comunicación directa está **Activado** para este perfil de Opciones de frecuencia y el campo Activación de frecuencia directa está **Desactivado**, la configuración de los campos de parámetros de Rx se utiliza siempre que el usuario inicie el modo Directo/comunicación directa.

La funcionalidad Directo/comunicación directa debe estar **Activada** en un perfil Opciones de frecuencia a fin de estar disponible para un canal de radio. Puede seleccionar el modo Directo/Comunicación directa mediante la pulsación del botón, la selección del switch Directo/Comunicación directa, o del menú Directo/Comunicación directa.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.34.4.4

Frecuencia de Tx

En este campo se selecciona la frecuencia designada que se usa para transmitir la señal del portador de una comunicación por radio.

Esta selección se aplica solo al perfil de [Opciones de frecuencia en la página 437](#) (registro/fila) actual de la [Personalidad convencional en la página 429](#) actual.

**ADVERTENCIA:**

Cuando el campo [Activación de rastreo de voto combinado en la página 479](#) está **Activado** y el campo [Dirección de Tx para rastreo de voto combinado en la página 479](#) está **Desactivado**, este campo debe coincidir con todas las Opciones de frecuencia de la personalidad actual; de lo contrario, la aplicación considera que el valor de este campo no es válido.

Tamaño de 6,25 kHz para la banda de frecuencia de 800 MHz:

A partir de la versión R09.01.00, cuando la [Desviación de Tx/espaciamento de canal en la página 442](#) es **2,5 kHz / 12,5 kHz**, la aplicación permite un tamaño de 6,25 kHz para frecuencias Convencionales en la banda de frecuencia de 800 MHz para cumplir con la normativa legal en ciertos países (fuera de la FCC); sin embargo, tenga en cuenta que dos radios que operan en canales adyacentes separados solo por 6,25 kHz pueden experimentar un fenómeno de conversación cruzada no deseado.

**NOTA:**

Es posible seleccionar los perfiles de Opciones de frecuencia para usarlos en la página Canales en asignación de canal de zona; primero, la personalidad se selecciona en el campo [Personalidad en la página 679](#) y, luego, el perfil Opciones de frecuencia se selecciona en el campo [Opción de frecuencia convencional en la página 681](#).

Solo se accede: Cuando el campo [Personalidad de solo recepción en la página 430](#) está **Desactivado** y cuando el radio admite modelos y opciones diferentes.

10.34.4.5

Directo/Comunicación directa

Este campo habilita la funcionalidad Directo/comunicación directa para el perfil Opciones de frecuencia actual.

Por lo general, el usuario inicia la funcionalidad Directo/comunicación directa para las comunicaciones de radio a radio en directo dentro de la cercanías o cuando no hay un repetidor operando o si está

fuera de rango. Esta función se aplica solo al perfil Opciones de frecuencia actual (registro/fila) de la Personalidad convencional actual.

**NOTA:**

Es posible seleccionar los perfiles de Opciones de frecuencia para usarlos en la página Canales en asignación de canal de zona; primero, la personalidad se selecciona en el campo [Personalidad en la página 679](#) y, luego, el perfil Opciones de frecuencia se selecciona en el campo [Opción de frecuencia convencional en la página 681](#).

**IMPORTANTE:**

(Aplicable a la señalización ASTRO)

Cuando la funcionalidad Directo/comunicación directa está **Activada** para este perfil Opciones de frecuencia y el campo [Permitir frecuencia directa en la página 402](#) está **Activado**, el ID de red directa se puede modificar según cada perfil de Opciones de frecuencia. Cuando el usuario inicia el modo Directo/comunicación directa, el radio entonces transmite y recibe en Frecuencia directa en vez de [Frecuencia de Rx/TA en la página 438](#).

Cuando Directo/comunicación directa está **Activado** para este perfil de Opciones de frecuencia y el campo Frecuencia directa está **Desactivado**, se utilizan las configuraciones de Frecuencia de Rx/TA y [ID de Red de Rx en la página 443](#) cuando el usuario inicia el modo Directo/comunicación directa.

La funcionalidad Directo/comunicación directa debe estar **Activada** en un perfil Opciones de frecuencia a fin de estar disponible para un canal de radio. Puede seleccionar el modo Directo/comunicación directa presionando el botón [Comunicación directa/Directo en la página 194](#), seleccionando el switch [Comunicación directa/Directo en la página 207](#) o el menú [Directo/Comunicación directa en la página 218](#).

**IMPORTANTE:**

aplicable a la señalización Sin ASTRO (MDC, DTMF, Quik-Call II y Un tono)

Cuando Directo/Comunicación directa está **Activado** para este perfil de Opciones de frecuencia y el campo Permitir frecuencia directa está **Activado**, los parámetros de Directo/Comunicación directa se pueden modificar para cada perfil de Opciones de frecuencia. Cuando el usuario inicia el Modo directo/comunicación directa, el radio transmite y recibe en Frecuencia directa con estos parámetros de frecuencia.

Cuando Directo/comunicación directa está **Activado** para este perfil de Opciones de frecuencia y el campo Activación de frecuencia directa está **Desactivado**, la configuración de los campos de parámetros de Rx se utiliza siempre que el usuario inicie el modo Directo/comunicación directa.

La funcionalidad Directo/comunicación directa debe estar **Activada** en un perfil Opciones de frecuencia a fin de estar disponible para un canal de radio. Puede seleccionar el modo Directo/Comunicación directa mediante la pulsación del botón, la selección del switch Directo/Comunicación directa, o del menú Directo/Comunicación directa.

Solo se accede: Cuando el campo [Personalidad de solo recepción en la página 430](#) está **Desactivado** y (si el campo [Tipo de voz/señal de Rx en la página 431](#) está establecido en **ASTRO**, el campo Sistema de interfaz de sitio remoto del Sistema convencional al que se hace referencia debe estar **Desactivado**), (cuando el campo [Tipo de voz/señal de Tx en la página 434](#) está establecido en **No ASTRO**, cuando el campo [Frecuencia de Rx/TA en la página 438](#) no es igual al campo [Frecuencia de Tx en la página 440](#), cuando el índice de [Tipo de silenciador de Rx/TA en la página 446](#) no es igual al índice de [Tipo de silenciador Tx en la página 454](#), cuando el Tipo de silenciador de Rx/TA no es **CSQ**, (cuando el Tipo de silenciador de Rx/TA no es PL o el índice de [Frecuencia de PL de Rx/TA en la página 447](#) no es igual al índice de [Frecuencia de PL de Tx en la página 454](#)), (cuando el Tipo de silenciador de Rx/TA no es **DPL** o el índice de [Código PL Rx/TA en la página 449](#) no es igual al índice de [Código DPL de Tx en la página 457](#) o el valor de [Inversión de DPL de Rx/TA en la página 453](#) no es igual al valor de [Inversión DPL de Tx en la página 459](#)) o (cuando el [Tipo de voz/señal de Tx en la página 434](#) no es **No ASTRO** y (Frecuencia de Rx/TA no es igual a Frecuencia de Tx o [ID de Red de Rx en la página 443](#) no es igual a [ID de red de Tx en la página 444](#)).

10.34.4.6

Desviación de Tx/espaciamento de canal

En este campo se selecciona la desviación de transmisión (Tx) y el espaciamento de canal correspondiente para el perfil Opciones de frecuencia actual (registro/fila) de la Personalidad convencional actual.

La desviación de Tx es la variación máxima (en kHz) que la frecuencia del operador seleccionada puede diferir u oscilar a partir de su frecuencia central no modulada. El espaciamento de canal se refiere a la diferencia de frecuencia asignada entre canales adyacentes dentro de una banda de frecuencia específica.

**NOTA:**

El radio también usa los valores de Desviación de Tx/Espaciamento de canal seleccionados cuando esta personalidad está funcionando en el modo [Directo/Comunicación directa en la página 440](#).

**ADVERTENCIA:**

Cuando el campo [Activación de rastreo de voto combinado en la página 479](#) está **Activado** y el campo [Dirección de Tx para rastreo de voto combinado en la página 479](#) está **Desactivado**, este campo debe coincidir con todas las Opciones de frecuencia en la personalidad actual; de lo contrario, RadioCentral considera que el valor de este campo no es válido.

**NOTA:**

Es posible seleccionar los perfiles de Opciones de frecuencia para usarlos en la página Canales en asignación de canal de zona; primero, la personalidad se selecciona en el campo [Personalidad en la página 679](#) y, luego, el perfil Opciones de frecuencia se selecciona en el campo [Opción de frecuencia convencional en la página 681](#).

Solo se accede: Cuando el campo [Personalidad de solo recepción en la página 430](#) está **Desactivado**.

Se admiten las siguientes selecciones:

4 kHz / 20 kHz

Banda 821 MHz que usa espaciamento de canal de 20 kHz.

**ADVERTENCIA:**

Esta selección no es válida si se cumple la siguiente condición cuando al mandato de banda estrecha FCC de 12,5 kHz se aplica a este codeplug y cuando el valor de la [Frecuencia de Tx en la página 440](#) o ([Frecuencia directa](#) o [Frecuencia de Rx/TA en la página 438](#) cuando está activado el funcionamiento en Directo/Comunicación directa) entra en alguno de estos rangos de requerimientos de la FCC.

5 kHz / 25 kHz

VHF, UHF y las bandas de 800 MHz que utilizan espaciamento de canal de 30/25/25 kHz.

**ADVERTENCIA:**

Esta selección no es válida si se cumple la siguiente condición cuando al mandato de banda estrecha FCC de 12,5 kHz se aplica a este codeplug y cuando el valor de la Frecuencia de Tx o (Frecuencia directa o Frecuencia de TA cuando está activado el funcionamiento en Directo/Comunicación directa) entra en alguno de estos rangos de requerimientos de la FCC.

2.5 kHz / 12.5 kHz

VHF, UHF, las bandas de 800 MHz y 900 MHz y el espaciamiento de canal de 12,5 kHz.

ADVERTENCIA:

Cuando la Frecuencia de Tx se encuentra dentro de la Banda de 900 MHz, esta es la única selección válida y este campo se convierte en solo ver.

Esta selección no es válida si alguno de los siguientes escenarios es verdadero:

(Cuando el campo [Tipo de voz/señal de Rx en la página 431](#) es **Modo No ASTRO**, el campo [Operación segura en la página 301](#) está configurado en **Hardware** y cuando el campo [Voz Protegida/Enlace Abierto en la página 487](#) no está configurado en **Borrar**) o (cuando el campo [Tipo de voz/señal de Rx en la página 431](#) es **Modo mixto** o **Modo ASTRO**, y cuando el campo [ASTRO Tipo de modulador digital de ASTRO en la página 460](#) es **Amplio**).

10.34.4.7

ID de Red de Rx

En este campo se selecciona (en formato decimal o hexadecimal) un ID de Código de acceso de red (NAC) de recepción (Rx) para usar mientras funciona en modo Sistema de ASTRO (digital).

Esto permite que el radio acceda de manera selectiva a uno de varios repetidores dentro de las áreas de cobertura de superposición, lo que permite que el radio escuche un repetidor específico. Finalmente, este ID permite la separación de los modos de llamado entre los usuarios de canales y adyacentes; esto cumple el mismo propósito que una Línea privada (PL), que se usa en modo análogo. Esta selección se aplica solo para el perfil de Opciones de frecuencia actual (registro/fila) de la Personalidad convencional actual.

ADVERTENCIA:

Cuando el campo [Activación de rastreo de voto combinado en la página 479](#) está **Activado** y el campo [Dirección de Tx para rastreo de voto combinado en la página 479](#) está **Desactivado**, este campo debe coincidir con todas las Opciones de frecuencia de la personalidad actual; de lo contrario, la aplicación considera que el valor de este campo no es válido.

NOTA:

Es posible seleccionar los perfiles de Opciones de frecuencia para usarlos en la página [Canales en asignación de canal de zona](#); primero, la personalidad se selecciona en el campo [Personalidad en la página 679](#) y, luego, el perfil Opciones de frecuencia se selecciona en el campo [Opción de frecuencia convencional en la página 681](#).

IMPORTANTE:

Cuando [Directo/Comunicación directa en la página 440](#) está **Activado** para este perfil de Opciones de frecuencia y el campo [Permitir frecuencia directa en la página 402](#) está **Activado**, el ID de red directa se puede modificar para cada perfil de Opciones de frecuencia. Cuando el usuario inicia el modo Directo/comunicación directa, el radio entonces transmite y recibe en Frecuencia directa (MHz) en vez de [Frecuencia de Rx/TA en la página 438](#).

Cuando [Directo/comunicación directa](#) está **Activado** para este perfil de Opciones de frecuencia y el campo [Frecuencia directa](#) está **Desactivado**, la Frecuencia de Rx/TA y la configuración de este ID de red Rx/TA se utilizarán cada vez que el usuario del radio inicia el modo [Directo/comunicación directa](#).

La funcionalidad [Directo/comunicación directa](#) debe estar **Activada** en un perfil Opciones de frecuencia a fin de estar disponible para un canal de radio. Puede seleccionar el modo [Directo/comunicación directa](#) presionando el botón [Comunicación directa/Directo en la página 194](#), seleccionando el switch [Comunicación directa/Directo en la página 207](#) o el menú [Directo/Comunicación directa en la página 218](#).

Solo se accede: Cuando el campo [Tipo de voz/señal de Rx en la página 431](#) está establecido en **Modo ASTRO** o **Modo mixto** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Mesa 209: Rango

Mínimo	Máximo	Monitor NAC
0 Hex	FFF Hex	F7E Hex

IMPORTANTE:

Cuando este ID de NAC de Rx está establecido en **F7E**, el radio desactiva el silencio de cualquier llamada ASTRO sin importar el ID de NAC de la llamada o la [Regla de desilenciación de Rx de ASTRO en la página 461](#) establecida para el perfil de Opciones de frecuencia actual.

10.34.4.8

ID de red de Tx

En este campo se selecciona (en formato decimal o hexadecimal) un número de ID del código de acceso de red (NAC) de transmisión (Tx) para usar mientras funciona en modo de sistema de ASTRO (digital).

Esto permite que el radio acceda de manera selectiva a uno de varios repetidores dentro de las áreas de cobertura de superposición, lo que permite que el radio haga que un repetidor específico retransmita la señal. Finalmente, este ID permite la separación de los modos de llamado entre los usuarios de cocanales y adyacentes; esto cumple el mismo propósito que una Línea privada (PL), que se usa en modo análogo. Esta selección se aplica solo para el perfil de Opciones de frecuencia actual (registro/fila) de la Personalidad convencional actual.

ADVERTENCIA:

Cuando el campo [Activación de rastreo de voto combinado en la página 479](#) está **Activado** y el campo [Dirección de Tx para rastreo de voto combinado en la página 479](#) está **Desactivado**, este campo debe coincidir con todas las Opciones de frecuencia en la personalidad actual; de lo contrario, RadioCentral considera que el valor de este campo no es válido.

NOTA:

Es posible seleccionar los perfiles de Opciones de frecuencia para usarlos en la página Canales en asignación de canal de zona; primero, la personalidad se selecciona en el campo [Personalidad en la página 679](#) y, luego, el perfil Opciones de frecuencia se selecciona en el campo [Opción de frecuencia convencional en la página 681](#).

Solo se accede: Cuando el campo [Tipo de voz/señal de Rx en la página 431](#) es **ASTRO** o **Modo mixto** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Mesa 210: Rango

Mínimo	Máximo
0 Hex	FFF Hex

ADVERTENCIA:

F7E es una selección no válida; para más información consulte el campo [ID de Red de Rx en la página 443](#).

10.34.4.9

ID de grupo de conversación ASTRO

En este campo se selecciona un grupo de conversación predeterminado desde la Lista de grupo de conversación ASTRO seleccionada en el campo Lista de grupo de conversación en esta personalidad.

Esta selección siempre se aplica cuando el campo [Tipo de selección en la página 475](#) del Grupo de conversación está configurado en **Acoplado**. Sin embargo, cuando el campo Tipo de selección se configura en **Seleccionable**, este grupo de conversación se aplica hasta que el usuario elige otro ID de la Lista de grupo de conversación seleccionada. Esta selección se aplica solo al perfil Opciones de frecuencia actual (registro/fila) de la Personalidad convencional actual.

**NOTA:**

Los perfiles Opción de frecuencia pueden seleccionarse para su uso en la sección [Canales en la página 678](#) de la página [Asignación de canal de zonas en la página 676](#); primero, la personalidad se selecciona en el campo [Personalidad en la página 679](#), y luego el perfil Opciones de frecuencia se selecciona en el campo Opciones de frecuencia.

Solo se accede: cuando el campo [Tipo de voz/señal de Rx en la página 431](#) está configurado en **ASTRO** o **modo Mixto**; y cuando el campo Grupo de conversación está activado, y cuando la función Clonación de zona no crea la personalidad de forma automática.

Se admiten las siguientes selecciones:

Selección de grupos de conversación

Los Grupos de Conversación que aparecen en la selección se basan en la Lista de grupo de conversación de ASTRO seleccionada en el campo Lista de grupo de conversación de esta personalidad.

DYN (Reagrupación dinámica)**ADVERTENCIA:**

Una configuración de Reagrupación dinámica solo es válida cuando el campo Activación de reagrupación dinámica está activado.

**NOTA:**

Solo un canal de reagrupación dinámica puede definirse según el Sistema de troncalización al que se hace referencia.

El usuario puede solicitar una nueva asignación de Reagrupación dinámica al despachador con una pulsación del botón Solicitud de reprogramación o una selección del menú de Solicitud de reprogramación. El despachador transmite de vuelta la configuración y las funciones disponibles del grupo de conversación de reagrupación dinámica.

Para que el grupo de conversación de Reagrupación dinámica pueda transmitir en el modo Seguro, se requiere la pulsación del botón Selección de Tx segura o el switch de alternación Selección de Tx segura o la selección del menú Seguro; en caso contrario, las transmisiones del grupo de conversación de Reagrupación dinámica se conectan a una transmisión en el modo "Borrar".

ATG (grupo de anuncios)

Actualmente no es compatible

10.34.4.10

Tipo de silenciador de Rx/TA

En este campo se selecciona el tipo de Línea privada (PL) o silenciador de la portadora de recepción necesario para comunicarse con otro radio.

**IMPORTANTE:**

La [Tipo de desilenciar/silenciar en la página 431](#) seleccionada para la personalidad también determina si se puede o no recibir una llamada. Esta selección se aplica solo al perfil Opciones de frecuencia actual (registro/fila) de la Personalidad convencional actual.

**ADVERTENCIA:**

Cuando el campo [Activación de rastreo de voto combinado en la página 479](#) está **Activado** y el campo [Dirección de Tx para rastreo de voto combinado en la página 479](#) está **Desactivado**, este campo debe coincidir con todas las Opciones de frecuencia en la personalidad actual; de lo contrario, RadioCentral considera que el valor de este campo no es válido.

**NOTA:**

Es posible seleccionar los perfiles de Opciones de frecuencia para usarlos en la página Canales en asignación de canal de zona; primero, la personalidad se selecciona en el campo [Personalidad en la página 679](#) y, luego, el perfil Opciones de frecuencia se selecciona en el campo [Opción de frecuencia convencional en la página 681](#).

**IMPORTANTE:**

Cuando [Directo/Comunicación directa en la página 440](#) está **Activado** para este perfil de Opciones de frecuencia y el campo [Permitir frecuencia directa en la página 402](#) está **Activado**, los parámetros de Directo/Comunicación directa se pueden modificar para cada perfil de Opciones de frecuencia. Cuando el usuario inicia el Modo directo/comunicación directa, el radio transmite y recibe en Frecuencia directa con estos parámetros de frecuencia.

Cuando Directo/comunicación directa está **Activado** para este perfil de Opciones de frecuencia y el campo Activación de frecuencia directa está **Desactivado**, la configuración de los campos de parámetros de Rx se utiliza siempre que el usuario inicie el modo Directo/comunicación directa.

La funcionalidad Directo/comunicación directa debe estar **Activada** en un perfil Opciones de frecuencia a fin de estar disponible para un canal de radio. Puede seleccionar el modo Directo/comunicación directa presionando el botón [Comunicación directa/Directo en la página 194](#), seleccionando el switch [Comunicación directa/Directo en la página 207](#) o el menú [Directo/Comunicación directa en la página 218](#).

Solo se accede: cuando el campo [Tipo de voz/señal de Rx en la página 431](#) está en **Sin ASTRO** o **modo Mixto**, y cuando el campo PL seleccionable por el usuario [MPL] está **Desactivado** o **Tx**.

Se admiten las siguientes selecciones:

- CSQ (Silenciador de la portadora)
- PL (Tono de línea privada)
- DPL (Línea privada digital)

10.34.4.11

Frecuencia de PL de Rx/TA

En este campo se selecciona una frecuencia designada que se usa cuando se recibe una comunicación de Línea privada (PL) de otro radio.

**NOTA:**

Esta frecuencia se correlaciona directamente con el [Código PL Rx/TA en la página 449](#); al seleccionar un valor para este campo se selecciona automáticamente un código de PL de Rx y viceversa. Esta selección se aplica solo al perfil Opciones de frecuencia actual (registro/fila) de la Personalidad convencional actual.

**ADVERTENCIA:**

Cuando el campo [Activación de rastreo de voto combinado en la página 479](#) está **Activado** y el campo [Dirección de Tx para rastreo de voto combinado en la página 479](#) está **Desactivado**, este campo debe coincidir con todas las Opciones de frecuencia en la personalidad actual; de lo contrario, RadioCentral considera que el valor de este campo no es válido.

**NOTA:**

Es posible seleccionar los perfiles de Opciones de frecuencia para usarlos en la página Canales en asignación de canal de zona; primero, la personalidad se selecciona en el campo [Personalidad en la página 679](#) y, luego, el perfil Opciones de frecuencia se selecciona en el campo [Opción de frecuencia convencional en la página 681](#).

**IMPORTANTE:**

Cuando [Directo/Comunicación directa en la página 440](#) está **Activado** para este perfil de Opciones de frecuencia y el campo [Permitir frecuencia directa en la página 402](#) está **Activado**, los parámetros de Directo/Comunicación directa se pueden modificar para cada perfil de Opciones de frecuencia. Cuando el usuario inicia el modo Directo/comunicación directa, el radio transmite y recibe en Frecuencia directa (MHz) con estos parámetros de frecuencia.

Cuando Directo/comunicación directa está en **Activado** para este perfil de Opciones de frecuencia y el campo Activación de frecuencia directa está **Desactivado**, la configuración de los campos de parámetros de Rx se utiliza siempre que el usuario inicie el modo Directo/comunicación directa.

La funcionalidad Directo/comunicación directa debe estar **Activada** en un perfil Opciones de frecuencia a fin de estar disponible para un canal de radio. Puede seleccionar el modo Directo/comunicación directa presionando el botón [Comunicación directa/Directo en la página 194](#), seleccionando el switch [Comunicación directa/Directo en la página 207](#) o el menú [Directo/Comunicación directa en la página 218](#).

Solo se accede: cuando el campo [Tipo de silenciador de Rx/TA en la página 446](#) es **PL**, y cuando el campo PL seleccionable por el usuario [MPL] está **Desactivado** o es **Tx**.

Se admiten las siguientes selecciones:

Mesa 211: Códigos y frecuencias del silenciador TPL

Frecuencia (Hz) = Código		Frecuencia (Hz) = Código	
67	XZ	159.8	159.8
69.3	WZ	162.2	5B

159.5	159.5		

10.34.4.12

Código PL Rx/TA

Este campo selecciona el código específico aceptado cuando se recibe una comunicación de Línea privada (PL) desde otro radio.

**NOTA:**

Este código se correlaciona directamente con la [Frecuencia de PL de Rx/TA en la página 447](#); al seleccionar un valor para este campo se selecciona automáticamente una frecuencia de PL Rx/TA y viceversa. Esta selección se aplica solo al perfil Opciones de frecuencia actual (registro/fila) de la Personalidad convencional actual.

**ADVERTENCIA:**

Cuando el campo [Activación de rastreo de voto combinado en la página 479](#) está **Activado** y el campo [Dirección de Tx para rastreo de voto combinado en la página 479](#) está **Desactivado**, este campo debe coincidir con todas las Opciones de frecuencia en la personalidad actual; de lo contrario, RadioCentral considera que el valor de este campo no es válido.

**NOTA:**

Es posible seleccionar los perfiles de Opciones de frecuencia para usarlos en la página Canales en asignación de canal de zona; primero, la personalidad se selecciona en el campo [Personalidad en la página 679](#) y, luego, el perfil Opciones de frecuencia se selecciona en el campo [Opción de frecuencia convencional en la página 681](#).

**IMPORTANTE:**

Cuando [Directo/Comunicación directa en la página 440](#) está **Activado** para este perfil de Opciones de frecuencia y el campo [Permitir frecuencia directa en la página 402](#) está **Activado**, los parámetros de Directo/Comunicación directa se pueden modificar para cada perfil de Opciones de frecuencia. Cuando el usuario inicia el modo Directo/comunicación directa, el radio transmite y recibe en Frecuencia directa (MHz) con estos parámetros de frecuencia.

Cuando Directo/comunicación directa está **Activado** para este perfil de Opciones de frecuencia y el campo Activación de frecuencia directa está **Desactivado**, la configuración de los campos de parámetros de Rx se utiliza siempre que el usuario inicie el modo Directo/comunicación directa.

La funcionalidad Directo/comunicación directa debe estar **Activada** en un perfil Opciones de frecuencia a fin de estar disponible para un canal de radio. Puede seleccionar el modo Directo/comunicación directa presionando el botón [Comunicación directa/Directo en la página 194](#), seleccionando el switch [Comunicación directa/Directo en la página 207](#) o el menú [Directo/Comunicación directa en la página 218](#).

Solo se accede: cuando el campo [Tipo de silenciador de Rx/TA en la página 446](#) es **PL**, y cuando el campo PL seleccionable por el usuario [MPL] está **Desactivado** o es **Tx**.

Se admiten las siguientes selecciones:

Mesa 212: Códigos y frecuencias del silenciador TPL

Frecuencia (Hz) = Código		Frecuencia (Hz) = Código	
67	XZ	159.8	159.8
69.3	WZ	162.2	5B

10.34.4.13

Código DPL Rx/TA

En este campo se selecciona el código específico aceptado cuando se recibe una comunicación de Línea digital privada (DPL) desde otro radio.

Esta selección se aplica solo al perfil Opciones de frecuencia actual (registro/fila) de la Personalidad convencional actual.

**ADVERTENCIA:**

Cuando el campo [Activación de rastreo de voto combinado en la página 479](#) está **Activado** y el campo [Dirección de Tx para rastreo de voto combinado en la página 479](#) está **Desactivado**, este campo debe coincidir con todas las Opciones de frecuencia de la personalidad actual; de lo contrario, la aplicación considera que el valor de este campo no es válido.

**NOTA:**

Los perfiles Opciones de frecuencia pueden seleccionarse para usarse en la página Canales en Asignación de canal de zona; primero, la personalidad se selecciona en el campo [Personalidad en la página 679](#) [Opción de frecuencia convencional en la página 681](#).

**IMPORTANTE:**

Cuando [Directo/Comunicación directa en la página 440](#) está **Activado** para este perfil de Opciones de frecuencia y el campo [Permitir frecuencia directa en la página 402](#) está **Activado**, los parámetros de Directo/Comunicación directa se pueden modificar para cada perfil de Opciones de frecuencia. Cuando el usuario inicia el modo Directo/comunicación directa, el radio transmite y recibe en Frecuencia directa (MHz) con estos parámetros de frecuencia.

Cuando Directo/comunicación directa está **Activado** para este perfil de Opciones de frecuencia y el campo Activación de frecuencia directa está **Desactivado**, la configuración de los campos de parámetros de Rx se utiliza siempre que el usuario inicie el modo Directo/comunicación directa.

La funcionalidad Directo/comunicación directa debe estar **Activada** en un perfil Opciones de frecuencia a fin de estar disponible para un canal de radio. Puede seleccionar el modo Directo/comunicación directa presionando el botón [Comunicación directa/Directo en la página 194](#), seleccionando el switch [Comunicación directa/Directo en la página 207](#) o el menú [Directo/Comunicación directa en la página 218](#).

Solo se accede: cuando el campo [Tipo de silenciador de Rx/TA en la página 446](#) es **DPL**, y cuando el campo PL seleccionable por el usuario [MPL] esté **Desactivado** o es **Tx**.

Se admiten las siguientes selecciones:

Mesa 213: Códigos de silenciador DPL

Código	Código	Código	Código
023	152	343	565
025	155	346	606
026	156	351	612
031	162	364	624
032	165	365	627
043	172	371	631
047	174	411	632
051	205	412	645*
054	223	413	654
065	226	423	662
071	243	431	664
072	244	432	703
073	245	445	712

Código	Código	Código	Código
074	251	464	723
114	261	465	731
115	263	466	732
116	265	503	734
125	271	506	743
131	306	516	754
132	311	525*	
134	315	532	
143	331	546	

**NOTA:**

Los códigos marcados con un asterisco no son parte del estándar 83 de los códigos EIA/TIA-603.

10.34.4.14

Inversión de DPL de Rx/TA

Este campo hace que las señales de Línea privada digital (DPL) se inviertan cuando son recibidas por el radio.

**NOTA:**

Los códigos invertidos permiten un mayor uso y tráfico en las frecuencias.

**IMPORTANTE:**

La opción Inversión de DPL debe configurarse tanto en el radio que transmite como en el que recibe para que ocurra la comunicación. Esta función se aplica solo al perfil Opciones de frecuencia actual (registro/fila) de la Personalidad convencional actual.

**ADVERTENCIA:**

Cuando el campo [Activación de rastreo de voto combinado en la página 479](#) está **Activado** y el campo [Dirección de Tx para rastreo de voto combinado en la página 479](#) está **Desactivado**, este campo debe coincidir con todas las Opciones de frecuencia en la personalidad actual; de lo contrario, RadioCentral considera que el valor de este campo no es válido.

**NOTA:**

Es posible seleccionar los perfiles de Opciones de frecuencia para usarlos en la página Canales en asignación de canal de zona; primero, la personalidad se selecciona en el campo [Personalidad en la página 679](#) y, luego, el perfil Opciones de frecuencia se selecciona en el campo [Opción de frecuencia convencional en la página 681](#).

**IMPORTANTE:**

Cuando [Directo/Comunicación directa en la página 440](#) está **Activado** para este perfil de Opciones de frecuencia y el campo [Permitir frecuencia directa en la página 402](#) está **Activado**, los parámetros de Directo/Comunicación directa se pueden modificar para cada perfil de Opciones de frecuencia. Cuando el usuario inicia el Modo directo/comunicación directa, el radio transmite y recibe en Frecuencia directa con estos parámetros de frecuencia.

Cuando Directo/comunicación directa está en **Activado** para este perfil Opciones de frecuencia y el campo Frecuencia directa está **Desactivado**, la configuración de los campos de parámetros de Rx se utiliza siempre que el usuario inicie el modo Directo/comunicación directa.

La funcionalidad Directo/comunicación directa debe estar **Activada** en un perfil Opciones de frecuencia a fin de estar disponible para un canal de radio. Puede seleccionar el modo Directo/comunicación directa presionando el botón [Comunicación directa/Directo en la página 194](#), seleccionando el switch [Comunicación directa/Directo en la página 207](#) o el menú [Directo/Comunicación directa en la página 218](#).

Solo se accede: cuando el campo [Tipo de silenciador de Rx/TA en la página 446](#) es **DPL**, y cuando el campo PL seleccionable por el usuario [MPL] esté **Desactivado** o es **Tx**.

10.34.4.15

Tipo de silenciador Tx

En este campo se selecciona el tipo de Línea privada (PL) de transmisión o silenciador de la portadora necesario para comunicarse con otro radio.

**IMPORTANTE:**

La [Tipo de desilenciar/silenciar en la página 431](#) seleccionada para la personalidad también determina si se puede o no recibir una llamada. Esta selección se aplica solo al perfil Opciones de frecuencia actual (registro/fila) de la Personalidad convencional actual.

**ADVERTENCIA:**

Cuando el campo [Activación de rastreo de voto combinado en la página 479](#) está **Activado** y el campo [Dirección de Tx para rastreo de voto combinado en la página 479](#) está **Desactivado**, este campo debe coincidir con todas las Opciones de frecuencia en la personalidad actual; de lo contrario, RadioCentral considera que el valor de este campo no es válido.

**NOTA:**

Es posible seleccionar los perfiles de Opciones de frecuencia para usarlos en la página Canales en asignación de canal de zona; primero, la personalidad se selecciona en el campo [Personalidad en la página 679](#) y, luego, el perfil Opciones de frecuencia se selecciona en el campo [Opción de frecuencia convencional en la página 681](#).

Solo se accede: Cuando el campo [Tipo de voz/señal de Rx en la página 431](#) es **no ASTRO** o **Modo mixto**, y cuando el campo [Personalidad de solo recepción en la página 430](#) está **Desactivado**, y cuando el campo PL seleccionable por el usuario [MPL] está **Desactivado** o **Rx**.

Se admiten las siguientes selecciones:

- Desactivado
- PL (Tono de línea privada)
- DPL (Línea privada digital)

10.34.4.16

Frecuencia de PL de Tx

En este campo se selecciona una frecuencia designada que se usa para transmitir una comunicación de Línea privada (PL) a otro radio.

**NOTA:**

Esta frecuencia se correlaciona directamente con el [Código PL de Tx en la página 456](#); al seleccionar un valor para este campo se selecciona automáticamente un código PL de Tx y viceversa. Esta selección se aplica solo al perfil Opciones de frecuencia actual (registro/fila) de la Personalidad convencional actual.

**ADVERTENCIA:**

Cuando el campo [Activación de rastreo de voto combinado en la página 479](#) está **Activado** y el campo [Dirección de Tx para rastreo de voto combinado en la página 479](#) está **Desactivado**, este campo debe coincidir con todas las Opciones de frecuencia en la personalidad actual; de lo contrario, RadioCentral considera que el valor de este campo no es válido.

**NOTA:**

Es posible seleccionar los perfiles de Opciones de frecuencia para usarlos en la página Canales en asignación de canal de zona; primero, la personalidad se selecciona en el campo [Personalidad en la página 679](#) y, luego, el perfil Opciones de frecuencia se selecciona en el campo [Opción de frecuencia convencional en la página 681](#).

Solo se accede: Cuando el campo [Personalidad de solo recepción en la página 430](#) está **Desactivado**, cuando el campo [Tipo de silenciador Tx en la página 454](#) es **PL** y cuando el campo PL seleccionable por el usuario [MPL] está **Desactivado** o es **Rx**.

Se admiten las siguientes selecciones:

Mesa 214: Códigos y frecuencias del silenciador TPL

Frecuencia (Hz) = Código		Frecuencia (Hz) = Código	
67	XZ	159.8	159.8
69.3	WZ	162.2	5B
71.9	XA	165.1	165.1

10.34.4.17

Código PL de Tx

En este campo se selecciona el código específico que se usa para transmitir una comunicación de Línea privada (PL) a otro radio.

**NOTA:**

Este código se correlaciona directamente con la [Frecuencia de PL de Tx en la página 454](#); al seleccionar un valor para este campo se selecciona automáticamente una frecuencia de PL de Tx y viceversa. Esta selección se aplica solo al perfil Opciones de frecuencia actual (registro/fila) de la Personalidad convencional actual.

**ADVERTENCIA:**

Cuando el campo [Activación de rastreo de voto combinado en la página 479](#) está **Activado** y el campo [Dirección de Tx para rastreo de voto combinado en la página 479](#) está **Desactivado**, este campo debe coincidir con todas las Opciones de frecuencia en la personalidad actual; de lo contrario, RadioCentral considera que el valor de este campo no es válido.

**NOTA:**

Es posible seleccionar los perfiles de Opciones de frecuencia para usarlos en la página Canales en asignación de canal de zona; primero, la personalidad se selecciona en el campo [Personalidad en la página 679](#) y, luego, el perfil Opciones de frecuencia se selecciona en el campo [Opción de frecuencia convencional en la página 681](#).

Solo se accede: Cuando el campo [Personalidad de solo recepción en la página 430](#) está **Desactivado**, cuando el campo [Tipo de silenciador Tx en la página 454](#) es **PL** y cuando el campo PL seleccionable por el usuario [MPL] está **Desactivado** o es **Rx**.

Se admiten las siguientes selecciones:

Mesa 215: Códigos y frecuencias del silenciador TPL

Frecuencia (Hz) = Código		Frecuencia (Hz) = Código	
67	XZ	159.8	159.8
69.3	WZ	162.2	5B

10.34.4.18

Código DPL de Tx

En este campo se selecciona el código de la Línea privada digital (DPL) que transmite cuando se oprime el botón PTT.

Esta selección se aplica solo al perfil Opciones de frecuencia actual (registro/fila) de la Personalidad convencional actual.

**ADVERTENCIA:**

Cuando el campo [Activación de rastreo de voto combinado en la página 479](#) está **Activado** y el campo [Dirección de Tx para rastreo de voto combinado en la página 479](#) está **Desactivado**, este campo debe coincidir con todas las Opciones de frecuencia en la personalidad actual; de lo contrario, RadioCentral considera que el valor de este campo no es válido.

**NOTA:**

Es posible seleccionar los perfiles de Opciones de frecuencia para usarlos en la página Canales en asignación de canal de zona; primero, la personalidad se selecciona en el campo [Personalidad en la página 679](#) y, luego, el perfil Opciones de frecuencia se selecciona en el campo [Opción de frecuencia convencional en la página 681](#).

Solo se accede: Cuando el campo [Personalidad de solo recepción en la página 430](#) está **Desactivado**, cuando el campo [Tipo de silenciador Tx en la página 454](#) es **DPL** y cuando el campo PL seleccionable por el usuario [MPL] está **Desactivado** o es **Rx**.

Se admiten las siguientes selecciones:

Mesa 216: Códigos de silenciador DPL

Código	Código	Código	Código
023	152	343	565
025	155	346	606
026	156	351	612
031	162	364	624
032	165	365	627
043	172	371	631
047	174	411	632
051	205	412	645*
054	223	413	654
065	226	423	662
071	243	431	664
072	244	432	703
073	245	445	712
074	251	464	723
114	261	465	731
115	263	466	732
116	265	503	734
125	271	506	743
131	306	516	754
132	311	525*	
134	315	532	
143	331	546	

NOTA:

Los códigos marcados con un asterisco no son parte del estándar 83 de los códigos EIA/TIA-603.

10.34.4.19

Inversión DPL de Tx

Este campo hace que se inviertan las señales de la Línea privada digital (DPL) antes de transmitirse.

**NOTA:**

Los códigos invertidos permiten un mayor uso y tráfico en las frecuencias.

**IMPORTANTE:**

La opción Inversión de DPL de Tx debe configurarse tanto en el radio que transmite como en el que recibe para que ocurra la comunicación. Esta función se aplica solo al perfil Opciones de frecuencia actual (registro/fila) de la Personalidad convencional actual.

**ADVERTENCIA:**

Cuando el campo [Activación de rastreo de voto combinado en la página 479](#) está **Activado** y el campo [Dirección de Tx para rastreo de voto combinado en la página 479](#) está **Desactivado**, este campo debe coincidir con todas las Opciones de frecuencia en la personalidad actual; de lo contrario, RadioCentral considera que el valor de este campo no es válido.

**NOTA:**

Es posible seleccionar los perfiles de Opciones de frecuencia para usarlos en la página Canales en asignación de canal de zona; primero, la personalidad se selecciona en el campo [Personalidad en la página 679](#) y, luego, el perfil Opciones de frecuencia se selecciona en el campo [Opción de frecuencia convencional en la página 681](#).

Solo se accede: Cuando el campo [Personalidad de solo recepción en la página 430](#) está **Desactivado**, cuando el campo [Tipo de silenciador Tx en la página 454](#) es **DPL** y cuando el campo PL seleccionable por el usuario [MPL] está **Desactivado** o es **Rx**.

10.34.4.20

Miembro persistente para rastreo de voto combinado

Este campo hace que el radio siempre verifique la Frecuencia Rx/TA seleccionada (de este registro/fila) cuando funciona en el Modo de rastreo y explora activamente el Rastreo de votación combinada activada de personalidad convencional.

Esto es así incluso cuando hay frecuencias/canales más fuertes en la misma Lista de rastreo en la que se selecciona esta Personalidad Convencional. Esta característica se aplica solo para el perfil de Opciones de frecuencia actual (registro/fila) de la Personalidad convencional actual.

**NOTA:**

Es posible seleccionar los perfiles de Opción de frecuencia desde la página Canales de asignación de canal de zona; primero, la personalidad se selecciona en el campo Personalidad y el perfil Opciones de frecuencia se selecciona en el campo Opciones de frecuencia.

Solo se accede: Cuando el campo [Activación de rastreo de voto combinado en la página 479](#) está **Activado**.

10.34.5

Señalización

Esta sección le permite ver o definir la funcionalidad de la Señalización de ASTRO y la Señalización sin ASTRO (MDC, DTMF, Quik-Call II y Un solo tono) para las Personalidades convencionales individuales.

**NOTA:**

Cuando las funciones de personalidades convencionales se hayan definido de manera única, cada personalidad se puede asignar a la posición deseada del selector de canal del radio. Esto se hace en la página Canales de asignación de canal de zona.

10.34.5.1

Sistema ASTRO

En este campo se selecciona el sistema de señalización de ASTRO o DVRS que utilizará la Personalidad convencional actual.

Este Sistema convencional y todas sus configuraciones programadas que se definieron previamente se aplican a este canal.

**IMPORTANTE:**

Solo los Sistemas convencionales que tienen un tipo de sistema de ASTRO o DVRS (definido previamente en el campo Tipo de sistema del Sistema) pueden seleccionarse en este campo.

**NOTA:**

Se hace referencia al valor del sistema ASTRO en el primer registro del Sistema convencional si la personalidad no la crea automáticamente la función Clonación de zona. El valor no se puede cambiar.

Solo se accede: Cuando el campo [Tipo de voz/señal de Rx en la página 431](#) es **ASTRO** o **Modo mixto** y cuando el radio admite modelos y opciones diferentes.

10.34.5.2

Tipo de modulador digital de ASTRO

En este campo se selecciona el Tipo de modulador digital mientras funciona el modo Señalización de ASTRO y en la Personalidad convencional actual.

Solo se accede: Cuando el campo [Tipo de voz/señal de Rx en la página 431](#) es **ASTRO** o **Modo mixto** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

C4FM

Modulación de frecuencia nivel 4 continua para operación no simultánea.

CQPSK

Modulación por desplazamiento de fase en cuadratura compatible para operación simultánea de banda estrecha. Disponible cuando el modelo de radio está equipado para Operación digital de interfaz de aire común (CAI).

WIDE

Operación simultánea de banda ancha. Disponible cuando el campo [Desviación de Tx/espaciamiento de canal en la página 442](#) no está establecido en **2,5 kHz**.

**ADVERTENCIA:**

Esta selección no es válida si ocurre lo siguiente cuando el campo Tipo de voz/señal de Rx está establecido en **ASTRO** o **Modo mixto**, (cuando la Banda de frecuencia primaria es **900 MHz**) o (cuando el campo Permitir frecuencias no válidas está **Activado** y cuando el campo 900 MHz utilizados en el codeplug está **Activado**).

10.34.5.3

Regla de desilenciación de Rx de ASTRO

En este campo se selecciona el modo Desilenciación de recepción (Rx) de ASTRO mientras funciona el modo Señalización de ASTRO o DVRS y cuando está en la Personalidad convencional actual.

**ADVERTENCIA:**

Cuando el ID de grupo de conversación de llamada general del sistema en general **65535** está seleccionado para el canal/personalidad actual (seleccionado en el campo ID de grupo de conversación ASTRO) y cuando el campo [Tipo de selección en la página 475](#) es **Compacto**, **Silenciador normal** es la única selección válida para este campo.

Cuando el ID de grupo de conversación de solo recepción del sistema en general **0** (un grupo de conversación de solo recepción) está seleccionado para el canal/personalidad actual, **Silenciador selectivo** es la única selección válida para este campo.

**NOTA:**

Cuando transmite en el ID de grupo de conversación de llamada del sistema en general **65535** (para el canal o la personalidad actual), el radio recibe automáticamente voz de ASTRO en la configuración **Silenciador normal**, sin importar la configuración de este campo.

Solo se accede: Cuando el campo [Tipo de voz/señal de Rx en la página 431](#) es **ASTRO** o **Modo mixto** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Silenciador normal

El radio se desilencia después de decodificar una coincidencia de [ID de Red de Rx en la página 443](#). El radio se desilencia incluso cuando experimenta DES-XL pero recibe DES-OFB (consulte el campo [DES-XL Tx predeterminado en la página 486](#)).

**NOTA:**

Disponible cuando el campo [Grupo de conversación en la página 475](#) o el campo [Rx/Tx de llamada selectiva en la página 470](#) está **Activado**.

Silenciador selectivo

Se quita el silencio al radio después de decodificar una coincidencia de ID de red y (ya sea una coincidencia de ID de grupo de conversación o una llamada selectiva). Si la selección DES-XL Tx predeterminado determina el tipo de algoritmo de encryption que el radio espera recibir cuando está en este modo.

**NOTA:**

Disponible cuando el campo Grupo de conversación o el campo Rx/Tx de llamada selectiva está **activado**.

Datos y silenciador

El radio se desilencia después de decodificar una coincidencia de ID de red y una llamada selectiva.

**NOTA:**

Disponible cuando el campo Rx/Tx de llamada selectiva está **Activado**.

CSQ digital

El radio se desilencia a todas las señales de voz que cumplen con la Operación digital de CAI.

10.34.5.4

Desilenciador rápido de ingreso tardío de ASTRO

Este campo permite al radio desilenciar una llamada en progreso antes de determinar si la llamada es una llamada segura.

Esta función permite que las llamadas se desilencien 180 a 360 ms más rápido. Esta función se aplica mientras funciona en el modo de señalización de ASTRO y en la Personalidad convencional actual.

**IMPORTANTE:**

Se recomienda que esta función solo se use en canales no seguros, ya que los radios que reciben llamadas seguras se silenciarán a un audio ininteligible hasta que la llamada se reconozca como segura.

Solo se accede: Cuando el campo [Tipo de voz/señal de Rx en la página 431](#) es **ASTRO** o **Modo mixto** y cuando el radio admite modelos y opciones diferentes.

10.34.5.5

Tipo de señalización sin ASTRO

En este campo se selecciona el tipo de sistema de señalización analógica que se usa para recibir y transmitir comunicaciones mientras funciona en la Personalidad convencional actual.

**ADVERTENCIA:**

Cuando el campo Audio plano analógico está **Activado**, este campo debe configurarse en **Ninguno**; de lo contrario, se vuelve no válido. Por lo tanto, no es posible activar ambas funciones en la misma personalidad.

Solo se accede: cuando el campo [Tipo de voz/señal de Rx en la página 431](#) está en **Sin ASTRO** o **modo Mixto** y la función Clonación de zona no crea de forma automática la personalidad.

Se admiten las siguientes selecciones:

- Ninguno
- MDC
- DTMF
- Quik-Call II

**NOTA:**

Las selecciones dependen del modelo o la opción del radio.

10.34.5.6

Número de sistema

10.34.5.7

ID de PTT no ASTRO

En este campo se activa el ID de PITO de MDC o DTMF para transmitir con cada comunicación saliente.

**NOTA:**

El ID de PTT ID es equivalente al ID principal definido por RadioCentral. La transmisión del ID primario permite el ID de llamada en el radio receptor. Esta función se aplica a la Personalidad convencional actual.

**NOTA:**

Cuando la selección del campo ID de PTT es **Borde anterior** o **Ambos**, el ID de PTT se transmite cada vez que se oprime el botón PTT.

Cuando la selección del campo ID de PTT está en **Borde de salida** o **Ambos**, y

**ADVERTENCIA:**

El ID de PTT no debe configurarse en **Ninguno** en el Sistema convencional MDC o DTMF al que se hace referencia.

Solo se accede: Cuando el campo [Tipo de voz/señal de Rx en la página 431](#) está en **No ASTRO** o **Modo mixto**, cuando el campo Tipo de señalización No ASTRO está en **MDC** o **DTMF** y cuando el campo [Personalidad de solo recepción en la página 430](#) está **Desactivado**.

10.34.5.8

ID de PPT de emergencia

En este campo se activa el ID principal de la Unidad MDC/ID primaria que se seleccionó actualmente del radio para transmitir con cada llamada del modo Emergencia.

Por lo tanto, el ID de PTT de emergencia solo se aplica cuando el campo Tipo de emergencia está configurado en **Alarma y llamada**. Esta función se aplica a la Personalidad convencional actual.

NOTA:

El ID de PTT de emergencia real transmitido se determina a través del número de sistema (MDC únicamente) seleccionado de la Personalidad convencional actual.

Solo se accede: Cuando el campo [Personalidad de solo recepción en la página 430](#) está **Desactivado**, cuando el campo [Tipo de voz/señal de Rx en la página 431](#) es **No ASTRO** o **Modo mixto**, cuando el campo Tipo de señalización No ASTRO es **MDC**, cuando se ha seleccionado un Sistema convencional al que se hace referencia del Tipo de sistema **MDC** que tiene un perfil de emergencia convencional al que se hace referencia y cuando ese perfil de emergencia al que se hace referencia tiene su campo Tipo de emergencia configurado en **Alarma y llamada**.

10.34.5.9

Tipo de inversión de emergencia

En este campo se selecciona el tipo de inversión de emergencia que se utilizará para la Personalidad convencional actual.

Solo se accede: (Cuando el campo [Tipo de voz/señal de Tx en la página 434](#) se ha configurado en **ASTRO**, cuando se ha seleccionado un Sistema convencional al que se hace referencia del Tipo de sistema ASTRO que tiene un perfil de emergencia convencional al que se hace referencia) o (cuando el campo Tipo de voz/señal de Tx está establecido en **No ASTRO**, cuando el campo Tipo de señalización No ASTRO está configurado en **MDC** y cuando se ha seleccionado un Sistema convencional al que se hace referencia del Tipo de sistema MDC que tiene un perfil de emergencia convencional.)

Se admiten las siguientes selecciones:

Canal seleccionado

No se usa ningún canal de inversión; las emergencias se transmiten en el canal de radio seleccionado actualmente.

Canal de inversión

Las opciones [Zona de inversión de emergencia en la página 464](#) y [Canal revertidor de emergencia en la página 464](#) seleccionadas para esta personalidad se utilizan para transmisiones de emergencia.

Grupo de conversación de inversión

El Grupo de conversación de inversión seleccionado para esta personalidad se utiliza para las transmisiones de emergencia.

Solo es posible acceder a esta selección cuando el radio tiene capacidad para Unidad de suscriptor portátil (PSU) de DVRS.

ADVERTENCIA:

Esta selección solo es válida cuando se ha seleccionado un Sistema convencional al que se hace referencia del Tipo de sistema **DVRS** que tiene un perfil de emergencia convencional al que se hace referencia y el campo [Grupo de conversación en la página 475](#) está **Activado**.

10.34.5.10

Zona de inversión de emergencia

En este campo se selecciona la zona que se utiliza mientras dure una transmisión en modo Emergencia.

Esta selección se aplica a la Personalidad convencional actual.

**NOTA:**

Una vez que se seleccione la zona, entonces es posible seleccionar [Canal revertidor de emergencia en la página 464](#).

Las zonas y sus canales deben definirse previamente en la ventana Asignación de canal de zona.

**ADVERTENCIA:**

Solo se pueden seleccionar Zonas no dinámicas (zonas que tienen la Zona dinámica activada en **Desactivado**); de lo contrario, este campo no será válido.

Solo se accede: Cuando el campo [Tipo de inversión de emergencia en la página 463](#) está establecido en **Revertir canal** y (cuando el campo [Tipo de voz/señal de Tx en la página 434](#) está establecido en **ASTRO** y cuando se ha seleccionado un Sistema convencional al que se hace referencia del Tipo de sistema ASTRO que tiene un perfil de emergencia convencional al que se hace referencia) o (cuando el campo Tipo de voz/señal de Tx está establecido en **No ASTRO**, cuando el campo Tipo de señalización No ASTRO está establecido en **MDC** y cuando se ha seleccionado un Sistema convencional al que se hace referencia del Tipo de sistema MDC que tiene un perfil de emergencia convencional al que se hace referencia).

10.34.5.11

Canal revertidor de emergencia

En este campo, se selecciona un canal convencional designado que se usa para la duración de una transmisión en modo de emergencia.

Esta selección se aplica a la Personalidad convencional actual.

**NOTA:**

El [Zona de inversión de emergencia en la página 464](#) debe seleccionarse antes de seleccionar este canal.

Las zonas y sus canales deben definirse previamente en la Asignación de canal de zona.

**ADVERTENCIA:**

Para que se seleccione un canal de troncalización como el canal revertidor de emergencia, debe aparecer la función **Reversión de emergencia múltiple** ampliada en el campo Nombre de la función ampliada.

Esta selección del canal de reversión de emergencia solo se considera válida cuando el campo Grupo de conversación de troncalización para la Personalidad de troncalización/canal no está configurada en **DYN** ni **ATG**, cuando el campo [Personalidad de solo recepción en la página 430](#) para la Personalidad convencional/canal está **Desactivado**, cuando el campo ID del grupo de conversación ASTRO para la Personalidad convencional/canal seleccionado no está configurado en **DYN** ni **ATG** y cuando el campo Modo de transmisión para la Personalidad de troncalización/canal no está configurado en **TG/AG desactivado (Solo escucha)** y cuando la Selección de perfil de emergencia para el canal seleccionado no está en **Tx de emergencia desactivada**.

Solo se accede: Cuando el campo [Tipo de inversión de emergencia en la página 463](#) está establecido en **Revertir canal**, cuando el campo Revertir zona no está establecido en una zona dinámica, (cuando el campo [Tipo de voz/señal de Tx en la página 434](#) está establecido en **ASTRO**, cuando se ha seleccionado un Sistema convencional al que se hace referencia del tipo de sistema ASTRO que tiene un perfil de emergencia convencional al que se hace referencia) o (cuando el campo

Tipo de voz/señal de Tx está establecido en **No ASTRO**, cuando el campo Tipo de señalización No ASTRO está establecido en **MDC** y cuando se ha seleccionado un Sistema convencional al que se hace referencia del Tipo de sistema MDC que tiene un perfil de emergencia convencional al que se hace referencia.)

10.34.5.12

Lista de señalización de tono

En este campo se selecciona la Lista de señalización de tono que se usará con la Personalidad convencional actual.

NOTA:

La funcionalidad de Lista de señalización de tono se define en la página Lista de señalización de tono.

Solo se accede: Cuando la Lista de señalización de tono está establecida en **Señalización de tono inhabilitada**, cuando el campo [Tipo de voz/señal de Rx en la página 431](#) está establecido en **No ASTRO**, cuando el campo Tipo de señalización está establecido en **Quik-Call II**, cuando el campo Tipo de voz/señal de Rx está establecido en **Modo mixto**, cuando el [Tipo de voz/señal de Tx en la página 434](#) está establecido en **No ASTRO**, cuando el Tipo de señalización está establecido en **Quik-Call II**, cuando el campo Tipo de voz/señal de Rx no está establecido en **No ASTRO** o cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

- Tono de señalización desactivado
- Listas de señalización de tono disponible

10.34.6

Llamada sin ASTRO

Esta sección permite ver o definir funciones relacionadas con señalización modo sin ASTRO o analógico como: MDC, DTMF, Quik-Call II y Un solo tono.

NOTA:

Los sistemas convencionales que tienen tipo de sistema **MDC**, **DTMF**, **Quik-Call II** o **Un solo tono** se pueden seleccionar desde el campo Sistema sin ASTRO de la Personalidad convencional, lo cual permite que se produzcan las comunicaciones específicas del Tipo de sistema.

Cuando las funciones de personalidades convencionales se hayan definido de manera única, cada personalidad se puede asignar a la posición deseada del selector de canal del radio. Esto se hace en la página Canales de asignación de canal de zona.

10.34.6.1

Rx/Tx de llamada selectiva

En este campo se selecciona si es posible transmitir o recibir (o ambos) Llamadas selectivas sin ASTRO (MDC, DTMF y Quik-Call II) para la Personalidad convencional actual.

**ADVERTENCIA:**

Cuando el campo Rango expandido de ID de MDC está **Activado**, este campo debe configurarse en **Desactivado**; de lo contrario, RadioCentral lo considera no válido. Estas dos funciones son incompatibles.

Cuando el campo Tipo de señalización sin ASTRO es **Quik-Call II**, y cuando el campo Activación de hardware del DVRS está **Activado**, y cuando el Perfil DVRS al que hace referencia la personalidad tiene el campo Activación remota del DVRS configurado en **Mediante alerta de llamada**, esta función debe estar en **Desactivado**; de lo contrario, RadioCentral lo considera no válido. Estas dos funciones son incompatibles.

Cuando el campo Tipo de señal Sin ASTRO es **Quik-Call II**, esta función y [RX/Tx de alerta de llamada en la página 467](#) son mutuamente excluyentes, por lo tanto, una de estas funciones debe estar en **Desactivado**; de lo contrario, ambas funciones serán consideradas no válidas.

**NOTA:**

Puede activar una codificación de Llamada selectiva (transmisión) con una pulsación del botón Llamada selectiva/privada o la selección del menú Llamada selectiva/privada.

Solo se accede: Cuando el campo [Tipo de voz/señal de Rx en la página 431](#) está en **No ASTRO** o **Modo mixto**, cuando el campo Tipo de señalización No ASTRO está en **MDC, DTMF** o **Quik-Call II** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Desactivado

No es posible realizar alertas de llamadas en la personalidad actual.

Decodificar

Las llamadas selectivas solo pueden recibirse (decodificarse).

Codificar

Las llamadas selectivas solo pueden transmitirse (codificarse).

**ADVERTENCIA:**

Cuando el campo Tipo de señalización No ASTRO es **Quik-Call II**, esta selección no es válida.

Decodificar y codificar

Las llamadas selectivas pueden recibirse y transmitirse.

**ADVERTENCIA:**

Cuando el campo Tipo de señalización No ASTRO es **Quik-Call II**, esta selección no es válida.

10.34.6.2

Tipo desilenciar

En este campo se selecciona la condición desilenciar para la Personalidad convencional de Sin ASTRO (MDC, DTMF o Quik-Call II) actual.

Esta regla de desilenciar se aplica solo a la detección de llamadas selectivas.

Solo se accede: Cuando el campo [Tipo de voz/señal de Rx en la página 431](#) es **Sin ASTRO** o **modo Mixto** y cuando el campo Tipo de señal sin ASTRO es **MDC, DTMF** o **Quik-Call II**, y cuando el campo [Rx/Tx de llamada selectiva en la página 466](#) se configura **Decodificar** o **Decodificar y codificar**, y cuando el radio admite modelos/opciones diferentes.

Se admiten las siguientes selecciones:

y

Tanto la regla [Tipo de desilenciar/silenciar en la página 431](#) seleccionada de la personalidad actual como la detección de llamada selectiva deben satisfacerse antes de poder desilenciar.

O

La regla Tipo de desilenciar/silenciar de la personalidad actual o la detección de llamada selectiva desilenciarán el altavoz del radio para recibir audio.

10.34.6.3

RX/Tx de alerta de llamada

En este campo se selecciona si es posible transmitir o recibir (o ambos) alertas de llamada que no sean ASTRO (MDC, DTMF, Quik-Call Ily Un tono) para la Personalidad convencional actual.

ADVERTENCIA:

Cuando el campo Rango expandido de ID de MDC está **Activado**, este campo debe configurarse en **Desactivado**; de lo contrario, RadioCentral lo considera no válido. Estas dos funciones son incompatibles.

Cuando el campo Tipo de señalización sin ASTRO es **Quik-Call II**, esta función y [Rx/Tx de llamada selectiva en la página 466](#) son mutuamente excluyentes; por lo tanto, una de estas funciones debe estar en **Desactivado**, de lo contrario, RadioCentral considera que ambas funciones son no válidas.

NOTA:

La Alerta de llamada se activa cuando se presiona el botón Alerta de llamada o se selecciona el menú Localizador (Alerta de llamada).

Solo se accede: (Cuando el radio admite modelos y opciones diferentes, cuando el campo [Tipo de voz/señal de Rx en la página 431](#) es **No ASTRO** o **Modo mixto** y cuando el campo Tipo de señalización No ASTRO es **MDC**, **DTMF** o **Quik-Call II** para la personalidad actual) y (cuando el campo Activación de hardware del DVRS está **Desactivado**) o (cuando el campo Activación de hardware del DVRS está **Activado** y cuando el Perfil de DVRS al que se hace referencia de la personalidad actual tiene el campo Activación remota del DVRS configurado en **Desactivado**.)

Se admiten las siguientes selecciones:

Desactivado

No es posible realizar alertas de llamadas en la personalidad actual.

Decodificar

Solo es posible recibir (decodificar) alertas de llamada.

Codificar

Las alertas de llamada solo pueden ser transmitidas (codificadas).

ADVERTENCIA:

Cuando el campo Tipo de señalización No ASTRO es **Quik-Call II**, esta selección no es válida.

Decodificar y codificar

Las alertas de llamadas pueden ser recibidas y transmitidas.

ADVERTENCIA:

Cuando el campo Tipo de señalización No ASTRO es **Quik-Call II**, esta selección no es válida.

10.34.6.4

Acceso al botón MDC\RTT

En este campo se selecciona el modo Solicitud para hablar (RTT) para la Personalidad convencional actual.

Cuando se activa con las selecciones **Manual** (presionando el botón RTT de MDC o seleccionando el menú [Solicitud para hablar](#)) o **Automático** (botón PTT), el radio envía un paquete de señalización de RTT al despachador donde solicita la capacidad de transmitir voz en el canal. De inmediato, el micrófono del radio se activa de 2 a 3 segundos, lo que permite al usuario coger el micrófono y comenzar una transmisión de voz. A partir de este punto, el radio tiene acceso normal a este canal.

**NOTA:**

Esta función permite al despachador administrar el tráfico de canal para las comunicaciones de voz. Esta función se aplica cuando se opera en modo Sistema MDC y en la Personalidad convencional actual.

**ADVERTENCIA:**

Si el campo [Tipo de acceso](#) está establecido en **Automático**, este campo no puede establecerse en **Automático**. Estas dos configuraciones de campo son mutuamente excluyentes.

Solo se accede: Cuando [Tipo de voz/señal de Tx en la página 434](#) se ha configurado en **No ASTRO** y cuando el campo Tipo de señalización no ASTRO para la personalidad actual está configurado en **MDC**.

Se admiten las siguientes selecciones:

Ninguno

La función está desactivada.

Manual

Cada vez que inicia la pulsación del botón RTT o la selección del menú RTT, el paquete de señalización RTT se transmite al despachador o la consola solicitando la capacidad de transmitir voz.

**ADVERTENCIA:**

Esta selección solo es válida cuando [Personalidad de solo recepción en la página 430](#) está **Desactivado** y cuando [Acceso al repetidor](#) está **Activado**.

Auto

Cada vez que oprime el botón RTT, el paquete de señalización RTT se transmite al despachador o la consola solicitando la capacidad de transmitir voz.

**ADVERTENCIA:**

Esta selección solo es válida cuando la Personalidad de solo recepción está **Desactivada**, cuando el [Acceso a repetidor](#) está **Activado** y cuando [Tipo de acceso](#) no está establecido en **Automático**.

10.34.6.5

Transmisión de llamada de selección automática de MDC

Cuando se activa, una vez que el usuario selecciona enviar una Llamada selectiva de MDC, y selecciona un destinatario de llamada en la Lista de uso frecuente de llamadas Sin ASTRO, se transmite un paquete de datos de Llamada selectiva cada vez que se oprime el botón PTT del radio.

Esta función se aplica cuando se opera en modo Sistema MDC y en la Personalidad convencional actual.

Cuando se desactiva, se transmite un paquete de datos de llamada selectiva de MDC solo cuando se inicia una llamada selectiva. Es decir, el paquete de datos de llamada selectiva se transmite cuando el usuario selecciona enviar una llamada selectiva, selecciona un destinatario de llamada en la Lista

de llamadas y luego oprime el botón PTT. Al oprimir nuevamente el botón PTT no se transmitirá un paquete de datos de llamada selectiva.

Solo se accede: Cuando el campo [Tipo de voz/señal de Rx en la página 431](#) es **No ASTRO** o **Modo mixto**, cuando el Tipo de señalización No ASTRO para la personalidad actual está definido en **MDC**, cuando el campo [Rx/Tx de llamada selectiva en la página 466](#) se ha configurado en **Codificar** o **Decodificar y codificar** y cuando el radio admite modelos y opciones diferentes.

10.34.6.6

Llamada ilimitada MDC

Este campo permite ingresar manualmente el ID de un radio de destino para una Llamada selectiva o Alerta de llamada; también conocido como entrada directa.

Cuando se selecciona Tipo de llamada y la Lista de uso frecuente de llamadas de MDC aparece en la pantalla del radio, es posible realiza el ingreso directo de un ID de radio de MDC (mediante un teclado). Al oprimir el botón PTT luego se transmite la llamada a los radios de destino del ID ingresado. Esta función se aplica cuando se opera en modo Sistema MDC y en la Personalidad convencional actual.

Solo se accede: Cuando el campo [Rx/Tx de llamada selectiva en la página 466](#) está configurado en **Codificar** o **Decodificar y codificar**, cuando el campo [RX/Tx de alerta de llamada en la página 467](#) está configurado en **Codificar** o **Decodificar y codificar**, cuando el campo [Tipo de voz/señal de Rx en la página 431](#) está configurado en **No ASTRO** o **Modo mixto**, cuando el campo Tipo de señalización No ASTRO está establecido en **MDC** y cuando el radio admite modelos y opciones diferentes.

10.34.6.7

Lista de uso frecuente de llamadas que no son ASTRO

En este campo se selecciona la Lista de uso frecuente Sin ASTRO (MDC, DTMF o Quik-Call I) que se utilizará para la Personalidad convencional actual.

Puede seleccionar miembros de la Lista de uso frecuente de llamadas individual mientras opera en el modo Comunicaciones convencionales. A los miembros de la Lista de llamadas frecuentes se les permite realizar comunicaciones de Llamada selectiva o Alerta de llamada a radios individuales o grupos de radios.

Solo se accede: Cuando el campo [Tipo de voz/señal de Rx en la página 431](#) es **No ASTRO** o **Modo mixto** y cuando el campo Tipo de señal no ASTRO no es igual a **Ninguno**.

10.34.6.8

Activación de alerta de usuario de llamada entrante

Este campo permite que el radio permanezca silenciado para las llamadas de despacho normales cada vez que activa la funcionalidad Silencio de voz.

Las Alertas de llamada grupales e individuales sí activan el sonido del radio para que suene el tono de alerta. El radio también activa el sonido para las llamadas de radio a radio individuales como las llamadas selectivas y las llamadas de interconexión (Modo teléfono). Esta función es muy útil cuando un usuario prefiere no escuchar el tráfico normal de despacho y, sin embargo, necesita seguir en contacto radial. Esta función se aplica cuando se opera en modo Sistema no ASTRO (MDC, DTMF y QCII) y cuando está en la Personalidad convencional actual.

Cuando está desactivado, el usuario no puede activar esta función para la Personalidad convencional actual.

**NOTA:**

La pulsación del botón Silencio de voz o la selección del menú Silencio de voz permiten encender o apagar la funcionalidad Silencio de voz para un canal con activación de alerta de usuario de llamada entrante.

**ADVERTENCIA:**

Este campo de Alerta de usuario de llamada entrante no ASTRO debe estar **Activado** cuando el campo [Tipo de voz/señal de Rx en la página 431](#) está establecido en **Modo mixto** y cuando el campo Tipo de señalización está establecido en **MDC, DTMF** o **Quik-Call II**.

**IMPORTANTE:**

Cuando el botón Silencio de voz está activo, las alertas de llamadas grupales o individuales decodificadas por el radio desactivan el silencio para el período de liberación del silenciador. El período de liberación del silenciador se define mediante la selección del campo Seleccionar llamada/restablecimiento de llamada entrante del sistema ASTRO de esta personalidad. Una vez que la alerta de llamada (enviada como llamada individual o llamada grupal) desilencia el radio, la llamada de voz siguiente puede ser una llamada grupal que puede escucharse por los altavoces del radio, pero solo hasta que el período de liberación del silenciador haya terminado.

Si se cambia el canal de radio y se desactiva el Silencio de voz, se debe reactivar el Silencio de voz si se desea cuando se regresa al canal.

Si el usuario oprime el botón PTT, o inicia el modo Emergencia, o apaga y prende el radio, el radio desactiva el Silencio de voz.

La funcionalidad Inhibición de radio MDC está disponible.

Las funciones del Modo rastreo y el Modo monitor no están disponibles.

Otras indicaciones de pantalla (de llamadas grupales) como LED e ID de PTT (si está activada) funcionan con normalidad.

Solo se accede: cuando el campo [RX/Tx de alerta de llamada en la página 467](#) se configura en **Decodificar** o **Decodificar y codificar**, y cuando el campo [Tipo de voz/señal de Rx en la página 431](#) se configura en **Sin ASTRO** o **modo Mixto**, y cuando el campo [Tipo de señalización sin ASTRO en la página 462](#) se configura en **MDC** o **Quik-Call II** o **DTMF**.

10.34.7

Llamada de ASTRO

Esta sección permite ver o definir la funcionalidad de Alerta de llamada y Llamada selectiva ASTRO o DVRS para las Personalidades convencionales individuales.

**NOTA:**

Los Sistemas convencionales definidos como "ASTRO" o "DVRS" o Tipo de sistema "DVRS" pueden seleccionarse desde el campo Sistema ASTRO de Personalidad convencional, que permite que las comunicaciones de los Sistemas ASTRO ocurran.

Cuando las funciones de personalidades convencionales se hayan definido de manera única, cada personalidad se puede asignar a la posición deseada del selector de canal del radio. Esto se hace en la página Canales de asignación de canal de zona.

10.34.7.1

Rx/Tx de llamada selectiva

En este campo se selecciona si una Llamada: ASTRO/DVRS puede transmitirse o recibirse (o ambas opciones).

Esta función se aplica cuando se opera en modo Sistema ASTRO o DVRS y en la Personalidad convencional actual.

IMPORTANTE:

Cuando el sistema convencional al que se hace referencia es un tipo de sistema ASTRO, esta función habilita la funcionalidad Llamada selectiva convencional.

Cuando el sistema convencional al que se hace referencia es un tipo de sistema DVRS, esta función habilita la funcionalidad Llamada privada de troncalización.

NOTA:

Puede activar una llamada selectiva o privada con la pulsación del botón Llamada selectiva/privada o la selección del menú Llamada selectiva/privada.

Solo se accede: cuando el radio admite modelos/opciones diferentes, y cuando la personalidad no se crea automáticamente mediante la función Clonación de zona; y

([cuando el campo [Tipo de voz/señal de Rx en la página 431](#) se configura en **modo Mixto**], o [cuando el campo Tipo de voz/señal de Rx se configura en **ASTRO**, y cuando el campo Sistema de interfaz de sitio remoto en el sistema de referencia convencional al que se hace referencia está **Desactivado**]).

Se admiten las siguientes selecciones:

Desactivado

No son posibles las Llamadas selectivas/privadas en la personalidad actual.

Decodificar

Las llamadas selectivas o privadas solo pueden recibirse (decodificarse).

Codificar

Las llamadas selectivas o privadas solo pueden transmitirse (codificarse).

Decodificar y codificar

Las llamadas selectivas o privadas pueden recibirse y transmitirse.

10.34.7.2

Transmisión automática de llamada selectiva

Cuando está activada, una vez que el usuario selecciona enviar una Llamada Selectiva - ASTRO y selecciona un receptor de la Lista de frecuente de llamadas ASTRO, un paquete de datos de Llamada selectiva se transmite cada vez que se oprime el botón PTT del radio.

Esta función se aplica cuando se opera en modo Sistema ASTRO y cuando está en la Personalidad convencional actual.

Cuando está desactivado, el paquete de datos de Llamada selectiva se transmite solo cuando el usuario inicia una Llamada selectiva. Esto significa que, cuando el usuario selecciona enviar una Llamada selectiva, selecciona un receptor de la Lista frecuente de llamadas y presiona el botón PTT, el paquete de datos de Llamada selectiva se transmite una vez. Al oprimir nuevamente el botón PTT no se transmitirá un paquete de datos de llamada selectiva.

NOTA:

El usuario puede activar la Llamada selectiva presionando el botón Llamada selectiva/privada o seleccionando el menú Llamada selectiva/privada.

Solo se accede: (Cuando el radio admite modelos y opciones diferentes, cuando el campo [Rx/Tx de llamada selectiva en la página 470](#) está establecido en **Codificar** o **Decodificar y codificar** y cuando el Sistema convencional al que se hace referencia y que está seleccionado en el campo Sistema ASTRO no es un tipo de sistema **DVRS**) y (cuando el campo [Tipo de voz/señal de Rx en la página 431](#) está establecido en **Modo mixto**) o (cuando el campo Tipo de voz/señal de Rx está establecido en **ASTRO** y cuando el campo Sistema de interfaz de sitio remoto del Sistema convencional al que se hace referencia está **Desactivado**).

10.34.7.3

RX/Tx de alerta de llamada

En este campo se selecciona si las Alertas de llamada (también conocidas como Localizadores) pueden transmitirse o recibirse (o ambas opciones).

Esta función se aplica cuando se opera en modo Sistema ASTRO y cuando está en la Personalidad convencional actual.

**NOTA:**

Puede activar la Alerta de llamada con la pulsación del botón Alerta de llamada o la selección del menú Localizador (Alerta de llamada).

Solo se accede: Cuando el radio admite modelos y opciones diferentes, (cuando el campo [Tipo de voz/señal de Rx en la página 431](#) está configurado en **Modo mixto**), (cuando el campo Tipo de voz/señal de Rx está configurado en **ASTRO** y cuando el campo Sistema de interfaz de sitio remoto del Sistema convencional al que se hace referencia está **Desactivado**), (cuando el campo Activación de hardware del DVRS está **Desactivado**) o (cuando el campo Activación de hardware del DVRS está **Activado** y el perfil de DVRS al que se hace referencia de la personalidad actual tiene el campo Activación remota de hardware del DVRS configurado en **Desactivado**).

Se admiten las siguientes selecciones:

Desactivado

No es posible realizar alertas de llamadas en la personalidad actual.

Decodificar

Solo es posible recibir (decodificar) alertas de llamada.

Codificar

Las alertas de llamada solo pueden ser transmitidas (codificadas).

Decodificar y codificar

Las alertas de llamadas pueden ser recibidas y transmitidas.

10.34.7.4

Llamada ilimitada ASTRO

Este campo le permite ingresar manualmente el ID de un radio de destino para una llamada selectiva, alerta de llamada o servicios tácticos. La acción se conoce como una entrada directa.

Una vez que se selecciona el tipo de llamada y aparece la lista de uso frecuente de llamadas ASTRO en la pantalla del radio, es posible la entrada directa de un ID de radio ASTRO (con un teclado) deseado. Para llamada selectiva y alerta de llamada, presionar el botón **PTT** transmite la llamada a uno o más radios de destino con el ID ingresado. En el caso de los servicios tácticos, presionar el menú de la tecla de pantalla **Enviar** transmite el comando de Servicios tácticos a uno o más radios de destino con el ID ingresado.

Esta función se aplica mientras funciona el sistema ASTRO o el modo DVRS y en la personalidad convencional actual.

**IMPORTANTE:**

Cuando el Sistema convencional al que se hace referencia es un Tipo de sistema DVRS, entonces esta función activa la funcionalidad Llamada privada de troncalización.

Solo se accede: Se puede acceder a este campo cuando el radio admite distintos modelos y opciones, y cuando se cumple una de las siguientes condiciones:

- El campo [Tipo de voz/señal de Rx en la página 431](#) está configurado en **Modo mixto**.
- El campo Tipo de voz/Señal de Rx está configurado como **ASTRO** y el campo Sistema de interfaz del sitio remoto en el sistema convencional al que se hace referencia está **Desactivado**.

- El campo [Rx/Tx de llamada selectiva en la página 470](#) o el campo [RX/Tx de alerta de llamada en la página 472](#) está configurado como **Codificar** o **Decodificar y codificar**.
- El campo Operación de deshabilitación o el campo Operación de bloqueo está configurado como **Codificar** o **Decodificar y codificar**.
- El campo Operación de servicios tácticos está configurado como **Codificar** o **Decodificar y codificar**.

10.34.7.5

Lista de uso frecuente de llamadas ASTRO

En este campo se selecciona la Lista Frecuente de ASTRO convencional que será usado con la Personalidad convencional actual.

Puede seleccionar miembros de la Lista de llamadas individual mientras opera en el modo Comunicaciones convencionales. Los miembros de la Lista de llamadas permiten comunicaciones de Llamada selectiva, Alerta de llamada o Servicios tácticos a uno o más radios. Esta función se aplica cuando se opera en modo Sistema ASTRO y en la Personalidad convencional actual.

Solo se accede: Se puede acceder a este campo cuando el radio admite distintos modelos y opciones, y cuando se cumple una de las siguientes condiciones:

- El campo [Tipo de voz/señal de Rx en la página 431](#) está configurado en **Modo mixto**.
- El campo Tipo de voz/Señal de Rx está configurado como **ASTRO** y cuando el campo Sistema de interfaz del sitio remoto en el sistema convencional al que se hace referencia está **Desactivado**.

10.34.7.6

Activación de alerta de usuario de llamada entrante

Este campo permite que el radio permanezca silenciado para las llamadas de despacho normales cada vez que activa la funcionalidad Silencio de voz.

Las Alertas de llamada grupales e individuales sí activan el sonido del radio para que suene el tono de alerta. El radio también desactiva el silencio para las llamadas individuales de radio a radio como las Llamadas selectivas, las Llamadas de señalización de tono y las Llamadas interconectadas (modo Teléfono). Esta función es muy útil cuando un usuario prefiere no escuchar el tráfico normal de despacho y, sin embargo, necesita seguir en contacto radial. Esta función se aplica cuando se opera en modo Sistema ASTRO y en la Personalidad convencional actual.

Cuando está desactivado, el usuario no puede activar esta función para la Personalidad convencional actual.

**NOTA:**

La pulsación del botón Silencio de voz o la selección del menú Silencio de voz permiten encender o apagar la funcionalidad Silencio de voz para un canal con activación de alerta de usuario de llamada entrante.

**ADVERTENCIA:**

Este campo de Alerta de usuario de llamada entrante ASTRO debe estar **Activado** cuando el campo [Tipo de voz/señal de Rx en la página 431](#) está configurado en **Modo mixto** y cuando el campo Tipo de señal está configurado en **MDC, DTMF o Quik-Call II**.

**IMPORTANTE:**

Cuando el botón Silencio de voz está activo, las alertas de llamadas grupales o individuales decodificadas por el radio desactivan el silencio para el período de liberación del silenciador. El período de liberación del silenciador se define mediante la selección del campo Seleccionar llamada/restablecimiento de llamada entrante del sistema ASTRO de esta personalidad. Una vez que la opción Alerta de llamada (enviada como llamada individual o llamada grupal) desilencia el radio, la llamada de voz siguiente puede ser una llamada grupal que puede escucharse por los altavoces del radio, pero solo hasta que el período de liberación del silenciador haya terminado.

Si se cambia el canal de radio y el radio desactiva el botón Silencio de voz, se debe reactivar el botón Silencio de voz si se desea cuando se regresa al canal.

Si el usuario presiona el botón PTT, inicia el modo Emergencia, o apaga y prende el radio, el radio desactiva el botón Silencio de voz.

La funcionalidad Inhibición de radio ASTRO está disponible.

Las funciones del Modo rastreo y el Modo monitor no están disponibles.

Otras indicaciones de pantalla de llamadas grupales como, por ejemplo, LED e ID de PTT (si está activada) funcionan con normalidad.

Solo se accede: Cuando el radio admite modelos/opciones diferentes, y (cuando el campo [RX/Tx de alerta de llamada en la página 472](#) es **Decodificar** o **Decodificar y codificar**, y cuando el campo [Tipo de voz/señal de Rx en la página 431](#) se configura en **modo Mixto**), o (cuando el campo Rx/Tx de Alerta de llamada es **Decodificar** o **Decodificar y codificar**, y cuando el campo Tipo de voz/señal de Rx se configura en **ASTRO**, y cuando el campo Sistema de interfaz de sitio remoto del sistema convencional al que se hace referencia está **Desactivado**), o (cuando el campo Tipo de voz/señal de Rx no está configura en **Sin ASTRO**, y cuando el campo Lista de señalización de tono de la personalidad convencional hace referencia a una lista de señalización de tono que tiene al menos un registro o una fila donde Desilenciar activado está **Activado**).

10.34.8

Grupo de conversación de ASTRO

Esta sección le permite ver o definir la funcionalidad de la Lista del grupo de conversación ASTRO de Sistema ASTRO para las Personalidades convencionales individuales.

**NOTA:**

Los Sistemas convencionales definidos como Tipos de sistema **ASTRO** se pueden seleccionar desde el campo Sistema ASTRO de la Personalidad convencional, lo que permite que se realice la comunicación de Sistemas ASTRO.

Cuando las funciones de personalidades convencionales se hayan definido de manera única, cada personalidad se puede asignar a la posición deseada del selector de canal del radio. Esto se hace en la página Canales de asignación de canal de zona.

10.34.8.1

Grupo de conversación

En este campo se activa la funcionalidad Grupo de conversación mientras se opera en el modo Sistema ASTRO y en la Personalidad convencional actual.

**NOTA:**

Los sistemas de ASTRO se seleccionan para personalidades convencionales individuales desde el campo Sistema ASTRO.

**ADVERTENCIA:**

El [Tipo de voz/señal de Rx en la página 431](#) debe estar establecido en **ASTRO** o **Modo mixto** para la personalidad actual; de lo contrario, este valor del campo no será válido.

Solo se accede: Cuando el radio admite modelos y opciones diferentes y (cuando el campo Sistema de interfaz de sitio remoto en el Sistema convencional al que se hace referencia está **Desactivado**; si está **Activado**, entonces el campo Tipo de voz/señal de Rx debe estar establecido en **ASTRO** y esta selección de grupo de conversación debe estar **Desactivada**; si no, este campo no será válido).

10.34.8.2

Tipo de selección

Este campo permite elegir un Grupo de conversación de la Lista de grupo de conversación ASTRO seleccionada, o bien no le otorga al usuario la capacidad de cambiar de Grupo de conversación.

La Lista de grupo de conversación se selecciona desde la [Lista de grupo de conversación en la página 475](#) en esta misma página. Esta selección se aplica cuando se opera en modo Sistema ASTRO y en la Personalidad convencional actual.

Solo se accede: Cuando el campo [Tipo de voz/señal de Rx en la página 431](#) se configura en **ASTRO** o **modo Mixto**, y cuando el campo [Grupo de conversación en la página 475](#) está **Activado**, y cuando la función Clonación de zona no crea la personalidad de forma automática.

Se admiten las siguientes selecciones:

Compacto

El Grupo de Conversación que selecciona el campo ID de grupo de conversación de ASTRO está enlazado a la Personalidad convencional y no se puede cambiar.

Seleccionable

Puede cambiar del ID de grupo de conversación predeterminado a otro ID de grupo de conversación desde dentro de la Lista de grupo de conversación, de la Personalidad convencional, seleccionada en la misma página.

Solo puede encender los Grupos de conversación con la pulsación del botón Grupo de conversación o la selección del menú Grupo de conversación.

10.34.8.3

Lista de grupo de conversación

En este campo se selecciona una Lista de grupo de conversación ASTRO mientras se opera en modo Sistema ASTRO y en la Personalidad convencional actual.

**ADVERTENCIA:**

Cuando el campo [ASTRO OTAR en la página 492](#) está **Activado** en la Personalidad convencional actual, solo se pueden seleccionar las Lista de grupos de conversación ASTRO que hacen referencia al mismo Perfil KMF seguro, en el campo Índice de perfil KMF de la Lista de grupo de conversación, al cual la Personalidad convencional hace referencia (en el campo [Índice de perfil de ASTRO OTAR en la página 492](#) de la personalidad).

Cuando el campo ASTRO OTAR está **Activado** para la Personalidad convencional actual, se puede seleccionar cualquier Lista de grupo de conversación.

Solo se accede: cuando el campo [Tipo de voz/señal de Rx en la página 431](#) está configurado en **ASTRO** o **modo Mixto**, y cuando el campo [Grupo de conversación en la página 475](#) está **Activado**, cuando la función Clonación de zona no crea la personalidad de forma automática.

10.34.9

Funciones

Esta sección permite ver o definir funciones de comunicaciones convencionales misceláneas.

NOTA:

Cuando las funciones de personalidades convencionales se hayan definido de manera única, cada personalidad se puede asignar a la posición deseada del selector de canal del radio. Esto se hace en la página Canales de asignación de canal de zona.

10.34.9.1

Mensajería OTACR/OTACS

Permite la mensajería de Reasignación de canal por el aire (OTACR) y Direccionamiento de canal por el aire (OTACS).

ADVERTENCIA:

Esta función no está disponible actualmente.

Esta función se aplica cuando se opera en la [Personalidad convencional en la página 429](#) actual.

ADVERTENCIA:

Cuando el [Sistema convencional en la página 415](#) mencionado (seleccionado en el campo [Sistema ASTRO en la página 460](#)) tiene un [perfil de datos](#) al que se hace referencia, cuyo [Tipo del perfil de datos en la página 376](#) es **Convencional y banda ancha** o **Solo banda ancha**, este campo debe configurarse como **Desactivado**; de lo contrario, se considera no válido.

Solo se accede: Cuando el [Tipo de voz/señal de Rx en la página 431](#) es **ASTRO** o **modo Mixto**, cuando [Función OTACR](#) está **activado** o el [Función OTACS](#) está **activado**, cuando el [Sistema convencional en la página 415](#) al que se hace referencia está seleccionado en el campo [Sistema ASTRO en la página 460](#) no es un [Tipo de sistema en la página 416](#) DVRS, y cuando el radio admite diferentes modelos y opciones.

10.34.9.2

Activación de regeneración de clave táctica

Este campo permite que el radio reciba comandos de regeneración de clave que se han enviado desde otros radios o Unidades de suscriptor (SU) en vez de un Equipo de red fija (FNE) o una Instalación de administración de claves (KMF).

La regeneración de clave es el proceso de cambiar las claves de encryption seguras actuales del radio. Las claves de encriptyon seguras permiten que ocurran las comunicaciones seguras.

NOTA:

Para usar este radio como módem de RF para transmitir comandos de regeneración de clave táctica, consulte el campo Datos de terminal.

Solo se accede: Cuando el campo Operación segura está configurado como **Hardware**, cuando el [Tipo de voz/señal de Rx en la página 431](#) es **ASTRO** o **Modo mixto** y cuando el campo [Tipo de voz/señal de Tx en la página 434](#) es **ASTRO**, y cuando se ha seleccionado un Sistema convencional al que se hace referencia del Tipo de sistema ASTRO que tiene un Perfil de datos válido al que se hace referencia, y cuando el Tipo de perfil de datos de dicho perfil es **Convencional**, y cuando el radio admite modelos y opciones diferentes.

10.34.9.3

Teclado de uso frecuente

Este campo permite que el usuario ingrese números telefónicos mediante el uso del teclado del radio, incluso si el radio no se encuentra en modo Teléfono.

Este modo de teclado de uso frecuente se inicia manteniendo oprimido el botón PTT mientras se oprimen los números requeridos. Esta función se aplica mientras funciona en la Personalidad convencional actual.

Solo se accede: Cuando el campo [Personalidad de solo recepción en la página 430](#) está **Desactivado** y la opción H de señalización de tono está presente, y cuando el radio admite modelos y opciones diferentes.

10.34.9.4

Activación de micrófono DTMF

Este campo permite transmitir tonos de DTMF mediante el uso del teclado del radio, incluso si el radio no se encuentra en modo Teléfono.

Para iniciar el micrófono DTMF, mantenga presionado el botón Superior o Lateral o Cabezal de control mientras se envía el número del teclado DTMF. Esta selección se aplica mientras funciona en la Personalidad convencional actual.

Solo se accede: Cuando el campo [Personalidad de solo recepción en la página 430](#) está **Desactivado** y la opción H de señalización de tono está presente, y cuando el radio admite modelos y opciones diferentes.

10.34.9.5

Finalizar Tx en ausencia de voz

Esta campo permite que el radio, durante una transmisión de voz de convencional, suelte el PTT automáticamente cuando su Procesador de señal digital (DSP) incorporado detecte una falta de voz del micrófono durante un período que supere el Temporizador de ausencia de voz.

Esta selección se aplica mientras funciona en la Personalidad convencional actual.

**ADVERTENCIA:**

La función no sirve cuando un radio en terreno:

- Está operando en Modo de emergencia y **Emergencia de micrófono de uso frecuente** o **Emergencia mediante silenciar audio** se encuentra actualmente activo (consulte también el Modo de transmisión automático de emergencia).
- Se está monitoreando actualmente en forma remota (consulte también Modo de radio remoto y Activación de monitor remoto de emergencia).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.34.9.6

Selección de lista de rastreo

En este campo se selecciona qué Lista de rastreo utiliza el radio mientras opera en modo Rastreo para la Personalidad convencional actual.

Esta Lista de rastreo determina a qué personas que llaman rastreará el radio (las escucha de manera activa) y considera desilenciar al canal convencional actual.

ADVERTENCIA:

Cuando el campo Audio plano analógico está **Activado**, este campo debe configurarse en **Ninguno**; de lo contrario, se vuelve no válido. Por lo tanto, no es posible activar ambas funciones en la misma personalidad.

Cuando el campo [Activación de rastreo de voto combinado en la página 479](#) está **Activado** para la Personalidad actual, este campo debe establecerse en **Convencional** [Tipo de rastreo en la página 689](#); de lo contrario, se vuelve no válido.

Cuando el Sistema convencional al que se hace referencia en el campo [Sistema ASTRO en la página 460](#) es un tipo de sistema DVRS, este campo debe estar configurado en **Ninguno**; de lo contrario, no es válido.

El RadioCentral considera esta selección no válida cuando la personalidad tiene banda ancha LTE activada y esta Lista de rastreo seleccionada posee cualquier canal Miembro de lista de rastreo con la siguiente condición:

- El campo [Frecuencia de interferencia LTE presente en la página 437](#) de su Personalidad convencional debe estar configurado en **Activado** o
- el campo Frec de interferencia LTE presente de su Sistema de troncalización debe estar en **Verdadero** o
- el campo Tipo de cobertura del Sistema de troncalización configurado en **Roaming Inter-WACN**.

NOTA:

Un canal convencional tiene LTE activada cuando el Sistema convencional ASTRO al que se hace referencia de la personalidad tiene un Perfil de datos al que se hace referencia que posee una selección de Tipo del perfil de datos igual a **Convencional y banda ancha** o **Solo banda ancha**, y cuando la Fuente de banda ancha del Perfil de datos es **Módem de LTE interno**.

El RadioCentral considera esta selección no válida cuando el campo Frecuencia de interferencia LTE presente de la Personalidad convencional actual está **Activado**, y esta Selección de lista de rastreo hace referencia a una Lista de rastreo con un canal con Banda ancha de LTE activada de Miembros de datos designados.

NOTA:

Un canal convencional tiene LTE activada cuando el Sistema convencional ASTRO al que se hace referencia de la personalidad tiene un Perfil de datos al que se hace referencia que posee un Tipo del perfil de datos igual a **Convencional y banda ancha** o **Solo banda ancha** y cuando el campo Activación de LTE de Perfiles de datos está **Activado**.

NOTA:

Las funcionalidades Lista de rastreo y Miembro de lista de rastreo se definen en la ventana Lista de rastreo.

Solo las Listas de rastreo con selección **Convencional** o **Grupos de conversación** en el campo Tipo de rastreo son selecciones de lista de rastreo válidas para la Personalidad convencional actual.

Solo las Listas de rastreo con la selección **Prioridad inteligente** en el campo Tipo de rastreo son selecciones de lista de rastreo válidas para la Personalidad convencional actual sin un sistema DVRS.

El usuario inicia la edición de la Lista de rastreo con el switch de alternación Programación de la lista de rastreo, la selección del menú Lista de rastreo o pulsando prolongadamente el botón Rastrear.

El Rastreo de votación es una selección no válida en una personalidad clonable.

Solo se accede: cuando el campo Sistema de interfaz de sitio remoto en el Sistema convencional al que se hace referencia está **Desactivado**;

si está **Activado**, el campo [Tipo de voz/señal de Rx en la página 431](#) debe configurarse en **ASTRO**, y esta Selección de lista de rastreo debe ser **Ninguno**; de lo contrario, este campo se vuelve no válido.

10.34.9.7

Rastreo automático

Este campo hace que el radio entre automáticamente al modo Exploración cuando el usuario selecciona (con el selector de canal) la Personalidad convencional actual.

También se invoca al rastreo automático cuando el radio se enciende en la personalidad actual.

Cuando se desactiva, el usuario puede invocar la operación del modo Rastreo mediante la pulsación del botón Rastreo, el switch de alternación Rastreo o la selección del menú Rastreo, mientras se opera en la Personalidad convencional actual.

Solo se accede: Cuando el campo [Selección de lista de rastreo en la página 477](#) no está configurado en **Ninguno**.

10.34.9.8

Activación de rastreo de voto combinado

En este campo se activa el Rastreo de voto convencional combinado para la Personalidad convencional actual.

Cuando este campo está **Activado**, todas las Opciones de frecuencia (registros/filas) en la personalidad actual se usan para formar la lista de Rastreo de votación.

IMPORTANTE:

Además, cuando este campo está habilitado el número máximo de opciones de frecuencia se limita a 15.

NOTA:

Es posible seleccionar los perfiles Opción de frecuencia desde la página Canales de Asignación de canal de zona; primero, la personalidad se selecciona en el campo Personalidad y el perfil Opciones de frecuencia se selecciona en el campo Opciones de frecuencia.

Solo se accede: cuando el radio admite modelos/opciones diferentes, y cuando la personalidad no se crea automáticamente mediante la función Clonación de zona; y

(cuando el campo Sistema de interfaz de sitio remoto en el Sistema convencional al que se hace referencia está **Desactivado**, si está **Activado**, entonces el campo [Tipo de voz/señal de Rx en la página 431](#) debe configurarse en **ASTRO**, y la selección Activación de rastreo de voto combinado debe estar en **Desactivado**; de lo contrario, este campo se vuelve no válido).

10.34.9.9

Dirección de Tx para rastreo de voto combinado

En este campo se activan los perfiles Opciones de frecuencia de la Personalidad convencional actual para que varíen cuando esa Personalidad tenga activada la opción Activación de rastreo de voto combinado convencional.

Consulte el campo [Activación de rastreo de voto combinado en la página 479](#). Cuando está desactivado, todas las opciones de frecuencia de Tx y las opciones de frecuencia de Rx específicas para la personalidad convencional actual deben ser iguales.

Solo se accede: cuando el campo Activación de rastreo de votación combinada está **Activado**.

10.34.9.10

Tipo de PTT inteligente

Este campo le permite seleccionar una regla de bloqueo de canal que evita que el radio transmita mientras existe la condición **Inhibición encendida** de Tx seleccionada.

Esta selección se aplica mientras funciona en la Personalidad convencional actual.

**IMPORTANTE:**

El campo [Anulación de tecla rápida en la página 481](#) es una función de anulación que corresponde a estas selecciones de **Inhibición de Tx encendida**. Esta función de anulación permite transmitir a pesar de la regla **Inhibición encendida** actualmente seleccionada.

**NOTA:**

Si el usuario intenta transmitir (mediante la pulsación del botón PTT) mientras una regla de **Inhibición encendida** de Tx seleccionada no permite la transmisión, el radio se comportará de una de las dos siguientes maneras:

- Si la condición **Inhibición encendida** de Tx seleccionada se cumple, pero el radio está actualmente silenciado, suena un tono de alerta continua hasta que se suelta el botón PTT. Esto incluye, por ejemplo, los casos cuando el repetidor está ocupado con una conversación encriptada, pero el radio permanece silenciado debido a una falta de soporte seguro (**Inhibición encendida en símbolos de estado**).
- Si el radio está actualmente recibiendo y está silenciada ante una transmisión de voz, presionar el botón PTT hará que se reproduzca un tono de alerta breve; esto se debe a que el radio se desilencia y recibe al audio de voz más alto después de un breve intervalo.

Solo se accede: Cuando el campo [Personalidad de solo recepción en la página 430](#) está **Desactivado**, cuando el Sistema convencional al que se hace referencia no es un tipo de sistema de DVRS y (si el campo [Tipo de voz/señal de Rx en la página 431](#) está establecido en **ASTRO**, entonces el campo Sistema de interfaz de sitio remoto del Sistema convencional al que se hace referencia debe estar **Desactivado**).

El Tipo de PTT inteligente es compatible con las siguientes selecciones:

Desactivado

Permite la transmisión cuando se detecta cualquier transmisión en el canal actual.

Inhibición en PL incorrecta

Para llamadas de voz analógicas (No ASTRO): Evita las transmisiones cuando se detecta un silenciador de la portadora con un código de PL que no coincide con la personalidad o el canal actuales. Si el código de PL de canal ocupado coincide con la personalidad actual, se permiten las transmisiones de radio.

Para llamadas de voz digitales (ASTRO): Evita la transmisión cuando el radio no se desilencia debido a que recibe un ID de grupo de conversación que no coincide con el ID de grupo de conversación de la personalidad/canal actuales. Si el grupo de conversación de canal ocupado coincide para el ID de grupo de conversación de la personalidad/canal actuales, se permiten las transmisiones de radio.

**NOTA:**

Los grupos de conversación permitidos se determinan mediante la Lista de grupo de conversación ASTRO a la que se hace referencia de la personalidad.

Inhibición en operador

Evita las transmisiones cuando se detecta un silenciador de la portadora en el canal actual.

Inhibición en NAC correcto

Evita la transmisión mientras el radio recibe una llamada de voz digital (ASTRO) que tiene un código de acceso a la red (NAC) coincidente para el canal actual (consulte [ID de Red de Rx en la página 443](#)).

Inhibición en símbolos de estado

Evita la transmisión mientras recibe una llamada de voz digital (ASTRO) y cuando el “último bit de estado de señal recibido” registrado fue **ocupado entrante** o **desconocido**.

NOTA:

Solo es posible recibir señales analógicas cuando el campo Tipo de voz/señal de Rx es **No ASTRO** o **Modo mixto**, se ha seleccionado un Tipo de sistema MDC o QCII en el campo Tipo de señalización No ASTRO y se ha seleccionado el Sistema No ASTRO correspondiente para la Personalidad convencional actual.

Solo es posible recibir señales digitales cuando el campo Tipo de voz/señal de Rx está establecido en **Modo ASTRO** o **Modo mixto** y se ha seleccionado un Sistema convencional ASTRO en el campo [Sistema ASTRO en la página 460](#).

10.34.9.11

Anulación de tecla rápida

Permite anular la regla **Inhibición encendida** del campo Tipo de PTT inteligente seleccionado, lo que permite enviar una transmisión en un canal ocupado de manera informal.

El usuario puede lograr esto mediante la doble pulsación rápida del botón PTT. La doble pulsación rápida es cuando presiona el botón PTT, lo suelta y lo vuelve a presionar rápidamente, dentro de la hora especificada por el campo Temporizador de tecla rápida Smart PTT. Esta función se aplica a la Personalidad convencional actual.

Solo se accede: Cuando el campo [Personalidad de solo recepción en la página 430](#) está **Desactivado**, cuando el campo [Tipo de PTT inteligente en la página 480](#) no está **Desactivado**, cuando el Sistema convencional al que se hace referencia no es un tipo de sistema DVRS y (si el campo [Tipo de voz/señal de Rx en la página 431](#) está establecido en **ASTRO**, entonces el campo Sistema de interfaz de sitio remoto del Sistema convencional al que se hace referencia debe estar **Desactivado**).

10.34.9.12

Tipo de señalización de incidentes

En este campo se selecciona el tipo de señalización Disposición del personal o Seguridad pública táctica (TPS) para la Personalidad convencional actual.

NOTA:

Ninguna de estas selecciones tiene influencia en la función [Activación UI de seguridad pública táctica en la página 483](#).

Solo se accede: Cuando la personalidad no es creada automáticamente por la función Clonación de zona y cuando el radio admite el modelo/opción.

Se admiten las siguientes selecciones:

Desactivado

No hay Disposición del personal ni Señalización de TPS disponible para el radio.

Disposición del personal

Permite la señalización de Responsabilidad del personal para la Personalidad convencional actual.

ADVERTENCIA:

Esta selección solo es válida cuando [Funcionamiento del teléfono](#) está configurada en **Ninguna**; y

cuando [Tipo de voz/señal de Tx en la página 434](#) se configura en **ASTRO** y

cuando el Sistema convencional al que se hace referencia no es un tipo de sistema DVRS y

cuando ese Perfil de datos del Sistema convencional al que se hace referencia está configurado en **Convencional y banda ancha** o **Solo banda ancha**.

Responsabilidad del personal con MDC

Permite la Disposición del personal con MDC para la Personalidad convencional actual

ADVERTENCIA:

Esta selección solo es válida cuando [Funcionamiento del teléfono](#) está configurada en **Ninguna**; y
 cuando [Tipo de voz/señal de Tx en la página 434](#) se configura en **ASTRO** y
 cuando Tipo de voz/señal de Rx está configurado en **Modo mixto**; y
 cuando Tipo de voz de Tx de Disposición del personal está configurado en **Analógico**; y
 cuando el Tipo de señalización No ASTRO está configurado en **MDC** ; y
 cuando RAC/Acceso a repetidor está desactivado y
 cuando el Sistema convencional al que se hace referencia está configurado en Tipo de sistema ASTRO; y
 cuando ese Perfil de datos del Sistema convencional al que se hace referencia está configurado en **Convencional y banda ancha** o **Solo banda ancha**.

Seguridad pública táctica

Activa la señalización TPS para la Personalidad convencional actual.

ADVERTENCIA:

Esta selección solo es válida cuando [Tipo de voz/señal de Rx en la página 431](#) está configurado en **Modo mixto**; y
 cuando el Tipo de voz/señal de Tx está configurado en **ASTRO**; y
 cuando el Tipo de señalización no ASTRO está configurado en **Ninguno**; y
 cuando el campo [Grupo de conversación en la página 475](#) está **Desactivado**, y
 cuando el campo [Rx/Tx de llamada selectiva en la página 470](#) está configurado en **Desactivado** o **Decodificación**; y
 cuando el Sistema convencional al que se hace referencia no es un tipo de sistema DVRS y
 cuando ese Perfil de datos del Sistema convencional al que se hace referencia de está configurado en **Convencional y banda ancha** o **Solo banda ancha**,
 y
 (cuando el campo Operación segura se encuentra **Desactivado**);
 o
 (cuando Operación segura está configurada en **Hardware** o **de privacidad digital avanzado**, y cuando [Voz Protegida/Enlace Abierto en la página 487](#) está configurado en **Borrar**).

10.34.9.13

Registro de responsabilidad del personal

Este campo permite al radio registrar la Disposición del personal (PA) en el terminal de comandos de incidentes (ICT).

El registro se realiza mediante la transmisión de paquetes de registro de PA al ICT con la expectativa de recibir una

confirmación del ICT de una transmisión de registro exitosa. Si la transmisión del paquete de registro no se ha confirmado, el radio seguirá intentando realizar la transmisión del paquete el número de

veces definido en el campo [Intentos de Tx máximos en la página 511](#) de Troncalización en general. Esta función se aplica cuando funciona en la Personalidad convencional actual.

**NOTA:**

El campo Radio en general, Responder a sondeos determina cuán a menudo (en minutos) el registro intentará realizarse nuevamente.

Solo se accede: cuando el campo [Tipo de señalización de incidentes en la página 481](#) se configura en **Disposición del personal** o **Disposición del personal con MDC**, y cuando el campo Registro de datos CAI en el Sistema convencional de la Personalidad convencional actual está **Desactivado**, y cuando los Datos de perfil a los que hace referencia ese Sistema convencional tiene el campo Modo ARS **Desactivado**, y cuando el radio admite modelos/opciones diferentes.

10.34.9.14

Tipo de voz de Tx

En este campo se selecciona el modo Transmisión de voz (Tx) que se usa durante la operación Disposición del personal para la Personalidad convencional actual.

Solo se accede: cuando el campo [Tipo de señalización de incidentes en la página 481](#) se configura en **Disposición del personal** o **Disposición del personal con MDC**, y cuando el radio admite modelos/opciones diferentes.

Se admiten las siguientes selecciones:

Digital

El modo digital ASTRO se usa para transmitir voz durante una operación de Disposición del personal. El modo digital ASTRO no es válido para Disposición del personal con MDC.

Analógico

El modo analógico Sin ASTRO se utiliza para transmitir voz durante el funcionamiento de Disposición del personal .

**ADVERTENCIA:**

Esta selección solo es válida conforme a una Personalidad convencional cuando el campo [Tipo de voz/señal de Rx en la página 431](#) está configurado en **Modo mixto**, cuando el campo [Grupo de conversación en la página 475](#) está **Desactivado** y cuando el campo [Rx/Tx de llamada selectiva en la página 470](#) no está configurado en **Codificar** o **Decodificar y codificar**.

10.34.9.15

Activación UI de seguridad pública táctica

En este campo se activan diversas funciones Seguridad pública táctica (TPS) que están relacionadas con la operación del modo Emergencia para la Personalidad convencional actual.

Estas funciones incluyen Radio en general, Seguridad pública táctica: Balizas audibles de emergencia, Enrutamiento de balizas audibles de emergencia, Tono lateral de Soltar el PTT para llamada de emergencia e Índice de reintento de alarma de emergencia.

**IMPORTANTE:**

Esta función se aplica a la Personalidad convencional, independientemente de la selección del [Tipo de señalización de incidentes en la página 481](#) de esta personalidad.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.34.9.16

Personalidad del Modo Zona de peligro

Este campo le permite activar el Modo Zona de peligro (HZM) mediante el switch concéntrico mientras funciona en la personalidad convencional actual.

**NOTA:**

Este campo solo se aplica al radio APX NEXT XN.

**IMPORTANTE:**

Cuando el HZM está **activado**, se deben cumplir las siguientes condiciones.

El campo Sistema ASTRO en la personalidad convencional está configurado para un sistema ASTRO con los siguientes ajustes:

- El campo Selección de perfil de emergencia está conectado a un perfil de emergencia convencional.
- El campo Selección de perfil de emergencia no está configurado como **Tx de emergencia desactivada**.
- El campo Indicador de Rx de alarma de emergencia está **activado**.

El campo Tipo de señal/voz de Tx y Tipo de señal/voz de Rx está configurado como **ASTRO** o el campo Tipo de señalización de incidente no está configurado como **Desactivado**.

Cuando el campo Personalidad de HZM está seleccionado, el campo Tipo de reversión de emergencia se establece como **Canal seleccionado** o en otro canal vinculado a una personalidad de HZM.

Solo se accede: Cuando el radio es el modelo más reciente de normas de servicio contra incendios.

10.34.9.17

Solicitud de PTT entrante de DVRS formal

Este campo activa PTT formal para el modo DVRS convencional. Las solicitudes de acceso de voz formal se envían mediante el reintento rápido en lugar de paciencia limitada.

Solo acceso: Este campo se aplica cuando el sistema ASTRO hace referencia a un sistema DVRS.

10.34.10

Teléfono

Esta sección permite ver o definir el sistema telefónico o la funcionalidad de marcado telefónico para las Personalidades convencionales individuales.

Estas configuraciones se aplican cuando funciona en Modo teléfono.

**NOTA:**

Cuando las funciones de personalidades convencionales se hayan definido de manera única, cada personalidad se puede asignar a la posición deseada del selector de canal del radio. Esto se hace en la página Canales de asignación de canal de zona.

Puede activar el modo Teléfono con una pulsación del botón Respuesta de llamada o Teléfono, o bien con una selección del menú Teléfono.

Se admiten los siguientes campos:

10.34.10.1

Selección de temporizador DTMF

En este campo se selecciona un conjunto de parámetros de cronómetro de DTMF desde la página Cronómetro DTMF de Amplitud de teléfono.

Cada conjunto define parámetros en los siguientes tres campos: Retraso inicial, Duración de dígito y Retraso de interdígito. Esta selección se aplica mientras funciona en el Modo teléfono para la Personalidad convencional actual.

Solo se accede: (Cuando el radio admite modelos y opciones diferentes, y cuando el campo [Personalidad de solo recepción en la página 430](#) está **Desactivado**, cuando el campo [Funcionamiento del teléfono](#) está establecido en **Solo lista** o **ilimitado** y cuando el Sistema convencional al que se hace referencia y que está seleccionado en el campo Sistema ASTRO no es un Tipo de sistema DVRS) y (si el campo [Tipo de voz/señal de Rx en la página 431](#) está establecido en **ASTRO**, entonces el campo Sistema de interfaz de sitio remoto del Sistema convencional al que se hace referencia debe estar **Desactivado**).

10.34.10.2

Selección de código de acceso automático

En este campo se selecciona un conjunto de códigos de Acceso y Término de acceso DTMF predefinidos para su utilización el modo Teléfono para comunicarse con un sistema telefónico.

Los códigos de acceso y terminación de acceso del sistema telefónico están asociados en conjuntos que se denominan en el campo Nombre de códigos DTMF. Esta selección se aplica mientras funciona en el Modo teléfono para la Personalidad convencional actual.

Solo se accede: (Cuando el radio admite modelos y opciones diferentes, y cuando el campo [Personalidad de solo recepción en la página 430](#) está **Desactivado**, cuando el campo [Funcionamiento del teléfono](#) está establecido en **Solo lista** o **ilimitado** y cuando el Sistema convencional al que se hace referencia y que está seleccionado en el campo Sistema ASTRO no es un Tipo de sistema DVRS) y (si el campo [Tipo de voz/señal de Rx en la página 431](#) está establecido en **ASTRO**, entonces el campo Sistema de interfaz de sitio remoto del Sistema convencional al que se hace referencia debe estar **Desactivado**).

10.34.11

Encriptación

Esta sección permite ver o definir la funcionalidad Seguridad para comunicaciones codificadas de transmisión y recepción seguras.

Esta funcionalidad puede personalizarse para la Personalidad convencional individual.

NOTA:

Cuando las funciones de personalidades convencionales se hayan definido de manera única, cada personalidad se puede asignar a la posición deseada del selector de canal del radio. Esto se hace en la página Canales de asignación de canal de zona.

10.34.11.1

Tipo de voz/señal seguro

En este campo se selecciona el modo Señalización de voz encriptada segura para la Personalidad convencional actual.

ADVERTENCIA:

Cuando el campo [Tipo de voz/señal de Rx en la página 431](#) está establecido en **ASTRO** o **Modo mixto**, ASTRO se convierte en el modo de señal/voz seguro válido.

Cuando el campo Tipo de voz/señal de Rx está establecido en **No ASTRO**, SecureNet se convierte en el modo de señal/voz seguro válido.

Solo se accede: cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware**, o (cuando el campo [Operación segura en la página 301](#) está configurado en **Software**, y cuando el campo [Tipo de voz/señal de Rx en la página 431](#) está configurado en **ASTRO** o **modo mixto**).

Se admiten las siguientes selecciones:

ASTRO

Cuando el campo Tipo de voz/señal de Rx está establecido en **ASTRO** o **Modo mixto**.

SecureNet

Cuando el campo Tipo de voz/señal de Rx está establecido en **No ASTRO**.

10.34.11.2

Transmisión XL

Este campo activa Estándar de encryption de datos - Rango extendido (DES-XL) analógico/SecureNet™ para la Personalidad convencional actual.

DES XL es un estándar de encryption Tipo 3 (nivel medio).

Cuando se desactiva, el Estándar de encryption de datos (DES) analógico/de SecureNet se aplica a la Personalidad convencional actual.

**NOTA:**

Las comunicaciones recibidas del chip XL seguro no necesitan configurarse, ya que este descifra automáticamente transmisiones continuas XL y no XL.

Solo se accede: cuando el campo Operación segura se configura en **Hardware**, y cuando el campo [Tipo de voz/señal de Rx en la página 431](#) está en **Sin ASTRO**, y cuando el campo [Voz Protegida/Enlace Abierto en la página 487](#) no está en **Borrar**, y cuando el campo [Tipo de voz/señal seguro en la página 485](#) es **Securenet**, y cuando el radio admite modelos/opciones diferentes.

10.34.11.3

DES-XL Tx predeterminado

Este campo habilita el algoritmo Estándar de encriptación de datos – Rango extendido (DES-XL) como predeterminado para todas las transmisiones de voz y datos encriptadas mientras funciona en la Personalidad convencional.

Esto solo se cumple cuando el usuario no inicia una transmisión durante el tiempo de desconexión de recepción de ID de clave. DES XL es un estándar de encryption Tipo 3 (nivel medio).

Cuando se desactiva, el Estándar de encryption de datos - respuesta de salida (DES-OFB) digital se aplica a la Personalidad convencional actual.

**IMPORTANTE:**

Esta función solo se aplica cuando el radio está equipado con un módulo de encryption de algoritmo doble DES-XL/DES-OFB.

Solo se accede: cuando el radio admite modelos/opciones diferentes, y cuando [Tipo de voz/señal de Rx en la página 431](#) es **ASTRO** o **modo Mixto**, y cuando el campo [Operación segura en la página 301](#) se configura en **Hardware**, y (cuando el campo [Tipo de voz/señal seguro en la página 485](#) es **ASTRO**, y cuando el campo [Grupo de conversación en la página 475](#) de ASTRO está **Activado**, o cuando el campo [Voz Protegida/Enlace Abierto en la página 487](#) es **Seleccionar** o **Asegurar**, o (cuando se ha seleccionado un Tipo de sistema **ASTRO** al que se hace referencia del Sistema convencional que tiene un Perfil de datos válido al que se hace referencia, y cuando el campo Datos de terminal en ese Perfil de datos está **Activado**), y cuando el campo [Paquete de datos seguro/borrar conexión en la página 488](#) es **Seleccionar** o **Asegurar**.

10.34.11.4

Voz Protegida/Enlace Abierto

En este campo se selecciona el modo Transmisión de encryption seguro para la Personalidad convencional actual.

**ADVERTENCIA:**

Cuando el campo Audio plano analógico está **Activado**, este campo debe configurarse en **Borrar**; de lo contrario, se vuelve no válido. Por lo tanto, no es posible activar ambas funciones en la misma personalidad.

(Cuando la Banda de frecuencia primaria es **900 MHz**), (cuando Permitir frecuencias no válidas está **Activado**, cuando 900 MHz utilizados en Codeplug está **Activado**), (cuando el campo Operación segura está establecido en **Hardware**, cuando el campo [Tipo de voz/señal de Rx en la página 431](#) está establecido en **No ASTRO** y cuando [Desviación de Tx/espaciamiento de canal en la página 442](#) para uno de los perfiles de Opciones de frecuencia actuales (registros/ filas) está establecido en **2,5 khz/12,5 khz**), este campo se debe establecer en **No encriptado**; de lo contrario, se invalida.

Solo se accede: (cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software**, y cuando el campo [Grupo de conversación en la página 475](#) está desactivado, y cuando la función Clonación de zona no crea automáticamente la personalidad; y

(cuando el campo [Tipo de voz/señal de Rx en la página 431](#) está en **modo Mixto** o **ASTRO**; y

cuando el campo Sistema de interfaz de sitio remoto en el Sistema convencional al que se hace referencia está desactivado);

O

(cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware**, y cuando el campo [Tipo de voz/señal de Rx en la página 431](#) está en **Sin ASTRO**).

Se admiten las siguientes selecciones:

Seleccionar

Permite activar o desactivar las comunicaciones encriptadas seguras.

Ya sea con la pulsación del botón Selección de Tx segura o el switch de alternación Selección de Tx segura o la selección del menú Seguro permite al usuario alterar entre las comunicaciones seguras y sin encryption para ese canal.

Borrar

Conecta o activa el canal en la operación convencional normal (no segura).

Encriptación

Conecta o activa el canal en la operación encriptada segura.

10.34.11.5

Conexión de clave de voz

En este campo se selecciona la clave de encryption de voz que se aplica mientras funciona en la Personalidad convencional actual.

Solo se accede: Cuando el campo [Voz Protegida/Enlace Abierto en la página 487](#) se puede configurar y no está en **No encriptado** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Seleccionar

Permite seleccionar la clave de encryption seguro que corresponde.

Compacto

La clave seleccionada desde el campo [Selección de clave de voz en la página 488](#) se ajusta de forma permanente a la Personalidad convencional actual.

ADVERTENCIA:

La selección del menú Clave debe elegirse para que el usuario pueda seleccionar claves para la Personalidad convencional actual.

10.34.11.6

Selección de clave de voz

En este campo se selecciona la clave de encryption de voz que se aplica mientras funciona en la Personalidad convencional actual.

Estas claves se programan en la Lista de clave de encryption segura.

IMPORTANTE:

Cuando el campo [ASTRO OTAR en la página 492](#) está **Activado** para la Personalidad convencional actual, el valor de Selección de clave se elige en la Lista de referencias de clave de encryption de hardware seguro de la función Perfil de KMF seguro seleccionada en el campo Índice de perfil de KMF para la Personalidad convencional actual.

ADVERTENCIA:

Considere que la aplicación en realidad apunta a las claves de la Lista de clave de encryption para esta selección; las claves individuales de la Lista de referencias de clave de encryption de hardware seguro hacen referencia a las claves de la Lista de clave de encryption en el campo Referencia de clave de encryption. Por lo tanto, cuando ASTRO OTAR está **Activado**, cualquier clave que se seleccione primero se debe definir en la Lista de referencias de clave de encryption para hardware seguro.

Cuando el campo ASTRO OTAR está **Desactivado** para la Personalidad convencional actual, este valor de Selección de clave se elige directamente en la Lista de clave de encryption de la ventana Encryption en general.

Solo se accede: Cuando el campo [Voz Protegida/Enlace Abierto en la página 487](#) se puede configurar y no está en **No encriptado** y cuando el radio admite modelos y opciones diferentes.

10.34.11.7

Ignorar voz no encriptada de Rx

Este campo permite que el radio ignore todas las comunicaciones de Borrar (sin encryption seguro) mientras se opera en la Personalidad convencional actual.

Solo se accede: cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software**; y

(Si el campo [Tipo de voz/señal de Rx en la página 431](#) está establecido en **ASTRO**, ENTONCES el campo Sistema de interfaz de sitio remoto del Sistema convencional al que se hace referencia debe desactivarse).

10.34.11.8

Paquete de datos seguro/borrar conexión

En este campo se selecciona el modo de transmisión de datos por paquete de la Asociación de Funcionarios de Comunicaciones de Seguridad Pública (APCO) para la Personalidad convencional.

Solo se accede: (cuando el radio admite modelos/opciones diferentes, y cuando el [Tipo de voz/señal de Rx en la página 431](#) se configura en **modo ASTRO** o **modo Mixto**, y cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software**, y cuando el Sistema convencional al que se hace referencia no es un Tipo de sistema DVRS, y cuando la función Clonación de zona no crea de forma automática la personalidad);

y

(cuando el campo Activar [Inhibición táctica] está activado o cuando el Sistema convencional al que se hace referencia tiene una referencia válida [Perfiles de datos en la página 376](#) seleccionada, y cuando el campo [Datos de terminal en la página 380](#) de ese Perfil de datos está activado).

Se admiten las siguientes selecciones:

Borrar

El radio transmite datos por paquete APCO en modo no seguro.

Encriptación

El radio transmite datos por paquete APCO en modo de encryption seguro.

10.34.11.9

Selección de clave de paquete de datos

En este campo se selecciona la clave de encryption que se usará para transmisiones de datos por paquete de la Asociación de Funcionarios de Comunicaciones de Seguridad Pública (APCO).

Esta selección se aplica a la Personalidad convencional actual.

IMPORTANTE:

Cuando el campo [ASTRO OTAR en la página 492](#) está **Activado** para la Personalidad convencional actual, el valor de Seleccionar clave se elige desde la Lista de referencias de clave de encryption de hardware seguro de la función Perfiles seguros de KMF seleccionada en el campo [Índice de perfil de ASTRO OTAR en la página 492](#) para la Personalidad convencional actual.

ADVERTENCIA:

Considere que la aplicación en realidad apunta a las claves de la Lista de clave de encryption para esta selección; las claves individuales de la Lista de referencias de clave de encryption de hardware seguro hacen referencia a las claves de la Lista de clave de encryption en el campo Referencia de clave de encryption. Por lo tanto, cuando ASTRO OTAR está **Activado**, cualquier clave que se seleccione primero se debe definir en la Lista de referencias de clave de encryption para hardware seguro.

Cuando el campo ASTRO OTAR está **Desactivado** para la Personalidad convencional actual, este valor de Selección de clave se elige directamente en la Lista de clave de encryption de la ventana Encryption en general.

Solo se accede: (cuando el radio admite modelos/opciones diferentes, y cuando [Tipo de voz/señal de Rx en la página 431](#) se configura en **modo ASTRO** o **modo Mixto**, y cuando el campo [Operación segura en la página 301](#) se configura en **Hardware**, y cuando el mencionado Sistema convencional no es un Tipo de sistema DVRS, y ([cuando el campo Activación de la inhibición táctica está **Activado**], o [cuando el mencionado Sistema convencional tiene un Perfil de datos válido seleccionado al que se hace referencia, y cuando el campo Datos de terminal en ese Perfil de datos está **Activado**]).

10.34.11.10

Ignorar datos por paquete no encriptados Rx

Este campo hace que el radio ignore todas las comunicaciones de datos por paquete convencionales de ASTRO (sin encryption seguro) mientras funciona en la Personalidad convencional.

NOTA:

Para obtener más información sobre los datos por paquete de sistemas ASTRO, consulte la Ventana de perfil de datos y el Sistema convencional. ASTRO, campo Selección de perfil de datos.

Solo se accede: (cuando [Tipo de voz/señal de Rx en la página 431](#) se configura en **modo ASTRO** o **modo Mixto**, y cuando el campo [Operación segura en la página 301](#) se configura en **Hardware**

o **Software**, y cuando el campo [Paquete de datos seguro/borrar conexión en la página 488](#) es **Asegurar**, y cuando el radio admite modelos/opciones diferentes);

y

(cuando el Sistema convencional al que se hace referencia no es un Tipo de sistema DVRS; y cuando ese Sistema convencional referenciado tiene un Perfil de datos seleccionado válido; y cuando el campo [Datos de terminal en la página 380](#) en dicho Perfil de datos está activado).

10.34.11.11

Detección de código adecuado

Este campo hace que el altavoz del radio se desilencie solo en datos de SecureNet™ cuando estos están encriptados con la clave de seguridad correcta.

La clave de seguridad encriptada es difícil de descifrar para los radios con un chip de encryption interno o un dispositivo de Cargador de variables de clave (KVL). Esta función se aplica a la Personalidad convencional actual.

Solo se accede: Cuando el campo Operación segura está configurado como **Hardware**, cuando el campo [Tipo de voz/señal seguro en la página 485](#) es **Securenet** y cuando el radio admite modelos y opciones diferentes.

10.34.11.12

OTAR Tx (Tx de OTAR)

Este campo habilita el radio para transmitir ASTRO y Regeneración de clave inalámbrica (OTAR) de MDC para la Personalidad convencional actual.

Las transmisiones de OTAR incluyen: Solicitudes de regeneración de clave, Confirmaciones de retraso o Confirmaciones de encendido.

ADVERTENCIA:

Se debe programar su capacidad para iniciar solicitudes de regeneración de clave.

NOTA:

Solicitudes de regeneración de clave: Cuando el campo [ASTRO OTAR en la página 492](#) está activado para el canal actual, y ASTRO y MDC están disponibles para el canal (consulte [Tipo de voz/señal de Rx en la página 431 modo Mixto](#)), las solicitudes de regeneración de clave iniciadas por el usuario siempre se transmiten con OTAR ASTRO. Sin embargo, cuando el radio responde a una transmisión de OTAR, el radio siempre transmite utilizando el mismo tipo de OTAR que se recibió.

Configuración del modo mezclado ASTRO y MDC: Cuando el campo Tipo de voz/señal de Rx está configurado en **modo Mixto**, se debe seleccionar un Sistema convencional de Tipo de sistema ASTRO en el campo [Sistema ASTRO en la página 460](#), y se debe seleccionar **MDC** en el campo Tipo de señalización Sin ASTRO, lo que permite que un Sistema convencional de Tipo de sistema MDC se seleccione en el campo Sistema sin ASTRO.

El Sistema convencional no es un Tipo de sistema DVRS

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está en **Hardware** o **Software** y el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) está activado; y

cuando el campo [Activación de OTAR en la página 303](#) está activado; y

cuando el campo [Personalidad de solo recepción en la página 430](#) está desactivado, y cuando el radio admite modelos y opciones diferentes;

y

(cuando el campo [Activación de ASTRO OTAR en la página 304](#) está activado; y

cuando el campo [Activación de MDC OTAR en la página 307](#) está activado).

O

(cuando el campo [Activación de ASTRO OTAR](#) está activado y cuando el campo [Activación de OTAR de MDC](#) está desactivado; y cuando el [Tipo de voz/señal de Rx en la página 431](#) está en **ASTRO** o **modo Mixto**);

O

(cuando el campo [Activación de ASTRO OTAR](#) está deshabilitado; y cuando el campo [Activación de MDC OTAR](#) está habilitado y cuando el campo [Tipo de voz/señal de Rx](#) está en **Sin ASTRO** o **modo Mixto**; y cuando el campo [Tipo de señalización sin ASTRO en la página 462](#) es **MDC**).

El Sistema convencional es un Tipo de sistema DVRS

Cuando el campo [Operación segura en la página 301](#) está en **Hardware** o **Software** y el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) está activado; y

cuando el campo [Activación de OTAR en la página 303](#) está activado; y

cuando el campo [Personalidad de solo recepción en la página 430](#) está desactivado, y cuando el radio admite modelos y opciones diferentes;

y

(cuando el campo [Activación de ASTRO OTAR en la página 304](#) está activado; y

cuando el campo [Activación de MDC OTAR en la página 307](#) esté activado); y

cuando el [Tipo de voz/señal de Rx en la página 431](#) está en **modo Mixto**; y

y cuando el campo [Tipo de señalización sin ASTRO en la página 462](#) es **MDC**);

O

(cuando el campo [Activación de ASTRO OTAR](#) está activado y

cuando el [Tipo de voz/señal de Rx en la página 431](#) no está configurado en **Sin ASTRO**).

10.34.11.13

ASTRO OTAR

Este campo activa la capacidad del radio para recibir Regeneración de clave inalámbrica (OTAR) de ASTRO o recibir MDC OTAR para la Personalidad convencional actual.

**NOTA:**

Para que tanto ASTRO OTAR como MDC OTAR reciban capacidad en el mismo canal, el campo [Tipo de voz/señal de Rx en la página 431](#) debe estar establecido en **Modo mixto**. ASTRO OTAR tiene prioridad sobre MDC OTAR; sin embargo, si se recibe una MDC OTAR, el radio primero intentará responder con MDC OTAR.

**IMPORTANTE:**

Cuando el campo [Activación de ASTRO OTAR en la página 304](#) está **Activado** para los valores actuales de Selección de clave de hardware de la Personalidad convencional, los valores de Selección de clave de hardware para esta personalidad utilizan [Lista de referencias de clave de encryption de hardware seguro en la página 321](#) del Perfil KMF seguro seleccionado en este Índice de perfil KMF para la Personalidad convencional actual.

**ADVERTENCIA:**

Tenga en cuenta que RadioCentral se dirige realmente a las claves de la [Lista de clave de encryption en la página 317](#) para esta selección; las claves individuales de la Lista de referencias de clave de encryption de hardware seguro hacen referencia a las claves de la Lista de clave de encryption del campo [Referencia de clave de encryption en la página 322](#). Por lo tanto, cuando ASTRO OTAR está activado, cualquier clave que se seleccione primero se debe definir en la Lista de referencias de clave de encryption para hardware seguro.

Cuando el campo [Activación de ASTRO OTAR en la página 304](#) está **Desactivado** para la Personalidad convencional actual, los valores de Selección de clave de hardware se eligen directamente en la Lista de clave de encryption de la ventana Asegurar amplitud.

Solo se accede: cuando el campo [Operación segura en la página 301](#) está en **Hardware** o **Software**, y cuando el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) está activado; y cuando el [Tipo de voz/señal de Rx en la página 431](#) está en **modo ASTRO** o **modo Mixto**; y cuando el campo [Activación de OTAR en la página 303](#) está **Activado**; y cuando el campo [Activación de ASTRO OTAR en la página 304](#) está **Activado**; y cuando la función Clonación de zona no crea automáticamente la personalidad; y Cuando el radio admite modelos y opciones diferentes.

10.34.11.14

Índice de perfil de ASTRO OTAR

En este campo se selecciona el Perfil de instalación de administración de claves (KMF) segura para usar mientras funciona en el modo ASTRO de Regeneración de clave inalámbrica (OTAR).

Esta selección se aplica mientras funciona en la Personalidad convencional actual.

**NOTA:**

Todos los parámetros de ASTRO OTAR especificados en el perfil KMF seleccionado se aplican para la Personalidad convencional actual.

**ADVERTENCIA:**

Este campo no es válido cuando esta personalidad hace referencia a un Sistema convencional (que tiene un tipo de sistema de **ASTRO**), que hace referencia a un perfil de datos (que tiene un tipo de perfil de datos de **Convencional y banda ancha** o **Solo banda ancha**) y cuando el campo Dirección IP de KMF está establecido en 0.0.0.0.

**IMPORTANTE:**

Cuando el campo [ASTRO OTAR en la página 492](#) está **Activado** para la Personalidad convencional actual, los valores de Selección de clave de hardware para esta personalidad usan la Lista de referencias de clave de encryption de hardware seguro del Perfil KMF seguro seleccionado en el campo Índice de perfil KMF para la Personalidad convencional actual.

**ADVERTENCIA:**

Considere que la aplicación en realidad apunta a las claves de la Lista de clave de encryption para esta selección; las claves individuales de la Lista de referencias de clave de encryption de hardware seguro hacen referencia a las claves de la Lista de clave de encryption en el campo Referencia de clave de encryption. Por lo tanto, cuando OTAR de ASTRO está en **Activado** cualquier clave que se seleccione primero se debe definir en la Lista de referencias de clave de encryption de hardware seguro.

Cuando el campo OTAR de ASTRO está **Desactivado** para la Personalidad convencional actual, los valores de Selección de clave de hardware se eligen directamente en la Lista de clave de encryption de la ventana Asegurar amplitud.

Solo se accede: cuando el campo [Operación segura en la página 301](#) está en **Hardware** o **Software**, y el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) está activado; y

cuando el campo OTAR de ASTRO está **Activado** y aplicable; y

cuando el [Tipo de voz/señal de Rx en la página 431](#) está en **ASTRO** o **modo Mixto**; y

cuando el campo [Activación de ASTRO OTAR en la página 304](#) está activado; y

cuando el campo [Activación de OTAR en la página 303](#) está activado; y

cuando el campo Activación de regeneración de clave táctica está desactivado; y

Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

- Desactivado
- Perfiles KMF seguros disponibles

10.34.11.15**Tiempo de silencio de eco**

En este campo se selecciona la cantidad de tiempo que el altavoz del radio permanece silenciado inmediatamente después de una transmisión encriptada segura.

Es decir, para sistemas de repetidor que tienen una gran cantidad de retardo de carga útil de datos, la última parte de la transmisión de voz encriptada puede escucharse nuevamente después de dejar de pulsar. Este tiempo puede permitir retrasos del sistema del repetidor, lo que silencia este efecto de eco posible. Este tiempo comienza cuando se suelta el botón PTT. Esta selección se aplica a la Personalidad convencional actual.

Solo se accede: (cuando el campo [Grupo de conversación en la página 475](#) de ASTRO está **Activado**, o cuando el campo Grupo de conversación ASTRO está **Desactivado**, y cuando el campo [Voz Protegida/Enlace Abierto en la página 487](#) es **Seleccionar** o **Asegurar**); y

(cuando el campo [Operación segura en la página 301](#) campo está configurado en **Hardware** o **Software**, y cuando el campo [Tipo de voz/señal de Rx en la página 431](#) está configurado en **ASTRO** o **modo Mixto**).

Mesa 217: Rango

Mínimo	Máximo	Incrementos
0 ms	1500 ms	50 ms

10.34.11.16

Selección de rastreo

En este campo se selecciona la cantidad de tiempo que el radio espera durante el modo Rastreo activa para detectar una transmisión de SecureNet™ codificada (Sin ASTRO).

Este período de espera comienza cuando se detecta el silenciador de la portadora. Esta función se aplica a la [Selección de lista de rastreo en la página 477](#) seleccionada de la Personalidad convencional actual y solo cuando explora un canal de miembros de lista de rastreo codificado de SecureNet.

Solo se accede: Cuando el campo Operación segura está configurado en **Hardware**, cuando el campo [Transmisión XL en la página 486](#) está **Desactivado**, cuando el campo [Tipo de voz/señal seguro en la página 485](#) es **Securenet** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

No XL

Si el canal de miembro de la Lista de rastreo está configurado en SecureNet no XL, el radio espera el período especificado en el campo Duración sin silenciador de rastreo no XL.

No XL y XL

Si el canal de miembro de la Lista de rastreo está configurado en SecureNet XL y no XL, el radio espera el período especificado en el campo Duración sin silenciador de rastreo no XL.

NOTA:

XL requiere un período de espera más largo.

10.34.11.17

Conexión de interrupción de rastreo

En este campo se selecciona optimizar el algoritmo de desilenciamiento de rastreo relacionado con las llamadas codificadas de SecureNet™ (Sin ASTRO).

El algoritmo también se basa en la configuración de [Tipo desilenciar en la página 466](#) seleccionada para la Personalidad convencional actual. Esta funcionalidad se aplica cuando intenta desilenciar en los canales de Miembro de lista de rastreo (solo convencional). Esta selección se aplica a la Personalidad convencional actual.

Solo se accede: Cuando el campo Operación segura está configurado como **Hardware**, cuando el campo [Tipo de voz/señal de Rx en la página 431](#) es **No ASTRO** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Ambos

Esta selección es la menos eficiente debido a la consideración de todos los tipos de rastreo posibles.

Solo sin encriptar

Se aplican configuraciones internas del radio a PL, DPL, el silenciador de la portadora (CSQ) y la señalización.

Solo encriptado

Usa la duración sin silenciador adecuada con base en la selección del campo [Selección de rastreo en la página 494](#) XL o no XL.

10.34.11.18

ID de clave

En este campo se selecciona el método de ID de clave mientras funciona en la Personalidad convencional actual.

Solo se accede: Cuando la opción Operación segura está configurada en **Hardware**, cuando el campo Tipo de señalización No ASTRO es **MDC**, cuando el campo es **Securenet** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Solo Tx (transmisión)

Transmitir el ID de clave al comienzo de cada transmisión.

Solo Rx (recepción)

Cambiar el ID de clave a lo especificado al comienzo de cada mensaje de recepción. Si dicho mensaje no especifica un ID de clave, el radio usará el actual.

Tx y Rx (recepción/transmisión)

Selecciona ambas funciones anteriores.

Ninguno

No selecciona ninguna de las funciones anteriores.

10.34.11.19

Retraso de XL después de ID de clave

En este campo se selecciona la cantidad de tiempo que el radio espera después de una transmisión de código de ID de clave antes de transmitir audio encriptado de rango extendido (XL).

Esta selección se aplica mientras funciona en la Personalidad convencional actual.

Solo se accede: Cuando el campo Operación segura está establecido en **Hardware**, cuando el [Tipo de voz/señal de Rx en la página 431](#) es **No ASTRO**, cuando el Tipo de señalización No ASTRO es **MDC**, cuando el campo [Voz Protegida/Enlace Abierto en la página 487](#) no está en **No encriptado**, cuando el campo [Transmisión XL en la página 486](#) está **Activado**, cuando el campo [Tipo de voz/señal seguro en la página 485](#) es **Securenet**, cuando el campo [ID de clave en la página 495](#) es **Solo Tx** o **Tx y Rx** y cuando el radio admite modelos y opciones diferentes.

Mesa 218: Rango

Mínimo	Máximo
0	200

10.34.11.20

ASTRO OTAR de banda ancha

Si este campo está activado, puede utilizar Regeneración de clave por el aire (OTAR) a través de banda ancha en canales analógicos.

Solo se accede: Cuando se cumplen las siguientes condiciones.

- El radio admite modelos y opciones diferentes.
- El campo Operación segura está configurado en **Hardware** o en **Software**, y el estándar de encryption avanzado (AES) está activado.
- El campo Activación de ASTRO OTAR está activado.
- Los campos Personalidad convencional y Tipo de voz/señal de Rx están configurados en **No ASTRO**.
- La Personalidad de solo recepción está desactivada.

10.34.12

Avanzada

Esta sección permite ver o definir la funcionalidad más diversa y compleja de las Personalidades convencionales individuales.

NOTA:

Cuando las funciones de personalidades convencionales se hayan definido de manera única, cada personalidad se puede asignar a la posición deseada del selector de canal del radio. Esto se hace en la página Canales de asignación de canal de zona.

10.34.12.1

AGC de RF avanzado

En este campo se selecciona el tipo de Control automático de ganancia (AGC) de la Frecuencia de recepción (RF) que se aplica a la Personalidad convencional actual.

Se admiten las siguientes selecciones:

Desactivado

Incluso cuando está **Desactivado**, el radio usa una forma básica de AGC incorporado al receptor del radio. Esta protección incorporada ayuda a evitar la saturación de la señal y del receptor que puede dañar los componentes del radio.

Estándar

Activa una forma avanzada de AGC de RF, que busca evitar la interferencia de intermodulación (IM) mediante la detección y la remoción de toda interferencia recibida causada por fuentes externas.

Mejorado

Activa el radio para usar esquemas adicionales a fin de disminuir la interferencia de IM, lo que limpia la señal.

Inteligente

Permite que el radio utilice un esquema único para mejorar la inmunidad a la interferencia cuando está cerca de estaciones base de fase 2 de transmisión Simulcast lineal y APCO. La opción inteligente es mutuamente excluyente con la casilla de verificación de protección de banda ancha.

IMPORTANTE:

El AGC de RF avanzado **Estándar** y **Mejorado** pueden degradar el rendimiento de los canales que no experimentan una interferencia de IM. Por lo tanto, solo se deben activar estas selecciones en canales con problemas de interferencia de IM.

10.34.13

Un toque

Esta sección permite ver o definir selecciones de **Función** e **Índice** de Un toque específicas para hasta cuatro pulsaciones del botón Un toque o selecciones de menú de Un toque.

Un toque permite crear menús de navegación o atajos de botones. Estos atajos reducen significativamente el esfuerzo que el usuario del radio realiza para iniciar una función del radio. Una pulsación del botón de Un toque o una selección de menú pueden reducir a una sola pulsación de botón el inicio de una función del radio; de lo contrario, para este mismo proceso se llevarían a cabo muchos pasos de navegación en el menú. Estas selecciones se aplican a la Personalidad convencional actual.

**NOTA:**

Cuando las funciones de personalidades convencionales se hayan definido de manera única, cada personalidad se puede asignar a la posición deseada del selector de canal del radio. Esto se hace en la página Canales de asignación de canal de zona.

10.34.13.1

Botón

Muestra solo la visualización del nombre asignado para la pulsación del botón Un toque o la selección del menú Un toque.

**NOTA:**

Los Sistemas de troncalización individuales hacen referencia a una Personalidad de troncalización. Luego, esta configuración de los Sistemas de troncalización puede quedar operativa para todos los tipos de canales dentro de dicha Personalidad de troncalización.

10.34.13.2

Función Botón un toque

En este campo se selecciona la función Un toque para la pulsación del botón Un toque o la selección de menú Un toque.

Este selección se aplica para el registro o la fila actuales, que se aplica para el Sistema de troncalización actual.

**IMPORTANTE:**

El botón convencional Un toque 1 (en otras palabras, el primer registro/fila) correspondería a una pulsación del botón Un toque 1 o a una selección del menú TCH1 o SIG1, y así sucesivamente.

**NOTA:**

Cuando se selecciona cualquiera de los tipos de función de botón de Un toque, también se requiere una selección de Índice/Miembro de Lista [Índice del botón Un toque en la página 498](#) para la personalidad actual: Teléfono, Llamada selectiva, Alerta de llamada, Estado o Mensaje.

Las selecciones de funciones disponibles del botón Un toque dependen del modelo u opción.

Solo se accede: Cuando el radio admite modelos y opciones diferentes, y (si el campo [Tipo de voz/señal de Rx en la página 431](#) está configurado en **ASTRO**, entonces el campo [Sistema de interfaz de sitio remoto](#) en el Sistema convencional al que se hace referencia debe estar **Desactivado**).

Se admiten las siguientes selecciones:

Desactivado

La opción Un toque no está disponible para la selección de botón actual.

Teléfono

La función [Funcionamiento del teléfono en la página 577](#) se activa para la personalidad actual.

Seleccionar llamada

La función [Rx/Tx de llamada selectiva en la página 466](#) está configurada en **Decodificar y codificar** o **Codificar**.

**IMPORTANTE:**

Cuando el Sistema convencional al que se hace referencia es un Tipo de sistema "DVRS", entonces esta función asocia la funcionalidad Llamada privada de troncalización con la pulsación del botón Un toque o la selección del menú [Un toque \(SIG1-SIG4/DISP\)](#).

Alerta de llamada

El campo [Funcionamiento de alerta/localización de llamada en la página 575](#) está configurado como **Solo lista** o **Ilimitado** para la Personalidad de troncalización referida.

Estado

La función [Estado en la página 419](#) del Sistema convencional al que se hace referencia (para la personalidad actual) está **Activada**.

Mensaje

La función [Mensaje](#) del Sistema convencional al que se hace referencia (para la personalidad actual) está **Activada**.

RAB1 (botón Acceso a repetidor)

La función [Acceso al repetidor](#) se activa para la personalidad actual. Cuando el campo [Tipo de acceso](#) está establecido en **Automático**, esta selección se invalida. Cuando el campo Tipo de acceso es **Manual**, se aplica la selección Tipo de código 1 para RAB1 a esta pulsación de botón.

RAB2

Se activa la función Acceso a repetidor para la personalidad actual. Cuando el campo Tipo de acceso se configura en **Auto** o el Tipo de código 2 para RAB2 se establece en **Ninguno**, esta selección se vuelve no válida.

RTT (Solicitud para hablar)

Se activa la función Acceso a repetidor y la función Tipo de acceso se configura en **Manual** para la personalidad actual.

10.34.13.3

Índice del botón Un toque

En este campo se selecciona el Índice/miembro de la lista de un toque para la pulsación del botón Un toque o la selección del menú Un toque correspondiente a la función del botón Un toque seleccionada.

El término Índice hace referencia al registro o la fila real de la lista determinada por la selección de la función del botón Un toque. Esta selección se aplica a la Personalidad convencional actual.

**IMPORTANTE:**

El botón Convencional de un toque 1, el primer registro/fila correspondería a una pulsación del botón Un toque 1 o a una selección del menú TCH1 o SIG1.

Solo se accede: Cuando el campo [Función Botón un toque en la página 497](#) no está establecido en **Desactivado**, **RAB1**, **RAB2** o **RTT**,

y si el campo [Tipo de voz/señal de Rx en la página 431](#) está configurado en **ASTRO**, entonces el campo [Sistema de interfaz de sitio remoto](#) en el Sistema convencional al que se hace referencia debe desactivarse.

Se admiten las siguientes selecciones:

Seleccionar llamada

Este número "Índice" se correlaciona con el número de fila de la Lista de llamadas frecuentes.

Disponible para el usuario cuando está [Rx/Tx de llamada selectiva en la página 466](#) configurado en **Decodificar y codificar** o **Codificar** para la personalidad actual.

IMPORTANTE:

Los campos Selección de lista de uso frecuente determinan cuál de esas listas se usa para la personalidad actual.

Alerta de llamada

Este número "Índice" se correlaciona con el número de fila de la Lista de llamadas frecuentes.

Disponible para el usuario cuando [RX/Tx de alerta de llamada en la página 467](#) está configurado en "Decodificar y codificar" o "Codificar" para la personalidad actual.

IMPORTANTE:

Los campos Selección de la lista de uso frecuente determinan qué Lista de uso frecuente se usa para la personalidad actual.

Teléfono

Este número "Índice" se correlaciona con el número de fila de la Lista de llamadas telefónicas frecuentes.

Disponible para el usuario cuando la función [Funcionamiento del teléfono](#) está activada para la personalidad actual.

Estado

Este número "Índice" se correlaciona con el número de fila de la Lista de alias de estado.

Disponible para el usuario cuando la función [Estado en la página 419 Sistema convencional en la página 415](#) a la que se hace referencia (para la personalidad actual) está activada.

Mensaje

Este número "Índice" se correlaciona con el número de fila de la Lista de alias de mensaje.

Disponible para el usuario cuando la función [Mensaje Sistema convencional en la página 415](#) a la que se hace referencia (para la personalidad actual) está activada.

10.35

Troncalización en general

Esta sección le permite ver o definir la funcionalidad que puede aplicarse a todos los Sistemas de troncalización y, por lo tanto, a todas las personalidades de troncalización.

10.35.1

General

Esta sección permite visualizar o definir la funcionalidad básica que puede aplicarse a todos los Sistemas de troncalización y, por lo tanto, a todas las Personalidades de troncalización.

10.35.1.1

Tiempo de timbre máximo del destino de llamada individual

En este campo se selecciona la cantidad máxima de tiempo que timbra la unidad de suscriptor (SU) luego de recibir una solicitud de llamada individual.

IMPORTANTE:

Una llamada individual incluye llamadas telefónicas y de unidad a unidad. Si usted responde la llamada antes de que se agote el temporizador, el temporizador y el timbre se detienen. Esta selección se aplica para todos los Sistemas de troncalización y, por lo tanto, para todas las Personalidades de troncalización. El tiempo está expresado en segundos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

NOTA:

Cuando se establece en **Infinito**, el tiempo de timbre es ilimitado.

Mesa 219: Rango

Mínimo	Máximo	Incrementos
61 s	120 s	1 seg

10.35.1.2

Timbre inicial máximo de llamada privada

En este campo se selecciona la cantidad máxima de tiempo que timbra la unidad de suscriptor después de iniciar una solicitud de llamada de unidad a unidad.

IMPORTANTE:

Las solicitudes de llamadas telefónicas no se incluyen. Si el temporizador se agota antes de que el radio de destino responda la llamada, se cancela el intento de llamada. El temporizador y el timbre se detienen si la unidad de destino responde la llamada antes de que se agote el temporizador. Esta selección se aplica para todos los Sistemas de troncalización y, por lo tanto, para todas las Personalidades de troncalización. El tiempo está expresado en segundos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

NOTA:

Cuando se establece en **Infinito**, el tiempo de timbre es ilimitado.

Mesa 220: Rango

Mínimo	Máximo	Incrementos
1 seg	255 s	1 seg

10.35.1.3

Interrupción de marcado automático de teléfono

En este campo se selecciona la cantidad de tiempo que el radio espera una vez que se ha otorgado el acceso al canal de voz digital al sistema telefónico.

Una vez que este cronómetro expira, se transmiten los números seleccionados o ingresados previamente de la Lista de uso frecuente de Tipo II seleccionada (marcado rápido) o del [Teclado de uso frecuente \(DTMF\) en la página 580](#).

IMPORTANTE:

Esta selección solo se aplica al teléfono digital dentro de los Sistemas de troncalización tipo II y, por ende, a todas las Personalidades de troncalización tipo II. Consulte también el campo Sistema de troncalización, Tipo de sistema. El tiempo está expresado en milisegundos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 221: Rango

Mínimo	Máximo	Incrementos
0 ms	6375 ms	25 ms

10.35.1.4

Emergencia bloqueada con degradación reducida

Este campo hace que el radio ignore cualquier intento de entrar a la función Modo de emergencia de Comunicaciones de troncalización cuando la red se encuentra en la condición de degradación reducida.

Esta selección se aplica para todos los Sistemas de troncalización y, por lo tanto, para todas las Personalidades de troncalización.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.35.1.5

Desactivación de AFC

Este campo hace que se desactive el algoritmo de Control automático de frecuencia (AFC) del radio.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

El AFC corrige automáticamente la deriva del oscilador de referencia (RO) del radio resolviendo la frecuencia de la señal de RF recibida y proporcionando comentarios sobre una señal de error proporcional al grado de mala sintonización del RO, el cual a su vez reduce el error de sintonización. Sin embargo, puede ser beneficioso desactivar el AFC en entornos ruidosos, donde la señal de error se puede rastrear a una frecuencia de interferencia en lugar de la asignada.

**IMPORTANTE:**

Cuando el AFC está **Desactivado**, se debe mantener el oscilador de referencia sintonizado en forma precisa. Esta selección se aplica para todos los Sistemas de troncalización y, por lo tanto, para todas las Personalidades de troncalización.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.35.1.6

Pasar por alto la tecla rápida del acceso al canal de voz

Cuando se activa este campo, se desactiva (omite) la función de Tecla rápida para las llamadas de voz grupales.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Por lo tanto, al recibir un permiso de acceso de un Canal de voz a una solicitud de canal de Voz de despacho, y cuando el botón PTT ya no está presionado, el radio finaliza la secuencia de solicitud y vuelve al estado inactivo. Esta selección se aplica para todos los Sistemas de troncalización y, por lo tanto, para todas las Personalidades de troncalización.

Cuando se desactiva, se activa la función Tecla rápida durante las llamadas de voz grupales.

IMPORTANTE:

Debido a que, especialmente en una condición de ocupado, puede pasar una cantidad considerable de tiempo entre que se presiona inicialmente el botón PTT que envía una solicitud de Voz de despacho al sistema de troncalización y se recibe el permiso de acceso de un Canal de voz que asigna un canal de voz al radio que lo solicita, puede decidir soltar el PTT del radio en lugar de permitir que expire el [Temporizador de tiempo de espera en la página 434](#). Cuando se recibe finalmente el permiso de acceso de un canal de voz, el radio reproduce un [Tono de permiso para hablar en la página 579](#) y la función de tecla rápida hace que el radio comience a transmitir audio en silencio durante tres segundos, aunque ya se no presione el botón PTT. Si presiona el botón PTT antes de que se expire el temporizador de la Tecla rápida, el radio continuará transmitiendo, pero con un micrófono activo; de lo contrario, el radio dejará de transmitir.

La función Tecla rápida siempre está activada para llamadas privadas y modo Teléfono.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

NOTA:

Esta es una configuración avanzada que solo está disponible en la Vista de experto (ver Vista del codeplug).

10.35.1.7

Umbral de salida RSSI de LMR

Cuando el radio detecta que la intensidad de la señal del RSSI filtrada de todos los sitios de LMR es menor que el umbral de salida del RSSI de LMR, el radio cambiará de forma automática de la operación de LMR a la operación de banda ancha, si está disponible.

Mesa 222: Rango

Predeterminado	Mínimo	Máximo	Incrementos
34 (hex)	0	FF (Hex)	1

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.35.2

Constantes de filtro de

Esta sección permite visualizar o definir la funcionalidad SmartZone que puede aplicarse a todos los Sistemas de troncalización y, por lo tanto, a todas las Personalidades de troncalización.

Las constantes de filtro de Indicación de intensidad de señal recibida (RSSI) de SmartZone permiten que el radio interprete las comunicaciones de SmartZone recibidas según las reglas y los ajustes operativos del sistema de troncalización de SmartZone. En un sistema SmartZone, las constantes K1, K2 y K3 están diseñadas para reducir la humedad del filtro a medida que aumenta el tiempo entre el muestreo de RSSI.

10.35.2.1

Constante del filtro K1

En este campo se selecciona el valor de la Constante del filtro K1, que se utiliza cuando transcurren más de ocho segundos entre las muestras de Indicación de intensidad de señal recibida (RSSI).

El valor de Constante de filtro K1 lo utiliza la [Constante T1 del umbral de filtro en la página 505](#). Esta selección se puede aplicar para todos los Sistemas de troncalización y, por lo tanto, para todas las Personalidades de troncalización.

**ADVERTENCIA:**

Únicamente un Representante técnico de campo de Motorola Solutions debe realizar modificaciones en las constantes del filtro.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 223: Rango

Mínimo	Máximo
0	9

**NOTA:**

El filtro RSSI cuenta con el siguiente Val. de filtro característico. = (Val. de filtro * K + lectura actual * (10 - K)/10, donde el dominio de K es {K: K = K1, K2, K3} y 0 (sin filtro) <= K3 <= K2 <= K1 <= 9 (filtro amortiguado en gran medida).

En un sistema SmartZone, las constantes K1, K2 y K3 están diseñadas para reducir la humedad del filtro a medida que aumenta el tiempo entre el muestreo.

- K1 se utiliza cuando transcurren menos de 8 segundos entre las muestras de RSSI.
- [Constante del filtro K2 en la página 503](#) se utiliza cuando transcurren de 8 a 16 segundos entre las muestras de RSSI.
- [Constante del filtro K3 en la página 504](#) se utiliza cuando transcurren más de 16 segundos entre las muestras de RSSI.

10.35.2.2

Constante del filtro K2

En este campo se selecciona el valor de la Constante del filtro K2, que se utiliza cuando transcurren de 8 a 16 segundos entre las muestras de Indicación de intensidad de señal recibida (RSSI).

El valor de K2 de constante de filtro seleccionado lo usa la [Constante T2 del umbral de filtro en la página 505](#). Esta selección se puede aplicar para todos los Sistemas de troncalización y, por lo tanto, para todas las Personalidades de troncalización.

**ADVERTENCIA:**

Únicamente un Representante técnico de campo de Motorola Solutions debe realizar modificaciones en las constantes del filtro.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 224: Rango

NOTA:

El filtro RSSI cuenta con el siguiente Val. de filtro característico. = (Val. de filtro * K + lectura actual * (10 - K)/10, donde el dominio de K es {K: K = K1, K2, K3} y 0 (sin filtro) <= K3 <= K2 <= K1 <= 9 (filtro amortiguado en gran medida).

En un sistema SmartZone, las constantes K1, K2 y K3 están diseñadas para reducir la humedad del filtro a medida que aumenta el tiempo entre el muestreo.

- [Constante del filtro K1 en la página 502](#) se utiliza cuando transcurren menos de 8 segundos entre las muestras de RSSI.
- K2 se utiliza cuando transcurren de 8 a 16 segundos entre las muestras de RSSI.
- [Constante del filtro K3 en la página 504](#) se utiliza cuando transcurren más de 16 segundos entre las muestras de RSSI.

10.35.2.3

Constante del filtro K3

En este campo selecciona el valor de la Constante del filtro K3, que se utiliza cuando transcurren más de 16 segundos entre las muestras de Indicación de intensidad de señal recibida (RSSI).

El valor de K3 de constante de filtro seleccionado lo utiliza la [Constante T3 del umbral de filtro en la página 506](#). Esta selección se puede aplicar para todos los Sistemas de troncalización y, por lo tanto, para todas las Personalidades de troncalización.

ADVERTENCIA:

Únicamente un Representante técnico de campo de Motorola Solutions debe realizar modificaciones en las constantes del filtro.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 225: Rango

Mínimo	Máximo
0	9

NOTA:

El filtro RSSI cuenta con el siguiente Val. de filtro característico. = (Val. de filtro * K + lectura actual * (10 - K)/10, donde el dominio de K es {K: K = K1, K2, K3} y 0 (sin filtro) <= K3 <= K2 <= K1 <= 9 (filtro amortiguado en gran medida).

En un sistema SmartZone, las constantes K1, K2 y K3 están diseñadas para reducir la humedad del filtro a medida que aumenta el tiempo entre el muestreo.

- [Constante del filtro K1 en la página 502](#) se utiliza cuando transcurren menos de 8 segundos entre las muestras de RSSI.
- [Constante del filtro K2 en la página 503](#) se utiliza cuando transcurren de 8 a 16 segundos entre las muestras de RSSI.
- K3 se utiliza cuando transcurren más de 16 segundos entre las muestras de RSSI.

10.35.2.4

Constante T1 del umbral de filtro

En este campo se selecciona un valor que crea una ventana temporizada que mide la Intensidad de la señal recibida (RSS) para comprobar que se encuentre en un rango válido.

Esta ventana está centrada en el valor de la [Constante del filtro K1 en la página 502](#) de la indicación de intensidad de la señal recibida (RSSI). La ventana tiene dos veces el valor de la constante del umbral. Esta constante T1 se utiliza cuando transcurren menos de ocho segundos entre las muestras de RSSI. Esta selección se puede aplicar para todos los Sistemas de troncalización y, por lo tanto, para todas las Personalidades de troncalización.

**ADVERTENCIA:**

Únicamente un Representante técnico de campo de Motorola Solutions debe realizar modificaciones en las constantes del filtro.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 226: Rango

Mínimo	Máximo
0 (Hex)	FF (Hex)

**IMPORTANTE:**

Las Constantes de umbral del filtro (T1, T2, T3) son números hexadecimales que van de 0 a FF y únicamente deben modificarse de acuerdo con lo siguiente: (00 <= T1 <= T2 <= T3 <= FF)

**NOTA:**

T1, T2 y T3 crean una ventana en la cual las muestras RSS deben adaptarse al valor considerado. La ventana se centra en el valor de la Constante de filtro RSSI actual ([Constante del filtro K1 en la página 502](#), [Constante del filtro K2 en la página 503](#) o [Constante del filtro K3 en la página 504](#)). La ventana tiene dos veces el valor de la constante del umbral.

- T1 se utiliza cuando transcurren menos de 8 segundos entre las muestras de RSSI.
- [Constante T2 del umbral de filtro en la página 505](#) se utiliza cuando transcurren de 8 a 16 segundos entre las muestras de RSSI.
- [Constante T3 del umbral de filtro en la página 506](#) se utiliza cuando transcurren más de 16 segundos entre las muestras de RSSI.

10.35.2.5

Constante T2 del umbral de filtro

En este campo se selecciona un valor que crea una ventana temporizada que mide la Intensidad de la señal recibida (RSS) para comprobar que se encuentre en un rango válido.

Esta ventana está centrada en el valor de la [Constante del filtro K2 en la página 503](#) de la indicación de intensidad de la señal recibida (RSSI). La ventana tiene dos veces el valor de la constante del umbral. Esta constante T2 se utiliza cuando transcurren de 8 a 16 segundos entre las muestras de RSSI. Esta selección se puede aplicar para todos los Sistemas de troncalización y, por lo tanto, para todas las Personalidades de troncalización.

**ADVERTENCIA:**

Únicamente un Representante técnico de campo de Motorola Solutions debe realizar modificaciones en las constantes del filtro.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 227: Rango

Mínimo	Máximo
0 (Hex)	FF (Hex)

IMPORTANTE:

Las Constantes de umbral del filtro (T1, T2, T3) son números hexadecimales que van de 0 a FF y únicamente deben modificarse de acuerdo con lo siguiente: (00 <= T1 <= T2 <= T3 <= FF)

NOTA:

T1, T2 y T3 crean una ventana en la cual las muestras RSS deben adaptarse al valor considerado. La ventana se centra en el valor de la Constante de filtro RSSI actual ([Constante del filtro K1 en la página 502](#), [Constante del filtro K2 en la página 503](#) o [Constante del filtro K3 en la página 504](#)). La ventana tiene dos veces el valor de la constante del umbral.

- [Constante T1 del umbral de filtro en la página 505](#) se utiliza cuando transcurren menos de 8 segundos entre las muestras de RSSI.
- T2 se utiliza cuando transcurren de 8 a 16 segundos entre las muestras de RSSI.
- [Constante T3 del umbral de filtro en la página 506](#) se utiliza cuando transcurren más de 16 segundos entre las muestras de RSSI.

10.35.2.6

Constante T3 del umbral de filtro

En este campo se selecciona un valor que crea una ventana temporizada que mide la Intensidad de la señal recibida (RSS) para comprobar que se encuentre en un rango válido.

Esta ventana está centrada en el valor de la [Constante del filtro K3 en la página 504](#) de la indicación de intensidad de la señal recibida (RSSI). La ventana tiene dos veces el valor de la constante del umbral. Esta constante T3 se utiliza cuando transcurren más de 16 segundos entre las muestras de RSSI. Esta selección se puede aplicar para todos los Sistemas de troncalización y, por lo tanto, para todas las Personalidades de troncalización.

ADVERTENCIA:

Únicamente un Representante técnico de campo de Motorola Solutions debe realizar modificaciones en las constantes del filtro.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 228: Rango

Mínimo	Máximo
0 (Hex)	FF (Hex)

IMPORTANTE:

Las Constantes de umbral del filtro (T1, T2, T3) son números hexadecimales que van de 0 a FF y únicamente deben modificarse de acuerdo con lo siguiente: (00 <= T1 <= T2 <= T3 <= FF)

NOTA:

T1, T2 y T3 crean una ventana en la cual las muestras RSS deben adaptarse al valor considerado. La ventana se centra en el valor de la Constante de filtro RSSI actual ([Constante del filtro K1 en la página 502](#), [Constante del filtro K2 en la página 503](#) o [Constante del filtro K3 en la página 504](#)). La ventana tiene dos veces el valor de la constante del umbral.

- [Constante T1 del umbral de filtro en la página 505](#) se utiliza cuando transcurren menos de 8 segundos entre las muestras de RSSI.
- [Constante T2 del umbral de filtro en la página 505](#) se utiliza cuando transcurren de 8 a 16 segundos entre las muestras de RSSI.
- T3 se utiliza cuando transcurren más de 16 segundos entre las muestras de RSSI.

10.35.3

Umbrales de RSSI

Esta sección le permite ver o definir la funcionalidad de Indicación de intensidad de señal recibida (RSSI) que se puede aplicar a todos los sistemas troncales y, por lo tanto, a todas las personalidades de troncalización.

La funcionalidad de los umbrales de RSSI permite al radio interpretar las comunicaciones SmartZone recibidas según las reglas y configuraciones operativas del Sistema de troncalización de SmartZone.

10.35.3.1

Contador de OSW para RSSI

En este campo se selecciona la cantidad de intervalos entre las palabras de la señal saliente (OSW): (23 ms) en los que el radio permanece inactivo en el Canal de control, antes de que se tome un conjunto de muestras del Indicador de intensidad de señal recibida (RSSI).

Una vez que se realizan los intervalos de OSW, las muestras de RSSI miden la fortaleza de la señal actual entrante. Esta selección se puede aplicar para todos los Sistemas de troncalización y, por lo tanto, para todas las Personalidades de troncalización.

ADVERTENCIA:

No intente modificar esta configuración de RSSI a menos que conozca muy bien esta función. Una configuración incorrecta puede hacer que su radio no sea capaz de comunicarse con el Equipo de red fija (FNE).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 229: Rango

Mínimo	Máximo
60	255

10.35.3.2

Contador RSSI OSP

En este campo se selecciona el número de paquetes de señalización saliente (OSP) de RSSI ASTRO 25 para los cuales el radio debe mantenerse inactivo en el Canal de control antes de tomar un conjunto de muestras de RSSI.

Este valor debe configurarse teniendo en cuenta el formato de canal único del Bloque de señalización de troncalización (TSBK) (1 OSP = 37,5 ms). Si el canal duplica o triplica el formato del TSBK, el valor del Codeplug aumentará de modo tal que el intervalo de tiempo que utiliza el radio para mantenerse inactiva sea igual a: Contador OSP de RSSI * 37,5 ms. Esta selección se puede aplicar para todos los Sistemas de troncalización y, por lo tanto, para todas las Personalidades de troncalización.

ADVERTENCIA:

No intente modificar esta configuración de RSSI a menos que conozca muy bien esta función. Una configuración incorrecta puede hacer que su radio no sea capaz de comunicarse con el Equipo de red fija (FNE).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 230: Rango

Mínimo	Máximo
40	255

10.35.3.3

Temporizador de cancelación de detección

En este campo se selecciona la cantidad de tiempo que el radio continua rastreando el sitio actual después de que deja de ser detectado.

Se considera que el radio deja de ser detectado si encuentra una señal de RF potente que silencia el canal de control. Se puede producir una condición así si otro radio de alta potencia está transmitiendo en un lugar físicamente cercano, no necesariamente en la misma frecuencia. El radio sale de la condición de cancelación de detección si encuentra un canal de control válido en el sitio de inicio o si encuentra una degradación reducida. Si el temporizador se agota mientras el radio todavía no es detectado, busca un canal de control válido en un sitio adyacente, si lo hubiera. Esta selección se puede aplicar para todos los Sistemas de troncalización y, por lo tanto, para todas las Personalidades de troncalización. El tiempo está expresado en segundos.

ADVERTENCIA:

No intente modificar esta configuración de RSSI a menos que conozca muy bien esta función. Una configuración incorrecta puede hacer que su radio no sea capaz de comunicarse con el Equipo de red fija (FNE).

IMPORTANTE:

El valor de este campo no se copiará cuando se realice un procedimiento de Arrastrar y soltar a través de bandas de frecuencia (por ejemplo, 700/800 a UHF).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

NOTA:

Cuando se configura en **Desactivado**, el temporizador está desactivado (0 segundos).

Mesa 231: Rango

Mínimo	Máximo	Incrementos
1 seg	30 s	1 seg

10.35.3.4

Umbral aceptable de RSSI

En este campo se selecciona una intensidad de señal que define que una señal de recepción en SmartZone se encuentra en un umbral deficiente/aceptable.

Luego, el sistema de troncalización de SmartZone utiliza esta información cuando se determina la prioridad de la señal. El Indicador de intensidad de señal recibida (RSSI) mide la intensidad de la señal entrante. Esta selección se puede aplicar para todos los Sistemas de troncalización y, por lo tanto, para todas las Personalidades de troncalización.

**ADVERTENCIA:**

No intente modificar esta configuración de RSSI a menos que conozca muy bien el funcionamiento de esta función. Una configuración incorrecta puede hacer que su radio no sea capaz de comunicarse con el Equipo de red fija (FNE).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 232: Rango

Mínimo	Máximo
0 (Hex)	FF (Hex)

10.35.3.5

Umbral bueno de RSSI

En este campo se selecciona una intensidad de señal que define que una señal de recepción en SmartZone se encuentra en un umbral aceptable/bueno.

Luego, el sistema de troncalización de SmartZone utiliza esta información cuando se determina la prioridad de la señal. El Indicador de intensidad de señal recibida (RSSI) mide la intensidad de la señal entrante. Esta selección se puede aplicar para todos los Sistemas de troncalización y, por lo tanto, para todas las Personalidades de troncalización.

**ADVERTENCIA:**

No intente modificar esta configuración de RSSI a menos que conozca muy bien esta función. Una configuración incorrecta puede hacer que su radio no sea capaz de comunicarse con el Equipo de red fija (FNE).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 233: Rango

Mínimo	Máximo
0 (Hex)	FF (Hex)

10.35.3.6

Umbral muy bueno de RSSI

En este campo se selecciona la fortaleza de una señal que define una señal SmartZone recibida en el Umbral bueno/muy bueno.

Luego, el sistema de troncalización de SmartZone utiliza esta información cuando se determina la prioridad de la señal. El Indicador de intensidad de señal recibida (RSSI) mide la intensidad de la

señal entrante. Esta selección se puede aplicar para todos los Sistemas de troncalización y, por lo tanto, para todas las Personalidades de troncalización.

ADVERTENCIA:

No intente modificar esta configuración de RSSI a menos que conozca muy bien esta función. Una configuración incorrecta puede hacer que su radio no sea capaz de comunicarse con el Equipo de red fija (FNE).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 234: Rango

Mínimo	Máximo
0 (Hex)	FF (Hex)

10.35.3.7

Umbral excelente de RSSI

En este campo se selecciona una intensidad de señal que define que una señal de recepción en SmartZone se encuentra en un umbral muy bueno/excelente.

Luego, el sistema de troncalización de SmartZone utiliza esta información cuando se determina la prioridad de la señal. El Indicador de intensidad de señal recibida (RSSI) mide la intensidad de la señal entrante. Esta selección se puede aplicar para todos los Sistemas de troncalización y, por lo tanto, para todas las Personalidades de troncalización.

ADVERTENCIA:

No intente modificar esta configuración de RSSI a menos que conozca muy bien esta función. Una configuración incorrecta puede hacer que su radio no sea capaz de comunicarse con el Equipo de red fija (FNE).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 235: Rango

Mínimo	Máximo
0 (Hex)	FF (Hex)

10.35.3.8

Itinerancia con señal fuerte

Cuando está habilitado, este campo activa el Indicador de intensidad de señal recibida (RSSI) adicional.

Los umbrales derivados en intervalos regulares se encuentran por encima de los Umbrales muy buenos/excelentes actualmente configurados. Esto proporciona un cambio de sitio adicional entre los sitios de Señales buenas. Aunque existirán cambios adicionales de sitio al habilitar este campo, se requieren dos niveles de mejora para que ocurra un cambio de sitio, a fin de evitar un exceso de cambio de sitios.

Cuando se deshabilita, el cambio de sitios basados en RSSI se limita a la mejora de las señales hasta el nivel Excelente configurado.

Esta selección se aplica a todos los Sistemas de troncalización y, por lo tanto, a todas las Personalidades de troncalización.

10.35.3.9

Volver al umbral de RSSI de LMR

La función Volver al umbral de RSSI de LMR corresponde a la intensidad de la señal que utiliza el radio para determinar que un sitio de LMR se ha recuperado lo suficiente para cambiar de la operación de banda ancha a LMR.

Mesa 236: Rango

Predeterminado	Mínimo	Máximo	Incrementos
41 (hex)	0	FF (Hex)	1

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.35.4

Datos de CAI

La sección **Datos de interfaz inalámbrica común (CAI)** permite ver o definir parámetros que definen la funcionalidad o las reglas para los paquetes de datos que se transmiten con el protocolo de CAI.

Estas selecciones se pueden aplicar para todos los Sistemas de troncalización y, por lo tanto, para todas las Personalidades de troncalización.

10.35.4.1

Intentos de Tx máximos

En este campo se selecciona la cantidad máxima de veces que el radio intenta enviar una transmisión de paquete de datos de Interfaz inalámbrica común (CAI).

El radio continúa con estos intentos hasta que recibe una confirmación de la recepción exitosa de la transmisión, o hasta que se alcanza esta cantidad seleccionada de intentos de Tx. Esta selección se aplica cuando está en una operación de CAI para todos los Sistemas de troncalización y las Personalidades de troncalización.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 237: Rango

Mínimo	Máximo
2	10

10.35.4.2

Cronómetro de respuesta

En este campo se selecciona la cantidad de tiempo durante el cual el radio espera la confirmación de una transmisión exitosa de Interfaz de aire común (CAI) antes de enviar nuevamente otro paquete de datos CAI.

Esta selección se aplica cuando está en una operación de CAI para todos los Sistemas de troncalización y las Personalidades de troncalización. El tiempo está expresado en milisegundos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 238: Rango

Mínimo	Máximo	Incrementos
100 ms	5000 ms	100 ms

10.35.4.3

Tiempo de respuesta mínimo

En este campo se selecciona la cantidad mínima de tiempo que el radio espera el envío de la confirmación de un Interfaz de aire común (CAI) a través del canal.

Este parámetro debe ser ligeramente mayor que el Retardo de carga útil de datos del Control de red de radio (RNC) (el controlador de datos) hacia el radio. Esta selección se aplica cuando está en una operación de CAI para todos los Sistemas de troncalización y las Personalidades de troncalización. El tiempo está expresado en milisegundos.

ADVERTENCIA:

No intente cambiar esta configuración sin verificar primero la tasa de transferencia particular de su sistema.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 239: Rango

Mínimo	Máximo	Incrementos
50 ms	2000 ms	50 ms

10.35.4.4

Período de búsqueda de sincronización de marco

En este campo se selecciona la cantidad de tiempo que el radio espera para escuchar una secuencia de sincronización de marco (FSS).

La presencia de una FSS en un canal indica que actualmente se están transmitiendo voz y datos. Si no se detecta una FSS dentro de este período de búsqueda, el radio supone que el canal está inactivo y, luego, transmite el siguiente paquete de Interfaz inalámbrica común (CAI) en fila para transmisión. Esta selección se aplica cuando está en una operación de CAI para todos los Sistemas de troncalización y las Personalidades de troncalización. El tiempo está expresado en milisegundos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 240: Rango

Mínimo	Máximo	Incrementos
0 ms	5000 ms	50 ms

10.35.4.5

Rango aleatorio corto de Tx

En este campo se selecciona la cantidad máxima de tiempo que el radio espera para transmitir una vez que se ha recibido la primera secuencia de sincronización de marco (FSS) calificada que indica que el canal está libre.

El radio verifica aleatoriamente el estado de acceso al canal según su tiempo máximo de espera. Esta selección se aplica cuando se encuentra en funcionamiento la Interfaz de aire común (CAI) en todos los Sistemas de troncalización y las Personalidades de troncalización. El tiempo está expresado en milisegundos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 241: Rango

Mínimo	Máximo	Incrementos
50 ms	500 ms	50 ms

10.35.4.6

Rango aleatorio largo de Tx

En este campo se selecciona el límite superior del rango aleatorio uniforme.

Cuando el radio detecta un estado de canal ocupado, utiliza un proceso de selección de tiempo aleatorio dentro de este rango conocido como "retraso de retiro" para determinar cuándo volver a intentar transmitir el mensaje de datos de la Interfaz de aire común (CAI). Esta selección se aplica cuando está en una operación de CAI para todos los Sistemas de troncalización y las Personalidades de troncalización. El tiempo está expresado en milisegundos.

IMPORTANTE:

El valor mínimo de este rango se configura automáticamente en 50 ms y los valores uniformes de este rango se encuentran en incrementos de 50 ms.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 242: Rango

Mínimo	Máximo	Incrementos
50 ms	5000 ms	50 ms

10.35.4.7

Rango aleatorio de respuesta Tx

En este campo se selecciona el límite superior del rango aleatorio uniforme.

Cuando el radio detecta un estado de canal ocupado, utiliza un proceso de selección de tiempo aleatorio dentro de este rango conocido como "retraso de retiro" para determinar cuándo volver a intentar transmitir el mensaje de datos de respuesta de Interfaz de aire común (CAI). La Respuesta generalmente es una confirmación "Ack" de un mensaje enviado desde el sistema. Esta selección se aplica cuando el funcionamiento de la CAI para el tiempo de todos los Sistemas de troncalización y las Personalidades de troncalización se encuentra en milisegundos.

IMPORTANTE:

El valor mínimo de este rango se configura automáticamente en 50 ms y los valores uniformes de este rango se encuentran en incrementos de 50 ms.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 243: Rango

Mínimo	Máximo	Incrementos
50 ms	1000 ms	50 ms

10.35.4.8

Paciencia limitada de Tx

En este campo se selecciona la cantidad máxima de tiempo durante el cual el radio intenta transmitir un paquete de datos de Interfaz de aire común (CAI).

Una vez que se cumple el tiempo, el radio deja de intentar transmitir. Esta selección se aplica cuando está en una operación de CAI para todos los Sistemas de troncalización y las Personalidades de troncalización. El tiempo está expresado en segundos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

NOTA:

Cuando se configura en **Infinito**, no se utiliza ningún temporizador; por lo tanto, no hay un límite de tiempo de transmisión.

Mesa 244: Rango

Mínimo	Máximo	Incrementos
1 seg	255 s	1 seg

10.35.5

Avanzada

Esta sección permite visualizar o definir la funcionalidad SmartZone que puede aplicarse a todos los Sistemas de troncalización y, por lo tanto, a todas las Personalidades de troncalización.

IMPORTANTE:

El modo SmartZone se selecciona según el Sistema de troncalización del campo Tipo de cobertura.

10.35.5.1

Inactividad con Failsoft de SmartZone

En este campo se selecciona la cantidad de tiempo de inactividad en el Modo de degradación reducida que determina cuándo el radio intenta buscar un canal de control válido y activo.

Este cronómetro comienza una vez que todas las comunicaciones recibidas y transmitidas de degradación reducida hayan cesado. Si el cronómetro termina antes de que ocurra cualquier comunicación de degradación reducida, el radio comienza a buscar un canal de control disponible. Si se producen comunicaciones durante este período, el cronómetro se reinicia. Esta selección se aplica cuando está en una operación de SmartZone para todos los Sistemas de troncalización y Personalidades de troncalización. El tiempo está expresado en segundos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 245: Rango

Mínimo	Máximo
0 seg	255 s

10.35.5.2

Postergación de la afiliación SmartZone

En este campo se selecciona la cantidad de tiempo que espera el radio antes de conectarse a un nuevo sitio de troncalización.

Este cronómetro comienza una vez que el radio deja el sitio de troncalización actual debido a una falla en la conexión del canal de control. El radio utiliza este tiempo seleccionado como promedio aleatorizado. Esta selección se aplica únicamente cuando se encuentra en funcionamiento en SmartZone para los Sistemas de troncalización "tipo II" y, por lo tanto, en Personalidades de troncalización "tipo II".

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

- 1 seg
- 3 s
- 7 s
- 15 s
- 31 s
- 63 s
- 127 s
- 255 s

10.35.5.3

Rastreo de canales de control de espectro completo SmartZone

Este campo permite que el radio realice automáticamente un Rastreo de canales de control de espectro completo cuando el radio se encuentra fuera de rango de toda su información del controlador actualmente programado.

Esta función hace que el radio busque todo su codeplug en todas las definiciones del canal a la vez que busca cualquier actividad del canal de control válida en cada definición de canal encontrada. Esta selección se aplica cuando está en una operación de SmartZone para todos los Sistemas de troncalización y Personalidades de troncalización.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.35.5.4

Cronómetro de rastreo de canal de control de espectro completo SmartZone

En este campo se selecciona la cantidad de tiempo en el que se asigna el radio para que realice un Rastreo de canales de control de espectro completo.

Una vez que este cronómetro haya terminado, el radio vuelve a realizar las operaciones normales del canal de control. Esta selección se aplica cuando está en una operación de SmartZone para todos los Sistemas de troncalización y Personalidades de troncalización. El tiempo está expresado en segundos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 246: Rango

Mínimo	Máximo
5 s	31 s

10.35.5.5

Interrupción de radio interna SmartZone

En este campo se selecciona la cantidad de Tiempo de interrupción aleatoria del radio interno (IRHOT) durante el cual el radio debe retrasarse antes de registrarse en un nuevo sitio cuando deja un sitio en el cual acaba de ocurrir una falla o regresa a un sitio que acaba de recuperarse de una falla.

El radio calcula un valor de espera aleatorio entre 0 y el valor IRHOT antes de que se registre después de una falla o recuperación de un sitio. IRHOT se utiliza únicamente si expira el [Retraso de interrupción SmartZone en la página 516](#) sin que el radio haya recibido un paquete por el aire que indique el período de interrupción. Esta selección se aplica cuando funciona en SmartZone y

únicamente en Sistemas de troncalización APCO y Personalidades de troncalización. El tiempo está expresado en minutos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 247: Rango

Mínimo	Máximo
0 min	60 min

10.35.5.6

Retraso de interrupción SmartZone

En este campo se selecciona la cantidad de tiempo durante el cual el radio debe retrasar el inicio de un tiempo de interrupción para realizar el registro o la afiliación.

Durante este tiempo, el radio espera que un paquete de datos por el aire indique el período de interrupción. Si no se recibe un valor por el aire antes del final del Retraso de interrupción, se utilizará el tiempo de [Interrupción de radio interna SmartZone en la página 515](#). Esta selección se aplica cuando funciona en SmartZone y únicamente en Sistemas de troncalización APCO y Personalidades de troncalización. El tiempo está expresado en segundos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 248: Rango

Mínimo	Máximo
5 s	60 s

10.35.5.7

Ajuste de ventana de ISW

En este campo se selecciona un valor en formato decimal o hexadecimal que ajusta correctamente la Ventana de palabras de la señal de entrada (ISW) con el fin de mejorar el rendimiento del Sistema de troncalización.

La Ventana de ISW es el tiempo que se sincroniza entre el radio y el Controlador central. Esta cantidad de tiempo se asigna con el fin de sincronizar la transmisión de ISW dentro del tiempo de llegada de ISW esperado del Controlador central. Esta selección se aplica únicamente en los Sistemas de troncalización tipo II y, por lo tanto, en todas las Personalidades de troncalización tipo II.

ADVERTENCIA:

No lo modifique a menos que sea Representante técnico de campo de Motorola Solutions. El ajuste inadecuado puede reducir el rendimiento del Sistema de troncalización.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 249: Rango

0 (Hex)	FFFF (Hex)

10.35.5.8

ViQi: Temporizador de actividad de llamada de socio virtual (s)

Este campo le permite seleccionar la cantidad de tiempo que puede permanecer activo en el canal Socio virtual antes de volver al grupo de conversación seleccionado.

**NOTA:**

Este campo solo se aplica a radios APX NEXT y APX N70.

Mesa 250: Rango

10.36

Sistema de troncalización tipo II

El **Sistema de troncalización tipo II** le permite al usuario crear y eliminar los Sistema de troncalización, además de definir la funcionalidad del Sistema de troncalización individual. Los sistemas de troncalización son configuraciones virtuales que reflejan las configuraciones y las funcionalidades del sistema de troncalización real (en el campo). La definición del sistema de RadioCentral le permite al radio comunicarse con los sistemas reales.

**ADVERTENCIA:**

Si se modifica el campo Tipo de sistema de un Sistema de troncalización, cualquier Personalidad de troncalización previamente asignada a ese Sistema de troncalización específico tendrá que reasignarse a otro sistema que tenga la selección de Tipo de sistema apropiada. De lo contrario, ocurrirá un error de codeplug cuando se escriba el codeplug en el radio. El Sistema de troncalización que aborda esquemas puede ser de **Tipo II** o **ASTRO 25**.

**NOTA:**

Los Sistemas de troncalización hacen referencia a una Personalidad de troncalización. La configuración de los Sistemas de troncalización puede volverse funcional para todos los tipos de canales de troncalización.

10.36.1

General (Sistema de troncalización tipo II)

La sección **General** del conjunto Sistema de troncalización tipo II permite al usuario ver o definir las funciones básicas de los Sistemas de troncalización individuales.

**NOTA:**

Los Sistemas de troncalización individuales hacen referencia a una Personalidad de troncalización. Una vez referidas, estas configuraciones de los Sistemas de troncalización pueden quedar operativas para todos los tipos de canales dentro de dicha Personalidad de troncalización.

10.36.1.1

Nombre del sistema de troncalización

Este campo permite definir un nombre reconocible para el Sistema de troncalización actual.

**NOTA:**

Los sistemas individuales de troncalización se asignan a una Personalidad de troncalización a través del campo Sistema mediante la selección de este nombre. Luego, esta configuración de los Sistemas de troncalización puede quedar operativa para todos los tipos de canales dentro de dicha Personalidad de troncalización.

Cuando **Monitor de prioridad** se selecciona como el tipo de rastreo para los canales Miembro de lista de rastreo, este nombre de sistema de troncalización debe seleccionarse para la lista de rastreo actual desde el campo Registro del sistema de troncalización.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

**NOTA:**

Ejemplos: EMT-001, #500, Eléctrico1, # A5

Se pueden usar caracteres, números, espacios y caracteres especiales.

Los espacios en blanco iniciales se sustituyen con guiones bajos en la pantalla del radio.

Los puntos iniciales no aparecen en la pantalla del radio.

10.36.1.2

Tipo de clave del sistema

En este campo se muestra la función solo lectura del Tipo de clave de sistema seleccionado para el Sistema de troncalización actual; ya sea **Clave de sistema** o **Clave WACN**.

Cuando el [Tipo de cobertura en la página 519](#) está configurado como **Roaming intra-WACN**, el tipo de clave del sistema es **Clave WACN**; de lo contrario, es **Clave de sistema**.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.36.1.3

Clave de sistema presente

La aplicación recupera y permite solo ver si está cargado un Archivo de claves de software del sistema o una Clave avanzada (Hardware) y si coincide con el ID seleccionado en el campo ID del sistema o ID de WACN doméstica para el Sistema de troncalización actual.

Consulte también [Tipo de clave del sistema en la página 518](#).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.36.1.4

Permitir clave de software heredado

Permitir clave de software heredado permite que el usuario pase por alto temporalmente la necesidad de utilizar ASK cuando programe un radio.

Solo se accede: Cuando la opción H para ejecutar claves de hardware o ASK está activada y cuando un uso ilimitado de ASK coincidente con el ID de sistema doméstico o de propietario del radio está cargado.

10.36.1.5

Tipo de cobertura

En este campo se selecciona el Tipo de cobertura geográfica del radio y, por lo tanto, los métodos específicos para determinar las comunicaciones de radio a radio dentro de los Sistemas de troncalización.

La selección Tipo de cobertura se aplica al Sistema de troncalización actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes, y cuando un archivo de clave de sistema de software o una clave avanzada de sistema con acceso se seleccionan en el campo ID del sistema, o una clave avanzada WACN con acceso se selecciona en el campo ID de WACN doméstica.

NOTA:

Estas selecciones dependen del modelo o la opción del radio.

Se admiten las siguientes selecciones:

Desactivado = SmartNet

Cuando el radio admite distintos modelos y opciones de SmartZone, desactivar este campo hace que el sistema de troncalización use SmartNet.

NOTA:

El funcionamiento de SmartNet se concentra en un solo sitio de SmartZone.

SmartZone

El funcionamiento en SmartZone permite que el radio determine mediante muestras de sondeo de la Indicación de intensidad de señal recibida (RSSI) el mejor sitio de troncalización para usar en los canales de troncalización habilitados para SmartZone.

NOTA:

Para los sistemas ASTRO 25: El funcionamiento está limitado a sitios dentro de una zona de un solo Sistema de troncalización.

Para los sistemas Tipo II: El funcionamiento está limitado a los sitios dentro de un solo Sistema de troncalización.

SmartZone y OmniLink

Brinda al radio que admite SmartZone la capacidad de itinerar de una zona de SmartZone a otra zona de SmartZone, dentro del mismo sistema OmniLink. OmniLink se aplica para canales de troncalización habilitados para OmniLink.

NOTA:

Para los sistemas ASTRO 25: El funcionamiento está limitado a los sitios y las zonas dentro de un solo sistema de OmniLink.

Para los sistemas Tipo II: El funcionamiento está limitado a sitios dentro de un conjunto de sistemas de troncalización interconectados.

Roaming intra-WACN

La selección Roaming intra-WACN da al radio compatible con Project 25 la capacidad de itinerar automáticamente entre todos los ID del sistema, dentro de la misma red de comunicaciones de área extendida (WACN), sin intervenciones del usuario. Consulte también ID de WACN doméstica.

NOTA:

Para los sistemas ASTRO 25: La operación está limitada a los Sistemas de troncalización que están dentro de una misma red WACN.

ADVERTENCIA:

La selección Roaming intra-WACN no es válida si alguno de los siguientes escenarios es verdadero:

Cuando el tipo de sistema es Tipo II.

Cuando el campo Activación de hardware del DVRS está **Activado**.

Cuando el campo Radio dual - Selección de radio está configurado como **Radio secundario** y cuando el campo Activar Tx de radio secundario está **Desactivado**.

Roaming intra-WACN

Roaming inter-WACN proporciona a los radios compatibles con Project 25 en los grupos de conversación seleccionados la capacidad de moverse automáticamente a través de diferentes redes de comunicaciones de área amplia (WACN), sin intervenciones del usuario.

ADVERTENCIA:

La selección Roaming intra-WACN no es válida si alguno de los siguientes escenarios es verdadero:

Cuando el tipo de sistema es Tipo II.

Cuando el campo Activación de hardware del DVRS está **Activado**.

Cuando el campo Radio dual - Selección de radio está configurado como **Radio secundario** y cuando el campo Activar Tx de radio secundario está **Desactivado**, o

Cuando el sistema tiene la opción Banda ancha LTE **activada**.

Un Sistema de troncalización tiene el estándar LTE activado cuando un perfil de datos referido tiene una selección de Tipo del perfil de datos igual a **Troncalización y banda ancha** o **Solo banda ancha**, y cuando el origen de banda ancha del perfil de datos es **Módem LTE interno**.

Los sistemas compatibles con SmartZone y Proyecto 25 también se configuran en los campos SmartZone de troncalización en general y en los campos constantes de filtro de troncalización en general.

10.36.1.6

ID del sistema

Este campo permite ver el ID del sistema ASTRO 25 en terreno y el ID del sistema tipo II para el Sistema de troncalización actualmente seleccionado.

En el campo Nombre de sistema se selecciona el Sistema de troncalización que desea para el registro o la fila actual. Este valor se aplica a la configuración de ID de llamada actual (registro/fila) del contacto actual en la Lista de llamadas unificada. Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 672](#) (ASTRO 25) [ID de llamada en la página 673](#) (Tipo II).

Solo se accede: Cuando el campo Nombre del sistema no está configurado como **Personalizado**, y cuando el radio admite diferentes modelos y opciones.

10.36.1.7

Banda de frecuencia tipo II

En este campo se selecciona la banda de frecuencia en funcionamiento del Sistema de troncalización tipo II.

**IMPORTANTE:**

Los sistemas de troncalización tipo II pueden operar solo en una frecuencia de banda simple. Esta selección se aplica para el Sistema de troncalización actual.

Solo se accede: Cuando el campo Tipo de sistema se configura en **Tipo II** y cuando el radio admite modelos y opciones diferentes.

Se admite la siguiente selección: VHF, UHF1, UHF2, 700/800 MHz, 900 MHz

10.36.1.8

Tono de conexión

En este campo se selecciona la frecuencia de tono de conexión para el Sistema de troncalización tipo II actual.

Esta selección debe coincidir con el tono esperado en el canal de tráfico por el controlador central del Sistema de troncalización, para verificar que esté ocurriendo una transmisión de radio. La frecuencia se expresa en Hz.

Solo se accede: Cuando un Archivo de claves de software del sistema o una Clave avanzada del sistema con acceso se ha seleccionado en el campo ID del sistema. Cuando el campo Tipo de sistema se configura en **Tipo II** y cuando el radio admite modelos y opciones diferentes.

10.36.1.9

Tono de conexión de degradación reducida

En este campo se selecciona la frecuencia del tono de conexión del modo Degradación reducida para el Sistema de troncalización actual.

Solo se accede: Cuando el campo Tipo de sistema se configura en **Tipo II** y cuando el radio admite modelos y opciones diferentes.

Se admite la siguiente selección:

Predeterminado

Cuando el Tipo de cobertura del sistema se configura en **SmartZone**, la selección "predeterminada" usa 105,88 Hz.

Cuando el tipo de cobertura del sistema está configurando en **Desactivado**, la selección de "Predeterminado" usa el [Tono de conexión en la página 521](#) como tono de degradación reducida.

10.36.1.10

ID de red

La aplicación recopila y permite ver solamente (en formato decimal y hexadecimal) el ID de red Tipo II para el Sistema de troncalización actual.

Solo se accede: Cuando el campo Tipo de sistema se configura en **Tipo II** y cuando el radio admite modelos y opciones diferentes.

10.36.1.11

Búsqueda de sitio no adyacente

Este campo permite al radio buscar lista programada de Canales de control para un sitio con una señal más potente.

Esto permite al radio hacer roaming y usar un sitio que no esté definido por el Equipo de red fija (FNE) al estar adyacente al sitio de inicio actual del radio, pero tiene una señal "Aceptable" o más potente.

**NOTA:**

Esto solo se cumple cuando el sitio de inicio actual y los sitios adyacentes definidos por FNE registran todos un valor de umbral que está por debajo del nivel de Umbral aceptable de RSSI. Esta función se aplica al Sistema de troncalización actual.

**IMPORTANTE:**

Cuando funciona en un área con mala cobertura, esta función hace que el radio busque en la lista programada de Canales de control cada dos minutos aproximadamente. Durante este tiempo de búsqueda, el radio no está monitoreando el canal de control del sitio de inicio y, por lo tanto, puede perder parte del audio. Según la cantidad de Canales de control que contiene la lista de Canales de control que corresponda para este Sistema de troncalización, esta búsqueda puede tardar hasta cuatro segundos.

Solo se accede: Cuando el campo [Tipo de cobertura en la página 519](#) no está configurado como **Desactivado** y cuando el radio admite modelos y opciones diferentes.

10.36.2

Asignación de canal OBT

La sección **Asignación de canal de troncalización de otras bandas (OBT)** permite ver o definir parámetros relacionados con frecuencia para comunicaciones de OBT de Tipo II.

**IMPORTANTE:**

La sección Asignación de canal de OBT es visible solo cuando el radio opera dentro de una banda de frecuencia UHF/VHF.

**NOTA:**

Estos parámetros se utilizan para validar todo el Canal de control de Tipo II de OBT y las frecuencias de degradación reducida que se ingresan. Esta programación se aplica para Sistemas de troncalización individuales.

Una vez que se definen los parámetros de las asignaciones de los canales OBT, se deben definir las frecuencias de control de canal del Sistema de troncalización y las frecuencias de degradación reducida de la Personalidad de troncalización.

Los Sistemas de troncalización hacen referencia a una Personalidad de troncalización. Luego, la programación de los Sistemas de troncalización puede volverse funcional para todos los tipos de canales de troncalización.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **Tipo II**, y cuando el campo Banda de frecuencia de Tipo II está configurado en una banda de frecuencia VHF/UHF.

10.36.2.1

Habilitación de Rx

En este campo se activa una división de frecuencia para el rango de canal OBT de recepción (Rx).

Esta selección se aplica para la [Sistema de troncalización tipo II en la página 517](#) actual.

**ADVERTENCIA:**

El primer registro o la primera fila dentro de esta sección Asignación de canal OBT debe estar activado para que se considere válido.

Esta configuración debe coincidir exactamente con la configuración del controlador central para que las comunicaciones del Sistema de troncalización sean posibles.

Solo se accede: Cuando el campo Tipo de sistema se configura en **Tipo II** y cuando el campo [Banda de frecuencia tipo II en la página 521](#) se configura en una banda de frecuencia OBT **VHF**, **UHF1** o **UHF2** y cuando el radio admite modelos y opciones diferentes.

10.36.2.2

Espaciamiento de Rx

En este campo se selecciona el espaciado (en kHz) entre frecuencias de Recepción (Rx) para el rango de canal OBT actual.

**IMPORTANTE:**

La [Frecuencia de inicio de Rx en la página 523](#) y la [Frecuencia de finalización de Rx en la página 523](#) definen el rango de frecuencia de recepción actual. Esta selección se aplica para el Sistema de troncalización actual.

**NOTA:**

El rango de valor ([Frecuencia de finalización de Rx en la página 523](#) - [Frecuencia de inicio de Rx en la página 523](#)) debe ser uniformemente divisible por este espaciamiento de canal. Esto permite que el rango se divida en un valor entero para asignar correctamente el número de canal de control.

**ADVERTENCIA:**

Esta configuración debe coincidir exactamente con la configuración del controlador central para que las comunicaciones del Sistema de troncalización sean posibles.

Solo se accede: Cuando el campo Tipo de sistema se configura en **Tipo II** y cuando el campo [Banda de frecuencia tipo II en la página 521](#) se configura en una banda de frecuencia OBT **VHF**, **UHF1** o **UHF2** y cuando el radio admite modelos y opciones diferentes.

10.36.2.3

Frecuencia de inicio de Rx

Este campo permite ingresar el punto de inicio (en MHz) para el rango de frecuencia de Recepción (Rx) para el rango de canal OBT.

**IMPORTANTE:**

La frecuencia de inicio de Rx debe ser inferior o igual a la [Frecuencia de finalización de Rx en la página 523](#). Esta selección se aplica para el Sistema de troncalización actual.

**ADVERTENCIA:**

Esta configuración debe coincidir exactamente con la configuración del controlador central para que las comunicaciones del Sistema de troncalización sean posibles.

Solo se accede: Cuando el campo Tipo de sistema se configura en **Tipo II** y cuando el campo [Banda de frecuencia tipo II en la página 521](#) se configura en una banda de frecuencia OBT **VHF**, **UHF1** o **UHF2** y cuando el radio admite modelos y opciones diferentes.

10.36.2.4

Frecuencia de finalización de Rx

Este campo permite ingresar el punto de término (en MHz) para el rango de frecuencia de Recepción (Rx) para el rango de canal OBT actual.

**IMPORTANTE:**

La frecuencia de finalización de Rx debe ser mayor o igual que [Espaciamiento de Rx en la página 523](#). Esta selección se aplica para el Sistema de troncalización actual.

**ADVERTENCIA:**

Esta configuración debe coincidir exactamente con la configuración del controlador central para que las comunicaciones del Sistema de troncalización sean posibles.

Solo se accede: Cuando el campo Tipo de sistema se configura en **Tipo II** y cuando el campo [Banda de frecuencia tipo II en la página 521](#) se configura en una banda de frecuencia OBT **VHF**, **UHF1** o **UHF2** y cuando el radio admite modelos y opciones diferentes.

10.36.2.5

Habilitación de Tx

En este campo se activa una división de frecuencia para el rango de canal de Recepción (Tx) de canal.

Esta selección se aplica para la [Sistema de troncalización tipo II en la página 517](#) actual.

**ADVERTENCIA:**

El primer registro o la primera fila dentro de esta sección Asignación de canal OBT debe estar activado para que se considere válido.

Esta configuración debe coincidir exactamente con la configuración del controlador central para que las comunicaciones del Sistema de troncalización sean posibles.

Solo se accede: Cuando el campo Tipo de sistema se configura en **Tipo II** y cuando el campo [Banda de frecuencia tipo II en la página 521](#) se configura en una banda de frecuencia OBT **VHF**, **UHF1** o **UHF2** y cuando el radio admite modelos y opciones diferentes.

10.36.2.6

Espaciamiento de Tx

En este campo se selecciona el espaciado (en kHz) entre frecuencias de Recepción (Tx) para el rango de canal OBT actual.

**IMPORTANTE:**

La [Frecuencia de inicio de Tx en la página 525](#) y la [Frecuencia de finalización de Tx en la página 525](#) definen el rango de frecuencia de recepción actual. Esta selección se aplica para el Sistema de troncalización actual.

**NOTA:**

El rango de valor ([Frecuencia de finalización de Tx en la página 525](#) - [Frecuencia de inicio de Tx en la página 525](#)) debe ser uniformemente divisible por este espaciamiento de canal. Esto permite que el rango se divida en un valor entero para asignar correctamente el número de canal de control.

**ADVERTENCIA:**

Esta configuración debe coincidir exactamente con la configuración del controlador central para que las comunicaciones del Sistema de troncalización sean posibles.

Solo se accede: Cuando el campo Tipo de sistema se configura en **Tipo II** y cuando el campo [Banda de frecuencia tipo II en la página 521](#) se configura en una banda de frecuencia OBT **VHF**, **UHF1** o **UHF2** y cuando el radio admite modelos y opciones diferentes.

10.36.2.7

Frecuencia de inicio de Tx

En este campo se selecciona el espaciado (en kHz) entre frecuencias de Recepción (Tx) para el rango de canal OBT actual.

**IMPORTANTE:**

La [Frecuencia de inicio de Tx en la página 525](#) y la [Frecuencia de finalización de Tx en la página 525](#) definen el rango de frecuencia de recepción actual. Esta selección se aplica para el Sistema de troncalización actual.

**NOTA:**

El rango de valor ([Frecuencia de finalización de Tx en la página 525](#) - [Frecuencia de inicio de Tx en la página 525](#)) debe ser uniformemente divisible por este espaciamiento de canal. Esto permite que el rango se divida en un valor entero para asignar correctamente el número de canal de control.

**ADVERTENCIA:**

Esta configuración debe coincidir exactamente con la configuración del controlador central para que las comunicaciones del Sistema de troncalización sean posibles.

Solo se accede: Cuando el campo Tipo de sistema se configura en **Tipo II** y cuando el campo [Banda de frecuencia tipo II en la página 521](#) se configura en una banda de frecuencia OBT **VHF**, **UHF1** o **UHF2** y cuando el radio admite modelos y opciones diferentes.

10.36.2.8

Frecuencia de finalización de Tx

Este campo permite ingresar el punto de término (en MHz) para el rango de frecuencia de Recepción (Tx) para el rango de canal OBT actual.

**IMPORTANTE:**

La frecuencia de finalización de Tx debe ser mayor o igual que el [Espaciamiento de Tx en la página 524](#). Esta selección se aplica para el Sistema de troncalización actual.

**ADVERTENCIA:**

Esta configuración debe coincidir exactamente con la configuración del controlador central para que las comunicaciones del Sistema de troncalización sean posibles.

Solo se accede: Cuando el campo Tipo de sistema se configura en **Tipo II** y cuando el campo [Banda de frecuencia tipo II en la página 521](#) se configura en una banda de frecuencia OBT **VHF**, **UHF1** o **UHF2** y cuando el radio admite modelos y opciones diferentes.

10.36.3

Canales de control (Sistema de troncalización tipo II)

La sección **Canales de control** del conjunto del sistema de troncalización tipo II permite que el usuario visualice o defina las frecuencias de recepción y transmisión para los canales de control. Se

pueden crear hasta un máximo de 250 canales de control para sistemas de troncalización individuales, según sea necesario.

**NOTA:**

Para modelos de radio que contienen firmware anterior a la versión R12.01.00, el número máximo de canales de control es de 128.

**IMPORTANTE:**

Los Sistemas de troncalización individuales hacen referencia a una Personalidad de troncalización. Una vez referidas, estas configuraciones de los Sistemas de troncalización pueden quedar operativas para todos los tipos de canales dentro de dicha Personalidad de troncalización.

Es útil ordenar las frecuencias de canales de control en orden ascendente en un sistema SmartZone. En una situación de degradación reducida, el radio usa el primer canal del Canal de control como su canal de degradación reducida. Si se ordenan los canales (o al menos si se ordenan en un orden diseñado para facilitar las operaciones de degradación reducida), se pueden evitar posibles problemas como tener varios radios en distintos canales de degradación reducida.

10.36.3.1**Frecuencia de Rx**

Este campo permite ingresar una Frecuencia de Rx (recepción) del Canal de control para el Sistema de troncalización actual.

**ADVERTENCIA:**

Las Restricciones de frecuencia de troncalización que se aplican a esta selección las determina la banda de frecuencia de este sistema.

Solo se accede: (Cuando un archivo de clave de sistema del software o una clave avanzada de sistema con acceso se seleccionan en el campo ID del sistema, o cuando una clave avanzada WACN con acceso se selecciona en el campo ID de WACN doméstica), y cuando el radio admite modelos y opciones diferentes.

10.36.3.2**Frecuencia de Tx**

En este campo se selecciona una Frecuencia de Tx (transmisión) del Canal de control para el Sistema de troncalización actual.

**ADVERTENCIA:**

Las Restricciones de frecuencia de troncalización que se aplican a esta selección están determinadas por el Tipo de sistema y la banda de frecuencia del sistema. Para los Sistemas de troncalización tipo II, el estado de este campo es de solo visualización cuando [Banda de frecuencia tipo II en la página 521](#) es de 700/800 MHz o 900 MHz.

Solo se accede: cuando un Archivo de claves de software del sistema o una Clave avanzada de sistema con acceso se selecciona en el campo ID del sistema o una clave avanzada WACN con acceso se selecciona en el campo ID de WACN doméstica, cuando el campo Tipo de sistema está configurado como **Tipo II**, y el campo [Banda de frecuencia tipo II en la página 521](#) está configurado en **700/800 MHz** o **900 MHz**, y cuando el radio admite modelos/opciones diferentes.

10.36.4

Funciones (Sistema de troncalización tipo II)

La sección **Funciones** del conjunto Sistema de troncalización tipo II permite al usuario ver o modificar la configuración para el sistema de troncalización individual.

**NOTA:**

Los Sistemas de troncalización individuales hacen referencia a una Personalidad de troncalización. Luego, esta configuración de los Sistemas de troncalización puede quedar operativa para todos los tipos de canales dentro de dicha Personalidad de troncalización.

10.36.4.1

Inhibición de radio

Este campo permite al radio recibir y responder a un comando de Inhibición remota cuando se opera en el Sistema de troncalización actual.

Este comando de inhibición se envía desde el despachador. Luego de una recepción exitosa, el radio transmite una confirmación de vuelta al equipo de despacho y, a continuación, pasa a un estado inactivo. Mientras está inhibida, el audio del receptor está silenciado y la ruta de audio de transmisión se bloquea; todos los controles del usuario están inoperativos; el modo Rastreo se detiene en el canal en funcionamiento que recibió el comando y todos los LED del radio se apagan.

**ADVERTENCIA:**

Cuando el campo Tipo de sistema se configura en **ASTRO 25** y cuando el campo **Índice de perfil de ASTRO OTAR** está activado (para el Sistema de troncalización actual), y cuando la Configuración segura, **Inhibición de radio mediante ASTRO OTAR** está activada, este campo puede desactivarse. En este caso, la inhibición del radio se logra "mediante ASTRO OTAR".

Cuando el campo Tipo de sistema se configura en **ASTRO 25** y cuando el campo Índice de perfil de ASTRO OTAR está desactivado (para el Sistema de troncalización actual), este campo debe estar activado. Esto garantiza que la inhibición de radio sea posible con la troncalización **ASTRO 25**.

Cuando el campo Tipo de sistema se configura en **Tipo II** y cuando el valor del campo ID del sistema del Sistema de troncalización coincide con el **ID de clave** de uno de los Archivos de claves de software del sistema cargados o las Claves avanzadas de sistema (consulte el Informe de claves de sistema), este campo se puede desactivar. En este caso, se ignorarán los comandos de Inhibición del radio que se reciben en este Sistema de troncalización y el radio continuará funcionando con normalidad.

Cuando **Inhibición de radio mediante el índice de perfil de ASTRO OTAR** de Configuración segura, y cuando el **campo Índice de perfil de ASTRO OTAR** está activado (para el Sistema de troncalización actual), este campo se puede desactivar. En este caso, la inhibición del radio se logra "mediante ASTRO OTAR".

Cuando el campo Índice de perfil de ASTRO OTAR está desactivado (para el Sistema de troncalización actual), este campo debe activarse. Esto garantiza que la inhibición de radio sea posible con la troncalización **ASTRO 25**.

**IMPORTANTE:**

Para despejar este estado de inhibición en el radio, se debe enviar un comando de anulación de inhibición al radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.36.4.2

Tipo de alias de radio inalámbrico

En este campo se configura la codificación (transmisión) y la decodificación (recepción) de la función Alias del radio inalámbrico (OTA).

ADVERTENCIA:

Si el radio recibe ID duplicados, no podrá mostrar el alias hasta que se elimine la duplicación. Cuando se escribe el codeplug de la aplicación en un radio, la lista de llamadas vuelve a su estado original y todas las actualizaciones de alias OTA se pierden.

IMPORTANTE:

Si la actualización del alias OTA no apareció en la pantalla, el usuario debe actualizar la lista de llamadas del radio o en el administrador de aprovisionamiento.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Desactivado

El radio no transmite ni recibe datos de alias del radio.

Solo decodificación

Los datos de alias del radio reciben datos sin limitaciones.

10.36.4.3

Nivel de potencia de Tx

En este campo se selecciona el nivel de potencia del radio para transmitir para el Sistema de troncalización actual.

La pulsación del botón Baja potencia de Tx, el switch de alternación Baja potencia de Tx y la selección de menú Potencia son más importantes que este ajuste cuando el usuario realiza la selección.

NOTA:

Durante el Modo emergencia el radio transmite automáticamente a alta potencia.

La potencia de transmisión puede disminuirse en un 1 vatio para modelos 800 y en 2 vatios para modelos VHF y UHF.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Bajo

Se usa para comunicaciones cercanas y para evitar que el radio transmita en otros grupos geográficos que funcionan en la misma frecuencia.

Alto

Se usa cuando se necesita una señal más fuerte para extender las distancias de las transmisiones.

10.36.4.4

HearClear

En este campo se selecciona para mejorar la claridad del audio mediante la aplicación de cancelación de ruido o un algoritmo de compresión/extensión a la señal de radio.

Esta función se aplica al Sistema de troncalización actual.

IMPORTANTE:

Con compresión-extensión, el rango dinámico del audio de la transmisión se comprime y, luego, se expande a su nivel original en el audio de recepción. Por lo tanto, compresión-extensión debe activarse para los radios de transmisión y recepción o se obtendrá como resultado audio distorsionado. Debido a que el algoritmo de compresión/expansión está activo en el audio de transmisión y recepción, la expansión del audio sin comprimir o la compresión del audio sin expandirlo posteriormente generarán como resultado una salida de sonido no natural. La ruta de audio al despachador también debe someterse a compresión-extensión.

Solo se accede: cuando el campo Tipo de sistema está establecido en **Tipo II**, y cuando el campo Activación de hardware del DVRS está desactivado.

Se admiten las siguientes selecciones:

Desactivado

No se aplica cancelación o compresión de audio a las señales de transmisión/recepción.

Solo compresión

La compresión-extensión se aplica a ambas señales. Consulte el aviso importante:

Solo cancelación de ruido

La cancelación de ruido se aplica al audio de recepción.

Compresión-extensión y cancelación de ruido

Compresión-extensión se aplica a ambas señales, de transmisión y recepción (consulte el Aviso importante) y la cancelación de ruido se aplica al audio de recepción.

NOTA:

La configuración de **Solo cancelación de ruido** y **Compresión y cancelación de ruido** solo se puede aplicar si todas las frecuencias de la personalidad actual están en el rango de 900 MHz.

10.36.4.5

Activación de monitor remoto/rastreo de radio

Este campo permite que el radio decodifique un comando de Monitor remoto o Rastreo de radio para el Sistema de troncalización actual.

ADVERTENCIA:

El **Tramo de radio** se aplica solo para el sistema **Tipo II**. Además, solo para un sistema **Tipo II**, y con el uso de **Monitor remoto** y **Rastreo de radio**, el radio se activa por el tiempo seleccionado en el Tiempo base de Tx de Monitor remoto/Rastreo de radio.

NOTA:

Para un Tipo de sistema **ASTRO 25**, el tiempo de transmisión del radio en terreno lo define un despachador dentro del comando **Monitor remoto**.

Cuando se recibe un comando de **Monitor remoto**, el radio se activa automáticamente y trasmite el audio del entrono desde su micrófono "activo". Esto es especialmente útil en una situación de emergencia de hombre caído.

Monitor remoto también se conoce como **Monitor de unidad de radio**.

Cuando se recibe un comando de **Rastreo de radio**, el radio se activa automáticamente y envía un portador no modulado, lo que permite encontrar un radio perdido o robado. El **Tramo de radio** se aplica solo para el sistema **Tipo II**.

Se aplica solo:

Para APX 7000XE y APX 6000, esta función se aplica solo cuando la Opción de sistema H43 está disponible para el radio. Además, el radio requiere la versión de firmware R05.xx.xx o superior, y el APX debe ser R05.xx.xx o superior.

Para APX 6500, esta función se aplica solo cuando la Opción de sistema G170 está disponible para el radio. Además, el radio requiere la versión de firmware R05.xx.xx o superior, y el APX debe ser R05.xx.xx o superior.

10.36.4.6

Tiempo base de Tx de monitor remoto/rastreo de radio

En este campo se selecciona la cantidad de tiempo que transmite un radio monitoreado en forma remota una vez que se recibe el comando Monitor remoto o Rastreo de radio para el Sistema de troncalización actual.

**NOTA:**

Esta configuración de campo de la aplicación no es compatible con accesorios de terceros. Cualquier cambio en la configuración se debe realizar a través de su desarrollador de accesorios.

Se aplica solo:

Para APX 7000XE y APX 6000, esta función se aplica solo cuando la Opción de sistema H43 está disponible para el radio. Además, el radio requiere la versión de firmware R05.xx.xx o superior, y el APX debe ser R05.xx.xx o superior.

Para APX 6500, esta función se aplica solo cuando la Opción de sistema G170 está disponible para el radio. Además, el radio requiere la versión de firmware R05.xx.xx o superior, y el APX debe ser R05.xx.xx o superior.

Solo se accede: cuando el campo Tipo de sistema está configurado en **Tipo II**, cuando el campo Activación de monitor remoto/rastreo de radio está activado, y cuando el radio admite modelos/ opciones diferentes.

Se admiten las siguientes selecciones:

- 15
- 30
- 45
- 60

10.36.4.7

Indicador de Rx de alarma de emergencia

Este campo permite que ocurra un indicador de audio o visual (o ambos) en el radio cuando se detecta y se recibe una Alarma de emergencia de otro radio.

El tipo de indicador de emergencia se determina mediante la configuración del Tipo de indicador de Rx de alarma de emergencia. Esta función se aplica al Sistema de troncalización actual.

**IMPORTANTE:**

El tiempo del indicador de Rx de alarma de emergencia es de 10 segundos. Durante estos 10 segundos, el usuario puede desactivar el indicador mediante la pulsación de cualquiera de los botones del radio, excepto Volumen e Iluminar/girar (la pantalla).

Una vez que ha borrado el indicador o que se borre, los reintentos por enviar alarmas de emergencia desde el mismo ID de unidad del Sistema de troncalización se ignoran durante los próximos 20 segundos.

Las alarmas de emergencia no se detectan mientras el radio se encuentra en Modo de rastreo.

Las Alarmas de emergencia podrían no ser detectadas mientras el radio no se encuentra monitoreando o decodificando el canal de control, por ejemplo, actividad en un canal de voz o datos, muestreo de RSSI, etc.

Solo se accede: Cuando el campo Tipo de indicador de Rx de alarma de emergencia no está configurado como **Sin indicación** y cuando el radio admite modelos y opciones diferentes.

10.36.4.8

LED seguro

En este campo se activa el LED de ocupado amarillo para que destelle cuando se recibe una llamada de voz encriptada segura y sigue destellando mientras la actividad de voz actual sea segura.

El LED de ocupado amarillo destellará bajo estas condiciones sin importar si el radio específico puede desilenciar la señal de voz. El LED seguro se aplica para el Sistema de troncalización actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.36.4.9

Activación de reagrupación dinámica

En este campo se activa un grupo de conversación de Reagrupación dinámica para una Personalidad de troncalización o canal que hace referencia al Sistema de troncalización actual.

NOTA:

Cuando este campo está activado, se deben seleccionar una [Zona de reagrupación dinámica en la página 532](#) y un [Canal de reagrupación dinámico en la página 532](#) para el Sistema de troncalización.

ADVERTENCIA:

Una configuración de reagrupación dinámica solo es válida cuando una de las personalidades de troncalización referidas a un canal tiene el campo Grupo de conversación de troncalización configurado como **DYN** (reagrupación dinámica), la zona y el canal de la personalidad seleccionada coinciden con las selecciones de la zona de reagrupación dinámica y el canal de reagrupación dinámica en el Sistema de troncalización al que hacen referencia las personalidades.

IMPORTANTE:

Por lo tanto, solo un canal dentro de un determinado Sistema de troncalización puede ser el canal de Reagrupación dinámica.

El usuario puede solicitar una nueva asignación de Reagrupación dinámica al despachador con una pulsación del botón Solicitud de reprogramación o una selección del menú de Solicitud de reprogramación. El despachador define y transmite de vuelta las funciones y la configuración actuales del grupo de conversación de reagrupación dinámica.

Para que el grupo de conversación de Reagrupación dinámica pueda transmitir en el modo Seguro, se requiere la pulsación del botón Selección de Tx segura o el switch de alternación Selección de Tx segura o la selección del menú Seguro; en caso contrario, las transmisiones del grupo de conversación de Reagrupación dinámica se conectan a una transmisión en el modo **Borrar**

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.36.4.10

Zona de reagrupación dinámica

En este campo se selecciona la zona de la Personalidad de troncalización/canal de Reagrupación dinámica a la que hace referencia el Sistema de troncalización actual.

**ADVERTENCIA:**

Las zonas de la Interfaz de sitio remoto (RSI) no son válidas y no se pueden seleccionar (zonas con el modo RSI activado).

**NOTA:**

El usuario puede solicitar una nueva asignación de Reagrupación dinámica al despachador con una pulsación del botón Solicitud de reprogramación o una selección del menú de Solicitud de reprogramación. El despachador define y transmite de vuelta las funciones y la configuración actuales del grupo de conversación de reagrupación dinámica.

Para que el grupo de conversación de Reagrupación dinámica pueda transmitir en el modo Seguro, se requiere la pulsación del botón Selección de Tx segura o el switch de alternación Selección de Tx segura o la selección del menú Seguro; en caso contrario, las transmisiones del grupo de conversación de Reagrupación dinámica se conectan a una transmisión en el modo **Borrar**

Cuando [Activación de reagrupación dinámica en la página 531](#) está **Activado**, se deben seleccionar una zona de reagrupación dinámica y un [Canal de reagrupación dinámico en la página 532](#) para dicho Sistema de troncalización.

**ADVERTENCIA:**

Las zonas seleccionadas en este campo deben tener desactivada la opción Activación de zona dinámica; de lo contrario, este campo será no válido.

Una configuración de reagrupación dinámica solo es válida cuando una de las personalidades de troncalización referidas a un canal tiene el campo Grupo de conversación de troncalización configurado como **DYN** (reagrupación dinámica), y la zona y el canal de la personalidad seleccionada coinciden con las selecciones de la zona de reagrupación dinámica y el canal de reagrupación dinámica en el Sistema de troncalización al que hacen referencia las personalidades.

**IMPORTANTE:**

Por lo tanto, solo un canal (dentro de un determinado sistema de troncalización) puede ser el canal de reagrupación dinámica.

Solo se accede: Cuando el campo [Activación de reagrupación dinámica en la página 531](#) está configurado como **Activado** y cuando el radio admite modelos y opciones diferentes.

10.36.4.11

Canal de reagrupación dinámico

En este campo se selecciona una Personalidad de troncalización/canal de Reagrupación dinámica que hace referencia al Sistema de troncalización actual.

Consulte también [Zona de reagrupación dinámica en la página 532](#).

NOTA:

El usuario puede solicitar una nueva asignación de Reagrupación dinámica al despachador con una pulsación del botón Solicitud de reprogramación o una selección del menú de Solicitud de reprogramación. El despachador define y transmite de vuelta las funciones y la configuración actuales del grupo de conversación de reagrupación dinámica.

Para que el grupo de conversación de Reagrupación dinámica pueda transmitir en el modo Seguro, se requiere la pulsación del botón Selección de Tx segura o el switch de alternación Selección de Tx segura o la selección del menú Seguro; en caso contrario, las transmisiones del grupo de conversación de Reagrupación dinámica se conectan a una transmisión en el modo **Borrar**

Cuando el campo [Activación de reagrupación dinámica en la página 531](#) está **activado**, se deben seleccionar una zona de reagrupación dinámica y un canal de reagrupación dinámica para dicho Sistema de troncalización.

ADVERTENCIA:

Una configuración de reagrupación dinámica solo es válida cuando una de las personalidades de troncalización referidas a un canal tiene el campo Grupo de conversación de troncalización configurado como **DYN** (reagrupación dinámica), y la zona y el canal de la personalidad seleccionada coinciden con las selecciones de la zona de reagrupación dinámica y el canal de reagrupación dinámica en el Sistema de troncalización al que hacen referencia las personalidades.

IMPORTANTE:

Por lo tanto, solo un canal dentro de un determinado Sistema de troncalización puede ser el canal de Reagrupación dinámica.

ADVERTENCIA:

En los codeplugs portátiles APX™ 3000 solo los primeros 48 canales de la Zona de reagrupación dinámica son considerados selecciones válidas.

Solo se accede: Cuando el campo [Activación de reagrupación dinámica en la página 531](#) está configurado como **Activado**, cuando el campo Zona de reagrupación dinámica no está establecido en una zona dinámica y cuando el radio admite modelos y opciones diferentes.

10.36.4.12

Restablecimiento de ICUA

En este campo se selecciona una excepción de desilenciar programada o manual para Alertas/ localización de llamadas de troncalización cuando la Alerta de usuario de llamada entrante de Silencio de voz está activada.

El tiempo de excepción (programado o manual) se conoce como Estado de liberación del silenciador. Para las dos selecciones programadas, el campo [Tiempo de restablecimiento automático de ICUA en la página 534](#) (para este Sistema de troncalización) determina de manera parcial la duración de Liberar estado del silenciador. El Estado de liberación del silenciador comienza cuando la función Alerta de usuario de llamada entrante de silencio de voz está activa y el radio se ha desilenciado. Esta selección se aplica para el Sistema de troncalización actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Manual

Cuando la función Alerta de usuario de llamada entrante de Silencio de voz está activa, la pulsación de botón Silencio de voz o la selección del menú Silencio de voz desactiva el Silencio de voz y finaliza la opción Liberar estado del silenciador. Oprimir el botón PTT finaliza el Estado de liberación del silenciador.

Auto

Si el cronómetro expira sin importar si el radio se silenció o no, el Estado de liberación del silenciador finaliza y se requieren nuevamente las reglas de Alerta de usuario de llamada entrante de silencio de voz activada para desilenciar cualquier transmisión futura.

Auto con portador

Si se desilencia el radio cuando el temporizador expira debido al Silenciador de la portadora correcto, el radio permanece desilenciado hasta que se pierde la portadora. Cuando se pierde una portadora y se silencia el radio, se restablece y se reinicia el temporizador, lo que en efecto extiende Liberar estado del silenciador nuevamente; si el radio permanece silenciado por un período completo sin ninguna anulación de portadora, Liberar estado del silenciador finaliza y nuevamente se necesitan las reglas de Alerta de usuario de llamada entrante de Silencio de voz para desilenciar cualquier transmisión futura.

10.36.4.13

Tiempo de restablecimiento automático de ICUA

En este campo se selecciona una cantidad de tiempo utilizada durante la excepción desilenciar para alertas de llamadas/localizadores de troncalización cuando el canal se activa con la alerta de usuario entrante Silencio de voz.

El tiempo de excepción se conoce como Estado de liberación del silenciador. Este temporizador solo es relevante para las dos selecciones programadas Restablecimiento de llamada entrante. Esta selección se aplica para el Sistema de troncalización actual. El tiempo está expresado en segundos.

Solo se accede: Cuando el campo [Restablecimiento de ICUA en la página 533](#) no está configurado como **Manual** y cuando el radio admite modelos y opciones diferentes.

Mesa 251: Rango

Mínimo	Máximo	Incrementos
0 seg	255 s	1 seg

10.36.4.14

Servicio de mensajería de texto

Este campo selecciona el modo Mensajería de texto para el Sistema de troncalización actual.

**NOTA:**

El usuario accede al modo Mensajería de texto con la pulsación de botón Servicio de mensajería de texto o la selección de menú Servicio de mensajería de texto.

El usuario accede al modo Mensajería de texto rápida con la pulsación del botón Texto rápido de SMT.

El usuario accede a Mensajería de consulta con la pulsación del botón Consulta SMT.

Solo se accede: cuando el campo Tipo de sistema está configurado como **ASTRO 25**, y cuando el Sistema de troncalización actual tiene un Perfil de datos al que se hace referencia, y cuando Selección de perfil de datos no está configurado en **Datos desactivados**.

Se admiten las siguientes selecciones:

Ninguno

La función está desactivada.

Solo lista

Permite seleccionar solamente los Mensajes de texto en la Lista de mensajes de texto rápido.

Ilimitado

Le permite seleccionar desde Mensajes de texto rápidos e ingresar mensajes de texto propios desde el teclado del radio.

**ADVERTENCIA:**

Esta selección solo está disponible en radios que tengan un teclado o micrófono del teclado.

**NOTA:**

Esta selección no se aplica a radios APX N70.

10.36.5

Alias de mensaje

Esta sección le permite ver o definir la funcionalidad del mensaje para Sistemas de troncalización individuales.

Puede seleccionar y transmitir estos mensajes. Los mensajes se pueden enviar desde una unidad de despachador o una unidad móvil portátil, o desde una unidad móvil o portátil a una unidad de despachador. Sin embargo, no se puede enviar un mensaje desde una unidad móvil o portátil a otra igual.

**ADVERTENCIA:**

Esta función se aplica solo cuando la [Personalidad de troncalización tipo II en la página 557](#) a la que hace referencia este Sistema de troncalización tiene el campo Activación de mensaje activado.

Cada alias de mensaje se debe programar de manera idéntica (o con el mismo significado) para el despachador y las unidades móviles o portátiles. Es decir, el alias 1 del mensaje desde la unidad despachadora debe ser idéntico (o debe tener el mismo significado) que el alias 1 del mensaje para la unidad móvil o portátil.

**NOTA:**

Comparada con una transmisión de voz, una transmisión de mensaje hace un uso más eficaz de un canal.

Los mensajes son aplicables solo para modelos con pantalla.

Solo se accede: Cuando el campo [Habilitación de alias de mensaje en la página 535](#) está activado, cuando el campo Tipo de sistema está configurado en **Tipo II** y cuando el radio admite modelos y opciones diferentes.

10.36.5.1

Habilitación de alias de mensaje

En este campo se activa la posibilidad de definir mensajes para el Sistema de troncalización actual.

**ADVERTENCIA:**

Esta función se aplica solo cuando la [Personalidad de troncalización tipo II en la página 557](#) a la que hace referencia este Sistema de troncalización tiene el campo Activación de mensaje activado.

Una vez habilitado, debe programar cada Alias de mensaje del radio (Nombre de alias de mensaje y el Número de alias de mensaje del mismo registro o la misma fila) para que coincida de manera idéntica con el Alias de mensaje de la unidad del despachador correspondiente (o tenga el mismo significado).

Después de la programación, puede acceder a la función Mensaje con una pulsación del botón [Mensaje en la página 188](#), una pulsación del botón Mensaje directo o la selección de menú [Mensaje en la página 220](#).

Solo se accede: Cuando el campo Tipo de sistema se configura en **Tipo II** y cuando el radio admite modelos y opciones diferentes.

10.36.5.2

Número de alias de mensaje

En este campo selecciona un número que identifica el Mensaje actual.

Esta selección se aplica al mensaje actual (registro/fila) que se aplica al sistema de troncalización actual.

ADVERTENCIA:

Esta función se aplica solo cuando la Personalidad de troncalización a la que hace referencia este Sistema de troncalización tiene el campo [Activación de mensaje en la página 579](#) activado.

Una vez que se define, puede acceder a la función Mensaje con una pulsación del botón Mensaje, una pulsación del botón Mensaje directo o la selección del menú Mensaje.

Solo se accede: Cuando el campo [Habilitación de alias de mensaje](#) está activado, cuando el campo Tipo de sistema está configurado en **Tipo II** y cuando el radio admite modelos y opciones diferentes.

10.36.5.3

Texto de alias de mensaje

Este campo permite definir nombres reconocibles para el Mensaje actual (registro/fila).

Esta selección se aplica para el Sistema de troncalización actual.

ADVERTENCIA:

Esta función se aplica solo cuando la Personalidad de troncalización a la que hace referencia este Sistema de troncalización tiene el campo [Activación de mensaje en la página 579](#) activado.

Una vez que se define, puede acceder a la función Mensaje con una pulsación del botón Mensaje, una pulsación del botón Mensaje directo o la selección del menú Mensaje.

NOTA:

El alias de mensaje se debe programar de manera idéntica (o con el mismo significado) para el despachador y las unidades móviles o portátiles. Es decir, el alias 1 del mensaje desde la unidad despachadora debe ser idéntico (o debe tener el mismo significado) que el alias 1 del mensaje para la unidad móvil o portátil.

Solo se accede: Cuando el campo [Habilitación de alias de mensaje](#) está activado, cuando el campo Tipo de sistema está configurado en **Tipo II** y cuando el radio admite modelos y opciones diferentes.

NOTA:

Ejemplos: MESSAGE-01, Electric1, #510

Se pueden usar caracteres, números, espacios y caracteres especiales.

Se pueden utilizar hasta 14 caracteres.

10.36.6

Configuración de canal tipo II

Esta sección permite ver o definir funciones específicas del Sistema de troncalización de Tipo II.

IMPORTANTE:

Los Sistemas de troncalización individuales hacen referencia a una Personalidad de troncalización. Luego, esta configuración de los Sistemas de troncalización se puede quedar operativa para todos los tipos de canales dentro de dicha [Personalidad de troncalización tipo II en la página 557](#).

Solo se accede: Cuando el campo Tipo de sistema se configura en **Tipo II** y cuando el radio admite modelos y opciones diferentes.

10.36.6.1

Canal de división

En este campo se activa el funcionamiento del canal fragmentado para admitir los Sistemas de troncalización que funcionan como un "sistema fragmentado" (solo de 800 MHz).

NOTA:

En este caso, las frecuencias del canal de control y las frecuencias de degradación reducida operan utilizando "canales fragmentados" que se encuentran entre las frecuencias "normales" del plan de la banda de 800 MHz y, por lo tanto, se reducen a 12,5 kHz. El radio interpreta los números de canales recibidos por el aire como canales fragmentados. Esta función se aplica al Sistema de troncalización actual.

Solo se accede: Cuando el radio opera dentro de la banda de frecuencias de 800 MHz; cuando se ha seleccionado un Archivo de claves de software del sistema o una Clave avanzada de sistema con acceso en el campo ID del sistema; cuando el campo Tipo de sistema está configurado como **Tipo II**; y cuando el radio admite distintos modelos y opciones.

10.36.6.2

Sistema de tránsito heredado

Este campo que activa esta función restringe el uso del Sistema de troncalización actual al formato de frecuencia heredado para que sea compatible con los sistemas de tránsito de legado.

ADVERTENCIA:

NO MODIFIQUE esta función a menos que lo indique expresamente un Representante técnico en terreno de Motorola Solutions.

Solo se accede: Cuando el campo Tipo de sistema se configura en **Tipo II** y cuando el radio admite modelos y opciones diferentes.

10.36.6.3

Ancho de banda de canal

En este campo se selecciona el ancho de banda del canal para el Sistema de troncalización actual.

Para la configuración del sistema con enlace troncal doméstico de 800 MHz, este campo tiene el ancho de banda de canal 806; es decir, esta selección especifica el ancho de banda de canal de las frecuencias que están en el rango de 806 MHz a 821 MHz.

IMPORTANTE:

El ancho de banda para las frecuencias que están en el rango de 821 MHz a 824 MHz se configura en el campo [Ancho de banda de canales del NPSPAC en la página 538](#).

Cuando se selecciona **12,5 kHz** y cuando el Tipo de voz y señal de un grupo está configurado como **Analógico**, el campo [Asegurar/borrar conexión de AG en la página 570](#) y los campos Conexión segura/no escriptada del grupo de conversación son obligados a **Eliminarse**.

Solo se accede: Cuando el campo Tipo de sistema está configurado como **Tipo II**, cuando el radio no está funcionando dentro de la banda de frecuencia de 900 MHz, cuando se ha seleccionado una Clave avanzada de sistema con acceso en el campo ID del sistema, y cuando el radio admite distintos modelos y opciones.

Se admiten las siguientes selecciones:

25,0 kHz**20 kHz****ADVERTENCIA:****20 kHz y 25 kHz no son válidas si se cumple la siguiente condición:**

Cuando se aplica el Requerimiento de banda estrecha de la FCC de 12,5 kHz para este codeplug; y

cuando el sistema de troncalización, [Banda de frecuencia tipo II en la página 521](#), es una troncalización de otras bandas (OBT); y

cuando cualquiera de los registros/filas de la página de asignación del canal de OBT tiene: (el campo [Habilitación de Tx en la página 524](#) está **activado**, y [Frecuencia de inicio de Tx en la página 525](#) O [Frecuencia de finalización de Tx en la página 525](#) cae en uno de los rangos de requerimiento de la FCC).

12,5 kHz

Siempre disponible

10.36.6.4**Ancho de banda de canales del NPSPAC**

En este campo se selecciona el ancho de banda de los canales según el Comité Asesor de Planificación de Seguridad Pública Nacional (NPSPAC) para el sistema de troncalización actual.

Esta selección especifica el ancho de banda del canal de las frecuencias que están en el rango de 821 MHz a 824 MHz.

**NOTA:**

El ancho de banda para las frecuencias que están en el rango de 806 MHz a 821 MHz se configura en el campo [Ancho de banda de canal en la página 537](#).

Cuando se selecciona **12,5 kHz** y cuando el Tipo de voz y señal de un grupo está configurado como **Analógico**, el campo [Asegurar/borrar conexión de AG en la página 570](#) y los campos Conexión segura/no escrita del grupo de conversación son obligados a **Eliminarse**.

Solo se accede: Cuando el campo Tipo de sistema está configurado como **Tipo II**, cuando el radio opera en la banda de frecuencia de 800 MHz y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

- 20 kHz
- 12,5 kHz

10.36.6.5**Tipo de asignación de canal**

En este campo se selecciona una variación leve en el tramo de la banda de frecuencia (en MHz) y, además, ajusta el ancho de banda del espaciamiento de canal (en kHz).

Esta selección se aplica para el Sistema de troncalización actual.

Solo se accede: Cuando el campo Tipo de sistema está configurado como **Tipo II**, cuando el radio opera en la banda de frecuencia de 800 MHz y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Nacional

Espaciamiento de canal de 25 kHz que se usa en los EE. UU.

Internacional

Espaciamiento de canal de 12,5 kHz que se usa fuera de los EE. UU.

10.36.7

Alias de estado (sistema de troncalización tipo II)

La sección **Alias de estado** del conjunto Sistema de troncalización tipo II permite al usuario ver o definir los estados de los sistemas de troncalización individuales. Los usuarios luego pueden seleccionar y transmitir su Estado actual al despachador (unidad base) con una pulsación del botón Estado, una pulsación del botón Estado directo o mediante la selección de menú Estado.

**NOTA:**

Comparado con la transmisión de voz, las transmisiones de estado hacen un uso más eficiente de un canal.

En el caso de los modelos sin teclado, esta función solo se puede utilizar con la función Botón un toque.

**ADVERTENCIA:**

Esta función se aplica solo cuando la Personalidad de troncalización a la que hace referencia este Sistema de troncalización tiene el campo Activación de estado habilitado.

El Alias de estado se debe programar de manera idéntica (o con el mismo significado) para el despachador y las unidades móviles o portátiles. Es decir, el Alias 1 de estado de la unidad despachadora debe ser idéntico (o debe tener el mismo significado) que el Alias 1 de estado para la unidad móvil o portátil.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.36.7.1

Activación de alias de estado

En este campo se activa la posibilidad de definir el Estado para el Sistema de troncalización actual.

**ADVERTENCIA:**

Esta función se aplica solo cuando la Personalidad de troncalización a la que hace referencia este Sistema de troncalización tiene el campo Activación de estado habilitado.

Una vez que se activa, debe programar cada Alias de estado del radio (Nombre de alias de mensaje y Número de alias de estado del mismo registro/fila) para corresponder de manera idéntica con el Alias de estado de la unidad del despachador correspondiente o tener el mismo significado.

Una vez que se define, puede acceder a la función Estado con una pulsación del botón Estado, una pulsación del botón Estado directo o la selección del menú Estado.

En el caso de los modelos sin teclado, la función Estado solo se puede utilizar con la función Botón un toque.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.36.7.2

Número de alias de estado

En este campo se selecciona un número que identifica el Estado actual.

Esta selección se aplica al estado actual (registro/fila) que se aplica al Sistemas de troncalización actual.

**ADVERTENCIA:**

- Esta función se aplica solo cuando la Personalidad de troncalización a la que hace referencia este Sistemas de troncalización tiene el campo Activación de estado habilitado.
- Una vez definido, el usuario puede acceder a la función Estado con la pulsación del botón Estado, la pulsación del botón Estado directo o la selección del menú Estado.

**IMPORTANTE:**

El alias de estado se debe programar de manera idéntica (o con el mismo significado) para el despachador y las unidades móviles o portátiles. Es decir, el Alias 1 de estado de la unidad despachadora debe ser idéntico (o debe tener el mismo significado) que el Alias 1 de estado para la unidad móvil o portátil.

Solo se accede: Cuando el campo [Activación de alias de estado en la página 539](#) está activado y cuando el radio admite modelos y opciones diferentes.

10.36.7.3

Texto de alias de estado

Este campo permite definir nombres reconocibles para el estado actual (registro/fila).

Esta selección se aplica al Sistema de troncalización actual.

**NOTA:**

- Esta función se aplica solo cuando la Personalidad de troncalización a la que hace referencia este Sistema de troncalización tiene el campo Activación de estado habilitado.
- Una vez que se define, puede acceder a la función Estado con una pulsación del botón Estado, una pulsación del botón Estado directo o la selección del menú Estado.

**IMPORTANTE:**

El alias de estado se debe programar de manera idéntica (o con el mismo significado) para el despachador y las unidades móviles o portátiles. Es decir, el Alias 1 de estado de la unidad despachadora debe ser idéntico (o debe tener el mismo significado) que el Alias 1 de estado para la unidad móvil o portátil.

Solo se accede: Cuando el campo [Activación de alias de estado en la página 539](#) está activado y cuando el radio admite modelos y opciones diferentes.

**NOTA:**

Se pueden usar caracteres, números, espacios y caracteres especiales.

Se pueden utilizar hasta 14 caracteres.

Ejemplos: STATUS-01, Electric1, #510

10.36.8

Alias del sitio (Sistema de troncalización tipo II)

La sección **Alias del sitio** del conjunto Sistema de troncalización tipo II permite al usuario ver o definir los alias sencillos para el usuario que identifican los sistemas de troncalización o los sitios individuales en aquellos sistemas que un radio puede encontrar a medida que se mueve a través de los sitios, los sistemas de troncalización o incluso las Redes de comunicación de área extendida (WACN). Los alias

también pueden identificar llamadas (mediante ID de PTT) recibidas desde radios fuera del Sistema de troncalización seleccionado (doméstico) del radio.

IMPORTANTE:

Solo están disponibles para el radio los Alias de sitio definidos en el Sistema de troncalización seleccionado actualmente por el usuario.

NOTA:

El Tipo de alias de sitio determina adónde se asigna el Texto de alias de sitio, ya sea a un Sistema de troncalización o a un sitio en un sistema.

IMPORTANTE:

Un Sistema de troncalización siempre se define por su Número de RAS WACN doméstico y su Número de sistema, mientras que un sitio se define mediante combinaciones específicas del Número de RAS WACN doméstico, el Número de sistema, el Número de alias de RFSS y el ID del sitio, en función del Tipo de cobertura y Tipo de sistema del Sistema de troncalización actual.

El usuario del radio activa la visualización del Alias del sitio actual y su Indicador de intensidad de señal recibida (RSSI) correspondiente o el cambio del sitio actual con el botón de Visualización/búsqueda del sitio. Si el usuario del radio presiona el botón Bloquear/Desbloquear sitio o selecciona el menú Sitio, podrá ver o cambiar el estado de bloqueo del sitio actual.

Los Sistemas de troncalización individuales hacen referencia a una Personalidad de troncalización. Luego, esta configuración de los Sistemas de troncalización puede quedar operativa para todos los tipos de canales dentro de dicha Personalidad de troncalización.

10.36.8.1

Activación de alias del sitio

En este campo se activan los campos Alias del sitio para el ID del sitio actual (registro/fila), que también se aplica al Sistema de troncalización actual.

NOTA:

El usuario del radio activa la visualización del Alias del sitio actual y su Indicador de intensidad de señal recibida (RSSI) correspondiente o el cambio del sitio actual con el botón de Visualización/búsqueda del sitio.

Con el botón bloquear/desbloquear sitio o la selección del menú del Sitio se puede ver o cambiar el estado de bloqueo del sitio actual.

NOTA:

Este producto no admite Selección automática de varios sitios (AMSS).

Solo se accede: cuando el campo Tipo de sistema se configura en **Tipo II**, y cuando el campo [Tipo de cobertura en la página 519](#) se configura en **SmartZone**, y cuando el radio admite modelos/ opciones diferentes;

O cuando el campo Tipo de sistema se configura en **ASTRO 25**, y cuando el campo Tipo de cobertura no se configura en **Desactivado**, y cuando el radio admite modelos/ opciones diferentes.

10.36.8.2

ID del sitio

Este campo permite ingresar (en formato decimal o hexadecimal) el número de ID que identifica el sitio para el (registro/fila) actual.

Para que se pueda realizar roaming entre diferentes sitios, cada ID del sitio debe ser único dentro de un Subsistema de frecuencia radial (RFSS). Esta selección se aplica al Sistema de troncalización actual.

Solo se accede: cuando el campo [Activación de alias del sitio en la página 541](#) está activado, cuando el campo Tipo de sistema se configura en **Tipo II**, cuando el campo Tipo de cobertura está establecido en **SmartZone** y cuando el radio admite modelos y opciones diferentes,

o cuando el campo [Activación de alias del sitio en la página 541](#) está activado, cuando el campo [Tipo de alias del sitio en la página 608](#) está establecido en **Sitio**, cuando el campo Tipo de sistema está establecido en **ASTRO 25**, cuando el campo Tipo de cobertura no está **Desactivado** y cuando el radio admite modelos y opciones diferentes.

Mesa 252: Rango

Mínimo	Máximo
0 (Hex)	FE (Hex)

10.36.8.3

Texto de alias del sitio

Este campo permite definir nombres reconocibles para el Alias del sitio actual (registro/fila) que se aplica al Sistema de troncalización actual.

Consulte también [Tipo de alias del sitio en la página 608](#). Puede activar el Texto de alias del sitio con la pulsación del botón Mostrar/Buscar sitio, la pulsación del botón Bloquear/desbloquear sitio y las funciones de selección del menú Sitio.

Solo se accede: cuando el campo [Activación de alias del sitio en la página 541](#) está activado, cuando el campo Tipo de sistema se configura en **Tipo II**, cuando el campo Tipo de cobertura está establecido en **SmartZone** y cuando el radio admite modelos y opciones diferentes,

o cuando el campo [Activación de alias del sitio en la página 541](#) está activado, cuando el campo Tipo de sistema está establecido en **ASTRO 25**, cuando el campo Tipo de cobertura no está establecido en **Desactivado** y cuando el radio admite modelos y opciones diferentes.

NOTA:

Se pueden usar caracteres, números, espacios y caracteres especiales.

Se pueden utilizar hasta 14 caracteres.

Ejemplos: EMT-001, #500, Electric1, Site Alias 01

10.36.9

Un toque (Sistema de troncalización tipo II)

La sección **Un toque** del conjunto Sistema de troncalización tipo II permite al usuario ver o definir las selecciones de [Función Botón un toque en la página 543](#) e [Índice del botón Un toque en la página 544](#) de Un toque específicas para hasta cuatro (4) pulsaciones del botón Un toque o selecciones del menú Un toque.

Un toque permite al usuario crear navegación de menús o atajos de botones para el usuario del radio. Estos atajos reducen significativamente el esfuerzo que el usuario del radio realiza para iniciar una función del radio. Una pulsación del botón de Un toque o una selección de menú pueden reducir a una sola pulsación de botón el inicio de una función del radio; de lo contrario, para este mismo proceso se llevarían a cabo muchos pasos de navegación en el menú. Estas selecciones se aplican para el Sistema de troncalización actual.

NOTA:

Los Sistemas de troncalización individuales hacen referencia a una Personalidad de troncalización. Luego, esta configuración de los Sistemas de troncalización puede quedar operativa para todos los tipos de canales dentro de dicha Personalidad de troncalización.

10.36.9.1

Botón

Muestra solo la visualización del nombre asignado para la pulsación del botón Un toque o la selección del menú Un toque.

**NOTA:**

Los Sistemas de troncalización individuales hacen referencia a una Personalidad de troncalización. Luego, esta configuración de los Sistemas de troncalización puede quedar operativa para todos los tipos de canales dentro de dicha Personalidad de troncalización.

10.36.9.2

Función Botón un toque

En este campo se selecciona la función Un toque para la pulsación del botón Un toque o la selección de menú Un toque.

Esta selección se aplica para el registro o la fila actual, que se aplica para el Sistema de troncalización actual.

**IMPORTANTE:**

El botón Troncalización con un toque 1, en otras palabras, el primer registro/fila, corresponderá a la presión del botón Un toque 1, o a la selección del menú TCH1 o SIG1, y así sucesivamente.

**NOTA:**

Con cualquier selección de estas funciones, la selección Índice de botón de un toque también debe definirse.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Desactivado

La opción Un toque no está disponible para la selección de botón actual.

Teléfono

La función [Funcionamiento del teléfono en la página 577](#) está configurada como **Solo lista** o **Ilimitado** para la Personalidad de troncalización a la que se hace referencia.

Llamada privada

La función [Tipo de llamada privada en la página 574](#) no está **desactivada** y el campo [Operación de llamada privada en la página 574](#) está configurado como **Solo lista** o **Ilimitado** para la Personalidad de troncalización a la que se hace referencia.

Alerta de llamada

El campo [Funcionamiento de alerta/localización de llamada en la página 575](#) está configurado como **Solo lista** o **Ilimitado** para la Personalidad de troncalización referida.

Estado

La función [Activación de alias de estado en la página 539](#) se activa para el Sistema de troncalización actual.

Mensaje

La función Mensaje se activa para el Sistema de troncalización actual.

**NOTA:**

Las selecciones de funciones disponibles del botón Un toque dependen del modelo u opción.

10.36.9.3

Índice del botón Un toque

En este campo se selecciona el Índice/miembro de la lista de un toque para la pulsación del botón Un toque o la selección del menú Un toque correspondiente a la función del botón Un toque seleccionada.

El término Índice hace referencia al registro o la fila real de la lista determinada por la selección de la función del botón Un toque. Esta selección se aplica para el Sistema de troncalización actual.

IMPORTANTE:

El botón Troncalización de un toque 1, el primer registro o la primera fila corresponderá a una pulsación del botón Un toque 1, y a una selección del menú TCH1 o SIG1.

Solo se accede: Cuando el campo [Función Botón un toque en la página 543](#) para el registro o la fila actuales no está configurado como **Desactivado** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Llamada privada

Este número de índice se correlaciona con el número de fila de la Lista de llamadas frecuentes Tipo II o ASTRO 25.

IMPORTANTE:

La selección de [Lista de uso frecuente de llamadas de troncalización en la página 576](#) determina qué Lista de llamadas frecuentes se usa para la Personalidad de troncalización a la que se hace referencia.

Está a disposición del usuario cuando la función [Tipo de llamada privada en la página 574](#) no está en **Desactivado**, y el campo [Operación de llamada privada en la página 574](#) está configurado en **Solo lista** o **Ilimitado** para la Personalidad de troncalización a la que se hace referencia.

Alerta de llamada

Este número de índice se correlaciona con el número de fila de la Lista de llamadas frecuentes Tipo II o ASTRO 25.

IMPORTANTE:

La selección Lista de uso frecuente de llamada de troncalización determina qué Lista de uso frecuente de llamada se usa para la Personalidad de troncalización a la que se hace referencia.

Está a disposición del usuario cuando el campo [Funcionamiento de alerta/localización de llamada en la página 575](#) está configurado en **Solo lista** o **Ilimitado** para la Personalidad de troncalización a la que se hace referencia.

Teléfono

Este número de Índice se correlaciona con el número de fila de la Lista de uso frecuente de llamadas.

Está a disposición del usuario cuando la función [Funcionamiento del teléfono en la página 577](#) está configurada en **Solo lista** o **Ilimitado** para la Personalidad de troncalización a la que se hace referencia.

Estado

Este número de índice se correlaciona con la posición o el número de fila de los miembros de la Lista de alias de estado.

Está a disposición del usuario cuando la función [Activación de alias de estado en la página 539](#) está **Activada** para el Sistema de troncalización actual.

Mensaje

Este número de índice se correlaciona con la posición o el número de fila de los miembros de la Lista de alias de mensaje.

Está a disposición del usuario cuando la función Mensaje está **Activada** para el Sistema de troncalización actual.

10.36.10

Digital (sistema de troncalización ASTRO 25)

La sección **Digital** del conjunto Sistema de troncalización ASTRO 25 permite al usuario ver o definir la funcionalidad de comunicación digital.

NOTA:

Los Sistemas de troncalización individuales hacen referencia a una Personalidad de troncalización. Luego, esta configuración de los Sistemas de troncalización puede quedar operativa para todos los tipos de canales dentro de dicha Personalidad de troncalización.

10.36.10.1

Alimentación adaptativa

En este campo se activa el radio para ajustar automáticamente el nivel de potencia del transmisor en el canal de voz, no en el canal de control, según la intensidad de la señal de información del Control del vínculo de adaptación de alimentación automática (APA LC) recibida de manera inalámbrica.

Si la intensidad de la señal es mejor que el umbral aceptable, el radio transmitirá a potencia media en lugar de alta potencia. Esta selección se aplica para el Sistema de troncalización actual.

NOTA:

Si presiona el botón PTT una segunda vez dentro de los 30 segundos en que APA está activada para el modo seguro F2 TDMA, el radio transmite en potencia media si el nivel de potencia actual se establece en alto. Si el tiempo supera los 30 segundos, el nivel de potencia permanece alto.

Solo se accede: cuando el campo Nivel de intensidad de Tx de [Nivel de potencia de Tx en la página 528](#) está configurado en **Bajo**, y cuando el radio admite modelos/opciones diferentes.

10.36.10.2

Longitud del preámbulo

En este campo se selecciona un número que determina la cantidad de tiempo que se envían los paquetes de preámbulos de sincronización de bits al comienzo de todas las transmisiones de canales de voz de ASTRO 25 para el Sistema de troncalización actual

Estos paquetes permiten transmitir y recibir radios para sincronizarse entre sí antes de una transmisión de ASTRO 25.

NOTA:

La duración del preámbulo es igual a este valor de longitud del preámbulo multiplicado por 0,2083 ms.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 253: Rango

Mínimo	Máximo
0	255

10.36.10.3

Tipo de modulador digital

En este campo se selecciona el ancho de banda del canal para el Sistema de troncalización actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

C4FM (predeterminado de fábrica para troncalización tipo II)

Modulación de frecuencia nivel 4 continua para operación no simultánea.

CQPSK (predeterminado de fábrica para Troncalización ASTRO 25)

Modulación por desplazamiento de fase en cuadratura compatible para operación de transmisión simultánea de la banda estrecha y operación de transmisión no simultánea.

IMPORTANTE:

Esta selección está disponible solo para modelos de radios con operación digital de Interfaz aéreo común (CAI).

WIDE

Operación simultánea de banda ancha.

IMPORTANTE:

Esta selección no puede elegirse si se selecciona un ancho de banda de canal de 12,5 kHz.

10.36.10.4

Umbral BER de sincronización de marco de TDMA

En este campo se selecciona la tasa de errores de bits (BER) de Acceso múltiple por división de tiempo (TDMA) máxima permisible de que tolera un radio que está en un canal de voz X2 o TDMA de fase 2.

NOTA:

La BER de TDMA se calcula durante la parte de sincronización del marco de una transmisión de voz de TDMA. Si se detecta una BER mayor a este máximo, el radio intenta cambiar a un sitio mejor cuando esté disponible. Esta selección se aplica para el Sistema de troncalización actual.

Solo se accede: cuando el campo Tipo de sistema se configura en **ASTRO 25**, y cuando el campo [Capacidad de voz de fase 2 en la página 616](#) está **Activado** y cuando el radio admite modelos/ opciones diferentes.

Mesa 254: Rango

Mínimo	Máximo	Incrementos
Desactivado	25,4 %	0,1 %

10.36.10.5

Umbral NID BER/de sincronización de marco de FDMA

En este campo se selecciona la Tasa de errores de bits (BER) del ID de red/sincronización de trama de Acceso múltiple por división de frecuencias (FDMA) máxima permitida que puede tolerar un radio en un sitio de troncalización.

Este máximo se aplica al canal de control y al canal de voz. Si se detecta una BER mayor a este máximo, el radio intenta cambiar a un sitio mejor cuando esté disponible. Esta selección se aplica para el Sistema de troncalización actual.

Solo se accede: Cuando el campo [Tipo de cobertura en la página 519](#) no está configurado como **Desactivado** y cuando el radio admite modelos y opciones diferentes.

Mesa 255: Rango

Mínimo	Máximo	Incrementos
Desactivado	25,4 %	0,1 %

10.36.11

Seguro/multiclave (sistema de troncalización tipo II)

La sección **Seguro/multiclave** del conjunto Sistema de troncalización tipo II permite al usuario ver o definir la funcionalidad de seguridad y multiclave para las comunicaciones codificadas de transmisión y recepción seguras. Esta funcionalidad puede personalizarse según el sistema de troncalización.

**NOTA:**

Los Sistemas de troncalización individuales hacen referencia a una Personalidad de troncalización. Luego, esta configuración de los Sistemas de troncalización puede quedar operativa para todos los tipos de canales dentro de dicha Personalidad de troncalización.

10.36.11.1

Tx/Rx de DES-XL predeterminada

En este campo se activa solamente el Estándar de encryption de datos - Rango extendido (DES-XL) digital que se utilizará para todas las llamadas de voz con encryption seguro.

DES-XL es un estándar de encryption Tipo 3 (nivel medio). Esta selección se aplica para el Sistema de troncalización actual.

Cuando se desactiva, solo se utiliza el estándar digital de datos de encryption - Respuesta de salida (DES-OFB) en todas las llamadas de voz con encryption seguro. DES-OFB es un estándar de encryption Tipo 3 (nivel medio).

**ADVERTENCIA:**

Esta función solo se aplica cuando el radio está equipado con un módulo de encryption de algoritmo doble DES-XL/DES-OFB.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** y cuando el radio admite modelos y opciones diferentes.

10.36.11.2

Selección de clave de vínculo

En este campo se selecciona la clave de encryption seguro que se utilizará durante las comunicaciones del Grupo de conversación de vínculo cuando se opera en el modo de encryption seguro.

Los Grupos de conversación de vínculo permiten a un despachador unirse a varios grupos de conversación o usuarios de modo que todos puedan comunicarse como un solo grupo de conversación. Esta selección se aplica para el Sistema de troncalización actual.

**IMPORTANTE:**

Cuando el campo [ASTRO OTAR en la página 620](#) está **Activado** para el Sistema de troncalización actual, el valor de Seleccionar clave se elige desde la Lista de referencias de clave de encryption de hardware seguro de la función Perfil de KMF seguro seleccionada en el campo [Índice de perfil de ASTRO OTAR en la página 621](#) para el Sistema de troncalización actual.

**ADVERTENCIA:**

Considere que está apuntando a las Claves de la Lista de clave de encryption para esta selección; las Claves individuales de la Lista de referencias de claves de encryption de hardware seguro hacen referencia a las Claves de la Lista de clave de encryption en el campo Referencia de claves de encryption. Por lo tanto, cuando ASTRO OTAR está activado, cualquier clave que se seleccione primero se debe definir en la Lista de referencias de clave de encryption para hardware seguro.

Cuando el campo ASTRO OTAR está **Desactivado** para el Sistema de troncalización actual, los valores de Selección de clave de hardware se eligen directamente en la Lista de clave de encryption de la ventana Asegurar amplitud.

Solo se accede: cuando el campo [Operación segura en la página 301](#) se configura en **Hardware**, y cuando el radio admite modelos/opciones diferentes;

O cuando el campo [Operación segura en la página 301](#) se configura en **Software**, y cuando el campo Tipo de sistema se configura en **ASTRO 25**, y cuando el radio admite modelos/opciones diferentes.

10.36.11.3

Asegurar/borrar conexión de Degradación reducida

En este campo se selecciona el tipo de conexión que se utiliza para la Degradación reducida.

Cuando el radio admite modelos y opciones diferentes.

Seleccionar

Permite activar o desactivar las comunicaciones encriptadas seguras.

**NOTA:**

Ya sea con la pulsación del botón Selección de Tx segura o el switch de alternación Selección de Tx segura o la selección del menú Seguro permite al usuario alterar entre las comunicaciones seguras y sin encryption para ese canal.

Borrar

Relaciona u obliga al canal a operar comunicaciones convencionales normales (no protegidas).

Encriptación

Conecta o activa el canal en la operación encriptada segura.

Solo se accede: cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software**.

10.36.11.4

Failsoft Key Select (Selección de clave de degradación reducida)

En este campo se selecciona la clave de encryption seguro que se utilizará para el modo Degradación reducida mientras se opera en el modo de encryption seguro.

Esta selección se aplica para el Sistema de troncalización actual.

IMPORTANTE:

Cuando el campo [ASTRO OTAR en la página 620](#) está **Activado** para el Sistema de troncalización actual, el valor de Seleccionar clave se elige desde la Lista de referencias de clave de encryption de hardware seguro de la función Perfil de KMF seguro seleccionada en el campo [Índice de perfil de ASTRO OTAR en la página 621](#) para el Sistema de troncalización actual.

ADVERTENCIA:

Considere que está apuntando a las Claves de la Lista de clave de encryption para esta selección; las Claves individuales de la Lista de referencias de claves de encryption de hardware seguro hacen referencia a las Claves de la Lista de clave de encryption en el campo Referencia de claves de hardware. Por lo tanto, cuando ASTRO OTAR está activado, cualquier clave que se seleccione primero se debe definir en la Lista de referencias de clave de encryption para hardware seguro.

Cuando el campo ASTRO OTAR está **Desactivado** para el Sistema de troncalización actual, el valor de Selección de clave se elige directamente en la Lista de clave de encryption de la ventana Encryption en general.

Solo se accede: Cuando el radio admite modelos y opciones diferentes y cuando el campo [Operación segura en la página 301](#) se configure en **Hardware**.

O cuando el campo [Operación segura en la página 301](#) se configura en **Software**, y cuando el campo Tipo de sistema está configurado en **ASTRO 25**, y cuando el campo Asegurar/borrar conexión de Degradación reducida se configura en **Borrar**

10.36.11.5

Asegurar/borrar conexión de Llamada privada

En este campo se selecciona el tipo de conexión que se utiliza para una Llamada privada.

Cuando el radio admite modelos y opciones diferentes.

Seleccionar

Permite activar o desactivar las comunicaciones encriptadas seguras.

NOTA:

Ya sea con la pulsación del botón Selección de Tx segura o el switch de alternación Selección de Tx segura o la selección del menú Seguro permite al usuario alterar entre las comunicaciones seguras y sin encryption para ese canal.

Borrar

Relaciona u obliga al canal a operar comunicaciones convencionales normales (no protegidas).

Encriptación

Conecta o activa el canal en la operación encriptada segura.

Solo se accede: cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software**.

10.36.11.6

Private Call Key Select (Selección de tecla de llamada privada)

En este campo se selecciona la clave de encryption seguro que se utilizará para una Llamada privada cuando se opera en modo de encryption seguro.

Esta selección se aplica para el Sistema de troncalización actual. Cuando el campo Índice de perfil de ASTRO OTAR para el Sistema de troncalización actual se configura en **Activado**, el valor de este campo se selecciona en la Lista de referencias de clave de encryption seguro.

IMPORTANTE:

La aplicación apunta a las Claves de la Lista de clave de encryption para esta selección. Las claves individuales de la Lista de referencias de clave de encryption seguro hacen referencia a las claves de la Lista de claves de encryption del campo Referencias de clave de encryption. Por ende, las claves deben estar definidas en la Lista de referencias de clave de encryption seguro antes de que las claves estén disponibles para su selección. Están disponibles las claves del perfil de OTAR con el campo de lista de claves independientes activado. Cuando el campo Índice de perfil de ASTRO OTAR para el Sistema de troncalización actual está **Desactivado**, el valor de este campo se selecciona en la Lista de clave de encryption dentro de la ventana Encryption en general.

Solo se accede: Cuando el radio admite modelos y opciones diferentes y cuando el campo [Operación segura en la página 301](#) se configure en **Hardware**.

O cuando el campo [Operación segura en la página 301](#) está configurado en **Software**, y cuando el campo Tipo de sistema está configurado en **ASTRO 25**, y cuando el campo Asegurar/borrar conexión de Privado no está configurado en **Hardware**

10.36.11.7

Asegurar/borrar conexión de Interconexión

En este campo se selecciona el tipo de conexión que se utiliza para Interconexión.

Cuando el radio admite modelos y opciones diferentes.

Seleccionar

Permite activar o desactivar las comunicaciones encriptadas seguras.

NOTA:

Ya sea con la pulsación del botón Selección de Tx segura o el switch de alternación Selección de Tx segura o la selección del menú Seguro permite al usuario alterar entre las comunicaciones seguras y sin encryption para ese canal.

Borrar

Relaciona u obliga al canal a operar comunicaciones convencionales normales (no protegidas).

Encriptación

Conecta o activa el canal en la operación encriptada segura.

Solo se accede: cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software**.

10.36.11.8

Interconnect Key Select (Selección de la tecla de interconexión)

En este campo se selecciona la clave de encryption seguro que se utilizará para una llamada de interconexión (modo Teléfono) cuando se opera en Modo de encryption seguro.

Esta selección se aplica para el Sistema de troncalización actual.

IMPORTANTE:

Cuando el campo Índice de perfil de OTAR de ASTRO está **Activado** para el Sistema de troncalización actual, este valor de Selección de clave se elige en la Lista de referencias de clave de encryption seguro del Perfil de OTAR de ASTRO que se selecciona en el campo Índice de perfil de OTAR de ASTRO del Sistema de troncalización actual.

ADVERTENCIA:

Considere que está apuntando a las Claves de la Lista de clave de encryption para esta selección; las Claves individuales de la Lista de referencias de claves de encryption seguro hacen referencia a las Claves de la Lista de clave de encryption en el campo Referencia de claves de hardware. Por lo tanto, cuando el índice del perfil de ASTRO OTAR está activado, cualquier clave seleccionada primero se debe definir en la Lista de referencias de clave de encryption seguro. Están disponibles las claves del perfil de OTAR con el campo de lista de claves independientes activado.

La aplicación apunta a las Claves de la Lista de clave de encryption para esta selección. Las claves individuales de la Lista de referencias de clave de encryption seguro hacen referencia a las claves de la Lista de claves de encryption del campo Referencias de clave de encryption. Por ende, las claves deben estar definidas en la Lista de referencias de clave de encryption seguro antes de que las claves estén disponibles para su selección.

Cuando el campo Índice de perfil de ASTRO OTAR para el Sistema de troncalización actual está **Desactivado**, el valor de este campo se selecciona en la Lista de clave de encryption dentro de la ventana Encryption en general.

Solo se accede: Cuando el radio admite modelos y opciones diferentes y cuando el campo [Operación segura en la página 301](#) se configure en **Hardware**.

O cuando el campo [Operación segura en la página 301](#) está configurado en **Software**, y cuando el campo Tipo de sistema está configurado en **ASTRO 25**, y cuando el campo Asegurar/borrar conexión de Interconexión no está configurado en **Hardware**

10.36.11.9

Asegurar/borrar conexión de Reagrupación dinámica

Este campo selecciona el tipo de conexión que se usa para Reagrupación dinámica.

Cuando el radio admite modelos y opciones diferentes.

10.36.11.10

Selección de clave de grupo de conversación dinámica

En este campo se selecciona la clave de encryption seguro que se utilizará para una Reagrupación dinámica (Grupo de conversación dinámico) cuando se opera en modo de encryption seguro.

Esta selección se aplica para el Sistema de troncalización actual.

IMPORTANTE:

Cuando el campo [ASTRO OTAR en la página 620](#) está **Activado** para el Sistema de troncalización actual, el valor de Seleccionar clave se elige desde la Lista de referencias de clave de encryption de hardware seguro de la función Perfil de KMF seguro seleccionada en el campo [Índice de perfil de ASTRO OTAR en la página 621](#) para el Sistema de troncalización actual.

ADVERTENCIA:

Considere que está apuntando a las Claves de la Lista de clave de encryption para esta selección; las Claves individuales de la Lista de referencias de claves de encryption de hardware seguro hacen referencia a las Claves de la Lista de clave de encryption en el campo Referencia de claves de encryption. Por lo tanto, cuando ASTRO OTAR está activado, cualquier clave que se seleccione primero se debe definir en la Lista de referencias de clave de encryption para hardware seguro.

Cuando el campo ASTRO OTAR está **Desactivado** para el Sistema de troncalización actual, el valor de Selección de clave se elige directamente en la Lista de clave de encryption de la ventana Encryption en general.

Solo se accede: cuando el radio admite modelos/opciones diferentes, cuando el campo [Activación de reagrupación dinámica en la página 531](#) está **Activado**, y cuando el campo Operación segura está configurado en **Hardware**;

O cuando el campo [Operación segura en la página 301](#) se configura en **Software**, y cuando el campo Tipo de sistema está configurado en **ASTRO 25**, y cuando el campo Asegurar/borrar conexión de Reagrupación dinámica se configura en **Hardware**

10.36.11.11

Selección de clave AG dinámica

En este campo se selecciona la clave de encryption segura que se utilizará para una agrupación dinámica de anuncios cuando se opera en modo de encryption seguro.

Esta selección se aplica para el Sistema de troncalización actual.

IMPORTANTE:

Cuando el campo [ASTRO OTAR en la página 620](#) está **Activado** para el sistema de troncalización actual, este valor de Seleccionar clave se elige de [Lista de referencias de clave de encryption de hardware seguro en la página 321](#) del Conjunto de perfiles KMF seguros seleccionado en el campo [Índice de perfil de ASTRO OTAR en la página 621](#) para el sistema de troncalización actual.

ADVERTENCIA:

Tenga en cuenta que se dirige realmente a las claves de la [Lista de clave de encryption en la página 317](#) para esta selección; las claves individuales de la [Lista de referencias de clave de encryption de hardware seguro en la página 321](#) hacen referencia a las claves de la Lista de clave de encryption del campo [Referencia de clave de encryption en la página 322](#). Por lo tanto, cuando ASTRO OTAR está activado, cualquier clave que se seleccione primero se debe definir en las Referencias de clave de encryption de hardware seguro.

Cuando el campo ASTRO OTAR está **Desactivado** para el Sistema de troncalización actual, el valor de Selección de clave se elige directamente en la Lista de clave de encryption de la ventana Encryption en general.

Solo se accede: cuando el campo [Activación de reagrupación dinámica en la página 531](#) está activado, y cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware**, y cuando el campo Tipo de sistema está configurado en **Tipo II**, y cuando el campo Asegurar/borrar

conexión de Reagrupación dinámica se configura en **Tipo II**, y cuando el radio admite opciones/ modelos diferentes.

10.36.12

Grupo de conversación (sistema de troncalización tipo II)

La sección **Grupo de conversación** del conjunto Sistema de troncalización tipo II permite al usuario ver o definir la funcionalidad Grupo de conversación individual para los sistemas de troncalización individuales. Un Grupo de conversación es una agrupación definida por RadioCentral de radios creada para el propósito de comunicaciones frecuentes y convenientes con otras.

NOTA:

Las frecuencias del Grupo de conversación se determinan mediante el Sistema de troncalización en terreno y no se programan en RadioCentral.

NOTA:

Las frecuencias de degradación reducida de la Personalidad de troncalización deben programarse dentro del RadioCentral.

Una vez definido, un Grupo de conversación se puede asignar a uno o más canales del Selector de canales del radio desde el campo [Asignación de canal de zonas en la página 676](#) y el campo Grupo de conversación de troncalización del conjunto de listas de canales.

Se admite el siguiente campo:

10.36.12.1

Nombre del grupo de conversación

Este campo permite definir un nombre reconocible de pantalla superior para el canal actual (registro/fila).

Esta selección se aplica a la Personalidad de troncalización actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

NOTA:

Ejemplos: PerTG-001, #500, Electric1, # A5

Se pueden usar caracteres, números, espacios y caracteres especiales.

Los espacios en blanco iniciales se sustituyen con guiones bajos en la pantalla del radio.

Los puntos iniciales no aparecen en la pantalla del radio.

10.36.12.2

ID de grupo de conversación

Este campo permite ingresar (en formato decimal o hexadecimal) el número del Grupo de conversación que identifica únicamente el grupo de conversación actual (registro/fila).

Esta selección se aplica a la Personalidad de troncalización actual.

Solo se accede: Cuando el Sistema de troncalización al que se hace referencia tiene (un archivo de clave de sistema de software o una clave avanzada de sistema con acceso seleccionado en el campo ID del sistema) o (una clave avanzada de WACN con acceso seleccionado en el campo ID de WACN doméstica),

y cuando el radio admite modelos y opciones diferentes.

Mesa 256: Rango

Para el Tipo de protocolo	Desactivado	Mínimo	Máximo
ASTRO 25	Ninguno	0001 hex	FFFE hex
Tipo II	Ninguno	001 hex	FFE hex

IMPORTANTE:

El rango de selección se puede modificar de acuerdo con la Clave avanzada mediante el programa del administrador de claves avanzadas.

10.36.12.3

Tipo de voz/señal de Tx

En este campo se selecciona el modo Señalización de transmisión para el grupo de conversación actual (registro/fila).

Esta selección se aplica para la personalidad de troncalización actual.

Solo se accede: solo se accede a **Digital** cuando el campo **Tipo de protocolo** se configura en **Tipo II**, y cuando **Banda de frecuencia tipo II en la página 521** no está en **900 MHz**.

Se admiten las siguientes selecciones:

- Analógico
- Digital

10.36.12.4

Conexión segura/sin encriptar

En este campo se selecciona el modo Transmisión y recepción de encryption seguro que se debe utilizar para el grupo de conversación actual (registro/fila).

Esta selección se aplica para la personalidad de troncalización actual.

Solo se accede: cuando un Sistema de troncalización al que se hace referencia tiene ([un Archivo de claves de software del sistema o un Clave avanzada de sistema con el acceso seleccionado en el campo **ID del sistema en la página 520**] o [una Clave avanzada WACN con el acceso seleccionado en el campo **ID de WACN de inicio en la página 669**]), y cuando el campo **Operación segura en la página 301** se configura en **Hardware** o **Software**, y cuando el campo **Tipo de protocolo** se configura en **ASTRO 25**, y cuando el radio admite modelos/radios diferentes.

Se admiten las siguientes selecciones:

Borrar

Conecta o activa el canal para comunicaciones normales (no seguras).

Seleccionar

Permite activar o desactivar el Modo de Encryption seguro. Se debe seleccionar el botón Selección de Tx seguro, el switch de alternación **Selección de Tx segura en la página 206** o la selección del menú Asegurar deben para que el usuario active o desactive las comunicaciones con encryption seguro.

Encriptación

Conecta o activa el canal para comunicaciones encriptadas seguras.

10.36.12.5

Selección de clave

Este campo selecciona la clave de encryption seguro que se utilizará en el modo de encryption seguro para el grupo de conversación (registro/fila) actual.

Esta selección se aplica para el grupo de conversación actual de la personalidad de troncalización actual.

**IMPORTANTE:**

Cuando el campo [Índice de perfil de ASTRO OTAR en la página 412](#) no está Desactivado para la Lista de grupo de conversación de ASTRO actual, este valor de Selección de clave se elige de la [Lista de referencias de clave de encryption de hardware seguro en la página 321](#) del Perfil KMF seguro seleccionado en el campo Índice de perfil KMF.

**ADVERTENCIA:**

Tenga en cuenta que la RadioCentral está apuntando a las Claves de la [Lista de clave de encryption en la página 317](#) para esta selección; las Claves individuales de la Lista de referencias de clave de encryption de hardware hacen referencia a las claves de la Lista de claves de encryption desde la [Referencia de clave de encryption en la página 322](#). Por lo tanto, cualquier clave seleccionada cuando OTAR de ASTRO está activado, debe definirse primero en la Lista de referencias de clave de encryption para hardware seguro.

Cuando el campo Índice de Perfil KMF está Desactivado o no se aplica (aparece en color gris) a la Lista de grupo de conversación de ASTRO actual, este valor de Selección de clave es tomado directamente de la Lista de claves de encryption seguro.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software**, y cuando el campo [Voz Protegida/Enlace Abierto en la página 414](#) está configurado en **Seguro** o **Seleccionar**, y cuando el radio admite el modelo/opción.

10.36.12.6

Degradación reducida del grupo de conversación

Este campo permite la operación de degradación reducida para el grupo de conversación actual (registro/fila).

Esta selección se aplica para la [Personalidad de troncalización](#) actual.

Solo se accede: cuando el Sistema de troncalización al que se hace referencia tenga un Archivo de clave del sistema de software o una Clave avanzada de sistema con acceso seleccionado en el campo [ID del sistema en la página 520](#) o una Clave avanzada WACN de sistema con acceso seleccionado en el campo [ID de WACN de inicio en la página 669](#), y cuando el campo [Tipo de degradación reducida en la página 560](#) está configurado en **Grupo de conversación**, y cuando el radio admite diferentes modelos/opciones.

10.36.12.7

Frecuencia de Rx de degradación reducida

Este campo permite ingresar la frecuencia de Recepción (Rx) de degradación reducida para el grupo de conversación actual (registro/fila).

Esta selección se aplica para la personalidad de troncalización actual.

**ADVERTENCIA:**

Las Restricciones de frecuencia de troncalización que se aplican a esta selección se determinan por la configuración de esta personalidad y la banda de frecuencia del Sistema de troncalización al que se hace referencia.

Solo se accede: cuando el Sistema de troncalización al que se hace referencia tenga un Archivo de clave del sistema de software o una Clave avanzada de sistema con acceso seleccionado en el campo [ID del sistema en la página 520](#), o una Clave avanzada WACN de sistema con acceso seleccionado en el campo [ID de WACN de inicio en la página 669](#), y cuando el campo [Tipo de degradación reducida en la página 560](#) está configurado en **Grupo de conversación** y cuando el campo [Degradación reducida del grupo de conversación en la página 555](#) esté activado **Activado**, y cuando el modelo o la opción del radio lo permitan.

10.36.12.8

Frecuencia de Tx de degradación reducida

Este campo permite ingresar la frecuencia de Transmisión (Tx) de degradación reducida para el grupo de conversación actual (registro/fila).

Esta selección se aplica para la [Personalidad de troncalización](#) actual.

ADVERTENCIA:

Las Restricciones de frecuencia de troncalización que se aplican a esta selección se determinan por la configuración de esta personalidad y la banda de frecuencia del Sistema de troncalización al que se hace referencia.

Solo se accede: cuando el Sistema de troncalización al que se hace referencia tenga un Archivo de clave del sistema de software o una Clave avanzada de sistema con acceso seleccionado en el campo [ID del sistema en la página 520](#), o una Clave avanzada WACN de sistema con acceso seleccionado en el campo de ID de WACN doméstica, y cuando el campo [Tipo de degradación reducida en la página 560](#) está configurado en **Grupo de conversación** y cuando el campo [Degradación reducida del grupo de conversación en la página 555](#) esté activado **Activado**, y cuando el modelo o la opción del radio lo permitan.

10.36.12.9

Degradación reducida secundaria de TG

Este campo permite la operación de degradación reducida secundaria para el grupo de conversación actual (registro/fila).

Esta selección se aplica para la personalidad de troncalización actual.

Solo se accede: Cuando el campo [Tipo de degradación reducida en la página 560](#) está establecido en **Grupo de conversación**, cuando el campo [Degradación reducida del grupo de conversación en la página 555](#) está activado y cuando el radio admite diferentes modelos y opciones.

10.36.12.10

Frecuencia de Rx de Failsoft secundario

Este campo permite ingresar la frecuencia de Recepción (Rx) secundaria de degradación reducida para el grupo de conversación actual (registro/fila).

Esta selección se aplica para la personalidad de troncalización actual.

ADVERTENCIA:

Las Restricciones de frecuencia de troncalización que se aplican a esta selección se determinan por la configuración y la banda de frecuencia de [Tipo de protocolo](#) de esta personalidad del [Sistema de troncalización](#) al que se hace referencia.

Solo se accede: Cuando el campo [Tipo de degradación reducida en la página 560](#) está configurado en **Grupo de conversación** y cuando el campo [Degradación reducida del grupo de conversación en la página 555](#) está **Activado**, y cuando el campo [Degradación reducida secundaria de TG en la página 556](#) está **Activado** y cuando el radio admite modelos y opciones diferentes.

10.36.12.11

Frecuencia de Tx de Failsoft secundario

Este campo permite ingresar la frecuencia de Transmisión (Tx) secundaria de degradación reducida para el grupo de conversación actual (registro/fila).

Esta selección se aplica para la personalidad de troncalización actual.

**IMPORTANTE:**

Las Restricciones de frecuencia de troncalización que se aplican a este selección se determinan por la configuración y la banda de frecuencia del Tipo de protocolo de esta personalidad del [Sistema de troncalización](#) al que se hace referencia.

Solo se accede: Cuando el campo [Tipo de degradación reducida en la página 560](#) está configurado en **Grupo de conversación** y cuando el campo [Degradación reducida del grupo de conversación en la página 555](#) está **Activado**, y cuando el campo [Degradación reducida secundaria de TG en la página 556](#) está **Activado** y cuando el radio admite modelos y opciones diferentes.

10.37

Personalidad de troncalización tipo II

La **Personalidad de troncalización tipo II** permite al usuario crear y eliminar las Personalidades de troncalización, además de definir las Personalidades de troncalización individual. Los dos modos de comunicación del radio son troncalización y convencional.

**NOTA:**

Los Sistemas de troncalización hacen referencia a Personalidades de troncalización. La configuración del Sistema de troncalización puede volverse funcional para todos los tipos de canales de troncalización.

Cuando las funciones de las personalidades de troncalización se definieron en forma exclusiva, cada personalidad se puede asignar a la posición deseada del selector de canal del radio con la función Asignación de canal de zona.

10.37.1

General (Personalidad de troncalización tipo II)

La sección **General** del conjunto Personalidad de troncalización tipo II permite al usuario ver o definir las funciones básicas de las personalidades de troncalización individuales.

**NOTA:**

Una vez que se han definido las funciones de las Personalidades de troncalización en forma exclusiva, cada personalidad puede asignarse a la posición deseada del selector de canal del radio con la función Asignación de canal de zona.

10.37.1.1

Nombre de la Personalidad de troncalización

Este campo permite definir un nombre reconocible para la Personalidad de troncalización actual.

**NOTA:**

Cuando las funciones de las personalidades de troncalización se definieron en forma exclusiva, cada personalidad se puede asignar a la posición deseada del selector de canal del radio con la función Asignación de canal de zona. Este nombre se usa para seleccionar la personalidad actual en la Página de canales de dicha función.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

NOTA:

Ejemplos: Personality-01, #500, Electric1, # A5

Se pueden usar caracteres, números, espacios y caracteres especiales.

Los espacios en blanco iniciales se sustituyen con guiones bajos en la pantalla del radio.

Los puntos iniciales no aparecen en la pantalla del radio.

10.37.1.2

Sistema

En este campo se selecciona el Sistema de troncalización programado para la Personalidad de troncalización actual.

IMPORTANTE:

Solo se deben seleccionar los Sistemas de troncalización que tienen un Tipo de sistema que coincida con el Tipo de protocolo de la personalidad actual.

Solo se pueden seleccionar los Sistemas de troncalización con Archivo de claves de software del sistema o Claves avanzadas (Hardware) que no tengan protección de campo o función (acceso ilimitado); en caso contrario, el campo se marca como inválido.

Cuando el valor de este campo se marca como no válido, todos los campos protegidos de Clave de sistema en la Personalidad de troncalización actual se muestran como de solo lectura.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.37.1.3

Temporizador de tiempo de espera

En este campo se selecciona la cantidad de tiempo que el radio puede transmitir de manera continua para la Personalidad de troncalización actual.

Cuando este tiempo está por acabarse, el radio emite un tono de alerta y deja de transmitir en forma automática. El tiempo está expresado en segundos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

NOTA:

Cuando se configura en **Infinito**:

No se utiliza temporizador para los radios APX Next y APX N70 ; por lo tanto, se utiliza un tiempo de conversación infinito.

Mesa 257: Rango

Tipo de radio	Mínimo	Máximo	Incrementos
Radios que no son APX4000XH	15 s	465 s	15 s
Radios APX4000XH	15 s	60 s	15 s

Mesa 258: Rango

Tipo de radio	Mínimo	Máximo	Incrementos
APX NEXT	0 seg	465 s	15 s

10.37.1.4

AGC de RF avanzado

En este campo se selecciona el tipo de Control de ganancia automática (AGC) de la Frecuencia de recepción (RF) para la Personalidad de troncalización actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Desactivado

Cuando está **Desactivado**, el radio utiliza una forma básica de formación de AGC en el receptor del radio. Esta protección incorporada ayuda a evitar la saturación de la señal y del receptor que puede dañar los componentes del radio.

Estándar

Activa una forma avanzada de AGC de RF, que busca evitar la interferencia de intermodulación (IM) mediante la detección y la remoción de toda interferencia recibida causada por fuentes externas.

Mejorado

Activa el radio para usar esquemas adicionales a fin de disminuir la interferencia de IM, lo que limpia la señal.

Inteligente

Permite que el radio utilice un esquema único para mejorar la inmunidad a la interferencia cuando está cerca de estaciones base de fase 2 de transmisión Simulcast lineal y APCO. La opción inteligente es mutuamente excluyente con la casilla de verificación de protección de banda ancha.

**IMPORTANTE:**

El ACG de RF avanzado **Estándar** y **Mejorado** pueden degradar el rendimiento de los canales que no experimentan una interferencia de IM. Por lo tanto, solo se deben activar estas selecciones en canales con problemas de interferencia de IM.

10.37.1.5

Protección de banda ancha

Este campo permite activar la protección de banda ancha de la personalidad de troncalización actual.

La protección de banda ancha mejora el AGC de RF avanzado agregando un filtro de banda ancha de alta selectividad cuando se recibe en frecuencias seleccionadas dentro de las bandas de 700 MHz y 800 MHz.

10.37.1.6

Tipo de conversación

En este campo se selecciona el modo de comunicación para la Personalidad de troncalización actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Mensaje

El sistema asigna un canal de tráfico durante el tiempo de una sola transmisión realizada por un único radio suscriptor. Cuando el radio deja de transmitir, todos los radios permanecen en el canal de tráfico hasta que el tiempo de desconexión finalice. Cuando termina el tiempo de desconexión, los radios regresan al canal de control. Cualquier radio involucrado en la llamada puede subir mientras está en el canal de tráfico sin volver al canal de control. La troncalización de mensaje está disponible en sistemas de canales de control de 3600 baudios.

**ADVERTENCIA:**

La troncalización de mensaje no es compatible con sistemas ASTRO 25.

Transmisión

El sistema asigna un canal de tráfico durante el tiempo de una sola transmisión realizada por un único radio suscriptor. Cuando el radio deja de transmitir, el canal de tráfico se desactiva y todos los suscriptores involucrados en la llamada vuelven al canal de control. Cualquier solicitud de tráfico subsiguiente se envía al canal de control mediante el radio solicitante.

ID DE PTT

El sistema asigna un canal de tráfico para la duración de toda la conversación de la siguiente manera. Luego de que un radio deja de transmitir, el canal de voz permanece activo (tiempo de desconexión) durante el tiempo en que los radios permanecen inactivos en el canal de voz. Cualquier radio que responda durante el tiempo de desconexión activará primero el canal de control para enviar un mensaje con ID de PTT (ID de unidad) que indica que desea enviar el audio ahora para esta llamada; luego, el sistema envía un mensaje de permiso que dirige al radio de vuelta al mismo canal de voz que actúa como la nueva fuente.

10.37.1.7

Tipo de degradación reducida

En esta campo se selecciona el tipo de Degradación reducida para la Personalidad de troncalización actual.

NOTA:

La degradación reducida ofrece funcionamiento de dos vías en el Modo convencional durante las fallas del Sistema de troncalización. El radio vuelve automáticamente al modo troncalizado cuando se restaura el Sistema de troncalización.

Solo se accede: Cuando el Sistema de troncalización al que se hace referencia tiene un archivo de clave del sistema de software o una clave avanzada del sistema con acceso seleccionado en el campo ID del sistema o una clave avanzada de WACN con acceso seleccionado en el campo ID de WACN de inicio y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Selecciones	Definiciones	Disponible para el usuario cuando	
		Tipo de protocolo es igual a	Tipo de cobertura es igual a
Desactivado	No se usa la degradación reducida.	Cualquiera	Cualquiera
Personalidad	<p>Cuando el Tipo de cobertura en la página 519 está Desactivado, el cual es SmartNet, la degradación reducida utiliza las Frecuencias de degradación reducida de la personalidad para todos los grupos de conversación dentro de su personalidad de troncalización.</p> <p>Cuando el Tipo de cobertura es igual a SmartZone no se usan las Frecuencias de degradación reducida de la personalidad, en su lugar:</p> <ul style="list-style-type: none"> Cuando el radio está bloqueado en el sitio, la degradación reducida usa el último canal de control activo. 	Tipo II	Cualquiera

	no se encuentra la Degradación reducida, el radio examina la Lista de canales de control desde el Sistema de troncalización al que se hace referencia para la Degradación reducida. Si el campo Degradación reducida del grupo de conversación no está Activado , la Degradación reducida usa el último canal de control activo y puede que luego deba examinar la lista de canales de control.		

10.37.1.8

Frecuencia de degradación reducida de Rx por personalidad

En este campo se selecciona la frecuencia de Recepción (Rx) que se utilizará durante la operación de Degradación reducida de SmartNet para la Personalidad de troncalización actual.

Esto solo se cumple para el funcionamiento de SmartNet (consulte Tipo de cobertura).

**IMPORTANTE:**

Cuando el Tipo de cobertura es igual a **SmartZone**, no se usan las frecuencias de degradación reducida de la personalidad. Se intenta la degradación reducida en los canales de control definidos en la Lista de canales de control del Sistema de troncalización al que se hace referencia.

Solo se accede:

Cuando el ya mencionado Sistema de troncalización tiene un archivo de claves del sistema de software o una clave avanzada de sistema con acceso seleccionado en el campo ID del sistema y

cuando el campo Tipo de cobertura del Sistema de troncalización al que se hace referencia está configurado en **Desactivado**, y cuando el campo Tipo de protocolo está configurado en **Tipo II**, y cuando el campo Tipo de degradación reducida está configurado en **Personalidad** y el radio admite modelos y opciones diferentes.

10.37.1.9

Frecuencia de Failsoft de Tx por personalidad

En este campo se selecciona la frecuencia de Transmisión (Tx) que se utilizará durante la operación Degradación reducida de SmartNet para la Personalidad de troncalización actual.

Esto solo se cumple para el funcionamiento de SmartNet (consulte Tipo de cobertura).

**IMPORTANTE:**

Cuando el Tipo de cobertura es igual a **SmartZone** no se usan las Frecuencias de degradación reducida de la personalidad. Se intenta la Degradación reducida en los Canales de control definidos en la Lista de canales de control del Sistema de troncalización al que se hace referencia.

Solo se accede:

Cuando el ya mencionado Sistema de troncalización tiene un archivo de claves del sistema de software o una clave avanzada de sistema con acceso seleccionado en el campo ID del sistema y

cuando el campo Tipo de cobertura del Sistema de troncalización al que se hace referencia está configurado en **Desactivado**, y cuando el campo Tipo de protocolo está configurado en **Tipo II**, y cuando el campo Tipo de degradación reducida está configurado en **Personalidad** y el radio admite modelos y opciones diferentes.

10.37.1.10

Degradación reducida secundaria por personalidad

En este campo se activa la selección de frecuencias de Recepción (Rx) y Transmisión (Tx) secundarias que se utilizarán durante la operación de Degradación reducida de SmartNet para la Personalidad de troncalización actual.

Esto solo se cumple para el funcionamiento de SmartNet (consulte [Tipo de cobertura en la página 519](#)).

IMPORTANTE:

Cuando [Tipo de cobertura en la página 519](#) es igual a SmartZone, no se usan las Frecuencias de degradación reducida de la personalidad. Se intenta la Degradación reducida en los Canales de control definidos en la Lista de [Canales de control](#) del [Sistema de troncalización](#) al que se hace referencia.

Solo acceso: cuando el campo [Tipo de cobertura en la página 519](#) del Sistema de troncalización al que se hace referencia está configurado en **Desactivado**, y cuando el campo [Tipo de protocolo](#) está configurado en **Tipo II**, y cuando el campo Tipo de degradación reducida se configura en **Personalidad**, y cuando el radio admite modelos/opciones diferentes.

10.37.1.11

Frecuencia de degradación reducida de Rx secundaria por personalidad

En este campo se selecciona la frecuencia de Recepción (Rx) secundaria que se utilizará durante la operación de Degradación reducida de SmartNet para la Personalidad de troncalización actual.

Esto solo se cumple para el funcionamiento de SmartNet (consulte [Tipo de cobertura](#)).

IMPORTANTE:

Cuando el Tipo de cobertura es igual a SmartZone, no se usan las frecuencias de degradación reducida de la personalidad. Se intenta la degradación reducida en los canales de control definidos en la Lista de canales de control del Sistema de troncalización al que se hace referencia.

Solo se accede: cuando el campo Tipo de cobertura del Sistema de troncalización al que se hace referencia está configurado en **Desactivado**, y cuando el campo Tipo de protocolo está configurado en **Tipo II**, y cuando el campo Tipo de degradación reducida está configurado en **Personalidad**, y el campo Degradación reducida secundaria está activado, y el radio admite modelos/opciones diferentes.

10.37.1.12

Frecuencia de Failsoft de Tx secundario por personalidad

En este campo se selecciona la frecuencia de Transmisión (Tx) secundaria que se utilizará durante la operación Degradación reducida de SmartNet para la Personalidad de troncalización actual.

Esto solo se cumple para el funcionamiento de SmartNet (consulte [Tipo de cobertura en la página 519](#)).

IMPORTANTE:

Cuando el Tipo de cobertura es igual a SmartZone, no se usan las frecuencias de degradación reducida de la personalidad. Se intenta la degradación reducida en los canales de control definidos en la Lista de canales de control del Sistema de troncalización al que se hace referencia.

Solo se accede: cuando el campo Tipo de cobertura del Sistema de troncalización al que se hace referencia está configurado en **Desactivado**, y cuando el campo Tipo de protocolo está configurado en **Tipo II**, y cuando el campo Tipo de degradación reducida está configurado en **Personalidad**, y el campo Degradación reducida secundaria está activado, y el radio admite modelos/opciones diferentes.

10.37.1.13

Modo de transmisión

En este campo se selecciona si la personalidad o el canal tendrá funcionalidad completa de transmisión, o se restringirá desde la transmisión del Grupo de conversación (TG) y las comunicaciones de voz del Grupo de anuncios (AG).

Esta selección se aplica para la personalidad de troncalización actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Sin restricciones

Sin límites en la funcionalidad de transmisión.

TG/AG desactivado (modo para escuchar solamente)

El radio no puede transmitir en el TG o AG seleccionado. Consulte el campo Grupo de conversación de troncalización. El radio puede recibir transmisiones de voz en el modo de canal seleccionado.

ADVERTENCIA:

La reagrupación dinámica no es compatible con esta selección.

El campo [Selección de perfil de emergencia en la página 564](#) de esta personalidad debe configurarse en **Tx de emergencia desactivada** o el perfil seleccionado debe tener el campo [Respuesta de emergencia en la página 353](#) configurado en **Revertir**; de lo contrario, la selección del campo Perfil de emergencia no se considerará válida.

La Lista de rastreo de esta personalidad a la que se hace referencia no debe tener el campo [Tipo de miembro de Tx de voz designada en la página 696](#) configurado en **Canal seleccionado**, es decir, este canal; de lo contrario, la [Selección de lista de rastreo en la página 578](#) no será válida.

El [Teclado de uso frecuente \(DTMF\) en la página 580](#) no es posible con esta selección.

10.37.1.14

Selección de perfil de emergencia

En este campo se selecciona el Perfil de troncalización de emergencia para utilizarlo con la personalidad de troncalización actual.

Puede iniciar la funcionalidad del modo Emergencia o iniciarla con un radio programado

ADVERTENCIA:

Cuando el campo [Modo de transmisión en la página 564](#) se configura en **TG/AG Desactivado** (Solo escuchar) para la Personalidad de troncalización actual, esta selección de Perfil debe estar en **Tx de emergencia desactivado**, o el Perfil seleccionado debe tener el campo [Respuesta de emergencia en la página 353](#) configurado en **Revertir**; de lo contrario, considera que esta selección no es válida.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

- Tx de emergencia desactivada
- Perfiles de emergencia de troncalización disponibles

10.37.1.15

Tipo de inversión de emergencia

En este campo se selecciona el tipo de reversión de emergencia **No táctico** que se va a usar mientras se opera en modo Emergencia en la Personalidad de troncalización actual.

Consulte también [Respuesta de emergencia en la página 353](#).

**ADVERTENCIA:**

Puede iniciar la funcionalidad del modo Emergencia o iniciarla con un radio programado.

Solo se accede: Cuando la función ampliada **Reversión de emergencia múltiple** aparezca en el campo Nombre de la función ampliada, cuando un Perfil de emergencia de troncalización de referencia se seleccione para la Personalidad de troncalización actual y cuando dicho Perfil de emergencia de troncalización tenga su campo Respuesta de emergencia configurado en **Revertir** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Reversión del grupo de conversación

El radio utiliza el ID de grupo de conversación de reversión de respuesta de emergencia definido para la Personalidad de troncalización actual para transmitir alarmas o llamadas de emergencia.

Reversión del sistema

El radio utiliza [Zona de inversión del sistema de emergencia en la página 567](#) y [Canal de inversión del sistema de emergencia en la página 568](#) para transmitir alarmas de emergencia o realizar llamadas de emergencia. Las transmisiones de emergencia también se envían a la consola del despachador.

**ADVERTENCIA:**

La reagrupación dinámica no es compatible con esta selección.

10.37.1.16

ID de grupo de conversación de inversión de respuesta de emergencia

Este campo permite ingresar, en formato decimal o hexadecimal, el número del Grupo de conversación que identifica de forma exclusiva el Grupo de conversación actual (registro/fila).

Esta selección se aplica a los [Personalidad de troncalización](#) actuales.

Solo se accede: cuando el Sistema de troncalización al que se hace referencia tenga un archivo de clave del sistema de software o una clave avanzada de sistema con acceso seleccionado en el campo [ID del sistema en la página 520](#), o una clave avanzada WACN de sistema con acceso seleccionado en el campo [ID de WACN de inicio en la página 669](#), y cuando el modelo o la opción del radio lo permitan.

[Mesa 259: Rango](#)

Para el Tipo de protocolo:	Desactivado	Mínimo	Máximo
ASTRO 25	Ninguna	0001 (Hex)	FFFE (Hex)
Tipo II	Ninguna	001 (Hex)	FFE (Hex)

**IMPORTANTE:**

El rango de selección se puede modificar de acuerdo con la Clave avanzada mediante el programa del administrador de claves avanzadas.

10.37.1.17

Tipo de señal/voz de inversión de respuesta de emergencia

En este campo se selecciona el modo de transmisión de señalización mientras funciona en el modo emergencia para el Grupo de conversación de inversión de respuesta de emergencia.

Esta selección se aplica para la personalidad de troncalización actual.

Solo se accede: solo se puede acceder a **Digital** cuando el campo Tipo de protocolo está configurado en **Tipo II**, y cuando Banda de frecuencia tipo II no es **900 MHz**

Se admiten las siguientes selecciones:

Analógico

No es posible para la troncalización ASTRO 25.

Digital

10.37.1.18

Conexión segura/sin encryption para inversión de respuesta de emergencia

En este campo se selecciona el modo Transmisión mientras funciona en el modo Emergencia para el Grupo de conversación de inversión de respuesta de emergencia.

Esta selección se aplica para la personalidad de troncalización actual.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software**, y cuando el campo Tipo de protocolo está configurado en **ASTRO 25**.

Se admiten las siguientes selecciones:

Borrar

Conecta o realiza la operación de troncalización del grupo de conversación/canal como normal (no seguro).

Seleccionar

Permite activar o desactivar la operación encriptada de seguridad para el grupo de conversación actual. La pulsación del botón Selección de Tx seguro o el switch de alternación [Selección de Tx segura en la página 206](#) o la selección del menú Asegurar permite activar o desactivar comunicaciones con encryption seguro.

Encriptación

Conecta o realiza la operación del grupo de conversación de encriptación de seguridad.

10.37.1.19

Selección de clave de inversión de respuesta de emergencia

En este campo se selecciona la clave de encryption seguro que se utiliza cuando se opera en modo Emergencia para el Grupo de conversación de inversión de respuesta de emergencia.

Esta selección se aplica para la personalidad de troncalización actual.

IMPORTANTE:

Cuando el campo [Índice de perfil de ASTRO OTAR en la página 621](#) está **Activado** para el Sistema de troncalización al que se hace referencia, el valor de Selección de clave se elige en la Lista de referencias de clave de encryption seguro del Perfil de OTAR de ASTRO seleccionado en el campo Índice de perfil de OTAR de ASTRO del Sistema de troncalización al que se hace referencia.

ADVERTENCIA:

Considere que está apuntando a las claves de la Lista de clave de encryption para esta selección; las claves individuales de la Lista de referencias de clave de encryption seguro hacen referencia a las claves de la Lista de clave de encryption en el campo Referencia clave de encryption. Por lo tanto, cuando el campo Índice de perfil de ASTRO OTAR está activado, cualquier clave seleccionada primero se debe definir en la Lista de referencias de clave de encryption seguro. Están disponibles las claves del perfil de OTAR con el campo de lista de claves independientes activado.

Cuando el campo Índice de perfil de ASTRO OTAR está **Desactivado** para el Sistema de troncalización al que se hace referencia, el valor de Selección de clave se elige directamente en la Lista de clave de encryption de la ventana Asegurar amplitud.

ADVERTENCIA:

Cuando hay una coincidencia entre el ID de grupo de conversación que utilizan otros radios y el ID del grupo de conversación de inversión de respuesta de emergencia de este radio y...

cuando no hay una coincidencia entre la Clave de grupo de conversación normal que utilizan otros radios y esta clave del grupo de conversación Inversión de emergencia...

Lo siguiente es verdadero:

- Cuando este radio cambia a su ID del grupo de conversación de inversión de respuesta de emergencia utilizando esta clave, la transmisión de emergencia de este radio no la escuchan estos otros radios.
- Sin embargo, las transmisiones de emergencia pueden recogerse mediante una exploración, incluso si no hay una coincidencia de claves.

Solo se accede: cuando el campo [Conexión segura/sin encryption para inversión de respuesta de emergencia en la página 566](#) de Respuesta de emergencia está configurado en **Seguro** o **Seleccionar**; y

Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software**, y cuando el campo Tipo de protocolo se configura en **ASTRO 25**, y cuando el radio admite modelos/ opciones diferentes.

10.37.1.20

Zona de inversión del sistema de emergencia

En este campo se selecciona una zona que se utilizará mientras dure una transmisión en modo Emergencia.

Esta selección se aplica para la personalidad de troncalización actual.

NOTA:

Una vez que se seleccione esta zona, es posible seleccionar el [Canal de inversión del sistema de emergencia en la página 568](#).

Las zonas y sus canales deben definirse previamente en la ventana Asignación de canal de zona.

ADVERTENCIA:

Solo se pueden seleccionar Zonas no dinámicas, zonas que tienen la Zona dinámica activada en **Desactivado**; de lo contrario, este campo no será válido.

Solo se accede: Cuando la función ampliada **Reversión de múltiples emergencias** aparezca en el campo Nombre de función ampliada, cuando un Perfil de emergencia de troncalización válido al que se hace referencia se seleccione para la Personalidad de troncalización actual, y cuando ese perfil de emergencia de troncalización tenga su campo [Respuesta de emergencia en la página 353](#) configurado en **Revertir**, cuando el campo [Tipo de inversión de emergencia en la página 565](#) esté configurado en **Reversión del sistema**, y cuando el radio admite modelos y opciones diferentes.

10.37.1.21

Canal de inversión del sistema de emergencia

En este campo se selecciona un canal de troncalización o convencional que se usa para la duración de una transmisión en modo Emergencia.

Esta selección se aplica para la personalidad de troncalización actual.

NOTA:

La [Zona de inversión del sistema de emergencia en la página 567](#) se debe seleccionar antes de seleccionar este canal.

Las zonas y sus canales deben definirse previamente en la ventana Asignación de canal de zona.

ADVERTENCIA:

En los codeplugs portátiles APX™ 3000, solo los primeros 48 canales de la [Zona de inversión del sistema de emergencia en la página 567](#) seleccionados se consideran selecciones válidas.

Esta selección del Canal de reversión del sistema de emergencia solo se considera válida: cuando el campo [Grupo de conversación de troncalización en la página 680](#) para la Personalidad de troncalización o el canal seleccionados no está configurado en **DYN** o **ATG**, cuando el campo [Personalidad de solo recepción en la página 430](#) para la Personalidad convencional o el canal seleccionados está **Desactivado**, y cuando el campo ID del grupo de conversación ASTRO para la Personalidad convencional o el canal seleccionados no está configurado en **DYN** o **ATG**, y cuando el campo [Modo de transmisión en la página 564](#) para la Personalidad de troncalización o el canal seleccionados no está configurado en **TG/AG desactivado (Solo escuchar)**, y cuando [Selección de perfil de emergencia en la página 564](#) para el canal seleccionado no está en **Tx de emergencia desactivado**.

Solo se accede: Cuando la función ampliada **Reversión de múltiples emergencias** aparezca en el campo Nombre de función ampliada, cuando un Perfil de emergencia de troncalización al que se hace referencia se seleccione para la Personalidad de troncalización actual, y cuando ese perfil de emergencia de troncalización tenga su campo [Respuesta de emergencia en la página 353](#) configurado en **Revertir**, cuando el campo [Tipo de inversión de emergencia en la página 565](#) esté configurado en **Reversión del sistema**, cuando el campo [Zona de inversión del sistema de emergencia en la página 567](#) no esté configurado en una zona dinámica, y cuando el radio admite modelos y opciones diferentes.

10.37.2

Grupo de anuncios (personalidad de troncalización tipo II)

La sección **Grupo de anuncios** del conjunto Personalidad de troncalización tipo II permite al usuario ver y definir parámetros del grupo de anuncios de las personalidades de troncalización individuales. Los grupos de anuncios permiten al usuario del radio iniciar y comunicar en un gran canal de

comunicación compuesto por todos los grupos de conversación definidos para la personalidad de troncalización actual.

**NOTA:**

Se debe seleccionar un Grupo de anuncios (ATG) para esta Personalidad de troncalización desde el campo [Asignación de canal de zonas en la página 676](#) y el campo Grupo de conversación de troncalización del conjunto de listas de canales. La selección de ATG permite designar específicamente un canal a los fines del Grupo de anuncios.

Una vez que se han definido las funciones de las Personalidades de troncalización en forma exclusiva, cada personalidad puede asignarse a la posición deseada del selector de canal del radio con la función Asignación de canal de zona.

10.37.2.1

Grupo de anuncios

Este campo permite ingresar, en formato decimal o hexadecimal, un ID que solo defina el Grupo de anuncios para la Personalidad de troncalización actual.

**NOTA:**

Los Grupos de anuncios permiten que el radio se inicie y comunique en un canal de gran comunicación compuesto por todos los Grupos de conversación definidos para la Personalidad de troncalización actual.

**ADVERTENCIA:**

Se debe seleccionar el Grupo de anuncios (ATG) para esta Personalidad de troncalización desde el campo [Grupo de conversación de troncalización en la página 680](#), en la página canales de Asignación de canales de zona. La selección de ATG permite designar específicamente un canal a los fines del Grupo de anuncios.

La personalidad se selecciona desde el campo [Personalidad en la página 679](#), en la página de canales de Asignación de canales de zona.

Solo se accede: cuando el Sistema de troncalización al que se hace referencia tenga un archivo de clave del sistema de software o una clave avanzada de sistema con acceso seleccionado en el campo [ID del sistema en la página 520](#), o una clave avanzada WACN de sistema con acceso seleccionado en el campo [ID de WACN de inicio en la página 669](#), y cuando el modelo o la opción del radio lo permitan.

Mesa 260: Rango

Para Tipo de protocolo	Desactivado	Mínimo	Máximo
ASTRO 25	Ninguna	0001 (Hex)	FFFE (Hex)
Tipo II	Ninguna	001 (Hex)	FFE (Hex)

**IMPORTANTE:**

El rango de selección se puede modificar de acuerdo con la Clave avanzada mediante el programa del administrador de claves avanzadas.

10.37.2.2

Tipo de voz/señal de AG

En este campo se selecciona el modo Transmisión y recepción del Grupo de anuncios para la Personalidad de troncalización actual.

Los Grupos de anuncios permiten que el radio se inicie y comunique en un canal de gran comunicación compuesto por todos los Grupos de conversación definidos para la Personalidad de troncalización actual.

Solo se accede: solo se puede acceder a **Digital** cuando el campo Tipo de protocolo se configura en **Tipo II**, y cuando Banda de frecuencia tipo II no es **900 MHz**, y el campo Grupo de anuncios no está configurado en **Ninguno**.

Se admiten las siguientes selecciones:

- Analógico
- Digital

10.37.2.3

Asegurar/borrar conexión de AG

En este campo se selecciona el modo Transmisión y recepción para el Grupo de anuncios de la Personalidad de troncalización actual.

Solo se accede: cuando el campo [Grupo de anuncios en la página 569](#) no está configurado en **Ninguno**, y cuando el radio admite modelos/opciones diferentes;

y

Cuando el campo [Operación segura en la página 301](#) se debe configurar en **Hardware**, y cuando el campo [Tipo de voz/señal de AG en la página 569](#) está configurado en **Digital**, y cuando el Ancho de banda de canales del Sistema de troncalización al que se hace referencia no está configurado en **12,5 kHz**;

O

Cuando el campo Tipo de protocolo se configura en **ASTRO 25**, y cuando el campo [Operación segura en la página 301](#) debe configurarse en **Hardware** o **Software**.

Se admiten las siguientes selecciones:

Borrar

Conecta o asigna el canal a Comunicaciones de troncalización normales (no seguras).

Seleccionar

Permite activar o desactivar el Modo de Encryption seguro.

El botón Selección de Tx seguro o el switch de alternación [Selección de Tx segura en la página 206](#) o la selección del menú Asegurar deben seleccionarse para que el usuario active o desactive las comunicaciones con encryption seguro.

Encriptación

Conecta o asigna el canal al modo de encryption seguro.

10.37.2.4

Selección de clave AG

En este campo se selecciona la clave de encryption segura que se utilizará para el Grupo de anuncios de la Personalidad de troncalización actual.

Esta selección se aplica cuando se opera en el modo encriptado de seguridad.

IMPORTANTE:

Cuando el campo [ASTRO OTAR en la página 620](#) está **Activado** para el Sistema de troncalización al que se hace referencia, el valor de Selección de clave se elige en la Lista de referencias de clave de encryption segura del Perfil de ASTRO OTAR seleccionado en el campo [Índice de perfil de ASTRO OTAR en la página 621](#) del Sistema de troncalización al que se hace referencia.

ADVERTENCIA:

Considere que está apuntando a las claves de la Lista de clave de encryption para esta selección; las claves individuales de la Lista de referencias de claves de encryption seguras hacen referencia a las claves de la Lista de clave de encryption en el campo [Referencia de clave de encryption en la página 322](#). Por lo tanto, cuando el perfil de ASTRO OTAR está activado, cualquier clave seleccionada primero se debe definir en la Lista de referencias de clave de encryption seguro. Están disponibles las claves del perfil de ASTRO OTAR con el campo de lista de claves independientes activado.

Cuando el campo ASTRO OTAR está **Desactivado** para el Sistema de troncalización al que se hace referencia, el valor de Selección de clave se elige directamente en la Lista de clave de encryption de la ventana Asegurar amplitud.

Solo se accede: cuando el campo [Asegurar/borrar conexión de AG en la página 570](#) no está configurado en **Borrar**, y cuando el campo [Grupo de anuncios en la página 569](#) no está configurado en **Ninguno**, y cuando el radio admite modelos/opciones diferentes;

y

Cuando el campo [Operación segura en la página 301](#) se configura en **Hardware**, y cuando el campo [Tipo de voz/señal de AG en la página 569](#) está configurado en **Digital**;

O

Cuando el campo Operación segura está configurado en **Hardware**, y cuando el campo Tipo de voz/señal de AG está configurado en **Analógico**, y cuando el Ancho de banda de canales del Sistema de troncalización al que se hace referencia no está configurado en **12,5 kHz**;

O

Cuando el campo Tipo de protocolo se configura en **ASTRO 25**, y cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software**.

10.37.2.5

Degradación reducida de grupo de anuncios

En este campo se activa la Degradación reducida para el Grupo de anuncios de la Personalidad de troncalización actual.

Solo se accede: Cuando el Sistema de troncalización al que se hace referencia tiene un archivo de clave del sistema de software, una clave avanzada del sistema con acceso seleccionado en el campo ID del sistema o una clave avanzada de WACN con acceso seleccionado en el campo ID de WACN de inicio y cuando el campo [Tipo de degradación reducida en la página 560](#) esté configurado en **Grupo de conversación**, cuando el campo [Grupo de anuncios en la página 569](#) no esté configurado en **Ninguno** y cuando el radio admite modelos y opciones diferentes.

10.37.2.6

Frecuencia de Rx de degradación reducida de AG

Este campo permite ingresar la frecuencia Recepción (Rx) para usarla durante la operación Degradación reducida para el grupo de anuncios de la personalidad de troncalización actual.

**ADVERTENCIA:**

Las Restricciones de frecuencia de troncalización que se aplican a esta selección se determinan por la configuración Tipo de protocolo de esta personalidad y la banda de frecuencia del Sistema de troncalización al que se hace referencia.

Solo se accede: Cuando el Sistema de troncalización al que se hace referencia tiene un archivo de clave del sistema de software, una clave avanzada del sistema con acceso seleccionado en el campo ID del sistema o una clave avanzada de WACN con acceso seleccionado en el campo ID de WACN de inicio y cuando el campo [Tipo de degradación reducida en la página 560](#) esté configurado en **Grupo de conversación**, cuando el campo [Grupo de anuncios en la página 569](#) no esté configurado en **Ninguno** y cuando el radio admite modelos y opciones diferentes.

10.37.2.7

Frecuencia de Tx de tolerancia a fallas menores de AG

Este campo permite ingresar la frecuencia Transmisión (Tx) para usarla durante la operación Degradación reducida para el Grupo de anuncios de la Personalidad de troncalización actual.

**ADVERTENCIA:**

Las Restricciones de frecuencia de troncalización que se aplican a esta selección se determinan por la configuración Tipo de protocolo de esta personalidad y la banda de frecuencia del Sistema de troncalización al que se hace referencia.

Solo se accede: Cuando el Sistema de troncalización al que se hace referencia tiene un archivo de clave del sistema de software, una clave avanzada del sistema con acceso seleccionado en el campo ID del sistema o una clave avanzada de WACN con acceso seleccionado en el campo ID de WACN de inicio y cuando el campo [Tipo de degradación reducida en la página 560](#) esté configurado en **Grupo de conversación**, cuando el campo [Grupo de anuncios en la página 569](#) no esté configurado en **Ninguno** y cuando el radio admite modelos y opciones diferentes.

10.37.2.8

Degradación reducida secundaria de AG

En este campo se activa la Degradación reducida secundaria para el Grupo de anuncios de la Personalidad de troncalización actual.

Solo se accede: Cuando el campo [Tipo de degradación reducida en la página 560](#) está configurado en **Grupo de conversación** y cuando el campo [Grupo de anuncios en la página 569](#) no está configurado en **Ninguno**, y cuando el campo [Degradación reducida de grupo de anuncios en la página 571](#) está en **Activado** y cuando el modelo o la opción del radio lo permitan.

10.37.2.9

Frecuencia de Rx F/S secundaria de AG

Este campo permite ingresar la frecuencia Recepción (Rx) secundaria para utilizarla durante la operación Degradación reducida para el Grupo de anuncios de la Personalidad de troncalización actual.

**ADVERTENCIA:**

Las Restricciones de frecuencia de troncalización que se aplican a esta selección se determinan por la configuración Tipo de protocolo de esta personalidad y la banda de frecuencia del Sistema de troncalización al que se hace referencia.

Solo se accede: Cuando el campo [Tipo de degradación reducida en la página 560](#) está configurado en **Grupo de conversación** y cuando el campo [Grupo de anuncios en la página 569](#) no está configurado en **Ninguno**, y cuando el campo [Degradación reducida de grupo de anuncios en la página 571](#) está **Activado**, y cuando el campo [Degradación reducida secundaria de AG en la página 572](#) está **Activado** y cuando el radio admite modelos y opciones diferentes.

10.37.2.10

Frecuencia de Tx F/S secundaria de AG

Este campo permite ingresar la frecuencia Transmisión (Tx) secundaria para usarla durante la operación Degradación reducida para el Grupo de anuncios de la Personalidad de troncalización actual.

ADVERTENCIA:

Las Restricciones de frecuencia de troncalización que se aplican a esta selección se determinan por la configuración Tipo de protocolo de esta personalidad y la banda de frecuencia del Sistema de troncalización al que se hace referencia.

Solo se accede: Cuando el campo [Tipo de degradación reducida en la página 560](#) está configurado en **Grupo de conversación** y cuando el campo [Grupo de anuncios en la página 569](#) no está configurado en **Ninguno**, y cuando el campo [Degradación reducida de grupo de anuncios en la página 571](#) está **Activado**, y cuando el campo [Degradación reducida secundaria de AG en la página 572](#) está **Activado** y cuando el radio admite modelos y opciones diferentes.

10.37.3

Grupo de conversación (personalidad de troncalización tipo II)

La sección **Grupo de conversación** del conjunto Personalidad de troncalización tipo II permite al usuario ver o definir la funcionalidad Grupo de conversación individual para las personalidades de troncalización individuales. Un Grupo de conversación es una agrupación definida por RadioCentral de radios creada para el propósito de comunicaciones frecuentes y convenientes con otras.

NOTA:

Las frecuencias del Grupo de conversación se determinan mediante el Sistema de troncalización en terreno y no se programan en RadioCentral.

NOTA:

Las frecuencias de degradación reducida de la Personalidad de troncalización deben programarse dentro del RadioCentral.

Una vez definido, un grupo de conversación se puede asignar a uno o más canales del selector de canales del radio desde [Asignación de canal de zonas en la página 676](#) y el campo Grupo de conversación de troncalización del conjunto de listas de canales.

10.37.3.1

Grupo de conversación

Muestra el nombre reconocible de usuario RadioCentral para el Grupo de conversación actual (registro/fila).

Esta selección se aplica a la Personalidad de troncalización actual o a la Personalidad de troncalización de ASTRO 25.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.37.4

Llamada/localización (Personalidad de troncalización tipo II)

La sección **Llamada/localización** del conjunto Personalidad de troncalización tipo II permite al usuario ver o definir la funcionalidad Llamada privada y localización para las personalidades de troncalización individuales. Esta funcionalidad puede aplicarse a la funcionalidad Lista de uso frecuente de llamadas de troncalización.

**NOTA:**

Una vez que se han definido las funciones de las Personalidades de troncalización en forma exclusiva, cada personalidad puede asignarse a la posición deseada del selector de canal del radio con la función Asignación de canal de zona.

10.37.4.1

Tipo de llamada privada

En este campo se selecciona el tipo de Llamada privada para la Personalidad de troncalización actual.

Puede iniciar una llamada privada con la pulsación del botón Llamada selectiva/privada o la selección del menú [Selección/llamada privada en la página 216](#)Llamada. A su vez, el usuario responde a una llamada privada mediante la presión del botón [Respuesta de llamada en la página 184](#).

Se admiten las siguientes selecciones:

Desactivado

La función Llamada privada está desactivada.

Disponible cuando el Tipo de protocolo es Tipo II o ASTRO 25

PC II

Llamada privada II permite llamadas entre dos radios individuales, independientemente de los grupos de conversación, sin necesidad de que el radio receptor confirme la llamada entrante.

Disponible cuando el Tipo de protocolo es Tipo II o ASTRO 25

Unidad a unidad mejorada

Llamada privada mejorada o Llamada privada entre unidades permite llamadas entre dos radios individuales, independientemente del grupo de conversación. El radio receptor sonará y es necesario que confirme la llamada entrante.

Disponible cuando el Tipo de protocolo es Tipo II o ASTRO 25

PC con CA

Llamada privada mejorada o Llamada privada entre unidades seguidas por una Alerta de llamada privada opcional. Consulte [Alerta de llamada automática en la página 577](#).

Disponible cuando el Tipo de protocolo es Tipo II o ASTRO 25

**NOTA:**

PC II es compatible en la operación de troncalización “analógica”. Consulte los campos [Tipo de voz/señal de AG en la página 569](#) y [Grupo de conversación en la página 573](#) en [Personalidad de troncalización tipo II en la página 557](#).

Hay un retraso de dos minutos para una PC II y una llamada privada mejorada cuando se opera en un sistema de troncalización 3600, y un retraso de seis segundos cuando se opera en un sistema de troncalización 9600. No se muestra ninguna indicación durante el retraso.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.37.4.2

Operación de llamada privada

En este campo se selecciona el modo Operación de la función Llamada privada de la Personalidad de troncalización actual.

Puede iniciar una llamada privada con la pulsación del botón Llamada selectiva/privada o una selección del menú [Selección/llamada privada en la página 216](#). A su vez, el usuario responde a una llamada privada mediante la presión del botón [Respuesta de llamada en la página 184](#).

Solo se accede: Cuando el campo [Tipo de llamada privada en la página 574](#) no está configurado en **Desactivado** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Solo respuesta (solo resp)

Permite al radio aceptar solo Páginas.

Solo lista

Permite páginas desde la Lista de uso frecuente de llamadas. Para modelos sin teclado, esta opción se puede usar solo con la función Botón de un toque. Esta función depende del modelo/opción.

Ilimitado

Permite enviar páginas desde la Lista de uso frecuente de llamadas y desde el teclado del radio. Esta función depende del modelo/opción.

ADVERTENCIA:

Esta selección no está disponible para radios portátiles que solo tienen una pantalla superior.

10.37.4.3

Funcionamiento de alerta/localización de llamada

En este campo se selecciona la funcionalidad Alerta/localización de llamada para la Personalidad de troncalización actual.

Puede activar el Funcionamiento de alerta/localización de llamada con la pulsación del botón [Alerta de llamada en la página 184](#) o la selección del menú [Localización en la página 221](#).

Solo se accede: Cuando el modelo o la opción del radio lo permitan y cuando el campo Activar hardware de DVRS está **Desactivado**, o cuando el campo Activar hardware de DVRS está **Activado** y cuando el perfil DVRS al que se hace referencia en la Personalidad de troncalización actual tiene su campo Activación remota de DVRS configurado en **Desactivado**.

Se admiten las siguientes selecciones:

Desactivado

La funcionalidad de Alerta de llamada/página no está disponible.

Solo respuesta (solo resp)

Permite al radio aceptar solo Páginas.

Solo lista

Permite páginas desde la Lista de uso frecuente de llamadas. Para modelos sin teclado, esta opción se puede usar solo con la función Botón de un toque. Esta función depende del modelo/opción.

Ilimitado

Permite enviar páginas desde la Lista de uso frecuente de llamadas y desde el teclado del radio. Esta función depende del modelo/opción.

ADVERTENCIA:

Esta selección no está disponible para radios portátiles que solo tienen una pantalla superior.

10.37.4.4

Lista de uso frecuente de llamadas de troncalización

En este campo se selecciona la Lista de uso frecuente de llamadas que se usará en la personalidad de troncalización actual.

La Lista de uso frecuente de llamadas que se usa depende de la selección del campo Tipo de protocolo en **Tipo II** o **ASTRO 25** para la Personalidad de troncalización actual. El usuario usa la Lista de uso frecuente de llamadas para transmitir llamadas privadas y localizaciones.

Solo se accede: Cuando el campo [Operación de llamada privada en la página 574](#) está configurado en **Solo lista** o **Ilimitado**, o cuando el campo [Funcionamiento de alerta/localización de llamada en la página 575](#) está configurado en **Solo lista** o **Ilimitado** y cuando el radio admite modelos y opciones diferentes.

10.37.4.5

Activación de alerta de usuario de llamada entrante

Este campo permite que el radio permanezca silenciado para las llamadas afiliadas de los Grupos de conversación mientras se opera en la Personalidad de troncalización actual.

Las páginas de grupos e individuales activan el audio del radio para que suene el tono de alerta. El radio también activa el audio para llamadas individuales entre radios como llamadas privadas, llamadas de tono de señalización y llamadas de modo teléfono de interconexión. Esta función es muy útil cuando el usuario prefiere no oír el tráfico del Grupo de conversación afiliado; sin embargo, debe permanecer en contacto con el radio. La pulsación del botón [Silencio de voz en la página 196](#) o la selección del menú [Silencio de voz en la página 225](#) permite que el usuario active y desactive la funcionalidad Silencio de voz para un canal de activación de Alerta de usuario de llamada entrante.

**ADVERTENCIA:**

Cuando está desactivado, el usuario no puede activar esta función para la Personalidad de troncalización actual.

**IMPORTANTE:**

Además, cuando el Silencio de voz está activado:

Una página individual o de grupo recibida por el radio activa el audio del radio. Luego de que la página activa el audio del radio, una llamada de voz siguiente puede ser una llamada grupal que se escucha por el altavoz del radio.

Si se cambia el canal de radio y se desactiva el Silencio de voz, se debe reactivar el Silencio de voz si se desea cuando se regresa al canal.

Si el usuario oprime el botón PTT, o inicia el modo Emergencia, o apaga y prende el radio, el radio desactiva el Silencio de voz.

También se pueden recibir los siguientes tipos de llamadas:

- [Activación de reagrupación dinámica en la página 531](#)
- [Inhibición de radio en la página 527](#)
- [Indicador de fuera de alcance en la página 233](#)
- Degradación reducida
- [Indicador de troncalización de sitio en la página 235](#)
 - La función Rastreo no está disponible.
 - Otras indicaciones de pantalla de llamadas grupales como, por ejemplo, LED e ID de PTT (si está activada) funcionan con normalidad.

Solo se accede: cuando el radio admite modelos/funciones diferentes, y cuando el campo [Funcionamiento de alerta/localización de llamada en la página 575](#) está configurado en **Desactivado**;

O cuando el campo Tipo de protocolo está configurado en **ASTRO 25**, y cuando el campo [Lista de señalización de tono en la página 651](#) de Personalidad de troncalización actual está haciendo referencia a una Lista de señalización de tono que tiene al menos un registro o una fila donde Desilenciar activado está **Activado**.

10.37.4.6

Alerta de llamada automática

En este campo se activa el radio para transmitir automáticamente una Alerta de llamada privada en caso de que el destinatario de una Llamada privada mejorada o entre unidades no haya respondido a esa llamada dentro de un cierto período.

Esta función se aplica a la Personalidad de troncalización actual y es aplicable para el Tipo de protocolo ASTRO 25 y Tipo II.

Solo se accede: Cuando el campo [Tipo de llamada privada en la página 574](#) está configurado en **PC con CA** y el radio admite modelos y opciones diferentes.

10.37.5

Funciones (Personalidad de troncalización tipo II)

La sección **Funciones** del conjunto Personalidad de troncalización tipo II permite al usuario ver o modificar varias funciones de las personalidades de troncalización para la personalidad de troncalización actual.

NOTA:

Una vez que se han definido las funciones de las Personalidades de troncalización en forma exclusiva, cada personalidad puede asignarse a la posición deseada del selector de canal del radio con la función Asignación de canal de zona.

10.37.5.1

Funcionamiento del teléfono

En este campo se selecciona la funcionalidad teléfono cuando se opera en el modo teléfono para la Personalidad de troncalización actual.

Debe iniciar el modo Teléfono con una pulsación del botón Respuesta de llamada o Teléfono o una selección del menú Teléfono.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Desactivado

El Modo teléfono no está disponible.

Solo respuesta

Permite al radio solo aceptar llamadas.

Solo lista

Permite realizar llamadas solo desde la Lista de uso frecuente de teléfonos del radio.

ADVERTENCIA:

Si el campo [Número telefónico editable en la página 662](#) de la Amplitud de lista de llamadas está **Activado**, el usuario puede modificar los números telefónicos dentro de la Lista de llamada unificada del radio.

Ilimitado

Permite realizar llamadas desde la lista telefónica o desde un teclado.

10.37.5.2

Selección de lista de rastreo

En este campo se selecciona qué Lista de rastreo utiliza el radio mientras opera en el modo Rastreo para la Personalidad de troncalización actual.

Esta Lista de rastreo determina qué personas rastrea el radio, busca o escucha de manera activa, y luego considera activar el sonido para el canal de troncalización actual.

**NOTA:**

Las funcionalidades Lista de rastreo y Miembro de lista de rastreo se definen en la ventana Lista de rastreo.

Solo las Listas de rastreo que tengan la selección **Monitor de prioridad** o el **Grupo de conversación de sistema múltiple** en el campo [Tipo de rastreo en la página 689](#) son selecciones de lista de rastreo válidas para la Personalidad de troncalización actual.

Solo las Listas de rastreo con la selección **Prioridad inteligente** en el campo Tipo de rastreo son selecciones de lista de rastreo válidas para la Personalidad convencional actual sin un sistema DVRS.

El usuario inicia la edición de la Lista de rastreo con el switch de alternación Programación de la lista de rastreo, la selección del menú Lista de rastreo o pulsando prolongadamente el botón Rastrear.

**ADVERTENCIA:**

Cuando el campo [Modo de transmisión en la página 564](#) se configura en el modo **TG/AG desactivado (Solo escuchar)** para la Personalidad de troncalización actual, esta Lista de rastreo a la que se hace referencia la personalidad no debe tener el campo [Tipo de miembro de Tx de voz designada en la página 696](#) configurado en **Canal seleccionado** (es decir, este canal); de lo contrario, considera que esta selección no es válida.

Cuando la [Selección de la Lista de alerta seleccionable del sitio en la página 598](#) del Sistema de troncalización al que se hace referencia no está **Desactivado**, la Lista de rastreo a la que se hace referencia en la personalidad no debe estar en el Tipo de rastreo del **Grupo de conversación de sistema múltiple**; de lo contrario, considera que esta selección no es válida.

La aplicación considera esta selección no válida cuando esta personalidad tiene Banda ancha LTE activada y esta Lista de rastreo seleccionada posee cualquier canal Miembro de lista de rastreo que tiene las siguientes dependencias:

- El campo [Frecuencia de interferencia LTE presente en la página 437](#) de su Personalidad convencional está configurado en **Activado** o
- El campo [Frecuencia de interferencia LTE presente en la página 601](#) de su Sistema de troncalización es **Verdadero** o
- El campo [Tipo de cobertura en la página 519](#) de su Sistema de troncalización está configurado en **Roaming intra-WACN**.

Un canal de troncalización tiene LTE activada cuando el Sistema de troncalización al que se hace referencia de la personalidad tiene un Perfil de datos al que se hace referencia que posee una selección de [Tipo del perfil de datos en la página 376](#) igual a **Troncalización y banda ancha** o **Solo banda ancha**, y cuando la Fuente de banda ancha del Perfil de datos es **Módem de LTE interno**.

Cuando el Sistema de troncalización al que se hace referencia en la Selección de lista de disposición del personal no está **Desactivado**, entonces la Lista de rastreo a la que se hace referencia en esta personalidad no debe estar en Tipo de rastreo del **Grupo de conversación de sistema múltiple**; de lo contrario, considera que esta selección no es válida.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.37.5.3

Rastreo automático

Este campo hace que el radio entre automáticamente al modo Rastreo, cuando el usuario selecciona (con el selector de canal) la Personalidad de troncalización actual.

El rastreo automático también se invoca cuando el radio enciende el canal actual.

Cuando se desactiva, el usuario puede invocar la operación del modo Rastreo mediante la pulsación del botón Rastrear, el switch de alternación Rastreo o la selección del menú Rastreo, mientras se opera en la Personalidad de troncalización actual.

Solo se accede: Cuando el campo [Selección de lista de rastreo en la página 578](#) no está configurado en **Ninguno** y cuando el radio admite modelos y opciones diferentes.

10.37.5.4

Activación de estado

Este campo permite seleccionar y transmitir un estado programado para la Personalidad de troncalización actual.

Los estados disponibles para el usuario dependen del Sistema de troncalización al que hace referencia la Personalidad.

Puede iniciar la función de Estado con la pulsación del botón Estado, con la pulsación del botón Estado directo o con la selección del menú Estado.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.37.5.5

Activación de mensaje

Este campo permite seleccionar y transmitir un mensaje programado para la Personalidad de troncalización actual.

Los mensajes disponibles para el usuario dependen del Sistema de troncalización al que hace referencia la personalidad. Puede activar la función de Mensaje con la pulsación del botón [Mensaje en la página 188](#), con la pulsación del botón [Mensaje directo](#) o con la selección del menú [Mensaje en la página 220](#).

Solo se accede: cuando el campo Tipo de protocolo se configura en **Hardware**, y cuando el radio admite modelos/opciones diferentes.

10.37.5.6

Tono de permiso para hablar

En este campo se activa el radio para que emita un tono de alerta cuando se recibe un permiso de acceso de un Canal de control desde un repetidor.

La función se aplica a la Personalidad de troncalización actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.37.5.7

Detección de código adecuado seguro

En este campo se activa el radio para desilenciar las comunicaciones encriptadas de SecureNet™.

Esta función se aplica a la personalidad de troncalización actual.

Solo se accede: cuando el campo Tipo de protocolo se configura en **Tipo II**, y cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software**, y cuando el radio admite modelos/opciones diferentes.

10.37.5.8

Ignorar voz no encriptada de Rx

Este campo permite que el radio ignore todas las comunicaciones de **Borrar** (sin encryption seguro) mientras se opera en la Personalidad de troncalización actual.

Solo se accede: cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software**.

10.37.5.9

Finalizar Tx en ausencia de voz

Esta campo permite que el radio, durante una transmisión de voz de troncalización, suelte el PTT automáticamente cuando su Procesador de señal digital (DSP) incorporado detecte una falta de voz del micrófono durante un período que supere el Temporizador de ausencia de voz.

Esta selección se aplica mientras funciona en la Personalidad de troncalización actual.

**ADVERTENCIA:**

La función no sirve cuando:

- Un radio en terreno está operando en Modo de emergencia y **Emergencia de mic de uso frecuente** o **Emergencia mediante silencio de audio** se encuentra actualmente activo (consulte también Modo de transmisión automático de emergencia) o
- El radio en terreno actualmente se está monitoreando de forma remota (consulte también Activación de monitor remoto/rastreo de radio).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.37.5.10

Teclado de uso frecuente (DTMF)

Este campo permite transmitir tonos de DTMF mediante el uso del teclado del radio, incluso si el radio no se encuentra en modo Teléfono.

Para iniciar el modo Teclado de uso frecuente, mantenga presionado el botón PTT mientras marca los números del teclado DTMF necesarios. Esta función se aplica a la personalidad de troncalización actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

**ADVERTENCIA:**

Esta característica no funciona cuando el campo [Modo de transmisión en la página 564](#) está configurado en el modo **TG/AG desactivado (modo para escuchar solamente)**.

10.37.5.11

Activación de micrófono DTMF

Este campo permite transmitir tonos de DTMF mediante el uso del teclado del radio, incluso si el radio no se encuentra en modo Teléfono.

Para iniciar el micrófono DTMF, mantenga presionado el botón Superior o Lateral o Cabezal de control mientras se envía el número del teclado DTMF.

La función Activar micrófono DTMF se aplica a la Personalidad de troncalización actual.

**ADVERTENCIA:**

Esta característica no funciona cuando el campo [Modo de transmisión en la página 564](#) está configurado en el modo **TG/AG desactivado (modo para escuchar solamente)**.

10.37.5.12

Temporizador de desconexión de despacho prioritario

En este campo se selecciona la cantidad de tiempo que se necesita para presionar el botón Despacho de prioridad hasta que Despacho de prioridad se cierre. El tiempo está expresado en segundos.

Mesa 261: Rango

Mínimo	Máximo	Incrementos
1	255	1

Solo se accede: cuando el campo Tipo de sistema está configurado en **ASTRO 25**, y cuando el campo Selección de perfil de DVRS está **Desactivado**.

10.37.6

Sitios preferidos (Personalidad de troncalización tipo II)

La sección **Sitios preferidos** del conjunto Personalidad de troncalización tipo II permite al usuario ver o definir las preferencias de sitio de troncalización de varios sitios para personalidades de troncalización individuales. Cuando un radio realice roaming en un área de cobertura superpuesta de varios sitios dentro de un Sistema de troncalización o una Red de comunicaciones de área extendida (WACN), busca un sitio que se prefiera de forma operacional mediante la evaluación de todos los demás sitios disponibles según la prioridad, conforme a la selección de Estado preferido correspondiente. Esta capacidad proporciona una administración y una conservación más inteligentes de recursos repetidores en áreas de superposición de cobertura.

**IMPORTANTE:**

El campo Tipo de cobertura del Sistema de troncalización con el que está relacionado determina la configuración de un solo sitio (SmartNet) o de varios sitios. En una configuración de varios sitios, la operación SmartZone permite que el radio determine, mediante muestras de sondeo de RSSI, el mejor sitio que se utilizará para las comunicaciones de troncalización.

Consulte también los campos avanzados de Troncalización en general y los campos de Constante de filtro del Sistema de troncalización.

Cuando las funciones de las personalidades de troncalización se definieron en forma exclusiva, cada personalidad se puede asignar a la posición deseada del selector de canal del radio con la función Asignación de canal de zona.

10.37.6.1

Ignorar preferencia de recursos del sitio

Este campo permite que el radio ignore la información de recursos del sitio recibida en las palabras de la señal de salida (OWS) del Canal de control adyacente, es decir, si el sitio tiene repetidores ASTRO, Seguridad de 12 Kbit o Analógico sin cifrado.

Esta función se aplica para la Personalidad de troncalización actual y solo durante el funcionamiento de una operación de SmartZone.

Si está **Desactivado**, el radio selecciona sitios según la información de recursos del sitio. Por ejemplo, si un radio seleccionó un grupo de conversación de ASTRO.

Solo se accede: Cuando el Sistema de troncalización al que se hace referencia no tiene el campo [Tipo de cobertura en la página 519](#) configurado en **Desactivado** y cuando el radio admite modelos y opciones diferentes.

10.37.6.2

Tipo de lista de sitios

Este campo permite seleccionar el tipo de Lista de sitios para la Personalidad de troncalización.

El tipo de lista de sitios define la forma en que el radio utilizará los sitios identificados en la siguiente Lista de sitios. El acceso a Preferencia de sitios y Movilidad (Roaming) está definido por el tipo de lista de sitios.

Solo se accede: Cuando el Sistema de troncalización al que se hace referencia no tiene el campo [Tipo de cobertura en la página 519](#) configurado en **Desactivado** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Lista de sitios preferidos

Esta es la selección heredada y predeterminada. No existen restricciones de acceso ni preferencias implícitas en el caso de los sitios que no aparezcan en la lista.

Lista de sitios permitidos

Se permite que el radio realice roaming solo a sitios que aparezcan en la lista y se aplicarán las preferencias definidas. El sistema aún puede denegar el acceso a un sitio en la lista de sitios permitidos después de que en el sitio se intente una “conexión” al sistema. Si el radio no está dentro del rango de alcance de al menos uno de los sitios que aparezcan en la lista, el radio permanecerá fuera de alcance.

Lista de sitios bloqueados

No se permite que el radio realice roaming a ninguno de los sitios que aparezcan en la lista. Todos los demás sitios reciben el trato de sitios permitidos sin preferencia definida.

10.37.6.3

ID del sitio

Este campo permite ingresar en formato decimal o hexadecimal, el número de ID que identifica al sitio de SmartZone actual (registro/fila), que se aplica a la Personalidad de troncalización actual.

ADVERTENCIA:

Para que se pueda realizar roaming entre diferentes sitios, cada ID del sitio debe ser único dentro de un Subsistema de frecuencia radial (RFSS).

Solo se accede: Cuando el Sistema de troncalización al que se hace referencia no tiene el campo [Tipo de cobertura en la página 519](#) configurado en **Desactivado** y cuando el radio admite modelos y opciones diferentes.

Mesa 262: Rango

Tipo de cobertura	Mínimo	Máximo
ASTRO 25	1	FE hex
Tipo II	1	40 hex

10.37.6.4

Estado preferido

En este campo se selecciona el estado preferido para el sitio de SmartZone cuando se determina, mediante muestras de sondeo de RSSI, el mejor sitio para usar con comunicaciones de troncalización.

Esta selección se aplica al sitio actual (registro/fila) que se aplica para la Personalidad de troncalización actual.

Solo se accede: Cuando el Sistema de troncalización al que se hace referencia no tiene el campo [Tipo de cobertura en la página 519](#) configurado en **Desactivado** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Ninguno

No se le da preferencia a este sitio.

IMPORTANTE:

Si un sitio no aparece en esta lista, el radio no le asigna ninguna preferencia en forma automática.

Menos preferidos

Se evitará el sitio a menos que sea el único sitio utilizable para el funcionamiento.

Preferido

El sitio se usará antes que todos los sitios no preferidos. El radio abandonará este sitio si ingresa en la troncalización de sitio.

Siempre; preferido

El sitio tendrá preferencia por sobre los sitios no preferidos, incluso si el sitio ingresa en la troncalización de sitio.

10.37.6.5

ID de RFSS

Este campo permite ingresar, en formato decimal o hexadecimal, el ID del subsistema de frecuencia del radio (RFSS) ASTRO 25 que corresponde al ID del sitio en el sitio actual (registro/fila), que se aplica a la Personalidad de troncalización actual.

ADVERTENCIA:

Para que se pueda realizar roaming entre diferentes RFSS en un Sistema de troncalización, cada RFSS debe tener un número único.

NOTA:

Un RFSS se compone de uno o más sitios.

Solo se accede: cuando el Sistema de troncalización al que se hace referencia tiene su campo [Tipo de cobertura en la página 519](#) configurado en **SmartZone y OmniLink**, o **Roaming Intra-WACN** o **Roaming Inter-WACN**, cuando el campo Tipo de protocolo está configurado en **Tipo II**, y cuando el radio admite modelos/opciones diferentes.

Mesa 263: Rango

Mínimo	Máximo
1	FE hex

10.37.6.6

ID del sistema

Este campo permite ingresar, en formato decimal o hexadecimal, el ID del sistema Tipo II o ASTRO 25 que corresponde al ID del sitio en el sitio actual (registro/fila), que se aplica a la Personalidad de troncalización actual.

ADVERTENCIA:

Para que se pueda realizar roaming entre diferentes Sistemas de troncalización que componen las redes de comunicación de área amplia (WACN), cada Sistema de troncalización debe tener un ID del sistema único.

NOTA:

Un Sistema de troncalización consta de uno o varios subsistemas de frecuencia radial (RFSS).

Solo se accede: cuando el Tipo de protocolo está configurado en **Tipo II**, y cuando el Sistema de troncalización al que se hace referencia tiene el campo [Tipo de cobertura en la página 519](#) configurado en **SmartZone & OmniLink**, y cuando el radio admite modelos/opciones diferentes.

O cuando el campo Tipo de protocolo está establecido en **ASTRO 25**, y cuando el Sistema de troncalización al que se hace referencia tiene el campo Tipo de cobertura establecido en **Roaming Intra-WACN** o **Roaming Inter-WACN**, y cuando el radio admite modelos/opciones diferentes.

Mesa 264: Rango

Tipo de cobertura	Mínimo	Máximo
ASTRO 25	0	0FFE hex
Tipo II	0	FFFE hex

10.37.6.7

ID de WACN RAS

Este campo permite ingresar (en formato decimal o hexadecimal) el ID de Redes de comunicaciones de área extendida (WACN) del Servidor de acceso remoto (RAS) local que corresponda al ID del sitio actual (registro/fila).

ADVERTENCIA:

Para admitir roaming entre diferentes WACN, cada WACN deben tener un número único.

NOTA:

Una WACN está compuesta de uno o más sistemas de troncalización. Esta selección se aplica para la Personalidad de troncalización actual.

Solo se accede: cuando el Tipo de protocolo está configurado en **ASTRO 25**, y cuando el Sistema de troncalización al que se hace referencia tiene el campo [Tipo de cobertura en la página 519](#) configurado en **Roaming Inter-WACN**, y cuando el radio admite modelos/opciones diferentes.

Mesa 265: Rango

Mínimo	Máximo
0	FFFFE hex

10.37.6.8

Comodín

Este campo define el tipo de entrada en la Lista de sitios. La selección es un tipo de comodín que determinará qué sitio o grupo de sitios será el **preferido**, **permitido** o **bloqueado**.

Solo se accede: Cuando el Sistema de troncalización al que se hace referencia no tiene el campo [Tipo de cobertura en la página 519](#) configurado en **Desactivado** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Sin comodín

Esta es la selección predeterminada.

Cualquier sitio

Todos los sitios del RFSS, el sistema, la WACN aplicables según la selección en el campo Tipo de cobertura.

Cualquier RFSS

Todos los sitios, los RFSS en un sistema, la WACN aplicables según la selección en el campo Tipo de cobertura.

Cualquier sistema

Todos los sitios, los RFSS, los sistemas en una WACN aplicables según la selección en el campo Tipo de cobertura.

10.37.6.9

Emergencia en un sitio bloqueado

Si este campo está activado, el radio intenta registrar el grupo de conversación seleccionado en un sitio que está configurado como bloqueado en el RadioCentral cuando el radio está en el modo de emergencia. Cuando se borra la emergencia, el radio continúa bloqueando el grupo de conversación seleccionado.

Solo se accede: Solo se puede acceder a este campo cuando se cumplen las siguientes condiciones:

- El campo **Tipo de lista de sitios** está configurado como **Bloqueado**.
- El campo **Tipo de cobertura** del sistema de troncalización al que se hace referencia **no** está configurado como **Desactivado**.

10.38

Sistema de troncalización ASTRO 25

El conjunto **Sistema de troncalización ASTRO 25** permite al usuario crear y eliminar los Sistema de troncalización, además de definir la funcionalidad Sistema de troncalización individual. Los Sistemas de troncalización son configuraciones virtuales que reflejan las configuraciones y la funcionalidad reales del Sistema de troncalización (en terreno), es decir, la definición de los sistemas RadioCentral activa el radio para que se comunique con los sistemas reales.

ADVERTENCIA:

Si se modifica el campo Tipo de sistema de un Sistema de troncalización, cualquier Personalidad de troncalización previamente asignada a ese Sistema de troncalización específico tendrá que reasignarse a otro sistema que tenga la selección de Tipo de sistema apropiada. De lo contrario, ocurrirá un error de codeplug cuando se escriba el codeplug en el radio. El Sistema de troncalización que aborda esquemas puede ser de Tipo II o ASTRO 25.

NOTA:

Los Sistemas de troncalización hacen referencia a una Personalidad de troncalización. Luego, la programación de los Sistemas de troncalización puede volverse funcional para todos los tipos de canales de troncalización.

10.38.1

General (Sistema de troncalización ASTRO 25)

La sección **General** del conjunto Sistema de troncalización ASTRO 25 permite al usuario ver o definir las funciones básicas de los sistemas de troncalización individuales.

**NOTA:**

Los Sistemas de troncalización individuales hacen referencia a una Personalidad de troncalización. Una vez referidas, estas configuraciones de los Sistemas de troncalización pueden quedar operativas para todos los tipos de canales dentro de dicha Personalidad de troncalización.

10.38.1.1

Nombre del sistema de troncalización

Este campo permite definir un nombre reconocible para el Sistema de troncalización actual.

**NOTA:**

Los sistemas individuales de troncalización se asignan a una Personalidad de troncalización a través del campo Sistema mediante la selección de este nombre. Luego, esta configuración de los Sistemas de troncalización puede quedar operativa para todos los tipos de canales dentro de dicha Personalidad de troncalización.

Cuando **Monitor de prioridad** se selecciona como el tipo de rastreo para los canales Miembro de lista de rastreo, este nombre de sistema de troncalización debe seleccionarse para la lista de rastreo actual desde el campo Registro del sistema de troncalización.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

**NOTA:**

Ejemplos: EMT-001, #500, Eléctrico1, # A5

Se pueden usar caracteres, números, espacios y caracteres especiales.

Los espacios en blanco iniciales se sustituyen con guiones bajos en la pantalla del radio.

Los puntos iniciales no aparecen en la pantalla del radio.

10.38.1.2

Tipo de clave del sistema

En este campo se muestra la función solo lectura del Tipo de clave de sistema seleccionado para el Sistema de troncalización actual; ya sea **Clave de sistema** o **Clave WACN**.

Cuando el [Tipo de cobertura en la página 519](#) está configurado como **Roaming intra-WACN**, el tipo de clave del sistema es **Clave WACN**; de lo contrario, es **Clave de sistema**.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.38.1.3

Clave de sistema presente

La aplicación recupera y permite solo ver si está cargado un Archivo de claves de software del sistema o una Clave avanzada (Hardware) y si coincide con el ID seleccionado en el campo ID del sistema o ID de WACN doméstica para el Sistema de troncalización actual.

Consulte también [Tipo de clave del sistema en la página 518](#).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.38.1.4

Tipo de cobertura

En este campo se selecciona el Tipo de cobertura geográfica del radio y, por lo tanto, los métodos específicos para determinar las comunicaciones de radio a radio dentro de los Sistemas de troncalización.

La selección Tipo de cobertura se aplica al Sistema de troncalización actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes, y cuando un archivo de clave de sistema de software o una clave avanzada de sistema con acceso se seleccionan en el campo ID del sistema, o una clave avanzada WACN con acceso se selecciona en el campo ID de WACN doméstica.

**NOTA:**

Estas selecciones dependen del modelo o la opción del radio.

Se admiten las siguientes selecciones:

Desactivado = SmartNet

Cuando el radio admite distintos modelos y opciones de SmartZone, desactivar este campo hace que el sistema de troncalización use SmartNet.

**NOTA:**

El funcionamiento de SmartNet se concentra en un solo sitio de SmartZone.

SmartZone

El funcionamiento en SmartZone permite que el radio determine mediante muestras de sondeo de la Indicación de intensidad de señal recibida (RSSI) el mejor sitio de troncalización para usar en los canales de troncalización habilitados para SmartZone.

**NOTA:**

Para los sistemas ASTRO 25: El funcionamiento está limitado a sitios dentro de una zona de un solo Sistema de troncalización.

Para los sistemas Tipo II: El funcionamiento está limitado a los sitios dentro de un solo Sistema de troncalización.

SmartZone y OmniLink

Brinda al radio que admite SmartZone la capacidad de itinerar de una zona de SmartZone a otra zona de SmartZone, dentro del mismo sistema OmniLink. OmniLink se aplica para canales de troncalización habilitados para OmniLink.

**NOTA:**

Para los sistemas ASTRO 25: El funcionamiento está limitado a los sitios y las zonas dentro de un solo sistema de OmniLink.

Para los sistemas Tipo II: El funcionamiento está limitado a sitios dentro de un conjunto de sistemas de troncalización interconectados.

Roaming intra-WACN

La selección Roaming intra-WACN da al radio compatible con Project 25 la capacidad de itinerar automáticamente entre todos los ID del sistema, dentro de la misma red de comunicaciones de área extendida (WACN), sin intervenciones del usuario. Consulte también ID de WACN doméstica.

NOTA:

Para los sistemas ASTRO 25: La operación está limitada a los Sistemas de troncalización que están dentro de una misma red WACN.

ADVERTENCIA:

La selección Roaming intra-WACN no es válida si alguno de los siguientes escenarios es verdadero:

Cuando el tipo de sistema es Tipo II.

Cuando el campo Activación de hardware del DVRS está **Activado**.

Cuando el campo Radio dual - Selección de radio está configurado como **Radio secundario** y cuando el campo Activar Tx de radio secundario está **Desactivado**.

Roaming intra-WACN

Roaming inter-WACN proporciona a los radios compatibles con Project 25 en los grupos de conversación seleccionados la capacidad de moverse automáticamente a través de diferentes redes de comunicaciones de área amplia (WACN), sin intervenciones del usuario.

ADVERTENCIA:

La selección Roaming intra-WACN no es válida si alguno de los siguientes escenarios es verdadero:

Cuando el tipo de sistema es Tipo II.

Cuando el campo Activación de hardware del DVRS está **Activado**.

Cuando el campo Radio dual - Selección de radio está configurado como **Radio secundario** y cuando el campo Activar Tx de radio secundario está **Desactivado**, o

Cuando el sistema tiene la opción Banda ancha LTE **activada**.

Un Sistema de troncalización tiene el estándar LTE activado cuando un perfil de datos referido tiene una selección de Tipo del perfil de datos igual a **Troncalización y banda ancha** o **Solo banda ancha**, y cuando el origen de banda ancha del perfil de datos es **Módem LTE interno**.

Los sistemas compatibles con SmartZone y Proyecto 25 también se configuran en los campos SmartZone de troncalización en general y en los campos constantes de filtro de troncalización en general.

10.38.1.5

ID de RFSS

En este campo se selecciona, en formato decimal o hexadecimal, el número de identificación del subsistema de frecuencia radial (RFSS) de troncalización de ASTRO 25.

NOTA:

Un RFSS se compone de uno o más sitios. Esta selección se aplica para el Sistema de troncalización actual.

Solo se accede: cuando un Archivo de claves de software del sistema o una Clave avanzada de sistema con acceso se seleccionan en el campo ID del sistema, o una Clave avanzada WACN con acceso se selecciona en el campo ID de WACN doméstica, cuando el campo Tipo de sistema está configurado en **ASTRO 25**, cuando el campo [Tipo de cobertura en la página 519](#) está configurado como **SmartZone** o **Desactivado**, y cuando el radio admite modelos/opciones diferentes.

ADVERTENCIA:

El rango de selección se puede modificar de acuerdo con la Clave avanzada mediante el programa del administrador de claves avanzadas.

Mesa 266: Rango

Mínimo	Máximo
01 (Hex)	FE (Hex)

10.38.1.6

ID del sitio

Selecciona el número de identificación (en formato decimal o hexadecimal) del sitio de estado preferido para el Sistema de troncalización ASTRO 25 actual.

Solo se accede: cuando un Archivo de claves de software del sistema o una Clave avanzada de sistema con acceso se selecciona en el campo ID del sistema, o una Clave avanzada WACN con acceso se selecciona en el campo ID de WACN doméstica, cuando el campo Tipo de sistema se configura en **ASTRO 25**, y cuando el campo [Tipo de cobertura en la página 519](#) está configurado como **Desactivado**, y cuando el radio admite modelos/opciones diferentes.

**ADVERTENCIA:**

Este rango de selección se puede modificar de acuerdo con la Clave avanzada mediante la herramienta del administrador de claves avanzadas.

Mesa 267: Rango

Mínimo	Máximo
01 (Hex)	FE (Hex)

10.38.1.7

Tiempo de respuesta del RFSS

En este campo se selecciona el tiempo de respuesta del subsistema de frecuencia radial (RFSS).

Este es el tiempo de respuesta base (cantidad mínima) que el radio receptor (final fijo) espera entre reintentos para que el equipo de red fija (FNE) responda al paquete de señalización entrante del radio.

**NOTA:**

Se añade un tiempo adicional aleatorio al tiempo base para evitar que todos los radios del sistema hagan un reintento al mismo tiempo. Esta selección se aplica para el Sistema de troncalización actual. El tiempo está expresado en milisegundos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 268: Rango

Mínimo	Máximo	Incrementos
25 ms	6375 ms	25 ms

10.38.1.8

Temporizador de estabilizador de RFSS

En este campo se selecciona la cantidad mínima de tiempo que el temporizador de antirrebote del subsistema de frecuencia radial (RFSS) posterga su registro/afiliación cuando rebota entre distintos Subsistemas de RF.

**NOTA:**

Después de que un radio se afilia con un RFSS, no se enviará la solicitud para cambiar a un RFSS distinto hasta que se agote este temporizador. Esta selección se aplica para el Sistema de troncalización actual.

Solo se accede: Cuando el campo [Tipo de cobertura en la página 519](#) está configurado como **SmartZone y OmniLink, Roaming intra-WACN o Roaming inter-WACN** y cuando el radio admite modelos y opciones diferentes.

Mesa 269: Rango

Mínimo	Máximo
1 seg	10 s

10.38.1.9

Búsqueda de sitio no adyacente

Este campo permite al radio buscar lista programada de Canales de control para un sitio con una señal más potente.

Esto permite al radio hacer roaming y usar un sitio que no esté definido por el Equipo de red fija (FNE) al estar adyacente al sitio de inicio actual del radio, pero tiene una señal "Aceptable" o más potente.

NOTA:

Esto solo se cumple cuando el sitio de inicio actual y los sitios adyacentes definidos por FNE registran todos un valor de umbral que está por debajo del nivel de Umbral aceptable de RSSI. Esta función se aplica al Sistema de troncalización actual.

IMPORTANTE:

Cuando funciona en un área con mala cobertura, esta función hace que el radio busque en la lista programada de Canales de control cada dos minutos aproximadamente. Durante este tiempo de búsqueda, el radio no está monitoreando el canal de control del sitio de inicio y, por lo tanto, puede perder parte del audio. Según la cantidad de Canales de control que contiene la lista de Canales de control que corresponda para este Sistema de troncalización, esta búsqueda puede tardar hasta cuatro segundos.

Solo se accede: Cuando el campo [Tipo de cobertura en la página 519](#) no está configurado como **Desactivado** y cuando el radio admite modelos y opciones diferentes.

10.38.1.10

Selección de perfil de datos

En este campo se selecciona el Perfil de datos que se utilizará con el Sistema de troncalización ASTRO 25 actual.

ADVERTENCIA:

Cuando el campo Radio Dual - Selección de radio está configurado como **Radio secundario** y el campo Activar Tx de radio secundario está **Desactivado**, este campo se debe configurar como **Datos desactivados** o, de lo contrario, se considerará no válido.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO 25** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Datos desactivados

Sin capacidades de datos.

Perfiles de datos disponibles

ADVERTENCIA:

Un perfil de datos activado para banda ancha LTE no puede seleccionarse cuando el [Tipo de cobertura en la página 519](#) del Sistema de troncalización actual está configurado como **Roaming intra-WACN**, o cuando el campo Frecuencia de interferencia LTE presente del Sistema de troncalización actual está configurado como **Verdadero**.

Un perfil de datos tiene activación de LTE para un Sistema de troncalización cuando el perfil de datos tiene una selección de tipo de perfil de datos igual que **Troncalización y banda ancha** o **Solo banda ancha**.

10.38.2

Canales de control (Sistema de troncalización ASTRO 25)

La sección **Canales de control** del conjunto del sistema de troncalización ASTRO 25 permite que el usuario visualice o defina las frecuencias de recepción y transmisión para canales de control. Se pueden crear hasta un máximo de 250 canales de control para sistemas de troncalización individuales, según sea necesario.

NOTA:

Para modelos de radio que contienen firmware anterior a la versión R12.01.00, el número máximo de canales de control es de 128.

IMPORTANTE:

Los Sistemas de troncalización individuales hacen referencia a una Personalidad de troncalización. Una vez referidas, estas configuraciones de los Sistemas de troncalización pueden quedar operativas para todos los tipos de canales dentro de dicha Personalidad de troncalización.

Es útil ordenar las frecuencias de canales de control en orden ascendente en un sistema SmartZone. En una situación de degradación reducida, el radio usa el primer canal del Canal de control como su canal de degradación reducida. Si se ordenan los canales (o al menos si se ordenan en un orden diseñado para facilitar las operaciones de degradación reducida), se pueden evitar posibles problemas como tener varios radios en distintos canales de degradación reducida.

Se admiten los siguientes campos:

10.38.2.1

Frecuencia de Rx

Este campo permite ingresar una Frecuencia de Rx (recepción) del Canal de control para el Sistema de troncalización actual.

ADVERTENCIA:

Las Restricciones de frecuencia de troncalización que se aplican a esta selección las determina la banda de frecuencia de este sistema.

Solo se accede: (Cuando un archivo de clave de sistema del software o una clave avanzada de sistema con acceso se seleccionan en el campo ID del sistema, o cuando una clave avanzada WACN con acceso se selecciona en el campo ID de WACN doméstica), y cuando el radio admite modelos y opciones diferentes.

10.38.2.2

Frecuencia de Tx

En este campo se selecciona una Frecuencia de Tx (transmisión) del Canal de control para el Sistema de troncalización actual.

**ADVERTENCIA:**

Las Restricciones de frecuencia de troncalización que se aplican a esta selección están determinadas por el Tipo de sistema y la banda de frecuencia del sistema. Para los Sistemas de troncalización tipo II, el estado de este campo es de solo visualización cuando [Banda de frecuencia tipo II en la página 521](#) es de 700/800 MHz o 900 MHz.

Solo se accede: cuando un Archivo de claves de software del sistema o una Clave avanzada del sistema con acceso se selecciona en el campo ID del sistema o una clave avanzada WACN con acceso se selecciona en el campo ID de WACN doméstica, cuando el campo Tipo de sistema está configurado como **Tipo II**, y el campo [Banda de frecuencia tipo II en la página 521](#) está configurado en **700/800 MHz** o **900 MHz**, y cuando el radio admite modelos/opciones diferentes.

10.38.3

ID de canal ASTRO 25

Esta sección permite ver o definir parámetros relacionados con frecuencia para comunicaciones ASTRO 25.

**ADVERTENCIA:**

Estos parámetros se utilizan para validar todas las Troncalizaciones de otras bandas (OBT) o los canales de control ASTRO 25 de 700/800/900 MHz y frecuencias de degradación reducida que se ingresan. Esta programación se aplica para Sistemas de troncalización individuales.

**NOTA:**

Una vez que se definen los parámetros de los ID del canal ASTRO 25, se deben definir las frecuencias de control de canal del Sistema de troncalización y las frecuencias de degradación reducida de la Personalidad de troncalización.

Los Sistemas de troncalización individuales hacen referencia a una Personalidad de troncalización. Luego, esta configuración de los Sistemas de troncalización puede quedar operativa para todos los tipos de canales dentro de dicha Personalidad de troncalización.

**ADVERTENCIA:**

Cada registro de selecciones de ID de canal contiene parámetros relacionados con la frecuencia que usan las reglas de restricción de frecuencia de troncalización para validar todos los OBT de ASTRO 25 o los canales de control de 700/800/900 MHz y las frecuencias de degradación reducida que se ingresaron.

Solo se accede: cuando el campo Tipo de sistema se configura en **ASTRO 25**.

10.38.3.1

Habilitación de identificador

En este campo se activan las selecciones del identificador de canal (ID) para el mismo ID de canal (registro/fila).

Esta selección se aplica para el Sistema de troncalización ASTRO 25 actual.

ADVERTENCIA:

Cada registro de selecciones de ID de canal contiene parámetros relacionados con la frecuencia que usan las reglas de restricción para validar todas las frecuencias de ASTRO 25 OBT o Canal de control de 700/800/900 MHz y de degradación reducida que se ingresaron.

NOTA:

El primer registro o la primera fila dentro de esta página ID de canal ASTRO 25 debe estar activado para que se considere válido.

Una vez que los registros o las filas de los parámetros de ID del canal ASTRO 25 se definen, se deben definir las frecuencias de control de canal del Sistema de troncalización y las frecuencias de degradación reducida de la Personalidad de troncalización.

Solo se accede: cuando el campo Tipo de sistema está configurado en **ASTRO 25**, y cuando un Archivo de claves de software del sistema o una Clave avanzada de sistema con acceso se selecciona en el campo ID del sistema, o cuando una Clave avanzada WACN con acceso se selecciona en el campo ID de WACN doméstica, y cuando el radio admite modelos/opciones diferentes.

10.38.3.2

Tipo de canal

En este campo se selecciona el tipo de protocolo de canales de tráfico que se usará para el ID de canal ASTRO 25 (registro/fila), ya sea Acceso múltiple por división de frecuencias (FDMA) o Acceso múltiple por división de tiempo (TDMA).

Solo se accede: Cuando el campo Tipo de sistema está configurado como **ASTRO 25**, y cuando el campo [Habilitación de identificador en la página 592](#) está activado para el ID del canal de ASTRO 25 actual (registro/fila) y cuando el radio admite distintos modelos/opciones.

Se admiten las siguientes selecciones:

FDMA

Selecciona la compatibilidad del Sistema de troncalización de acceso múltiple por división de frecuencias.

TDMA

Selecciona la compatibilidad del Sistema de troncalización de acceso múltiple por división de tiempo.

NOTA:

Esto se aplica al canal de voz.

10.38.3.3

Señal de compensación de transmisión

En este campo se selecciona la Señal de compensación de transmisión (más o menos) para el ID de canal ASTRO 25 actual (registro/fila).

Esta selección se aplica para el Sistema de troncalización ASTRO 25 actual.

ADVERTENCIA:

Cada registro de selecciones de ID de canal contiene parámetros relacionados con la frecuencia que usan las reglas de restricción para validar todas las frecuencias de ASTRO 25 OBT o Canal de control de 700/800/900 MHz y de degradación reducida que se ingresaron.

Solo se accede: ([cuando un Archivo de claves de software del sistema o una Clave avanzada de sistema con acceso se selecciona en el campo ID del sistema] o [una Clave avanzada WACN

con acceso se selecciona en el campo ID de WACN doméstica]), cuando el campo Tipo de sistema está configurado en **ASTRO 25**, y cuando el campo [Habilitación de identificador en la página 592](#) está activado para el ID de canal ASTRO 25 actual (registro/fila), y cuando el radio admite modelos/ opciones diferentes.

10.38.3.4

Compensación de transmisión

Este campo permite ingresar el valor de Compensación de transmisión (en MHz) para el ID de canal ASTRO 25 actual (registro/fila).

Esta selección se aplica para el Sistema de troncalización ASTRO 25 actual.

**ADVERTENCIA:**

Cada registro de selecciones de ID de canal contiene parámetros relacionados con la frecuencia que usan las reglas de restricción para validar todas las frecuencias de ASTRO 25 OBT o Canal de control de 700/800/900 MHz y de degradación reducida que se ingresaron.

Solo se accede: (Cuando un archivo de claves de sistema de software o una clave avanzada de sistema con acceso se seleccionan en el campo ID del sistema) o (una clave avanzada WACN con acceso se selecciona en el campo ID de WACN doméstica), cuando el campo Tipo de sistema está configurado en **ASTRO 25**, cuando el campo [Habilitación de identificador en la página 592](#) está activado para el ID de canal ASTRO 25 actual (registro/fila) y cuando el radio admite modelos y opciones diferentes.

10.38.3.5

Espaciamiento de canal

Este campo permite ingresar el valor Espaciamiento de canal para el ID de canal ASTRO 25 actual (registro/fila).

Esta selección se aplica para el Sistema de troncalización ASTRO 25 actual.

**ADVERTENCIA:**

Cada registro de selecciones de ID de canal contiene parámetros relacionados con la frecuencia que usan las reglas de restricción para validar todas las frecuencias de ASTRO 25 OBT o Canal de control de 700/800/900 MHz y de degradación reducida que se ingresaron.

Solo se accede: (Cuando un archivo de claves de sistema de software o una clave avanzada de sistema con acceso se seleccionan en el campo ID del sistema) o (una clave avanzada WACN con acceso se selecciona en el campo ID de WACN doméstica), cuando el campo Tipo de sistema está configurado en **ASTRO 25**, cuando el campo [Habilitación de identificador en la página 592](#) está activado para el ID de canal ASTRO 25 actual (registro/fila) y cuando el radio admite modelos y opciones diferentes.

10.38.3.6

Frecuencia de base

Este campo permite ingresar cualquier frecuencia dentro del rango de las bandas de frecuencia del radio como el valor de la frecuencia base para el ID de canal ASTRO 25 actual (registro/fila).

**ADVERTENCIA:**

Cada registro de selecciones de ID de canal contiene parámetros relacionados con la frecuencia que usan las reglas de restricción para validar todas las frecuencias de ASTRO 25 OBT o Canal de control de 700/800/900 MHz y de degradación reducida que se ingresaron.

**IMPORTANTE:**

Una vez que los registros o las filas de los parámetros de ID del canal ASTRO 25 se definen, se deben definir las frecuencias de control de canal del Sistema de troncalización y las frecuencias de degradación reducida de la Personalidad de troncalización.

Para que el algoritmo interno sea válido, el valor de esta frecuencia base debe ser igual o menor que las frecuencias del Canal de control y de Recepción de degradación reducida.

Solo se accede: cuando el campo Tipo de sistema se configura en **ASTRO 25**, y ([cuando un Archivo de claves de software del sistema o una Clave avanzada de sistema se selecciona en el campo ID del sistema] o [una Clave avanzada WACN con acceso se selecciona en el campo ID de WACN doméstica]), y cuando el campo [Habilitación de identificador en la página 592](#) está activado para el ID de canal ASTRO 25 actual (registro/fila), y cuando el radio admite modelos/opciones diferentes.

Cualquier frecuencia dentro del rango de bandas de frecuencia del radio.

10.38.4

Funciones (Sistema de troncalización ASTRO 25)

La sección **Funciones** del conjunto Sistema de troncalización ASTRO 25 permite al usuario ver o modificar la configuración para el Sistema de troncalización individual.

**NOTA:**

Los Sistemas de troncalización individuales hacen referencia a una Personalidad de troncalización. Luego, esta configuración de los Sistemas de troncalización puede quedar operativa para todos los tipos de canales dentro de dicha Personalidad de troncalización.

10.38.4.1

Inhibición de radio

Este campo permite al radio recibir y responder a un comando de Inhibición remota cuando se opera en el Sistema de troncalización actual.

Este comando de inhibición se envía desde el despachador. Luego de una recepción exitosa, el radio transmite una confirmación de vuelta al equipo de despacho y, a continuación, pasa a un estado inactivo. Mientras está inhibida, el audio del receptor está silenciado y la ruta de audio de transmisión

se bloquea; todos los controles del usuario están inoperativos; el modo Rastreo se detiene en el canal en funcionamiento que recibió el comando y todos los LED del radio se apagan.

ADVERTENCIA:

Cuando el campo Tipo de sistema se configura en **ASTRO 25** y cuando el campo **Índice de perfil de ASTRO OTAR** está activado (para el Sistema de troncalización actual), y cuando la Configuración segura, **Inhibición de radio mediante ASTRO OTAR** está activada, este campo puede desactivarse. En este caso, la inhibición del radio se logra "mediante ASTRO OTAR".

Cuando el campo Tipo de sistema se configura en **ASTRO 25** y cuando el campo Índice de perfil de ASTRO OTAR está desactivado (para el Sistema de troncalización actual), este campo debe estar activado. Esto garantiza que la inhibición de radio sea posible con la troncalización **ASTRO 25**.

Cuando el campo Tipo de sistema se configura en **Tipo II** y cuando el valor del campo ID del sistema del Sistema de troncalización coincide con el **ID de clave** de uno de los Archivos de claves de software del sistema cargados o las Claves avanzadas de sistema (consulte el Informe de claves de sistema), este campo se puede desactivar. En este caso, se ignorarán los comandos de Inhibición del radio que se reciben en este Sistema de troncalización y el radio continuará funcionando con normalidad.

Cuando **Inhibición de radio mediante el índice de perfil de ASTRO OTAR** de Configuración segura, y cuando el **campo Índice de perfil de ASTRO OTAR** está activado (para el Sistema de troncalización actual), este campo se puede desactivar. En este caso, la inhibición del radio se logra "mediante ASTRO OTAR".

Cuando el campo Índice de perfil de ASTRO OTAR está desactivado (para el Sistema de troncalización actual), este campo debe activarse. Esto garantiza que la inhibición de radio sea posible con la troncalización **ASTRO 25**.

IMPORTANTE:

Para despejar este estado de inhibición en el radio, se debe enviar un comando de anulación de inhibición al radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.38.4.2

Servicio de mensajería de texto

Este campo selecciona el modo Mensajería de texto para el Sistema de troncalización actual.

NOTA:

El usuario accede al modo Mensajería de texto con la pulsación de botón Servicio de mensajería de texto o la selección de menú Servicio de mensajería de texto.

El usuario accede al modo Mensajería de texto rápida con la pulsación del botón Texto rápido de SMT.

El usuario accede a Mensajería de consulta con la pulsación del botón Consulta SMT.

Solo se accede: cuando el campo Tipo de sistema está configurado como **ASTRO 25**, y cuando el Sistema de troncalización actual tiene un Perfil de datos al que se hace referencia, y cuando Selección de perfil de datos no está configurado en **Datos desactivados**.

Se admiten las siguientes selecciones:

Ninguno

La función está desactivada.

Solo lista

Permite seleccionar solamente los Mensajes de texto en la Lista de mensajes de texto rápido.

Ilimitado

Le permite seleccionar desde Mensajes de texto rápidos e ingresar mensajes de texto propios desde el teclado del radio.

**ADVERTENCIA:**

Esta selección solo está disponible en radios que tengan un teclado o micrófono del teclado.

**NOTA:**

Esta selección no se aplica a radios APX N70.

10.38.4.3

Nivel de potencia de Tx

En este campo se selecciona el nivel de potencia del radio para transmitir para el Sistema de troncalización actual.

La pulsación del botón Baja potencia de Tx, el switch de alternación Baja potencia de Tx y la selección de menú Potencia son más importantes que este ajuste cuando el usuario realiza la selección.

**NOTA:**

Durante el Modo emergencia el radio transmite automáticamente a alta potencia.

La potencia de transmisión puede disminuirse en un 1 vatio para modelos 800 y en 2 vatios para modelos VHF y UHF.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Bajo

Se usa para comunicaciones cercanas y para evitar que el radio transmita en otros grupos geográficos que funcionan en la misma frecuencia.

Alto

Se usa cuando se necesita una señal más fuerte para extender las distancias de las transmisiones.

10.38.4.4

Activación de monitor remoto/rastreo de radio

Este campo permite que el radio decodifique un comando de Monitor remoto o Rastreo de radio para el Sistema de troncalización actual.

**ADVERTENCIA:**

El **Tramo de radio** se aplica solo para el sistema **Tipo II**. Además, solo para un sistema **Tipo II**, y con el uso de **Monitor remoto** y **Rastreo de radio**, el radio se activa por el tiempo seleccionado en el Tiempo base de Tx de Monitor remoto/Rastreo de radio.

**NOTA:**

Para un Tipo de sistema **ASTRO 25**, el tiempo de transmisión del radio en terreno lo define un despachador dentro del comando **Monitor remoto**.

Cuando se recibe un comando de **Monitor remoto**, el radio se activa automáticamente y trasmite el audio del entrono desde su micrófono "activo". Esto es especialmente útil en una situación de emergencia de hombre caído.

Monitor remoto también se conoce como **Monitor de unidad de radio**.

Cuando se recibe un comando de **Rastreo de radio**, el radio se activa automáticamente y envía un portador no modulado, lo que permite encontrar un radio perdido o robado. El **Tramo de radio** se aplica solo para el sistema **Tipo II**.

Se aplica solo:

Para APX 7000XE y APX 6000, esta función se aplica solo cuando la Opción de sistema H43 está disponible para el radio. Además, el radio requiere la versión de firmware R05.xx.xx o superior, y el APX debe ser R05.xx.xx o superior.

Para APX 6500, esta función se aplica solo cuando la Opción de sistema G170 está disponible para el radio. Además, el radio requiere la versión de firmware R05.xx.xx o superior, y el APX debe ser R05.xx.xx o superior.

10.38.4.5

Indicador de Rx de alarma de emergencia

Este campo permite que ocurra un indicador de audio o visual (o ambos) en el radio cuando se detecta y se recibe una Alarma de emergencia de otro radio.

El tipo de indicador de emergencia se determina mediante la configuración del Tipo de indicador de Rx de alarma de emergencia. Esta función se aplica al Sistema de troncalización actual.

IMPORTANTE:

El tiempo del indicador de Rx de alarma de emergencia es de 10 segundos. Durante estos 10 segundos, el usuario puede desactivar el indicador mediante la pulsación de cualquiera de los botones del radio, excepto Volumen e Iluminar/girar (la pantalla).

Una vez que ha borrado el indicador o que se borre, los reintentos por enviar alarmas de emergencia desde el mismo ID de unidad del Sistema de troncalización se ignoran durante los próximos 20 segundos.

Las alarmas de emergencia no se detectan mientras el radio se encuentra en Modo de rastreo.

Las Alarmas de emergencia podrían no ser detectadas mientras el radio no se encuentra monitoreando o decodificando el canal de control, por ejemplo, actividad en un canal de voz o datos, muestreo de RSSI, etc.

Solo se accede: Cuando el campo Tipo de indicador de Rx de alarma de emergencia no está configurado como **Sin indicación** y cuando el radio admite modelos y opciones diferentes.

10.38.4.6

LED seguro

En este campo se activa el LED de ocupado amarillo para que destelle cuando se recibe una llamada de voz encriptada segura y sigue destellando mientras la actividad de voz actual sea segura.

El LED de ocupado amarillo destellará bajo estas condiciones sin importar si el radio específico puede desilenciar la señal de voz. El LED seguro se aplica para el Sistema de troncalización actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.38.4.7

Selección de la Lista de alerta seleccionable del sitio

En este campo se selecciona la Lista de alertas seleccionables del sitio que se usará con el Sistema de troncalización ASTRO 25 actual.

NOTA:

La funcionalidad de la Lista de alertas seleccionables del sitio está definida en la página Lista de alertas seleccionables del sitio.

Puede activar o desactivar las Alertas seleccionables del sitio con una selección del menú Alerta seleccionable del sitio. Ya sea un sitio único o todos los sitios disponibles en la zona se pueden seleccionar para activar o desactivar una Alerta seleccionable del sitio.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO 25** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

- Desactivado
- Listas de alertas seleccionables del sitio disponibles

ADVERTENCIA:

Es posible que no puedan efectuarse selecciones en la Lista cuando el campo [Tipo de cobertura en la página 519](#) se configure en **Desactivado**, o cuando el campo Tipo de cobertura se configure en **Desactivado** y cuando el campo [Activación de alias del sitio en la página 541](#) esté **Activado**. De lo contrario, se considerará no válida la selección de una Lista.

10.38.4.8

Activación de reagrupación dinámica

En este campo se activa un grupo de conversación de Reagrupación dinámica para una Personalidad de troncalización o canal que hace referencia al Sistema de troncalización actual.

NOTA:

Cuando este campo está activado, se deben seleccionar una [Zona de reagrupación dinámica en la página 532](#) y un [Canal de reagrupación dinámico en la página 532](#) para el Sistema de troncalización.

ADVERTENCIA:

Una configuración de reagrupación dinámica solo es válida cuando una de las personalidades de troncalización referidas a un canal tiene el campo Grupo de conversación de troncalización configurado como **DYN** (reagrupación dinámica), la zona y el canal de la personalidad seleccionada coinciden con las selecciones de la zona de reagrupación dinámica y el canal de reagrupación dinámica en el Sistema de troncalización al que hacen referencia las personalidades.

IMPORTANTE:

Por lo tanto, solo un canal dentro de un determinado Sistema de troncalización puede ser el canal de Reagrupación dinámica.

El usuario puede solicitar una nueva asignación de Reagrupación dinámica al despachador con una pulsación del botón Solicitud de reprogramación o una selección del menú de Solicitud de reprogramación. El despachador define y transmite de vuelta las funciones y la configuración actuales del grupo de conversación de reagrupación dinámica.

Para que el grupo de conversación de Reagrupación dinámica pueda transmitir en el modo Seguro, se requiere la pulsación del botón Selección de Tx segura o el switch de alternación Selección de Tx segura o la selección del menú Seguro; en caso contrario, las transmisiones del grupo de conversación de Reagrupación dinámica se conectan a una transmisión en el modo **Borrar**

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.38.4.9

Zona de reagrupación dinámica

En este campo se selecciona la zona de la Personalidad de troncalización/canal de Reagrupación dinámica a la que hace referencia el Sistema de troncalización actual.

**ADVERTENCIA:**

Las zonas de la Interfaz de sitio remoto (RSI) no son válidas y no se pueden seleccionar (zonas con el modo RSI activado).

**NOTA:**

El usuario puede solicitar una nueva asignación de Reagrupación dinámica al despachador con una pulsación del botón Solicitud de reprogramación o una selección del menú de Solicitud de reprogramación. El despachador define y transmite de vuelta las funciones y la configuración actuales del grupo de conversación de reagrupación dinámica.

Para que el grupo de conversación de Reagrupación dinámica pueda transmitir en el modo Seguro, se requiere la pulsación del botón Selección de Tx segura o el switch de alternación Selección de Tx segura o la selección del menú Seguro; en caso contrario, las transmisiones del grupo de conversación de Reagrupación dinámica se conectan a una transmisión en el modo **Borrar**

Cuando [Activación de reagrupación dinámica en la página 531](#) está **Activado**, se deben seleccionar una zona de reagrupación dinámica y un [Canal de reagrupación dinámico en la página 532](#) para dicho Sistema de troncalización.

**ADVERTENCIA:**

Las zonas seleccionadas en este campo deben tener desactivada la opción Activación de zona dinámica; de lo contrario, este campo será no válido.

Una configuración de reagrupación dinámica solo es válida cuando una de las personalidades de troncalización referidas a un canal tiene el campo Grupo de conversación de troncalización configurado como **DYN** (reagrupación dinámica), y la zona y el canal de la personalidad seleccionada coinciden con las selecciones de la zona de reagrupación dinámica y el canal de reagrupación dinámica en el Sistema de troncalización al que hacen referencia las personalidades.

**IMPORTANTE:**

Por lo tanto, solo un canal (dentro de un determinado sistema de troncalización) puede ser el canal de reagrupación dinámica.

Solo se accede: Cuando el campo [Activación de reagrupación dinámica en la página 531](#) está configurado como **Activado** y cuando el radio admite modelos y opciones diferentes.

10.38.4.10

Canal de reagrupación dinámico

En este campo se selecciona una Personalidad de troncalización/canal de Reagrupación dinámica que hace referencia al Sistema de troncalización actual.

Consulte también [Zona de reagrupación dinámica en la página 532](#).

NOTA:

El usuario puede solicitar una nueva asignación de Reagrupación dinámica al despachador con una pulsación del botón Solicitud de reprogramación o una selección del menú de Solicitud de reprogramación. El despachador define y transmite de vuelta las funciones y la configuración actuales del grupo de conversación de reagrupación dinámica.

Para que el grupo de conversación de Reagrupación dinámica pueda transmitir en el modo Seguro, se requiere la pulsación del botón Selección de Tx segura o el switch de alternación Selección de Tx segura o la selección del menú Seguro; en caso contrario, las transmisiones del grupo de conversación de Reagrupación dinámica se conectan a una transmisión en el modo **Borrar**

Cuando el campo [Activación de reagrupación dinámica en la página 531](#) está **activado**, se deben seleccionar una zona de reagrupación dinámica y un canal de reagrupación dinámica para dicho Sistema de troncalización.

ADVERTENCIA:

Una configuración de reagrupación dinámica solo es válida cuando una de las personalidades de troncalización referidas a un canal tiene el campo Grupo de conversación de troncalización configurado como **DYN** (reagrupación dinámica), y la zona y el canal de la personalidad seleccionada coinciden con las selecciones de la zona de reagrupación dinámica y el canal de reagrupación dinámica en el Sistema de troncalización al que hacen referencia las personalidades.

IMPORTANTE:

Por lo tanto, solo un canal dentro de un determinado Sistema de troncalización puede ser el canal de Reagrupación dinámica.

ADVERTENCIA:

En los codeplugs portátiles APX™ 3000 solo los primeros 48 canales de la Zona de reagrupación dinámica son considerados selecciones válidas.

Solo se accede: Cuando el campo [Activación de reagrupación dinámica en la página 531](#) está configurado como **Activado**, cuando el campo Zona de reagrupación dinámica no está establecido en una zona dinámica y cuando el radio admite modelos y opciones diferentes.

10.38.4.11

Servicio de mensajería de texto grupal

En este campo se selecciona el modo de Servicio de mensajería de texto grupal para el Sistema ASTRO25 convencional actual.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO 25** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Desactivado

No se recibirán mensajes de texto grupales.

Decodificación completa

Se recibirán mensajes de texto grupales.

10.38.4.12

Frecuencia de interferencia LTE presente

La aplicación permite solo ver (Verdadero o Falso) cuando la tabla de ID de canal ASTRO 25 contiene una frecuencia de base de 700 MHz que pueda causar interferencia en este canal de banda ancha LTE.

Un perfil de datos referido de un Sistema de troncalización con un Tipo del perfil de datos configurado como **Banda ancha** y un origen de banda ancha configurado como **Módem LTE interno** crea un canal de troncalización que admite banda ancha LTE. Por lo tanto, cuando existe la capacidad de banda ancha LTE, y cualquier frecuencia de base de la tabla contiene una frecuencia dentro de la banda de frecuencia de 700 MHz, este campo tendrá la advertencia de posibles interferencias de frecuencia configurada como **verdadero**. Esta función se aplica para el Sistema de troncalización ASTRO 25 actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

IMPORTANTE:

Esta función solo está disponible en la Vista experta (consulte Vista de codeplug).

10.38.4.13

Selección de lista de la disposición del personal

Este campo permite seleccionar una lista de disposición del personal para utilizarla mientras se opera el Sistema de troncalización.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO 25** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

- Desactivado
- Disposición del personal disponible

10.38.4.14

Ubicación en PTT

El sistema ASTRO 25 permite a los radios APX transmitir la ubicación del GPS a la infraestructura a través de marcos de voz en el canal de voz, después de la operación de PTT.

Esto permite ver la ubicación del radio transmisor en la aplicación de asignación.

ADVERTENCIA:

El Modo ARS se debe definir como **Servidor mejorado** en el registro del Perfil de datos para evitar el Informe de campos no válidos.

Solo se accede: cuando el radio admite modelos/opciones diferentes, y cuando el campo Tipo de sistema está configurado en **ASTRO 25**, y cuando el modo ARS está en configurado en **Servidor mejorado** en el Perfil de datos, y cuando el campo [Activación de ubicación en la página 120](#) está activado.

10.38.4.15

Activación de actualización de alias de radio OTA

Permite que el sistema actual actualice el alias del radio.

Solo se accede: Cuando la Activación de alias del radio está activada, el tipo de sistema es **ASTRO 25**, el campo Tipo de alias de radio inalámbrico no está **Desactivado** y cuando el radio admite distintos modelos y opciones.

10.38.4.16

Tipo de alias de radio inalámbrico

Configura la codificación (mediante la transmisión) y la decodificación (mediante la recepción) de la función del alias del radio OTA (Por el aire).

**ADVERTENCIA:**

Si el radio recibe ID duplicados, no podrá mostrar el alias hasta que se elimine la duplicación. La escritura en el radio causará que la lista de llamadas vuelva a su estado original y todas las actualizaciones de alias OTA se pierdan.

**IMPORTANTE:**

Si la actualización de alias OTA no se mostró en la pantalla, el usuario debe actualizar la lista de llamadas de radio en RadioCentral o el administrador de aprovisionamiento.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Desactivado

El radio no transmite ni recibe datos de alias del radio.

Solo decodificación

Los datos de alias del radio reciben datos sin limitaciones.

10.38.4.17

Restablecimiento de ICUA

En este campo se selecciona una excepción de desilenciar programada o manual para Alertas/ localización de llamadas de troncalización cuando la Alerta de usuario de llamada entrante de Silencio de voz está activada.

El tiempo de excepción (programado o manual) se conoce como Estado de liberación del silenciador. Para las dos selecciones programadas, el campo [Tiempo de restablecimiento automático de ICUA en la página 534](#) (para este Sistema de troncalización) determina de manera parcial la duración de Liberar estado del silenciador. El Estado de liberación del silenciador comienza cuando la función Alerta de usuario de llamada entrante de silencio de voz está activa y el radio se ha desilenciado. Esta selección se aplica para el Sistema de troncalización actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Manual

Cuando la función Alerta de usuario de llamada entrante de Silencio de voz está activa, la pulsación de botón Silencio de voz o la selección del menú Silencio de voz desactiva el Silencio de voz y finaliza la opción Liberar estado del silenciador. Oprimir el botón PTT finaliza el Estado de liberación del silenciador.

Auto

Si el cronómetro expira sin importar si el radio se silenció o no, el Estado de liberación del silenciador finaliza y se requieren nuevamente las reglas de Alerta de usuario de llamada entrante de silencio de voz activada para desilenciar cualquier transmisión futura.

Auto con portador

Si se desilencia el radio cuando el temporizador expira debido al Silenciador de la portadora correcto, el radio permanece desilenciado hasta que se pierde la portadora. Cuando se pierde una portadora y se silencia el radio, se restablece y se reinicia el temporizador, lo que en efecto extiende Liberar estado del silenciador nuevamente; si el radio permanece silenciado por un período completo sin ninguna anulación de portadora, Liberar estado del silenciador finaliza y nuevamente se necesitan las reglas de Alerta de usuario de llamada entrante de Silencio de voz para desilenciar cualquier transmisión futura.

10.38.4.18

Tiempo de restablecimiento automático de ICUA

En este campo se selecciona una cantidad de tiempo utilizada durante la excepción desilenciar para alertas de llamadas/localizadores de troncalización cuando el canal se activa con la alerta de usuario entrante Silencio de voz.

El tiempo de excepción se conoce como Estado de liberación del silenciador. Este temporizador solo es relevante para las dos selecciones programadas Restablecimiento de llamada entrante. Esta selección se aplica para el Sistema de troncalización actual. El tiempo está expresado en segundos.

Solo se accede: Cuando el campo [Restablecimiento de ICUA en la página 533](#) no está configurado como **Manual** y cuando el radio admite modelos y opciones diferentes.

Mesa 270: Rango

Mínimo	Máximo	Incrementos
0 seg	255 s	1 seg

10.38.4.19

LED ocupado

Cuando este campo está activado, el LED amarillo de ocupado parpadea cada vez que se recibe una llamada de voz.

NOTA:

El LED amarillo de ocupado sigue parpadeando siempre que la actividad de voz actual esté en curso.

10.38.5

Alias de estado (sistema de troncalización ASTRO 25)

La sección **Alias de estado** del conjunto Sistema de troncalización ASTRO 25 permite al usuario ver o definir los estados de los sistemas de troncalización individuales. Los usuarios luego pueden seleccionar y transmitir su Estado actual al despachador (unidad base) con una pulsación del botón Estado, una pulsación del botón Estado directo o mediante la selección de menú Estado.

NOTA:

Comparado con la transmisión de voz, las transmisiones de estado hacen un uso más eficiente de un canal.

En el caso de los modelos sin teclado, esta función solo se puede utilizar con la función Botón un toque.

ADVERTENCIA:

Esta función se aplica solo cuando la Personalidad de troncalización a la que hace referencia este Sistema de troncalización tiene el campo Activación de estado habilitado.

El Alias de estado se debe programar de manera idéntica (o con el mismo significado) para el despachador y las unidades móviles o portátiles. Es decir, el Alias 1 de estado de la unidad despachadora debe ser idéntico (o debe tener el mismo significado) que el Alias 1 de estado para la unidad móvil o portátil.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.38.5.1

Activación de alias de estado

En este campo se activa la posibilidad de definir el Estado para el Sistema de troncalización actual.

**ADVERTENCIA:**

Esta función se aplica solo cuando la Personalidad de troncalización a la que hace referencia este Sistema de troncalización tiene el campo Activación de estado habilitado.

Una vez que se activa, debe programar cada Alias de estado del radio (Nombre de alias de mensaje y Número de alias de estado del mismo registro/fila) para corresponder de manera idéntica con el Alias de estado de la unidad del despachador correspondiente o tener el mismo significado.

Una vez que se define, puede acceder a la función Estado con una pulsación del botón Estado, una pulsación del botón Estado directo o la selección del menú Estado.

En el caso de los modelos sin teclado, la función Estado solo se puede utilizar con la función Botón un toque.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.38.5.2

Número de alias de estado

En este campo se selecciona un número que identifica el Estado actual.

Esta selección se aplica al estado actual (registro/fila) que se aplica al Sistemas de troncalización actual.

**ADVERTENCIA:**

- Esta función se aplica solo cuando la Personalidad de troncalización a la que hace referencia este Sistemas de troncalización tiene el campo Activación de estado habilitado.
- Una vez definido, el usuario puede acceder a la función Estado con la pulsación del botón Estado, la pulsación del botón Estado directo o la selección del menú Estado.

**IMPORTANTE:**

El alias de estado se debe programar de manera idéntica (o con el mismo significado) para el despachador y las unidades móviles o portátiles. Es decir, el Alias 1 de estado de la unidad despachadora debe ser idéntico (o debe tener el mismo significado) que el Alias 1 de estado para la unidad móvil o portátil.

Solo se accede: Cuando el campo [Activación de alias de estado en la página 539](#) está activado y cuando el radio admite modelos y opciones diferentes.

10.38.5.3

Texto de alias de estado

Este campo permite definir nombres reconocibles para el estado actual (registro/fila).

Esta selección se aplica al Sistema de troncalización actual.

NOTA:

- Esta función se aplica solo cuando la Personalidad de troncalización a la que hace referencia este Sistema de troncalización tiene el campo Activación de estado habilitado.
- Una vez que se define, puede acceder a la función Estado con una pulsación del botón Estado, una pulsación del botón Estado directo o la selección del menú Estado.

IMPORTANTE:

El alias de estado se debe programar de manera idéntica (o con el mismo significado) para el despachador y las unidades móviles o portátiles. Es decir, el Alias 1 de estado de la unidad despachadora debe ser idéntico (o debe tener el mismo significado) que el Alias 1 de estado para la unidad móvil o portátil.

Solo se accede: Cuando el campo [Activación de alias de estado en la página 539](#) está activado y cuando el radio admite modelos y opciones diferentes.

NOTA:

Se pueden usar caracteres, números, espacios y caracteres especiales.

Se pueden utilizar hasta 14 caracteres.

Ejemplos: STATUS-01, Electric1, #510

10.38.6

Alias del sitio (sistema de troncalización ASTRO 25)

La sección **Alias del sitio** del conjunto Sistema de troncalización ASTRO 25 permite al usuario ver o definir los alias de fácil uso que identifican los sistemas de troncalización o los sitios individuales en aquellos sistemas que un radio puede encontrar a medida que se mueve a través de los sitios, los sistemas de troncalización o incluso las Redes de comunicaciones de área extendida (WACN). Los alias también pueden identificar llamadas (mediante ID de PTT) recibidas desde radios fuera del Sistema de troncalización seleccionado (doméstico) del radio.

IMPORTANTE:

Solo están disponibles para el radio los Alias de sitio definidos en el Sistema de troncalización seleccionado actualmente por el usuario.

NOTA:

El Tipo de alias de sitio determina adónde se asigna el Texto de alias de sitio, ya sea a un Sistema de troncalización o a un sitio en un sistema.

IMPORTANTE:

Un Sistema de troncalización siempre se define por su Número de RAS WACN doméstico y su Número de sistema, mientras que un sitio se define mediante combinaciones específicas del Número de RAS WACN doméstico, el Número de sistema, el Número de alias de RFSS y el ID del sitio, en función del Tipo de cobertura y Tipo de sistema del Sistema de troncalización actual.

El usuario del radio activa la visualización del Alias del sitio actual y su Indicador de intensidad de señal recibida (RSSI) correspondiente o el cambio del sitio actual con el botón de Visualización/búsqueda del sitio. Si el usuario presiona el botón Bloquear/Desbloquear sitio o selecciona el menú Sitio, podrá ver o cambiar el estado de bloqueo del sitio actual.

Los Sistemas de troncalización individuales hacen referencia a una Personalidad de troncalización. Luego, esta configuración de los Sistemas de troncalización puede quedar operativa para todos los tipos de canales dentro de dicha Personalidad de troncalización.

10.38.6.1

Activación de alias del sitio

En este campo se activan los campos Alias del sitio para el ID del sitio actual (registro/fila), que también se aplica al Sistema de troncalización actual.

**NOTA:**

El usuario del radio activa la visualización del Alias del sitio actual y su Indicador de intensidad de señal recibida (RSSI) correspondiente o el cambio del sitio actual con el botón de Visualización/búsqueda del sitio.

Con el botón bloquear/desbloquear sitio o la selección del menú del Sitio se puede ver o cambiar el estado de bloqueo del sitio actual.

**NOTA:**

Este producto no admite Selección automática de varios sitios (AMSS).

Solo se accede: cuando el campo Tipo de sistema se configura en **Tipo II**, y cuando el campo [Tipo de cobertura en la página 519](#) se configura en **SmartZone**, y cuando el radio admite modelos/ opciones diferentes;

O cuando el campo Tipo de sistema se configura en **ASTRO 25**, y cuando el campo Tipo de cobertura no se configura en **Desactivado**, y cuando el radio admite modelos/ opciones diferentes.

10.38.6.2

Número de alias de RFSS

Este campo permite ingresar (en formato decimal) el número de RFSS (Subsistema de frecuencia radial) que corresponde al ID del sitio actual (registro/fila).

Para que se pueda realizar roaming entre diferentes RFSS en un Sistema de troncalización, cada RFSS debe tener un número único. Un RFSS se compone de uno o más sitios. Esta selección se aplica al Sistema de troncalización actual.

Solo se accede: cuando el campo Tipo de sistema se configura en **ASTRO 25**, y cuando el campo Tipo de cobertura se estable en **SmartZone y OmniLink o Roaming Intra-WACN o Roaming Inter-WACN**, y cuando el campo [Activación de alias del sitio en la página 541](#) está activado, y cuando el campo [Tipo de alias del sitio en la página 608](#) se configura en **Sitio**, y cuando el radio admite modelos/ opciones diferentes.

Mesa 271: Rango

Mínimo	Máximo
1	254

10.38.6.3

ID del sitio

Este campo permite ingresar (en formato decimal o hexadecimal) el número de ID que identifica el sitio para el (registro/fila) actual.

Para que se pueda realizar roaming entre diferentes sitios, cada ID del sitio debe ser único dentro de un Subsistema de frecuencia radial (RFSS). Esta selección se aplica al Sistema de troncalización actual.

Solo se accede: cuando el campo [Activación de alias del sitio en la página 541](#) está activado, cuando el campo Tipo de sistema se configura en **Tipo II**, cuando el campo Tipo de cobertura está establecido en **SmartZone** y cuando el radio admite modelos y opciones diferentes,

o cuando el campo [Activación de alias del sitio en la página 541](#) está activado, cuando el campo [Tipo de alias del sitio en la página 608](#) está establecido en **Sitio**, cuando el campo Tipo de sistema está

establecido en **ASTRO 25**, cuando el campo Tipo de cobertura no está **Desactivado** y cuando el radio admite modelos y opciones diferentes.

Mesa 272: Rango

Mínimo	Máximo
0 (Hex)	FE (Hex)

10.38.6.4

Texto de alias del sitio

Este campo permite definir nombres reconocibles para el Alias del sitio actual (registro/fila) que se aplica al Sistema de troncalización actual.

Consulte también [Tipo de alias del sitio en la página 608](#). Puede activar el Texto de alias del sitio con la pulsación del botón Mostrar/Buscar sitio, la pulsación del botón Bloquear/desbloquear sitio y las funciones de selección del menú Sitio.

Solo se accede: cuando el campo [Activación de alias del sitio en la página 541](#) está activado, cuando el campo Tipo de sistema se configura en **Tipo II**, cuando el campo Tipo de cobertura está establecido en **SmartZone** y cuando el radio admite modelos y opciones diferentes,

o cuando el campo [Activación de alias del sitio en la página 541](#) está activado, cuando el campo Tipo de sistema está establecido en **ASTRO 25**, cuando el campo Tipo de cobertura no está establecido en **Desactivado** y cuando el radio admite modelos y opciones diferentes.

NOTA:

Se pueden usar caracteres, números, espacios y caracteres especiales.

Se pueden utilizar hasta 14 caracteres.

Ejemplos: EMT-001, #500, Electric1, Site Alias 01

10.38.6.5

Tipo de alias del sitio

En este campo se selecciona la asignación del Texto de alias del sitio para un Sistema de troncalización o un sitio dentro de un sistema.

Puede ver el alias del sitio actual del radio o el alias del sistema con la pulsación del botón Mostrar/buscar sitio. Esta selección se aplica para el alias del sitios actual (registro/fila) que se aplica para el Sistema de troncalización actual.

Solo se accede: cuando el campo Tipo de sistema se configura en **ASTRO 25**, y cuando el Tipo de cobertura no se configura en **Desactivado**, y cuando el campo [Activación de alias del sitio en la página 541](#) está activado, y cuando el radio admite modelos/opciones diferentes.

Se admiten las siguientes selecciones:

Sitio

Se utiliza como “Alias de sitio” para el sitio del radio registrado actualmente. La selección del Tipo de cobertura del Sistema de troncalización determina cómo se debe definir un sitio para la generación de alias.

- Para **SmartZone**, solo se necesita el ID del sitio.
- Para **SmartZone y OmniLink**, se necesitan el Número de alias de RFSS y el ID del sitio.
- Para **Roaming intra-WACN**, se necesitan el Número de sistema, el Número de alias de RFSS y el ID del sitio.
- Para **Roaming inter-WACN**, se necesitan el Número de sistema, el Número de alias de RFSS, el ID del sitio y el Número de RAS-WACN doméstico.

Sistema

El [Texto de alias del sitio en la página 542](#) se utiliza como alias del sistema para el Sistema de troncalización externo actualmente registrado en el radio. Los alias de los sistemas se definen por su Número de RAS WACN doméstico y Número de sistema. Solo el tipo de cobertura del Sistema de troncalización **Roaming inter-WACN** es posible para el tipo de alias del sistema. Los alias del sistema se utilizan para crear un ID de PTT o un alias del sitio:

- Cuando el radio recibe una llamada de un radio externo y no hay definido un alias del sitio para el sitio en el Sistema de troncalización especificado, aparecerá el alias del sistema y el ID de la unidad en la pantalla del radio receptor, identificando al radio que llama. Si un alias de sistema no está definido, todo el ID de la unidad del suscriptor (SUID) del radio externo aparece en la pantalla del radio receptor. El SUID es una combinación del ID de WACN doméstico, del ID del sistema y del ID de la unidad.
- Si el radio se ha movido a un Sistema de troncalización externo donde no hay un alias del sitio disponible para el sitio actual, este alias de sistema, el ID de sitio y su correspondiente nivel de indicadores de intensidad de señal recibida (RSSI) aparecen en la pantalla del radio cuando el usuario presiona el botón Mostrar/buscar sitio. Si un alias del sistema no se define para el sistema externo registrado actualmente, el ID del sitio completo (Número de RAS WACN doméstico + Número de sistema + ID del sitio + Nivel de RSSI) aparece en la pantalla del radio.

10.38.6.6

Número de sistema

Este campo le permite ingresar (en formato decimal o hexadecimal) el ID del sistema que corresponde al ID del sitio actual (registro/fila).

Para permitir el roaming entre los diferentes sistemas de troncalización que componen las redes de comunicaciones de área extendida (WACN). Cada sistema de troncalización debe tener un ID de sistema exclusivo. Un Sistema de troncalización consta de uno o varios subsistemas de frecuencia radial (RFSS). Esta selección se aplica al sistema de troncalización actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes, cuando el campo [Activación de alias del sitio en la página 541](#) está activado y cuando el campo Tipo de sistema está establecido en **ASTRO 25**,

Cuando el campo Tipo de cobertura está establecido en **Roaming intra-WACN** o **Roaming inter-WACN** y cuando el campo [Tipo de alias del sitio en la página 608](#) está establecido en **Sitio**,

O cuando el campo Tipo de cobertura no está establecido en **Desactivado** y cuando el campo [Tipo de alias del sitio en la página 608](#) está establecido en **Sistema**.

Mesa 273: Rango

Mínimo	Máximo
000 (Hex)	FFE (Hex)

IMPORTANTE:

Un valor de "0" provoca que el radio copie el valor del campo ID de sistema del sistema de troncalización actual en este campo.

10.38.6.7

Número de RAS-WACN doméstico

Este campo permite ingresar (en formato decimal o hexadecimal) el ID de Redes de comunicaciones de área extendida (WACN) del Servidor de acceso remoto (RAS) local que corresponda al ID del sitio actual (registro/fila).

Para admitir roaming entre diferentes WACN (consulte también Roaming Inter-WACN), cada WACN debe tener un número único. Una WACN está compuesta de uno o más sistemas de troncalización. Esta selección se aplica para el Sistema de troncalización actual.

Solo se accede: cuando el radio admite modelos/opciones diferentes, y cuando el campo [Activación de alias del sitio en la página 541](#) está activado, y cuando el campo Tipo de sistema está establecido en **ASTRO 25**; y

Cuando el campo Tipo de cobertura está establecido en **Roaming inter-WACN** y cuando el campo [Tipo de alias del sitio en la página 608](#) está establecido en **Sitio**,

o cuando el campo Tipo de cobertura no está establecido en **Desactivado** y cuando el campo [Tipo de alias del sitio en la página 608](#) está establecido en **Sistema**.

Mesa 274: Rango

Mínimo	Máximo
00000 (Hex)	FFFFE (Hex)

IMPORTANTE:

Predeterminado de fábrica = 1. Un valor de "0" provoca que el radio copie el valor del campo ID de WACN doméstica para el Sistema de troncalización actual para este campo.

10.38.7

Un toque

Esta sección permite ver o definir selecciones de **Función** e **Índice** de Un toque específicas para hasta cuatro pulsaciones del botón Un toque o selecciones de menú de Un toque.

Un toque permite crear menús de navegación y atajos de botones. Estos atajos reducen significativamente el esfuerzo que el usuario del radio realiza para iniciar una función del radio.

Una pulsación del botón de Un toque o una selección de menú pueden reducir a una sola pulsación de botón el inicio de una función del radio; de lo contrario, para este mismo proceso se llevarían a cabo muchos pasos de navegación en el menú. Estas selecciones se aplican para el Sistema de troncalización actual.

NOTA:

Los Sistemas de troncalización individuales hacen referencia a una Personalidad de troncalización. Luego, esta configuración de los Sistemas de troncalización puede quedar operativa para todos los tipos de canales dentro de dicha Personalidad de troncalización.

10.38.7.1

Botón

Muestra solo la visualización del nombre asignado para la pulsación del botón Un toque o la selección del menú Un toque.

NOTA:

Los Sistemas de troncalización individuales hacen referencia a una Personalidad de troncalización. Luego, esta configuración de los Sistemas de troncalización puede quedar operativa para todos los tipos de canales dentro de dicha Personalidad de troncalización.

10.38.7.2

Función Botón un toque

En este campo se selecciona la función Un toque para la pulsación del botón Un toque o la selección de menú Un toque.

Esta selección se aplica para el registro o la fila actual, que se aplica para el Sistema de troncalización actual.

IMPORTANTE:

El botón Troncalización con un toque 1, en otras palabras, el primer registro/fila, corresponderá a la presión del botón Un toque 1, o a la selección del menú TCH1 o SIG1, y así sucesivamente.

NOTA:

Con cualquier selección de estas funciones, la selección Índice de botón de un toque también debe definirse.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Desactivado

La opción Un toque no está disponible para la selección de botón actual.

Teléfono

La función [Funcionamiento del teléfono en la página 577](#) está configurada como **Solo lista o Ilimitado** para la Personalidad de troncalización a la que se hace referencia.

Llamada privada

La función [Tipo de llamada privada en la página 574](#) no está **desactivada** y el campo [Operación de llamada privada en la página 574](#) está configurado como **Solo lista o Ilimitado** para la Personalidad de troncalización a la que se hace referencia.

Alerta de llamada

El campo [Funcionamiento de alerta/localización de llamada en la página 575](#) está configurado como **Solo lista o Ilimitado** para la Personalidad de troncalización referida.

Estado

La función [Activación de alias de estado en la página 539](#) se activa para el Sistema de troncalización actual.

Mensaje

La función Mensaje se activa para el Sistema de troncalización actual.

NOTA:

Las selecciones de funciones disponibles del botón Un toque dependen del modelo u opción.

10.38.7.3

Índice del botón Un toque

En este campo se selecciona el Índice/miembro de la lista de un toque para la pulsación del botón Un toque o la selección del menú Un toque correspondiente a la función del botón Un toque seleccionada.

El término Índice hace referencia al registro o la fila real de la lista determinada por la selección de la función del botón Un toque. Esta selección se aplica para el Sistema de troncalización actual.

IMPORTANTE:

El botón Troncalización de un toque 1, el primer registro o la primera fila corresponderá a una pulsación del botón Un toque 1, y a una selección del menú TCH1 o SIG1.

Solo se accede: Cuando el campo [Función Botón un toque en la página 543](#) para el registro o la fila actuales no está configurado como **Desactivado** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Llamada privada

Este número de índice se correlaciona con el número de fila de la Lista de llamadas frecuentes Tipo II o ASTRO 25.

**IMPORTANTE:**

La selección de [Lista de uso frecuente de llamadas de troncalización en la página 576](#) determina qué Lista de llamadas frecuentes se usa para la Personalidad de troncalización a la que se hace referencia.

Está a disposición del usuario cuando la función [Tipo de llamada privada en la página 574](#) no está en **Desactivado**, y el campo [Operación de llamada privada en la página 574](#) está configurado en **Solo lista** o **Ilimitado** para la Personalidad de troncalización a la que se hace referencia.

Alerta de llamada

Este número de índice se correlaciona con el número de fila de la Lista de llamadas frecuentes Tipo II o ASTRO 25.

**IMPORTANTE:**

La selección Lista de uso frecuente de llamada de troncalización determina qué Lista de uso frecuente de llamada se usa para la Personalidad de troncalización a la que se hace referencia.

Está a disposición del usuario cuando el campo [Funcionamiento de alerta/localización de llamada en la página 575](#) está configurado en **Solo lista** o **Ilimitado** para la Personalidad de troncalización a la que se hace referencia.

Teléfono

Este número de Índice se correlaciona con el número de fila de la Lista de uso frecuente de llamadas.

Está a disposición del usuario cuando la función [Funcionamiento del teléfono en la página 577](#) está configurada en **Solo lista** o **Ilimitado** para la Personalidad de troncalización a la que se hace referencia.

Estado

Este número de índice se correlaciona con la posición o el número de fila de los miembros de la Lista de alias de estado.

Está a disposición del usuario cuando la función [Activación de alias de estado en la página 539](#) está **Activada** para el Sistema de troncalización actual.

Mensaje

Este número de índice se correlaciona con la posición o el número de fila de los miembros de la Lista de alias de mensaje.

Está a disposición del usuario cuando la función Mensaje está **Activada** para el Sistema de troncalización actual.

10.38.8

ASTRO 25

Esta sección permite ver o modificar la funcionalidad básica que se usa mientras se opera en el modo ASTRO 25.

Esta programación se aplica para Sistemas de troncalización individuales.

**NOTA:**

Los Sistemas de troncalización individuales hacen referencia a una Personalidad de troncalización. Luego, esta configuración de los Sistemas de troncalización puede quedar operativa para todos los tipos de canales dentro de dicha Personalidad de troncalización.

10.38.8.1

Funciones de propiedad de Motorola

En este campo se activan las transmisiones del Paquete de señalización entrante (ISP) de propiedad de Motorola para enviarlas por el radio.

Esta función se aplica al Sistema de troncalización actual.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO 25** y cuando el radio admite modelos y opciones diferentes.

10.38.8.2

Extensión de la secuencia ISP

En este campo se selecciona el tiempo máximo permitido por sitio para una secuencia de reintento de Paquete de señalización entrante (ISP).

El radio reintenta cinco veces o hasta que este tiempo expire, lo que ocurra primero. Esta selección se aplica para el Sistema de troncalización actual. El tiempo está expresado en segundos.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO 25** y cuando el radio admite modelos y opciones diferentes.

**NOTA:**

Cuando se establece como **Infinito**, el temporizador no caduca.

Mesa 275: Rango

Mínimo	Máximo	Incrementos
10 (segundo)	255 (segundos)	1 (segundo)

10.38.8.3

Tamaño de ranura máximo

En este campo se selecciona el tamaño máximo de ranura del Paquete de señalización entrante (ISP) que puede utilizar el radio.

**IMPORTANTE:**

Este valor no puede ser mayor que el tamaño de la ranura permitida por el sistema.

**NOTA:**

Este valor se utiliza para acelerar el proceso de búsqueda de ranura del firmware del radio. Esta selección se aplica para el Sistema de troncalización actual. El tiempo está expresado en milisegundos.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO 25** y cuando el radio admite modelos y opciones diferentes.

**NOTA:**

Cuando se establece como **Sin límites**, el tamaño de la ranura es ilimitado.

Mesa 276: Rango

Mínimo	Máximo	Incrementos
37,5 (milisegundos)	142,550 (milisegundos)	7,5 (milisegundos)

10.38.8.4

Forzar tiempo de activación de sonido

En este campo se selecciona la cantidad máxima de tiempo que un radio permanece silenciado para recibir audio adelantándose al retardo de carga útil del sistema.

El temporizador comienza luego de que el radio envía una transmisión. Si el firmware del radio confirma por otro medio que el audio entrante no es el propio, se ignora el tiempo. Esta selección se aplica para el Sistema de troncalización actual. El tiempo está expresado en milisegundos.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO 25** y cuando el radio admite modelos y opciones diferentes.

**NOTA:**

Cuando se establece como **Inmediato**, lo que significa 0 (cero tiempo), no hay un tiempo de silencio después de la transmisión.

Mesa 277: Rango

Mínimo	Máximo	Incrementos
250 (ms)	6375 (ms)	25 (ms)

10.38.8.5

Protección de desvanecimiento rápido

En este campo se selecciona la cantidad de tiempo que el radio permanece en el canal de control luego de perder la sincronización y antes de intentar volver a sincronizar.

Esto permite que el tiempo del radio recupere la señal sin una resincronización completa del canal. Esta selección se aplica para el Sistema de troncalización actual. El tiempo está expresado en milisegundos.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO 25** y cuando el radio admite modelos y opciones diferentes.

Mesa 278: Rango

Mínimo	Máximo	Incrementos
200 ms	6375 ms	25 ms

10.38.8.6

Tiempo de advertencia del PTT

En este campo se selecciona la cantidad de tiempo que el radio espera antes de emitir un Tono de prohibición para hablar para advertir al usuario que se está procesando una solicitud de PTT y que el usuario debe soltar el botón PTT.

Esta selección se aplica para el Sistema de troncalización actual. El tiempo está expresado en milisegundos.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO 25** y cuando el radio admite modelos y opciones diferentes.

**NOTA:**

Cuando está configurado como **Desactivado**, no se emite ninguna advertencia.

Mesa 279: Rango

Mínimo	Máximo	Incrementos
0 ms	6375 ms	25 ms

10.38.8.7

Tiempo de actualización de ocupado

En este campo se selecciona la cantidad de tiempo de espera del radio en estado de ocupado para conceder, rechazar u otra actualización de ocupado desde el Equipo de red fija (FNE).

Si este tiempo expira, el radio ya no espera una respuesta desde el FNE y reintenta la transmisión. Esta selección se aplica para el Sistema de troncalización actual. El tiempo está expresado en segundos.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO 25** y cuando el radio admite modelos y opciones diferentes.

NOTA:

Cuando se establece como **Infinito**, el radio espera indefinidamente una respuesta.

Mesa 280: Rango

Mínimo	Máximo	Incrementos
150 (segundos)	945 (segundos)	15 (segundos)

10.38.8.8

Tiempo pendiente de respuesta

En este campo se selecciona la cantidad de tiempo de espera del radio cuando aguarda una mayor respuesta a una solicitud desde el Equipo de red fija (FNE).

Esta situación ocurre cuando el FNE envía una indicación al radio de que se está procesando su solicitud y esa señalización mayor está en camino. Si este tiempo expira, el radio ya no espera una respuesta desde FNE y vuelve a un estado de reposo. Esta selección se aplica para el Sistema de troncalización actual. El tiempo está expresado en segundos.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO 25** y cuando el radio admite modelos y opciones diferentes.

NOTA:

Cuando se establece como **Infinito**, el radio espera indefinidamente otra respuesta del FNE.

Mesa 281: Rango

Mínimo	Máximo	Incrementos
10 (segundo)	255 (segundos)	1 (segundo)

10.38.8.9

ID de RCM predeterminada

En este campo se selecciona la dirección del Administrador de control de radio (RCM) que se usa como dirección de destino de las transmisiones del Paquete de señalización entrante (ISP) dirigido al FNE, por ejemplo, transmisiones de estado y mensaje.

Esta selección se aplica para el Sistema de troncalización actual.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO 25** y cuando el radio admite modelos y opciones diferentes.

Mesa 282: Rango

Mínimo	Máximo
000000 (Hex)	FFFFFF (Hex)

10.38.8.10

Capacidad de voz de fase 2

Este campo permite que el radio transmita en un Sistema de troncalización compatible con comunicaciones de voz de Acceso múltiple por división de tiempo (TDMA) de fase 2 de acuerdo con el protocolo Project 25.

NOTA:

El TDMA de fase 2 utiliza un protocolo TDMA de dos ranuras en un canal de 12,5 kHz, que permite duplicar la capacidad de la voz en comparación con la implementación del FDMA (Acceso múltiple por división de frecuencias) de fase 1. Esta selección se aplica para el Sistema de troncalización actual.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO 25** y cuando el radio admite modelos y opciones diferentes.

10.38.8.11

Fin de transmisión TDMA de fase 2 fuera de rango

Este campo permite que el radio detenga una transmisión TDMA de fase 2 (Acceso múltiple por división de tiempo) en curso.

ADVERTENCIA:

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Esta función también alerta que durante la transmisión, el radio ha circulado fuera del rango de cobertura del Equipo de red fija (FNE). Un tono de alerta audible persiste durante el tiempo que se presione el botón PTT. Esta selección se aplica para el Sistema de troncalización actual.

Solo se accede: Cuando el campo Tipo de sistema está configurado como **ASTRO 25** y cuando el campo [Capacidad de voz de fase 2 en la página 616](#) está **activado**.

10.38.8.12

Validar NAC con ID del sistema

Este campo hace que el radio valide los 8 bits superiores del ID del sistema de 16 bits con los 8 bits superiores del Código de acceso de red (NAC) de 12 bits recibidos en el canal de control de troncalización.

Si no se encuentra una coincidencia, el radio no intenta registrar/afiliarse al sitio de troncalización. Por lo tanto, si se habilita este campo, el radio puede hacer coincidir rápidamente el código NAC de un sitio con su ID del sistema y rechazar los canales de control del Sistema de troncalización que interfieren. Esta selección se aplica para el Sistema de troncalización actual.

ADVERTENCIA:

Si algún sitio en el Sistema de troncalización no está configurado de esta manera, entonces este campo debe desactivarse.

Cuando está desactivado, el radio no intenta hacer coincidir los 8 bits superiores del ID del sistema de 16 bits con los 8 bits superiores del código NAC de 12 bits. Esto permite que el radio funcione

en canales de control con un NAC que es independiente del ID del sistema de este Sistema de troncalización. Al radio puede llevarle más tiempo rechazar los canales de control del Sistema de troncalización que causan interferencia. Esta selección se aplica para el Sistema de troncalización actual.

ADVERTENCIA:

Cuando el campo [Tipo de cobertura en la página 519](#) se configura en **Roaming Inter-WACN**, esta selección debe estar desactivada; de lo contrario, se la considera como no válida.

Cuando el campo [Tipo de cobertura en la página 519](#) se configura en **Roaming:Intra-WACN**, y el campo Activación de hardware del DVRS está activado, esta selección debe estar desactivada; de lo contrario, se considera que esta selección no es válida.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO 25** y cuando el radio admite modelos y opciones diferentes.

10.38.8.13

Soporte para validez de WUID

Este campo hace que el radio vuelva a validar periódicamente su ID de unidad de trabajo (WUID) con el Equipo de red fija (FNE).

El WUID se asigna a un radio durante la actividad inicial de registro o afiliación del FNE; cualquier solicitud de ISP (paquete de señalización entrante) al FNE que contenga el WUID del radio lo revalidará con su Sistema de troncalización actual en el campo.

IMPORTANTE:

Esta selección solo se requiere para un FNE que depende del radio para rastrear períodos de inactividad y volver a validar su WUID antes de que expire. Esta selección se aplica para el Sistema de troncalización actual.

Cuando está deshabilitado, el radio no vuelve a validar su WUID automáticamente porque espera el tipo de FNE que envía una consulta al radio después de un período de inactividad antes de eliminar el registro y quitar el WUID del Sistema de troncalización.

ADVERTENCIA:

Cuando el campo [Tipo de cobertura en la página 519](#) se configura en **Roaming Inter-WACN**, esta selección debe estar desactivada; de lo contrario, se la considera como no válida.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO 25** y cuando el radio admite modelos y opciones diferentes.

10.38.9

Digital (sistema de troncalización ASTRO 25)

La sección **Digital** del conjunto Sistema de troncalización ASTRO 25 permite al usuario ver o definir la funcionalidad de comunicación digital.

NOTA:

Los Sistemas de troncalización individuales hacen referencia a una Personalidad de troncalización. Luego, esta configuración de los Sistemas de troncalización puede quedar operativa para todos los tipos de canales dentro de dicha Personalidad de troncalización.

10.38.9.1

Alimentación adaptativa

En este campo se activa el radio para ajustar automáticamente el nivel de potencia del transmisor en el canal de voz, no en el canal de control, según la intensidad de la señal de información del Control del vínculo de adaptación de alimentación automática (APA LC) recibida de manera inalámbrica.

Si la intensidad de la señal es mejor que el umbral aceptable, el radio transmitirá a potencia media en lugar de alta potencia. Esta selección se aplica para el Sistema de troncalización actual.

**NOTA:**

Si presiona el botón PTT una segunda vez dentro de los 30 segundos en que APA está activada para el modo seguro F2 TDMA, el radio transmite en potencia media si el nivel de potencia actual se establece en alto. Si el tiempo supera los 30 segundos, el nivel de potencia permanece alto.

Solo se accede: cuando el campo Nivel de intensidad de Tx de [Nivel de potencia de Tx en la página 528](#) está configurado en **Bajo**, y cuando el radio admite modelos/opciones diferentes.

10.38.9.2

Longitud del preámbulo

En este campo se selecciona un número que determina la cantidad de tiempo que se envían los paquetes de preámbulos de sincronización de bits al comienzo de todas las transmisiones de canales de voz de ASTRO 25 para el Sistema de troncalización actual

Estos paquetes permiten transmitir y recibir radios para sincronizarse entre sí antes de una transmisión de ASTRO 25.

**NOTA:**

La duración del preámbulo es igual a este valor de longitud del preámbulo multiplicado por 0,2083 ms.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 283: Rango

Mínimo	Máximo
0	255

10.38.9.3

Tx de alta desviación

Este campo permite al radio transmitir datos o voz de ASTRO con desviación incrementada.

Una desviación de alta transmisión es necesaria solo si el radio se utilizará en vehículos o aplicaciones sujetas a la unidad a una velocidad en aumentos de aprox. 257 km/h (160 mph). Esta función se aplica al Sistema de troncalización actual.

**ADVERTENCIA:**

No active este campo a menos que el sistema físico de radio se haya configurado de manera similar y la desviación de transmisión aumentada se haya identificado según sea necesario. La activación de este parámetro puede provocar una grave degradación del rendimiento del radio de manera indiscriminada.

Solo se accede: Cuando el campo Tipo de sistema se configura en **Tipo II** y cuando el radio admite modelos y opciones diferentes.

10.38.9.4

Tipo de modulador digital

En este campo se selecciona el ancho de banda del canal para el Sistema de troncalización actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

C4FM (predeterminado de fábrica para troncalización tipo II)

Modulación de frecuencia nivel 4 continua para operación no simultánea.

CQPSK (predeterminado de fábrica para Troncalización ASTRO 25)

Modulación por desplazamiento de fase en cuadratura compatible para operación de transmisión simultánea de la banda estrecha y operación de transmisión no simultánea.

**IMPORTANTE:**

Esta selección está disponible solo para modelos de radios con operación digital de Interfaz aéreo común (CAI).

WIDE

Operación simultánea de banda ancha.

**IMPORTANTE:**

Esta selección no puede elegirse si se selecciona un ancho de banda de canal de 12,5 kHz.

10.38.9.5

Umbral BER de sincronización de marco de TDMA

En este campo se selecciona la tasa de errores de bits (BER) de Acceso múltiple por división de tiempo (TDMA) máxima permisible de que tolera un radio que está en un canal de voz X2 o TDMA de fase 2.

**NOTA:**

La BER de TDMA se calcula durante la parte de sincronización del marco de una transmisión de voz de TDMA. Si se detecta una BER mayor a este máximo, el radio intenta cambiar a un sitio mejor cuando esté disponible. Esta selección se aplica para el Sistema de troncalización actual.

Solo se accede: cuando el campo Tipo de sistema se configura en **ASTRO 25**, y cuando el campo [Capacidad de voz de fase 2 en la página 616](#) está **Activado** y cuando el radio admite modelos/ opciones diferentes.

Mesa 284: Rango

Mínimo	Máximo	Incrementos
Desactivado	25,4 %	0,1 %

10.38.9.6

Umbral NID BER/de sincronización de marco de FDMA

En este campo se selecciona la Tasa de errores de bits (BER) del ID de red/sincronización de trama de Acceso múltiple por división de frecuencias (FDMA) máxima permitida que puede tolerar un radio en un sitio de troncalización.

Este máximo se aplica al canal de control y al canal de voz. Si se detecta una BER mayor a este máximo, el radio intenta cambiar a un sitio mejor cuando esté disponible. Esta selección se aplica para el Sistema de troncalización actual.

Solo se accede: Cuando el campo [Tipo de cobertura en la página 519](#) no está configurado como **Desactivado** y cuando el radio admite modelos y opciones diferentes.

Mesa 285: Rango

Mínimo	Máximo	Incrementos
Desactivado	25,4 %	0,1 %

10.38.10

Seguro/multiclave (sistema de troncalización ASTRO 25)

La sección **Seguro/multiclave** del conjunto Sistema de troncalización ASTRO 25 permite al usuario ver o definir la funcionalidad de seguridad y multiclave para las comunicaciones codificadas de transmisión y recepción seguras. Esta funcionalidad puede personalizarse según el sistema de troncalización.

**NOTA:**

Los Sistemas de troncalización individuales hacen referencia a una Personalidad de troncalización. Luego, esta configuración de los Sistemas de troncalización puede quedar operativa para todos los tipos de canales dentro de dicha Personalidad de troncalización.

10.38.10.1

Tx/Rx de DES-XL predeterminada

En este campo se activa solamente el Estándar de encryption de datos - Rango extendido (DES-XL) digital que se utilizará para todas las llamadas de voz con encryption seguro.

DES-XL es un estándar de encryption Tipo 3 (nivel medio). Esta selección se aplica para el Sistema de troncalización actual.

Cuando se desactiva, solo se utiliza el estándar digital de datos de encryption - Respuesta de salida (DES-OFB) en todas las llamadas de voz con encryption seguro. DES-OFB es un estándar de encryption Tipo 3 (nivel medio).

**ADVERTENCIA:**

Esta función solo se aplica cuando el radio está equipado con un módulo de encryption de algoritmo doble DES-XL/DES-OFB.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** y cuando el radio admite modelos y opciones diferentes.

10.38.10.2

ASTRO OTAR

Permite que el radio pueda recibir la funcionalidad ASTRO 25 de Regeneración de clave inalámbrica (OTAR).

**IMPORTANTE:**

Cuando el campo ASTRO OTAR está **Activado** para el Sistema de troncalización actual, los valores de la Selección de clave de hardware se eligen en la Lista de referencias de clave de encryption de hardware seguro del Perfil KMF seguro seleccionado en el campo [Índice de perfil de ASTRO OTAR en la página 621](#) para el Sistema de troncalización actual.

**ADVERTENCIA:**

Considere que RadioCentral está apuntando a las claves de la Lista de clave de encryption para esta selección; las claves individuales de la Lista de referencias de clave de encryption para hardware seguro hacen referencia a las claves de la Lista de clave de encryption en el campo Referencia de clave de encryption. Por lo tanto, cuando ASTRO OTAR está activado, cualquier clave que se seleccione primero se debe definir en la Lista de referencias de clave de encryption para hardware seguro.

Cuando el campo ASTRO OTAR está **Desactivado** para el Sistema de troncalización actual, los valores de Selección de clave de hardware se eligen directamente en la Lista de clave de encryption de la ventana Asegurar amplitud.

Solo se accede: cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software** y cuando el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) está activado; y

cuando el campo [Activación de OTAR en la página 303](#) está activado; y
cuando el campo [Activación de ASTRO OTAR en la página 304](#) está activado; y
cuando el campo ASTRO OTAR está activado y
cuando el Sistema de troncalización actual tiene un Perfil de datos al que se hace referencia y
Cuando el radio admite modelos y opciones diferentes.

10.38.10.3

OTAR Tx (Tx de OTAR)

Este campo habilita el radio para transmitir información de ASTRO y Regeneración de clave inalámbrica (OTAR) para el Sistema de troncalización actual.

Las transmisiones de OTAR incluyen: Solicitudes de regeneración de clave y confirmaciones retrasadas.

ADVERTENCIA:

Se debe programar su capacidad para iniciar solicitudes de regeneración de clave.

Solo se accede: cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software** y cuando el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) está activado; y

cuando el campo Operación de OTAR se configura en **Solo ASTRO** o **ASTRO y MDC**; y

Cuando el campo Tipo de sistema se configura en **ASTRO 25**; y

cuando el campo Índice de perfil de ASTRO OTAR está activado y

cuando el Sistema de troncalización actual tiene un Perfil de datos al que se hace referencia y

Cuando el radio admite modelos y opciones diferentes.

10.38.10.4

Índice de perfil de ASTRO OTAR

En este campo se selecciona el Perfil de instalación de administración de claves (KMF) seguras que se va a usar mientras se opera en el modo OTAR de ASTRO.

Esta selección se aplica para el Sistema de troncalización actual.

**NOTA:**

Todos los parámetros de ASTRO OTAR especificados en el perfil KMF seleccionado se aplican para el Sistema de troncalización actual.

**ADVERTENCIA:**

Este campo no es válido cuando el sistema hace referencia a un perfil de datos con el tipo de perfil de datos **Troncalización, Troncalización y banda ancha o Solo banda ancha**, y cuando el campo Dirección IP de KMF está configurado como 0.0.0.0.

**IMPORTANTE:**

Cuando el campo [ASTRO OTAR en la página 620](#) está **Desactivado** para la Sistema de troncalización actual, los valores de Selección de clave de hardware se eligen directamente en la Lista de clave de encryption de la ventana Asegurar amplitud.

Cuando el campo OTAR de ASTRO está **Activado** para el Sistema de troncalización actual, los valores de la Selección de clave de hardware se eligen en la Lista de referencias de clave de encryption de hardware seguro del Perfil de KMF seguro seleccionado en el campo [Índice de perfil de ASTRO OTAR en la página 621](#) para el Sistema de troncalización actual.

**ADVERTENCIA:**

Considere que está apuntando a las Claves de la Lista de clave de encryption para esta selección; las Claves individuales de la Lista de referencias de claves de encryption de hardware seguro hacen referencia a las Claves de la Lista de clave de encryption en el campo Referencia de claves de hardware. Por lo tanto, cuando ASTRO OTAR está activado, cualquier clave que se seleccione primero se debe definir en la Lista de referencias de clave de encryption para hardware seguro.

Solo se accede: cuando el campo [Operación segura en la página 301](#) se configura en **Hardware o Software**, y [Estándar de encryption avanzado \(AES256\) en la página 302](#) está activado; y

cuando el campo Operación de OTAR se configura en **Solo ASTRO o ASTRO y MDC**; y

cuando el Tipo de sistema es **ASTRO 25**; y

cuando el Sistema de troncalización hace referencia a un Perfil de datos, y cuando el radio admite modelos/opciones diferentes.

Se admiten las siguientes selecciones:

Desactivado**Perfiles de ASTRO OTAR****10.38.10.5****Selección de clave de vínculo**

En este campo se selecciona la clave de encryption seguro que se utilizará durante las comunicaciones del Grupo de conversación de vínculo cuando se opera en el modo de encryption seguro.

Los Grupos de conversación de vínculo permiten a un despachador unirse a varios grupos de conversación o usuarios de modo que todos puedan comunicarse como un solo grupo de conversación. Esta selección se aplica para el Sistema de troncalización actual.

IMPORTANTE:

Cuando el campo [ASTRO OTAR en la página 620](#) está **Activado** para el Sistema de troncalización actual, el valor de Seleccionar clave se elige desde la Lista de referencias de clave de encryption de hardware seguro de la función Perfil de KMF seguro seleccionada en el campo [Índice de perfil de ASTRO OTAR en la página 621](#) para el Sistema de troncalización actual.

ADVERTENCIA:

Considere que está apuntando a las Claves de la Lista de clave de encryption para esta selección; las Claves individuales de la Lista de referencias de claves de encryption de hardware seguro hacen referencia a las Claves de la Lista de clave de encryption en el campo Referencia de claves de encryption. Por lo tanto, cuando ASTRO OTAR está activado, cualquier clave que se seleccione primero se debe definir en la Lista de referencias de clave de encryption para hardware seguro.

Cuando el campo ASTRO OTAR está **Desactivado** para el Sistema de troncalización actual, los valores de Selección de clave de hardware se eligen directamente en la Lista de clave de encryption de la ventana Asegurar amplitud.

Solo se accede: cuando el campo [Operación segura en la página 301](#) se configura en **Hardware**, y cuando el radio admite modelos/opciones diferentes;

O cuando el campo [Operación segura en la página 301](#) se configura en **Software**, y cuando el campo Tipo de sistema se configura en **ASTRO 25**, y cuando el radio admite modelos/opciones diferentes.

10.38.10.6

Asegurar/borrar conexión de Degradación reducida

En este campo se selecciona el tipo de conexión que se utiliza para la Degradación reducida.

Cuando el radio admite modelos y opciones diferentes.

Seleccionar

Permite activar o desactivar las comunicaciones encriptadas seguras.

NOTA:

Ya sea con la pulsación del botón Selección de Tx segura o el switch de alternación Selección de Tx segura o la selección del menú Seguro permite al usuario alterar entre las comunicaciones seguras y sin encryption para ese canal.

Borrar

Relaciona u obliga al canal a operar comunicaciones convencionales normales (no protegidas).

Encriptación

Conecta o activa el canal en la operación encriptada segura.

Solo se accede: cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software**.

10.38.10.7

Failsoft Key Select (Selección de clave de degradación reducida)

En este campo se selecciona la clave de encryption seguro que se utilizará para el modo Degradación reducida mientras se opera en el modo de encryption seguro.

Esta selección se aplica para el Sistema de troncalización actual.

IMPORTANTE:

Cuando el campo [ASTRO OTAR en la página 620](#) está **Activado** para el Sistema de troncalización actual, el valor de Seleccionar clave se elige desde la Lista de referencias de clave de encryption de hardware seguro de la función Perfil de KMF seguro seleccionada en el campo [Índice de perfil de ASTRO OTAR en la página 621](#) para el Sistema de troncalización actual.

ADVERTENCIA:

Considere que está apuntando a las Claves de la Lista de clave de encryption para esta selección; las Claves individuales de la Lista de referencias de claves de encryption de hardware seguro hacen referencia a las Claves de la Lista de clave de encryption en el campo Referencia de claves de hardware. Por lo tanto, cuando ASTRO OTAR está activado, cualquier clave que se seleccione primero se debe definir en la Lista de referencias de clave de encryption para hardware seguro.

Cuando el campo ASTRO OTAR está **Desactivado** para el Sistema de troncalización actual, el valor de Selección de clave se elige directamente en la Lista de clave de encryption de la ventana Encryption en general.

Solo se accede: Cuando el radio admite modelos y opciones diferentes y cuando el campo [Operación segura en la página 301](#) se configure en **Hardware**.

O cuando el campo [Operación segura en la página 301](#) se configura en **Software**, y cuando el campo Tipo de sistema está configurado en **ASTRO 25**, y cuando el campo Asegurar/borrar conexión de Degradación reducida se configura en **Borrar**

10.38.10.8

Asegurar/borrar conexión de Llamada privada

En este campo se selecciona el tipo de conexión que se utiliza para una Llamada privada.

Cuando el radio admite modelos y opciones diferentes.

Seleccionar

Permite activar o desactivar las comunicaciones encriptadas seguras.

NOTA:

Ya sea con la pulsación del botón Selección de Tx segura o el switch de alternación Selección de Tx segura o la selección del menú Seguro permite al usuario alterar entre las comunicaciones seguras y sin encryption para ese canal.

Borrar

Relaciona u obliga al canal a operar comunicaciones convencionales normales (no protegidas).

Encriptación

Conecta o activa el canal en la operación encriptada segura.

Solo se accede: cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software**.

10.38.10.9

Private Call Key Select (Selección de tecla de llamada privada)

En este campo se selecciona la clave de encryption seguro que se utilizará para una Llamada privada cuando se opera en modo de encryption seguro.

Esta selección se aplica para el Sistema de troncalización actual. Cuando el campo Índice de perfil de ASTRO OTAR para el Sistema de troncalización actual se configura en **Activado**, el valor de este campo se selecciona en la Lista de referencias de clave de encryption seguro.

IMPORTANTE:

La aplicación apunta a las Claves de la Lista de clave de encryption para esta selección. Las claves individuales de la Lista de referencias de clave de encryption seguro hacen referencia a las claves de la Lista de claves de encryption del campo Referencias de clave de encryption. Por ende, las claves deben estar definidas en la Lista de referencias de clave de encryption seguro antes de que las claves estén disponibles para su selección. Están disponibles las claves del perfil de OTAR con el campo de lista de claves independientes activado. Cuando el campo Índice de perfil de ASTRO OTAR para el Sistema de troncalización actual está **Desactivado**, el valor de este campo se selecciona en la Lista de clave de encryption dentro de la ventana Encryption en general.

Solo se accede: Cuando el radio admite modelos y opciones diferentes y cuando el campo [Operación segura en la página 301](#) se configure en **Hardware**.

O cuando el campo [Operación segura en la página 301](#) está configurado en **Software**, y cuando el campo Tipo de sistema está configurado en **ASTRO 25**, y cuando el campo Asegurar/borrar conexión de Privado no está configurado en **Hardware**

10.38.10.10

Asegurar/borrar conexión de Interconexión

En este campo se selecciona el tipo de conexión que se utiliza para Interconexión.

Cuando el radio admite modelos y opciones diferentes.

Seleccionar

Permite activar o desactivar las comunicaciones encriptadas seguras.

NOTA:

Ya sea con la pulsación del botón Selección de Tx segura o el switch de alternación Selección de Tx segura o la selección del menú Seguro permite al usuario alterar entre las comunicaciones seguras y sin encryption para ese canal.

Borrar

Relaciona u obliga al canal a operar comunicaciones convencionales normales (no protegidas).

Encriptación

Conecta o activa el canal en la operación encriptada segura.

Solo se accede: cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software**.

10.38.10.11

Interconnect Key Select (Selección de la tecla de interconexión)

En este campo se selecciona la clave de encryption seguro que se utilizará para una llamada de interconexión (modo Teléfono) cuando se opera en Modo de encryption seguro.

Esta selección se aplica para el Sistema de troncalización actual.

**IMPORTANTE:**

Cuando el campo Índice de perfil de OTAR de ASTRO está **Activado** para el Sistema de troncalización actual, este valor de Selección de clave se elige en la Lista de referencias de clave de encryption seguro del Perfil de OTAR de ASTRO que se selecciona en el campo Índice de perfil de OTAR de ASTRO del Sistema de troncalización actual.

**ADVERTENCIA:**

Considere que está apuntando a las Claves de la Lista de clave de encryption para esta selección; las Claves individuales de la Lista de referencias de claves de encryption seguro hacen referencia a las Claves de la Lista de clave de encryption en el campo Referencia de claves de hardware. Por lo tanto, cuando el índice del perfil de ASTRO OTAR está activado, cualquier clave seleccionada primero se debe definir en la Lista de referencias de clave de encryption seguro. Están disponibles las claves del perfil de OTAR con el campo de lista de claves independientes activado.

La aplicación apunta a las Claves de la Lista de clave de encryption para esta selección. Las claves individuales de la Lista de referencias de clave de encryption seguro hacen referencia a las claves de la Lista de claves de encryption del campo Referencias de clave de encryption. Por ende, las claves deben estar definidas en la Lista de referencias de clave de encryption seguro antes de que las claves estén disponibles para su selección.

Cuando el campo Índice de perfil de ASTRO OTAR para el Sistema de troncalización actual está **Desactivado**, el valor de este campo se selecciona en la Lista de clave de encryption dentro de la ventana Encryption en general.

Solo se accede: Cuando el radio admite modelos y opciones diferentes y cuando el campo [Operación segura en la página 301](#) se configure en **Hardware**.

O cuando el campo [Operación segura en la página 301](#) está configurado en **Software**, y cuando el campo Tipo de sistema está configurado en **ASTRO 25**, y cuando el campo Asegurar/borrar conexión de Interconexión no está configurado en **Hardware**

10.38.10.12

Asegurar/borrar conexión de Reagrupación dinámica

Este campo selecciona el tipo de conexión que se usa para Reagrupación dinámica.

Cuando el radio admite modelos y opciones diferentes.

10.38.10.13

Selección de clave de grupo de conversación dinámica

En este campo se selecciona la clave de encryption seguro que se utilizará para una Reagrupación dinámica (Grupo de conversación dinámico) cuando se opera en modo de encryption seguro.

Esta selección se aplica para el Sistema de troncalización actual.

IMPORTANTE:

Cuando el campo [ASTRO OTAR en la página 620](#) está **Activado** para el Sistema de troncalización actual, el valor de Seleccionar clave se elige desde la Lista de referencias de clave de encryption de hardware seguro de la función Perfil de KMF seguro seleccionada en el campo [Índice de perfil de ASTRO OTAR en la página 621](#) para el Sistema de troncalización actual.

ADVERTENCIA:

Considere que está apuntando a las Claves de la Lista de clave de encryption para esta selección; las Claves individuales de la Lista de referencias de claves de encryption de hardware seguro hacen referencia a las Claves de la Lista de clave de encryption en el campo Referencia de claves de encryption. Por lo tanto, cuando ASTRO OTAR está activado, cualquier clave que se seleccione primero se debe definir en la Lista de referencias de clave de encryption para hardware seguro.

Cuando el campo ASTRO OTAR está **Desactivado** para el Sistema de troncalización actual, el valor de Selección de clave se elige directamente en la Lista de clave de encryption de la ventana Encryption en general.

Solo se accede: cuando el radio admite modelos/opciones diferentes, cuando el campo [Activación de reagrupación dinámica en la página 531](#) está **Activado**, y cuando el campo Operación segura está configurado en **Hardware**;

O cuando el campo [Operación segura en la página 301](#) se configura en **Software**, y cuando el campo Tipo de sistema está configurado en **ASTRO 25**, y cuando el campo Asegurar/borrar conexión de Reagrupación dinámica se configura en **Hardware**

10.38.10.14

ViQi: Conexión segura/sin cifrado del socio virtual

Este campo le permite seleccionar el tipo de conexión que se utiliza para ViQi: Socio virtual.

Esta selección se aplica a la operación de LMR.

Borrar

Relaciona u obliga al canal a operar comunicaciones convencionales normales (no protegidas). Esta es la configuración predeterminada.

Seleccionar

Permite al usuario activar o desactivar las comunicaciones con encryption seguro.

NOTA:

La pulsación del botón Selección de Tx segura, el switch de alternación Selección de Tx segura o la selección del menú Seguro permite al usuario del radio acceder a comunicaciones con encryption seguro.

Encriptación

Conecta o activa el canal en la operación encriptada segura.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software**, y cuando el radio admite diferentes modelos y opciones.

10.38.10.15

ViQi: Selección de clave del socio virtual

Este campo le permite seleccionar la clave de encryption segura que se utilizará para ViQi: Socio virtual mientras opera en el modo de encryption seguro.

Esta selección se aplica para el Sistema de troncalización actual.

IMPORTANTE:

Cuando el campo [ASTRO OTAR en la página 620](#) está **Activado** para el Sistema de troncalización actual, el valor de Seleccionar clave se elige desde la Lista de referencias de clave de encryption de hardware seguro de la función Perfil de KMF seguro seleccionada en el campo [Índice de perfil de ASTRO OTAR en la página 621](#) para el Sistema de troncalización actual. Esta selección se aplica a la operación de LMR.

ADVERTENCIA:

Considere que el programa está apuntando a las Claves de la Lista de Clave de encryption para esta selección; las claves individuales de la Lista de referencias de clave de encryption de hardware seguro hacen referencia a las claves de la Lista de clave de encryption desde el campo Referencia de la clave de hardware. Cuando ASTRO OTAR está activado, cualquier clave que se seleccione primero se debe definir en la Lista de referencias de clave de encryption de hardware seguro.

Cuando el campo ASTRO OTAR está **Desactivado** para el Sistema de troncalización actual, el valor de Selección de clave se elige directamente en la Lista de clave de encryption de la ventana Encryption en general.

Solo se accede: Cuando el radio admite diferentes modelos y opciones, cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o cuando el campo [Operación segura en la página 301](#) está configurado en **Software** para un [Sistema de troncalización ASTRO 25 en la página 585](#).

10.38.10.16

Rx de ID de clave automática

Este campo permite al radio activar el ID de clave (KID) y el ID de algoritmo (ALGID) que se reciben de manera inalámbrica (OTA) y responder mediante KID OTA y ALGID durante el tiempo de desconexión del ID de clave de Rx o Tx.

NOTA:

Recibir otra llamada con una Clave no coincidente diferente durante [ID de clave: Tiempo de desconexión en la página 316](#) o [ID de grupo de claves: tiempo de desconexión de Tx en la página 316](#) sobrescribe la Clave no coincidente anterior con la nueva clave.

Solo se accede: O cuando el campo [Operación segura en la página 301](#) se configura en **Desactivado**, y cuando el campo Tipo de sistema se configura en "ASTRO 25", y cuando el radio admite modelos/opciones diferentes.

10.38.11

Grupo de conversación (sistema de troncalización ASTRO 25)

La sección **Grupo de conversación** del conjunto Sistema de troncalización ASTRO permite al usuario ver o definir la funcionalidad Grupo de conversación individual para los sistemas de troncalización individuales. Un Grupo de conversación es una agrupación definida por RadioCentral de radios creada para el propósito de comunicaciones frecuentes y convenientes con otras.

NOTA:

Las frecuencias del Grupo de conversación se determinan mediante el Sistema de troncalización en terreno y no se programan en RadioCentral.

NOTA:

Las frecuencias de degradación reducida de la Personalidad de troncalización deben programarse dentro del RadioCentral.

Una vez definido, un Grupo de conversación se puede asignar a uno o más canales del Selector de canales del radio desde el campo [Asignación de canal de zonas en la página 676](#) y el campo Grupo de conversación de troncalización del conjunto de listas de canales.

10.38.11.1

Nombre del grupo de conversación

Este campo permite definir un nombre reconocible de pantalla superior para el canal actual (registro/fila).

Esta selección se aplica a la Personalidad de troncalización actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

**NOTA:**

Ejemplos: PerTG-001, #500, Electric1, # A5

Se pueden usar caracteres, números, espacios y caracteres especiales.

Los espacios en blanco iniciales se sustituyen con guiones bajos en la pantalla del radio.

Los puntos iniciales no aparecen en la pantalla del radio.

10.38.11.2

ID de grupo de conversación

Este campo permite ingresar (en formato decimal o hexadecimal) el número del Grupo de conversación que identifica únicamente el grupo de conversación actual (registro/fila).

Esta selección se aplica a la Personalidad de troncalización actual.

Solo se accede: Cuando el Sistema de troncalización al que se hace referencia tiene (un archivo de clave de sistema de software o una clave avanzada de sistema con acceso seleccionado en el campo ID del sistema) o (una clave avanzada de WACN con acceso seleccionado en el campo ID de WACN doméstica),

y cuando el radio admite modelos y opciones diferentes.

Mesa 286: Rango

Para el Tipo de protocolo	Desactivado	Mínimo	Máximo
ASTRO 25	Ninguno	0001 hex	FFFE hex
Tipo II	Ninguno	001 hex	FFE hex

**IMPORTANTE:**

El rango de selección se puede modificar de acuerdo con la Clave avanzada mediante el programa del administrador de claves avanzadas.

10.38.11.3

Grupo de conversación de prioridad

Este campo permite llamar al despachador cuando se presiona el botón Despacho de prioridad, seguido del botón PTT.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO 25**, y cuando el campo Perfil de DVRS está configurado en **Desactivado**.

Se admite la siguiente selección:

Ninguno

Valor predeterminado. Se aplica a todos los grupos de conversación creados a partir del conjunto Personalidad actual.

10.38.11.4

Conexión segura/sin encriptar

En este campo se selecciona el modo Transmisión y recepción de encryption seguro que se debe utilizar para el grupo de conversación actual (registro/fila).

Esta selección se aplica para la personalidad de troncalización actual.

Solo se accede: cuando un Sistema de troncalización al que se hace referencia tiene ([un Archivo de claves de software del sistema o un Clave avanzada de sistema con el acceso seleccionado en el campo [ID del sistema en la página 520](#)] o [una Clave avanzada WACN con el acceso seleccionado en el campo [ID de WACN de inicio en la página 669](#)]), y cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software**, y cuando el campo [Tipo de protocolo](#) se configura en **ASTRO 25**, y cuando el radio admite modelos/radios diferentes.

Se admiten las siguientes selecciones:

Borrar

Conecta o activa el canal para comunicaciones normales (no seguras).

Seleccionar

Permite activar o desactivar el Modo de Encryption seguro. Se debe seleccionar el botón Selección de Tx seguro, el switch de alternación [Selección de Tx segura en la página 206](#) o la selección del menú Asegurar deben para que el usuario active o desactive las comunicaciones con encryption seguro.

Encriptación

Conecta o activa el canal para comunicaciones encriptadas seguras.

10.38.11.5

Selección de clave

Este campo selecciona la clave de encryption seguro que se utilizará en el modo de encryption seguro para el grupo de conversación (registro/fila) actual.

Esta selección se aplica para el grupo de conversación actual de la personalidad de troncalización actual.

IMPORTANTE:

Cuando el campo [Índice de perfil de ASTRO OTAR en la página 412](#) no está Desactivado para la Lista de grupo de conversación de ASTRO actual, este valor de Selección de clave se elige de la [Lista de referencias de clave de encryption de hardware seguro en la página 321](#) del Perfil KMF seguro seleccionado en el campo Índice de perfil KMF.

ADVERTENCIA:

Tenga en cuenta que la RadioCentral está apuntando a las Claves de la [Lista de clave de encryption en la página 317](#) para esta selección; las Claves individuales de la Lista de referencias de clave de encryption de hardware hacen referencia a las claves de la Lista de claves de encryption desde la [Referencia de clave de encryption en la página 322](#). Por lo tanto, cualquier clave seleccionada cuando OTAR de ASTRO está activado, debe definirse primero en la Lista de referencias de clave de encryption para hardware seguro.

Cuando el campo Índice de Perfil KMF está Desactivado o no se aplica (aparece en color gris) a la Lista de grupo de conversación de ASTRO actual, este valor de Selección de clave es tomado directamente de la Lista de claves de encryption seguro.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software**, y cuando el campo [Voz Protegida/Enlace Abierto en la página 414](#) está configurado en **Seguro** o **Seleccionar**, y cuando el radio admite el modelo/opción.

10.38.11.6

Degradación reducida del grupo de conversación

Este campo permite la operación de degradación reducida para el grupo de conversación actual (registro/fila).

Esta selección se aplica para la [Personalidad de troncalización](#) actual.

Solo se accede: cuando el Sistema de troncalización al que se hace referencia tenga un Archivo de clave del sistema de software o una Clave avanzada de sistema con acceso seleccionado en el campo [ID del sistema en la página 520](#) o una Clave avanzada WACN de sistema con acceso seleccionado en el campo [ID de WACN de inicio en la página 669](#), y cuando el campo [Tipo de degradación reducida en la página 560](#) está configurado en **Grupo de conversación**, y cuando el radio admite diferentes modelos/opciones.

10.38.11.7

Frecuencia de Rx de degradación reducida

Este campo permite ingresar la frecuencia de Recepción (Rx) de degradación reducida para el grupo de conversación actual (registro/fila).

Esta selección se aplica para la personalidad de troncalización actual.

**ADVERTENCIA:**

Las Restricciones de frecuencia de troncalización que se aplican a esta selección se determinan por la configuración de esta personalidad y la banda de frecuencia del Sistema de troncalización al que se hace referencia.

Solo se accede: cuando el Sistema de troncalización al que se hace referencia tenga un Archivo de clave del sistema de software o una Clave avanzada de sistema con acceso seleccionado en el campo [ID del sistema en la página 520](#), o una Clave avanzada WACN de sistema con acceso seleccionado en el campo [ID de WACN de inicio en la página 669](#), y cuando el campo [Tipo de degradación reducida en la página 560](#) está configurado en **Grupo de conversación** y cuando el campo [Degradación reducida del grupo de conversación en la página 555](#) esté activado **Activado**, y cuando el modelo o la opción del radio lo permitan.

10.38.11.8

Frecuencia de Tx de degradación reducida

Este campo permite ingresar la frecuencia de Transmisión (Tx) de degradación reducida para el grupo de conversación actual (registro/fila).

Esta selección se aplica para la [Personalidad de troncalización](#) actual.

**ADVERTENCIA:**

Las Restricciones de frecuencia de troncalización que se aplican a esta selección se determinan por la configuración de esta personalidad y la banda de frecuencia del Sistema de troncalización al que se hace referencia.

Solo se accede: cuando el Sistema de troncalización al que se hace referencia tenga un Archivo de clave del sistema de software o una Clave avanzada de sistema con acceso seleccionado en el campo [ID del sistema en la página 520](#), o una Clave avanzada WACN de sistema con acceso seleccionado en el campo de ID de WACN doméstica, y cuando el campo [Tipo de degradación reducida en la página 560](#) está configurado en **Grupo de conversación** y cuando el campo [Degradación reducida del grupo de conversación en la página 555](#) esté activado **Activado**, y cuando el modelo o la opción del radio lo permitan.

10.38.11.9

Degradación reducida secundaria de TG

Este campo permite la operación de degradación reducida secundaria para el grupo de conversación actual (registro/fila).

Esta selección se aplica para la personalidad de troncalización actual.

Solo se accede: Cuando el campo [Tipo de degradación reducida en la página 560](#) está establecido en **Grupo de conversación**, cuando el campo [Degradación reducida del grupo de conversación en la página 555](#) está activado y cuando el radio admite diferentes modelos y opciones.

10.38.11.10

Frecuencia de Rx de Failsoft secundario

Este campo permite ingresar la frecuencia de Recepción (Rx) secundaria de degradación reducida para el grupo de conversación actual (registro/fila).

Esta selección se aplica para la personalidad de troncalización actual.

**ADVERTENCIA:**

Las Restricciones de frecuencia de troncalización que se aplican a esta selección se determinan por la configuración y la banda de frecuencia de [Tipo de protocolo](#) de esta personalidad del [Sistema de troncalización](#) al que se hace referencia.

Solo se accede: Cuando el campo [Tipo de degradación reducida en la página 560](#) está configurado en **Grupo de conversación** y cuando el campo [Degradación reducida del grupo de conversación en la página 555](#) está **Activado**, y cuando el campo [Degradación reducida secundaria de TG en la página 556](#) está **Activado** y cuando el radio admite modelos y opciones diferentes.

10.38.11.11

Frecuencia de Tx de Failsoft secundario

Este campo permite ingresar la frecuencia de Transmisión (Tx) secundaria de degradación reducida para el grupo de conversación actual (registro/fila).

Esta selección se aplica para la personalidad de troncalización actual.

**IMPORTANTE:**

Las Restricciones de frecuencia de troncalización que se aplican a este selección se determinan por la configuración y la banda de frecuencia del [Tipo de protocolo](#) de esta personalidad del [Sistema de troncalización](#) al que se hace referencia.

Solo se accede: Cuando el campo [Tipo de degradación reducida en la página 560](#) está configurado en **Grupo de conversación** y cuando el campo [Degradación reducida del grupo de conversación en la página 555](#) está **Activado**, y cuando el campo [Degradación reducida secundaria de TG en la página 556](#) está **Activado** y cuando el radio admite modelos y opciones diferentes.

10.38.11.12

ID de sistema TG

Este campo permite ingresar (en formato decimal o hexadecimal) el ID del sistema (de troncalización) de tres dígitos del Grupo de conversación que se necesita cuando Roaming Intra-WACN o Roaming Inter-WACN es [Tipo de cobertura en la página 519](#) seleccionado por el Sistema de troncalización al que se hace referencia.

Esta selección se aplica al grupo de conversación actual (registro/fila) que se emplea para la [Personalidad de troncalización](#) actual.

Solo se accede: Cuando el campo [Tipo de protocolo](#) está establecido en **ASTRO 25**, y cuando el Sistema de troncalización al que se hace referencia tiene el campo [Tipo de cobertura en la página 519](#)

establecido en **Roaming Intra-WACN** o **Roaming Inter-WACN**, y cuando el radio admite modelos/ opciones diferentes.

Mesa 287: Rango

Mínimo	Máximo
000 (Hex)	FFE (Hex)

IMPORTANTE:

Predeterminado de fábrica = 1. Un valor de "0" provoca que el radio copie el valor del campo **ID del sistema en la página 520** para el **Sistema de troncalización** consultado actual para este campo.

10.38.11.13

ID de WACN TG

Este campo permite ingresar (en formato decimal o hexadecimal) el ID de WACN (Red de comunicaciones de área extendida) de **Grupo de conversación** de cinco dígitos que se necesita cuando Roaming Inter-WACN es el **Tipo de cobertura en la página 519** seleccionado del Sistemas de troncalización al que se hace referencia.

Esta selección se aplica al **Grupo de conversación** actual (registro/fila) que se emplea para la **Personalidad de troncalización** actual.

Solo se accede: Cuando el **Tipo de protocolo** está configurado en **ASTRO 25**, cuando el sistema de troncalización al que se hace referencia tiene el campo **Tipo de cobertura en la página 519** configurado en **Roaming Inter-WACN** y cuando el radio admite diferentes modelos y opciones.

Mesa 288: Rango

Mínimo	Máximo
00000 (Hex)	FFFFE (Hex)

IMPORTANTE:

Predeterminado de fábrica = 1. Un valor de "0" provoca que el radio copie el valor del campo **ID de WACN de inicio en la página 669** para el **Sistema de troncalización** consultado actual para este campo.

10.39

Personalidad de troncalización ASTRO 25

La **Personalidad de troncalización ASTRO 25** permite crear y eliminar Personalidades de troncalización, así como definir Personalidades de troncalización individuales. Los dos modos de comunicación del radio son troncalización y convencional.

NOTA:

Los Sistemas de troncalización hacen referencia a Personalidades de troncalización. Luego, la configuración de los sistemas de troncalización puede volverse funcional para todos los tipos de canales de troncalización.

Cuando las funciones de las personalidades de troncalización se definieron en forma exclusiva, cada personalidad se puede asignar a la posición deseada del selector de canal del radio con la función Asignación de canal de zona.

10.39.1

General (Personalidad de troncalización ASTRO 25)

La sección **General** del conjunto Personalidad de troncalización ASTRO 25 permite al usuario ver o definir las funciones básicas de las personalidades de troncalización individuales.

**NOTA:**

Una vez que se han definido las funciones de las Personalidades de troncalización en forma exclusiva, cada personalidad puede asignarse a la posición deseada del selector de canal del radio con la función Asignación de canal de zona.

10.39.1.1

Nombre de la Personalidad de troncalización

Este campo permite definir un nombre reconocible para la Personalidad de troncalización actual.

**NOTA:**

Cuando las funciones de las personalidades de troncalización se definieron en forma exclusiva, cada personalidad se puede asignar a la posición deseada del selector de canal del radio con la función Asignación de canal de zona. Este nombre se usa para seleccionar la personalidad actual en la Página de canales de dicha función.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

**NOTA:**

Ejemplos: Personality-01, #500, Electric1, # A5

Se pueden usar caracteres, números, espacios y caracteres especiales.

Los espacios en blanco iniciales se sustituyen con guiones bajos en la pantalla del radio.

Los puntos iniciales no aparecen en la pantalla del radio.

10.39.1.2

Sistema

En este campo se selecciona el Sistema de troncalización programado para la Personalidad de troncalización actual.

**IMPORTANTE:**

Solo se deben seleccionar los Sistemas de troncalización que tienen un Tipo de sistema que coincida con el Tipo de protocolo de la personalidad actual.

Solo se pueden seleccionar los Sistemas de troncalización con Archivo de claves de software del sistema o Claves avanzadas (Hardware) que no tengan protección de campo o función (acceso ilimitado); en caso contrario, el campo se marca como inválido.

Cuando el valor de este campo se marca como no válido, todos los campos protegidos de Clave de sistema en la Personalidad de troncalización actual se muestran como de solo lectura.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.39.1.3

Temporizador de tiempo de espera

En este campo se selecciona la cantidad de tiempo que el radio puede transmitir de manera continua para la Personalidad de troncalización actual.

Cuando este tiempo está por acabarse, el radio emite un tono de alerta y deja de transmitir en forma automática. El tiempo está expresado en segundos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

NOTA:

Cuando se configura en **Infinito**:

No se utiliza temporizador para los radios APX Next y APX N70 ; por lo tanto, se utiliza un tiempo de conversación infinito.

Mesa 289: Rango

Tipo de radio	Mínimo	Máximo	Incrementos
Radios que no son APX4000XH	15 s	465 s	15 s
Radios APX4000XH	15 s	60 s	15 s

Mesa 290: Rango

Tipo de radio	Mínimo	Máximo	Incrementos
APX NEXT	0 seg	465 s	15 s

10.39.1.4

AGC de RF avanzado

En este campo se selecciona el tipo de Control de ganancia automática (AGC) de la Frecuencia de recepción (RF) para la Personalidad de troncalización actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Desactivado

Cuando está **Desactivado**, el radio utiliza una forma básica de formación de AGC en el receptor del radio. Esta protección incorporada ayuda a evitar la saturación de la señal y del receptor que puede dañar los componentes del radio.

Estándar

Activa una forma avanzada de AGC de RF, que busca evitar la interferencia de intermodulación (IM) mediante la detección y la remoción de toda interferencia recibida causada por fuentes externas.

Mejorado

Activa el radio para usar esquemas adicionales a fin de disminuir la interferencia de IM, lo que limpia la señal.

Inteligente

Permite que el radio utilice un esquema único para mejorar la inmunidad a la interferencia cuando está cerca de estaciones base de fase 2 de transmisión Simulcast lineal y APCO. La opción inteligente es mutuamente excluyente con la casilla de verificación de protección de banda ancha.

IMPORTANTE:

El ACG de RF avanzado **Estándar** y **Mejorado** pueden degradar el rendimiento de los canales que no experimentan una interferencia de IM. Por lo tanto, solo se deben activar estas selecciones en canales con problemas de interferencia de IM.

10.39.1.5

Protección de banda ancha

Este campo permite activar la protección de banda ancha de la personalidad de troncalización actual.

La protección de banda ancha mejora el AGC de RF avanzado agregando un filtro de banda ancha de alta selectividad cuando se recibe en frecuencias seleccionadas dentro de las bandas de 700 MHz y 800 MHz.

10.39.1.6

Tipo de conversación

En este campo se selecciona el modo de comunicación para la Personalidad de troncalización actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Mensaje

El sistema asigna un canal de tráfico durante el tiempo de una sola transmisión realizada por un único radio suscriptor. Cuando el radio deja de transmitir, todos los radios permanecen en el canal de tráfico hasta que el tiempo de desconexión finalice. Cuando termina el tiempo de desconexión, los radios regresan al canal de control. Cualquier radio involucrado en la llamada puede subir mientras está en el canal de tráfico sin volver al canal de control. La troncalización de mensaje está disponible en sistemas de canales de control de 3600 baudios.

ADVERTENCIA:

La troncalización de mensaje no es compatible con sistemas ASTRO 25.

Transmisión

El sistema asigna un canal de tráfico durante el tiempo de una sola transmisión realizada por un único radio suscriptor. Cuando el radio deja de transmitir, el canal de tráfico se desactiva y todos los suscriptores involucrados en la llamada vuelven al canal de control. Cualquier solicitud de tráfico subsiguiente se envía al canal de control mediante el radio solicitante.

ID DE PTT

El sistema asigna un canal de tráfico para la duración de toda la conversación de la siguiente manera. Luego de que un radio deja de transmitir, el canal de voz permanece activo (tiempo de desconexión) durante el tiempo en que los radios permanecen inactivos en el canal de voz. Cualquier radio que responda durante el tiempo de desconexión activará primero el canal de control para enviar un mensaje con ID de PTT (ID de unidad) que indica que desea enviar el audio ahora para esta llamada; luego, el sistema envía un mensaje de permiso que dirige al radio de vuelta al mismo canal de voz que actúa como la nueva fuente.

10.39.1.7

Tipo de degradación reducida

En esta campo se selecciona el tipo de Degradación reducida para la Personalidad de troncalización actual.

NOTA:

La degradación reducida ofrece funcionamiento de dos vías en el Modo convencional durante las fallas del Sistema de troncalización. El radio vuelve automáticamente al modo troncalizado cuando se restaura el Sistema de troncalización.

Solo se accede: Cuando el Sistema de troncalización al que se hace referencia tiene un archivo de clave del sistema de software o una clave avanzada del sistema con acceso seleccionado en el campo ID del sistema o una clave avanzada de WACN con acceso seleccionado en el campo ID de WACN de inicio y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Selecciones	Definiciones	Disponible para el usuario cuando	
		Tipo de protocolo es igual a	Tipo de cobertura es igual a
Desactivado	No se usa la degradación reducida.	Cualquiera	Cualquiera
Personalidad	<p>Cuando el Tipo de cobertura en la página 519 está Desactivado, el cual es SmartNet, la degradación reducida utiliza las Frecuencias de degradación reducida de la personalidad para todos los grupos de conversación dentro de su personalidad de troncalización.</p> <p>Cuando el Tipo de cobertura es igual a SmartZone no se usan las Frecuencias de degradación reducida de la personalidad, en su lugar:</p> <ul style="list-style-type: none"> • Cuando el radio está bloqueado en el sitio, la degradación reducida usa el último canal de control activo. • Cuando el radio está desbloqueado en el sitio, la degradación reducida usa el último canal de control activo. Si todavía no se encuentra la Degradación reducida, el radio examina la Lista de canales de control para buscar la Degradación reducida. 	Tipo II	Cualquiera
Grupo de conversación	<p>Cuando el Tipo de cobertura está Desactivado, el cual es SmartNet:</p> <ul style="list-style-type: none"> • La degradación reducida usa las frecuencias del grupo de conversación de degradación reducida o <p> ADVERTENCIA: El campo Degradación reducida del grupo de conversación debe estar Activado.</p> <ul style="list-style-type: none"> • La degradación reducida puede usar las frecuencias de degradación reducida del grupo de anuncios cuando la degradación reducida se solicita desde un Grupo de anuncios. <p> ADVERTENCIA: El campo Degradación reducida de grupo de anuncios en la página 571 debe estar Activado.</p> <ul style="list-style-type: none"> • Si ninguno de los campos anteriores está Activado, el radio utiliza el último canal de control activo. <p>Cuando el Tipo de cobertura es igual a SmartZone:</p> <ul style="list-style-type: none"> • Cuando el radio está en Sitio bloqueado y cuando el campo Degradación reducida del grupo 	Cualquiera	Cualquiera

Selecciones	Definiciones	Disponible para el usuario cuando	
		Tipo de protocolo es igual a	Tipo de cobertura es igual a
	<p>de conversación está Activado, la Degradación reducida utiliza las Frecuencias del grupo de conversación de degradación reducida; si todavía no se encuentra la Degradación reducida, esta usa el último canal de control activo. Si el campo Degradación reducida del grupo de conversación no está Activado, la Degradación reducida usa el último canal de control activo.</p> <ul style="list-style-type: none"> • Cuando el radio está en Sitio desbloqueado y cuando el campo Degradación reducida del grupo de conversación está Activado, la Degradación reducida usa las Frecuencias del grupo de conversación de degradación reducida; si todavía no se encuentra la Degradación reducida, esta usa el último canal de control activo. Si todavía no se encuentra la Degradación reducida, el radio examina la Lista de canales de control desde el Sistema de troncalización al que se hace referencia para la Degradación reducida. Si el campo Degradación reducida del grupo de conversación no está Activado, la Degradación reducida usa el último canal de control activo y puede que luego deba examinar la lista de canales de control. 		

10.39.1.8

Modo de transmisión

En este campo se selecciona si la personalidad o el canal tendrá funcionalidad completa de transmisión, o se restringirá desde la transmisión del Grupo de conversación (TG) y las comunicaciones de voz del Grupo de anuncios (AG).

Esta selección se aplica para la personalidad de troncalización actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Sin restricciones

Sin límites en la funcionalidad de transmisión.

TG/AG desactivado (modo para escuchar solamente)

El radio no puede transmitir en el TG o AG seleccionado. Consulte el campo Grupo de conversación de troncalización. El radio puede recibir transmisiones de voz en el modo de canal seleccionado.

**ADVERTENCIA:**

La reagrupación dinámica no es compatible con esta selección.

El campo [Selección de perfil de emergencia en la página 564](#) de esta personalidad debe configurarse en **Tx de emergencia desactivada** o el perfil seleccionado debe tener el campo [Respuesta de emergencia en la página 353](#) configurado en **Revertir**; de lo contrario, la selección del campo Perfil de emergencia no se considerará válida.

La Lista de rastreo de esta personalidad a la que se hace referencia no debe tener el campo [Tipo de miembro de Tx de voz designada en la página 696](#) configurado en **Canal seleccionado**, es decir, este canal; de lo contrario, la [Selección de lista de rastreo en la página 578](#) no será válida.

El [Teclado de uso frecuente \(DTMF\) en la página 580](#) no es posible con esta selección.

10.39.1.9

Selección de perfil de emergencia

En este campo se selecciona el Perfil de troncalización de emergencia para utilizarlo con la personalidad de troncalización actual.

Puede iniciar la funcionalidad del modo Emergencia o iniciarla con un radio programado

**ADVERTENCIA:**

Cuando el campo [Modo de transmisión en la página 564](#) se configura en **TG/AG Desactivado** (Solo escuchar) para la Personalidad de troncalización actual, esta selección de Perfil debe estar en **Tx de emergencia desactivado**, o el Perfil seleccionado debe tener el campo [Respuesta de emergencia en la página 353](#) configurado en **Revertir**; de lo contrario, considera que esta selección no es válida.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

- Tx de emergencia desactivada
- Perfiles de emergencia de troncalización disponibles

10.39.1.10

Tipo de inversión de emergencia

En este campo se selecciona el tipo de reversión de emergencia **No táctico** que se va a usar mientras se opera en modo Emergencia en la Personalidad de troncalización actual.

Consulte también [Respuesta de emergencia en la página 353](#).

**ADVERTENCIA:**

Puede iniciar la funcionalidad del modo Emergencia o iniciarla con un radio programado.

Solo se accede: Cuando la función ampliada **Reversión de emergencia múltiple** aparezca en el campo Nombre de la función ampliada, cuando un Perfil de emergencia de troncalización de referencia se seleccione para la Personalidad de troncalización actual y cuando dicho Perfil de emergencia de troncalización tenga su campo Respuesta de emergencia configurado en **Revertir** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Reversión del grupo de conversación

El radio utiliza el ID de grupo de conversación de reversión de respuesta de emergencia definido para la Personalidad de troncalización actual para transmitir alarmas o llamadas de emergencia.

Reversión del sistema

El radio utiliza [Zona de inversión del sistema de emergencia en la página 567](#) y [Canal de inversión del sistema de emergencia en la página 568](#) para transmitir alarmas de emergencia o realizar llamadas de emergencia. Las transmisiones de emergencia también se envían a la consola del despachador.

ADVERTENCIA:

La reagrupación dinámica no es compatible con esta selección.

10.39.1.11

ID de grupo de conversación de inversión de respuesta de emergencia

Este campo permite ingresar, en formato decimal o hexadecimal, el número del Grupo de conversación que identifica de forma exclusiva el Grupo de conversación actual (registro/fila).

Esta selección se aplica a los [Personalidad de troncalización](#) actuales.

Solo se accede: cuando el Sistema de troncalización al que se hace referencia tenga un archivo de clave del sistema de software o una clave avanzada de sistema con acceso seleccionado en el campo [ID del sistema en la página 520](#), o una clave avanzada WACN de sistema con acceso seleccionado en el campo [ID de WACN de inicio en la página 669](#), y cuando el modelo o la opción del radio lo permitan.

Mesa 291: Rango

Para el Tipo de protocolo:	Desactivado	Mínimo	Máximo
ASTRO 25	Ninguna	0001 (Hex)	FFFE (Hex)
Tipo II	Ninguna	001 (Hex)	FFE (Hex)

IMPORTANTE:

El rango de selección se puede modificar de acuerdo con la Clave avanzada mediante el programa del administrador de claves avanzadas.

10.39.1.12

Conexión segura/sin encryption para inversión de respuesta de emergencia

En este campo se selecciona el modo Transmisión mientras funciona en el modo Emergencia para el Grupo de conversación de inversión de respuesta de emergencia.

Esta selección se aplica para la personalidad de troncalización actual.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software**, y cuando el campo Tipo de protocolo está configurado en **ASTRO 25**.

Se admiten las siguientes selecciones:

Borrar

Conecta o realiza la operación de troncalización del grupo de conversación/canal como normal (no seguro).

Seleccionar

Permite activar o desactivar la operación encriptada de seguridad para el grupo de conversación actual. La pulsación del botón Selección de Tx seguro o el switch de alternación [Selección](#)

de Tx segura en la página 206 o la selección del menú Asegurar permite activar o desactivar comunicaciones con encryption seguro.

Encriptación

Conecta o realiza la operación del grupo de conversación de encriptación de seguridad.

10.39.1.13

Selección de clave de inversión de respuesta de emergencia

En este campo se selecciona la clave de encryption seguro que se utiliza cuando se opera en modo Emergencia para el Grupo de conversación de inversión de respuesta de emergencia.

Esta selección se aplica para la personalidad de troncalización actual.

IMPORTANTE:

Cuando el campo [Índice de perfil de ASTRO OTAR en la página 621](#) está **Activado** para el Sistema de troncalización al que se hace referencia, el valor de Selección de clave se elige en la Lista de referencias de clave de encryption seguro del Perfil de OTAR de ASTRO seleccionado en el campo Índice de perfil de OTAR de ASTRO del Sistema de troncalización al que se hace referencia.

ADVERTENCIA:

Considere que está apuntando a las claves de la Lista de clave de encryption para esta selección; las claves individuales de la Lista de referencias de clave de encryption seguro hacen referencia a las claves de la Lista de clave de encryption en el campo Referencia clave de encryption. Por lo tanto, cuando el campo Índice de perfil de ASTRO OTAR está activado, cualquier clave seleccionada primero se debe definir en la Lista de referencias de clave de encryption seguro. Están disponibles las claves del perfil de OTAR con el campo de lista de claves independientes activado.

Cuando el campo Índice de perfil de ASTRO OTAR está **Desactivado** para el Sistema de troncalización al que se hace referencia, el valor de Selección de clave se elige directamente en la Lista de clave de encryption de la ventana Asegurar amplitud.

ADVERTENCIA:

Cuando hay una coincidencia entre el ID de grupo de conversación que utilizan otros radios y el ID del grupo de conversación de inversión de respuesta de emergencia de este radio y... cuando no hay una coincidencia entre la Clave de grupo de conversación normal que utilizan otros radios y esta clave del grupo de conversación Inversión de emergencia...

Lo siguiente es verdadero:

- Cuando este radio cambia a su ID del grupo de conversación de inversión de respuesta de emergencia utilizando esta clave, la transmisión de emergencia de este radio no la escuchan estos otros radios.
- Sin embargo, las transmisiones de emergencia pueden recogerse mediante una exploración, incluso si no hay una coincidencia de claves.

Solo se accede: cuando el campo [Conexión segura/sin encryption para inversión de respuesta de emergencia en la página 566](#) de Respuesta de emergencia está configurado en **Seguro** o **Seleccionar**; y

Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software**, y cuando el campo Tipo de protocolo se configura en **ASTRO 25**, y cuando el radio admite modelos/ opciones diferentes.

10.39.1.14

Zona de inversión del sistema de emergencia

En este campo se selecciona una zona que se utilizará mientras dure una transmisión en modo Emergencia.

Esta selección se aplica para la personalidad de troncalización actual.

**NOTA:**

Una vez que se seleccione esta zona, es posible seleccionar el [Canal de inversión del sistema de emergencia en la página 568](#).

Las zonas y sus canales deben definirse previamente en la ventana Asignación de canal de zona.

**ADVERTENCIA:**

Solo se pueden seleccionar Zonas no dinámicas, zonas que tienen la Zona dinámica activada en **Desactivado**; de lo contrario, este campo no será válido.

Solo se accede: Cuando la función ampliada **Reversión de múltiples emergencias** aparezca en el campo Nombre de función ampliada, cuando un Perfil de emergencia de troncalización válido al que se hace referencia se seleccione para la Personalidad de troncalización actual, y cuando ese perfil de emergencia de troncalización tenga su campo [Respuesta de emergencia en la página 353](#) configurado en **Revertir**, cuando el campo [Tipo de inversión de emergencia en la página 565](#) esté configurado en **Reversión del sistema**, y cuando el radio admite modelos y opciones diferentes.

10.39.1.15

Canal de inversión del sistema de emergencia

En este campo se selecciona un canal de troncalización o convencional que se usa para la duración de una transmisión en modo Emergencia.

Esta selección se aplica para la personalidad de troncalización actual.

**NOTA:**

La [Zona de inversión del sistema de emergencia en la página 567](#) se debe seleccionar antes de seleccionar este canal.

Las zonas y sus canales deben definirse previamente en la ventana Asignación de canal de zona.

**ADVERTENCIA:**

En los codeplugs portátiles APX™ 3000, solo los primeros 48 canales de la [Zona de inversión del sistema de emergencia en la página 567](#) seleccionados se consideran selecciones válidas.

Esta selección del Canal de reversión del sistema de emergencia solo se considera válida: cuando el campo [Grupo de conversación de troncalización en la página 680](#) para la Personalidad de troncalización o el canal seleccionados no está configurado en **DYN** o **ATG**, cuando el campo [Personalidad de solo recepción en la página 430](#) para la Personalidad convencional o el canal seleccionados está **Desactivado**, y cuando el campo ID del grupo de conversación ASTRO para la Personalidad convencional o el canal seleccionados no está configurado en **DYN** o **ATG**, y cuando el campo [Modo de transmisión en la página 564](#) para la Personalidad de troncalización o el canal seleccionados no está configurado en **TG/AG desactivado (Solo escuchar)**, y cuando [Selección de perfil de emergencia en la página 564](#) para el canal seleccionado no está en **Tx de emergencia desactivado**.

Solo se accede: Cuando la función ampliada **Reversión de múltiples emergencias** aparezca en el campo Nombre de función ampliada, cuando un Perfil de emergencia de troncalización al que se hace referencia se seleccione para la Personalidad de troncalización actual, y cuando ese perfil de emergencia de troncalización tenga su campo [Respuesta de emergencia en la página 353](#) configurado en **Revertir**, cuando el campo [Tipo de inversión de emergencia en la página 565](#) esté configurado en **Reversión del sistema**, cuando el campo [Zona de inversión del sistema de emergencia en la](#)

[página 567](#) no esté configurado en una zona dinámica, y cuando el radio admite modelos y opciones diferentes.

10.39.2

Grupo de anuncios (personalidad de troncalización de ASTRO 25)

La sección **Grupo de anuncios** del conjunto Personalidad de troncalización de ASTRO 25 permite al usuario ver y definir parámetros del grupo de anuncios de las personalidades de troncalización individuales. Los grupos de anuncios permiten al usuario del radio iniciar y comunicar en un gran canal de comunicación compuesto por todos los grupos de conversación definidos para la personalidad de troncalización actual.

NOTA:

Se debe seleccionar un Grupo de anuncios (ATG) para esta Personalidad de troncalización desde el campo [Asignación de canal de zonas en la página 676](#) y el campo Grupo de conversación de troncalización del conjunto de listas de canales. La selección de ATG permite designar específicamente un canal a los fines del Grupo de anuncios.

Una vez que se han definido las funciones de las Personalidades de troncalización en forma exclusiva, cada personalidad puede asignarse a la posición deseada del selector de canal del radio con la función Asignación de canal de zona.

10.39.2.1

Grupo de anuncios

Este campo permite ingresar, en formato decimal o hexadecimal, un ID que solo defina el Grupo de anuncios para la Personalidad de troncalización actual.

NOTA:

Los Grupos de anuncios permiten que el radio se inicie y comunique en un canal de gran comunicación compuesto por todos los Grupos de conversación definidos para la Personalidad de troncalización actual.

ADVERTENCIA:

Se debe seleccionar el Grupo de anuncios (ATG) para esta Personalidad de troncalización desde el campo [Grupo de conversación de troncalización en la página 680](#), en la página canales de Asignación de canales de zona. La selección de ATG permite designar específicamente un canal a los fines del Grupo de anuncios.

La personalidad se selecciona desde el campo [Personalidad en la página 679](#), en la página de canales de Asignación de canales de zona.

Solo se accede: cuando el Sistema de troncalización al que se hace referencia tenga un archivo de clave del sistema de software o una clave avanzada de sistema con acceso seleccionado en el campo [ID del sistema en la página 520](#), o una clave avanzada WACN de sistema con acceso seleccionado en el campo [ID de WACN de inicio en la página 669](#), y cuando el modelo o la opción del radio lo permitan.

Mesa 292: Rango

Para Tipo de protocolo	Desactivado	Mínimo	Máximo
ASTRO 25	Ninguna	0001 (Hex)	FFFE (Hex)
Tipo II	Ninguna	001 (Hex)	FFE (Hex)

IMPORTANTE:

El rango de selección se puede modificar de acuerdo con la Clave avanzada mediante el programa del administrador de claves avanzadas.

10.39.2.2

Asegurar/borrar conexión de AG

En este campo se selecciona el modo Transmisión y recepción para el Grupo de anuncios de la Personalidad de troncalización actual.

Solo se accede: cuando el campo [Grupo de anuncios en la página 569](#) no está configurado en **Ninguno**, y cuando el radio admite modelos/opciones diferentes;

y

Cuando el campo [Operación segura en la página 301](#) se debe configurar en **Hardware**, y cuando el campo [Tipo de voz/señal de AG en la página 569](#) está configurado en **Digital**, y cuando el Ancho de banda de canales del Sistema de troncalización al que se hace referencia no está configurado en **12,5 kHz**;

O

Cuando el campo Tipo de protocolo se configura en **ASTRO 25**, y cuando el campo [Operación segura en la página 301](#) debe configurarse en **Hardware** o **Software**.

Se admiten las siguientes selecciones:

Borrar

Conecta o asigna el canal a Comunicaciones de troncalización normales (no seguras).

Seleccionar

Permite activar o desactivar el Modo de Encryption seguro.

El botón Selección de Tx seguro o el switch de alternación [Selección de Tx segura en la página 206](#) o la selección del menú Asegurar deben seleccionarse para que el usuario active o desactive las comunicaciones con encryption seguro.

Encriptación

Conecta o asigna el canal al modo de encryption seguro.

10.39.2.3

Selección de clave AG

En este campo se selecciona la clave de encryption segura que se utilizará para el Grupo de anuncios de la Personalidad de troncalización actual.

Esta selección se aplica cuando se opera en el modo encriptado de seguridad.

**IMPORTANTE:**

Cuando el campo [ASTRO OTAR en la página 620](#) está **Activado** para el Sistema de troncalización al que se hace referencia, el valor de Selección de clave se elige en la Lista de referencias de clave de encryption segura del Perfil de ASTRO OTAR seleccionado en el campo [Índice de perfil de ASTRO OTAR en la página 621](#) del Sistema de troncalización al que se hace referencia.

**ADVERTENCIA:**

Considere que está apuntando a las claves de la Lista de clave de encryption para esta selección; las claves individuales de la Lista de referencias de claves de encryption seguras hacen referencia a las claves de la Lista de clave de encryption en el campo [Referencia de clave de encryption en la página 322](#). Por lo tanto, cuando el perfil de ASTRO OTAR está activado, cualquier clave seleccionada primero se debe definir en la Lista de referencias de clave de encryption seguro. Están disponibles las claves del perfil de ASTRO OTAR con el campo de lista de claves independientes activado.

Cuando el campo ASTRO OTAR está **Desactivado** para el Sistema de troncalización al que se hace referencia, el valor de Selección de clave se elige directamente en la Lista de clave de encryption de la ventana Asegurar amplitud.

Solo se accede: cuando el campo [Asegurar/borrar conexión de AG en la página 570](#) no está configurado en **Borrar**, y cuando el campo [Grupo de anuncios en la página 569](#) no está configurado en **Ninguno**, y cuando el radio admite modelos/opciones diferentes;

y

Cuando el campo [Operación segura en la página 301](#) se configura en **Hardware**, y cuando el campo [Tipo de voz/señal de AG en la página 569](#) está configurado en **Digital**;

O

Cuando el campo Operación segura está configurado en **Hardware**, y cuando el campo Tipo de voz/señal de AG está configurado en **Analógico**, y cuando el Ancho de banda de canales del Sistema de troncalización al que se hace referencia no está configurado en **12,5 kHz**;

O

Cuando el campo Tipo de protocolo se configura en **ASTRO 25**, y cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software**.

10.39.2.4

Degradación reducida de grupo de anuncios

En este campo se activa la Degradación reducida para el Grupo de anuncios de la Personalidad de troncalización actual.

Solo se accede: Cuando el Sistema de troncalización al que se hace referencia tiene un archivo de clave del sistema de software, una clave avanzada del sistema con acceso seleccionado en el campo ID del sistema o una clave avanzada de WACN con acceso seleccionado en el campo ID de WACN de inicio y cuando el campo [Tipo de degradación reducida en la página 560](#) esté configurado en **Grupo de conversación**, cuando el campo [Grupo de anuncios en la página 569](#) no esté configurado en **Ninguno** y cuando el radio admite modelos y opciones diferentes.

10.39.2.5

Frecuencia de Rx de degradación reducida de AG

Este campo permite ingresar la frecuencia Recepción (Rx) para usarla durante la operación Degradación reducida para el grupo de anuncios de la personalidad de troncalización actual.

ADVERTENCIA:

Las Restricciones de frecuencia de troncalización que se aplican a esta selección se determinan por la configuración Tipo de protocolo de esta personalidad y la banda de frecuencia del Sistema de troncalización al que se hace referencia.

Solo se accede: Cuando el Sistema de troncalización al que se hace referencia tiene un archivo de clave del sistema de software, una clave avanzada del sistema con acceso seleccionado en el campo ID del sistema o una clave avanzada de WACN con acceso seleccionado en el campo ID de WACN de inicio y cuando el campo [Tipo de degradación reducida en la página 560](#) esté configurado en **Grupo de conversación**, cuando el campo [Grupo de anuncios en la página 569](#) no esté configurado en **Ninguno** y cuando el radio admite modelos y opciones diferentes.

10.39.2.6

Frecuencia de Tx de tolerancia a fallas menores de AG

Este campo permite ingresar la frecuencia Transmisión (Tx) para usarla durante la operación Degradación reducida para el Grupo de anuncios de la Personalidad de troncalización actual.

ADVERTENCIA:

Las Restricciones de frecuencia de troncalización que se aplican a esta selección se determinan por la configuración Tipo de protocolo de esta personalidad y la banda de frecuencia del Sistema de troncalización al que se hace referencia.

Solo se accede: Cuando el Sistema de troncalización al que se hace referencia tiene un archivo de clave del sistema de software, una clave avanzada del sistema con acceso seleccionado en el campo ID del sistema o una clave avanzada de WACN con acceso seleccionado en el campo ID de WACN de inicio y cuando el campo [Tipo de degradación reducida en la página 560](#) esté configurado en **Grupo de conversación**, cuando el campo [Grupo de anuncios en la página 569](#) no esté configurado en **Ninguno** y cuando el radio admite modelos y opciones diferentes.

10.39.2.7

Degradación reducida secundaria de AG

En este campo se activa la Degradación reducida secundaria para el Grupo de anuncios de la Personalidad de troncalización actual.

Solo se accede: Cuando el campo [Tipo de degradación reducida en la página 560](#) está configurado en **Grupo de conversación** y cuando el campo [Grupo de anuncios en la página 569](#) no está configurado en **Ninguno**, y cuando el campo [Degradación reducida de grupo de anuncios en la página 571](#) está en **Activado** y cuando el modelo o la opción del radio lo permitan.

10.39.2.8

Frecuencia de Rx F/S secundaria de AG

Este campo permite ingresar la frecuencia Recepción (Rx) secundaria para utilizarla durante la operación Degradación reducida para el Grupo de anuncios de la Personalidad de troncalización actual.

ADVERTENCIA:

Las Restricciones de frecuencia de troncalización que se aplican a esta selección se determinan por la configuración Tipo de protocolo de esta personalidad y la banda de frecuencia del Sistema de troncalización al que se hace referencia.

Solo se accede: Cuando el campo [Tipo de degradación reducida en la página 560](#) está configurado en **Grupo de conversación** y cuando el campo [Grupo de anuncios en la página 569](#) no está configurado en **Ninguno**, y cuando el campo [Degradación reducida de grupo de anuncios en la página 571](#) está **Activado**, y cuando el campo [Degradación reducida secundaria de AG en la página 572](#) está **Activado** y cuando el radio admite modelos y opciones diferentes.

10.39.2.9

Frecuencia de Tx F/S secundaria de AG

Este campo permite ingresar la frecuencia Transmisión (Tx) secundaria para usarla durante la operación Degradación reducida para el Grupo de anuncios de la Personalidad de troncalización actual.

ADVERTENCIA:

Las Restricciones de frecuencia de troncalización que se aplican a esta selección se determinan por la configuración Tipo de protocolo de esta personalidad y la banda de frecuencia del Sistema de troncalización al que se hace referencia.

Solo se accede: Cuando el campo [Tipo de degradación reducida en la página 560](#) está configurado en **Grupo de conversación** y cuando el campo [Grupo de anuncios en la página 569](#) no está configurado en **Ninguno**, y cuando el campo [Degradación reducida de grupo de anuncios en la página 571](#) está **Activado**, y cuando el campo [Degradación reducida secundaria de AG en la página 572](#) está **Activado** y cuando el radio admite modelos y opciones diferentes.

10.39.2.10

ID de sistema AG

Este campo permite ingresar, en formato decimal o hexadecimal, el ID del sistema (Sistema de troncalización) de tres dígitos para el Grupo de anuncios que se necesita cuando Roaming Inter-WACN es el Tipo de cobertura seleccionado del Sistema de troncalización al que se hace referencia.

Esta selección se aplica a la Personalidad de troncalización actual.

Solo se accede: Cuando el campo Tipo de sistema del Sistema de troncalización al que se hace referencia se configure en **ASTRO 25** cuando el campo [Tipo de cobertura en la página 519](#) se establezca en **Itinerancia entre WACN** y cuando el modelo/opción del radio lo permitan.

Mesa 293: Rango

Mínimo	Máximo
000 hex	FFE hex

10.39.2.11

ID WACN de AG

Este campo permite ingresar (en formato decimal o hexadecimal) el ID de Red de comunicaciones de área extendida (WACN) de cinco dígitos del Grupo de anuncios que se necesita cuando Roaming Inter-WACN es el Tipo de cobertura seleccionado del Sistema de troncalización al que se hace referencia.

El ID WACN de AG se aplica a la Personalidad de troncalización actual.

Solo se accede: Cuando el campo Tipo de sistema del Sistema de troncalización al que se hace referencia se configure en **ASTRO 25** cuando su campo [Tipo de cobertura en la página 519](#) se establezca en **Itinerancia entre WACN** y cuando el modelo o la opción del radio lo permitan.

Mesa 294: Rango

Mínimo	Máximo
00000 (Hex)	FFFFE (Hex)

10.39.3

Grupo de conversación (Personalidad de troncalización ASTRO 25)

La sección **Grupo de conversación** del conjunto Personalidad de troncalización ASTRO 25 permite al usuario ver o definir la funcionalidad Grupo de conversación individual para las Personalidades de troncalización individuales. Un Grupo de conversación es una agrupación definida por RadioCentral de radios creada para el propósito de comunicaciones frecuentes y convenientes con otras.

**NOTA:**

Las frecuencias del Grupo de conversación se determinan mediante el Sistema de troncalización en terreno y no se programan en RadioCentral.

**NOTA:**

Las frecuencias de degradación reducida de la Personalidad de troncalización deben programarse dentro del RadioCentral.

Una vez definido, un Grupo de conversación se puede asignar a uno o más canales del Selector de canales del radio desde el campo [Asignación de canal de zonas en la página 676](#) y el campo Grupo de conversación de troncalización del conjunto de listas de canales.

10.39.3.1

Grupo de conversación

Muestra el nombre reconocible de usuario RadioCentral para el Grupo de conversación actual (registro/fila).

Esta selección se aplica a la Personalidad de troncalización actual o a la Personalidad de troncalización de ASTRO 25.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.39.3.2

Selección de clave

En este campo se selecciona la clave de encryption seguro que se debe utilizar para el grupo de conversación actual (registro/fila).

Esta selección se aplica para la personalidad de troncalización actual.

**IMPORTANTE:**

Cuando el campo [ASTRO OTAR en la página 620](#) está **Activado** para el [Sistema de troncalización](#) al que se hace referencia, el valor Selección de clave se elige en la Lista de referencias de clave de encryption seguro del Perfil de ASTRO OTAR seleccionado en el campo [Índice de perfil de ASTRO OTAR en la página 621](#) del Sistema de troncalización al que se hace referencia.

**ADVERTENCIA:**

Tenga en cuenta que realmente se dirige a las claves de la [Lista de clave de encryption en la página 317](#) para esta selección; las claves individuales de la Lista de referencias de clave de encryption seguro hacen referencia a las claves de la Lista de clave de encryption del campo [Referencia de clave de encryption en la página 322](#). Por lo tanto, cuando el índice del perfil de ASTRO OTAR está activado, cualquier clave seleccionada primero se debe definir en la Lista de referencias de clave de encryption seguro. Están disponibles las claves del perfil de OTAR con el campo de lista de claves independientes activado.

Solo se accede: cuando el Sistema de troncalización al que se hace referencia tenga (un Archivo de claves de software del sistema o una Clave avanzada de sistema con acceso seleccionado en el campo ID del sistema) o (una Clave avanzada de WACN con acceso seleccionado en el campo ID de WACN doméstica); y

cuando el campo [Conexión segura/sin encriptar en la página 554](#) para la fila o el grupo de conversación actuales (de esta tabla) no se configura en **Borrar**.

y

Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software**, y cuando el campo Tipo de protocolo se configura en **ASTRO 25**, y cuando el radio admite modelos/ opciones diferentes.

10.39.3.3

Grupo de conversación de prioridad

Este campo permite llamar al despachador cuando se presiona el botón Despacho de prioridad, seguido del botón PTT.

Solo se accede: Cuando el campo Tipo de sistema está configurado en **ASTRO 25**, y cuando el campo Perfil de DVRS está configurado en **Desactivado**.

Se admite la siguiente selección:

Ninguno

Valor predeterminado. Se aplica a todos los grupos de conversación creados a partir del conjunto Personalidad actual.

10.39.4

Llamada/localización (Personalidad de troncalización ASTRO 25)

La sección **Llamada/localización** del conjunto Personalidad de troncalización ASTRO 25 permite al usuario ver o definir la funcionalidad Llamada privada y localización para las personalidades de troncalización individuales. Esta funcionalidad puede aplicarse a la funcionalidad Lista de uso frecuente de llamadas de troncalización.

**NOTA:**

Una vez que se han definido las funciones de las Personalidades de troncalización en forma exclusiva, cada personalidad puede asignarse a la posición deseada del selector de canal del radio con la función Asignación de canal de zona.

10.39.4.1

Tipo de llamada privada

En este campo se selecciona el tipo de Llamada privada para la Personalidad de troncalización actual.

Puede iniciar una llamada privada con la pulsación del botón Llamada selectiva/privada o la selección del menú [Selección/llamada privada en la página 216](#)Llamada. A su vez, el usuario responde a una llamada privada mediante la presión del botón [Respuesta de llamada en la página 184](#).

Se admiten las siguientes selecciones:

Desactivado

La función Llamada privada está desactivada.

Disponible cuando el Tipo de protocolo es Tipo II o ASTRO 25

PC II

Llamada privada II permite llamadas entre dos radios individuales, independientemente de los grupos de conversación, sin necesidad de que el radio receptor confirme la llamada entrante.

Disponible cuando el Tipo de protocolo es Tipo II o ASTRO 25

Unidad a unidad mejorada

Llamada privada mejorada o Llamada privada entre unidades permite llamadas entre dos radios individuales, independientemente del grupo de conversación. El radio receptor sonará y es necesario que confirme la llamada entrante.

Disponible cuando el Tipo de protocolo es Tipo II o ASTRO 25

PC con CA

Llamada privada mejorada o Llamada privada entre unidades seguidas por una Alerta de llamada privada opcional. Consulte [Alerta de llamada automática en la página 577](#).

Disponible cuando el Tipo de protocolo es Tipo II o ASTRO 25

**NOTA:**

PC II es compatible en la operación de troncalización “analógica”. Consulte los campos [Tipo de voz/señal de AG en la página 569](#) y [Grupo de conversación en la página 573](#) en [Personalidad de troncalización tipo II en la página 557](#).

Hay un retraso de dos minutos para una PC II y una llamada privada mejorada cuando se opera en un sistema de troncalización 3600, y un retraso de seis segundos cuando se opera en un sistema de troncalización 9600. No se muestra ninguna indicación durante el retraso.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.39.4.2

Operación de llamada privada

En este campo se selecciona el modo Operación de la función Llamada privada de la Personalidad de troncalización actual.

Puede iniciar una llamada privada con la pulsación del botón Llamada selectiva/privada o una selección del menú [Selección/llamada privada en la página 216](#). A su vez, el usuario responde a una llamada privada mediante la presión del botón [Respuesta de llamada en la página 184](#).

Solo se accede: Cuando el campo [Tipo de llamada privada en la página 574](#) no está configurado en **Desactivado** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Solo respuesta (solo resp)

Permite al radio aceptar solo Páginas.

Solo lista

Permite páginas desde la Lista de uso frecuente de llamadas. Para modelos sin teclado, esta opción se puede usar solo con la función Botón de un toque. Esta función depende del modelo/opción.

Ilimitado

Permite enviar páginas desde la Lista de uso frecuente de llamadas y desde el teclado del radio. Esta función depende del modelo/opción.

ADVERTENCIA:

Esta selección no está disponible para radios portátiles que solo tienen una pantalla superior.

10.39.4.3

Funcionamiento de alerta/localización de llamada

En este campo se selecciona la funcionalidad Alerta/localización de llamada para la Personalidad de troncalización actual.

Puede activar el Funcionamiento de alerta/localización de llamada con la pulsación del botón [Alerta de llamada en la página 184](#) o la selección del menú [Localización en la página 221](#).

Solo se accede: Cuando el modelo o la opción del radio lo permitan y cuando el campo Activar hardware de DVRS está **Desactivado**, o cuando el campo Activar hardware de DVRS está **Activado** y cuando el perfil DVRS al que se hace referencia en la Personalidad de troncalización actual tiene su campo Activación remota de DVRS configurado en **Desactivado**.

Se admiten las siguientes selecciones:

Desactivado

La funcionalidad de Alerta de llamada/página no está disponible.

Solo respuesta (solo resp)

Permite al radio aceptar solo Páginas.

Solo lista

Permite páginas desde la Lista de uso frecuente de llamadas. Para modelos sin teclado, esta opción se puede usar solo con la función Botón de un toque. Esta función depende del modelo/opción.

Ilimitado

Permite enviar páginas desde la Lista de uso frecuente de llamadas y desde el teclado del radio. Esta función depende del modelo/opción.

ADVERTENCIA:

Esta selección no está disponible para radios portátiles que solo tienen una pantalla superior.

10.39.4.4

Lista de uso frecuente de llamadas de troncalización

En este campo se selecciona la Lista de uso frecuente de llamadas que se usará en la personalidad de troncalización actual.

La Lista de uso frecuente de llamadas que se usa depende de la selección del campo Tipo de protocolo en **Tipo II** o **ASTRO 25** para la Personalidad de troncalización actual. El usuario usa la Lista de uso frecuente de llamadas para transmitir llamadas privadas y localizaciones.

Solo se accede: Cuando el campo [Operación de llamada privada en la página 574](#) está configurado en **Solo lista** o **Ilimitado**, o cuando el campo [Funcionamiento de alerta/localización de llamada en la página 575](#) está configurado en **Solo lista** o **Ilimitado** y cuando el radio admite modelos y opciones diferentes.

10.39.4.5

Alerta de llamada automática

En este campo se activa el radio para transmitir automáticamente una Alerta de llamada privada en caso de que el destinatario de una Llamada privada mejorada o entre unidades no haya respondido a esa llamada dentro de un cierto período.

Esta función se aplica a la Personalidad de troncalización actual y es aplicable para el Tipo de protocolo ASTRO 25 y Tipo II.

Solo se accede: Cuando el campo [Tipo de llamada privada en la página 574](#) está configurado en **PC con CA** y el radio admite modelos y opciones diferentes.

10.39.4.6

Lista de señalización de tono

En este campo se selecciona la Lista de señalización de tono que se usará mientras opera en modo ASTRO 25 y en la Personalidad de troncalización actual.

NOTA:

La funcionalidad de Lista de señalización de tono se define en la página Lista de señalización de tono.

Solo se accede: Cuando el campo Tipo de protocolo está configurado en **ASTRO 25** y cuando el radio admite modelos y opciones diferentes.

ADVERTENCIA:

El Tipo de lista de tonos en la Lista de señalización de tono debe ser **Quick-Call II**.

Se admiten las siguientes selecciones:

- Tono de señalización desactivado
- Lista de señalización de tono disponible

10.39.4.7

Activación de alerta de usuario de llamada entrante

Este campo permite que el radio permanezca silenciado para las llamadas afiliadas de los Grupos de conversación mientras se opera en la Personalidad de troncalización actual.

Las páginas de grupos e individuales activan el audio del radio para que suene el tono de alerta. El radio también activa el audio para llamadas individuales entre radios como llamadas privadas, llamadas de tono de señalización y llamadas de modo teléfono de interconexión. Esta función es muy útil cuando el usuario prefiere no oír el tráfico del Grupo de conversación afiliado; sin embargo, debe permanecer en contacto con el radio. La pulsación del botón [Silencio de voz en la página 196](#) o la selección del menú [Silencio de voz en la página 225](#) permite que el usuario active y desactive la funcionalidad Silencio de voz para un canal de activación de Alerta de usuario de llamada entrante.

**ADVERTENCIA:**

Cuando está desactivado, el usuario no puede activar esta función para la Personalidad de troncalización actual.

**IMPORTANTE:**

Además, cuando el Silencio de voz está activado:

Una página individual o de grupo recibida por el radio activa el audio del radio. Luego de que la página activa el audio del radio, una llamada de voz siguiente puede ser una llamada grupal que se escucha por el altavoz del radio.

Si se cambia el canal de radio y se desactiva el Silencio de voz, se debe reactivar el Silencio de voz si se desea cuando se regresa al canal.

Si el usuario oprime el botón PTT, o inicia el modo Emergencia, o apaga y prende el radio, el radio desactiva el Silencio de voz.

También se pueden recibir los siguientes tipos de llamadas:

- [Activación de reagrupación dinámica en la página 531](#)
- [Inhibición de radio en la página 527](#)
- [Indicador de fuera de alcance en la página 233](#)
- Degradación reducida
- [Indicador de troncalización de sitio en la página 235](#)
 - La función Rastreo no está disponible.
 - Otras indicaciones de pantalla de llamadas grupales como, por ejemplo, LED e ID de PTT (si está activada) funcionan con normalidad.

Solo se accede: cuando el radio admite modelos/funciones diferentes, y cuando el campo [Funcionamiento de alerta/localización de llamada en la página 575](#) está configurado en **Desactivado**;

O cuando el campo Tipo de protocolo está configurado en **ASTRO 25**, y cuando el campo [Lista de señalización de tono en la página 651](#) de Personalidad de troncalización actual está haciendo referencia a una Lista de señalización de tono que tiene al menos un registro o una fila donde Desilenciar activado está **Activado**.

10.39.5

Funciones (Personalidad de troncalización ASTRO 25)

La sección **Funciones** del conjunto Personalidad de troncalización ASTRO 25 permite al usuario ver o modificar varias funciones de las personalidades de troncalización para la Personalidad de troncalización actual.

**NOTA:**

Una vez que se han definido las funciones de las Personalidades de troncalización en forma exclusiva, cada personalidad puede asignarse a la posición deseada del selector de canal del radio con la función Asignación de canal de zona.

10.39.5.1

Selección de lista de rastreo

En este campo se selecciona qué Lista de rastreo utiliza el radio mientras opera en el modo Rastreo para la Personalidad de troncalización actual.

Esta Lista de rastreo determina qué personas rastrea el radio, busca o escucha de manera activa, y luego considera activar el sonido para el canal de troncalización actual.

**NOTA:**

Las funcionalidades Lista de rastreo y Miembro de lista de rastreo se definen en la ventana Lista de rastreo.

Solo las Listas de rastreo que tengan la selección **Monitor de prioridad** o el **Grupo de conversación de sistema múltiple** en el campo [Tipo de rastreo en la página 689](#) son selecciones de lista de rastreo válidas para la Personalidad de troncalización actual.

Solo las Listas de rastreo con la selección **Prioridad inteligente** en el campo Tipo de rastreo son selecciones de lista de rastreo válidas para la Personalidad convencional actual sin un sistema DVRS.

El usuario inicia la edición de la Lista de rastreo con el switch de alternación Programación de la lista de rastreo, la selección del menú Lista de rastreo o pulsando prolongadamente el botón Rastrear.

**ADVERTENCIA:**

Cuando el campo [Modo de transmisión en la página 564](#) se configura en el modo **TG/AG desactivado (Solo escuchar)** para la Personalidad de troncalización actual, esta Lista de rastreo a la que se hace referencia la personalidad no debe tener el campo [Tipo de miembro de Tx de voz designada en la página 696](#) configurado en **Canal seleccionado** (es decir, este canal); de lo contrario, considera que esta selección no es válida.

Cuando la [Selección de la Lista de alerta seleccionable del sitio en la página 598](#) del Sistema de troncalización al que se hace referencia no está **Desactivado**, la Lista de rastreo a la que se hace referencia en la personalidad no debe estar en el Tipo de rastreo del **Grupo de conversación de sistema múltiple**; de lo contrario, considera que esta selección no es válida.

La aplicación considera esta selección no válida cuando esta personalidad tiene Banda ancha LTE activada y esta Lista de rastreo seleccionada posee cualquier canal Miembro de lista de rastreo que tiene las siguientes dependencias:

- El campo [Frecuencia de interferencia LTE presente en la página 437](#) de su Personalidad convencional está configurado en **Activado** o
- El campo [Frecuencia de interferencia LTE presente en la página 601](#) de su Sistema de troncalización es **Verdadero** o
- El campo [Tipo de cobertura en la página 519](#) de su Sistema de troncalización está configurado en **Roaming intra-WACN**.

Un canal de troncalización tiene LTE activada cuando el Sistema de troncalización al que se hace referencia de la personalidad tiene un Perfil de datos al que se hace referencia que posee una selección de [Tipo del perfil de datos en la página 376](#) igual a **Troncalización y banda ancha** o **Solo banda ancha**, y cuando la Fuente de banda ancha del Perfil de datos es **Módem de LTE interno**.

Cuando el Sistema de troncalización al que se hace referencia en la Selección de lista de disposición del personal no está **Desactivado**, entonces la Lista de rastreo a la que se hace referencia en esta personalidad no debe estar en Tipo de rastreo del **Grupo de conversación de sistema múltiple**; de lo contrario, considera que esta selección no es válida.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.39.5.2

Rastreo automático

Este campo hace que el radio entre automáticamente al modo Rastreo, cuando el usuario selecciona (con el selector de canal) la Personalidad de troncalización actual.

El rastreo automático también se invoca cuando el radio enciende el canal actual.

Cuando se desactiva, el usuario puede invocar la operación del modo Rastreo mediante la pulsación del botón Rastrear, el switch de alternación Rastreo o la selección del menú Rastreo, mientras se opera en la Personalidad de troncalización actual.

Solo se accede: Cuando el campo [Selección de lista de rastreo en la página 578](#) no está configurado en **Ninguno** y cuando el radio admite modelos y opciones diferentes.

10.39.5.3

Activación de estado

Este campo permite seleccionar y transmitir un estado programado para la Personalidad de troncalización actual.

Los estados disponibles para el usuario dependen del Sistema de troncalización al que hace referencia la Personalidad.

Puede iniciar la función de Estado con la pulsación del botón Estado, con la pulsación del botón Estado directo o con la selección del menú Estado.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.39.5.4

Tono de permiso para hablar

En este campo se activa el radio para que emita un tono de alerta cuando se recibe un permiso de acceso de un Canal de control desde un repetidor.

La función se aplica a la Personalidad de troncalización actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.39.5.5

Ignorar voz no encriptada de Rx

Este campo permite que el radio ignore todas las comunicaciones de **Borrar** (sin encryption seguro) mientras se opera en la Personalidad de troncalización actual.

Solo se accede: cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software**.

10.39.5.6

Finalizar Tx en ausencia de voz

Esta campo permite que el radio, durante una transmisión de voz de troncalización, suelte el PTT automáticamente cuando su Procesador de señal digital (DSP) incorporado detecte una falta de voz del micrófono durante un período que supere el Temporizador de ausencia de voz.

Esta selección se aplica mientras funciona en la Personalidad de troncalización actual.

ADVERTENCIA:

La función no sirve cuando:

- Un radio en terreno está operando en Modo de emergencia y **Emergencia de mic de uso frecuente** o **Emergencia mediante silencio de audio** se encuentra actualmente activo (consulte también Modo de transmisión automático de emergencia) o
- El radio en terreno actualmente se está monitoreando de forma remota (consulte también Activación de monitor remoto/rastreo de radio).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.39.5.7

Temporizador de desconexión de despacho prioritario

En este campo se selecciona la cantidad de tiempo que se necesita para presionar el botón Despacho de prioridad hasta que Despacho de prioridad se cierre. El tiempo está expresado en segundos.

Mesa 295: Rango

Mínimo	Máximo	Incrementos
1	255	1

Solo se accede: cuando el campo Tipo de sistema está configurado en **ASTRO 25**, y cuando el campo Selección de perfil de DVRS está **Desactivado**.

10.39.5.8

Personalidad del Modo Zona de peligro

Este campo le permite activar el Modo Zona de peligro (HZM) mediante el switch concéntrico mientras funciona en la personalidad de troncalización actual.

NOTA:

Este campo solo se aplica al radio APX NEXT XN.

IMPORTANTE:

Cuando el HZM está **activado**, se deben cumplir las siguientes condiciones:
El sistema seleccionado para la personalidad de troncalización actual está configurado para un sistema ASTRO25 y el campo Indicador de Rx de alarma de emergencia está activado en el sistema seleccionado.

El campo Selección de perfil de emergencia de troncalización está conectado a un perfil de emergencia de troncalización y no está configurado como **Tx de emergencia desactivado**.

Si el campo Tipo de reversión de emergencia está configurado como **Reversión del sistema**, el Canal de reversión debe estar configurado para que coincida con la Personalidad HZM, cuando el campo Personalidad HZM está marcado.

Solo se accede: Cuando el radio es el modelo más reciente de normas de servicio contra incendios.

10.39.5.9

Operación de SmartConnect

Activa la función SmartConnect para el sistema de troncalización actual.

El tipo de protocolo de la personalidad debe configurarse como "ASTRO 25".

Se admiten las siguientes selecciones:

LMR

Los grupos de conversación contenidos en la personalidad actual funcionan como solo LMR.

LMR preferido

Los grupos de conversación en la personalidad actual cambiarán automáticamente de LMR a banda ancha según la configuración de [Umbral de salida RSSI de LMR en la página 502](#). Los grupos de conversación en la personalidad actual cambiarán automáticamente de banda ancha a LMR según la configuración de [Volver al umbral de RSSI de LMR en la página 511](#). LMR preferido y Solo banda ancha son selecciones válidas cuando la personalidad de troncalización actual hace referencia a un sistema de troncalización ASTRO 25. La selección del perfil de datos debe hacer referencia a un perfil de datos válido en el que se configuran el nombre de host de la puerta de enlace de SmartConnect y el número de puerto de TLS de la puerta de enlace de SmartConnect.

Solo con banda ancha

Los grupos de conversación en la personalidad actual funcionarán como solo de banda ancha.

Solo se accede: Cuando el tipo de protocolo se configura en “ASTRO 25” y cuando el radio admite diferentes modelos y opciones.

10.39.5.10

Activación UI de seguridad pública táctica

En este campo, se activan diversas funciones de Seguridad pública táctica (TPS) que están relacionadas con la operación del modo Emergencia para la Personalidad de troncalización ASTRO 25 actual.

Estas funciones incluyen Radio en general, Seguridad pública táctica: Señal periódica audible de emergencia, Enrutamiento de señales periódicas audibles de emergencia y Tono lateral de desconexión de llamada de emergencia.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.39.6

Sitios preferidos (Personalidad de troncalización ASTRO 25)

La sección **Sitios preferidos** del conjunto Personalidad de troncalización ASTRO 25 permite al usuario ver o definir las preferencias de sitio de troncalización de varios sitios para las Personalidades de troncalización individuales. Cuando un radio realice roaming en un área de cobertura superpuesta de varios sitios dentro de un Sistema de troncalización o una Red de comunicaciones de área extendida (WACN), busca un sitio que se prefiera de forma operacional mediante la evaluación de todos los demás sitios disponibles según la prioridad, conforme a la selección de Estado preferido correspondiente. Esta capacidad proporciona una administración y una conservación más inteligentes de recursos repetidores en áreas de superposición de cobertura.

**IMPORTANTE:**

El campo Tipo de cobertura del Sistema de troncalización con el que está relacionado determina la configuración de un solo sitio (SmartNet) o de varios sitios. En una configuración de varios sitios, la operación SmartZone permite que el radio determine, mediante muestras de sondeo de RSSI, el mejor sitio que se utilizará para las comunicaciones de troncalización.

Consulte también los campos avanzados de Troncalización en general y los campos de Constante de filtro del Sistema de troncalización.

Cuando las funciones de las personalidades de troncalización se definieron en forma exclusiva, cada personalidad se puede asignar a la posición deseada del selector de canal del radio con la función Asignación de canal de zona.

10.39.6.1

Ignorar preferencia de recursos del sitio

Este campo permite que el radio ignore la información de recursos del sitio recibida en las palabras de la señal de salida (OWS) del Canal de control adyacente, es decir, si el sitio tiene repetidores ASTRO, Seguridad de 12 Kbit o Analógico sin cifrado.

Esta función se aplica para la Personalidad de troncalización actual y solo durante el funcionamiento de una operación de SmartZone.

Si está **Desactivado**, el radio selecciona sitios según la información de recursos del sitio. Por ejemplo, si un radio seleccionó un grupo de conversación de ASTRO.

Solo se accede: Cuando el Sistema de troncalización al que se hace referencia no tiene el campo [Tipo de cobertura en la página 519](#) configurado en **Desactivado** y cuando el radio admite modelos y opciones diferentes.

10.39.6.2

Tipo de lista de sitios

Este campo permite seleccionar el tipo de Lista de sitios para la Personalidad de troncalización.

El tipo de lista de sitios define la forma en que el radio utilizará los sitios identificados en la siguiente Lista de sitios. El acceso a Preferencia de sitios y Movilidad (Roaming) está definido por el tipo de lista de sitios.

Solo se accede: Cuando el Sistema de troncalización al que se hace referencia no tiene el campo [Tipo de cobertura en la página 519](#) configurado en **Desactivado** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Lista de sitios preferidos

Esta es la selección heredada y predeterminada. No existen restricciones de acceso ni preferencias implícitas en el caso de los sitios que no aparezcan en la lista.

Lista de sitios permitidos

Se permite que el radio realice roaming solo a sitios que aparezcan en la lista y se aplicarán las preferencias definidas. El sistema aún puede denegar el acceso a un sitio en la lista de sitios permitidos después de que en el sitio se intente una “conexión” al sistema. Si el radio no está dentro del rango de alcance de al menos uno de los sitios que aparezcan en la lista, el radio permanecerá fuera de alcance.

Lista de sitios bloqueados

No se permite que el radio realice roaming a ninguno de los sitios que aparezcan en la lista. Todos los demás sitios reciben el trato de sitios permitidos sin preferencia definida.

10.39.6.3

ID del sitio

Este campo permite ingresar en formato decimal o hexadecimal, el número de ID que identifica al sitio de SmartZone actual (registro/fila), que se aplica a la Personalidad de troncalización actual.

ADVERTENCIA:

Para que se pueda realizar roaming entre diferentes sitios, cada ID del sitio debe ser único dentro de un Subsistema de frecuencia radial (RFSS).

Solo se accede: Cuando el Sistema de troncalización al que se hace referencia no tiene el campo [Tipo de cobertura en la página 519](#) configurado en **Desactivado** y cuando el radio admite modelos y opciones diferentes.

Mesa 296: Rango

Tipo de cobertura	Mínimo	Máximo
ASTRO 25	1	FE hex
Tipo II	1	40 hex

10.39.6.4

Estado preferido

En este campo se selecciona el estado preferido para el sitio de SmartZone cuando se determina, mediante muestras de sondeo de RSSI, el mejor sitio para usar con comunicaciones de troncalización.

Esta selección se aplica al sitio actual (registro/fila) que se aplica para la Personalidad de troncalización actual.

Solo se accede: Cuando el Sistema de troncalización al que se hace referencia no tiene el campo [Tipo de cobertura en la página 519](#) configurado en **Desactivado** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Ninguno

No se le da preferencia a este sitio.

IMPORTANTE:

Si un sitio no aparece en esta lista, el radio no le asigna ninguna preferencia en forma automática.

Menos preferidos

Se evitará el sitio a menos que sea el único sitio utilizable para el funcionamiento.

Preferido

El sitio se usará antes que todos los sitios no preferidos. El radio abandonará este sitio si ingresa en la troncalización de sitio.

Siempre; preferido

El sitio tendrá preferencia por sobre los sitios no preferidos, incluso si el sitio ingresa en la troncalización de sitio.

10.39.6.5

ID de RFSS

Este campo permite ingresar, en formato decimal o hexadecimal, el ID del subsistema de frecuencia del radio (RFSS) ASTRO 25 que corresponde al ID del sitio en el sitio actual (registro/fila), que se aplica a la Personalidad de troncalización actual.

ADVERTENCIA:

Para que se pueda realizar roaming entre diferentes RFSS en un Sistema de troncalización, cada RFSS debe tener un número único.

NOTA:

Un RFSS se compone de uno o más sitios.

Solo se accede: cuando el Sistema de troncalización al que se hace referencia tiene su campo [Tipo de cobertura en la página 519](#) configurado en **SmartZone y OmniLink**, o **Roaming Intra-WACN** o **Roaming Inter-WACN**, cuando el campo Tipo de protocolo está configurado en **Tipo II**, y cuando el radio admite modelos/opciones diferentes.

Mesa 297: Rango

Mínimo	Máximo
1	FE hex

10.39.6.6

ID del sistema

Este campo permite ingresar, en formato decimal o hexadecimal, el ID del sistema Tipo II o ASTRO 25 que corresponde al ID del sitio en el sitio actual (registro/fila), que se aplica a la Personalidad de troncalización actual.

ADVERTENCIA:

Para que se pueda realizar roaming entre diferentes Sistemas de troncalización que componen las redes de comunicación de área amplia (WACN), cada Sistema de troncalización debe tener un ID del sistema único.

NOTA:

Un Sistema de troncalización consta de uno o varios subsistemas de frecuencia radial (RFSS).

Solo se accede: cuando el Tipo de protocolo está configurado en **Tipo II**, y cuando el Sistema de troncalización al que se hace referencia tiene el campo [Tipo de cobertura en la página 519](#) configurado en **SmartZone & OmniLink**, y cuando el radio admite modelos/opciones diferentes.

O cuando el campo Tipo de protocolo está establecido en **ASTRO 25**, y cuando el Sistema de troncalización al que se hace referencia tiene el campo Tipo de cobertura establecido en **Roaming Intra-WACN** o **Roaming Inter-WACN**, y cuando el radio admite modelos/opciones diferentes.

Mesa 298: Rango

Tipo de cobertura	Mínimo	Máximo
ASTRO 25	0	0FFE hex
Tipo II	0	FFFE hex

10.39.6.7

ID de WACN RAS

Este campo permite ingresar (en formato decimal o hexadecimal) el ID de Redes de comunicaciones de área extendida (WACN) del Servidor de acceso remoto (RAS) local que corresponda al ID del sitio actual (registro/fila).

ADVERTENCIA:

Para admitir roaming entre diferentes WACN, cada WACN deben tener un número único.

NOTA:

Una WACN está compuesta de uno o más sistemas de troncalización. Esta selección se aplica para la Personalidad de troncalización actual.

Solo se accede: cuando el Tipo de protocolo está configurado en **ASTRO 25**, y cuando el Sistema de troncalización al que se hace referencia tiene el campo [Tipo de cobertura en la página 519](#) configurado en **Roaming Inter-WACN**, y cuando el radio admite modelos/opciones diferentes.

Mesa 299: Rango

Mínimo	Máximo
0	FFFFE hex

10.39.6.8

Comodín

Este campo define el tipo de entrada en la Lista de sitios. La selección es un tipo de comodín que determinará qué sitio o grupo de sitios será el **preferido**, **permitido** o **bloqueado**.

Solo se accede: Cuando el Sistema de troncalización al que se hace referencia no tiene el campo [Tipo de cobertura en la página 519](#) configurado en **Desactivado** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Sin comodín

Esta es la selección predeterminada.

Cualquier sitio

Todos los sitios del RFSS, el sistema, la WACN aplicables según la selección en el campo Tipo de cobertura.

Cualquier RFSS

Todos los sitios, los RFSS en un sistema, la WACN aplicables según la selección en el campo Tipo de cobertura.

Cualquier sistema

Todos los sitios, los RFSS, los sistemas en una WACN aplicables según la selección en el campo Tipo de cobertura.

10.39.6.9

Emergencia en un sitio bloqueado

Si este campo está activado, el radio intenta registrar el grupo de conversación seleccionado en un sitio que está configurado como bloqueado en el RadioCentral cuando el radio está en el modo de emergencia. Cuando se borra la emergencia, el radio continúa bloqueando el grupo de conversación seleccionado.

Solo se accede: Solo se puede acceder a este campo cuando se cumplen las siguientes condiciones:

- El campo **Tipo de lista de sitios** está configurado como **Bloqueado**.
- El campo **Tipo de cobertura** del sistema de troncalización al que se hace referencia **no** está configurado como **Desactivado**.

10.40

Amplitud de lista de llamadas

La sección **Amplitud de lista de llamadas** permite activar de manera selectiva cambios en terreno a la información de Contacto.

10.40.1

UCL editable

Este campo permite crear Contactos dentro de la UCL (Lista de llamadas unificada) del radio.

NOTA:

La UCL completa se guarda en el radio junto con todas las funciones programadas por el codeplug.

Puede crear Contactos con la pulsación del botón Contactos o con la selección del menú Contactos.

IMPORTANTE:

Active este campo para activar el campo [Lista de uso frecuente editable en la página 662](#); sin embargo, desactivar este campo, no desactiva el campo Lista de uso frecuente editable.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.40.2

Lista de uso frecuente editable

Este campo permite crear, borrar o modificar los miembros de la lista de las Listas de uso frecuente de llamadas individuales del radio.

**NOTA:**

Las Listas de uso frecuente individuales se programan en función del canal, salvo por la [Lista de uso frecuente de teléfonos](#) que se aplica según la amplitud del radio.

El acceso del usuario al modo de edición Lista de uso frecuente se inicia al presionar el botón Contactos o al seleccionar el menú Contactos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.40.3

Número telefónico editable

Este campo permite editar números telefónicos dentro de la UCL (Lista de llamadas unificada) del radio.

**NOTA:**

La UCL completa se guarda en el radio junto con todas las funciones programadas por el codeplug.

El acceso del usuario a los números telefónicos se inicia al presionar el botón Contactos o al seleccionar el menú Contactos.

Solo se accede: Cuando el modelo o la opción del radio lo permitan y cuando el campo [UCL editable en la página 661](#) esté **Activado**.

10.40.4

ID de radio editable

Este campo permite editar el ID de llamada dentro de las Listas de uso frecuente de llamadas que están programadas en el radio.

El acceso del usuario a la Lista de uso frecuente de llamadas se inicia al presionar el botón Contactos o al seleccionar el menú Contactos.

Solo se accede: Cuando el modelo o la opción del radio lo permitan y cuando el campo [UCL editable en la página 661](#) esté **Activado**.

10.40.5

Indicador de pedido de datos de contacto

Este campo le permite especificar el orden en el que aparecen en la pantalla del radio los ID de las llamadas de la Lista de llamadas unificada (UCL) para las entradas de contactos individuales.

Para cambiar el orden actual, seleccione un elemento con el cursor del mouse y arrástrelo a una posición de la lista.

Puede iniciar la visualización o la edición de las entradas de contactos presionando el botón Contactos o seleccionando el menú Contactos. Esta selección se aplica en base a la amplitud de radio.

**NOTA:**

La UCL completa se guarda en el radio junto con todas las funciones programadas por el codeplug.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.41

Lista de Llamadas unificada

La sección **Lista de Llamadas unificada** le permite ver o modificar los Contactos de la lista de llamadas individuales.

Cada contacto puede contener información correspondiente a los distintos tipos de señalización convencionales, tipos de cobertura de troncalización o parámetros de conectividad de teléfono.

NOTA:

Una vez definidos, los Contactos y los ID de llamada pueden seleccionarse desde las Listas de uso frecuente individuales. Estas selecciones de Contacto e ID de llamada le permiten construir las Listas de uso frecuente individuales.

Si el radio recibe ID duplicados, no podrá mostrar un alias hasta que se haya eliminado la duplicación.

La escritura del codeplug en un radio hace que la lista de llamadas regrese a su estado original y se pierdan todas las actualizaciones de alias OTA.

10.41.1

Contacto

El Contacto permite al usuario configurar los nombres e ID del sistema para ID de troncalización de ASTRO 25, ID de troncalización de tipo II, ID convencional de ASTRO, ID convencional de MDC y Número telefónico.

10.41.1.1

Nombre de contacto

Este campo permite definir nombres reconocibles para los Contactos de la lista de llamadas unificada actual.

Para este contacto, se pueden definir ID de llamadas/números de teléfonos de comunicaciones convencionales y de troncalización múltiples. Una vez definidos, los Contactos y los ID de llamada pueden seleccionarse desde las Listas de uso frecuente individuales.

NOTA:

Ejemplos: EMT 001, 500, Electric1.

Se pueden utilizar caracteres, números y espacios.

Es posible usar un total de 14 caracteres.

10.41.1.2

ID de troncalización tipo II

El ID de troncalización tipo II de la sección Contacto le permite ver o modificar los ID de las llamadas de troncalización tipo II para contactos individuales.

10.41.1.2.1

Nombre del sistema

En este campo se selecciona el Sistema de troncalización de Tipo II deseado o permite crear una configuración de ID personalizada.

Tras elegir un sistema de troncalización, se selecciona de forma automática el valor de [ID del sistema en la página 520](#). Esta selección se aplica a la configuración de ID de llamada (registro/fila) del [Contacto](#) actual en la [Lista de Llamadas unificada en la página 663](#). Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 673](#).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Sin asignar

Sin selección.

Personalizado

Permite ingresar un [ID del sistema personalizado en la página 664](#) para el registro/fila actual. Estos ID se aplican para un Sistema de troncalización de Tipo II no definido en el codeplug actual. Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 673](#).

Examinar

Seleccione un conjunto en el [Sistema de troncalización tipo II en la página 517](#) disponible.

10.41.1.2.2

ID del sistema

Este campo permite ver el ID del sistema ASTRO 25 en terreno y el ID del sistema tipo II para el Sistema de troncalización actualmente seleccionado.

En el campo Nombre de sistema se selecciona el Sistema de troncalización que desea para el registro o la fila actual. Este valor se aplica a la configuración de ID de llamada actual (registro/fila) del contacto actual en la Lista de llamadas unificada. Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 672](#) (ASTRO 25) [ID de llamada en la página 673](#) (Tipo II).

Solo se accede: Cuando el campo Nombre del sistema no está configurado como **Personalizado**, y cuando el radio admite diferentes modelos y opciones.

10.41.1.2.3

ID del sistema personalizado

Este campo permite definir un ID de sistema de Tipo II para un sistema de troncalización no definido en el codeplug actual.

Esta selección solo se aplica cuando el campo [Nombre del sistema en la página 663](#) de troncalización está establecido en **Personalizado** para el registro/fila actual. Por lo tanto, esta selección corresponde a un [Sistema de troncalización](#) en el campo. Esta selección se aplica a la configuración de ID de llamada actual (registro/fila) del [Contacto actual en la Lista de llamadas unificada en la página 663](#). Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 673](#).

Solo se accede: Cuando el campo [Nombre del sistema en la página 663](#) está establecido en **Personalizado** y cuando el radio admite modelos y opciones diferentes.

NOTA:

Las opciones se basan en los Archivos de clave del sistema de software o en las Claves avanzadas del sistema disponibles en la aplicación. El Informe de clave del sistema le permite ver las claves disponibles actualmente.

[Mesa 300: Rango](#)

Mínimo	Máximo	Incremento
1	65535	1

10.41.1.2.4

ID de unidad

En este campo se selecciona el ID de unidad de Tipo II del radio de destino que funciona en el modo de comunicaciones de troncalización de Tipo II.

Este ID es una coincidencia para el [ID de unidad](#) del mismo [Sistema de troncalización](#) que se ha definido en el radio de destino. Esta selección se aplica a la configuración de ID de llamada (registro/fila) del [Contacto](#) actual en la [Lista de llamadas unificada en la página 663](#). Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 673](#).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

**ADVERTENCIA:**

El rango de selección se puede modificar de acuerdo con la Clave (Hardware) avanzada mediante el programa Administrador de claves avanzadas.

Mesa 301: Rango

Mínimo	Máximo
000001	16777215

10.41.1.3

ID de MDC convencional

El ID de MDC convencional de la sección Contacto le permite al usuario ver o modificar conjuntos de ID de MDC convencional para contactos individuales.

10.41.1.3.1

Nombre del sistema

En este campo se selecciona el Sistema de MDC convencional o permite crear un ID configurado personalizado.

Tras seleccionar un sistema de MDC convencional, se selecciona en forma automática el valor de [Número de grupo de sistema](#). Esta selección se aplica a la configuración de ID de llamada (registro/fila) del [Contacto](#) actual en la [Lista de llamadas unificada en la página 663](#). Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 675](#).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Sin asignar

Sin selección.

Personalizado

Permite ingresar un [Número de grupo personalizado en la página 666](#) para el registro/fila actual. Estos ID se aplican para un [Sistema convencional en la página 415](#) de MDC no definido en el codeplug actual. Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 675](#).

Sistemas convencionales posibles

Selecciona un sistema convencional programado desde dentro del codeplug actual.

10.41.1.3.2

Número de grupo de sistema

Le permite ver solamente el Número de grupo de sistema para el sistema convencional de MDC actualmente seleccionado. El campo Nombre del sistema selecciona el sistema ASTRO que desea para el registro/fila actual.

Este valor se aplica a la configuración de ID de llamada actual (registro/fila) del contacto actual en la Lista de Llamadas unificada. Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 675](#).

Solo se accede: Cuando el campo Tipo de sistema está establecido en **Personalizado** y cuando el radio admite diferentes modelos y opciones.

10.41.1.3.3

Número de grupo personalizado

Este campo permite definir un Número de grupo de sistema para un sistema de MDC convencional no definido en el codeplug actual.

Esta selección solo se aplica cuando el campo [Nombre del sistema en la página 665](#) está configurado como **Personalizado** para el registro/fila actual. Por lo tanto, esta selección corresponde a un Sistema de MDC convencional en el campo. Esta selección se aplica a la configuración de ID de llamada actual del [Contacto](#) actual en la [Lista de Llamadas unificada en la página 663](#). Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 675](#).

Solo se accede: Cuando el campo [Nombre del sistema en la página 666](#) está establecido en **Personalizado** y cuando el radio admite modelos y opciones diferentes.

10.41.1.3.4

ID principal

En este campo se selecciona el ID principal del radio de destino que funciona en el modo MDC convencional.

Este ID es una coincidencia para el [ID principales de MDC](#) del mismo Sistema convencional que se ha definido en el radio de destino. Esta selección se aplica a la configuración de ID de llamada (registro/fila) del [Contacto](#) actual en la [Lista de Llamadas unificada en la página 663](#). Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 675](#).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Mesa 302: Rango

Mínimo	Máximo	Incremento
0 (Hex)	FFFFFFFF (Hex)	1

10.41.1.4

ID de ASTRO convencional

El ID de ASTRO Convencional de la sección Contacto le permite ver o modificar los ID de llamadas de troncalización de ASTRO 25 para contactos individuales.

10.41.1.4.1

Nombre del sistema

En este campo se selecciona el Sistema de ASTRO convencional o permite crear un ID configurado personalizado.

Tras seleccionar un Sistema convencional, se selecciona en forma automática el valor [Número de grupo de sistema](#). Esta selección se aplica a la configuración de ID de llamada (registro/fila) del [Contacto](#) actual en la [Lista de Llamadas unificada en la página 663](#). Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 674](#).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Sin asignar

Sin selección.

Personalizado

Permite ingresar un [Número de grupo personalizado](#) para el registro/fila actual. Estos ID se aplican para un [Sistema convencional en la página 415](#) de ASTRO no definido en el codeplug actual. Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 674](#).

Sistemas convencionales posibles

Selecciona un sistema convencional programado desde dentro del codeplug actual.

10.41.1.4.2

Número de grupo de sistema

Le permite ver solamente el Número de grupo de sistema - ASTRO para el sistema convencional actualmente seleccionado. El campo Nombre del sistema selecciona el sistema ASTRO que desea para el registro/fila actual.

Este valor se aplica a la configuración de ID de llamada actual (registro/fila) del contacto actual en la Lista de llamadas unificada. Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 674](#).

Solo se accede: Cuando el campo Tipo de sistema está establecido en **Personalizado** y cuando el radio admite diferentes modelos y opciones.

10.41.1.4.3

Número de grupo de sistema

Este campo le permite definir un número de Grupo de sistema para un Sistema de ASTRO convencional no definido en el codeplug actual.

El número de grupo del sistema proporciona una forma de agrupar de manera lógica varios sistemas convencionales en el codeplug que realmente son el mismo sistema por el aire.

IMPORTANTE:

Esta selección solo se aplica cuando el campo Nombre del sistema está programado como **Personalizado** para el registro/fila actual. Por lo tanto, esta selección corresponde a un Sistema de ASTRO convencional en el campo. Esta selección se aplica a la configuración de ID de llamada actual (registro/fila) del Contacto actual en la Lista de llamadas unificada. Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 674](#).

Solo se accede: Cuando el campo Tipo de sistema está configurado como **Personalizado** o cuando el radio admite distintos modelos y opciones.

10.41.1.4.4

ID individual

En este campo se selecciona el ID Individual del radio de destino que funciona en el modo ASTRO - convencional.

Este ID es una coincidencia para el ID individual del radio de destino. El ID individual también debe coincidir con el Sistema convencional ([Número de grupo de sistema](#)) seleccionado en el campo [Nombre del sistema en la página 666](#) para el mismo registro/fila. Esta selección se aplica a la configuración de ID de llamada (registro/fila) del [Contacto](#) actual en la [Lista de llamadas unificada en la página 663](#). Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 674](#).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Mesa 303: Rango

Mínimo	Máximo	Incremento
1	16777215	1

10.41.1.4.5

Tipo de llamada

En este campo se selecciona el Tipo de llamada del radio de destino que funciona en el modo ASTRO - convencional.

Esta selección se aplica a la configuración de ID de llamada (registro/fila) del [Contacto](#) actual en la [Lista de llamadas unificada en la página 663](#). Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 674](#).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Individual

Cuando la configuración de ID de llamada actual se usará para una llamada individual.

Grupo

Cuando la configuración de ID de llamada actual se usará para una llamada grupal.

10.41.1.5

ID de troncalización de ASTRO 25

El ID de troncalización de ASTRO 25 de la sección Contacto le permite ver o modificar los ID de las llamadas de troncalización de ASTRO 25 para contactos individuales.

10.41.1.5.1

Nombre del sistema

Selecciona el Sistema de troncalización deseado o permite crear una configuración de ID personalizada.

Tras seleccionar un Sistema de troncalización, se seleccionan de forma automática los valores de [ID de RAS/WACN doméstica](#) y de [ID del sistema en la página 520](#). Esta opción se aplica para la configuración de ID de llamada (registro/fila) del Contacto actual en la Lista de llamadas unificada. Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 672](#).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Sin asignar

Sin selección.

Personalizado

Permite ingresar un ID de WACN personalizada, un ID del sistema personalizado y un ID individual para el registro/fila actual. Estos ID se aplican para un Sistema de troncalización no definido en el codeplug actual. Este ajuste de ID de llamada se puede seleccionar desde el campo.

Examinar

Seleccione un conjunto en el [Sistema de troncalización ASTRO 25 en la página 585](#) disponible.

10.41.1.5.2

ID de WACN de inicio

Este campo permite ver el ID de WACN (doméstica) RAS de ASTRO 25 para el Sistema de troncalización actualmente seleccionado.

El campo [Nombre del sistema en la página 668](#) selecciona el Sistema de troncalización deseado para el registro o la fila actuales. Este valor se aplica a la configuración de ID de llamada actual (registro/fila) del contacto actual en la Lista de llamadas unificada. La configuración de ID de llamada se puede seleccionar en el campo [ID de llamada en la página 672](#).

Solo se accede: Cuando el campo [Nombre del sistema en la página 668](#) no está configurado como **Personalizado** y cuando el radio admite modelos y opciones diferentes.

10.41.1.5.3

ID del sistema

Este campo permite ver el ID del sistema ASTRO 25 en terreno y el ID del sistema tipo II para el Sistema de troncalización actualmente seleccionado.

En el campo Nombre de sistema se selecciona el Sistema de troncalización que desea para el registro o la fila actual. Este valor se aplica a la configuración de ID de llamada actual (registro/fila) del contacto actual en la Lista de llamadas unificada. Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 672](#) (ASTRO 25) [ID de llamada en la página 673](#) (Tipo II).

Solo se accede: Cuando el campo Nombre del sistema no está configurado como **Personalizado**, y cuando el radio admite diferentes modelos y opciones.

10.41.1.5.4

ID de unidad

En este campo se selecciona el ID de unidad de ASTRO 25 del radio de destino que funciona en el modo de comunicaciones de troncalización de ASTRO 25.

Este ID es una coincidencia para el ID de unidad del radio de destino. El ID de unidad también debe coincidir con el Sistema de troncalización ([ID del sistema en la página 520](#) y [ID de WACN de inicio en la página 669](#)) seleccionado en el campo [Nombre del sistema en la página 668](#) para el mismo registro/fila. Esta selección se aplica a la configuración de ID de llamada (registro/fila) del [Contacto actual en la Lista de llamadas unificada en la página 663](#). Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 672](#).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

**ADVERTENCIA:**

El rango de selección se puede modificar de acuerdo con la Clave (Hardware) avanzada mediante el programa Administrador de claves avanzadas.

Mesa 304: Rango

Mínimo	Máximo
000001	16777215

10.41.1.5.5

ID del sistema personalizado

Este campo permite definir un ID del Sistema de ASTRO 25 (en formato decimal o hexadecimal) para un Sistema de troncalización no definido en el codeplug actual.

Esta selección solo se aplica cuando el campo [Nombre del sistema en la página 668](#) de troncalización está configurado en **Personalizado** para el registro/fila actual y corresponde a un [Sistema de troncalización](#) en el campo. Esta selección se aplica a la configuración de ID de llamada actual (registro/fila) del [Contacto](#) actual en la [Lista de llamadas unificada en la página 663](#). Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 672](#).

Solo se accede: Cuando el campo [Nombre del sistema en la página 668](#) está establecido en **Personalizado** y cuando el radio admite modelos y opciones diferentes.

**NOTA:**

Las opciones se basan en los Archivos de clave del sistema de software o en las Claves (hardware) avanzadas disponibles en la aplicación. El Informe de clave del sistema le permite ver las Claves del sistema disponibles actualmente.

Existen dos valores separados que definen el rango.

[Mesa 305: Primer valor](#)

Mínimo	Máximo	Incremento
1	65535	1

[Mesa 306: Segundo valor](#)

Mínimo	Máximo	Incremento
1	FFFF	1

10.41.1.5.6

ID de WACN personalizada

Este campo permite definir un ID de WACN de ASTRO 25 (en formato decimal o hexadecimal) para un Sistema de troncalización no definido en el codeplug actual.

Esta selección solo se aplica cuando el campo [Nombre del sistema en la página 668](#) de troncalización está establecido en **Personalizado** para el registro/fila actual. Por lo tanto, esta selección corresponde a un Sistema de troncalización en el campo. Esta selección se aplica a la configuración de ID de llamada actual (registro/fila) del [Contacto](#) actual en la [Lista de llamadas unificada en la página 663](#). Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 672](#).

Solo se accede: Cuando el campo [Nombre del sistema en la página 668](#) está establecido en **Personalizado** y cuando el radio admite modelos y opciones diferentes.

Existen dos valores separados que definen el rango.

[Mesa 307: Primer valor](#)

[Mesa 308: Segundo valor](#)

Mínimo	Máximo	Incremento
1	FFFFE	1

10.42

Lista de troncalización ASTRO 25 de uso frecuente

Esto permite ver o definir Listas de uso frecuente de llamadas individuales para las comunicaciones de troncalización de ASTRO 25.

Puede seleccionar miembros de la Lista de llamadas individual mientras opera en el modo Troncalización. Los miembros de la lista de llamadas permiten tipos de llamada como llamadas privadas y localizaciones a radios individuales o grupos de radios.

La lista de uso frecuente de llamada de troncalización también permite el “ID de llamada”.

**NOTA:**

Los [Contactos](#) se deben definir primero en la [Lista de llamada unificada \(UCL\)](#) antes de que puedan seleccionarse para una Lista de uso frecuente de llamada de troncalización ASTRO 25.

Los conjuntos de ID de llamada también deben definirse en la [página ID de troncalización de llamada de ASTRO 25](#) antes de que puedan seleccionarse para una Lista de uso frecuente de llamada de troncalización de ASTRO 25.

Las Listas de uso frecuente individuales luego pueden seleccionarse según [Personalidad de troncalización](#) en el campo [Lista de uso frecuente de llamadas de troncalización en la página 576](#).

Puede iniciar el modo Edición de la lista de uso frecuente con la pulsación del botón [Contactos en la página 185](#) o la selección del menú [Contactos en la página 217](#).

10.42.1

Alias de lista de uso frecuente

Este campo permite definir nombres reconocibles para la lista de uso frecuente de troncalización de ASTRO 25 actual.

Una vez definidas, las listas de uso frecuente ASTRO 25 individuales se pueden seleccionar por [Personalidad de troncalización](#) desde el campo [Lista de uso frecuente de llamadas de troncalización en la página 576](#).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

**NOTA:**

Ejemplos: EMT-001, #500, Electric1, # A5.

Se pueden usar caracteres, números, espacios y caracteres especiales. Para los caracteres unicode no identificados, como los emoji, la pantalla superior del radio muestra “cuadrados”.

Se pueden utilizar hasta 14 caracteres.

10.42.2

Contacto

En este campo se selecciona el Contacto para el registro/fila actual de la Lista de uso frecuente de troncalización ASTRO 25 actual.

El [Contacto](#) debe definirse primero en la [Lista de llamadas unificada \(UCL\)](#). Una vez seleccionado este contacto, la configuración del ID de llamada (definido en la [Página de ID de troncalización ASTRO 25](#) de la UCL) puede seleccionarse desde el campo [ID de llamada en la página 672](#) de este mismo registro/fila.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.42.3

ID de llamada

En este campo se selecciona la configuración de ID de llamada para el registro/fila actual de la Lista de uso frecuente de troncalización ASTRO 25 actual.

Esta configuración de ID de llamada se define en la [Página de ID de troncalización ASTRO 25 - Lista de llamadas unificada](#). El [Contacto en la página 671](#) para el registro o fila actual debe seleccionarse antes de efectuar esta selección.

Solo se accede: Cuando el campo [Contacto en la página 671](#) para el registro o la fila actual no está configurado como **Sin asignar**, y cuando el radio admite modelos y opciones diferentes.

10.43

Lista de uso frecuente de troncalización tipo II

Esta sección permite ver o definir las Listas de uso frecuente de llamada individual para comunicaciones de troncalización de Tipo II.

Puede seleccionar miembros de la Lista de llamadas individual mientras opera en el modo Troncalización. Los miembros de la lista de llamadas permiten tipos de llamada como llamadas privadas y localizaciones a radios individuales o grupos de radios.

La lista de uso frecuente de llamada de troncalización también permite el "ID de llamada".

NOTA:

Los [Contactos](#) deben definirse primero en la [Lista de llamadas unificada \(UCL\)](#) antes de que se seleccionen para una Lista de uso frecuente de llamadas de troncalización de Tipo II.

Los conjuntos de ID de llamada también deben definirse en la [Página de ID de troncalización de Tipo II](#) de la UCL antes de seleccionarlos para una Lista de uso frecuente de llamada de troncalización de Tipo II.

Las Listas de uso frecuente individuales luego pueden seleccionarse según [Personalidad de troncalización](#) en el campo [Lista de uso frecuente de llamadas de troncalización en la página 576](#).

Puede iniciar el modo Edición de la lista de uso frecuente con la pulsación del botón [Contactos en la página 185](#) o la selección del menú [Contactos en la página 217](#).

10.43.1

Alias de lista de uso frecuente

Este campo permite definir nombres reconocibles para la Lista de uso frecuente de troncalización de Tipo II.

Una vez definidas, las Listas de uso frecuente de llamada de Tipo II individuales se pueden seleccionar por [Personalidad de troncalización](#) desde el campo [Lista de uso frecuente de llamadas de troncalización en la página 576](#).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

NOTA:

Ejemplos: EMT-001, #500, Electric1, # A5.

Se pueden usar caracteres, números, espacios y caracteres especiales. Para los caracteres unicode no identificados, como los emoji, la pantalla superior del radio muestra "cuadrados".

Se pueden utilizar hasta 14 caracteres.

10.43.2

Contacto

En este campo se selecciona el Contacto para el registro/fila actual de la Lista de uso frecuente de troncalización de Tipo II.

El contacto debe definirse primero en el campo [Contacto](#) de la [Lista de llamadas unificada en la página 663](#). Una vez seleccionado este contacto, la configuración del ID (definido en la [Página ID de troncalización de Tipo II](#) de la UCL) puede seleccionarse desde el campo [ID de llamada en la página 673](#) de este mismo registro/fila.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.43.3

ID de llamada

En este campo se selecciona la configuración de ID de llamada para el registro/fila actual de la Lista de uso frecuente de troncalización de Tipo II.

El Contacto para el registro/fila actual debe seleccionarse antes de efectuar esta selección.

Solo se accede: Cuando el campo [Contacto en la página 673](#) para el registro o la fila actual no está configurado como **Sin asignar**, y cuando el radio admite modelos y opciones diferentes.

10.44

Lista de uso frecuente de ASTRO convencional

Esta sección permite ver o definir las Listas de uso frecuente de llamadas individuales para comunicaciones convencionales.

Puede seleccionar miembros de la Lista de llamadas individual mientras opera en el modo Comunicaciones convencionales. Los miembros de la lista de llamadas permiten tipos de llamada como Llamadas selectivas y Alertas de llamada a radios individuales o grupos de radios.

La lista de uso frecuente de llamada de ASTRO también permite el “ID de llamada”.

NOTA:

Los [Contactos](#) deben definirse primero en la [Lista de llamada unificada \(UCL\)](#) antes de que puedan seleccionarse para una Lista de uso frecuente de llamadas ASTRO.

Los conjuntos de ID de llamada también deben definirse en [ID de ASTRO convencional](#) de UCL antes de que puedan seleccionarse para una Lista de uso frecuente de llamadas ASTRO.

Las Listas de uso frecuente individuales luego pueden seleccionarse según [Personalidad convencional en la página 429](#) en el campo [Lista de uso frecuente de llamadas ASTRO en la página 473](#).

Puede iniciar el modo Edición de la lista de uso frecuente con la pulsación del botón [Contactos en la página 185](#) o la selección del menú [Contactos en la página 217](#).

10.44.1

Alias de lista de uso frecuente

Este campo permite definir un nombre reconocible para la Lista de uso frecuente de ASTRO convencional actual.

Una vez definidas, las listas de uso frecuente de llamada ASTRO individuales se pueden seleccionar por [Personalidad convencional en la página 429](#) desde el campo [Lista de uso frecuente de llamadas ASTRO en la página 473](#).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

NOTA:

Ejemplos: EMT-001, #500, Electric1, # A5.

Se pueden usar caracteres, números, espacios y caracteres especiales. Para los caracteres unicode no identificados, como los emoji, la pantalla superior del radio muestra “cuadrados”.

Se pueden utilizar hasta 14 caracteres.

10.44.2

Contacto

En este campo se selecciona el Contacto para el registro/fila actual de la Lista de uso frecuente de ASTRO convencional actual.

El contacto debe definirse primero en el campo [Contactos](#) de la [Lista de llamadas unificada \(UCL\)](#). Una vez seleccionado este contacto, la configuración del ID de llamada (definido en la [sección ID \[Contacto\] convencional del ASTRO](#) de la UCL) puede seleccionarse desde el campo [ID de llamada en la página 674](#) de este mismo registro/fila.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.44.3

ID de llamada

En este campo se selecciona la configuración de ID de llamada para el registro/fila actual de la Lista de uso frecuente de ASTRO convencional actual.

Esta configuración de ID de llamada se define en la página ID de ASTRO Convencional de la Lista de llamadas unificada. El Contacto para el registro/fila actual debe seleccionarse antes de efectuar esta selección.

Solo se accede: Cuando el campo [Contacto en la página 674](#) para el registro o la fila actual no está configurado como **Sin asignar**, y cuando el radio admite modelos y opciones diferentes.

10.45

Lista de uso frecuente de MDC convencional

Esta sección le permite ver o definir Listas de uso frecuente de llamadas individuales para comunicaciones convencionales de MDC.

Puede seleccionar miembros de la lista de llamadas individuales mientras opera en el modo convencional. Los miembros de la lista de llamadas permiten tipos de llamada como Llamadas selectivas y Alertas de llamada a radios individuales o grupos de radios.

La lista de uso frecuente de llamada de MDC también permite el “ID de llamada”.

NOTA:

Los [Contactos](#) deben definirse primero en la [Lista de llamada unificada \(UCL\)](#) antes de que se seleccionen para una Lista de uso frecuente de llamadas MDC.

Los conjuntos de ID de llamada también deben definirse en la [Página de ID convencional de MDC](#) de la UCL antes de que puedan seleccionarse para una Lista de uso frecuente de llamadas MDC.

Las Listas de uso frecuente individuales luego pueden seleccionarse según [Personalidad convencional en la página 429](#) en el campo [Lista de uso frecuente de llamadas que no son ASTRO en la página 469](#).

Puede iniciar el modo de edición de la Lista de uso frecuente presionando el botón [Contactos en la página 185](#) o seleccionando el menú [Contactos en la página 217](#).

10.45.1

Alias de lista de uso frecuente

Este campo permite definir nombres reconocibles para la Lista de uso frecuente de MDC convencional actual.

Una vez definidas, las Listas de uso frecuente de llamada MDC individuales se pueden seleccionar por [Personalidad convencional en la página 429](#) desde el campo [Lista de uso frecuente de llamadas que no son ASTRO en la página 469](#).

**NOTA:**

Ejemplos: EMT-001, #500, Electric1, # A5.

Se pueden usar caracteres, números, espacios y caracteres especiales. Para los caracteres unicode no identificados, como los emoji, la pantalla superior del radio muestra “cuadrados”.

Se pueden utilizar hasta 14 caracteres.

10.45.2

Contacto

En este campo se selecciona el Contacto deseado para el registro/fila actual de la Lista de uso frecuente de MDC convencional actual.

El contacto debe definirse primero en el campo [Contacto](#) de la [Lista de llamadas unificada en la página 663](#). Una vez seleccionado este contacto, la configuración del ID de llamada (definido en la sección ID [Contacto] convencional del MDC de la UCL) puede seleccionarse desde el campo [ID de llamada en la página 675](#) de este mismo registro/fila.

Solo se accede: Cuando el campo para el registro/fila actual no está configurado como **Sin asignar**, y cuando el radio admite el modelo/opción.

10.45.3

ID de llamada

En este campo se selecciona la configuración de ID de llamada para el registro/fila actual de la Lista de uso frecuente de MDC convencional actual.

Esta configuración de ID de llamada se define en la [página ID de MDC Convencional](#) de la [Lista de llamadas unificada](#). El [Contacto en la página 675](#) para el registro/fila actual debe seleccionarse antes de efectuar esta selección.

Solo se accede: Cuando el campo [Contacto en la página 674](#) para el registro/fila actual no está configurado como **No asignado**, y cuando el radio admite el modelo/opción.

10.45.4

ID principal

En este campo se selecciona el ID principal del radio de destino que funciona en el modo MDC convencional.

Este ID es una coincidencia para el [ID principales de MDC](#) del mismo Sistema convencional que se ha definido en el radio de destino. Esta selección se aplica a la configuración de ID de llamada (registro/fila) del [Contacto](#) actual en la [Lista de llamadas unificada en la página 663](#). Esta configuración de ID de llamada se puede seleccionar desde el campo [ID de llamada en la página 675](#).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Mesa 309: Rango

Mínimo	Máximo	Incremento
0 (Hex)	FFFFFFFF (Hex)	1

10.46

Asignación de canal de zonas

La **Asignación de canal de zona** permite diseñar y crear configuraciones de zona y canal.

La selección de personalidades convencionales para canales convencionales y de grupos de troncalización para canales de troncalización crea, en última instancia, las posiciones deseadas para el selector del canal de radio para cada zona.

NOTA:

Puede seleccionar zonas con el switch de alternación Selección de zona o mediante una selección del menú Selección de zona.

10.46.1

Zona

Esta sección permite ver o modificar nombres reconocibles para cada zona.

NOTA:

Las posiciones de zona en el radio se determinan según el orden en que están definidos en la aplicación.

NOTA:

La selección de personalidades convencionales para canales convencionales y de grupos de troncalización para canales de troncalización crea, en última instancia, las posiciones deseadas para el selector del canal de radio para cada zona.

Puede seleccionar zonas con el switch de alternación Selección de zona o mediante una selección del menú Selección de zona.

10.46.1.1

Nombres de zona

Este campo permite definir nombres reconocibles de pantalla superior para la zona actual.

IMPORTANTE:

Para radios portátiles, este nombre aparece en la pantalla principal del radio, no en la pantalla superior del radio.

Solo se accede: cuando el campo [Tamaño de texto de zona en la página 232](#) es mayor que 0.

NOTA:

Ejemplos: EMT-001, #500, Electric1, # A5.

Se pueden usar caracteres, números, espacios y caracteres especiales. Para los caracteres unicode no identificados, como los emoji, la pantalla superior del radio muestra “cuadrados”.

La cantidad real de caracteres del nombre de zona que aparecen en la pantalla principal del radio la determina el campo **Tamaño de texto de zona**. Las entradas mayores a este valor se consideran no válidas.

El nombre de zona aparece arriba del nombre de canal en la pantalla principal del radio.

10.46.1.2

Nombre de zona de pantalla superior

Este campo permite definir nombres reconocibles de pantalla superior para la zona actual.

Este nombre aparece solo en la pantalla superior del radio o también en la pantalla de Micrófono y altavoz remoto de pantalla (DRSM) opcional. Esta selección se aplica a la zona actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

NOTA:

Ejemplos: EMT-001, #500, Electric1, # A5.

Se pueden usar caracteres, números, espacios y caracteres especiales.

La cantidad real de caracteres de Nombre de zona que aparecen en la pantalla del radio la determina el campo [Tamaño de texto de zona superior](#). Las entradas mayores a este valor se consideran no válidas.

Cuando la cantidad total de caracteres del campo [Tamaño de texto de zona superior](#) y el campo [Tamaño de texto de canal superior](#) es inferior a 8, este nombre [Nombre de zona de pantalla superior en la página 676](#) nombre y el nombre [Nombre de canal de pantalla superior en la página 679](#) pueden aparecer al mismo tiempo en la pantalla superior del radio. El nombre de zona aparece a la izquierda del nombre de canal.

Cuando el número total de caracteres del campo [Tamaño de texto de zona superior](#) y el campo [Tamaño de texto de canal superior](#) es mayor que 8, este nombre [Nombre de zona de pantalla superior en la página 676](#) y el nombre [Nombre de canal de pantalla superior en la página 679](#) se alternan en la pantalla superior del radio.

10.46.1.3

Anuncio de zona

En este campo, se selecciona el archivo de Anuncio de voz de Motorola (.MVA) que se utilizará para el Anuncio de voz en la zona actual.

Cuando el usuario cambia el radio a esta zona, se reproduce el aviso de voz. Puede que también se reproduzca la instrucción de voz [anuncio de canal](#) si corresponde. Si se selecciona Texto a voz (TTS), el texto en el campo Comando de voz correspondiente se convertirá en voz y se reproducirá como audio. Consulte el campo [Prioridad de anuncio de voz en la página 278](#).

NOTA:

La página [Lista de anuncios de voz en la página 298](#) le permite cargar los archivos de Anuncio de voz de Motorola (.MVA) en el codeplug actual.

Se admiten las siguientes selecciones:

Ninguno

No se necesitan instrucciones de voz para la zona actual.

TTS

Cuando la función Control de voz está activada, el texto en el campo Comando de voz para Anuncio de zona se reproduce como audio.

Archivo de Anuncio de voz de Motorola (.MVA)

Muestra todos los archivos de voz posibles definidos en la página [Lista de anuncios de voz en la página 298](#).

10.46.1.4

Anuncio de TTS/nombre del control de voz de zona

Una palabra comúnmente hablada con el fin de referirse a esta zona para los anuncios de Control de voz y Texto a voz (TTS).

Al hacer clic en el “botón de reproducción” , RadioCentral convierte el texto en el campo del comando de voz a voz y lo reproduce a través del altavoz.

**IMPORTANTE:**

Esto se debe establecer para cambiar la zona mediante el control de voz. Asegúrese de que las palabras sean únicas y de que no haya dos controles de voz de zona fonéticamente similares, ya que se marcarán como no válidos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

**NOTA:**

Configurado por zona.

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.46.2

Canales

Esta sección permite ver o modificar configuraciones de canal específicas dentro de la zona deseada.

**NOTA:**

La selección de personalidades [convencionales](#) para canales convencionales y de grupos de troncalización para canales de troncalización crea, en última instancia, las posiciones deseadas para el selector del canal de radio para cada zona.

Puede seleccionar canales con la pulsación del botón [Selección de canal](#), el switch de alternación [Selección de canal en la página 205](#) o la selección del menú [Selección de canal en la página 217](#).

Solo se accede: Cuando el campo [Zona dinámica activada](#) está **Desactivado**.

10.46.2.1

Nombre del canal

Este campo permite definir un nombre reconocible de pantalla superior para el canal actual (registro/fila).

**IMPORTANTE:**

Para radios portátiles, este nombre aparece en la pantalla principal del radio, no en la [pantalla superior](#) del radio.

Esta selección se aplica a la zona actual.

Solo se accede: Cuando el campo [Zona dinámica activada](#) está desactivado.

**NOTA:**

Ejemplos: EMT-001, #500, Electric1, # A5.

Se pueden usar caracteres, números, espacios y caracteres especiales. Para los caracteres unicode no identificados, como los emoji, la pantalla superior del radio muestra “cuadrados”.

La cantidad real de caracteres de nombre del canal que aparecen en la pantalla principal del radio la determina el campo **Tamaño de texto de canal**. Las entradas mayores a este valor se consideran no válidas.

El nombre de zona aparece arriba del nombre de canal en la pantalla principal del radio.

10.46.2.2

Nombre de canal de pantalla superior

Este campo permite definir un nombre reconocible de pantalla superior para el canal actual (registro/fila).

Este nombre aparece solo en la pantalla superior del radio y también en la pantalla de Micrófono y altavoz remoto de pantalla (DRSM) opcional. Esta selección se aplica a la zona actual.

Solo se accede: Cuando el campo [Zona dinámica activada](#) está activado y cuando el radio admite modelos y opciones diferentes.

**NOTA:**

Ejemplos: EMT-001, #500, Electric1, # A5.

Se pueden usar caracteres, números, espacios y caracteres especiales.

La cantidad real de caracteres de Nombre de canal que aparecen en la pantalla del radio la determina el campo [Tamaño de texto de canal superior](#). Las entradas mayores a este valor se consideran no válidas.

Cuando la cantidad total de caracteres del campo [Tamaño de texto de zona superior](#) y el campo [Tamaño de texto de canal superior](#) es inferior a 8, el nombre de [Nombre de zona de pantalla superior en la página 676](#) y este Nombre de canal de pantalla superior pueden aparecer al mismo tiempo en la pantalla superior del radio. El nombre de zona aparece a la izquierda del nombre de canal.

Cuando el número total de caracteres del campo [Tamaño de texto de zona superior](#) y el campo [Tamaño de texto de canal superior](#) es mayor que 8, el [Nombre de zona de pantalla superior en la página 676](#) y este Nombre de canal de pantalla superior se alternan en la pantalla superior del radio.

10.46.2.3

Tipo de canal

En este campo se selecciona el tipo de comunicaciones del radio, Convencional o de Troncalización, para el canal actual (registro/fila).

Esta selección se aplica a la zona actual.

**NOTA:**

Una vez que se haya realizado esta selección, es posible efectuar la selección del campo [Personalidad en la página 679](#).

Solo se accede: Cuando el radio admite diferentes modelos y opciones, cuando el campo [Zona dinámica activada](#) está desactivado y cuando el campo [Activación de clonación](#) está desactivado.

Se admiten las siguientes selecciones:

Tronc

Troncalización

Cnv

Convencional

10.46.2.4

Personalidad

En este campo se selecciona la Personalidad convencional o de troncalización para el canal actual (registro/fila).

Esta selección se aplica a la zona actual.

IMPORTANTE:

El campo [Tipo de canal en la página 679](#) determina el tipo de comunicaciones de la personalidad que está disponible para seleccionarse de este campo.

Las personalidades se deben crear y definir para poder seleccionarse en este campo.

Solo se accede: cuando el campo [Zona dinámica activada](#) y el campo [Activación de clonación](#) están desactivados.

10.46.2.5

Grupo de conversación de troncalización

En este campo se selecciona el Grupo de conversación o el tipo de Grupo de conversación que se va a utilizar para el canal actual (registro/fila).

Esta selección se aplica a la zona actual.

Solo se accede: Cuando el campo [Zona dinámica activada](#) está **Desactivado**, cuando el campo [Tipo de canal en la página 679](#) está configurado en **Tronc** (Troncalización) y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Selección de grupos de conversación

Los Grupos de conversación que aparecen para ser seleccionados se basan en la [Personalidad de troncalización](#) seleccionada en este campo [Personalidad en la página 679](#) del canal.

Un Grupo de conversación es una agrupación programada de radios creada para el propósito de comunicaciones frecuentes y convenientes con otras.

NOTA:

Los Grupos de conversación se definen en la página [Grupo de conversación](#) de la personalidad.

DYN (Reagrupación dinámica)

ADVERTENCIA:

Esta selección es válida únicamente cuando el campo [Modo de transmisión en la página 564](#) para la Personalidad de troncalización que se selecciona en este campo [Personalidad en la página 679](#) del canal no se configura en **TG/AG desactivado** (Solo escuchar).

Una configuración de Reagrupación dinámica solo es válida cuando una Personalidades de troncalización a la que se hace referencia en un canal tiene el campo configurado en **DYN**, y la Zona y el Canal de la personalidad seleccionada coinciden con las selecciones de [Zona de reagrupación dinámica en la página 532](#) y [Canal de reagrupación dinámico en la página 532](#) en el Sistema de troncalización al que hace referencia la personalidad.

IMPORTANTE:

Solo un canal de reagrupación dinámica puede definirse según el Sistema de troncalización al que se hace referencia.

El usuario puede solicitar una nueva asignación de Reagrupación dinámica al despachador con una pulsación del botón [Solicitud de reprogramación en la página 192](#) o una selección del menú [Solicitud de reprogramación](#). La configuración y las funciones disponibles del grupo de conversación de Reagrupación dinámica las define y transmite de vuelta el despachador.

Para que el grupo de conversación de Reagrupación dinámica pueda transmitir en el modo Seguro, se requiere la pulsación del botón [Selección de Tx segura](#) o el switch de alternación [Selección de Tx segura en la página 206](#) o la selección del menú [Encriptación](#); en caso contrario, las transmisiones del grupo de conversación de Reagrupación dinámica se conectan a una transmisión en el modo **Borrar**.

ATG (grupo de anuncios)

Esta selección es solo válida cuando el campo [Grupo de anuncios en la página 569](#) para la Personalidad de troncalización que se selecciona en este campo [Personalidad en la página 679](#) del canal no se configura en **Ninguno**.

Los Grupos de anuncios permiten iniciar y comunicar en un canal de gran comunicación compuesto por todos los [Grupos de conversación](#) definidos para la Personalidad de troncalización actual.

10.46.2.6

Opción de frecuencia convencional

En este campo se selecciona el perfil Opciones de frecuencia convencional para el canal actual (registro/fila).

Esta selección se aplica a la zona actual.

**NOTA:**

Primero se debe seleccionar la Personalidad convencional en el campo [Personalidad en la página 679](#).

Los perfiles Opción de frecuencia se deben crear y definir antes de que puedan ser seleccionados en este campo.

Solo se accede: Cuando el campo [Zona dinámica activada](#) está desactivado y cuando el campo [Tipo de canal en la página 679](#) está configurado en **Cnv** (Convencional).

10.46.2.7

Selección de perfil del radio

En este campo se selecciona el perfil de radio para el canal actual (registro/fila).

Los perfiles de radio permiten que las agrupaciones diseñadas de configuraciones de audio se designen a canales de radio específicos o a casos específicos de uso en terreno.

Puede seleccionar perfiles de radio (por canal) con la pulsación del botón [Perfiles de radio en la página 191](#) o la selección del menú [Perfiles de radio en la página 222](#).

Esta selección se aplica a la zona actual.

Solo se accede: Cuando el campo [Zona dinámica activada](#) está desactivado.

Se admiten las siguientes selecciones:

Último seleccionado

Se usa el primer registro/fila de [Perfiles de radio en la página 703](#) (independientemente del nombre del perfil) hasta que se cambie a un perfil distinto. Luego de eso, bloquea la selección de su perfil actual en el canal hasta que se vuelva a cambiar la selección del perfil.

Nombres de otros perfiles

Para su comodidad, se han proporcionado tres registros de perfiles con un nombre predefinido: **Predeterminado**, **Supervisión** y **Audio fuerte**. Estos perfiles se pueden renombrar, y se deben definir según las necesidades del usuario si es posible crear más perfiles.

10.46.2.8

Anuncio de canal

En este campo, se selecciona el archivo de Anuncio de voz de Motorola (.MVA) que se utilizará para el Anuncio de voz en el canal/modo actual.

Cuando el usuario cambia el radio a este canal, se reproduce la instrucción de voz. La pulsación del botón [Anuncio de canal en la página 184](#) permite escuchar la grabación de voz del canal actual del radio cuando sea necesario. Consulte también el campo Prioridad del anuncio de voz. Si se

selecciona Texto a voz (TTS), el texto en el campo Comando de voz correspondiente se convertirá en voz y se reproducirá como audio.

Esta selección se aplica a la zona actual.

**NOTA:**

La página [Lista de anuncios de voz en la página 298](#) le permite cargar los archivos de Anuncio de voz de Motorola (.MVA) en el codeplug actual.

Solo se accede:

- El campo [Zona dinámica activada](#) está desactivado.
- El campo [Modo RSI](#) está desactivado para la zona actual.

Se admiten las siguientes selecciones:

Ninguno

No se necesitan instrucciones de voz para el canal actual.

TTS

Cuando la función Control de voz está activada, el texto en el campo Comando de voz para Anuncio de canal: se reproduce como audio.

Archivo de Anuncio de voz Motorola (*.MVA)

Muestra todos los archivos de voz posibles definidos en la página [Lista de anuncios de voz en la página 298](#).

10.46.2.9**Anuncio de TTS/nombre del control de voz del canal**

Una palabra comúnmente hablada con el fin de referirse a este canal para el control de voz. Esto también se puede utilizar para establecer el anuncio de canal en este texto, si el anuncio de canal está configurado en Texto a voz (TTS).

Al hacer clic en el “botón de reproducción” , RadioCentral convierte el texto en el campo del comando de voz a voz y lo reproduce a través del altavoz.

**IMPORTANTE:**

Esto se debe establecer para cambiar el canal mediante el control de voz. Asegúrese de que las palabras sean únicas y de que no haya dos controles de voz de canal fonéticamente similares elegidos dentro de una zona, ya que se marcarán como no válidos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

**NOTA:**

Configurado por canal.

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.46.2.10**ID de sector de disposición del personal**

En este campo se selecciona el número de ID que identifica la ubicación actual del Sector de disposición del personal para el canal actual.

Esta selección se aplica a la zona actual.

**IMPORTANTE:**

Cuando el usuario o un radio se mueven a un nuevo sector, puede cambiar el canal del radio al canal apropiado designado para la nueva ubicación del sector.

Solo se accede: cuando el radio admite modelos/opciones diferentes, y cuando el campo [Tipo de canal en la página 679](#) está configurado en **Cnv** (Convencional), y cuando la [Personalidad convencional en la página 429](#) a la que se referencia en el canal convencional actual tiene el campo [Tipo de señalización de incidentes en la página 481](#) configurado en **Disposición del personal** o **Disposición del personal con MDC**.

Mesa 310: Rango

Mínimo	Máximo	Incrementos
0 (Hex)	FF (Hex)	1

NOTA:

Cada valor debe ser único para cada canal. De otra manera, cada valor solo se puede usar una vez por radio.

0 (el valor predeterminado de fábrica) se utiliza para designar canales sin Disposición del personal y, por lo tanto, se puede volver a utilizar si es necesario.

10.46.2.11

Zona de repliegue

Este campo describe la zona a la que se debe cambiar el radio cuando se produce el repliegue de canal.

Si el campo Canal de repliegue está desactivado, el repliegue de canal no podrá activarse en el canal seleccionado.

Solo se accede: Cuando el campo Repliegue de canal está activado.

10.46.2.12

Canal de repliegue

Este campo permite seleccionar el canal en la zona de repliegue seleccionada a la que el radio debe cambiar cuando se produce el repliegue de canal. Si este campo está desactivado, el repliegue de canal no se podrá activar en el canal seleccionado.

Solo se accede: Cuando el campo **Habilitación del repliegue de canal** está activado.

10.46.2.13

Selección de luz de fondo de color de canal

Este campo le permite seleccionar el color de luz de fondo del canal (registro/fila) actual.

NOTA:

Esta selección se aplica solo a la zona actual.

Solo se accede: cuando [Luz de fondo de color de canal](#) está **Activado**, y la Selección de perfil del radio no está configurada en un perfil con [Activación de las gafas de visión nocturna](#) o [Desactivar luces en la página 704](#) activado.

Se admiten las siguientes selecciones:

- Blanco
- Rojo
- Verde
- Naranja

10.47

Rastreo en general

La sección **Rastreo en general** permite ver o definir la funcionalidad de rastreo relacionada con el modo Comunicaciones convencionales y de troncalización.

Las funciones Rastreo en general pueden aplicarse según la amplitud del radio a todas las [Lista de rastreo en la página 688](#).

Una Lista de rastreo cuenta con muchos canales de recepción posibles mientras funciona en el Modo de rastreo.

NOTA:

Las Listas de rastreo individuales se pueden asignar a Personalidades [convencionales](#) y [de troncalización](#) con su respectivo campo Selección de lista de rastreo.

10.47.1

General

La sección **General** permite ver o definir la funcionalidad de rastreo relacionada con los modos de comunicación convencional y de troncalización.

Las funciones de Amplitud de rastreo se aplican según la amplitud de radio a todas las Listas de rastreo. Una Lista de rastreo cuenta con muchos canales de recepción posibles mientras funciona en el Modo de rastreo.

NOTA:

Las Listas de rastreo individuales se pueden asignar a [Personalidad convencional en la página 429](#) y [Personalidad de troncalización ASTRO 25 en la página 633](#) con sus respectivos campos Selección de lista de rastreo.

10.47.1.1

Alerta de rastreo de prioridad

Este campo permite que el radio avise al usuario de manera audible.

Esta función se activa cuando detecta un [Miembro de prioridad 1 en la página 694](#) o un canal de [Miembro de prioridad 2 en la página 695](#) - [Miembro de lista de rastreo](#) durante el rastreo.

Se genera un beep tanto para los canales Prioridad 1 como Prioridad 2. Esta función se aplica a todos los [Tipos de rastreo](#).

Solo se accede: Cuando el campo Tonos de alerta está **Activado** y cuando el radio admite modelos y opciones diferentes.

10.47.1.2

Tiempo de espera de voz de Rx Tx

En este campo se selecciona la cantidad de tiempo que el radio permanece en un canal de Modo de rastreo detectado - Miembro de la lista de rastreo antes de reanudar la operación en el Modo de rastreo activo.

Este cronómetro comienza una vez que todas las comunicaciones de voz de recepción y transmisión han cesado. Esta función se aplica a todos los [Tipos de rastreo](#) mientras operan en el Modo de rastreo. El tiempo está expresado en segundos.

Mesa 311: Rango

Mínimo	Máximo
0 (segundo)	255 (segundos)

10.47.1.3

Tiempo de espera de datos de Rx Tx

En este campo se selecciona la cantidad de tiempo que el radio permanece en un canal de Modo de rastreo detectado - Miembro de la lista de rastreo antes de reanudar la operación en el Modo de rastreo activo.

Este cronómetro comienza una vez que todo el proceso de envío y recepción de datos de comunicación ha cesado. Esta función solo se aplica a una [Lista de rastreo en la página 688](#) que tiene su campo [Tipo de rastreo en la página 689](#) configurado en **Convencional**, y mientras se encuentra en modo Rastreo. El tiempo está expresado en segundos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 312: Rango

Mínimo	Máximo
0 seg	255 s

10.47.2

Convencional

Esta sección permite ver o definir la funcionalidad para todos los que tienen seleccionado un **Grupo de conversación multisistema** o **convencional**.

**NOTA:**

Las Listas de rastreo individuales se pueden asignar a [Personalidad convencional en la página 429](#) y [Personalidad de troncalización ASTRO 25 en la página 633](#) con sus respectivos campos Selección de lista de rastreo.

10.47.2.1

Detector de operador requerido

Este campo permite que el radio llegue al silenciador del portador, pero solamente desilencie en Prioridad: Miembros de lista de rastreo o en detección de código de Línea privada (PL) adecuada.

Esto se aplica al realizar un rastreo activo de un canal de miembros de la lista de exploración convencional, mientras está en el modo de rastreo.

10.47.2.2

Marcación de canal prioritario

Este campo permite mejorar el rendimiento del Rastreo de canal prioritario gracias a que genera transmisiones no calificadas de miembros de lista de rastreo prioritario para su "Marcación" y eliminación temporal de la lista de rastreo.

Esto es especialmente eficaz cuando se encuentra en modo de rastreo detectado en un miembro de lista de rastreo no prioritario y cuando el radio se silencia brevemente a [intervalos de tiempo](#) específicos para revisar si hay alguna actividad de [Miembro de prioridad 1 en la página 694](#) o [Miembro de prioridad 2 en la página 695](#).

Esta eliminación temporal del Miembro de lista de rastreo permite que este período de silencio sea de un tiempo más breve y una menor interrupción para la llamada actual. Esta función se aplica solo a canales de miembro de lista de rastreo convencionales.

**IMPORTANTE:**

Un Canal prioritario analógico se "marca" cuando se explora de forma no exitosa debido a que no hay códigos TPL/DPL (PL) donde se esperaba un código de PL, o donde el código de PL es incorrecto.

Se "marca" un Canal prioritario digital (Sistema ASTRO) cuando se explora de manera no exitosa debido a que no hay Códigos de acceso a red (NAC) en donde se espera que exista un código NAC, o donde el código NAC es incorrecto.

Una vez que se oprime el botón PTT, o cuando el rastreo determina que el operador ha dejado un Canal prioritario "marcado" o se detecta el PL/NAC adecuado en el canal "marcado", luego se elimina el estado de "Marcado" para dicho Canal prioritario y se reanuda el rastreo de prioridad normal.

**NOTA:**

Análogo y digital se determinan con la configuración del campo [Tipo de voz/señal de Rx en la página 431](#) según el canal.

10.47.2.3

Tiempo de espera del monitor

En este campo se selecciona la cantidad de tiempo que el radio permanece en el canal de Miembro de lista de rastreo actual en la espera de actividad en el canal.

Este temporizador comienza una vez que se suelta el botón [Monitor en la página 188](#). Esta selección se aplica solo a canales de miembros de lista de rastreo convencional. El tiempo está expresado en segundos.

**NOTA:**

En ocasiones, se utiliza el botón Monitor como un método para suspender el rastreo. Una vez que el tiempo termina, el radio continúa la operación normal del Modo de rastreo.

Mesa 313: Rango

Mínimo	Máximo
0 (segundo)	255 (segundos)

10.47.2.4

Tiempo entre muestras prioritarias

En este campo se selecciona la cantidad de tiempo que el radio espera entre la toma de muestras.

Las muestras se toman para comprobar la actividad del canal [Miembro de prioridad 1 en la página 694](#) o [Miembro de prioridad 2 en la página 695](#) entrante.

Este muestreo es necesario cuando el radio se encuentra en Modo de rastreo detectado en un miembro de la lista de rastreo no prioritario, o cuando se encuentra en un canal de miembro de la lista de rastreo de Prioridad 2 y revisando en busca de una transmisión de Prioridad 1. Cuando ocurre el muestreo, el radio se silencia brevemente causando interrupciones cortas en el audio de recepción del radio. Esta selección se aplica solo a canales de miembros de lista de rastreo convencional. El tiempo está expresado en milisegundos.

**NOTA:**

Consulte también [Marcación de canal prioritario en la página 685](#).

Mesa 314: Rango

Mínimo	Máximo	Incrementos
250 ms	6375 ms	25 ms

10.47.2.5

Umbral de elección de RSSI

En este campo se selecciona un nivel de señal potente de la Indicación de potencia de señal recibida (RSSI) que se requiere del canal de Miembro de lista de rastreo para que el radio lo desilencie.

Esta función se aplica solo cuando el radio tiene la capacidad de Rastreo de elección convencional. Cuando se está en un sistema de comunicaciones convencional, varios repetidores vuelven a difundir la misma transmisión simultáneamente en diferentes frecuencias; luego, el radio selecciona la señal más potente o clara. Por lo tanto, esta configuración de umbral define cuando la mejor señal tiene la suficiente potencia para desilenciar el radio. Si ningún Rastreo de elección – Miembro de lista de rastreo excede el umbral, entonces el canal con el valor de RSSI más alto se selecciona para desilenciarse. Esta selección se aplica solo a canales de miembros de lista de rastreo convencional.

**ADVERTENCIA:**

Esta función solo es válida: Cuando una [Lista de rastreo en la página 688](#) tiene el campo [Tipo de rastreo en la página 689](#) establecido en **Rastreo de votación**, cuando ninguno de los canales de [miembro de lista de rastreo](#) de esta lista está [Rastreo automático en la página 479](#) **Activado** y cuando todos los canales miembro de lista de rastreo emplean repetidores dentro de una red de área extendida de Rastreo de votación convencional.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 315: Rango

Mínimo	Máximo
00 (Hex)	FF (Hex)

10.47.3

Troncalización

Esta sección le permite ver o definir la funcionalidad para todas las Listas que tienen el **Grupo de conversación de sistema múltiple** seleccionado para Tipo de exploración.

**NOTA:**

Las Listas de rastreo individuales se pueden asignar a [Personalidad convencional en la página 429](#) y [Personalidad de troncalización ASTRO 25 en la página 633](#) con sus respectivos campos Selección de lista de rastreo.

10.47.3.1

Tiempo de espera de degradación reducida

En este campo se selecciona el tiempo en que el radio permanece desilenciado en un canal (Troncalización solamente) de Rastreo de llegada - Miembro de lista de rastreo una vez que se produce la Degradación reducida.

Durante este período, el radio se desilencia para el canal de degradación reducida que percibe un operador de degradación reducida silencioso o transmisión de voz. Una vez que el tiempo ha terminado se reanuda el Modo de rastreo activo. Esta selección se aplica solamente a las listas de

rastreo donde **Grupo de conversación de sistema múltiple** es el [Tipo de rastreo en la página 689](#) seleccionado.

**NOTA:**

Solo una Lista de rastreo de tipo **Grupo de conversación de sistema múltiple** permite los canales de troncalización con [Sistemas de troncalización](#). Por lo tanto, cuando ha ocurrido una degradación reducida en un canal y una vez que el tiempo de espera ha terminado, se pueden rastrear otros canales en funcionamiento.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 316: Rango

Mínimo	Máximo
0 (segundo)	255 (segundos)

10.47.3.2

Tiempo de búsqueda del sistema

En este campo se selecciona la cantidad de tiempo que el radio permanece silenciado en un canal de control de Rastreo de llegada cuando rastrea Miembros de lista de rastreo.

Durante este período, el radio se encuentra decodificando concesiones de canales de sistema de troncalización en busca de concesiones para sus miembros de lista de rastreo de troncalización. Una vez que este cronómetro termine sin que el radio reciba una concesión de canal, el radio comienza a rastrear activamente al próximo miembro de la lista de rastreo convencional o vuelve al canal del radio seleccionado actualmente.

**ADVERTENCIA:**

Esta función opera solo para [Listas de rastreo](#) en las que **Grupo de conversación de sistema múltiple** es el [Tipo de rastreo en la página 689](#) seleccionado.

**IMPORTANTE:**

Mientras se rastrea un sistema de troncalización desde un canal convencional, el radio no escucha el canal convencional del radio seleccionado actualmente. En consecuencia, mientras más tiempo se ejecute el cronómetro, más tiempo pasa fuera del canal seleccionado actualmente. Por lo tanto, la selección solo debería programarse en un valor de tiempo más prolongado cuando se explora un canal de control en un sistema ocupado y podría programarse en un valor de tiempo más corto cuando se rastree un sistema menos ocupado.

Solo una [Lista de rastreo en la página 688](#) con un **Grupo de conversación de sistema múltiple** y un [Tipo de rastreo en la página 689](#) permite canales de troncalización con varios [Sistemas de troncalización](#). De este modo, este cronómetro de búsqueda permite que se exploren otros sistemas de forma alternativa.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 317: Rango

Mínimo	Máximo
1 (segundo)	255 (segundos)

10.48

Lista de rastreo

Esta sección le permite crear y eliminar listas de rastreo, y, también, definir la funcionalidad de la lista de rastreo individual.

Una Lista de rastreo contiene agrupaciones deseadas de canales convencionales o de troncalización que se seleccionan para cada lista en la sección Miembro de lista de rastreo.

Los canales seleccionados pueden entonces explorarse en busca de actividad de transmisión, uno por uno, cuando el radio está en Modo de Rastreo. Por lo tanto, permite muchos canales de recepción posibles. El radio solo rastrea la lista de rastreo asignada al canal que está funcionando actualmente.

NOTA:

Las Listas de rastreo individuales se pueden asignar a Personalidades convencionales y de troncalización con su respectivo campo Selección de lista de rastreo.

Puede iniciar el modo rastreo automáticamente mediante el rastreo automático o la pulsación del botón de rastreo, el switch de alternación de rastreo o la selección del menú de rastreo.

10.48.1

General

Esta sección permite ver o definir la funcionalidad que se aplica a Listas de rastreo individuales.

NOTA:

Los Tipos de listas de rastreo que permiten los canales Miembro de lista de rastreo dependen de un [Sistema de troncalización ASTRO 25 en la página 585](#) o más. Por lo tanto, el sistema de troncalización debe definirse antes de configurar las funciones de la Lista de rastreo.

Las Listas de rastreo individuales se pueden asignar a [Personalidad convencional en la página 429](#) y [Personalidad de troncalización ASTRO 25 en la página 633](#) con sus respectivos campos Selección de lista de rastreo.

10.48.1.1

Alias de la lista de rastreo

Este campo permite definir nombres reconocibles para la Lista de rastreo actual.

NOTA:

Ejemplos: Lista de rastreo 05, Electric1, #510

Se pueden usar caracteres, números, espacios y caracteres especiales.

Se pueden utilizar hasta 14 caracteres.

10.48.1.2

Tipo de rastreo

En este campo se seleccionan los tipos de canales de Miembro de lista de rastreo que se pueden seleccionar para la Lista de rastreo actual.

Estos canales convencional o troncalización (o ambos) de [Miembro de lista de rastreo](#) se exploran en busca de actividad de transmisiones calificadas cuando el radio se encuentra operando en el Modo de rastreo.

IMPORTANTE:

Los tipos de rastreo que permiten personalidades/canales de Miembro de lista de rastreo de troncalización que podrían requerir de ciertos [Sistemas de troncalización](#) seleccionados. Por lo tanto, los Sistemas de troncalización deben definirse para estas Personalidades de troncalización antes de configurar ciertas funciones de la Lista de rastreo relacionadas con la troncalización. Los Sistemas de troncalización hacen referencia a una Personalidad de troncalización con el campo [Sistema en la página 558](#) de Personalidad de troncalización.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Convencional

Solo se pueden seleccionar canales convencionales para este tipo de lista de rastreo; incluidas las personalidades convencionales configuradas para rastreo de elección mixto convencional designadas por tener el campo [Activación de rastreo de voto combinado en la página 479](#) **Activado**.

Se permiten hasta 30 [Canal en la página 701](#) por lista de rastreo en las siguientes condiciones:

- Cuando una Personalidad convencional tiene su campo Activación de rastreo de voto mezclado **Activado**, cada Opción de frecuencia (registro/fila) de esa personalidad cuenta para el máximo de 30 miembros de la Lista de rastreo.
- Por Lista de rastreo, es posible contar con un máximo de tres Personalidades convencionales con Rastreo de voto mezclado activado como canales de Miembro de lista de rastreo.

Validez para personalidades de rastreo de elección combinado:

ADVERTENCIA:

Cuando el campo [Dirección de Tx para rastreo de voto combinado en la página 479](#) está **Desactivado** para esta lista de rastreo, cualquier canal miembro de la lista de rastreo (seleccionado para la lista de rastreo actual) debe tener los parámetros de transmisión (Tx) de Opciones de frecuencia establecidos según las siguientes normas:

La Frecuencia de Tx [Frecuencia de Tx en la página 440](#) debe coincidir con todos los canales de la Lista de rastreo.

La [Desviación de Tx/espaciamento de canal en la página 442](#) debe coincidir con todos los canales de la lista de rastreo.

La [ID de red de Tx en la página 444](#) debe coincidir con todos los canales de la lista de rastreo.

o

La Frecuencia de Tx debe coincidir con todos los canales de la Lista de rastreo.

El parámetro Desviación de Tx/Espaciamento de canal debe coincidir con todos los canales de la lista de rastreo.

El campo PL seleccionable por el usuario (MPL) se debe **desactivar** para todos los canales de la Lista de rastreo.

La [Tipo de silenciador Tx en la página 454](#) debe coincidir con todos los canales de la lista de rastreo. Si el Tipo de silenciador Tx está establecido en **PL**, el [Código PL de Tx en la página 456](#) debe coincidir con todos los canales de la lista de rastreo, o si el Tipo de silenciador Tx está establecido en **DPL**, el [Código DPL de Tx en la página 457](#) y la [Inversión DPL de Tx en la página 459](#) deben coincidir para todos los canales de la lista de rastreo.

Monitoreo de prioridad

Disponible según la capacidad de admitir modelos y opciones diferentes.

Solo se pueden seleccionar canales de troncalización para este tipo de Lista de rastreo.

Según la Lista de rastrei, el rastreo de Monitor de prioridad permite hasta 50 canales de Miembro de lista de rastreo.

Es posible que el campo Grupo de conversación de troncalización, en el caso de cualquiera de los canales de miembros de lista de rastreo de troncalización seleccionado en la lista de rastreo actual, no esté configurado como **DYN** o **ATG**.

La selección del "Sistema" del campo Registro de sistema de troncalización (para la Lista de rastreo actual) debe coincidir con el campo al que se le hace referencia de Sistema de troncalización de todos los canales de Miembro de lista de rastreo de troncalización seleccionados para la Lista de rastreo actual.

Si el campo [Tipo de cobertura en la página 519](#) de la selección del sistema de troncalización del campo Registro de sistema de troncalización (en el caso de la lista de rastreo actual) está configurado como **Roaming Inter-WACN**, entonces el ID de WACN doméstica y el ID de sistema de dicho sistema de troncalización deben coincidir con el ID de WACN de TG y el ID de sistema de TG del Grupo de conversación de troncalización en el caso de cualquiera de los canales de miembros de lista de rastreo de troncalización seleccionados para la actual lista de rastreo.

Grupo de conversación de múltiples sistemas

Disponible según la capacidad de admitir modelos y opciones diferentes.

Tanto los canales convencionales como de troncalización se pueden seleccionar para este tipo de Lista de rastreo.

Por lista de rastreo, el rastreo de grupo de conversación de sistema múltiple se limita a cinco sistemas de troncalización, con hasta 50 canales miembro de lista de rastreo por Sistema de troncalización, y puede incluir hasta 10 canales miembro de lista de rastreo convencionales. Sin embargo, el máximo por Lista de rastreo es de 250 canales de Miembro de lista de rastreo.

Un máximo de 50 de los canales de miembro de lista de rastreo podrán referirse al mismo sistema de troncalización.

Es posible que el campo Grupo de conversación de troncalización, en el caso de cualquiera de los canales de miembros de lista de rastreo de troncalización seleccionado en la lista de rastreo actual, no esté configurado como **DYN** o **ATG**.

El campo Activación de rastreo de voto mezclado de Personalidad convencional debe estar **Desactivado** para todos los canales de Miembro de lista de rastreo seleccionados para este tipo de Lista de rastreo.

ADVERTENCIA:

Las operaciones de datos de interfaz de aire común (CAI) no son compatibles en este tipo de rastreo. Esto es cierto debido a la naturaleza conflictiva de la operación de datos CAI (la cual requiere que el radio reciba transmisiones intermitentes cortas) y el rastreo de sistema múltiple (que requiere que el radio pase largos períodos monitoreando miembros de rastreo secundarios).

Rastreo de elección

Disponible según la capacidad de admitir modelos y opciones diferentes.

Solo los canales convencionales se pueden seleccionar para este tipo de Lista de rastreo.

El rastreo de elección solo permite hasta 10 canales miembro de lista de rastreo por lista de rastreo.

ADVERTENCIA:

Un sistema de rastreo de elección funciona solamente cuando todos los canales de Miembro de lista de rastreo (seleccionados para la Lista de rastreo actual) utilizan repetidores dentro de una red de amplitud de área de rastreo de elección convencional.

NOTA:

Cuando se opera en un sistema de Rastreo de votación, varios repetidores vuelven a difundir la misma transmisión simultáneamente en diferentes frecuencias; entonces, el radio puede seleccionar la señal más fuerte o clara. La configuración de Umbral de rastreo RSSI define cuando la mejor señal tiene la suficiente potencia para desilenciar el radio. Si ningún canal excede el umbral, entonces el canal con el valor de RSSI más alto se selecciona para desilenciarse.

Validez para canal de lista de rastreo:

El campo Activación de rastreo de voto mezclado de Personalidad convencional debe estar **Desactivado** para todos los canales de Miembro de lista de rastreo seleccionados para la Lista de rastreo actual.

El campo [Rastreo automático en la página 479](#) debe estar **Desactivado** para todos los canales miembro de lista de rastreo seleccionados para la lista de rastreo actual.

Cuando el campo Direccionamiento de Tx se encuentra **activado** o **desactivado** para esta Lista de rastreo, no está relacionado con ningún canal de Miembro de lista de rastreo (seleccionado para la Lista de rastreo actual) que tiene su campo [Personalidad de solo recepción en la página 430](#) **activado**.

**ADVERTENCIA:**

Sin embargo, cuando el campo Direccionamiento de Tx se encuentra **Desactivado** para esta Lista de rastreo, cualquier canal de Miembro de Lista de rastreo (seleccionado para la Lista de rastreo actual) que tenga su campo Personalidad de recepción solamente **Desactivado** también debe tener sus parámetros de transmisión (Tx) configurados de acuerdo con las siguientes normas.

Cuando todos los canales miembro de lista de rastreo de la lista de rastreo actual tienen el campo [Tipo de voz/señal de Tx en la página 434](#) establecido en **ASTRO**, se debe cumplir lo siguiente:

La Frecuencia de Tx debe coincidir con todos los canales de la Lista de rastreo.

El parámetro Desviación de Tx/Espaciamiento de canal debe coincidir con todos los canales de la lista de rastreo.

El ID de red de Tx debe coincidir con todos los canales de la Lista de rastreo.

o

La Frecuencia de Tx debe coincidir con todos los canales de la Lista de rastreo.

El parámetro Desviación de Tx/Espaciamiento de canal debe coincidir con todos los canales de la lista de rastreo.

El campo PL seleccionable por el usuario (MPL) se debe **desactivar** para todos los canales de la Lista de rastreo.

El Tipo de silenciador de Tx debe coincidir con todos los canales de la Lista de rastreo. Si el Tipo de silenciador Tx está establecido en **PL**, el Código PL de Tx debe coincidir con todos los canales de la lista de rastreo, o bien si el Tipo de silenciador Tx está establecido en **DPL**, el Código DPL de Tx y la Inversión DPL de Tx deben coincidir para todos los canales de la lista de rastreo.

**ADVERTENCIA:**

También debe tener en cuenta: Una lista de rastreo de tipo de rastreo de votación no puede combinar canales de miembros de lista de rastreo en que algunos miembros pertenezcan al Tipo de voz/señal de Tx **No ASTRO** y en que algunos pertenezcan al Tipo de voz/señal de Tx **ASTRO**. Por lo tanto, todos los canales de Miembro de lista de rastreo de **Escaneo de votación** deben ser del mismo Tipo de voz/señal de Tx.

Prioridad inteligente

Tanto los canales convencionales como de troncalización se pueden seleccionar para este tipo de Lista de rastreo.

Este tipo de rastreo se basa en el rastreo de grupos de conversación de sistema múltiple, por lo cual es compatible con los límites de dicho tipo de rastreo. Este tipo de rastreo proporciona la habilidad de configurar un miembro de rastreo de prioridad 1 y de prioridad 2.

**NOTA:**

La actividad de rastreo prioritario se recibirá cuando el radio esté rastreando el mismo sistema que el miembro de rastreo prioritario. La actividad de rastreo prioritario no se recibirá mientras el radio se encuentre abierto a un miembro de rastreo no prioritario, incluido el canal seleccionado a partir de un sistema diferente, sea convencional o de troncalización.

10.48.1.3

Registro de sistema de troncalización

En este campo se selecciona un Sistema de troncalización por su nombre programado.

Luego, este Sistema de troncalización se utiliza para comunicaciones durante el Modo de rastreo para la [Lista de rastreo en la página 688](#)!

**IMPORTANTE:**

Cuando el campo [Tipo de rastreo en la página 689](#) está configurado en **Monitor de prioridad**, este Sistema de troncalización seleccionado debe ser el mismo (coincidencia) para todos los canales de Miembro de lista de rastreo para la Lista de rastreo actual.

Cuando los canales/[Personalidades de troncalización](#) se seleccionan para una Lista de rastreo, estos Sistemas de troncalización "coincidentes" hacen referencia a una Personalidad de troncalización con el campo [Sistema en la página 558](#) de la Personalidad de troncalización.

Solo se accede: Cuando el campo [Tipo de rastreo en la página 689](#) está configurado como **Monitor de prioridad** y cuando el radio admite modelos y opciones diferentes.

10.48.1.4

Prioridad dinámica

Este campo permite definir el último canal en que el Modo de exploración del radio ha determinado y transmitido, para convertirse en el nuevo canal Miembro de prioridad 2.

Este canal permanece como canal de Prioridad 2 hasta que se transmite por un nuevo canal o hasta que se desactive el Modo de rastreo. Esta función se aplica a la Lista de rastreo actual.

**IMPORTANTE:**

Active Prioridad dinámica presionando un botón [Prioridad dinámica en la página 185](#) o seleccionando un menú [Prioridad dinámica en la página 218](#).

El canal [Miembro de prioridad 1 en la página 694](#) no se ve afectado.

Solo se accede: Cuando el campo [Tipo de rastreo en la página 689](#) está establecido en **Convencional**.

10.48.1.5

Prioridad 1: tipo

En este campo se selecciona el tipo de rastreo de Miembro de prioridad 1 utilizado por la Lista de rastreo actual.

Consulte también [Canal prioritario PTT en la página 190](#).

Solo se accede: Cuando el campo [Tipo de rastreo en la página 689](#) está configurado en **convencional**, **Monitor prioritario**, o **prioridad inteligente**.

Se admiten las siguientes selecciones:

Desactivado

El canal [Miembro de prioridad 1 en la página 694](#) está desactivado.

Fijo

El canal de prioridad 1 se selecciona desde el campo [Miembro de prioridad 1 en la página 694](#) y no se puede cambiar.

Canal seleccionado

El radio utiliza el Selector de canal actual seleccionado como el Miembro de prioridad 1.

Selección de operador

Utiliza el [Miembro de prioridad 1 en la página 694](#) seleccionado. Sin embargo, puede modificar esta opción mediante la selección del menú [Lista de rastreo en la página 224](#).

NOTA:

Tanto Prioridad 1 - Tipo y [Prioridad 2: tipo en la página 694](#) no pueden establecerse en **Canal seleccionado**; uno debe ser diferente.

10.48.1.6

Miembro de prioridad 1

En este campo se selecciona un canal/modo de Prioridad 1 de Miembro de lista de rastreo para la Lista de rastreo actual.

Este canal de miembros de la lista de rastreo se selecciona por su número de registro programado de la lista de rastreo actual. Cuando el radio se encuentra explorando activamente una Lista de rastreo, el 50 % del rastreo tiene como objetivo el canal del Miembro de prioridad 1. Consulte también [Canal prioritario PTT en la página 190](#).

Ejemplo: Si el Miembro de prioridad 1 es P1 y los Miembros de la lista de rastreo no prioritarios son Nn, entonces la secuencia de rastreo es: P1 N1, P1 N2, P1 N3, P1 N4, P1 N5, etc.

IMPORTANTE:

Cuando el altavoz del radio se encuentra desilenciado para una llamada no prioritaria (modo de rastreo detectado), o se encuentra desilenciado para el [Miembro de prioridad 2 en la página 695](#) (si existe uno), el radio continúa rastreando en busca de actividad de transmisión en el canal de Miembro de prioridad 1. Si el radio descubre una transmisión de Prioridad 1 válida, deja la transmisión actual y desilencia la llamada de Prioridad 1. Consulte también [Marcación de canal prioritario en la página 685](#) y [Tiempo entre muestras prioritarias en la página 686](#).

Cuando el radio se encuentra en Modo de rastreo detectado en busca de una llamada de Miembro de prioridad 1, no es necesario revisar la prioridad del miembro.

Solo se accede: Cuando el campo [Tipo de rastreo en la página 689](#) está configurado en **convencional**, **Monitor prioritario**, o **prioridad inteligente**, y cuando [Prioridad 1: tipo en la página 693](#) no está configurado en **canal seleccionado** o **Desactivado**.

10.48.1.7

Prioridad 2: tipo

En este campo se selecciona el tipo de rastreo de Miembro de prioridad 2 utilizado por la Lista de rastreo actual.

Solo se accede: Cuando el campo [Tipo de rastreo en la página 689](#) está configurado en **Monitor de prioridad** o **prioridad inteligente**, o (cuando el campo [Tipo de rastreo en la página 689](#) está configurado como **convencional**, y cuando el campo [Prioridad dinámica en la página 693](#) está **desactivado**).

Se admiten las siguientes selecciones:

Desactivado

El canal [Miembro de prioridad 1 en la página 694](#) está desactivado.

Fijo

El canal prioridad 2 se selecciona desde el campo [Miembro de prioridad 2 en la página 695](#) y no se puede cambiar.

Canal seleccionado

El radio utiliza el Selector de canal actual seleccionado como el Miembro de prioridad 2.

Selección de operador

Utiliza el [Miembro de prioridad 2 en la página 695](#) seleccionado. Sin embargo, puede modificar esta opción mediante la selección del menú [Lista de rastreo en la página 224](#).

NOTA:

Tanto [Prioridad 1: tipo en la página 693](#) como Prioridad 2 - Tipo no pueden programarse como **Canal seleccionado**; uno debe ser diferente.

10.48.1.8

Miembro de prioridad 2

En este campo se selecciona un canal/modo de Prioridad 2 de Miembro de lista de prioridad para la Lista de rastreo actual.

Este canal de miembros de la lista de rastreo se selecciona por su número de registro programado. Cuando el radio se encuentra explorando activamente una Lista de rastreo, el 33,33 % del rastreo tiene como objetivo el canal del Miembro de prioridad 2. Cuando existe un Miembro de prioridad 2, las revisiones en busca de un [Miembro de prioridad 1 en la página 694](#) se reducen de 50 % a 33,33 %.

Ejemplo: Si el Miembro de prioridad 1 es P1, el Miembro de prioridad 2 es P2 y los Miembros de la lista de rastreo no prioritarios son Nn, entonces la secuencia de rastreo es: N1 P1 P2, N2 P1 P2, N3 P1 P2, etc.

IMPORTANTE:

Cuando el altavoz del radio se encuentra desilenciado para una llamada no prioritaria (Modo de rastreo de llegada), el radio continua rastreando en busca de actividad de transmisión en el canal de Miembro prioritario 2. Si el radio descubre una transmisión de Prioridad 2 válida, deja la transmisión actual y desilencia la llamada de Prioridad 2. Consulte también [Marcación de canal prioritario en la página 685](#) y [Tiempo entre muestras prioritarias en la página 686](#).

Si se encuentra en Modo de rastreo detectado en una llamada de Prioridad 2, y el radio descubre una transmisión de Prioridad 1 válida, deja la llamada de Prioridad 2 y desilencia la llamada de Prioridad 1.

Cuando el campo [Prioridad 2: tipo en la página 694](#) está configurado en **Selección de operador o fijo**, y (cuando el campo [Tipo de rastreo en la página 689](#) está configurado en **Monitor de prioridad o prioridad inteligente**, o cuando el campo [Tipo de rastreo en la página 689](#) está configurado como **convencional**, y cuando el campo [Prioridad dinámica en la página 693](#) está **desactivado**).

10.48.1.9

Miembros de no prioridad

En este campo se selecciona si el estado de un canal de Miembro de lista de rastreo prioritario se puede cambiar a un estado No prioritario.

Esta función se aplica a la Lista de rastreo actual.

Solo se accede: Cuando el campo [Tipo de rastreo en la página 689](#) no esté establecido en **Rastreo de elección**.

Se admiten las siguientes selecciones:

Fijo

Los miembros de la lista de rastreo que están programados con un estado de Miembro de lista de rastreo [Miembro de prioridad 1 en la página 694](#) o [Miembro de prioridad 2 en la página 695](#) no se pueden cambiar.

Seleccionable por el operador

Los miembros de la Lista de rastreo que se definen por el CPS como que tienen un estado de Miembro de la lista de rastreo de Miembro de prioridad 1 o Miembro de prioridad 2 se pueden cambiar a un estado No prioritario, a través de la selección del menú [Lista de rastreo en la página 224](#).

10.48.1.10

Tipo de miembro de Tx de voz designada

En este campo se selecciona el tipo de canal (fijo o variable) deseado de transmisión de voz de rastreo de llegada de la Lista de rastreo actual.

Esta selección se aplica mientras se opera en el Modo de rastreo y una vez que un canal Miembro de la lista de rastreo se ha determinado.

**IMPORTANTE:**

Este campo no está disponible cuando el campo [Tipo de rastreo en la página 689](#) está establecido en **Rastreo de elección** y el campo [Dirección de Tx](#) está **Activado**, ya que el radio debe utilizar Respuesta para dirección de Tx.

Solo se accede: Cuando el campo [Tipo de rastreo en la página 689](#) no está configurado en **escaneo de votación**, o cuando el [Dirección de Tx](#) campo está **desactivado**.

Se admiten las siguientes selecciones:

Fijo

Permite seleccionar el canal de transmisión de voz designado/fijo a partir de la Lista de rastreo actual.

La selección de canal debe realizarse desde el campo [Miembro de Tx de voz designada en la página 696](#).

**ADVERTENCIA:**

Los Miembros de Tx de voz fijos solo funcionan cuando el campo [Tipo de rastreo en la página 689](#) está configurado en **convencional** o **Escaneo de elección** y no funcionan cuando está configurado en **Monitor de prioridad** o rastreo de **Grupo de conversación de sistema múltiple**.

Los Miembros de Tx de voz fijos no funcionan si el canal convencional seleccionado tiene el campo [Personalidad de solo recepción en la página 430](#) **Activado**.

Canal seleccionado

Causa que el radio transmita voz en el canal/modo actualmente seleccionado de el radio (comunicaciones Conventional o Troncalización).

**ADVERTENCIA:**

No funciona si el canal convencional actual del radio tiene su campo [Personalidad de solo recepción en la página 430](#) **Activado**.

No funciona si el canal de troncalización actual del radio tiene el campo [Modo de transmisión en la página 564](#) establecido en **TG/AG desactivado (Solo escucha)**.

Responder

Causa que el radio trasmita voz en la llegada actualmente seleccionada del radio: el canal/modo de [Miembro de lista de rastreo](#) (comunicaciones convencional o de troncalización).

10.48.1.11

Miembro de Tx de voz designada

En este campo se selecciona el canal de transmisión de voz de rastreo de llegada.

**NOTA:**

Los Miembros de lista de rastreo se seleccionan a partir de la Lista de rastreo actual. Esta selección se aplica mientras opera en el Modo de rastreo para la Lista de rastreo actual y una vez que un canal de [Miembro de lista de rastreo](#) se haya determinado.

Solo se accede: Cuando el campo [Tipo de miembro de Tx de voz designada en la página 696](#) está configurado en **fijo**, y (cuando el campo [Tipo de rastreo en la página 689](#) no está configurado en **Rastreo de votación**, o cuando el campo [Dirección de Tx](#) está **desactivado**).

ADVERTENCIA:

Este campo no está disponible cuando el campo [Tipo de rastreo en la página 689](#) está establecido en **Rastreo de elección** y el campo [Dirección de Tx](#) está **Activado**, ya que el radio debe utilizar Respuesta para dirección de Tx.

ADVERTENCIA:

Los Miembros de Tx de voz fijos solo funcionan cuando el campo [Tipo de rastreo en la página 689](#) está configurado en **convencional** o **Escaneo de elección** y no funcionan cuando está configurado en **Monitor de prioridad** o rastreo de **Grupo de conversación de sistema múltiple**.

Los Miembros de Tx de voz fijos no funcionan si el canal convencional seleccionado tiene el campo [Personalidad de solo recepción en la página 430](#) **Activado**.

Los miembros de Tx de voz fija no funcionan si la zona y el canal seleccionados es Canal dinámico.

10.48.1.12

Tipo de datos Rx/Tx designados

En este campo se selecciona el tipo de canal (fijo o variable) de transmisión de datos de la interfaz aéreo común (CAI) del rastreo de llegada.

NOTA:

[Miembros de la lista de rastreo en la página 700](#) se seleccionan de la Lista de rastreo actual. Esta selección se aplica mientras se opera en el Modo de rastreo y una vez que un canal Miembro de la lista de rastreo se ha determinado.

Solo se accede: Cuando el campo [Tipo de rastreo en la página 689](#) está establecido en **Convencional**.

Se admiten las siguientes selecciones:

Ninguno

El rastreo de datos está desactivado.

Fijo

Permite seleccionar el canal de transmisión de datos designado/fijo a partir de la Lista de rastreo actual.

La selección de canal debe realizarse desde el campo [Miembro de datos designados en la página 698](#).

ADVERTENCIA:

Los Miembros de datos Tx fijos solo funcionan cuando el campo [Tipo de rastreo en la página 689](#) está configurado en **convencional**.

Los Miembros de datos de Tx fijos no funcionan si una Personalidad convencional que hace referencia a una lista de rastreo **fija** tiene el campo [Personalidad de solo recepción en la página 430](#) **Activado**.

Canal seleccionado

Causa que el radio transmita datos en el canal/modo actualmente seleccionado del radio (comunicaciones convencional o Troncalización).

ADVERTENCIA:

Si las funciones de [datos](#) no se encuentran disponibles en el canal, el rastreo de datos es inoperable.

10.48.1.13

Miembro de datos designados

En este campo, se determina el canal de datos de transmisión de la interfaz aéreo común (CAI) del rastreo de llegada.

NOTA:

Este Miembro de lista de rastreo se selecciona desde la Lista de rastreo actual. Esta selección se aplica mientras se opera en el Modo de rastreo y cuando el canal Miembro de la lista de rastreo se ha determinado.

ADVERTENCIA:

Se aplica solo cuando esta Lista de rastreo hace referencia a una Personalidad convencional que tiene las condiciones siguientes: El campo [Tipo de voz/señal de Rx en la página 431](#) configurado en **Modo mixto** o **ASTRO**, y tiene un sistema convencional al que se hace referencia con un Perfil de datos referenciado que tiene su campo de datos de terminal **Activado** y cuando el campo Índice de perfil de ASTRO OTAR está **Activado** y no aparece atenuado.

Solo se accede: Cuando el campo [Tipo de rastreo en la página 689](#) está establecido en **Convencional**, cuando el campo [Tipo de datos Rx/Tx designados en la página 697](#) está establecido en **Fijo**, cuando no es una zona y un canal dinámicos y cuando el radio admite modelos u opciones diferentes.

10.48.2

Avanzada

Esta sección permite ver o definir una variedad de funciones o parámetros que se aplican según la Lista de rastreo.

NOTA:

Las Listas de rastreo individuales se pueden asignar a [Personalidad convencional en la página 429](#) y [Personalidad de troncalización ASTRO 25 en la página 633](#) con sus respectivos campos Selección de lista de rastreo.

10.48.2.1

Temporizador de paciencia limitada de Tx de datos

Este campo permite definir el tiempo de espera del radio para transmitir datos mientras se encuentra en el modo de rastreo.

Cuando el temporizador termina, se descartan los datos. Esta selección se aplica a la Lista de rastreo actual. El valor de este campo se expresa en segundos.

NOTA:

Solo se accede: Cuando el campo [Tipo de rastreo en la página 689](#) está establecido en **Convencional**, cuando el campo [Tipo de datos Rx/Tx designados en la página 697](#) no está establecido en **Ninguno** y cuando el radio admite modelos u opciones diferentes.

Cuando está establecido en **Infinito**, el tiempo de espera de transferencia de datos del radio es ilimitado.

Mesa 318: Rango

Mínimo	Máximo	Incrementos
1 s	255 s	1 s

10.48.2.2

Temporizador de retraso de rastreo de elección

Este campo define el tiempo de espera del radio antes de la elección o la selección mientras rastrea activamente en **Rastreo de elección** o **Rastreo de elección convencional combinado**.

Consulte el campo [Activación de rastreo de voto combinado en la página 479](#).

Consulte también las selecciones **Convencional** y **Rastreo de elección** del campo [Tipo de rastreo en la página 689](#).

En el caso de Rastreo de elección o Rastreo de elección convencional combinado, varios repetidores retransmiten la misma transmisión de manera simultánea en diferentes frecuencias. Luego, el radio puede seleccionar la señal más fuerte o más clara. Esta selección se aplica para la Lista de rastreo actual.

**NOTA:**

Solo se accede: Cuando el campo [Tipo de rastreo en la página 689](#) está establecido en **Convencional** o **Rastreo de elección**, y cuando el radio admite modelos u opciones diferentes.

Mesa 319: Rango

Mínimo	Máximo	Incrementos
0 ms	255 ms	5 ms

10.48.2.3

Mostrar canal más elegido

Este campo permite que el canal Rastreo de elección del rastreo de llegada aparezca en la pantalla del radio.

Cuando se encuentra en un sistema de rastreo de elección, varios repetidores retransmiten la misma transmisión de manera simultánea en diferentes frecuencias. Luego, el radio puede seleccionar la señal más fuerte o clara cuando está en el modo de rastreo. El canal de llegada del Rastreo de votación se basa en la RSSI (Indicador de intensidad de señal recibida). Consulte también las selecciones **Convencional** y **Rastreo de elección** de los campos [Umbral de elección de RSSI en la página 687](#) y [Tipo de rastreo en la página 689](#). Esta función se aplica a la Lista de rastreo actual.

**NOTA:**

Solo se accede: Cuando el campo [Tipo de rastreo en la página 689](#) está establecido en **Convencional** o **Rastreo de elección**, y cuando el radio admite modelos u opciones diferentes.

10.48.2.4

Cronómetro de inactividad de rastreo de elección convencional combinado

En este campo, se define el tiempo de espera del radio cuando rastrea activamente en Rastreo de elección convencional combinado, antes de comenzar a explorar frecuencias o canales adicionales cuando no se ha encontrado actividad calificada en las dos frecuencias actualmente más fuertes en la lista de rastreo actual.

El valor de este campo se expresa en minutos.

**NOTA:**

Solo se accede: Cuando el campo [Tipo de rastreo en la página 689](#) está establecido en **Convencional**.

Mesa 320: Rango

Mínimo	Máximo	Incrementos
1 m	255 m	1 m

10.48.3

Miembros de la lista de rastreo

Esta sección le permite seleccionar los canales de comunicaciones convencionales o de troncalización deseados desde zonas específicas para la Lista de rastreo actual.

Cuando el radio está funcionando en el modo Rastreo, estos canales seleccionados se pueden rastrear (uno a la vez) para la actividad de transmisión, lo que permite de este modo muchos canales de recepción posibles. Se debe programar el rastreo de Miembro prioritario de la lista de rastreo.

NOTA:

El radio solo explora la Lista de rastreo asignada al canal que está funcionando actualmente.

Los canales de comunicaciones de troncalización o convencionales de Miembro de lista de rastreo deben estar definidos en [Asignación de canal de zonas en la página 676](#) antes de efectuar la Lista de rastreo.

Las Listas de rastreo individuales se pueden asignar a [Personalidad convencional en la página 429](#) y [Personalidad de troncalización ASTRO 25 en la página 633](#) con sus respectivos campos Selección de lista de rastreo.

Puede iniciar el modo Rastrear automáticamente mediante el Rastreo automático o la pulsación del botón [Rastreo en la página 193](#), el switch de alternación [Rastreo en la página 206](#) o la selección del menú [Rastreo en la página 223](#).

ADVERTENCIA:

Cuando una Lista de rastreo contiene 250 o más Miembros de lista de rastreo (registro/fila) y 5 o más [Sistema de troncalización ASTRO 25 en la página 585](#) (dentro de estos canales), el rendimiento del radio en modo Rastreo puede reducirse significativamente.

Para condiciones que determinan las selecciones válidas del canal de Miembro de lista de rastreo para los Tipos de lista de rastreo disponibles, consulte las selecciones de [Tipo de rastreo en la página 689](#).

10.48.3.1

Posición

Este campo de solo lectura es asignado por RadioCentral e identifica el orden del elemento en una lista.

NOTA:

Solo se accede: Cuando el radio depende de modelos u opciones diferentes.

10.48.3.2

Zona

En este campo, se selecciona una zona para el Miembro de lista de rastreo actual (registro o fila) dentro de la Lista de rastreo actual.

Una vez que se selecciona esta zona, un canal de la zona debe seleccionarse para el mismo registro o fila. Consulte también la ventana [Asignación de canal de zonas en la página 676](#).

ADVERTENCIA:

Si la función ampliada **Capacidad de rastreo de zona dinámica** no está disponible, las zonas dinámicas no son válidas y no se pueden seleccionar (zonas que tienen la opción [Zona dinámica activada](#) activada). En caso contrario, las zonas dinámicas podrán seleccionarse.

Las zonas de la interfaz de sitios remotos (RSI) no son válidas y no se pueden seleccionar (zonas con [Modo RSI](#) activado).

10.48.3.3

Canal

En este campo se selecciona un canal para el Miembro de lista de rastreo actual (registro/fila) dentro de la Lista de rastreo actual.

El campo Zona de Miembro de lista de rastreo debe seleccionarse para el mismo registro o fila antes de que la selección de este canal sea posible.

**ADVERTENCIA:**

Para conocer las condiciones que determinan una selección de canal válida para los diferentes tipos de lista de rastreo, consulte las selecciones de [Tipo de rastreo en la página 689](#).

Cuando el campo [Tipo de cobertura en la página 519](#) del sistema de troncalización está configurado en **Roaming Inter-WACN** y el Tipo de rastreo es **Grupo de conversación de varios sistemas**, entonces [ID de WACN TG en la página 633](#) y [ID de sistema TG en la página 632](#) del [Grupo de conversación de troncalización en la página 680](#) asignado a esta selección de canales debe coincidir con el ID de WACN doméstico y el ID del sistema del sistema de troncalización. De lo contrario, la aplicación considera esta selección de canal como no válida.

La aplicación considera que esta selección de canales no es válida cuando el campo [Miembro de datos designados en la página 698](#) hace referencia a un canal convencional de banda ancha LTE activado y otro canal de miembros de la lista de rastreo (de la misma lista de rastreo) hace referencia a un canal Convencional que tiene su campo [Frecuencia de interferencia LTE presente en la página 437](#) establecido en **Activado**, o un canal de troncalización cuyo campo [Frecuencia de interferencia LTE presente en la página 601](#) está establecido en **Verdadero**. Un canal convencional tiene LTE activada cuando el sistema convencional ASTRO mencionado de la personalidad tiene un perfil de datos al que se hace referencia con un [Tipo del perfil de datos en la página 376](#) igual a **Convencional y banda ancha** o **Solo banda ancha**, y cuando [Fuente de banda ancha](#) del Perfil de datos es **Módem de LTE interno**.

Si la función ampliada "Capacidad de rastreo de zona dinámica" y el canal es un canal dinámico:

- Si [Tipo de rastreo en la página 689](#) está establecido en **Rastreo de elección**, el Canal dinámico no es válido.
- Si [Tipo de rastreo en la página 689](#) está establecido en **Convencional, Monitor prioritario** o **Grupo de conversación de varios sistemas**, el Canal dinámico sin ninguna asignación es válido.
- Si [Tipo de rastreo en la página 689](#) es **Convencional, Monitor prioritario, Grupo de conversación de varios sistemas** o **Prioridad inteligente**, el Canal dinámico con asignación se considerará como otros canales normales.

**NOTA:****Solo se accede:**

- El campo [Zona en la página 700](#) no está establecido como **Sin asignar** y la zona no es una Zona dinámica.
- El campo [Zona en la página 700](#) no está establecido como **Sin asignar**.
- La zona es una Zona dinámica con la disponibilidad de **Capacidad de rastreo de zona dinámica**.

10.49

Perfiles de radio

La sección **Perfiles de radio** permite ver o definir Perfiles de radio individuales. Los perfiles de radio permiten que se combinen distintas configuraciones de indicadores y audio para canales específicos de radio o para escenarios específicos de uso en terreno.

**NOTA:**

Los perfiles de radio están seleccionados para su uso por canal desde la Asignación de canales de zona del campo Perfil de radio.

La pulsación del botón Perfiles de radio o la selección del menú Perfiles de radio permiten modificar la asignación del Perfil de radio de un canal.

10.49.1

General

Esta sección permite ver o modificar las configuraciones para Perfiles de radio individuales.

**NOTA:**

Los perfiles de radio están seleccionados para su uso por canal desde la Asignación de canales de zona del campo Perfil de radio.

La pulsación del botón Perfiles de radio o la selección del menú Perfiles de radio permiten modificar la asignación del Perfil de radio de un canal.

10.49.1.1

Nombre del perfil del radio

Este campo le permite ver o definir nombres reconocibles para el Perfil de radio actual.

Los perfiles de radio están seleccionados para su uso por canal desde la Asignación de canales de zona del campo Perfil de radio.

**NOTA:**

Para su comodidad, se han proporcionado tres registros de perfiles DE radio con un nombre predefinido: **Predeterminado**, **Supervisión** y **Audio fuerte**. Puede cambiar todos los nombres sugeridos. Estos perfiles deben definirse de acuerdo con la necesidad; se pueden crear más perfiles.

**NOTA:**

Ejemplos: PROFILE-001, #500, Electric1, # A5.

Se pueden usar caracteres, números, espacios y caracteres especiales.

Es posible usar un total de 14 caracteres.

El nombre del perfil del radio aparece en la pantalla frontal.

10.49.1.2

Luz de fondo de la pantalla frontal permanente

Este campo hace que la luz de fondo de la pantalla frontal ilumine de manera permanente.

Esta selección se aplica al Perfil de radio actual.

**IMPORTANTE:**

Cuando este campo está habilitado, habrá un desgaste mayor de la vida de la batería estándar de aproximadamente 20 minutos menos de duración para un ciclo de trabajo normal

Cuando el campo Desactivar luces está habilitado, esta función no se aplicará.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.49.1.3

Luz de fondo de la pantalla superior permanente

Si esta opción está activada, este campo permite que la luz de fondo de la pantalla superior del radio se ilumine de forma permanente.

Esta selección se aplica al Perfil de radio actual.

IMPORTANTE:

Cuando este campo está habilitado, habrá un desgaste mayor de la vida de la batería estándar de aproximadamente 20 minutos menos de duración para un ciclo de trabajo normal.

Cuando el campo Desactivar luces está habilitado, esta función no se aplicará.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.49.1.4

Control de volumen con detección de ruido

Si este campo está activado, el radio establecerá automáticamente el volumen del altavoz a un nivel adecuado para el entorno de escucha.

Esta función no es compatible con altavoces inalámbricos ni micrófonos en altavoz del radio (RSM) con cable.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.49.1.5

Enrutamiento de audio de altavoz

En este campo se selecciona el enrutamiento del audio a los altavoces internos del radio.

Esta selección se aplica al Perfil de radio actual.

IMPORTANTE:

El dispositivo portátil de pantalla dual está equipado con dos altavoces internos, uno a cada lado del radio. Para este modelo, se puede enrutar el audio a cada parlante de manera independiente (o a ambos).

El dispositivo portátil de pantalla superior está equipado con solo un altavoz. Para este modelo, se puede activar o desactivar el audio a este parlante.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.49.1.6

Desactivar luces

Este campo hace que todos los LED y luces de fondo de un radio y sus accesorios, como el DRSM, se desactiven del Perfil de radio actual.

Esta función es útil durante operaciones encubiertas/de vigilancia.

IMPORTANTE:

Cuando está desactivada, los radios equipados con Encryption Tipo 1 no funcionarán. La Encryption Tipo 1 requiere que sea capaz de distinguir (según los colores de las luces LED) una llamada entrante o saliente con encryption tipo 1.

Para el Cabezal de control O9 móvil, la selección Desactivar luces/LED del Modo silencioso invalida esta selección cuando el botón de Modo sigiloso exclusivo está en posición ENCENDIDO. Una vez que el Modo silencioso está APAGADO, el radio se devuelve a su configuración de Perfil de radio.

10.49.1.7

Desactivar tonos

Este campo hace que todos los tonos de alerta, tonos laterales y tonos de teclado del radio se desactiven para el Perfil de radio actual.

Esta selección es útil durante las operaciones encubiertas/de vigilancia.

NOTA:

Para el Cabezal de control O9 móvil, la selección de Modo silencioso, Desactivar tonos invalida esta selección cuando el botón de Modo silencioso está en la posición ENCENDIDO. Una vez que el Modo silencioso está APAGADO, el radio se devuelve a su configuración de Perfil de radio.

10.49.1.8

Desactivar notificación de emergencia

Este campo hace que se desactive la Iluminación inteligente que indica el Modo de emergencia.

Esta selección se aplica al Perfil de radio actual.

NOTA:

Cuando el campo Desactivar luces está habilitado, la luz de fondo de colores no se encenderá.

10.49.1.9

Desactivar notificación crítica

Este campo hace que se desactive la Iluminación inteligente para el diagnóstico automático y la detección de fallas. Esto se aplica cuando el radio es el modelo de Normas de servicio contra incendios más recientes y en un canal compatible con Modo Sin Peligro.

Esta selección se aplica al Perfil de radio actual.

NOTA:

Cuando el campo Desactivar luces está activado, la luz de fondo de color se desactiva.

10.49.1.10

Desactivar notificación de llamada

Este campo hace que se desactive la Iluminación inteligente para las llamadas recibidas.

Esta selección se aplica al Perfil de radio actual.

IMPORTANTE:

Cuando el campo [Desactivar luces en la página 704](#) está activado, la luz de fondo de colores no se encenderá.

10.49.2

Configuración de audio: No APX3000 (Perfiles de radio)

La sección **Configuración de audio: No APX3000** del conjunto Perfiles de radio permite al usuario ver o modificar diversas configuraciones de micrófono y audio, configuraciones de volumen de tono de alerta y configuraciones de micrófono y audio personalizadas que se aplican para perfiles de radio diferentes al APX3000.

NOTA:

Los perfiles de radio están seleccionados para su uso por canal desde la Asignación de canales de zona del campo Perfil de radio.

La pulsación del botón Perfiles de Radio o la selección del menú de los Perfiles de Radio permiten que el usuario del radio modifique la asignación de canal de un Perfil de radio.

10.49.2.1

Configuración del grupo de reducción de ruido

En este campo se predefine un conjunto de valores para los campos de la sección de ecualización de audio en el grupo Micrófono/Ajustes de TX.

Cuando el valor Configuración de grupo cambia a un valor distinto de **Personalizar**, el valor de los campos en esa sección cambia según corresponda. Cuando la configuración de grupo no está configurada en **Personalizar**, entonces todos los campos se vuelven de solo visualización.

La siguiente lista enumera las selecciones y definiciones para Configuración de grupo de reducción de ruido (Radio).

Desactivado

El valor de los siguientes campos se configura como: Reducción de ruido personalizada está **Desactivada**, Nivel de reducción de ruido de fondo está **Apagado**, Nivel de reducción de ruido del viento está **Apagado**, Alarma PASS está **Desactivada**, Selección de perfil de reducción de ruido es **Radio NR 1**, Modo de reducción de ruido de fondo es **Encendido/Aplicado**, Modo de reducción de ruido del viento está **Encendido/Activo**, Modo seguro está en **Automático completo** y Modo de directividad está **Encendido/adaptando**.

Normal

El valor de los siguientes campos se configura como: Reducción de ruido personalizada está **Desactivada**, Nivel de reducción de ruido de fondo es **Normal**, Nivel de reducción de ruido del viento es **Normal**, Alarma PASS está **Desactivada**, Selección de perfil de reducción de ruido es **Radio NR 1**, Modo de reducción de ruido de fondo está **Encendido/Aplicado**, Modo de reducción de ruido del viento está **Encendido/Activo**, Modo seguro es **Automático completo** y Modo de directividad está **Encendido/adaptando**.

Agresivo

El valor de los siguientes campos se configura como: Reducción de ruido personalizada está **Desactivada**, Nivel de reducción de ruido de fondo es **Agresivo**, Nivel de reducción de ruido del viento es **Normal**, Alarma PASS está **Desactivada**, Selección de perfil de reducción de ruido es **Radio NR 1**, Modo de reducción de ruido de fondo está **Encendido/Aplicado**, Modo de reducción de ruido del viento está **Encendido/Activo**, Modo seguro es **Automático completo** y Modo de directividad está **Encendido/adaptando**.

Extremo

El valor de los siguientes campos se configura como: Reducción de ruido personalizada está **Desactivada**, Nivel de reducción de ruido de fondo es **Extreme_1-sided**, Nivel de reducción de ruido del viento es **Normal**, Alarma PASS está **Activada**, Selección de perfil de reducción de ruido es **Radio NR 1**, Modo de reducción de ruido de fondo está **Encendido/Aplicado**, Modo de reducción de ruido del viento está **Encendido/Activo**, Modo seguro es **Automático completo** y Modo de directividad está **Encendido/adaptando**.

Auto

El valor de los siguientes campos se configura como: Reducción de ruido personalizada está **Desactivada**, Nivel de reducción de ruido de fondo es **Automático**, Nivel de reducción de ruido del viento es **Normal** y Alarma PASS está **Activada**. Activación del perfil de autoagresividad de reducción de ruido. Esta selección solo se aplica cuando el radio admite modelos y opciones diferentes.

La siguiente lista enumera las selecciones y definiciones para Configuración de grupo de reducción de ruido (Accesorio).

Desactivado

El valor de los siguientes campos se configura como: Reducción de ruido personalizada está **Desactivada**, Nivel de reducción de ruido de fondo está **Apagado**, Nivel de reducción de ruido del viento está **Apagado**, Alarma PASS está **Desactivada**, Selección de perfil de reducción de ruido es **Acc NR 1**, Modo de reducción de ruido de fondo está **Encendido/Aplicado**, Modo de reducción

de ruido del viento está **Encendido/Activo**, Modo seguro es **Mic 1** y Modo de directividad está **Encendido/adaptando**.

Normal

El valor de los siguientes campos se configura como: Reducción de ruido personalizada está **Desactivada**, Nivel de reducción de ruido de fondo es **Normal**, Nivel de reducción de ruido del viento es **Normal**, Alarma PASS está **Desactivada**, Selección de perfil de reducción de ruido es **Acc NR 1**, Modo de reducción de ruido de fondo está **Encendido/Aplicado**, Modo de reducción de ruido del viento está **Encendido/Activo**, Modo seguro es **Mic 1** y Modo de directividad está **Encendido/adaptando**.

Agresivo

El valor de los siguientes campos se configura como: Reducción de ruido personalizada está **Desactivada**, Nivel de reducción de ruido de fondo es **Agresivo**, Nivel de reducción de ruido del viento es **Normal**, Alarma PASS está **Desactivada**, Selección de perfil de reducción de ruido es **Acc NR 1**, Modo de reducción de ruido de fondo está **Encendido/Aplicado**, Modo de reducción de ruido del viento está **Encendido/Activo**, Modo seguro es **Mic 1** y Modo de directividad está **Encendido/adaptando**.

Extremo

El valor de los siguientes campos se configura como: Reducción de ruido personalizada está **Desactivada**, Nivel de reducción de ruido de fondo es **Extreme_1-sided**, Nivel de reducción de ruido del viento es **Normal**, Alarma PASS está **Activada**, Selección de perfil de reducción de ruido es **Acc NR 1**, Modo de reducción de ruido de fondo está **Encendido/Aplicado**, Modo de reducción de ruido del viento está **Encendido/Activo**, Modo seguro es **Mic 1** y Modo de directividad está **Encendido/adaptando**.

Auto

El valor de los siguientes campos se configura como: Reducción de ruido personalizada está **Desactivada**, Nivel de reducción de ruido de fondo es **Automático**, Nivel de reducción de ruido del viento es **Normal** y Alarma PASS está **Activada**. Activación del perfil de autoagresividad de reducción de ruido. Esta selección solo se aplica cuando el radio admite modelos y opciones diferentes.

Solo se accede: Esta es una configuración avanzada que solo está disponible en la Vista completa (ver Vista del codeplug).

10.49.2.2

Configuración de grupo (Accesorio)

El propósito de Configuración de grupo de reducción de ruido es predefinir un conjunto de valores para los campos de la sección Reducción de ruido bajo el grupo Micrófono/Configuración de TX.

Cuando el valor Configuración de grupo cambia a un valor distinto de **Personalizar**, el valor de los campos en esa sección cambia según corresponda. Cuando la configuración de grupo no está configurada en **Personalizar**, entonces todos los campos se vuelven de solo visualización.

NOTA:

Para la configuración **Personalizada**, se recomienda tener un conocimiento experto de las diferentes configuraciones de reducción de ruido antes de realizar ajustes individuales.

La siguiente lista enumera las selecciones y definiciones para Configuración de grupo de reducción de ruido (Accesorio).

Desactivado

El valor de los siguientes campos se configura como: Reducción de ruido personalizada está **Desactivada**, Nivel de reducción de ruido de fondo está **Apagado**, Nivel de reducción de ruido del viento está **Apagado**, Alarma PASS está **Desactivada**, Selección de perfil de reducción de ruido es **Acc NR 1**, Modo de reducción de ruido de fondo está **Encendido/Aplicado**, Modo de reducción de ruido del viento está **Encendido/Activo**, Modo seguro es **Mic 1** y Modo de directividad está **Encendido/adaptando**.

Normal

El valor de los siguientes campos se configura como: Reducción de ruido personalizada está **Desactivada**, Nivel de reducción de ruido de fondo es **Normal**, Nivel de reducción de ruido del viento es **Normal**, Alarma PASS está **Desactivada**, Selección de perfil de reducción de ruido es **Acc NR 1**, Modo de reducción de ruido de fondo está **Encendido/Aplicado**, Modo de reducción de ruido del viento está **Encendido/Activo**, Modo seguro es **Mic 1** y Modo de directividad está **Encendido/adaptando**.

Agresivo

El valor de los siguientes campos se configura como: Reducción de ruido personalizada está **Desactivada**, Nivel de reducción de ruido de fondo es **Agresivo**, Nivel de reducción de ruido del viento es **Normal**, Alarma PASS está **Desactivada**, Selección de perfil de reducción de ruido es **Acc NR 1**, Modo de reducción de ruido de fondo está **Encendido/Aplicado**, Modo de reducción de ruido del viento está **Encendido/Activo**, Modo seguro es **Mic 1** y Modo de directividad está **Encendido/adaptando**.

Extremo

El valor de los siguientes campos se configura como: Reducción de ruido personalizada está **Desactivada**, Nivel de reducción de ruido de fondo es **Extreme_1-sided**, Nivel de reducción de ruido del viento es **Normal**, Alarma PASS está **Activada**, Selección de perfil de reducción de ruido es **Acc NR 1**, Modo de reducción de ruido de fondo está **Encendido/Aplicado**, Modo de reducción de ruido del viento está **Encendido/Activo**, Modo seguro es **Mic 1** y Modo de directividad está **Encendido/adaptando**.

Auto

El valor de los siguientes campos se configura como: Reducción de ruido personalizada está **Desactivada**, Nivel de reducción de ruido de fondo es **Automático**, Nivel de reducción de ruido del viento es **Normal** y Alarma PASS está **Activada**. Activación del perfil de autoagresividad de reducción de ruido. Esta selección solo se aplica cuando el radio admite modelos y opciones diferentes.

Personalizado

Utilice la opción Personalizado para establecer de forma individual configuraciones de ganancia de Ecuación de audio de altavoz únicas para el radio que no son compatibles con las otras opciones del menú Configuración de grupo. Se recomienda evitar la configuración máxima para las mismas bandas de frecuencia entre las ecualizaciones del micrófono y el altavoz.

10.49.2.3

Reducción de ruido personalizada

Este campo permite que los micrófonos de Radio o Accesorio del radio usen Perfil de reducción de ruido del radio o Perfil de reducción de ruido de accesorio personalizados diseñados para condiciones de ruido específicas.

**ADVERTENCIA:**

Las configuraciones de Reducción de ruido de micrófono personalizado deben ser implementadas solo por Personal de servicio calificado. Si las configuraciones no se realizan adecuadamente, la supresión de ruido de micrófono puede degradarse seriamente y, en consecuencia, la inteligibilidad del discurso transmitido.

Se recomienda utilizar la configuración Reducción de ruido del radio y Reducción de ruido del accesorio para la mayoría de los ambientes ruidosos.

**NOTA:**

La reducción de ruido mejora la claridad de la voz al reducir el ruido ambiental. La reducción de ruido ocurre en el radio transmisor antes de la transmisión (en modo análogo) y antes de la codificación de voz (en modo digital). Con la reducción de ruido ambiental no solo mejora la claridad de la voz en el modo de transmisión análogo, en el modo digital, cuando llega una señal más clara al codificador de voz (vocoder) se recibirá y decodificará una voz más clara en el receptor.

10.49.2.4

Reducción de ruido personalizada (Accesorio)

Permite que los micrófonos de Radio/accesorio del radio usen Perfil de reducción de ruido del radio o Perfil de reducción de ruido de accesorio personalizados diseñados para condiciones de ruido específicas.

**ADVERTENCIA:**

Las configuraciones de Reducción de ruido de micrófono personalizado deben ser implementadas solo por Personal de servicio calificado. Si las configuraciones no se realizan adecuadamente, la supresión de ruido de micrófono puede degradarse seriamente y, en consecuencia, la inteligibilidad del discurso transmitido.

Se recomienda utilizar la configuración Reducción de ruido del radio y Reducción de ruido del accesorio para la mayoría de los ambientes ruidosos.

**NOTA:**

La reducción de ruido mejora la claridad de la voz al reducir el ruido ambiental. La reducción de ruido ocurre en el radio transmisor antes de la transmisión (en modo análogo) y antes de la codificación de voz (en modo digital). Con la reducción de ruido ambiental no solo mejora la claridad de la voz en el modo de transmisión análogo, en el modo digital, cuando llega una señal más clara al codificador de voz (vocoder) se recibirá y decodificará una voz más clara en el receptor.

10.49.2.5

Nivel de reducción de ruido de fondo (radio)

Selecciona el nivel de reducción de ruido de fondo que se aplica a los micrófonos duales internos y a un micrófono externo.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Esta selección se aplica al Perfil de radio actual.

**NOTA:**

La reducción de ruido mejora la claridad de la voz al reducir el ruido ambiental. La reducción de ruido ocurre en el radio transmisor antes de la transmisión (en modo análogo) y antes de la codificación de voz (en modo digital). Con la reducción de ruido ambiental no solo mejora la claridad de la voz en el modo de transmisión análogo, en el modo digital, cuando llega una señal más clara al codificador de voz (vocoder) se recibirá y decodificará una voz más clara en el receptor.

Solo se accede: Cuando el campo Reducción de ruido personalizada está desactivado.

La siguiente lista muestra las selecciones y definiciones para Nivel de reducción de ruido de fondo (Radio).

Desactivado

Deshabilita la reducción de ruido ambiental del micrófono dual. Ambos micrófonos permanecen activos, y el usuario del radio puede hablar en cualquiera de los lados del radio, pero no se aplica la reducción de ruido de fondo.

Normal

Ambos micrófonos permanecen activos y se adaptan continuamente a la señal de voz para una claridad óptima sobre una amplia gama de ruido ambiental. Configuración recomendada para la mayoría de los ambientes ruidosos.

Agresivo

Habilita un nivel aumentado de reducción de ruido ambiental. Recomendado para ambientes muy ruidosos.

Xtreme 1_Sided

Habilita la cantidad máxima de reducción de ruido ambiental. Se recomienda para entornos de ruido EXTREMADAMENTE ALTOS, por ejemplo: Alarma PASS (sistema de seguridad de alerta persona) de bomberos, alerta de baja cantidad de aire, camión autobomba, ventilador de gas, sierra.

**NOTA:**

Esta configuración requiere que el usuario del radio hable del lado del radio que tiene el altavoz grande. Esta selección solo se aplica cuando el radio admite modelos y opciones diferentes.

Auto

Activación del perfil de autoagresividad de reducción de ruido.

**NOTA:**

Esta selección solo se aplica cuando el radio admite modelos y opciones diferentes.

La siguiente lista muestra las selecciones y definiciones para Nivel de reducción de ruido de fondo (Accesorio).

Desactivado

Deshabilita la reducción de ruido ambiental. El micrófono externo continúa activo pero no se aplica reducción de ruido.

Normal

El micrófono externo se adapta continuamente a la señal de voz para una claridad óptima sobre una amplia gama de ruido ambiental. Configuración recomendada para la mayoría de los ambientes ruidosos.

Xtreme 1_Sided

Habilita la cantidad máxima de reducción de ruido ambiental. Se recomienda para entornos de ruido EXTREMADAMENTE ALTOS, por ejemplo: Alarma PASS de bomberos, alerta de baja cantidad de aire, camión autobomba, ventilador de gas, sierra.

**NOTA:**

Esta configuración requiere que el usuario del radio hable del lado del radio que tiene el altavoz grande. Esta selección solo se aplica cuando el radio admite modelos y opciones diferentes.

Auto

Activación del perfil de autoagresividad de reducción de ruido.

**NOTA:**

Esta selección solo se aplica cuando el radio admite modelos y opciones diferentes.

10.49.2.6

Nivel de reducción de ruido de fondo (accesorio)

Selecciona el nivel de reducción de ruido de fondo que se aplica a los micrófonos duales internos y a un micrófono externo.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Esta selección se aplica al Perfil de radio actual.

**NOTA:**

La reducción de ruido mejora la claridad de la voz al reducir el ruido ambiental. La reducción de ruido ocurre en el radio transmisor antes de la transmisión (en modo análogo) y antes de la codificación de voz (en modo digital). Con la reducción de ruido ambiental no solo mejora la claridad de la voz en el modo de transmisión análogo, en el modo digital, cuando llega una señal más clara al codificador de voz (vocoder) se recibirá y decodificará una voz más clara en el receptor.

Solo se accede: Cuando el campo Reducción de ruido personalizada está desactivado.

La siguiente lista muestra las selecciones y definiciones para Nivel de reducción de ruido de fondo (Radio).

Desactivado

Deshabilita la reducción de ruido ambiental del micrófono dual. Ambos micrófonos permanecen activos, y el usuario del radio puede hablar en cualquiera de los lados del radio, pero no se aplica la reducción de ruido de fondo.

Normal

Ambos micrófonos permanecen activos y se adaptan continuamente a la señal de voz para una claridad óptima sobre una amplia gama de ruido ambiental. Configuración recomendada para la mayoría de los ambientes ruidosos.

Agresivo

Habilita un nivel aumentado de reducción de ruido ambiental. Recomendado para ambientes muy ruidosos.

Xtreme 1_Sided

Habilita la cantidad máxima de reducción de ruido ambiental. Se recomienda para entornos de ruido EXTREMADAMENTE ALTOS, por ejemplo: Alarma del Sistema de seguridad de alerta personal de bomberos (PASS), alertas de baja cantidad de aire, camión autobomba, ventilador de gas, sierra.

**NOTA:**

Esta configuración requiere que el usuario del radio hable del lado del radio que tiene el altavoz grande. Esta selección solo se aplica cuando el radio admite modelos y opciones diferentes.

Auto

Activación del perfil de autoagresividad de reducción de ruido.

**NOTA:**

Esta selección solo se aplica cuando el radio admite modelos y opciones diferentes.

La siguiente lista muestra las selecciones y definiciones para Nivel de reducción de ruido de fondo (Accesorio).

Desactivado

Deshabilita la reducción de ruido ambiental. El micrófono externo continúa activo pero no se aplica reducción de ruido.

Normal

El micrófono externo se adapta continuamente a la señal de voz para una claridad óptima sobre una amplia gama de ruido ambiental. Configuración recomendada para la mayoría de los ambientes ruidosos.

Agresivo

Habilita un nivel aumentado de reducción de ruido ambiental. Recomendado para ambientes muy ruidosos.

Xtreme 1_Sided

Habilita la cantidad máxima de reducción de ruido ambiental. Se recomienda para entornos de ruido EXTREMADAMENTE ALTOS, por ejemplo: Alarma PASS de bomberos, alerta de baja cantidad de aire, camión autobomba, ventilador de gas, sierra.

**NOTA:**

Esta configuración requiere que el usuario del radio hable del lado del radio que tiene el altavoz grande. Esta selección solo se aplica cuando el radio admite modelos y opciones diferentes.

Auto

Activación del perfil de autoagresividad de reducción de ruido.

**NOTA:**

Esta selección solo se aplica cuando el radio admite modelos y opciones diferentes.

10.49.2.7

Nivel de reducción de ruido del viento (radio)

Selecciona el nivel de reducción de ruido del viento que se aplica a los micrófonos duales internos y al micrófono externo.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Esta selección se aplica al Perfil de radio actual.

**NOTA:**

La reducción de ruido mejora la claridad de la voz al reducir el ruido ambiental. La reducción de ruido ocurre en el radio transmisor antes de la transmisión (en modo análogo) y antes de la codificación de voz (en modo digital). Con la reducción de ruido ambiental no solo mejora la claridad de la voz en el modo de transmisión análogo, en el modo digital, cuando llega una señal más clara al codificador de voz (vocoder) se recibirá y decodificará una voz más clara en el receptor.

Solo se accede: Cuando el campo Reducción de ruido personalizada está desactivado.

La siguiente tabla enumera las selecciones y definiciones para Configuración de reducción del ruido del viento (Radio).

Desactivado

Deshabilita la reducción de ruido de viento del micrófono dual. Ambos micrófonos permanecen activos, y el usuario de la radio puede hablar en cualquiera de los lados de la radio, pero no se aplica la reducción de ruido del viento.

Normal

Ambos micrófonos permanecen activos y se adaptan continuamente a la señal de voz para una claridad óptima sobre una amplia gama de ruido.

**NOTA:**

Configuración recomendada para la mayoría de los ambientes.

Agresivo

Esta habilitado un nivel aumentado de reducción de ruido de viento.

**NOTA:**

Se recomienda para ambientes muy ruidosos.

10.49.2.8

Nivel de reducción de ruido del viento (accesorio)

En la siguiente tabla se indican la selección y definición para el nivel de reducción de ruido del viento (accesorio).

**NOTA:**

Este es un campo no configurable y la configuración predeterminada es **Desactivado**.

Desactivado

Deshabilita la reducción de ruido de viento. El micrófono externo continúa activo pero no se aplica reducción de ruido de viento.

10.49.2.9

Filtro de alarma PASS (radio)

El filtro de alarma (radio) del Sistema de seguridad de alerta personal (PASS) permite la reducción del ruido de fondo para el micrófono interno del radio cada vez que el radio está transmitiendo en presencia de una alarma PASS activa.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

El filtro de alarma PASS (accesorio) permite la reducción del ruido de fondo para el micrófono externo del radio cada vez que el radio está transmitiendo en presencia de una alarma PASS activa. Esta selección se aplica al Perfil de radio actual.

Las selecciones compatibles son **Desactivado** y **Activado**.

**NOTA:**

La reducción de ruido mejora la claridad de la voz al reducir el ruido ambiental. La reducción de ruido ocurre en el radio transmisor antes de la transmisión (en modo análogo) y antes de la codificación de voz (en modo digital). Con la reducción de ruido ambiental no solo mejora la claridad de la voz en el modo de transmisión análogo, en el modo digital, cuando llega una señal más clara al codificador de voz (vocoder) se recibirá y decodificará una voz más clara en el receptor.

Solo se accede:

Cuando el campo Activación de reducción de ruido personalizada está desactivado, y

(Cuando el campo Nivel de reducción de ruido de fondo no está establecido en **Apagado** y cuando el campo Nivel de reducción de ruido del viento no está establecido en **Apagado**).

10.49.2.10

Filtro de alarma PASS (accesorio)

El filtro de alarma del Sistema de seguridad de alerta personal (PASS) permite la reducción del ruido de fondo para el micrófono interno del radio cada vez que el radio está transmitiendo en presencia de una alarma PASS activa.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

El filtro de alarma PASS (accesorio) permite la reducción del ruido de fondo para el micrófono externo del radio cada vez que el radio está transmitiendo en presencia de una alarma PASS activa. Esta selección se aplica al Perfil de radio actual.

Las selecciones compatibles están configuradas en **Activado** y **Desactivado**.

**NOTA:**

La reducción de ruido mejora la claridad de la voz al reducir el ruido ambiental. La reducción de ruido ocurre en el radio transmisor antes de la transmisión (en modo análogo) y antes de la codificación de voz (en modo digital). Con la reducción de ruido ambiental no solo mejora la claridad de la voz en el modo de transmisión análogo, en el modo digital, cuando llega una señal más clara al codificador de voz (vocoder) se recibirá y decodificará una voz más clara en el receptor.

Solo se accede:

Cuando el campo Activación de reducción de ruido personalizada está desactivado, y

(Cuando el campo Nivel de reducción de ruido de fondo no está establecido en **Apagado** y cuando el campo Nivel de reducción de ruido del viento no está establecido en **Apagado**).

10.49.2.11

Selección de perfil de reducción de ruido

Esta configuración personalizada se aplica solo cuando el campo Reducción de ruido personalizada está seleccionado en el perfil del radio al que se hace referencia.

**ADVERTENCIA:**

No modifique la configuración de Reducción de ruido personalizada a menos que sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

Los Perfiles del radio hacen referencia a un canal específico con el campo **Selección del perfil del radio** de la página del canal de Asignación de canal de zona.

10.49.2.12

Selección de perfil de reducción de ruido (accesorio)

Permite que los micrófonos de Radio/accesorio del radio usen Perfil de reducción de ruido del radio o Perfil de reducción de ruido de accesorio personalizados diseñados para condiciones de ruido específicas.

**ADVERTENCIA:**

Las configuraciones de Reducción de ruido de micrófono personalizado deben ser implementadas solo por Personal de servicio calificado. Si las configuraciones no se realizan adecuadamente, la supresión de ruido de micrófono puede degradarse seriamente y, en consecuencia, la inteligibilidad del discurso transmitido.

Se recomienda utilizar la configuración Reducción de ruido del radio y Reducción de ruido del accesorio para la mayoría de los ambientes ruidosos.

**NOTA:**

La reducción de ruido mejora la claridad de la voz al reducir el ruido ambiental. La reducción de ruido ocurre en el radio transmisor antes de la transmisión (en modo análogo) y antes de la codificación de voz (en modo digital). Con la reducción de ruido ambiental no solo mejora la claridad de la voz en el modo de transmisión análogo, en el modo digital, cuando llega una señal más clara al codificador de voz (vocoder) se recibirá y decodificará una voz más clara en el receptor.

10.49.2.13

Modo de reducción de ruido de fondo (radio)

Esta configuración personalizada se aplica solo cuando el campo Reducción de ruido personalizada está seleccionado en el perfil del radio al que se hace referencia.

**ADVERTENCIA:**

No modifique la configuración de Reducción de ruido personalizada, a menos que el usuario sea parte del personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

Los Perfiles del radio hacen referencia a un canal específico con el campo **Selección del perfil del radio** de la página del canal de Asignación de canal de zona.

10.49.2.14

Modo de reducción de ruido de fondo (accesorio)

Esta configuración personalizada se aplica solo cuando el campo Reducción de ruido personalizada está seleccionado en el perfil del radio al que se hace referencia.

**ADVERTENCIA:**

No modifique la configuración de Reducción de ruido personalizada, a menos que el usuario sea parte del personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

Los Perfiles del radio hacen referencia a un canal específico con el campo **Selección del perfil del radio** de la página del canal de Asignación de canal de zona.

10.49.2.15

Modo de reducción de ruido del viento (radio)

Esta configuración personalizada se aplica solo cuando el campo Reducción de ruido personalizada está seleccionado en el perfil del radio al que se hace referencia.

**ADVERTENCIA:**

No modifique la configuración de Reducción de ruido personalizada, a menos que el usuario sea parte del personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

Los Perfiles del radio hacen referencia a un canal específico con el campo **Selección del perfil del radio** de la página del canal de Asignación de canal de zona.

10.49.2.16

Modo de reducción de ruido del viento (accesorio)

Esta configuración personalizada se aplica solo cuando el campo Reducción de ruido personalizada está seleccionado en el perfil del radio al que se hace referencia.

**ADVERTENCIA:**

No modifique la configuración de Reducción de ruido personalizada, a menos que el usuario sea parte del personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

Los Perfiles del radio hacen referencia a un canal específico con el campo **Selección del perfil del radio** de la página del canal de Asignación de canal de zona.

10.49.2.17

Modo de fuente (radio)

Esta configuración personalizada se aplica solo cuando el campo Reducción de ruido personalizada está seleccionado en el perfil del radio al que se hace referencia.

**ADVERTENCIA:**

No modifique la configuración de Reducción de ruido personalizada, a menos que el usuario sea parte del personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

Los perfiles del radio hacen referencia a un canal específico con el campo Selección del perfil del radio de la página del canal de asignación de canal de zona.

Se admiten las siguientes selecciones:

- Transferencia 1
- Transferencia 2
- Automático completo
- Mic 1
- Mic 1 y Mic 2
- Mic 2
- Mic 3
- Desactivado
- Mic de proximidad 1
- Mic de proximidad 2

10.49.2.18

Modo seguro (accesorio)

Esta configuración personalizada se aplica solo cuando el campo Reducción de ruido personalizada está seleccionado en el perfil del radio al que se hace referencia.

**ADVERTENCIA:**

No modifique la configuración de Reducción de ruido personalizada, a menos que el usuario sea parte del personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

10.49.2.19

Modo de directividad (radio)

Esta configuración personalizada se aplica solo cuando el campo Reducción de ruido personalizada está seleccionado en el perfil del radio al que se hace referencia.

**ADVERTENCIA:**

No modifique la configuración de Reducción de ruido personalizada, a menos que el usuario sea parte del personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

Los Perfiles del radio hacen referencia a un canal específico con el campo **Selección del perfil del radio** de la página del canal de Asignación de canal de zona.

10.49.2.20

Modo de directividad (accesorio)

Esta configuración personalizada se aplica solo cuando el campo Reducción de ruido personalizada está seleccionado en el perfil del radio al que se hace referencia.

**ADVERTENCIA:**

No modifique la configuración de Reducción de ruido personalizada, a menos que el usuario sea parte del personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

10.49.2.21

Modo SAM

Altavoz como micrófono (SAM) es una fuente de audio alternativa.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

El rendimiento de audio mejora el ruido del viento cuando usa el Modo SAM.

Las selecciones disponibles son **Apagado**, **en** y **Wind_On**.

Si configura esta función en **Wind_On**, la entrada de audio del SAM funciona solo en condiciones con viento.

Solo se accede: Cuando el radio admite modelos y opciones diferentes y cuando el [Reducción de ruido personalizada en la página 708](#) está **Activado**.

10.49.2.22

Modo automático del micrófono del radio

Modo automático de mic de radio hace referencia a la configuración automática de la agresividad de supresión de ruido para el radio.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Las selecciones disponibles son **Apagado** y **Encendido**.

Solo se accede: Cuando el radio admite modelos y opciones diferentes y cuando el [Reducción de ruido personalizada en la página 708](#) está **Activado**.

10.49.2.23

Modo automático del micrófono del accesorio

Modo automático de mic de accesorio hace referencia a la configuración automática del nivel de agresividad de supresión de ruido para el accesorio.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Las selecciones disponibles son **Apagado** y **Encendido**.

Solo se accede: Cuando el radio admite modelos y opciones diferentes y cuando el [Reducción de ruido personalizada \(Accesorio\) en la página 709](#) está **Activado**.

10.49.2.24

Compensación de sobrecarga (Radio)

Este campo permite que una compensación automática para la sobrecarga de micrófono mejore el rendimiento de la reducción de ruido en condiciones con mucho ruido.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Las selecciones son **Apagado** y **Encendido**.

Solo se accede: Cuando el radio admite modelos y opciones diferentes y cuando el [Reducción de ruido personalizada en la página 708](#) está **Activado**.

10.49.2.25

Configuración de grupo (radio)

En este campo se predefine un conjunto de valores para los campos de Sección de sensibilidad/ganancia en Grupo de configuración de micrófono/TX.

Cuando el valor Configuración de grupo cambia a un valor distinto de **Personalizar**, el valor de los campos en esa sección cambia según corresponda. Cuando la configuración de grupo no está configurada en **Personalizar**, entonces todos los campos se vuelven de solo visualización.

A continuación, se enumeran las selecciones y definiciones para Ganancia / Configuración de grupo de sensibilidad (Radio) y Ganancia / Configuración de grupo de sensibilidad (Accesorio).

Normal

El valor de los siguientes campos se configura como: AGC analógico está **Activado**, AGC Digital está **Activado**, AGC de Securenet está **Activado**, Ganancia fija analógica es **0**, Ganancia fija digital es **0**, Ganancia fija de Securenet es **0**, Salida de control de ganancia es **0**, Total de control de ganancia es **6** y Balance digital/analógico está **Desactivado**.

Optimización de ruido

El valor de los siguientes campos se configura como: AGC analógico está **Desactivado**, AGC Digital está **Desactivado**, AGC de Securenet está **Desactivado**, Ganancia fija analógica es **-6**, Ganancia fija digital es **-6**, Ganancia fija de Securenet es **-6**, Salida de control de ganancia es **0**, Total de control de ganancia es **6** y Balance digital/analógico está **Activado**.

Salida alta

El valor de los siguientes campos se configura como: AGC analógico está **Activado**, AGC Digital está **Activado**, AGC de Securenet está **Activado**, Ganancia fija analógica es **0**, Ganancia fija digital es **0**, Ganancia fija de Securenet es **0**, Salida de control de ganancia es **6**, Total de control de ganancia es **9** y Balance digital/analógico está **Desactivado**.

Reducir retroalimentación

El valor de los siguientes campos se configura como: AGC analógico está **Desactivado**, AGC Digital está **Desactivado**, AGC de Securenet está **Desactivado**, Ganancia fija analógica es **-9**, Ganancia fija digital es **-9**, Ganancia fija de Securenet es **-9**, Salida de control de ganancia es **0**, Total de control de ganancia es **6** y Balance digital/analógico está **Activado**.

10.49.2.26

Configuración de grupo (Accesorio)

El propósito de este campo es predefinir un conjunto de valores para los campos de la sección Ganancia/Sensibilidad bajo el grupo Micrófono/configuración de TX.

Cuando el valor Configuración de grupo cambia a un valor distinto de **Personalizar**, el valor de los campos en esa sección cambia según corresponda. Cuando la configuración de grupo no está configurada en **Personalizar**, entonces todos los campos se vuelven de solo visualización.

A continuación, se enumeran las selecciones y definiciones para Ganancia / Configuración de grupo de sensibilidad (Radio) y Ganancia / Configuración de grupo de sensibilidad (Accesorio).

Normal

El valor de los siguientes campos se configura como: AGC analógico está **Activado**, AGC digital está **Activado**, AGC de Securenet está **Activado**, Ganancia fija analógica es **0**, Ganancia fija digital es **0**, Ganancia fija de Securenet es **0**, Salida de control de ganancia es **0**, Total de control de ganancia es **6** y Balance digital/analógico está **Desactivado**.

Optimización de ruido

El valor de los siguientes campos se configura como: AGC analógico está **Desactivado**, AGC Digital está **Desactivado**, AGC de Securenet está **Desactivado**, Ganancia fija analógica es **-6**, Ganancia fija digital es **-6**, Ganancia fija de Securenet es **-6**, Salida de control de ganancia es **0**, Total de control de ganancia es **6** y Balance digital/analógico está **Activado**.

Salida alta

El valor de los siguientes campos se configura como: AGC analógico está **Activado**, AGC Digital está **Activado**, AGC de Securenet está **Activado**, Ganancia fija analógica es **0**, Ganancia fija digital es **0**, Ganancia fija de Securenet es **0**, Salida de control de ganancia es **6**, Total de control de ganancia es **9** y Balance digital/analógico está **Desactivado**.

Reducir retroalimentación

El valor de los siguientes campos se configura como: AGC analógico está **Desactivado**, AGC Digital está **Desactivado**, AGC de Securenet está **Desactivado**, Ganancia fija analógica es **-9**, Ganancia fija digital es **-9**, Ganancia fija de Securenet es **-9**, Salida de control de ganancia es **0**, Total de control de ganancia es **6** y Balance digital/analógico está **Activado**.

Personalizado

Utilice la opción Personalizado para establecer de forma individual configuraciones de ganancia de Ecuilibración de audio de altavoz únicas para el radio que no son compatibles con las otras opciones del menú Configuración de grupo. Se recomienda evitar la configuración máxima para las mismas bandas de frecuencia entre las ecualizaciones del micrófono y el altavoz.

10.49.2.27

AGC analógico

Este campo habilita el Control automático de ganancia (AGC) para su uso con el micrófono interno o externo del radio.

Esta selección solo se aplica cuando el radio está transmitiendo en modo analógico. El AGC compensa la diferencia entre el nivel de voz y el estilo de operación. Como resultado del AGC, el

audio se transmite y se recibe en el mismo nivel de audio/decibel. Esta selección se aplica al Perfil de radio actual.

ADVERTENCIA:

(Si establece el Nivel de configuración de audio en **Básico**) Cuando está activado, el campo Balance digital/analógico de Tx de Amplitud del radio no debe configurarse en **Amplitud del radio**, y el Balance digital/analógico de Tx en el mismo registro o la misma fila de Perfiles de radio debe estar **Desactivado**. De lo contrario, esta selección se considerará no válida.

(Si establece el nivel de configuración de audio en **Mejorado**). Cuando está activado, el campo Balance digital/analógico de Tx de Amplitud del radio no debe configurarse en **Amplitud del radio** y el balance digital/analógico de Tx en el mismo registro o la misma fila de Perfil de radio debe estar **Desactivado**; de lo contrario, esta selección se considera no válida.

IMPORTANTE:

El nivel de control total de ganancia Tx (también conocido como ganancia pura) se aplica antes de que haya ocurrido el AGC. Para el sonido entrante al micrófono a un nivel más bajo que el nominal: salida real del micrófono = entrada en micrófono + Total de control de ganancia Tx.

El nivel de Control de salida de ganancia Tx se aplica después del AGC. El Control de salida de ganancia Tx implementa una razón de infinito:1 dB cuando la entrada en el micrófono supera el nivel nominal. Esto significa que con cualquier entrada sobre el nominal, la salida nunca será mayor al nivel establecido con este parámetro.

10.49.2.28

AGC analógico (accesorio)

Permite que el Control automático de ganancia (AGC) se utilice para el micrófono interno o externo del radio. Esta selección solo se aplica cuando el radio está transmitiendo en modo analógico.

ADVERTENCIA:

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

El AGC compensa la diferencia entre el nivel de voz y el estilo de operación. Como resultado del AGC, el audio se transmite y se recibe en el mismo nivel de audio/decibel. Esta selección se aplica al Perfil de radio actual.

ADVERTENCIA:

(Si el usuario establece el nivel de configuración de audio en **Básico**). Cuando está activado, el campo Balance digital/analógico de Tx de amplitud del radio no debe configurarse en **Amplitud del radio**, y el Balance digital/analógico de Tx en el mismo registro/fila de perfil de radio debe estar **desactivado**. De lo contrario, esta selección se considerará no válida.

(Si el usuario establece el nivel de configuración de audio en **Mejorado**). Cuando está activado, el campo Balance digital/analógico de Tx de amplitud del radio no debe configurarse en **Amplitud del radio**, y el Balance digital/analógico de Tx en el mismo registro/fila de perfil de radio debe estar **desactivado**. De lo contrario, esta selección se considerará no válida.

IMPORTANTE:

El nivel de control total de ganancia Tx (también conocido como ganancia pura) se aplica antes de que haya ocurrido el AGC. Para el sonido entrante al micrófono a un nivel más bajo que el nominal: salida real del micrófono = entrada en micrófono + Total de control de ganancia Tx.

El nivel de Control de salida de ganancia Tx se aplica después del AGC. El Control de salida de ganancia Tx implementa una razón de infinito:1 dB cuando la entrada en el micrófono supera el nivel nominal. Esto significa que con cualquier entrada sobre el nominal, la salida nunca será mayor al nivel establecido con este parámetro.

10.49.2.29

AGC digital

Este campo habilita el Control automático de ganancia (AGC) para su uso con el micrófono interno o externo del radio.

Esta selección solo se aplica cuando el radio está transmitiendo en modo digital. El AGC compensa la diferencia entre el nivel de voz y el estilo de operación. Como resultado del AGC, el audio se transmite y se recibe en el mismo nivel de audio/decibel. Esta selección se aplica al Perfil de radio actual.

**NOTA:**

(Si el usuario establece el nivel de configuración de audio en **Básico**). Cuando está activado, el campo Balance digital/analógico de Tx de amplitud del radio no debe configurarse en **Amplitud del radio**, y el Balance digital/analógico de Tx en el mismo registro/fila de perfil de radio debe estar **desactivado**. De lo contrario, esta selección se considerará no válida.

(Si el usuario establece el nivel de configuración de audio en **Mejorado**). Cuando está activado, el campo Balance digital/analógico de Tx de amplitud del radio no debe configurarse en **Amplitud del radio**, y el Balance digital/analógico de Tx en el mismo registro/fila de perfil de radio debe estar **desactivado**. De lo contrario, esta selección se considerará no válida.

**NOTA:**

El nivel de control total de ganancia Tx (también conocido como ganancia pura) se aplica antes de que haya ocurrido el AGC. Para el sonido entrante al micrófono a un nivel más bajo que el nominal: salida real del micrófono = entrada en micrófono + Total de control de ganancia Tx.

El nivel de Control de salida de ganancia Tx se aplica después del AGC. El Control de salida de ganancia Tx implementa una razón de infinito:1 dB cuando la entrada en el micrófono supera el nivel nominal. Esto significa que con cualquier entrada sobre el nominal, la salida nunca será mayor al nivel establecido con este parámetro.

10.49.2.30

AGC Digital (accesorio)

Permite que el Control automático de ganancia (AGC) se utilice para el micrófono interno o externo del radio.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Esta selección solo se aplica cuando el radio está transmitiendo en modo digital. El AGC compensa la diferencia entre el nivel de voz y el estilo de operación. Como resultado del AGC, el audio se transmite y se recibe en el mismo nivel de audio/decibel. Esta selección se aplica al Perfil de radio actual.

**ADVERTENCIA:**

(Si el usuario establece el nivel de configuración de audio en **Básico**). Cuando está activado, el campo Balance digital/analógico de Tx de amplitud del radio no debe configurarse en **Amplitud del radio**, y el Balance digital/analógico de Tx en el mismo registro/fila de perfil de radio debe estar **desactivado**. De lo contrario, esta selección se considerará no válida.

(Si el usuario establece el nivel de configuración de audio en **Mejorado**). Cuando está activado, el campo Balance digital/analógico de Tx de amplitud del radio no debe configurarse en **Amplitud del radio**, y el Balance digital/analógico de Tx en el mismo registro/fila de perfil de radio debe estar **desactivado**. De lo contrario, esta selección se considerará no válida.

**NOTA:**

El nivel de control total de ganancia Tx (también conocido como ganancia pura) se aplica antes de que haya ocurrido el AGC. Para el sonido entrante al micrófono a un nivel más bajo que el nominal: salida real del micrófono = entrada en micrófono + Total de control de ganancia Tx.

El nivel de Control de salida de ganancia Tx se aplica después del AGC. El Control de salida de ganancia Tx implementa una razón de infinito:1 dB cuando la entrada en el micrófono supera el nivel nominal. Esto significa que con cualquier entrada sobre el nominal, la salida nunca será mayor al nivel establecido con este parámetro.

10.49.2.31

AGC de Securenet

Este campo le permite activar Control de ganancia automático (AGC) a fin de que se utilice para el micrófono interno o externo del radio.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Esta selección solo se aplica cuando el radio está transmitiendo en modo Securenet. El AGC compensa la diferencia entre el nivel de voz y el estilo de operación. Como resultado del AGC, el audio se transmite y se recibe en el mismo nivel de audio/decibel. Esta selección se aplica al Perfil de radio actual.

**IMPORTANTE:**

El nivel de control total de ganancia Tx (también conocido como ganancia pura) se aplica antes de que haya ocurrido el AGC. Para el sonido entrante al micrófono a un nivel más bajo que el nominal: salida real del micrófono = entrada en micrófono + Total de control de ganancia Tx.

El nivel de Control de salida de ganancia Tx se aplica después del AGC. El Control de salida de ganancia Tx implementa una razón de infinito:1 dB cuando la entrada en el micrófono supera el nivel nominal. Esto significa que con cualquier entrada sobre el nominal, la salida nunca será mayor al nivel establecido con este parámetro.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.49.2.32

AGC de Securenet (accesorio)

Permite que el Control automático de ganancia (AGC) se utilice para el micrófono interno o externo del radio.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Esta selección solo se aplica cuando el radio está transmitiendo en modo Securenet. El AGC compensa la diferencia entre el nivel de voz y el estilo de operación. Como resultado del AGC, el audio se transmite y se recibe en el mismo nivel de audio/decibel. Esta selección se aplica al Perfil de radio actual.

**NOTA:**

El nivel de control total de ganancia Tx (también conocido como ganancia pura) se aplica antes de que haya ocurrido el AGC. Para el sonido entrante al micrófono a un nivel más bajo que el nominal: salida real del micrófono = entrada en micrófono + Total de control de ganancia Tx.

El nivel de Control de salida de ganancia Tx se aplica después del AGC. El Control de salida de ganancia Tx implementa una razón de infinito:1 dB cuando la entrada en el micrófono supera el nivel nominal. Esto significa que con cualquier entrada sobre el nominal, la salida nunca será mayor al nivel establecido con este parámetro.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.49.2.33**Salida de control de ganancia de AGC (radio)**

Selecciona la ganancia de los micrófonos del radio para que se incremente (valores positivos), se reduzca (valores negativos) o se mantenga (0).

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

El nivel de Salida de control de ganancia de AGC se aplica después del AGC (Control automático de ganancia). La Salida de control de ganancia de AGC implementa una razón de infinito:1 dB cuando la entrada en el micrófono es sobre el nivel nominal. Esto significa que con cualquier entrada sobre el nominal, la salida nunca será mayor al nivel establecido con este parámetro. Esta selección se aplica al Perfil de radio actual.

**NOTA:**

Si el usuario establece el nivel de configuración de audio en **Básico**, el campo Salida de control de ganancia de AGC (accesorio) es de solo lectura (excepto para radios APX3000 únicamente).

Para los radios distintos al modelo APX3000, el valor del Total de control de ganancia de AGC (Accesorio) se sincroniza desde la Salida de control de ganancia de AGC (Radio).

Para los radios APX3000, el valor del Total de control de ganancia de AGC (Accesorio) se sincroniza con la Salida de control de ganancia de AGC (Radio).

La Salida de control de ganancia de AGC se aplica a cualquiera de los campos ACG activados por RadioCentral.

Solo se accede:

(Si el usuario establece el Nivel de configuración de audio en **Básico**) Cuando uno de los campos AGC activado se activa, entonces este campo también lo hace; o

(Si el usuario establece el nivel de configuración de audio en **Mejorado**). Cuando uno de los campos AGC (radio) habilitados se activa, el campo Salida de control de ganancia de AGC (radio) se activa. Cuando alguno de los campos AGC (Accesorio) activados se activa, entonces el campo Salida de control de ganancia de AGC (Accesorio) se activa.

Mesa 321: Rango

Mínimo	Máximo	Incrementos
-12 decibeles	12 decibeles	3 decibeles

10.49.2.34

Salida de control de ganancia de AGC (accesorio)

Selecciona la ganancia de los micrófonos del radio para que se incremente (valores positivos), se reduzca (valores negativos) o se mantenga ("0").

ADVERTENCIA:

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

El nivel de Salida de control de ganancia de AGC se aplica después del AGC (Control automático de ganancia). La Salida de control de ganancia de AGC implementa una razón de infinito:1 dB cuando la entrada en el micrófono es sobre el nivel nominal. Esto significa que con cualquier entrada sobre el nominal, la salida nunca será mayor al nivel establecido con este parámetro. Esta selección se aplica al Perfil de radio actual.

NOTA:

Si el usuario establece el nivel de configuración de audio en **Básico**, el campo Salida de control de ganancia de AGC (accesorio) es de solo lectura (excepto para radios APX3000 únicamente).

Para los radios distintos al modelo APX3000, el valor del Total de control de ganancia de AGC (Accesorio) se sincroniza desde la Salida de control de ganancia de AGC (Radio).

Para los radios APX3000, el valor del Total de control de ganancia de AGC (Accesorio) se sincroniza con la Salida de control de ganancia de AGC (Radio).

La Salida de control de ganancia de AGC se aplica a cualquiera de los campos AGC activados por RadioCentral.

Solo se accede:

(Si el usuario establece el nivel de configuración de audio en **Básico**). Cuando uno de los campos AGC habilitado se activa, este campo también lo hace; o

(Si el usuario establece el nivel de configuración de audio en **Mejorado**). Cuando uno de los campos AGC (radio) habilitados se activa, el campo Salida de control de ganancia de AGC (radio) se activa. Cuando alguno de los campos AGC (Accesorio) activados se activa, entonces el campo Salida de control de ganancia de AGC (Accesorio) se activa.

Mesa 322: Rango

Mínimo	Máximo	Incrementos
-12 decibeles	12 decibeles	3 decibeles

10.49.2.35

Total de control de ganancia de AGC (radio)

Selecciona la ganancia de los micrófonos del radio para que se incremente (valores positivos), se reduzca (valores negativos) o se mantenga (0) para el perfil de radio actual.

ADVERTENCIA:

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

El nivel de Total de control de ganancia de AGC (también conocido como ganancia pura) se aplica antes del AGC (Control automático de ganancia). Para el sonido entrante al micrófono a un nivel más

bajo que el nominal: salida real del micrófono = sonido en micrófono + Total de control de ganancia de AGC.

**NOTA:**

Si el usuario establece el nivel de configuración de audio en **Básico**, el campo Total de control de ganancia de AGC (accesorio) es de solo lectura (excepto para radios APX3000 únicamente).

Para los radios distintos al modelo APX3000, el valor del Total de control de ganancia de AGC (Accesorio) se sincroniza desde el Total de control de ganancia de AGC (Radio).

Para los radios APX3000, el valor del Total de control de ganancia de AGC (Accesorio) se sincroniza con el Total de control de ganancia de AGC (Radio).

Hay valores Total de control de ganancia de AGC independientes para cada uno de los campos AGC activados por RadioCentral.

Solo se accede:

(Si el usuario establece el Nivel de configuración de audio en **Básico**) Cuando uno de los campos AGC activado se activa, entonces este campo también lo hace; o

(Si el usuario establece el nivel de configuración de audio en **Mejorado**). Cuando uno de los campos AGC (radio) habilitados se activa, el campo Total de control de ganancia de AGC (radio) se activa. Cuando alguno de los campos AGC (Accesorio) activados se activa, entonces el campo del Total de control de ganancia de AGC (Accesorio) se activa.

En la siguiente tabla se enumeran los valores mínimos y máximos para la Salida de control de ganancia de AGC, así como fragmentos de audio de muestra cuando se ingresan valores específicos.

Mesa 323: Rango

Mínimo	Máximo	Incrementos
-12 decibeles	12 decibeles	3 decibeles

10.49.2.36

Total de control de ganancia de AGC (accesorio)

Selecciona la ganancia de los micrófonos del radio a fin de que se incremente (valores positivos), se reduzca (valores negativos) o se mantenga (**0**) para el perfil de radio actual.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

El nivel de Total de control de ganancia de AGC (también conocido como ganancia pura) se aplica antes del AGC (Control automático de ganancia). Para el sonido entrante al micrófono a un nivel más bajo que el nominal: salida real del micrófono = sonido en micrófono + Total de control de ganancia de AGC.

**NOTA:**

Si el usuario establece el nivel de configuración de audio en **Básico**, el campo Total de control de ganancia de AGC (accesorio) es de solo lectura (excepto para radios APX3000 únicamente).

Para los radios distintos al modelo APX3000, el valor del Total de control de ganancia de AGC (Accesorio) se sincroniza desde el Total de control de ganancia de AGC (Radio).

Para los radios APX3000, el valor del Total de control de ganancia de AGC (Accesorio) se sincroniza con el Total de control de ganancia de AGC (Radio).

Hay valores Total de control de ganancia de AGC independientes para cada uno de los campos AGC activados por RadioCentral.

Solo se accede:

(Si el usuario establece el Nivel de configuración de audio en **Básico**) Cuando uno de los campos AGC activado se activa, entonces este campo también lo hace; o

(Si el usuario establece el nivel de configuración de audio en **Mejorado**). Cuando uno de los campos AGC (radio) habilitados se activa, el campo Total de control de ganancia de AGC (radio) se activa. Cuando alguno de los campos AGC (Accesorio) activados se activa, entonces el campo del Total de control de ganancia de AGC (Accesorio) se activa.

Se admiten las siguientes selecciones:

Mesa 324: Rango

Mínimo	Máximo	Incrementos
-12 decibeles	12 decibeles	3 decibeles

10.49.2.37

Ganancia fija analógica

En este campo se selecciona la cantidad de ganancia de audio fija (también conocida como lineal) que se usará para el micrófono externo del radio.

Esta selección solo se aplica cuando el radio está transmitiendo en modo analógico. La opción Lineal es útil para añadir ganancia pura a la señal. Esta selección se aplica al Perfil de radio actual.

Solo se accede: Cuando el campo AGC analógico está desactivado.

Se admiten las siguientes selecciones:

Mesa 325: Rango

Mínimo	Máximo	Incrementos
-12 decibeles	12 decibeles	3 decibeles

10.49.2.38

Ganancia fija analógica (accesorio)

Selecciona la cantidad de ganancia de audio fija (también conocida como lineal) para su uso con el micrófono interno o externo del radio.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Esta selección solo se aplica cuando el radio está transmitiendo en modo analógico. La opción Lineal es útil para añadir ganancia pura a la señal. Esta selección se aplica al Perfil de radio actual.

Solo se accede: Cuando el campo AGC analógico está desactivado.

Se admiten las siguientes selecciones:

Mesa 326: Rango

Mínimo	Máximo	Incrementos
-12 decibeles	12 decibeles	3 decibeles

10.49.2.39

Ganancia fija digital

En este campo se selecciona la cantidad de ganancia de audio fija (también conocida como lineal) que se usará para el micrófono externo del radio.

Esta selección solo se aplica cuando el radio está transmitiendo en modo digital. La opción Lineal es útil para añadir ganancia pura a la señal. Esta selección se aplica al Perfil de radio actual.

Solo se accede: Cuando el campo [AGC digital en la página 721](#) está desactivado.

Mesa 327: Rango

Mínimo	Máximo	Incrementos
-12 decibeles	12 decibeles	3 decibeles

10.49.2.40

Ganancia fija digital (accesorio)

Selecciona la cantidad de ganancia de audio fija (también conocida como lineal) para su uso con el micrófono interno o externo del radio.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Esta selección solo se aplica cuando el radio está transmitiendo en modo Securenet. La opción Lineal es útil para añadir ganancia pura a la señal. Esta selección se aplica al Perfil de radio actual.

Solo se accede: Cuando el campo [AGC de Securenet \(accesorio\) en la página 722](#) está desactivado y cuando el radio admite modelos y opciones diferentes.

Mesa 328: Rango

Mínimo	Máximo	Incrementos
-12 decibeles	12 decibeles	3 decibeles

10.49.2.41

Ganancia fija de Securenet (radio)

Selecciona la cantidad de ganancia de audio fija (también conocida como lineal) para su uso con el micrófono interno o externo del radio.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Esta selección solo se aplica cuando el radio está transmitiendo en modo Securenet. La opción Lineal es útil para añadir ganancia pura a la señal. Esta selección se aplica al Perfil de radio actual.

Solo se accede: Cuando el campo [AGC de Securenet en la página 722](#) está desactivado y cuando el radio admite modelos y opciones diferentes.

Mesa 329: Rango

Mínimo	Máximo	Incrementos
-12 decibeles	12 decibeles	3 decibeles

10.49.2.42

Ganancia fija de Securenet (accesorio)

Selecciona la cantidad de ganancia de audio fija (también conocida como lineal) para su uso con el micrófono interno o externo del radio.

ADVERTENCIA:

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Esta selección solo se aplica cuando el radio está transmitiendo en modo Securenet. La opción Lineal es útil para añadir ganancia pura a la señal. Esta selección se aplica al Perfil de radio actual.

Solo se accede: Cuando el campo AGC de Securenet está desactivado y cuando el radio admite modelos y opciones diferentes.

Mesa 330: Rango

Mínimo	Máximo	Incrementos
-12 decibeles	12 decibeles	3 decibeles

10.49.2.43

Balance digital/analógico

En este campo se habilita la ecualización o el balance del nivel de transmisión de audio cuando se cambia de analógica a digital, y viceversa, para cada Perfil de radio.

En la siguiente tabla se enumeran las selecciones y el fragmento de audio de muestra para el Balance digital/analógico.

La selección se puede **desactivar** o **activar**.

ADVERTENCIA:

(Si establece el nivel de configuración de audio en **Básico**). Cuando el campo se encuentra activo, el AGC digital (radio y accesorio), el AGC analógico (radio y accesorio) en el mismo registro o fila del Perfil de radio deben estar en **Desactivado**; de lo contrario, esta selección se considera no válida.

(Si establece el nivel de configuración de audio en **Mejorado**). Cuando el campo Balance digital/analógico (radio) está activado, el AGC digital (radio), el AGC analógico (radio) en el mismo registro o la misma fila del Perfil de radio deben estar en **Desactivado**; de lo contrario, esta selección se considera no válida.

(Si establece el nivel de configuración de audio en **Mejorado**). Cuando está activado, el campo Balance digital/analógico (accesorio) está activado, el AGC digital (accesorio) y el AGC analógico (accesorio) en el mismo registro o la misma fila del Perfil de radio deben estar en **Desactivado**; de lo contrario, esta selección se considera no válida.

NOTA:

Si establece el Nivel de configuración de audio en **Básico**, entonces el campo Balance digital/analógico (accesorio) será solo de lectura (excepto para los radios APX3000).

Para radios distintos al modelo APX3000, el valor de Balance digital/analógico (accesorio) se sincroniza desde el Balance digital/analógico (radio).

Para los radios APX3000, el valor del Balance digital/analógico (accesorio) se sincroniza con el Balance digital/analógico (radio).

El total de control de ganancia de AGC se aplica a cualquiera de los campos ACG activados por RadioCentral.

Solo se accede:

(Si el Nivel de configuración de audio se establece en **Básico**). Cuando alguno de los campos AGC habilitados está activado, entonces los campos Balance digital/analógico se activan; o

(Si el Nivel de configuración de audio está configurado en **Mejorado**). Cuando alguno de los campos AGC (radio) habilitados está activado, entonces los campos Balance digital/analógico se activan. Cuando alguno de los campos AGC (accesorio) habilitados se activa, entonces el campo Balance digital/analógico (accesorio) se activa; o

Cuando el campo Balance digital/analógico de Radio en general está configurado en **Por perfil**.

10.49.2.44

Balance digital/analógico (accesorio)

Habilita la ecualización o balance del nivel de transmisión de audio cuando se cambia de análogo a digital y viceversa, para cada perfil de radio.

ADVERTENCIA:

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

La selección se puede **desactivar** o **activar**.

ADVERTENCIA:

(Si el usuario establece el nivel de configuración de audio en **Básico**). Cuando este campo está activado, AGC digital (radio y accesorio) y AGC analógico (radio y accesorio) en el mismo registro/fila del perfil del radio deben estar configurados en **Desactivado**; de lo contrario, esta selección se considerará no válida.

(Si el usuario establece el nivel de configuración de audio en **Mejorado**). Cuando el campo Balance digital/analógico (radio) está activado, AGC Digital (radio) y AGC analógico en el mismo registro/fila del perfil del radio deben estar configurados en **Desactivado**; de lo contrario, esta selección se considerará no válida.

(Si el usuario establece el nivel de configuración de audio en **Mejorado**). Cuando está activado, el campo Balance digital/analógico (accesorio) está activado, AGC Digital (accesorio) y AGC analógico (accesorio) en el mismo registro/fila del perfil del radio deben estar configurados en **Desactivado**; de lo contrario, esta selección se considerará no válida.

NOTA:

Si el usuario establece el nivel de configuración de audio en **Básico**, el campo Balance digital/analógico (accesorio) será de solo de lectura (excepto para los radios APX3000).

Para los radios distintos al modelo APX3000, el valor de Balance digital/analógico (accesorio) se sincroniza desde Balance digital/analógico (radio).

Para los radios APX3000, el valor de Balance digital/analógico (accesorio) está sincronizado con la banda digital/análoga (radio).

El total de control de ganancia de AGC se aplica a cualquiera de los campos ACG activados por RadioCentral.

Solo se accede:

(Si el nivel de configuración de audio se establece en **Básico**). Cuando alguno de los campos AGC habilitados está activado, los campos Balance digital/analógico se activan; o

(Si el nivel de configuración de audio está configurado en **Mejorado**). Cuando alguno de los campos AGC (radio) habilitados está activado, los campos Balance digital/analógico se activan. Cuando alguno de los campos AGC (accesorio) habilitados se activa, el campo Balance digital/analógico (accesorio) se activa; o

Cuando el campo Balance digital/analógico de Radio en general está configurado en **Por perfil**.

10.49.2.45

Configuración de grupo (radio)

El propósito de este campo es predefinir un conjunto de valores para los campos de la sección Ecualización de audio bajo el grupo Micrófono / Configuración de TX.

Cuando el valor Configuración de grupo cambia a un valor distinto de **Personalizar**, el valor de los campos en esa sección cambia según corresponda. Todos los campos deben ser No editables, cuando la configuración de grupo no está configurada en **Personalizar**.

**NOTA:**

Para la configuración **Personalizada**, es muy recomendable evitar la configuración máxima para las mismas bandas de frecuencia entre las equalizaciones del micrófono y el altavoz.

La siguiente enumera las selecciones y las definiciones para la Configuración de grupo de ecualización de audio (Radio) y la Configuración de grupo de ecualización de audio (Accesorio) bajo el grupo Micrófono/configuración de TX.

Normal

Banda de baja frecuencia es **0**, Banda de frecuencia media es **0** y Banda de alta frecuencia es **0**.

Aumento de agudos

Banda de baja frecuencia es **0**, Banda de frecuencia media es **0** y Banda de alta frecuencia es **6**.

Corte de graves

Banda de baja frecuencia es **-9**, Banda de frecuencia media es **0** y Banda de alta frecuencia es **0**.

XTS

Banda de baja frecuencia es **-3**, Banda de frecuencia media es **0** y Banda de alta frecuencia es **6**.

Personalizado

Utilice la opción Personalizado para establecer de forma individual configuraciones de ganancia de Ecualización de audio de altavoz únicas para el radio que no son compatibles con las otras opciones del menú Configuración de grupo. Se recomienda evitar la configuración máxima para las mismas bandas de frecuencia entre las equalizaciones del micrófono y el altavoz.

10.49.2.46

Configuración de grupo (Accesorio)

El propósito de este campo es predefinir un conjunto de valores para los campos de la sección Ecualización de audio bajo el grupo Micrófono / Configuración de TX.

Cuando el valor Configuración de grupo cambia a un valor distinto de **Personalizar**, el valor de los campos en esa sección cambia según corresponda. Todos los campos deben ser No editables, cuando la configuración de grupo no está configurada en **Personalizar**.

**NOTA:**

Para la configuración **Personalizada**, es muy recomendable evitar la configuración máxima para las mismas bandas de frecuencia entre las equalizaciones del micrófono y el altavoz.

La siguiente enumera las selecciones y las definiciones para la Configuración de grupo de ecualización de audio (Radio) y la Configuración de grupo de ecualización de audio (Accesorio) bajo el grupo Micrófono/configuración de TX.

Normal

Banda de baja frecuencia es **0**, Banda de frecuencia media es **0** y Banda de alta frecuencia es **0**.

Aumento de agudos

Banda de baja frecuencia es **0**, Banda de frecuencia media es **0** y Banda de alta frecuencia es **6**.

Corte de graves

Banda de baja frecuencia es **-9**, Banda de frecuencia media es **0** y Banda de alta frecuencia es **0**.

XTS

Banda de baja frecuencia es **-3**, Banda de frecuencia media es **0** y Banda de alta frecuencia es **6**.

Personalizado

Utilice la opción Personalizado para establecer de forma individual configuraciones de ganancia de Ecuación de audio de altavoz únicas para el radio que no son compatibles con las otras opciones del menú Configuración de grupo. Se recomienda evitar la configuración máxima para las mismas bandas de frecuencia entre las ecualizaciones del micrófono y el altavoz.

10.49.2.47

Banda de baja frecuencia

Selecciona el nivel de sonido de llamadas transmitidas en un ambiente analógico/digital/Securenet.

Esta selección se aplica al Perfil de radio actual.

Mesa 331: Rango

Mínimo	Máximo
-12	12

10.49.2.48

Banda de baja frecuencia (Accesorio)

Selecciona el nivel de sonido de llamadas transmitidas en un ambiente analógico/digital/Securenet.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Esta selección se aplica al Perfil de radio actual.

Mesa 332: Rango

Mínimo	Máximo
-12	12

10.49.2.49

Banda de frecuencia media

Selecciona el nivel de sonido de llamadas transmitidas en un ambiente analógico/digital/Securenet.

Esta selección se aplica al Perfil de radio actual.

Mesa 333: Rango

Mínimo	Máximo
-12	12

10.49.2.50

Banda de frecuencia media (Accesorio)

Selecciona el nivel de sonido de llamadas transmitidas en un ambiente analógico/digital/Securenet.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Esta selección se aplica al Perfil de radio actual.

Mesa 334: Rango

Mínimo	Máximo
-12	12

10.49.2.51

Banda de alta frecuencia (radio)

Selecciona el nivel de sonido de llamadas transmitidas en un ambiente analógico/digital/Securenet.

Esta selección se aplica al Perfil de radio actual.

Se admiten las siguientes selecciones:

Mesa 335: Rango

Mínimo	Máximo
-12	12

10.49.2.52

Banda de alta frecuencia (Accesorio)

Selecciona el nivel de sonido de llamadas transmitidas en un ambiente analógico/digital/Securenet.

ADVERTENCIA:

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Esta selección se aplica al Perfil de radio actual.

Se admiten las siguientes selecciones:

Mesa 336: Rango

Mínimo	Máximo
-12	12

10.49.2.53

Control de volumen: Volumen máximo de audio

Selecciona el nivel más alto posible de volumen de recepción de voz del radio.

El nivel de volumen de recepción de voz del radio nunca sube por sobre el nivel seleccionado.

NOTA:

Consulte también la configuración del campo Compensación de ajuste de volumen del tono. Esta selección se aplica al Perfil de radio actual.

ADVERTENCIA:

Esta configuración debe ser mayor que la configuración de Volumen mínimo de audio; de lo contrario, ambos campos se tomarán no válidos.

INFORMACIÓN IMPORTANTE PARA LAS CONFIGURACIONES DE AUDÍFONOS PARA CASCOS DE MOTOCICLETA: PRECAUCIÓN:

Si el radio del usuario se utiliza con un auricular de casco de motocicleta, no se debe poner el radio en el nivel de volumen de recepción de voz más alto posible. Para evitar posibles lesiones en la audición del usuario, se debe reducir el valor del nivel de volumen de recepción de voz a uno no mayor que 130.

INFORMACIÓN IMPORTANTE AL UTILIZAR KITS DE AUDIO DE SUPERVISIÓN IMPRES: RLN5882, RLN5883, RLN5886, RLN6483, RLN6484, PMLN5111, PMLN5112, PMLN6123, PMLN6124, PMLN6129, PMLN6130 y el KIT DE BAJO NIVEL DE RUIDO RLN5886:

PRECAUCIÓN: Si el radio APX del usuario se utiliza el radio con los accesorios de audio anteriores, no ponga el radio en el nivel de volumen de recepción de voz más alto posible. Para evitar posibles lesiones en la audición del usuario, se debe reducir el valor del nivel de volumen de recepción de voz a uno no mayor que 160.

IMPORTANTE:

Si se desea tener el volumen máximo del radio en un nivel constante mayor o menor que el volumen máximo de recepción de voz del radio (configurado en este campo), el usuario debe utilizar la función Compensación de volumen (dB).

Cuando la función Compensación de volumen (dB) está configurada como “0” (cero), el radio siempre utiliza esta configuración de Volumen máximo de audio para el volumen máximo, independientemente de la configuración del campo Volumen máximo del tono de alerta.

Se admiten las siguientes selecciones:

Mesa 337: Rango

Mínimo	Máximo
1	255

NOTA:

5 = 1 decibel (dB)

10.49.2.54

Control de volumen: Volumen de audio mínimo

Selecciona el nivel de audio de Rx (Recepción) mínimo.

El nivel de volumen del radio nunca cae por debajo de este nivel, incluso cuando el usuario del radio establece el control de volumen en **0** (cero). Consulte también la configuración del campo Compensación de ajuste de volumen del tono. Esta selección se aplica al Perfil de radio actual.

**ADVERTENCIA:**

Esta configuración debe ser menor que la configuración de Volumen de audio máximo; de lo contrario, ambos serán no válidos.

**IMPORTANTE:**

Si se desea tener el Volumen mínimo del radio en un nivel constante mayor o menor que el volumen mínimo de voz de recepción del radio (configurado en este campo), el usuario debe utilizar la función Compensación de volumen (dB).

Cuando la función Compensación de volumen (dB) está establecida en **0** (cero), el radio siempre utiliza la configuración Volumen mínimo de audio para el volumen mínimo, independientemente de la configuración del campo Volumen mínimo.

10.49.2.55**Compensación de volumen del tono de alerta (dB)**

Selecciona el valor en decibeles (dB) que aumenta o disminuye el volumen de un tono de alerta en comparación con el volumen de audio de recepción seleccionado por el usuario.

Consulte también la configuración del campo Compensación de ajuste de volumen del tono. Esta selección se aplica al Perfil de radio actual.

Si el usuario desea un volumen más alto o más bajo de los tonos de alerta: Configure el campo Volumen máximo y Volumen máximo de audio en el mismo valor, y establezca el campo Volumen mínimo y Volumen mínimo de audio en el mismo valor, luego utilice esta configuración de Compensación de volumen de tono de alerta para que los tonos de alerta del radio tengan un nivel constante mayor o menor que el volumen de voz de recepción del radio.

**IMPORTANTE:**

Cuando el campo Compensación de volumen del tono de alerta se configura en **0** (cero): El radio utiliza siempre la configuración Volumen máximo de audio para Volumen máximo, independientemente de la configuración del campo Volumen máximo del tono de alerta.

El radio utiliza siempre la configuración Volumen mínimo de audio para Volumen mínimo, independientemente de la configuración del campo Volumen mínimo del tono de alerta.

Solo se accede: Cuando el campo Tonos de alerta está **Activado**.

Se admiten las siguientes selecciones:

Mesa 338: Rango

Mínimo	Máximo	Incrementos
-26 decibeles	25 decibeles	1 decibel

10.49.2.56**Volumen del tono de alerta mínimo**

Selecciona el nivel de tono de alerta de recepción mínimo, independientemente de qué tan bajo el usuario del radio establezca el volumen.

Consulte también la configuración del campo Compensación de ajuste de volumen del tono. Esta selección se aplica al Perfil de radio actual.

**ADVERTENCIA:**

Esta configuración debe ser menor que el ajuste de Volumen máximo; de lo contrario, ambos serán no válidos.

**IMPORTANTE:**

Si se desea tener Volumen mínimo del radio (configurado en este campo) en un nivel constante mayor o menor que el volumen de voz de recepción mínimo del radio (configurado en el campo Volumen mínimo de audio), el usuario debe utilizar la función Compensación de volumen (dB).

Cuando la función Compensación de volumen (dB) se configura en "0" (cero), el radio siempre utiliza la configuración Volumen mínimo de audio para este Volumen mínimo, independientemente de la configuración de este campo Volumen mínimo.

Solo se accede: Cuando el campo Tonos de alerta está **Activado**.

Se admiten las siguientes selecciones:

Mesa 339: Rango

Mínimo	Máximo
0	200

10.49.2.57

Volumen del tono de alerta máximo

Selecciona el nivel de volumen más alto posible para el tono de alerta. La configuración del campo Compensación de volumen (dB) puede anular esta configuración.

Consulte también la configuración del campo Compensación de ajuste de volumen del tono. Esta selección se aplica al Perfil de radio actual.

**ADVERTENCIA:**

Esta configuración debe ser mayor que la configuración de Volumen mínimo, de lo contrario, ambos campos serán inválidos.

**NOTA:**

Si se desea tener volumen máximo del radio (configurado en este campo) en un nivel constante mayor o menor que el volumen de voz de recepción mínimo del radio (configurado en el campo Volumen mínimo de audio), se debe utilizar la función Compensación de volumen (dB).

Cuando la función Compensación de volumen (dB) está definida en **0** (cero), el radio siempre utiliza la configuración Volumen máximo de audio para este Volumen máximo, independientemente de la configuración de este campo Volumen máximo.

Se admiten las siguientes selecciones:

Mesa 340: Rango

Mínimo	Máximo
0	255

**NOTA:**

5 = 1 decibel (dB)

10.49.2.58

Configuración de grupo (radio)

El propósito de este campo es predefinir un conjunto de valores para los campos de la sección Ecuación de audio bajo el grupo Altavoz / Configuración de RX.

Cuando el valor Configuración de grupo cambia a un valor distinto de **Personalizar**, el valor de los campos en esa sección cambia según corresponda. Cuando la configuración de grupo no está definida en **Personalizar**, entonces todos los campos deben volverse de solo visualización.

En las siguientes selecciones se enumeran las selecciones y las definiciones para el Ajuste de grupo (Radio) de ecuación de audio y Ajuste de grupo (Accesorio) de ecuación de audio bajo el grupo Altavoz/ajuste de RX.

Normal

El valor de los siguientes campos se configura como: [Banda analógica de baja frecuencia \(accesorio\) en la página 738](#) es **0**, [Banda analógica de frecuencia media \(accesorio\) en la página 738](#) es **0**, [Banda analógica de alta frecuencia \(accesorio\) en la página 739](#) es **0**, Banda digital de baja frecuencia es **0**, Banda digital de frecuencia media es **0**, Banda digital de alta frecuencia es **0**, Banda de baja frecuencia de Securenet es **0**, Banda de frecuencia media de Securenet es **0** y Banda de alta frecuencia de Securenet es **0**.

Aumento de agudos

El valor de los siguientes campos se configura como: [Banda analógica de baja frecuencia \(accesorio\) en la página 738](#) es **0**, [Banda analógica de frecuencia media \(accesorio\) en la página 738](#) es **0**, [Banda analógica de alta frecuencia \(accesorio\) en la página 739](#) es **6**, Banda digital de baja frecuencia es **0**, Banda digital de frecuencia media es **0**, Banda digital de alta frecuencia es **6**, Banda de baja frecuencia de Securenet es **0**, Banda de frecuencia media de Securenet es **0** y Banda de alta frecuencia de Securenet es **6**.

Corte de graves

El valor de los siguientes campos se configura como: [Banda analógica de baja frecuencia \(accesorio\) en la página 738](#) es **-9**, [Banda analógica de frecuencia media \(accesorio\) en la página 738](#) es **0**, [Banda analógica de alta frecuencia \(accesorio\) en la página 739](#) es **0**, Banda digital de baja frecuencia es **-9**, Banda digital de frecuencia media es **0**, Banda digital de alta frecuencia es **0**, Banda de baja frecuencia de Securenet es **-9**, Banda de frecuencia media de Securenet es **0** y Banda de alta frecuencia de Securenet es **0**.

Reducir retroalimentación

El valor de los siguientes campos se configura como: [Banda analógica de baja frecuencia \(accesorio\) en la página 738](#) es **-6**, [Banda analógica de frecuencia media \(accesorio\) en la página 738](#) es **0**, [Banda analógica de alta frecuencia \(accesorio\) en la página 739](#) es **-6**, Banda digital de baja frecuencia es **-6**, Banda digital de frecuencia media es **0**, Banda digital de alta frecuencia es **-6**, Banda de baja frecuencia de Securenet es **-6**, Banda de frecuencia media de Securenet es **0** y Banda de alta frecuencia de Securenet es **-6**.

Personalizado

Utilice la opción Personalizado para establecer de forma individual configuraciones de ganancia de Ecuación de audio de altavoz únicas para el radio que no son compatibles con las otras opciones del menú Configuración de grupo. Se recomienda evitar la configuración máxima para las mismas bandas de frecuencia entre las ecuaciones del micrófono y el altavoz.

10.49.2.59

Configuración de grupo (Accesorio)

El propósito de este campo es predefinir un conjunto de valores para los campos de la sección Ecuación de audio bajo el grupo Altavoz / Configuración de RX.

Cuando el valor Configuración de grupo cambia a un valor distinto de **Personalizar**, el valor de los campos en esa sección cambia según corresponda. Cuando la configuración de grupo no está definida en **Personalizar**, entonces todos los campos deben volverse de solo visualización.

En las siguientes selecciones se enumeran las selecciones y las definiciones para el Ajuste de grupo (Radio) de ecualización de audio y Ajuste de grupo (Accesorio) de ecualización de audio bajo el grupo Altavoz/ajuste de RX.

Normal

El valor de los siguientes campos se configura como: [Banda analógica de baja frecuencia \(accesorio\) en la página 738](#) es **0**, [Banda analógica de frecuencia media \(accesorio\) en la página 738](#) es **0**, [Banda analógica de alta frecuencia \(accesorio\) en la página 739](#) es **0**, [Banda digital de baja frecuencia \(Accesorio\) en la página 740](#) es **0**, [Banda digital de frecuencia media \(Accesorio\) en la página 741](#) es **0**, [Banda digital de alta frecuencia \(Accesorio\) en la página 741](#) es **0**, Banda de baja frecuencia de Securenet es **0**, Banda de frecuencia media de Securenet es **0** y [Banda de alta frecuencia de Securenet \(radio\) en la página 743](#) es **0**.

Aumento de agudos

-12	12

10.49.2.64

Banda analógica de alta frecuencia

En este campo se selecciona el nivel de sonido de las llamadas recibidas en un ambiente analógico.

Esta selección se aplica al Perfil de radio actual.

NOTA:

Si configura el Nivel de configuración del audio como **Básico**, el campo Banda analógica de alta frecuencia (Accesorio) será solo de lectura (excepto para los radios APX3000).

Para radios distintos al modelo APX3000, el valor de la Banda analógica de alta frecuencia (Accesorio) se sincroniza desde la Banda analógica de alta frecuencia (Radio).

Para radios APX3000, el valor de la Banda analógica de alta frecuencia (Accesorio) se sincroniza con la Banda analógica de alta frecuencia (Radio).

Solo se accede:

(Si establece el Nivel de configuración de audio en **Básico**). Cuando uno de los campos AGC habilitados se activa, entonces este campo se activa; o

(Si configura el Nivel de configuración del audio como **Mejorado**) Cuando se activa uno de los campos AGC (radio) activados, se activa el campo Banda analógica de alta frecuencia (Radio). Cuando alguno de los campos AGC (Accesorio) activados se activa, entonces el campo Banda de alta frecuencia digital (Accesorio) se activa.

Se admiten las siguientes selecciones:

Mesa 345: Rango

baja frecuencia (Accesorio) en la página 740 es **0**, Banda digital de frecuencia media (Accesorio) en la página 741 es **0**, Banda digital de alta frecuencia (Accesorio) en la página 741 es **6**, Banda de baja frecuencia de Securenet es **0**, Banda de frecuencia media de Securenet es **0** y Banda de alta frecuencia de Securenet (radio) en la página 743 es **6**.

Corte de graves

El valor de los siguientes campos se configura como: Banda analógica de baja frecuencia (accesorio) en la página 738 es **-9**, Banda analógica de frecuencia media (accesorio) en la página 738 es **0**, Banda analógica de alta frecuencia (accesorio) en la página 739 es **0**, Banda digital de baja frecuencia es **-9**, Banda digital de frecuencia media es **0**, Banda digital de alta frecuencia es **0**, Banda de baja frecuencia de Securenet es **-9**, Banda de frecuencia media de Securenet es **0** y Banda de alta frecuencia de Securenet es **0**.

Reducir retroalimentación

El valor de los siguientes campos se configura como: Banda analógica de baja frecuencia (accesorio) en la página 738 es **-6**, Banda analógica de frecuencia media (accesorio) en la página 738 es **0**, Banda analógica de alta frecuencia (accesorio) en la página 739 es **-6**, Banda digital de baja frecuencia es **-6**, Banda digital de frecuencia media es **0**, Banda digital de alta frecuencia es **-6**, Banda de baja frecuencia de Securenet es **-6**, Banda de frecuencia media de Securenet es **0** y Banda de alta frecuencia de Securenet es **-6**.

Personalizado

Utilice la opción Personalizado para establecer de forma individual configuraciones de ganancia de Ecualización de audio de altavoz únicas para el radio que no son compatibles con las otras opciones del menú Configuración de grupo. Se recomienda evitar la configuración máxima para las mismas bandas de frecuencia entre las ecualizaciones del micrófono y el altavoz.

10.49.2.80

Salida de control de ganancia de AGC (radio)

Selecciona la ganancia de los micrófonos del radio para que se incremente (valores positivos), se reduzca (valores negativos) o se mantenga (0).

ADVERTENCIA:

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

El nivel de Salida de control de ganancia de AGC se aplica después del AGC (Control automático de ganancia). La Salida de control de ganancia de AGC implementa una razón de infinito:1 dB cuando la entrada en el micrófono es sobre el nivel nominal. Esto significa que con cualquier entrada sobre el nominal, la salida nunca será mayor al nivel establecido con este parámetro. Esta selección se aplica al Perfil de radio actual.

NOTA:

Si el usuario establece el nivel de configuración de audio en **Básico**, el campo Salida de control de ganancia de AGC (accesorio) es de solo lectura (excepto para radios APX3000 únicamente).

Para los radios distintos al modelo APX3000, el valor del Total de control de ganancia de AGC (Accesorio) se sincroniza desde la Salida de control de ganancia de AGC (Radio).

Para los radios APX3000, el valor del Total de control de ganancia de AGC (Accesorio) se sincroniza con la Salida de control de ganancia de AGC (Radio).

La Salida de control de ganancia de AGC se aplica a cualquiera de los campos AGC activados por RadioCentral.

Solo se accede:

(Si el usuario establece el Nivel de configuración de audio en **Básico**) Cuando uno de los campos AGC activado se activa, entonces este campo también lo hace; o

(Si el usuario establece el nivel de configuración de audio en **Mejorado**). Cuando uno de los campos AGC (radio) habilitados se activa, el campo Salida de control de ganancia de AGC (radio) se activa. Cuando alguno de los campos AGC (Accesorio) activados se activa, entonces el campo Salida de control de ganancia de AGC (Accesorio) se activa.

Mesa 359: Rango

Mínimo	Máximo	Incrementos
-12 decibeles	12 decibeles	3 decibeles

10.49.2.81

Salida de control de ganancia de AGC (accesorio)

Selecciona la ganancia de los micrófonos del radio para que se incremente (valores positivos), se reduzca (valores negativos) o se mantenga ("0").

ADVERTENCIA:

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

El nivel de Salida de control de ganancia de AGC se aplica después del AGC (Control automático de ganancia). La Salida de control de ganancia de AGC implementa una razón de infinito:1 dB cuando la entrada en el micrófono es sobre el nivel nominal. Esto significa que con cualquier entrada sobre el nominal, la salida nunca será mayor al nivel establecido con este parámetro. Esta selección se aplica al Perfil de radio actual.

NOTA:

Si el usuario establece el nivel de configuración de audio en **Básico**, el campo Salida de control de ganancia de AGC (accesorio) es de solo lectura (excepto para radios APX3000 únicamente).

Para los radios distintos al modelo APX3000, el valor del Total de control de ganancia de AGC (Accesorio) se sincroniza desde la Salida de control de ganancia de AGC (Radio).

Para los radios APX3000, el valor del Total de control de ganancia de AGC (Accesorio) se sincroniza con la Salida de control de ganancia de AGC (Radio).

La Salida de control de ganancia de AGC se aplica a cualquiera de los campos ACG activados por RadioCentral.

Solo se accede:

(Si el usuario establece el nivel de configuración de audio en **Básico**). Cuando uno de los campos AGC habilitado se activa, este campo también lo hace; o

(Si el usuario establece el nivel de configuración de audio en **Mejorado**). Cuando uno de los campos AGC (radio) habilitados se activa, el campo Salida de control de ganancia de AGC (radio) se activa. Cuando alguno de los campos AGC (Accesorio) activados se activa, entonces el campo Salida de control de ganancia de AGC (Accesorio) se activa.

Mesa 360: Rango

Mínimo	Máximo	Incrementos
-12 decibeles	12 decibeles	3 decibeles

10.49.2.82

Total de control de ganancia de AGC (radio)

Selecciona la ganancia de los micrófonos del radio para que se incremente (valores positivos), se reduzca (valores negativos) o se mantenga (0) para el perfil de radio actual.

ADVERTENCIA:

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

El nivel de Total de control de ganancia de AGC (también conocido como ganancia pura) se aplica antes del AGC (Control automático de ganancia). Para el sonido entrante al micrófono a un nivel más bajo que el nominal: salida real del micrófono = sonido en micrófono + Total de control de ganancia de AGC.

NOTA:

Si el usuario establece el nivel de configuración de audio en **Básico**, el campo Total de control de ganancia de AGC (accesorio) es de solo lectura (excepto para radios APX3000 únicamente).

Para los radios distintos al modelo APX3000, el valor del Total de control de ganancia de AGC (Accesorio) se sincroniza desde el Total de control de ganancia de AGC (Radio).

Para los radios APX3000, el valor del Total de control de ganancia de AGC (Accesorio) se sincroniza con el Total de control de ganancia de AGC (Radio).

Hay valores Total de control de ganancia de AGC independientes para cada uno de los campos AGC activados por RadioCentral.

Solo se accede:

(Si el usuario establece el Nivel de configuración de audio en **Básico**) Cuando uno de los campos AGC activado se activa, entonces este campo también lo hace; o

(Si el usuario establece el nivel de configuración de audio en **Mejorado**). Cuando uno de los campos AGC (radio) habilitados se activa, el campo Total de control de ganancia de AGC (radio) se activa. Cuando alguno de los campos AGC (Accesorio) activados se activa, entonces el campo del Total de control de ganancia de AGC (Accesorio) se activa.

En la siguiente tabla se enumeran los valores mínimos y máximos para la Salida de control de ganancia de AGC, así como fragmentos de audio de muestra cuando se ingresan valores específicos.

Mesa 361: Rango

Mínimo	Máximo	Incrementos
-12 decibeles	12 decibeles	3 decibeles

10.49.2.83

Total de control de ganancia de AGC (accesorio)

Selecciona la ganancia de los micrófonos del radio a fin de que se incremente (valores positivos), se reduzca (valores negativos) o se mantenga (0) para el perfil de radio actual.

ADVERTENCIA:

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

El nivel de Total de control de ganancia de AGC (también conocido como ganancia pura) se aplica antes del AGC (Control automático de ganancia). Para el sonido entrante al micrófono a un nivel más

bajo que el nominal: salida real del micrófono = sonido en micrófono + Total de control de ganancia de AGC.

**NOTA:**

Si el usuario establece el nivel de configuración de audio en **Básico**, el campo Total de control de ganancia de AGC (accesorio) es de solo lectura (excepto para radios APX3000 únicamente).

Para los radios distintos al modelo APX3000, el valor del Total de control de ganancia de AGC (Accesorio) se sincroniza desde el Total de control de ganancia de AGC (Radio).

Para los radios APX3000, el valor del Total de control de ganancia de AGC (Accesorio) se sincroniza con el Total de control de ganancia de AGC (Radio).

Hay valores Total de control de ganancia de AGC independientes para cada uno de los campos AGC activados por RadioCentral.

Solo se accede:

(Si el usuario establece el Nivel de configuración de audio en **Básico**) Cuando uno de los campos AGC activado se activa, entonces este campo también lo hace; o

(Si el usuario establece el nivel de configuración de audio en **Mejorado**). Cuando uno de los campos AGC (radio) habilitados se activa, el campo Total de control de ganancia de AGC (radio) se activa. Cuando alguno de los campos AGC (Accesorio) activados se activa, entonces el campo del Total de control de ganancia de AGC (Accesorio) se activa.

Se admiten las siguientes selecciones:

Mesa 362: Rango

Mínimo	Máximo	Incrementos
-12 decibeles	12 decibeles	3 decibeles

10.49.2.84**Supresión de retroalimentación acústica**

Cuando esta opción está activada, la Supresión de retroalimentación acústica suprime la retroalimentación o los silbidos que se producen cuando los radios están en una llamada muy cerca uno de otro.

Esta función es compatible con estos modelos de accesorios para los siguientes radios:

Mesa 363: Modelos de accesorios compatibles con la supresión de retroalimentación acústica

Radios	Modelos de accesorios
APX NEXT	XV, XVP850, XVP830, XVE500, XVN500
APX N30	XVP730, XVP750, RM760, RM780
APX N50	
APX N70	

La supresión de retroalimentación acústica no es compatible con el modo de señalización Securenet, los accesorios de audio inalámbricos o ambos.

Para obtener un rendimiento óptimo de la Supresión de retroalimentación acústica, se recomienda seleccionar **Normal** como la Configuración de grupo para la Ecuación de audio del micrófono y el altavoz. Aplique la Configuración de grupo normal recomendada para los ajustes del radio y los

accesorios. No seleccione **Configuración de grupo personalizada** para Control de ganancia en Ajustes de altavoz para la configuración de accesorios.

Direitos de licença

A aquisição de produtos da Motorola Solutions não pressupõe garantia, explícita ou implícita, por impedimento ou qualquer outra forma, de qualquer licença de direito autoral, patente ou aplicação de patente da Motorola Solutions, exceto a licença de uso regular não exclusiva, isenta de exploração de patente concedida por força de lei na venda de um produto.

Conteúdo de código aberto

Este produto pode conter software de código aberto usado conforme licença. Consulte na mídia de instalação do produto o conteúdo completo sobre Atribuições e comunicados jurídicos de código aberto.

Diretiva WEEE (Waste of Electrical and Electronic Equipment, resíduos de equipamentos elétricos e eletrônicos) da UE (União Europeia) e do Reino Unido

A diretiva WEEE da União Europeia e a regulamentação WEEE do Reino Unido exigem que os produtos vendidos nos países da União Europeia e do Reino Unido exibam a etiqueta de lixeira cruzada no produto (ou na embalagem, em alguns casos). Conforme definido pela diretiva WEEE, essa etiqueta de lixeira cruzada indica que os clientes e os usuários finais nos países da União Europeia e do Reino Unido não podem descartar equipamentos ou acessórios elétricos ou eletrônicos em lixo doméstico.

Os clientes ou usuários finais dos países da União Europeia e do Reino Unido devem entrar em contato com o representante do fornecedor do equipamento ou o centro de assistência local para obter informações sobre o sistema de coleta de lixo em seu país.

Isenção de responsabilidade

Fale conosco

O CMSO (Centralized Managed Support Operations, centro de operações de suporte técnico gerenciado) é o principal contato para suporte técnico incluído no contrato de serviço da sua organização com a Motorola Solutions.

Clientes do contrato de serviço devem fazer uma chamada para o CMSO em todas as situações listadas na seção responsabilidades do cliente do contrato, tais como:

- Para confirmar os resultados e as análises da solução de problemas antes de agir

Sua organização recebeu números de telefone de suporte e outras informações de contato apropriadas para sua região geográfica e seu contrato de serviço. Use estas informações de contato para obter a resposta mais eficiente. No entanto, se necessário, também é possível encontrar informações gerais de contato de suporte no site da Motorola Solutions seguindo estas etapas:

- 1 Digite motorolasolutions.com no navegador.
- 2 Verifique se o país ou a região da organização é exibido na página. Clique ou toque no nome da região para alterá-lo, caso necessário.
- 3 Na página motorolasolutions.com, selecione "Suporte".

Capítulo 1

Introdução ao RadioCentral

O RadioCentral oferece recursos de software para que usuários APX NEXT™ e APX N70 gerenciem as seguintes funções no dispositivo:

- Provisionamento de todos os campos associados
- Gerenciamento de atualizações de firmware de software
- Habilitação de novas licenças no recurso adquirido

O banco de dados da agência RadioCentral reside em uma nuvem do Microsoft Azure. O RadioCentral Public Safety Client permite que os usuários se conectem, façam login e acessem com segurança o banco de dados da agência selecionada.

A solução RadioCentral fornece aos usuários uma opção de login seguro em qualquer conexão de rede. O usuário pode usar o RadioCentral para revisar e editar as configurações de ID do rádio em uma tabela de fácil utilização sem precisar abrir ou editar um arquivo. O usuário pode aplicar as alterações de configuração ou configurações individuais por meio de atualizações programadas por meio de Wi-Fi e LTE.

Capítulo 2

Visão geral da interface do usuário

Esta seção descreve as diferentes áreas da interface de usuário do RadioCentral.

As seguintes janelas e recursos são compatíveis com a Visão geral da interface do usuário:

[Ícones de Menu e Seletor de Visualização na página 45](#)

[Painel de navegação do cliente de configuração do RadioCentral na página 45](#)

[Painel de Programação no Cliente de Configuração do RadioCentral na página 46](#)

[Janelas de informações no cliente de configuração do RadioCentral na página 47](#)

2.1

Ícones de Menu e Seletor de Visualização

O usuário pode acessar as principais funções do menu e visualizações de cliente na parte superior.

Acima 1: Ícones de Menu e Seletor de Visualização

Ícone	Funcionalidade
	O menu Ações contém todas as funções e operações que o RadioCentral suporta em uma lista suspensa conveniente.
	O menu Agenda é habilitado quando um ou mais rádios na janela principal são selecionados. A Agenda permite que as tarefas de leitura, gravação ou alternância sejam programadas para execução imediata ou que elas ocorram dentro de um intervalo de tempo especificado.
	O Seletor de visualização alterna o conjunto de informações mostrado nas janelas de programação.

2.2

Painel de navegação do cliente de configuração do RadioCentral

O painel de navegação do Cliente de configuração do RadioCentral permite que o usuário alterne entre outros itens nas seguintes visualizações:

- Visualização da configuração
- Visualização de Extração de Dados
- Visualização da Licença do Rádio
- Visualização do Recurso

As diferentes visualizações são exibidas ao selecionar **Ações**→**Gerenciar**.

Ocultar automaticamente a Navegação

Para aumentar a área de Programação à direita do painel de navegação, o usuário pode selecionar o ícone de pino de **Ocultar automaticamente**  na seção de cabeçalho. Quando selecionado, o

painel de navegação se torna não fixo e desloca-se para a esquerda. O nome da visualização atual é, então, exibido verticalmente. Ao selecionar o nome da visualização vertical, o painel de navegação é expandido. Para fixar o painel de navegação ao aplicativo, selecione o ícone de pino horizontal **Ocultar Automaticamente**.

2.3

Painel de Programação no Cliente de Configuração do RadioCentral

O painel de programação no Cliente de Configuração do RadioCentral é a principal área no aplicativo em que os usuários selecionam e configuram funções e propriedades do rádio. As informações são estruturadas em um formato de tabela com colunas e linhas para cada item.

2.3.1

Botões operacionais no RadioCentral

Os botões operacionais permitem que o usuário gerencie dados do rádio no banco de dados do servidor RadioCentral. Esses botões aparecem nas principais visualizações, como a Visualização do rádio, nas principais janelas de conjuntos e acima das tabelas Lista de itens dentro de um conjunto.

OBSERVAÇÃO:

Se um botão da linha selecionada não estiver habilitado, isso significa que operação solicitada não está disponível. Algumas áreas do painel de programação podem permitir apenas uma única operação, como exportação.

Acima 2: Botões operacionais

Botão	Descrição
	O botão Editar é utilizado para modificar as propriedades da linha selecionada.
	O botão Adicionar é usado para adicionar itens à tabela.
	O botão Excluir é usado para remover o item selecionado da tabela.
	O botão Grade para Arquivo é usado para exportar os dados das linhas selecionadas para um arquivo CVS delimitado por vírgulas.
	O botão Arquivo para grade é usado para importar dados de um arquivo CVS delimitado por vírgulas no servidor RadioCentral.

2.3.2

Seleção de linha no RadioCentral

A seleção de itens é executada ao mover o cursor para a esquerda da linha desejada e clicar no botão esquerdo do mouse.

Passar o cursor sobre a primeira coluna de uma linha muda o formato padrão do ponteiro do mouse para o formato de uma mão. As teclas SHIFT e CTRL são utilizadas para selecionar um intervalo de linhas ou linhas seletivas. As linhas selecionadas são destacadas.

Figura 1: Exemplo de linha selecionada

Serial Number	Radio Alias	Configuration	Group	Modified	Job Status	Job Name	Model Number
682IQU0069	Hormel Teldio	SL_Casino	None				H81QCN9NA2AN
871TNF0772	Sherman2	871TNF0772	None				H56JDN9KA1AN
682TPD1915	RM1915	682TPD1915(3)	None				H81QCN9NA2AN

2.3.3

Organizar e ocultar colunas no RadioCentral

É possível organizar as colunas do painel de programação ao arrastar qualquer coluna pela seção do cabeçalho para um novo local.

Após selecionar e arrastar a coluna, as setas serão exibidas acima e abaixo da seção do cabeçalho para indicar o novo local.

As colunas exibidas no painel de programação podem ser ocultadas para exibir somente as colunas dos dados que são relevantes. Para ocultar colunas, clique com o botão direito do mouse em qualquer cabeçalho de coluna para abrir a janela **Seleção de campo** e selecione somente os campos relevantes para a exibição.

2.4

Janelas de informações no cliente de configuração do RadioCentral

O Cliente de configuração do RadioCentral fornece janelas de informações na parte inferior do aplicativo. Por padrão, essas janelas de informações ficam ocultas, onde somente os nomes ficam visíveis nas guias.

Essas janelas de informações fornecem ao usuário detalhes importantes e úteis sobre as operações realizadas no aplicativo.

OBSERVAÇÃO:

As guias exibidas dependem da visualização atual do aplicativo.

As seguintes janelas são compatíveis:

2.4.1

Janela Analisar Resultados

A janela **Analisar Resultados** exibe erros ou avisos resultantes de uma tarefa agendada de leitura ou gravação. Quando uma tarefa de leitura ou gravação for programada, o codeplug será compilado e todas as validações e dependências serão verificadas. Se ocorrer um erro, a tarefa não será realizada. Correções de configuração devem ser realizadas. O usuário pode procurar por erros antes de agendar uma tarefa analisando o rádio. Consulte [Analisar a Configuração do Rádio na página 48](#).

As colunas a seguir estão disponíveis na tabela Analisar Resultados:

Número de série

O Número de Série do rádio selecionado como parte da tarefa.

Configuração

Nome da Configuração que é atribuído ao rádio sendo analisado.

Caminho do Item

Caminho dentro da Configuração ao campo que contém o erro. Clique duas vezes na mensagem de erro, e o RadioCentral navegará automaticamente ao campo na Configuração ou no Conjunto.

Descrição

Descrição dos erros (se houver algum).

Ações

Ações realizadas nos erros (se houver algum).

Para redefinir os rádios em um único lote, clique no botão **Redefinir Tudo em Um Rádio**.

OBSERVAÇÃO:

Todo o texto na guia Analisar resultados oferece suporte a vários idiomas baseado na configuração do RadioCentral.

A guia Analisar Resultados não atualiza automaticamente; mesmo quando o usuário tenha fixado os erros ou avisos. Execute a operação de verificação ortográfica novamente para confirmar ou não se as alterações feitas foram refletidas.

Se houver uma operação em execução, o RadioCentral não permite que o usuário execute outra operação de verificação ortográfica. Uma operação de verificação ortográfica pode ter vários itens.

Iniciar uma nova operação excluirá os resultados da operação anterior.

Se o conjunto referido não for adicionado à configuração, o caminho do item é identificado com uma bandeira especial. A Motorola Solutions recomenda adicionar o conjunto referido à configuração.

2.4.2

Analisar a Configuração do Rádio

As configurações do rádio podem ser analisadas antes que uma tarefa seja agendada.

Procedimento:

- 1 Na **Visualização do rádio**, selecione os rádios relevantes.
- 2 Clique com o botão direito no rádio selecionado e escolha **Analisar**.

OBSERVAÇÃO:

A opção **Analisar** também pode ser aberta selecionando o atalho **Analisar** sobre o campo de pesquisa.

- 3 Amplie a janela **Analisar Resultados** clicando na guia **Analisar Resultados** na parte inferior. Rádios sem erros exibem um ícone de marcação verde.

OBSERVAÇÃO:

Os erros ou avisos são exibidos no botão de rádio **Todos**. Para exibir somente erros, selecione o botão de rádio **Erros**. Para exibir somente avisos, selecione o botão de rádio **Avisos**.

O usuário pode abrir a Ajuda para itens relacionados a erros selecionando a linha com o erro e pressionando a tecla F1.

2.4.3

Janela de Tarefas

A janela **Tarefas** exibe todos os processos em segundo plano realizados no RadioCentral. Sempre que um processo em segundo plano, como importação de rádios ou exclusão em lote, for realizado no RadioCentral, uma tarefa é criada no Servidor RadioCentral e as informações relacionadas à tarefa são exibidas na tabela Tarefas.

O botão **Limpar** é usado para excluir todas as tarefas listadas na tabela Tarefas.

OBSERVAÇÃO:

Quando o usuário clica duas vezes em qualquer linha, mais detalhes são exibidos na janela **Visualização da Tarefa**.

O conteúdo da janela **Tarefas** é apagado quando o Cliente de Configuração do RadioCentral é fechado.

As colunas a seguir estão disponíveis na tabela Tarefas:

Nome da tarefa

Todas as tarefas recebem um nome padrão. Por exemplo, a ação para converter um rádio do modo de Modelo para o modo de Configuração cria uma tarefa *Converter o Rádio do Modo de Modelos*. O cliente pode especificar o nome de algumas tarefas, como, por exemplo, tarefas de programação.

Horário de Criação

A data e a hora em que a tarefa foi iniciada.

Resumo

Esta coluna mostra uma barra de progresso enquanto uma tarefa estiver sendo processada. Ela também contém informações sobre o número de itens dentro da tarefa.

Ações

Enquanto a tarefa estiver sendo processada, a coluna **Ações** contém o ícone **Cancelar**. Clicar no ícone **Cancelar** cancela a tarefa.

2.4.4

Comparar configurações

O recurso Comparar configuração permite que o usuário compare os valores de codeplug em duas configurações.

O recurso Comparar configuração pode ser realizado na **Visualização do rádio** e na **Visualização da configuração**.

Visualização do rádio

Na **Visualização do rádio**, as seguintes operações são compatíveis:

Configuração atribuída

Compara os valores de codeplug das configurações atribuídas atualmente.

Última programação

Compara os valores de codeplug das últimas configurações programadas no rádio.

OBSERVAÇÃO:

A comparação não é aplicável para as seguintes situações:

- Quando um dos rádios não é lido em **Visualização do Rádio**→**Comparar**→**Último Programado...**
- Quando um dos rádios não é atribuído a uma configuração em **Visualização do Rádio**→**Comparar**→**Configuração Atribuída...**
- Quando houver tarefas com falha em **Visualização de Detalhes do Rádio**→**Histórico de Tarefas**→**Comparar** para o rádio selecionado.

2.4.4.1

Janela Comparar resultados

A janela **Comparar resultados** exibe as diferenças entre as configurações do rádio, geradas pelo recurso Comparar Configuração.

OBSERVAÇÃO:

O recurso Comparar configuração pode ser realizado da **Visualização do rádio** ou da **Visualização da configuração**.

A tabela de comparação exibe as seguintes colunas:

Caminho de navegação

Exibe o caminho de navegação do campo.

Nome do campo

Exibe o nome do campo.

Valor de origem

Exibe o valor na configuração de origem.

Valor de destino

Exibe o valor na configuração de destino.

OBSERVAÇÃO:

A seleção de qualquer valor vinculado nas colunas Origem ou Destino redirecionará o usuário para o Conjunto que contém o campo e colocará o foco no campo. Para valores que não são links, use o Caminho de navegação para localizar manualmente o campo dentro da configuração.

Os botões de opção **Exibir por** permitem que o usuário exiba o seguinte:

Botão de opção	Descrição
Tudo	Exibe todos os campos com diferenças, valores ausentes e mudanças no campo de MVO.
Diferente	Exibe os campos que contêm valores diferentes.
Ausente	Exibe campos que existem em uma configuração, mas não na outra.
MVO	Exibe campos de MVO (Model, Version, Option, modelo, versão, opção) que foram alterados do valor de MVO padrão.

2.4.5

Janela Resultados da Validação

A janela **Resultados da Validação** exibe as condições de erro na configuração.

OBSERVAÇÃO:

A janela **Resultados da Validação** é exibida somente quando uma configuração está sendo editada.

As colunas a seguir estão disponíveis na tabela Resultados da Validação:

Caminho

Caminho dentro da Configuração ao campo que contém o erro.

Código de erro

Um código de erro interno que identifica o erro no sistema.

Descrição

Uma descrição que fornece detalhes ao usuário sobre a causa do erro.

Ações

Quando um ícone (Redefinir valor) é exibido na coluna **Ações**, o erro de validação pode ser automaticamente resolvido ao clicar no ícone. O usuário é direcionado para o conjunto associado ao erro. O campo com o erro será destacado em vermelho.

O botão **Redefinir Tudo (para o Conjunto Superior selecionado)** permite que o usuário redefina todos os erros de validação encontrados no Conjunto Superior selecionado no momento.

2.4.6

Janela Mensagens de Aviso

A janela **Mensagens de Aviso** exibirá os avisos que ocorrem nas configurações.

OBSERVAÇÃO:

A janela **Mensagens de Aviso** é exibida somente quando uma configuração está sendo editada.

2.4.7

Janela Resultados da Busca

A janela **Resultados da Busca** permite que o usuário pesquise campos e/ou valores de campo ao editar as configurações. A função pesquisar permite que o usuário localize rapidamente os campos em uma configuração sem ser necessário saber o conjunto.

Durante a edição de uma configuração, o usuário digita uma palavra, frase ou valor no campo **Pesquisar**. O **x** à direita do campo **Pesquisar** é usado para limpar a entrada e os resultados da busca. O ícone de pesquisa (🔍) é usado para iniciar a pesquisa. A seta suspensa à direita do campo **Pesquisar** permite que o usuário selecione entre as 10 pesquisas anteriores.

As opções a seguir são usadas para restringir a pesquisa:

Nome

Quando selecionado, o texto inserido no campo **Pesquisar** é comparado ao nome de todos os campos.

Valor

Quando selecionado, o número ou o texto inserido no campo **Pesquisar** é comparado ao valor de todos os campos.

Nome e valor

Quando selecionados, o nome e valor do campo são comparados com a entrada no campo **Pesquisar**.

Coincidir palavra inteira

Quando marcada, a palavra exata, frase ou valor digitado no campo **Pesquisar** é usado para restringir os resultados da busca.

As colunas a seguir fornecem detalhes sobre a pesquisa:

Caminho

O caminho para o campo dentro da configuração no formato do Nome do conjunto\Nome do campo.

Valor

O valor atual para o campo.

OBSERVAÇÃO:

Clicar duas vezes em qualquer linha nos resultados da busca abre o conjunto relevante e coloca o campo em foco.

2.4.8

Funções de Usuário

A função dos usuários aparece na barra de status de acordo com a opção selecionada na caixa de diálogo **Selecionar agência**.

Função	Acessar
Admin	Todos os privilégios.
Técnico	Todos os privilégios, exceto registros de licenças.
Etiqueta	Só é possível visualizar os campos e as configurações do rádio. Não é possível adicionar, modificar ou importar nenhum item para o Cliente.

2.4.9

Janela de ajuda

A janela **Ajuda** é usada para exibir a ajuda sensível ao contexto para campos usados em Configurações e Conjuntos.

**OBSERVAÇÃO:**

A janela **Ajuda** é exibida somente quando uma configuração está sendo editada.

Quando um usuário estiver editando uma configuração, o conteúdo de ajuda é exibido na janela **Ajuda** quando um campo é selecionado no Conjunto. Pressionar a tecla F1 abre o sistema de ajuda completo com o atual campo selecionado em foco.

Capítulo 3

Menu Ações

O menu **Ações** permite que o usuário acesse rapidamente as funções mais comuns usadas na configuração de um sistema do RadioCentral.

As seleções disponíveis no menu **Ações** dependem da visualização atual.

As seguintes janelas e recursos são compatíveis no menu **Ações**:

3.1

Importar Seleções

As seleções no menu **Importar** permitem que o usuário importe dados arquivados para ajudar na configuração do sistema RadioCentral.

3.1.1

Importação de Arquivos à Grade

Essa função permite que o usuário importe dados do codeplug do rádio de um arquivo ***.csv** delimitado por vírgulas ou arquivo de planilha ***.xlsx**.

Os dados do codeplug que são exportados do RadioCentral (consulte [Janela Exportar na página 55](#)) podem ser modificados em um programa de planilha e salvos como um arquivo **.csv** (com o uso do comando **Salvar como**).

OBSERVAÇÃO:

Os arquivos ***.csv** delimitados por vírgulas ou ***.xlsx** de planilha só podem ser importados na **Visualização de Rádio**.

Procedimento:

- 1 Em **Visualização do Rádio**, selecione **Ações**→**Importar**→**Arquivo para a Grade**.

OBSERVAÇÃO:

A janela **Importar Arquivo à Grade** também pode ser aberta pressionando CTRL+H.

- 2 Na janela **Importar Arquivo à Grade**, vá até o local de armazenamento que contém os arquivos de arquivamento de codeplug e realize uma das seguintes ações:
 - Para arquivos CSV (delimitados por vírgulas), selecione **CSV (delimitados por vírgulas) (*.csv)** na lista suspensa de tipos de arquivos.

OBSERVAÇÃO:

Por padrão, o **CSV (delimitado por vírgulas) (*.csv)** é o tipo de arquivo selecionado.

- 3 Selecione os arquivos relevantes.

OBSERVAÇÃO:

Use a tecla CTRL (seletiva) ou SHIFT (intervalo) para selecionar diversos arquivos.

- 4 Clique em **Abrir**.

3.1.2

Importar Configurações

Esse recurso permite que o usuário importe arquivos de configuração da **Visualização da Configuração**.

Procedimento:

- 1 No menu **Ações**, selecione **Gerenciar**→**Configurações** para abrir a janela **Visualização da configuração**.
- 2 Selecione **Ações**→**Importar**→**Configurações**.

OBSERVAÇÃO:

A janela **Importar Configurações** também pode ser aberta clicando no botão **Importar**.

- 3 Na janela **Importar Configurações**, selecione os arquivos **.dbn** relevantes.
- 4 Clique em **Abrir**. A caixa de diálogo **Importar Configuração** é exibida.
- 5 Digite um nome relevante no campo **Sufixo para Conjuntos**.
- 6 Clique em **OK**.

3.1.3

Importar Anúncios de Voz

Esse recurso permite que o usuário importe arquivos de anúncio de voz da **Visualização de Recursos de Anúncios de Voz**.

Procedimento:

- 1 No menu **Ações**, selecione **Gerenciar**→**Anúncios de Voz** para abrir a janela **Visualização de Recursos para Anúncios de Voz**.
- 2 Selecione **Ações**→**Importar**→**Anúncios de Voz**.

OBSERVAÇÃO:

A janela **Importar Anúncios de Voz** também pode ser aberta clicando no botão **Importar**.

- 3 Na janela **Importar Anúncios de Voz**, selecione os arquivos **.mva** ou **.wav** relevantes.
- 4 Clique em **Abrir**.

3.1.4

Como Importar Certificados CA Manualmente

O recurso **Importar Arquivos de Certificados CA** permite que o usuário importe novas versões dos arquivos de Certificados CA ao Servidor RadioCentral.

Quando e onde usar:

Use esse procedimento para importar arquivos de Certificados CA.

Procedimento:

- 1 No menu **Ações**, selecione **Gerenciar**→**Certificados CA** para abrir a janela **Visualização do Recurso de Certificados CA**.
- 2 Clique no botão **Importar**.
- 3 Na janela **Importar Certificados CA**, selecione o arquivo ***.*** relevante.

O tamanho do certificado CA não deve exceder 10K e deve ser formatado para PEM (Privacy Enhanced Mail, correspondência de privacidade aprimorada). Certificados CA não podem ser importados de forma automática ou manual se houver um arquivo de nome correspondente no Servidor RadioCentral.

- 4 Clique em **Abrir**.

3.2

Janela Exportar

As opções no menu **Exportar** permitem que o usuário exporte dados do rádio a diversos tipos de arquivos.

3.2.1

Exportar configuração

Esse recurso permite que o usuário exporte uma ou mais configurações da **Visualização da configuração**.

Procedimento:

- 1 No menu **Ações**, selecione **Gerenciar**→**Configurações**.
- 2 Para exportar uma única configuração, realize as seguintes ações:
 - a Selecione a linha relevante.
 - b Clique com o botão direito na linha selecionada e escolha **Exportar configuração**.
 - c Na janela **Exportar configuração**, procure e selecione uma pasta.
 - d Insira um nome para o arquivo de configuração.
 - e Clique em **Salvar**.

- 3 Para exportar várias configurações, realize as seguintes ações:

- a Selecione a primeira linha.
- b Mantenha a tecla **CTRL** pressionada.

OBSERVAÇÃO:

Para selecionar linhas consecutivas, mantenha a tecla **SHIFT** pressionada.

- c Selecione uma ou mais linhas adicionais.
- d Clique com o botão direito nas linhas selecionadas e escolha **Exportar configuração**.
- e Procure e selecione uma localização na pasta.

OBSERVAÇÃO:

Uma vez que os arquivos de configuração selecionados serão salvos na pasta selecionada, recomenda-se criar uma nova pasta para ajudar a organizar os arquivos exportados.

- f Clique em **OK**.

3.2.2

Exportar Grade para Arquivo

A opção **Grade para Arquivo** permite que o usuário exporte todos os rádios selecionados na **Visualização de Rádio** em um arquivo delimitado por vírgulas (*.csv) que pode ser exibido por um aplicativo de planilha. O arquivo CSV exportado contém os mesmos dados que são representados na **Visualização de Rádio**.

Procedimento:

- 1 Selecione um ou mais rádios da tabela.
- 2 Na **Visualização de Rádio**, selecione **Ações**→**Exportar**→**Grade para Arquivo** para abrir a janela **Exportar Grade para Arquivo**.

Como alternativa, pressione **Ctrl+Shift+S**.

- 3 Na janela **Exportar Grade para Arquivo**, procure e selecione um local para o arquivo.
- 4 Digite um nome para o arquivo **.cvs**.
- 5 Clique em **Salvar**. A caixa de diálogo **Exportar Grade para Arquivo** é exibida.
O arquivo **.cvs** é exportado com êxito.
- 6 Clique em **OK**

3.3

Gerenciar configurações

O gerenciamento de configurações permite que o usuário defina as configurações que serão criadas e armazenadas no Servidor RadioCentral.

A **Visualização da Configuração** é iniciada no menu **Ações** selecionando **Gerenciar**→**Configurações**.

OBSERVAÇÃO:

As Configurações atribuídas a um dispositivo não podem ser excluídas do Servidor RadioCentral. O usuário deve primeiro selecionar uma Configuração diferente para o dispositivo em Visualização do Rádio antes que ela possa ser excluída do Servidor RadioCentral.

Na **Visualização da Configuração**, o usuário pode realizar as seguintes operações básicas:

-  **Editar**
-  **Adicionar**
-  **Excluir**

OBSERVAÇÃO:

O ícone **Excluir** remove configurações do banco de dados do Servidor RadioCentral que não estão atribuídas a um dispositivo.

-  **Importar**
-  **Exportar**

Gerenciamento de configurações

Acima 3: Colunas da Tabela da Visualização da Configuração

Coluna	Descrição
Nome	Permite que o usuário veja e modifique o nome da configuração. Uma configuração deve ter um nome exclusivo. O nome modificado da configuração é mostrado em todas as tabelas em que é usado.
Data da última modificação	Exibe a data e a hora real de quando a configuração foi modificada pela última vez.
Rádios	Exibe o número de rádios atribuídos para a configuração.
Comentários	Permite que o usuário adicione um comentário à configuração.

Opção de menu acessada com o botão direito do mouse

As seguintes opções de menu acessadas com o botão direito do mouse disponíveis quando a configuração é selecionada e o usuário clica com o botão direito do mouse na configuração selecionada:

Acima 4: Seleções de configuração acessadas com o botão direito

Coluna	Descrição
Editar	Essa seleção permite que o usuário edite todos os Conjuntos atribuídos à configuração.
Excluir	Essa seleção está disponível apenas quando a Configuração selecionada não está atribuída a um rádio.
Copiar configuração	Essa seleção abre a janela Copiar configuração e permite que o usuário duplique a Configuração selecionada. Na janela Copiar configuração , o usuário pode renomear a Configuração e adicionar um sufixo que é anexado a cada Conjunto da configuração.
Mostrar rádios relacionados	Essa seleção abre a janela Rádios Selecionados e exibe todos os rádios armazenados no Servidor RadioCentral que estão usando a configuração selecionada no momento.  OBSERVAÇÃO: Rádios relacionados exibe apenas rádios com permissão de visualização atribuída. Não há restrições para usuários com a função de Administrador de RM.
Exportar configurações	Essa seleção permite que o usuário exporte a Configuração para uma unidade local ou para a unidade de rede como um arquivo de dados binário (*.dbn).

3.4

Gerenciar Extração de Dados

O recurso Mineração de Dados no RadioCentral permite que o usuário localize campos específicos com valores usados em Configurações e Rádios.

O usuário pode criar consultas simples ou avançadas que ajudem a identificar onde determinados campos estão sendo utilizados. A Extração de Dados é inicializada no menu **Ações** ao selecionar as opções **Gerenciar**→**Extração de Dados**.

Na visualização principal da mineração de dados, o usuário pode **Adicionar** , **Editar** , **Excluir**  ou **Exportar**  consultas. As consultas são exportadas para um arquivo CSV delimitado por vírgula.

Acima 5: Tabela de Extração de Dados

Coluna	Descrição
Nome da Consulta	Exibe os nomes das consultas criadas para extração de dados.
Pesquisar por	Exibe o principal objeto de pesquisa da consulta. Os objetos disponíveis são: Configuração, Rádio e Conjunto.

Coluna	Descrição
Agrupar Consulta	Uma coleção de consultas exclusivas. Útil para classificação de consultas.
Data da Última Modificação	Exibe a data e a hora em que a consulta foi modificada pela última vez.
Comentários	Permite que o usuário insira um comentário para ajudar a identificar a finalidade da consulta.

OBSERVAÇÃO:

A funcionalidade Mineração de dados está disponível apenas para usuários com a função de Administrador de RM.

3.4.1

Janela Consulta da Extração de Dados

A janela **Consulta** permite que os usuários criem consultas simples e avançadas que podem ser executadas e compartilhadas em um sistema RM. O usuário pode adicionar mais consultas à janela Extração de Dados clicando no botão **Adicionar**.

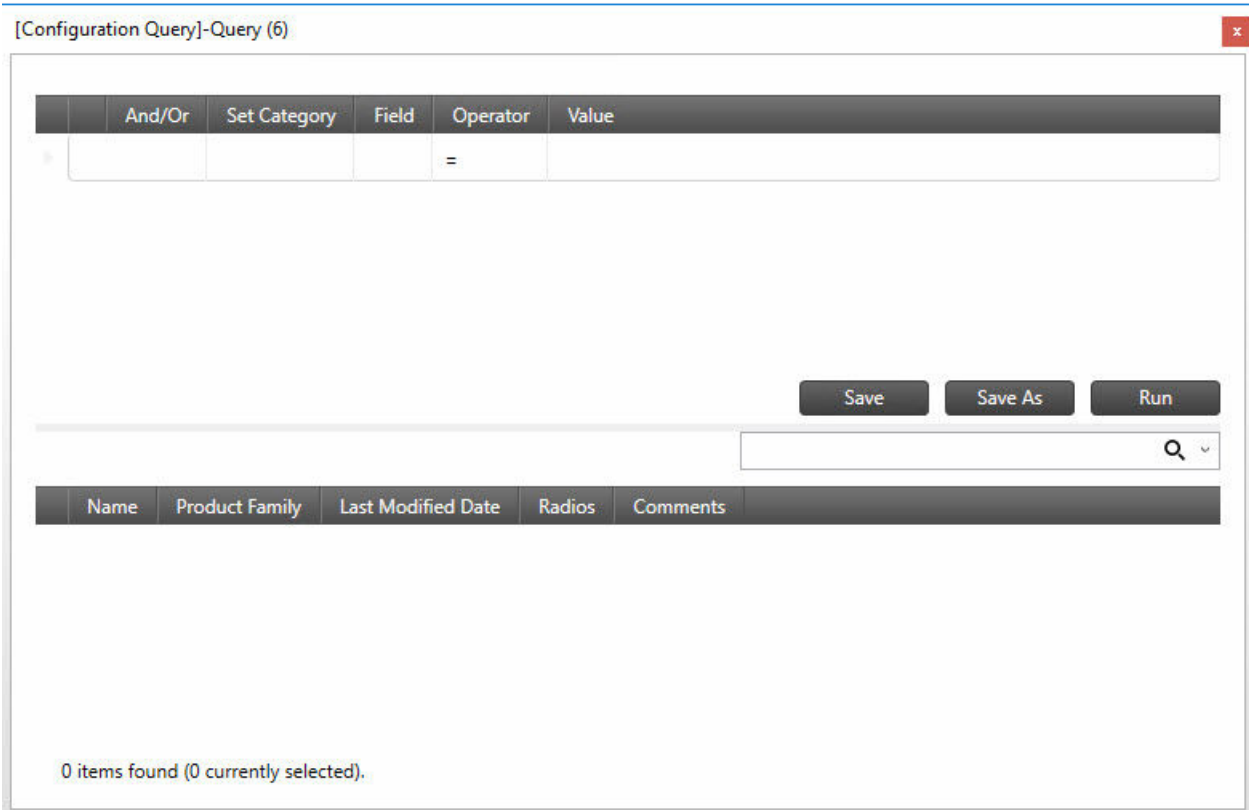

Figura 2: Janela Nova consulta

A janela **Nova consulta** permite que o usuário pesquise campos usados em uma **Configuração**, **Rádio** ou **Conjunto**.

Quando o tipo de consulta **Pesquisar por** for selecionado, a janela principal **Consulta** será exibida. O cabeçalho da janela principal de consulta mostra o tipo de consulta selecionado.

Figura 3: Janela principal de consulta

As colunas na metade superior da janela são usadas para criar as cláusulas da consulta.

Acima 6: Colunas de cláusula da consulta

Coluna	Função
E/Ou	Os operadores E/Ou são usados para filtrar os resultados de uma ou mais cláusulas. O operador E exibe um resultado quando as condições de todas as cláusulas são verdadeiras. O operador Ou exibe um resultado quando pelo menos uma das cláusulas é verdadeira. Esses operadores são válidos apenas para consultas que usam mais de uma cláusula.
Categoria de conjunto	Esta lista suspensa é usada para selecionar uma Categoria de conjunto. As Categorias de conjunto são um agrupamento de campos.
Campo	Esta lista suspensa é usada para selecionar um campo contido em uma Categoria de conjunto selecionada.
Operador	Esta lista suspensa é usada para selecionar um operador de consulta de pesquisa. Os operadores suportados são: <ul style="list-style-type: none"> • Contém • <= • < • >= • >

Coluna	Função
	<ul style="list-style-type: none">• Não contém• < > <p>A lista de operadores disponíveis depende do campo selecionado.</p>
Valor	Esse campo define o valor usado na expressão de consulta para o Campo selecionado. O valor pode ser verdadeiro/falso, numérico ou uma seleção suspensa.

As colunas na metade inferior da janela são usadas para exibir os resultados da consulta realizada. As colunas exibidas dependem do tipo de consulta selecionado. Os resultados podem ser classificados clicando no cabeçalho de uma coluna.

Acima 7: Colunas de resultados da consulta

Tipo de Consulta	Colunas Exibidas
Configuração	Nome/Família do produto/Data da última modificação/Rádios/Comentários
Rádio	Número de série/Alias do rádio/Número do modelo/Comentários
Definir	Nome do conjunto/Data da última modificação/Comentários

3.4.2

Adicionar uma Consulta para Extração de Dados

As consultas permitem que o usuário identifique onde um parâmetro, que contenha um valor específico, é usado. Elas são criadas ao adicionar uma ou mais expressões de cláusula. Consultas simples podem ser criadas para localizar um parâmetro único. Consultas mais avançadas podem ser criadas para localizar vários parâmetros.

Quando e onde usar:

Use este procedimento para criar consultas e localizar parâmetros e Configurações, Conjuntos e Rádios.

Depois que as consultas forem criadas, o usuário poderá realizar as seguintes operações:

- [Agrupar Cláusulas de Consulta na página 61](#)
- [Excluir uma Cláusula de Consulta na página 62](#)

Procedimento:

- 1 Clique no menu **Ações** e selecione **Gerenciar**→**Extração de dados**.
- 2 Na visualização **Extração de Dados**, clique no botão **Adicionar**.
- 3 Na janela **Nova Consulta**, selecione **Configuração**, **Rádio** ou **Conjunto** na lista suspensa Pesquisar Por.
- 4 Clique em **OK**.
- 5 Na janela **Consulta**, crie uma consulta da seguinte forma:

Se...	Então...
Se estiver criando uma	faça o seguinte:

Se...	Então...
consulta para cláusula única,	<p>a Clique na coluna Categoria de Conjunto e selecione o respectivo Conjunto.</p> <p>b Clique sob a coluna Campo e escolha um Parâmetro para a Categoria de Conjunto selecionada.</p> <p>c Selecione um Operador. Consulte Acima 6: Colunas de cláusula da consulta na página 59 para obter uma lista de operadores.</p> <p>d Digite ou selecione um Valor para o Campo selecionado.</p>
Se estiver criando uma consulta para várias cláusulas,	<p>faça o seguinte:</p> <p>a Após criar a primeira cláusula, clique com o botão direito do mouse em qualquer lugar da metade superior e selecione Adicionar nova Cláusula. Por padrão, a nova cláusula é E para a cláusula anterior.</p> <p>b Na lista suspensa E/Ou, selecione o operador apropriado.</p> <p>c Selecione uma Categoria de Conjunto.</p> <p>d Selecione um Campo para a Categoria de Conjunto escolhida.</p> <p>e Selecione um Operador.</p> <p>f Digite ou selecione um Valor para o Campo selecionado.</p>

- 6 Clique em **Salvar** ou **Salvar Como** para atribuir um nome à consulta.
- 7 Clique em **Executar** para iniciar a pesquisa da consulta.

Se a consulta não retornar resultados, a mensagem *Extração de dados concluída, mas sem dados correspondentes* será exibida à direita do botão **Salvar**. Caso contrário, as correspondências serão exibidas na parte inferior da janela.

3.4.2.1

Agrupar Cláusulas de Consulta

O agrupamento de cláusulas permite que o usuário combine várias cláusulas em uma única expressão. As expressões de cláusula podem ser agrupadas ao criar a consulta pela primeira vez ou ao editar uma consulta existente.

Quando e onde usar:

Use este procedimento para agrupar expressões de cláusula em uma consulta.

OBSERVAÇÃO:

As consultas e as expressões de cláusula são selecionadas ao mover o cursor à esquerda da linha desejada e clicar com o botão esquerdo do mouse.

Procedimento:

- 1 Selecione uma consulta na visualização **Extração de Dados** e clique no botão **Editar**.
- 2 Selecione a primeira cláusula na consulta a ser agrupada.
Ao selecionar a linha da cláusula, ela ficará realçada.
- 3 Mantenha a tecla **CTRL** pressionada e selecione a segunda cláusula.
- 4 Clique com o botão direito do mouse sobre as cláusulas selecionadas e, em seguida, selecione **Agrupar Cláusulas**.

Um agrupamento vertical é exibido à esquerda das cláusulas agrupadas.

OBSERVAÇÃO:

Para excluir um agrupamento, selecione todas as cláusulas no grupo, clique com o botão direito do mouse e, em seguida, selecione **Desagrupar Cláusulas**.

3.4.2.2

Excluir uma Cláusula de Consulta

É possível realizar a exclusão de uma expressão de cláusula dentro de uma consulta de extração de dados ao criar a consulta ou modificar consultas existentes.

Quando e onde usar:

Use este procedimento para excluir uma expressão de cláusula em uma consulta.

OBSERVAÇÃO:

As consultas e as expressões de cláusula são selecionadas ao mover o cursor à esquerda da linha desejada e clicar com o botão esquerdo do mouse.

Procedimento:

- 1 Clique no menu **Ações** e selecione **Gerenciar**→**Extração de dados**.
- 2 Selecione a consulta desejada e clique no botão **Editar**.
O usuário também pode clicar com o botão direito do mouse sobre a consulta selecionada e, em seguida, selecionar **Editar Consulta**.
- 3 Selecione a expressão de cláusula, clique com o botão direito do mouse e selecione **Excluir Cláusulas**.
- 4 Na visualização **Extração de Dados**, clique no botão **Adicionar**.
- 5 Se aplicável, faça outras alterações, salve ou execute a consulta.

3.4.3

Excluir uma Consulta da Extração de Dados

A exclusão de consultas da extração de dados permite que o usuário mantenha as consultas usadas para extração de dados atualizadas.

Quando e onde usar:

Use este procedimento para excluir consultas da extração de dados.

OBSERVAÇÃO:

As consultas são selecionadas ao mover o cursor à esquerda da linha desejada e clicar com o botão esquerdo do mouse. Passar o mouse sobre a coluna inicial da tabela muda o cursor de ponteiro padrão para ponteiro manual.

Procedimento:

- 1 Clique no menu **Ações** e selecione **Gerenciar**→**Extração de dados**.
- 2 Na seção **Extração de Dados**, selecione uma ou mais consultas na tabela.

OBSERVAÇÃO:

Os botões **Editar** e **Excluir** ficam esmaecidos até que uma consulta seja selecionada.

- 3 Clique no botão **Excluir**.
- 4 Clique em **Sim** para excluir a consulta ou em **Não** para cancelar a operação.

OBSERVAÇÃO:

Após concluir a operação de exclusão, não é possível desfazê-la.

3.4.4

Agrupar Consultas na Extração de Dados

O agrupamento de consultas permite que o usuário as organize em coleções exclusivas. É necessário criar os grupos de consulta para poder atribuí-los às consultas.

Quando e onde usar:

Use este procedimento para agrupar uma ou mais consultas em uma coleção exclusiva.

OBSERVAÇÃO:

As consultas são selecionadas ao mover o cursor à esquerda da linha desejada e clicar com o botão esquerdo do mouse. Passar o mouse sobre a coluna inicial da tabela muda o cursor de ponteiro padrão para ponteiro manual.

Procedimento:

- 1 Clique no menu **Ações** e selecione **Gerenciar**→**Extração de dados**.
- 2 Na visualização **Extração de Dados**, clique com o botão direito do mouse no painel de navegação e selecione **Novos Grupos de Consulta**.
- 3 Renomeie o novo grupo de consulta. Execute as seguintes ações:
 - a Selecione o grupo de consulta.
 - b Clique com o botão direito do mouse e selecione **Renomear**.
 - c Digite um nome para o grupo de consulta e pressione ENTER.

OBSERVAÇÃO:

Os grupos de consulta também podem ser renomeados, basta clicar duas vezes sobre ele e inserir um novo nome.

- 4 Clique em **Todos os Grupos de Consulta** para exibir todas as consultas existentes à direita do painel de navegação.
- 5 Na coluna **Grupo de Consulta**, selecione a lista suspensa e escolha um grupo de consulta para a consulta.
- 6 Repita a etapa 5 até que todas as consultas tenham sido adicionadas ao grupo.

OBSERVAÇÃO:

Selecionar as consultas do grupo no painel de navegação exibe somente as consultas que foram adicionadas ao grupo. Selecionar **Todos os Grupos de Consulta** a qualquer momento exibe todas as consultas do sistema.

3.5

Gerenciar Licenças

O recurso Gerenciar Licenças permite que um usuário adicione mais rádios ao sistema RM.

O usuário pode comprar o recurso RM por meio do site Motorola Solutions Online (MOL). Se a compra for bem-sucedida, uma ID de permissão (EID) será fornecida. Com essa função, o usuário especifica o número de rádios que deseja gerenciar. O número de rádios associados a cada EID é dividido em várias instâncias do Servidor RM.

O recurso Gerenciar Licenças é iniciado no menu **Ações** selecionando **Gerenciar**→**Licenças**.

Na visualização de cada Licença, o usuário pode **Adicionar** , **Editar** ou **Excluir** rádios.

Os seguintes tipos de licenças podem ser gerenciados no Radio Management:

3.5.1

Visualização Gerenciar licenças de rádio

Gerenciar licenças permite que o usuário adicione mais rádios ao Sistema RadioCentral. O usuário pode comprar a função RadioCentral por meio do site MOL (Motorola Solutions Online, soluções Motorola online). Se a compra for bem-sucedida, uma ID de permissão (EID) será fornecida. Com esse recurso, o usuário poderá especificar a quantidade de rádios que deseja gerenciar. A contagem de rádios associados a cada EID é dividida em várias instâncias do servidor RadioCentral. A visualização da Licença do rádio é aberta no menu **Ações** selecionando **Gerenciar**→**Licenças**→**Licenças do Rádio**.

Acima 8: Licenças do rádio

Coluna	Descrição
Número de série	Permite que o usuário somente visualize o Número de série do rádio para todas as funções licenciadas. Os Números de série são lidos pelos codeplugs.
Alias do rádio	Permite que o usuário somente visualize o nome de identificação do usuário do rádio para todas as funções licenciadas. Esse campo pode ser modificado apenas na Visualização do rádio .
Número do modelo	Permite que o usuário somente visualize o Número do modelo do rádio para todas as funções licenciadas. Os Números de modelo são lidos pelos codeplugs.
Região	Permite que o usuário somente visualize a região do rádio para todos os recursos licenciados.
Nome da Funcionalidade	Permite que o usuário somente visualize o nome da Função. Nesse caso, o Nome da função é lido a partir da licença real.
Status	Permite que o usuário somente visualize o status de todas as licenças do rádio.
Comentários	O usuário pode adicionar uma breve descrição sobre essa linha de licença do rádio.

Acima 9: Licenças do rádio

Coluna	Descrições
Número de série	Permite que o usuário somente visualize o Número de série do rádio para todas as funções licenciadas. Os Números de série são lidos pelos codeplugs.
Alias do rádio	Permite que o usuário somente visualize o nome de identificação do usuário do rádio para todas as funções licenciadas. Esse campo pode ser modificado apenas na Visualização do rádio .
Número do modelo	Permite que o usuário somente visualize o número do modelo.
Número do FLASHcode	Permite que o usuário somente visualize o FLASHcode adquirido no rádio atualmente conectado.
Nome da Funcionalidade	Permite que o usuário somente visualize o nome da função.
Status	Permite que o usuário somente visualize o status de todas as licenças do rádio.

Coluna	Descrições										
Acima 10: Colunas na Visualização de licenças do rádio											
	<table border="1"> <thead> <tr> <th>Status possíveis</th> <th>Explicação do status</th> </tr> </thead> <tbody> <tr> <td>Registrado</td> <td>A função é registrada para o rádio e mudanças acionadas por causa de seu registro são descartadas. O usuário pode usar o menu contextual para restaurá-lo para Pronto para Ativação.</td> </tr> <tr> <td>Disponível para registro</td> <td>A função não é registrada para o dispositivo, o usuário pode registrar a função para o rádio.</td> </tr> <tr> <td>Pronto para Ativação</td> <td>A função é registrada para o dispositivo e fica pendente de ativação no rádio.</td> </tr> <tr> <td>Ativada – adquirida</td> <td>Essa função é adquirida e ativada para o rádio.</td> </tr> </tbody> </table>	Status possíveis	Explicação do status	Registrado	A função é registrada para o rádio e mudanças acionadas por causa de seu registro são descartadas. O usuário pode usar o menu contextual para restaurá-lo para Pronto para Ativação .	Disponível para registro	A função não é registrada para o dispositivo, o usuário pode registrar a função para o rádio.	Pronto para Ativação	A função é registrada para o dispositivo e fica pendente de ativação no rádio.	Ativada – adquirida	Essa função é adquirida e ativada para o rádio.
Status possíveis	Explicação do status										
Registrado	A função é registrada para o rádio e mudanças acionadas por causa de seu registro são descartadas. O usuário pode usar o menu contextual para restaurá-lo para Pronto para Ativação .										
Disponível para registro	A função não é registrada para o dispositivo, o usuário pode registrar a função para o rádio.										
Pronto para Ativação	A função é registrada para o dispositivo e fica pendente de ativação no rádio.										
Ativada – adquirida	Essa função é adquirida e ativada para o rádio.										
Comentários	O usuário pode adicionar uma breve descrição sobre essa linha de licença do rádio.										

OBSERVAÇÃO:

Em todas as exibições que listam rádios (recursos, rádios, detalhes do recurso), o usuário pode ver apenas rádios com permissão de visualização atribuída. A coluna Contagem de rádios mostra apenas rádios com permissões de visualização atribuídas para o usuário RM atual.

O registro de recursos só é possível para dispositivos com permissões de exibir e modificar. Não há restrições para usuários com a função de Administrador de RM.

3.5.1.1

Restaurar Licenças Registradas para o Rádio

Essa seção aborda a capacidade de encontrar licenças na tabela Capacidade do Dispositivo que estejam associadas a um determinado rádio, mas não exibidas na visualização de Licenças do Rádio. As licenças podem acabar nesse estado quando alterações no dispositivo são ignoradas com licenças no estado registrado (antes de ser ativadas no dispositivo por meio de uma operação de gravação).

Procedimento:

- 1 Abra a **Visualização de licenças do rádio**.
- 2 Carregue um (ou mais) dispositivo de rádio no banco de dados do RadioCentral .
- 3 Selecione uma ou mais linhas na visualização de Licenças de Rádio.
- 4 Clique com o botão direito do mouse e selecione **Restaurar licenças** ou clique em CTR +O.

O Cliente do RadioCentral se comunicam com o servidor do RadioCentral para determinar se há alguma licença associada ao dispositivo por meio do ID registrado. As licenças restauradas são exibidas na Visualização de licenças de rádio como no estado Pronto para ativação.

3.5.1.2

Recuperar licenças de rádio

Esse recurso ajuda o usuário a recuperar informações de licenciamento perdidas devido à recriação de imagem da máquina do servidor do RadioCentral. Entre em contato com o suporte ao cliente

se o hardware da máquina for alterado. O usuário deve retornar a chamada para o Servidor de licenciamento para recuperar licenças (na forma de respostas de capacidade) para todos os rádios no RadioCentral .

Procedimento:

- 1 Clique em  e, em seguida, clique em **Configurações**.
- 2 Selecione a guia **Licenças**.
- 3 Na janela **Recuperar licenças**, clique no botão **Licenças de rádio-Recuperar**.
- 4 Clique em **OK**.

As licenças existentes do servidor de Licenciamento do Motorola estão restauradas.

3.5.1.3

Classificação da Grade na Visualização de Licenças do Rádio

Os dados na tabela são classificados em ordem crescente de acordo com o Número de série do rádio.

Procedimento:

- Clique em um dos cabeçalhos de coluna na grade.
- Classifique os dados em ordem crescente ou decrescente com base na coluna selecionada.

3.5.1.4

Filtrar os Rádios Disponíveis por Grupos

Procedimento:

- O usuário pode classificar os dados do rádio por qualquer coluna clicando no cabeçalho da coluna.
- O usuário pode filtrar Rádios disponíveis por Grupo.

3.5.2

Janela Registrar Licenças de Rádio

Essa janela permite que o usuário envie uma atribuição de licença de software. A janela Licenciamento de dispositivos apresenta a seguinte interface de usuário:

- Campo de texto – uma caixa de campo para o usuário inserir o ID de autorização (EID).
- Lista de rádios disponíveis – uma lista que exibe todos os dispositivos que atendem aos critérios de licença de EID.
- Lista de rádios selecionados – uma lista para visualizar todos os dispositivos que o usuário deseja associar à licença.

Para acessar a janela de Licenciamento de rádios, clique no botão  na **Visualização de licenças do rádio**.

A tabela a seguir lista as descrições para as colunas na tabela Consultar EID.

Acima 11: Licenças do rádio

Colunas e Botões	Descrição
Caixa de texto para a ID de Permissão	Para que o usuário digite a EID a ser consultada. Consulte Execução de uma consulta EID na página 67 .
Consulta	Clicar nesse botão exibe as informações de EID na tabela.
Limpar Tudo	Clicar nesse botão exclui as EIDs consultadas anteriormente.
ID de Autorização	Permite que o usuário somente visualize a linha da ID de Permissão para cada licença única. Consulte Selecionar vários itens de linha na tabela de EID na página 68 .
Nome da Funcionalidade	Permite que o usuário somente visualize o nome de cada nova função.
Disponível	Permite que o usuário somente visualize o número restante das licenças de funções que estão disponíveis para ser registradas em um rádio.
Adquirido	Permite que o usuário somente visualize o número original de licenças de função adquiridas.
Número de série	Permite que o usuário somente visualize o número de série do dispositivo.
Alias do rádio	Permite que o usuário somente visualize o nome de identificação do usuário do rádio para todas as funções licenciadas. Esse campo pode ser modificado apenas na Visualização do rádio .
Adicionar tudo	Clicar nesse botão adiciona todos os dispositivos selecionados na tabela Rádios disponíveis à tabela Rádios selecionados.
Adicionar	Clicar nesse botão adiciona o dispositivo selecionado na tabela Rádios disponíveis à tabela Rádios selecionados.
Remover	Clicar nesse botão remove o dispositivo selecionado na tabela Rádios selecionados e os devolve para a tabela Rádios disponíveis.
Remover tudo	Clicar nesse botão remove todos os dispositivos da tabela Rádios selecionados para a tabela Rádios disponíveis.
PTT	Clique nesse botão para registrar os recursos selecionados na tabela ID de consulta para os dispositivos na tabela Rádios selecionados. Consulte Enviar a Atribuição de Licença de Software na página 68 .

3.5.2.1

Execução de uma consulta EID

Procedimento:

- 1 Digite o "ID de permissão" na caixa de texto ID de permissão.
- 2 Clique no botão **Consultar**.
Para cancelar, clique no botão **Apagar tudo**.

3.5.2.2

Selecionar vários itens de linha na tabela de EID

Procedimento:

- 1 Clique na caixa de seleção na primeira coluna da linha desejada.
- 2 Para marcar ou desmarcar tudo, clique na caixa de seleção no cabeçalho da coluna da tabela de EID.
O Cliente do RadioCentral atualiza a tabela de EID e aplica a filtragem das tabelas Rádios disponíveis e Rádios selecionados.
- 3 Clique em **OK** para remover qualquer rádio da tabela Rádios Selecionados e adicione manualmente os rádios da tabela Rádios Disponíveis.
O usuário pode ignorar essa etapa se não houver nenhum rádio a ser removido. Para cancelar, clique no botão **Apagar tudo**.
- 4 Clique em **OK**. Os rádios são filtrados a partir da tabela Rádios selecionados.

3.5.2.3

Enviar a Atribuição de Licença de Software

Após selecionar os rádios para atribuir licenças, clique no botão **Registrar** para confirmar essas associações.

Pré-requisitos:

- Abra a janela **Licenciamento de rádios**.
- A tabela de EID deve conter pelo menos uma linha totalmente preenchida e pelo menos uma linha onde a tabela de EID está selecionada.
- A tabela Rádios selecionados é preenchida com pelo menos uma linha totalmente preenchida.
- O número total de rádios na tabela Rádios selecionados não deve exceder o número de licenças disponíveis em qualquer uma das linhas selecionadas na tabela de EID.
- O Cliente do RadioCentral tem uma conexão de Internet válida.

Procedimento:

- 1 Clique em **Registrar**. depois de selecionar os rádios aos quais licenças serão atribuídas.
- 2 Clique em **OK**.

3.6

Gerenciar firmware

O recurso **Gerenciar firmware** permite que o usuário veja as versões de firmware importadas automaticamente armazenadas no Servidor RadioCentral.

Sempre que um rádio é adicionado ao RadioCentral, caso não esteja armazenado no RadioCentral, sua versão de firmware é adicionada automaticamente. Os rádios adicionados recentemente ficam então disponíveis a outros rádios gerenciados.

Gerenciar Firmware é iniciado no menu **Ações** selecionando **Gerenciar**→**Firmware**.

Acima 12: Firmware

Coluna e botões	Descrição
Nome	Permite que o usuário veja somente o nome de todas as versões de firmware disponíveis.
Versão	Permite que o usuário veja somente o número de versão de todas as versões de firmware disponíveis.
Tamanho (KB)	Permite que o usuário veja somente o tamanho do arquivo de todas as versões de firmware.
Data da importação	Permite que o usuário visualize somente a Data e Hora reais em que todas as versões de firmware foram importadas.
Codeplug	Permite que o usuário veja somente o nome da versão do codeplug.
Rádios em uso	Permite que o usuário veja somente a quantidade de rádios usando cada arquivo de firmware.
Rádios em Uso (modo de modelo)	Exibe o número de modelos que estão usando cada arquivo de firmware no Modo de Modelo.
Rádios Em Uso (modo de configuração)	Exibe o número de rádios que estão usando cada arquivo de firmware no Modo de Configuração.
Comentários	Permite que o usuário adicione comentários com base no arquivo de firmware.

3.7

Gerenciar anúncios de voz

O recurso **Gerenciar Anúncios de Voz** permite visualizar os arquivos de Anúncio de Voz importados automaticamente que estejam armazenados no Servidor RM e importar manualmente novos arquivos de Anúncio de Voz para o Servidor RM.

Gerenciar Anúncios de Voz é iniciado no menu **Ações** selecionando **Gerenciar**→**Anúncios de Voz**.

O usuário pode **Adicionar** , **Editar**  ou **Excluir**  pacotes de idiomas.

OBSERVAÇÃO:

Os arquivos de Anúncio de Voz não podem ser importados de forma automática ou manual se houver um arquivo de nome correspondente no Servidor RM. Essa importação ocorre mesmo se a duração e o conteúdo do arquivo forem diferentes.

OBSERVAÇÃO:

A duração do áudio do arquivo .mva não deve exceder 20 segundos.

Há dois métodos de armazenamento de arquivos de notificação de voz para o servidor RM:

Importação Automática

Sempre que um rádio é adicionado ao Servidor RM, seus arquivos de Anúncio de Voz são adicionados automaticamente caso não já não estejam armazenados no Servidor RM. Os arquivos de Anúncio de Voz ficam então disponíveis a outros rádios gerenciados. Consulte [Adicionar rádios ao Radio Management](#).

Importação Manual

Utilizar a opção Importar Arquivos de Voz. Consulte [Importar Arquivos de Anúncio de Voz Manualmente](#).

Acima 13: Gerenciar anúncios de voz

Coluna e botões	Descrição
Nome	Permite que o usuário veja somente o nome de cada arquivo de Anúncio de Voz.
Tamanho (KB)	Permite que o usuário veja o tamanho de cada arquivo de Anúncio de Voz.
Data da importação	Permite que o usuário visualize somente a Data e Hora reais em que todos os arquivos de Anúncio de Voz foram importados.
Modelo e Rádios Em Uso	Permite que o usuário veja somente a quantidade de modelos e rádios usando cada arquivo de Anúncio de Voz.
Modelos em uso (modo de modelo)	Permite que o usuário veja somente a quantidade de modelos usando cada arquivo de Anúncio de Voz no Modo de Modelo.
Rádios Em Uso (modo de configuração)	Permite que o usuário veja somente a quantidade de rádios usando cada arquivo de Anúncio de Voz.
Comentários	Permite que o usuário adicione comentários com base no arquivo de Anúncio de Voz.

3.8

Gerenciar Certificados CA

O recurso **Gerenciar Certificados CA** permite ao usuário visualizar os Certificados CA automaticamente importados e armazenados no Servidor RadioCentral e importar manualmente novos Certificados CA para o Servidor RadioCentral.

Gerenciar Certificados CA é aberto no menu **Ações** selecionando **Gerenciar**→**Certificados CA**.

O usuário pode **Importar**  ou **Excluir**  certificados.

OBSERVAÇÃO:

- Certificados CA não podem ser importados de forma automática ou manual se houver um arquivo de nome correspondente no Servidor RadioCentral.
- Somente arquivos de Certificado CA formatados para PEM (Privacy Enhanced Mail, correspondência de privacidade aprimorada) e com tamanho inferior ou igual a 10K podem ser importados para o Servidor RadioCentral.

Há dois métodos de armazenamento de arquivos de Certificados CA no Servidor RadioCentral:

Importação Automática

Sempre que um rádio é adicionado ao Servidor RadioCentral, os arquivos de Certificados CA são adicionados automaticamente caso não já não estejam armazenados no Servidor RadioCentral. Os arquivos de Certificados CA ficam então disponíveis a outros rádios gerenciados.

Importação Manual

Utilizar a opção Importar Certificados CA. Consulte [Como Importar Certificados CA Manualmente na página 54](#).

Acima 14: Certificados

Colunas e Botões Incluídos	Definição
Nome	Permite que o usuário somente visualize o nome de todos os certificados disponíveis.
Tamanho	Permite que o usuário somente visualize o tamanho do arquivo de todos os certificados.
Data da importação	Permite que o usuário somente visualize a Data e hora reais em que todos os certificados foram importados.
Em uso (rádios)	Permite que o usuário somente visualize o número de rádios usando cada arquivo de certificado.
Comentários	Permite que o usuário adicione comentários por arquivo de certificado.

3.9

Gerenciar Chaves de Sistema

O recurso **Gerenciar chaves de sistema** permite que o usuário visualize as chaves de sistema armazenadas no Servidor RadioCentral.

Chaves de sistema é aberto no menu **Ações** selecionando **Gerenciar**→**Gerenciar chaves de sistema**.

O usuário pode **Adicionar** , **Editar**  ou **Excluir**  chaves de sistema.

Acima 15: Gerenciar Chaves de Sistema

Coluna	Descrição
ID do Sistema Hexadecimal	ID do sistema de entroncamento atribuído à chave do sistema.
Tipo	Mostra o tipo de chave de sistema como Chave avançada de sistema ou Chave de software.
Número de série do iButton	O Número de Série dos Dispositivos de chave do iButton que contém a(s) Chave(s) (de Hardware) Avançada(s) usada(s) para as últimas operações de programação que exigiram uma Chave avançada.
Nível de acesso	<p>Acesso Ilimitado</p> <p>Esse tipo de acesso habilita todos os campos protegidos de todos os recursos de entroncamento nas categorias Sistema de entroncamento e Personalidade de entroncamento. A chave de sistema permite o acesso de leitura e gravação a todos os recursos de entroncamento protegidos no codeplug.</p> <p>Acesso Ilimitado sem Proteção contra Gravação</p> <p>Esse tipo de acesso habilita todos os campos protegidos de todos os recursos de entroncamento nas categorias Sistema de entroncamento e Personalidade de entroncamento. Essa seleção não permite habilitar a proteção contra gravação para o rádio.</p>

Coluna	Descrição
	Limitado Esse tipo de acesso permite que o administrador habilite campos protegidos selecionados de todos os recursos de entroncamento nas categorias Sistema de entroncamento e Personalidade de entroncamento. O administrador também pode limitar o intervalo de valores dos campos para valores aceitos. A chave de sistema permite acesso ao campo, mas limita o valor para o intervalo especificado.
Proteção contra gravação ativada	Protege contra programação não autorizada de determinados campos da Personalidade de Entroncamento e do Sistema de Entroncamento ASTRO protegidos por chave.

3.10

Migração do codeplug

O recurso de migração de codeplug é um recurso que permite ao usuário converter codeplugs portáteis APX do Customer Programming Software, no formato .mc, para a configuração do seu rádio no formato .dbn.

3.11

Janela Configurações

A janela **Configurações** permite que o usuário visualize ou modifique as comunicações entre o Cliente RadioCentral e o banco de dados do Servidor RadioCentral e que "Recupere" Licenças de aplicativos e de rádios.

Selecione **Ações** → **Configurações** para abrir a janela **Configurações**.

3.11.1

Configurações de Licenças

A janela das **Configurações de licenças** permite que o usuário recupere as Licenças de rádio e de aplicativo para o servidor RadioCentral.

Configurações de Licenças é iniciado no menu **Ações** selecionando **Configurações** → **Licenças**.

Acima 16: Configurações de Licenças

Coluna	Descrição
Recuperar Licenças de Aplicativo	Somente com o Método "A Partir de EID" (ID de Autorização). Se o usuário precisar montar uma nova imagem ou reformatar o disco rígido do servidor RadioCentral, a opção Recuperar licenças dos aplicativos permitirá que o usuário recupere todas as Licenças dos aplicativos para o servidor RadioCentral: <ol style="list-style-type: none">1 Verifique se o usuário tem uma conexão de Internet.2 "Insira o ID de permissão" no campo de entrada.3 Selecione o botão Recuperar licenças do aplicativo.4 Verifique na coluna Ações → Gerenciar → Licenças → Visualização de Licenças do Aplicativo → Disponível para transferir para o campo do servidor se a quantidade apropriada de licenças foi recuperada do revendedor da Motorola Solutions.

Coluna	Descrição
Recuperar licenças de rádio	<p>Se o usuário precisar montar uma nova imagem ou reformatar o disco rígido do servidor RadioCentral, a opção Recuperar licenças dos rádios permitirá que o usuário recupere todas as Licenças dos rádios para o servidor RadioCentral:</p> <ol style="list-style-type: none">1 Depois que o rádio voltar ao RadioCentral, a opção Recuperar licenças dos rádios poderá ser executada.2 Depois que o processo de Recuperação estiver concluído, o usuário também deverá executar a opção Recuperar Licenças para alterar as Licenças do Rádio de um Status de Registrado para Pronto para Ativação. <p> OBSERVAÇÃO:</p> <p>Para executar a opção Recuperar Licenças de Rádio, vá para Ações→Gerenciar→Licenças→Visualização da Licença do Rádio, clique com o botão direito no rádio desejado e selecione Restaurar Licenças.</p>

3.11.2

Idioma

A janela **Configurações de idioma** permite selecionar o idioma utilizado no aplicativo.

O aplicativo é compatível com os seguintes idiomas:

- Português (Brasil)
- Francês (Canadá)
- Espanhol
- Português (Brasil)

OBSERVAÇÃO:

Quando um novo idioma for selecionado, o RadioCentral deverá ser reiniciado antes que o novo idioma seja aplicado.

O idioma de inserção depende da seleção de teclado configurada para o sistema operacional do computador e não desta seleção de idioma; entretanto, os números inseridos em um campo de texto são sempre exibidos na forma de 0-9, independentemente da seleção de idioma.

3.12

Exibir tarefas

A janela informativa **Tarefas** permite que o usuário visualize as tarefas operacionais.

A janela Tarefas contém um resumo de todos os trabalhos operacionais. Uma tarefa operacional é uma operação realizada em um ou mais objetos do RadioCentral que não envolvam uma operação de programação (leitura, gravação). Por exemplo, se o usuário selecionar cem rádios e selecionar **Excluir**, ele estará realizando uma tarefa operacional.

Uma tarefa aparece na janela **Tarefas** sempre que o usuário realiza uma operação em uma entidade RadioCentral, com a tarefa mais recente na parte superior. A janela Tarefas mostra apenas trabalhos que aconteceram durante a sessão atual do Cliente RadioCentral.

A janela informativa **Tarefas** é iniciada no menu **Ações** selecionando **Visualizar tarefas**.

Acima 17: Visualizar Tabela de tarefas

Coluna	Descrição
Nome da tarefa	O nome da tarefa operacional que foi executada no RadioCentral.
Horário de Criação	A hora em que a tarefa operacional foi criada no RadioCentral.
Resumo	Um resumo da tarefa realizada no RadioCentral.
Ações	O tipo de tarefas operacionais realizadas pelo Servidor RadioCentral. Uma tarefa pode ser cancelada antes de ser concluída clicando no X.

Capítulo 4

Programador

O menu **Programador** abre a janela **Agendar tarefa**. A janela **Agendar tarefa** permite que o usuário agende um ou mais rádios para uma Leitura, Gravação ou Redefinição de fábrica. As tarefas podem ser agendadas para ocorrer imediatamente ou dentro de uma janela de tempo específica. Consulte [Agendamento de tarefas no RadioCentral na página 97](#).

OBSERVAÇÃO:

O menu **Programador** é habilitado em **Visualização do rádio** quando um ou mais rádios estão selecionados no painel de programação, têm dados e configuração válidos de rádio e não estão esperando por um processo de tarefa.

A janela **Agendar tarefa** contém campos que permitem que o usuário ajuste as seguintes configurações:

Acima 18: Configurações para Agendar tarefa

Configuração	Função
Tipo de tarefa	<p>Os tipos de tarefas a seguir são compatíveis:</p> <p>Gravar</p> <p>Os dados de configuração de todos os rádios selecionados são gravados nos rádios. A caixa de seleção Forçar atualização imediata está disponível para permitir a instalação imediata de uma atualização. Isso fará com que o dispositivo de destino reinicie imediatamente após o download sem confirmação do usuário e será permitido em apenas um rádio por vez.</p> <p> OBSERVAÇÃO:</p> <p>Esse recurso está disponível somente para tarefas em um único dispositivo provisionado. Se uma atualização imediata for necessária e esse texto estiver esmaecido, o usuário precisará retornar à Visualização do rádio para selecionar apenas um rádio desejado a ser atualizado.</p> <p>Confirmação de proteção contra gravação</p> <p>Permite que o Programador em lote POP25 (Programação via Projeto 25) proteja o rádio contra gravação. Ao habilitar este campo, uma correspondência de ID de proprietário e Chave avançada (carregada e anexada) deve existir para cada rádio alvo.</p> <p>Leitura</p> <p>Os rádios selecionados são lidos e as informações de configuração são atualizadas no servidor. A caixa de seleção Gerar configuração está disponível para uma tarefa de leitura e gera uma configuração dos dados no rádio. Se a opção Aplicar ao rádio estiver marcada, a configuração será atribuída ao rádio no RadioCentral.</p> <p>Redefinição de fábrica</p> <p>A configuração do rádio selecionado foi excluída. O rádio foi restaurado para as configurações originais.</p>
Nome da tarefa	<p>Seleciona um nome para a tarefa atual. Recomenda-se inserir um nome significativo, como "Gravação com fio para Corpo de bombeiros n. 3" para identificar a tarefa com mais facilidade em Visualização da tarefa.</p>

Configuração	Função
Fuso horário	Seleciona o fuso horário no qual o evento da tarefa atual é executado em um Programador de dispositivos do RadioCentral. Esta seleção se aplica aos rádios selecionados para esta tarefa na janela Agendar tarefa .
Iniciar após	Seleciona a data (no formato dia-mês-ano) e a hora (no formato de 24 horas) de início do intervalo da tarefa. Esse campo é opcional e, caso não especificado, a tarefa será executada assim que possível.
Finalizar até	Seleciona a data (no formato dia-mês-ano) e a hora (no formato de 24 horas) do término do intervalo da tarefa ativa. Se a tarefa programada não tiver sido iniciada até a hora de término, ela expirará e não poderá ser executada. Este campo é opcional e, se nada for inserido, a tarefa não expirará.

OBSERVAÇÃO:

Quando o tipo de tarefa selecionado for **Leitura**, o Programador do dispositivo do RadioCentral recuperará o codeplug de cada rádio associado à tarefa. Quando o codeplug for carregado no servidor do RadioCentral, a associação da configuração anterior do rádio selecionado será substituída.

Capítulo 5

Visualização do rádio

A **Visualização do rádio** fornece informações sobre os dispositivos que estão no sistema.

O número de série é preenchido automaticamente. A agência é criada pela Motorola Solutions. O rádio preenchido automaticamente tem codeplug padrão personalizado e recursos adquiridos.

A **Visualização do rádio** é compatível com as seguintes operações:

- Editar e Selecionar Configurações
- Agendar e Cancelar Tarefas
- Agrupar Rádios
- Analisar a Configuração do Rádio

Quando um rádio é selecionado da lista, o painel de programação exibe atalhos para **Exibir Detalhes**, **Editar Configuração**, **Analisar** e **Agendar Tarefa**. Para mais informações, consulte [Painel de Programação no Cliente de Configuração do RadioCentral na página 46](#).

Tabela Visualização do rádio

Os campos do rádio são personalizáveis. Por padrão, são exibidos os campos mais comuns. Campos, como **Número de Série**, **Alias do Rádio**, **Configuração**, **Grupo**, **Modificado**, **Status do Trabalho** e assim por diante. Consulte [Tabela Visualização do rádio na página 83](#).

Acima 19: Botões Operacionais na Visualização de Rádios

Botão	Descrição
	Não há suporte para o botão Editar. As propriedades de rádio são únicas para cada rádio e não podem ser editadas.
	O botão Grade para o Arquivo (exportar) será habilitado quando um rádio for selecionado e usado para exportar os dados de rádio das linhas selecionadas para um arquivo CVS delimitado por vírgulas.
	O botão Arquivo para Grade (Importar) é usado para importar dados de rádio de um arquivo CVS delimitado por vírgulas.

Operações ao Clicar com o Botão Direito nos Rádios

As seguintes operações podem ser realizadas em um rádio selecionado:

Acima 20: Operações ao Clicar com o Botão Direito nos Rádios

Operação	Descrição
Mostrar detalhes	Exibe Informações do rádio, Histórico de tarefas e Conjuntos de recursos do rádio selecionado. Essa operação também está disponível como um atalho localizado sobre o campo de pesquisa.
Excluir	Exclui o rádio selecionado do banco de dados do Servidor RM.
Selecionar grupo	Permite que o usuário atribua o rádio selecionado a um grupo ou subgrupo.

Operação	Descrição
Editar configuração	Abre a Visualização da Configuração e exibe as informações do dispositivo juntamente com todos os Conjuntos atribuídos à configuração. Nesta visualização, o usuário pode modificar campos em todos os Conjuntos relevantes.
Selecionar Configuração	Abre a janela Selecionar Configuração que permite que o usuário atribua uma configuração ao rádio selecionado.
Comparar	<p>Permite que o usuário compare diferenças nos valores de codeplug em duas configurações, atribuídas aos rádios, usando o recurso de comparar configurações.</p> <p>As seguintes operações são compatíveis:</p> <p>Configuração atribuída Compara os valores de codeplug das configurações atribuídas atualmente.</p> <p>Última programação Compara os valores de codeplug das últimas configurações programadas no rádio.</p> <p> OBSERVAÇÃO: Essas seleções ficam acessíveis quando dois rádios são selecionados.</p>
Descartar alterações	<p>Descarta as mudanças recentes feitas ao rádio selecionado. Isso é verdadeiro para todas as alterações nos dados. No entanto, uma alteração de Grupo não é restaurada (consulte Grupos de rádio na página 80).</p> <p> AVISO: Quaisquer recursos pendentes adicionados via FLASHport serão perdidos permanentemente. A FLASHkey já foi reduzida e não pode ser revertida. Recursos pendentes adicionados via Licença de Rádio podem ser recuperados via Configurações.</p> <p>Quando um recurso for adicionado a um rádio via Licença de Rádio (consulte Visualização Gerenciar licenças de rádio na página 64) em vez de via FLASHport e, em seguida, "Descartar Alterações" for selecionado antes de essas alterações de FLASHcode serem gravadas no rádio, a seleção "Restaurar" poderá ser usada (consulte Gerenciar Licenças de Rádio) para mudar o "Status" da janela Gerenciar Licença de Rádio de "Registrado" para "Pronto para Ativação".</p>
Agendar tarefa	Abre a janela Agendar Tarefa que permite que o usuário crie uma tarefa de programação de leitura ou gravação para os rádios selecionados.
Cancelar tarefa	Permite que o usuário cancele uma tarefa do rádio selecionado atualmente.
Concluir tarefa	Permite que o usuário mude manualmente o estado do rádio selecionado do estado transferido para o estado concluído. Essa ação fica disponível somente quando o rádio está no estado transferido, o que indica que um novo firmware foi transferido ao rádio over the air (pelo ar) e está aguardando instalação no rádio pelo usuário final. Só use essa ação quando tiver certeza

Operação	Descrição
	de que o usuário final aplicou as mudanças ou que ele pretende realizar uma leitura de rádio, pois transferir manualmente esse rádio para "concluído" pode fazer com que o Gerenciamento do Rádio fique dessincronizado com este rádio.
Selecionar MVO	Permite que o usuário atribua um modelo, versão e opção (MVO) a um novo rádio. Consulte Modelo, Versão e Opções .
Atualizar dados do rádio	Abre a janela Consultar/Atualizar Dados de Rádio, que permite que o usuário modifique o Tipo de Chave Avançada do Proprietário e/ou o ID do Proprietário de um rádio, E/OU habilite ou desabilite a Proteção contra Gravação de um rádio.
Verificação Ortográfica	Permite que o usuário analise uma configuração quanto a erros ou avisos antes de criar uma tarefa. Consulte Analisar a Configuração do Rádio na página 48 .
Relatórios	Abre páginas de relatório para Resumo do Canal e Folheto p/ Clientes . Esses relatórios podem ser impressos ou salvos localmente ou em arquivos de rede.
Atualizar firmware	<p>Permite que o usuário atualize o firmware do rádio existente para uma versão mais recente.</p> <p>A versão do codeplug é automaticamente aprimorada, com base na versão do firmware escolhida. Novos recursos estarão disponíveis com base na versão do codeplug mais recente.</p> <p>O usuário pode verificar firmwares existentes no RadioCentral por meio da função Gerenciar firmware. Consulte Gerenciar firmware na página 68.</p> <p>A atualização de firmware é iniciada no menu Ações selecionando Atualizar→Atualizar firmware.</p>
Atualizar Pacote de idiomas	<p>Compara as versões do pacote de idiomas lidas atualmente no rádio com as que estão armazenadas no Servidor RM. Se uma versão de pacote de idiomas mais nova for detectada, ele será atualizado e o marcador Pacotes de Idiomas Modificados será definido.</p> <p>Uma tarefa de Gravação com ou sem fio deve ser programada para atualizar os pacotes de idiomas no rádio e remover o marcador Pacotes de Idiomas Modificados.</p> <p> OBSERVAÇÃO: O marcador Pacotes de Idiomas Modificados só é definido quando uma versão de pacote de idiomas mais nova é detectada no servidor RM.</p> <p>Além disso, as tarefas de gravação para modificações de codeplug poderão ser programadas Over The Air mesmo se o marcador Pacotes de Idiomas Modificados estiver definido. Os pacotes de idiomas só podem ser gravados no rádio por uma conexão com ou sem fio.</p>
Atualizar Versão do Codeplug	Permite que o usuário atualize a versão do codeplug. O usuário pode manter sua seleção de idioma após a atualização da versão.

Operação	Descrição
Exportar rádio	Permite que o usuário exporte os rádios selecionados a um formato de arquivo de array de bytes de codeplug (*.xpba). Consulte Exportar Rádio
Exportar DVRS	Permite que o usuário exporte o registro/linha do rádio destacado atualmente para um formato de arquivo (.XML). Consulte Exportar dados DVRS
Exportar Grade para Arquivo	Permite que o usuário exporte os rádios selecionados a um formato de arquivo delimitador por vírgulas (*.csv). Consulte Exportar Grade para Arquivo na página 55
Modificar senha do rádio	Abre a janela Modificar Senha do Rádio, que permite que o usuário substitua a senha atual do codeplug da configuração do rádio.
Copiar identidade	Permite que o usuário copie dados de identidade (como IDs, Aliases, IPs e assim por diante) de um rádio para outro.
Colar identidade	Permite que o usuário cole dados de identidade copiados (como IDs, Aliases, IPs e assim por diante) de um rádio para outro.  OBSERVAÇÃO: Esse recurso será habilitado quando um rádio for selecionado e seus dados de identidade forem copiados.

5.1

Grupos de rádio

O agrupamento de rádios no Cliente de configuração RadioCentral permite que você organize e gerencie seu rádio para o sistema RadioCentral em uma estrutura de visualização em árvore. Grupos são usados com configurações e conjuntos compartilhados para proporcionar um gerenciamento mais eficiente do seu sistema de rádio.

Na **Visualização do rádio**, o painel de navegação para **Grupos** permite que o usuário crie grupos e subgrupos usando operações de clique com o botão direito do mouse.

As seguintes operações podem ser realizadas em grupos ou subgrupos:

- Criar um grupo ou subgrupo
- Excluir um grupo ou subgrupo
- Renomear um grupo ou subgrupo
- Arrastar e soltar um grupo ou subgrupo em um novo local
- Expandir ou recolher nós de grupo dentro da exibição de árvore

Selecione **Todos** para exibir todos os rádios no sistema RadioCentral, independentemente da atribuição de grupo. A atribuição de rádios para um grupo ou subgrupo é executada na coluna **Grupo** na tabela. Um ou mais rádios podem ser selecionados na tabela e atribuídos a um grupo ou subgrupo. Consulte [Criação e gerenciamento de grupos de rádios](#).

[Acima 21: Operações de clique com o botão direito para grupos de rádio](#)

Seleção	Descrição
Novo grupo	Permite que o usuário crie um grupo ou subgrupo.
Excluir	Permite que o usuário exclua um grupo ou subgrupo.

Seleção	Descrição
	<p>Quando um grupo que contém rádios ou subgrupos é excluído, será exibida uma janela de confirmação que avisa ao usuário que o grupo e todos os subgrupos selecionados serão excluídos. Qualquer rádio atribuído ao grupo ou subgrupo não será mais atribuído a um grupo.</p> <p>A coluna Grupo na tabela para todos os rádios que foram removidos de um grupo ou subgrupo exibe <i>Nenhum</i>.</p>
Renomear	Permite que o usuário renomeie um grupo ou subgrupo.

5.1.1

Criação e gerenciamento de grupos de rádios

Grupos e subgrupos de rádio são criados e gerenciados no painel de navegação **Grupo**. Uma vez que os grupos e subgrupos de rádio são criados, eles podem ser renomeados, excluídos ou movidos dentro da estrutura da visualização em árvore.

Procedimento:

- 1 Clique no ícone **Visualização do rádio** para exibir a tabela de visualização do Rádio.
- 2 Criar, gerenciar, ou mover um grupo ou subgrupo. Execute uma das seguintes ações:

Se...	Então...
Para criar um grupo,	<p>faça o seguinte:</p> <ol style="list-style-type: none"> a clique com o botão direito no painel de navegação e selecione Novo grupo. b Digite um <code>name</code> para o novo grupo.
Para criar um subgrupo,	<p>faça o seguinte:</p> <ol style="list-style-type: none"> a clique com o botão direito do mouse no grupo ou subgrupo correspondente e selecione Novo grupo. b Digite um <code>name</code> para o novo subgrupo.
Para excluir um grupo ou subgrupo,	<p>faça o seguinte:</p> <ol style="list-style-type: none"> a selecione o grupo ou subgrupo relevante. b Clique com o botão direito do mouse e selecione Excluir. <p> OBSERVAÇÃO: Será exibida uma janela de confirmação que avisa ao usuário que o grupo e todos os subgrupos selecionados serão excluídos. Qualquer rádio atribuído ao grupo ou subgrupo não será mais atribuído a um grupo.</p>
Para renomear um grupo ou subgrupo,	<p>faça o seguinte:</p> <ol style="list-style-type: none"> a selecione o grupo ou subgrupo relevante. b Clique com o botão direito do mouse e selecione Renomear.

Se...	Então...
	<p>c Digite um novo <code>name</code> para o grupo ou subgrupo.</p>
Para mover um grupo ou subgrupo,	<p>faça o seguinte:</p> <p>a selecione o grupo ou subgrupo relevante.</p> <p>b Usando o recurso padrão de "arrastar e soltar", mova o grupo ou subgrupo para seu novo local.</p> <p> OBSERVAÇÃO: Os grupos ou subgrupos podem ser movidos e colocados sobre um grupo existente ou entre os grupos.</p> <p>Qualquer rádio atribuído ao grupo ou subgrupo é movido com o grupo ou subgrupo para o novo local.</p>

3 Atribuir rádios a um grupo ou subgrupo. Execute uma das seguintes ações:

Se...	Então...
Para atribuir um único rádio,	<p>faça o seguinte:</p> <p>a No painel de navegação, selecione Todos para exibir todos os rádios no sistema do RadioCentral.</p> <p>b Na tabela, selecione a lista suspensa da coluna Grupo de um rádio, expanda os nós, se necessário, e selecione o grupo ou subgrupo correspondente.</p> <p>c Repita a etapa anterior até que todos os rádios do grupo ou subgrupo sejam atribuídos.</p>
Para atribuir vários rádios,	<p>faça o seguinte:</p> <p>a No painel de navegação, selecione Todos para exibir todos os rádios no sistema do RadioCentral.</p> <p>b Selecione todos os rádios relevantes na tabela usando a funcionalidade principal padrão SHIFT e CTRL.</p> <p>c Clique com o botão direito em qualquer linha realçada e selecione Selecionar grupo.</p> <p>d Na janela Selecionar grupo, expanda os nós, se necessário, e selecione o grupo ou subgrupo correspondente.</p> <p>e Clique em OK.</p>

 **OBSERVAÇÃO:**
 Um rádio só pode ser atribuído a um grupo ou subgrupo.

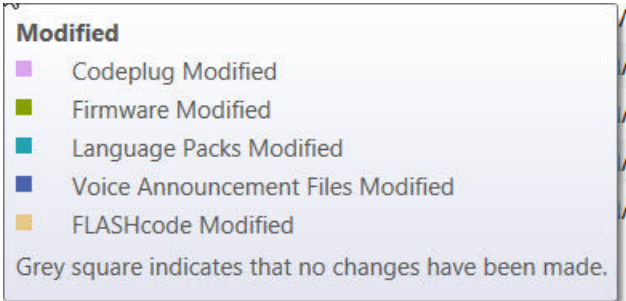

Se **Nenhum** for o único valor na lista suspensa **Grupo**, não haverá nenhum grupo de rádio no painel de navegação.

5.2

Tabela Visualização do rádio

A tabela a seguir define todos os campos da coluna que são suportados na **Visualização do rádio**.

Acima 22:

Coluna	Descrição	Notas
Número de série	Exibe o número de série do rádio armazenado no Servidor RadioCentral.	Somente leitura
Alias do rádio	Exibe e permite a edição direta do Nome do rádio.	Esse campo pode ser editado.
Configuração	Um arquivo exclusivo que reside no servidor RadioCentral e contém todos os Conjuntos atribuídos ao rádio.	
Grupo	Consulte Grupos de rádio na página 80 .	
Modificado	Exibe os indicadores coloridos alertando o usuário de determinado status modificado para o rádio. O usuário pode passar o mouse sobre a palavra "Modificado" no cabeçalho da coluna para recuperar a legenda das cores: 	
Status da tarefa	Exibe o status não editável do rádio e qualquer tarefa atual que possa estar associada a ele.	
Nome da tarefa	Exibe o nome não editável dado para a Tarefa quando ela foi criada. O valor não poderá ser editado depois que uma tarefa tiver sido criada.	
Número do modelo	Exibe o número do modelo não editável do rádio.	

Coluna	Descrição	Notas
FLASHcode	O número do FLASHcode reflete a lista inteira de recursos/opções do sistema que um codeplug é capaz de usar. Quando se coloca o cursor do mouse sobre o FLASHcode de um rádio, todo o Conjunto de recursos desse rádio é exibido; ele também pode ser visto na janela Visualização Gerenciar licenças de rádio na página 64 .	
Configurar senha por dispositivo	Exibe se uma senha foi ou não definida para o rádio. A senha é necessária para editar a configuração de um rádio.	
Verificar senha	Exibe o acesso configurado (Ler ou LeituraGravação) para rádios que suportam a função Modificar senha do rádio . Se nenhuma senha for atribuída ao rádio, Nenhum será exibido.	Somente leitura
ID OTAR	Exibe o ID OTAR (Over-The-Air-Rekeying) necessário para a comunicação do rádio com o KMF (Key Management Facility, local de gerenciamento de chaves).	
IP fixo OTAR	Exibe o FIP (Fixed IP Address, endereço IP fixo) OTA (Over The Air) para todos os codeplugs (registro/linhas) na Visualização do rádio. Quando um endereço IP do rádio for conhecido, ele pode ser usado para direcionar o Programador de dispositivos - POP25 / OTAP para as comunicações do rádio, eliminando a necessidade do ARS, que é também conhecido como Modo FIP.	
IP do rádio	Exibe o Endereço IP do rádio do link de série 1 de todos os codeplugs (registro/linhas) na Visualização do rádio. Este endereço IP é atribuído ao	

Coluna	Descrição	Notas
	terminal da unidade do rádio (SU) do link de série 1.	
IP do par	Exibe o Endereço IP da pessoa remota do link de série 1 de todos os codeplugs (registro/linhas) na Visualização do rádio. Este endereço IP é atribuído ao terminal da unidade do rádio MC (Mobile Computer, computador móvel) do link de série 1.	
IP do rádio da DUN Bluetooth	Exibe o Endereço IP do Rádio da DUN (Dial Up Network, rede de telefonia discada) Bluetooth de todos os codeplugs (registro/linhas) na Visualização do Rádio. Este endereço IP é atribuído à unidade do rádio (SU = rádio) do link Bluetooth (BT).	
IP da pessoa remota da DUN Bluetooth	Exibe o endereço IP da Pessoa Remota da DUN Bluetooth de todos os codeplugs (registro/linhas) na Visualização do Rádio. Esse endereço IP é atribuído ao terminal do MC (Mobile Computer, computador móvel) do link BT (Bluetooth) e é também usado para endereçar o MC por meio de dados de pacotes pelo ar.	
Nome amigável do Bluetooth	Exibe o nome de Bluetooth reconhecível do usuário do rádio de todos os codeplugs (registro/linhas) na Visualização do rádio. Esse nome identifica o rádio para um dispositivo Bluetooth emparelhado e conectado.	
Nome do usuário	Permite que o usuário insira um Automatic Registration Service ou um nome de usuário de login padrão de autenticação do usuário de todos os codeplugs de rádio (registro/linhas) na Visualização do rádio. O nome de usuário pode se aplicar a todos os Perfis de dados	

Coluna	Descrição	Notas
	habilitados para "Servidor" ARS. Quando o recurso ID virtual estiver ativado, esse nome de usuário será também usado para todos os canais habilitados para ASTRO de despacho convencional.	
PIN do Usuário	Permite que o usuário insira um PIN (Personal Identification Number, número de identificação pessoal) de login do Serviço de Registro Automático padrão ou um PIN/Senha de Autenticação do Usuário para todos os codeplugs (registro/linha) na Visualização do Rádio. Este PIN/senha pode se aplicar a todos os perfis de dados habilitados para "Servidor" ARS (consulte Modo ARS). Asteriscos serão exibidos ao inserir um PIN do usuário.	
ID de unidade de login de usuário	Exibe um ID de unidade de login padrão de Autenticação do usuário de todos os codeplugs de rádio (registro/linhas) na Visualização do rádio. Esse ID pode ser usado para designar todos os usos de rádio em um veículo ou grupo específico. Esse ID se aplica a todos os Perfis de dados habilitados para "Servidor" ARS.	
Grupo de conversação de dados do grupo	Exibe o grupo de conversação que é usado para a sessão de Dados do grupo para transmitir o firmware (e opcionalmente o pacote de idiomas) Over The Air por meio do Gateway de dados do grupo. Esse valor não pode ser editado e é atualizado assim que o rádio inicia o download do firmware.	
ASK necessário	Exibe o Tipo de Chave de Sistema do Proprietário, ID do Sistema do Proprietário, Proteção Contra Gravação e ASK (Advanced System	

Coluna	Descrição	Notas
	<p>Key, chave de sistema avançada) de todos os codeplugs (registro/linhas) nessa Visualização do Rádio.</p> <p>A ativação dessa função garante que somente as Chaves (de Hardware) Avançadas possam ser carregadas no RC e atribuídas para uso para os Sistemas de Entroncamento; os Arquivos de Chave de Sistema de Software não podem ser atribuídos.</p> <p>Quando desativadas, as Chaves de Software e Chaves de Hardware carregadas no RC podem ser atribuídas para uso em um campo ID do Sistema de Entroncamento. Além disso, desabilitar essas funções permite que o usuário desabilite um status de Proteção contra gravação de um rádio.</p>	
Tipo de chave do sistema do proprietário	Exibe o Tipo de chave do sistema do proprietário de todos os codeplugs (registro/linhas) na Visualização do rádio.	O "Tipo de chave" avançada do proprietário e seu "ID do sistema do proprietário" ou "ID WACN do proprietário" correspondente são inicialmente determinados para o rádio e seus codeplugs no momento da compra original do rádio.
ID do sistema do proprietário (Hex)	Exibe o ID do sistema do proprietário de todos os codeplugs (registro/linhas) na Visualização do rádio.	O "Tipo de chave" avançada do proprietário e seu "ID do sistema do proprietário" ou "ID WACN do proprietário" correspondente são inicialmente determinados para o rádio e seus codeplugs no momento da compra original do rádio.
Proteção contra gravação	<p>Exibe a Proteção contra gravação de todos os codeplugs (registro/linhas) na Visualização do rádio.</p> <p>Quando habilitado, é usado para proteger o rádio contra gravação.</p>	Desativar o ASK necessário desabilitará o status Protegido contra gravação no rádio.

Coluna	Descrição	Notas
	Quando desabilitado, é usado desativar a Proteção contra gravação do rádio.	
Versão do firmware	Exibe a versão do firmware não editável do rádio.	As versões do firmware geralmente controlam quais recursos estão disponíveis em um rádio. Em geral, uma versão do firmware mais recente oferecerá suporte para recursos novos ou aprimorados em relação a uma versão mais antiga.
Pacote de idiomas	Exibe os pacotes de idiomas atualmente atribuídos ao rádio.	
Anúncios de voz	Exibe o número de notificações de voz atribuídas ao rádio no momento.	
Versão do codeplug	Exibe a versão do codeplug não editável do rádio.	As versões do codeplug descrevem o formato das informações de configuração programadas em um rádio e estão geralmente vinculadas a versões de firmware específicas.
Comentários	Um parâmetro editável em que o usuário pode colocar quaisquer observações ou comentários sobre um rádio. Por exemplo, o usuário poderá usar esse campo para inserir o nome de um cliente. Visto que as informações inseridas podem ser pesquisadas, essa será uma maneira rápida de procurar todos os rádios de um determinado cliente.	
Provisionado	Exibe o status de provisionamento não editável do rádio.	
Hora do último contato	Exibe a hora e a data não editáveis do último contato.	

5.3

Detalhes do rádio

A tabela a seguir define todos os campos da coluna que são suportados nos **Detalhes do Rádio**.

Definição de conceito.

Operação	Descrição	Notas
Número de série	Exibe o número alfanumérico exclusivo que identifica o dispositivo.	
Identificador de produto	Define o tipo de dispositivo que está sendo adicionado ao Servidor RM.	
Número do modelo	Exibe o número do modelo para o tipo de dispositivo selecionado.	
Nome do Perfil de MCIF	Exibe o nome do perfil de MCIF (Mission Critical Interaction Framework, estrutura de interação de missão crítica) usado pelo dispositivo.	O usuário deve importar manualmente o pacote de MCIF. O pacote de MCIF contém os arquivos <code>mcifconfig.xml</code> , <code>interactions.csv</code> e <code>manifest.xml</code> .
Versão do Perfil de MCIF	Exibe a versão do perfil de MCIF (Mission Critical Interaction Framework, estrutura de interação de missão crítica) usado pelo dispositivo.	
Última data programada	Exibe a data das últimas tarefas programadas.	
Comentários	Um parâmetro editável em que o usuário pode colocar quaisquer observações ou comentários sobre um rádio. Por exemplo, o usuário pode usar esse campo para inserir o nome de um cliente. Visto que as informações inseridas podem ser pesquisadas, essa será uma maneira rápida de procurar todos os rádios de um determinado cliente.	
Total de Trabalhos	Exibe a quantidade da contagem de trabalhos.	

Capítulo 6

Visualização dos Sistemas de Rádio

A **Visualização dos sistemas de rádio** exibe IDs de rádio convencionais ou de entroncamento específicas de rádio no banco de dados do Servidor do RadioCentral.

Visualização de sistemas de rádio mostra informações sobre o status de sua infraestrutura de rádio. Cada linha da tabela representa um sistema convencional ou de entroncamento.

As informações exibidas na tabela podem ser filtradas selecionando **Todos**, **Rádios**, ou **Sistemas**.

As seguintes informações do sistema de rádio são exibidas:

- Número de série
- ID do rádio
- Configuração
- Alias do rádio
- Tipo de comunicação
- Tipo de subsistema
- ID do sistema
- Nome do sistema

Capítulo 7

Visualização do Perfil de Dados

Visualização do perfil de dados mostra informações sobre a configuração do rádio.

A estratégia de agrupamento de rádio elaborada na Visualização do Rádio determina o acesso aos dados nessa visualização. Consulte [Grupos de rádio na página 80](#). Cada linha nesta **Visualização do perfil de dados** representa um Perfil de dados criado pelo RadioCentral. Quando mais de um perfil de dados existe para um codeplug, várias linhas representa o mesmo codeplug.

A seleção **Exibir por** permite que o usuário filtre todos os perfis de dados por **Rádios** ou **Perfis de Dados**. A seleção **Todos** é a visualização padrão.

Há suporte para os seguintes campos na tabela da Visualização do Perfil de Dados:

Coluna	Descrição
Número de série	Exibe o número de série do rádio armazenado no Servidor RadioCentral.
Configuração	Um arquivo exclusivo que reside no servidor RadioCentral e contém todos os Conjuntos atribuídos ao rádio.
Alias do rádio	Exibe e permite a edição direta do Nome do rádio.
Tipo de comunicação	Exibe Entroncamento ou Convencional.
Gerar IPs Automaticamente	Verdadeiro quando o campo Gerar Endereço IP Automaticamente no Perfis de Dados na página 369 está habilitado.
IP do rádio	Exibe o endereço IP do final da Unidade do Rádio (SU) do link de série 1.
IP do par	Exibe o Endereço IP da Pessoa remota do Link de Série 1 de todo Perfil de Dados Convencional (registro/linhas) neste modo de Visualização do Perfil de Dados. Esse Endereço IP é atribuído ao terminal do MC (Mobile Computer, computador móvel) do link de série 1, e é também usado para endereçar o MC por meio de dados de pacotes pelo ar.
IP do rádio da DUN Bluetooth	Exibe o Endereço IP do Rádio da DUN (Dial Up Network, rede de telefonia discada) Bluetooth de todos os codeplugs (registro/linhas) na Visualização do Rádio. Este endereço IP é atribuído à unidade do rádio (SU = rádio) do link Bluetooth (BT).
IP da pessoa remota da DUN Bluetooth	Exibe o endereço IP da Pessoa Remota da DUN Bluetooth de todos os codeplugs (registro/linhas) na Visualização do Rádio. Esse endereço IP é atribuído ao terminal do MC do link BT e é também usado para endereçar o MC por meio de dados de pacotes pelo ar.

Coluna	Descrição
IP da Interface aérea do rádio	Exibe o Endereço IP da Interface Aérea do Rádio de todo Perfil de Dados Convencional (registro/linhas) nesta Visualização do Perfil de Dados. Este endereço IP é necessário para a comunicação de dados de pacote via OTA com o rádio.
Nome do perfil de dados	Exibe o nome do conjunto de Perfis de Dados selecionado para o Perfil de Dados.

Capítulo 8

Visualização da tarefa

A **Visualização da Tarefa** exibe informações históricas relacionadas a todas as tarefas processadas e armazenadas no servidor RadioCentral.

A visualização inicial exibe todas as tarefas realizadas no sistema. A seleção **Exibir por** permite que o usuário filtre todas as tarefas por **Tarefas de Programação** ou **Tarefas Operacionais**.

Trabalhos de Programação

Essa seleção exibe as tarefas que foram processadas como tarefas de Leitura ou Gravação na janela **Agendar Tarefa**.

Tarefas Operacionais

Esta opção exibe as tarefas que são operações realizadas no RadioCentral, tais como importação e exportação de rádios, agendamento de tarefas, seleção e exclusão de configurações e muitas outras.

A tabela Visualização da tarefa oferece suporte aos seguintes campos:

Coluna	Descrição
Nome da tarefa	O nome atribuído à tarefa quando agendada na janela Agendar Tarefa .
Tipo	O tipo de tarefa configurado na janela Agendar Tarefa .
Horário de Criação	A data e a hora de criação da tarefa na janela Agendar Tarefa .
Hora de início	A data e a hora em que tarefa foi programada para iniciar inseridas no campo Iniciar após na janela Agendar Tarefa .
Hora de término	A data e a hora em que tarefa foi programada para ser encerrada, conforme indicado no campo Concluir antes na janela Agendar Tarefa .
Total	Exibe o número de rádios agendados para a tarefa.
Concluído	Exibe o número de rádios concluídos na tarefa agendada.

Seleção do Nome da Tarefa

A coluna **Nome da Tarefa** exibe todas as tarefas como links selecionáveis.

O link Nome da tarefa oferece as seguintes informações:

Coluna	Descrição
Item	O nome do arquivo que foi selecionado como parte do trabalho.
Status	Os status a seguir são compatíveis: Pendente Uma tarefa agendada não foi iniciada, porque o rádio não foi detectado em um Programador do Dispositivo ou o Processador de Tarefas está ocupado processando outra tarefa. Em execução A tarefa foi iniciada e está em andamento.

Coluna	Descrição
	Cancelado A tarefa foi cancelada pelo usuário.
	Concluído A tarefa foi bem-sucedida.
	Falha O trabalho falhou. O motivo da falha está descrito na coluna Motivo.
	Expirado A Data de término passou e a tarefa não foi realizada e/ou executada.
Data de execução	Esta é a data e hora reais em que a tarefa agendada foi executada.
Motivo	Esse campo ficará em branco quando tarefas de rádio forem concluídas. Se houver falha em uma tarefa, uma descrição da causa da falha será exibida.

Capítulo 9

Tarefas comuns do RadioCentral

O RadioCentral é compatível com uma ampla variedade de tarefas que podem ser realizadas por usuários e administradores de um Sistema RadioCentral. Tarefas comuns permitem que os usuários obtenham rapidamente as informações necessárias para realizar a tarefa.

9.1

Configuração do SmartConnect

Procedimento:

- 1 Em Definir categorias, selecione **Configuração de dados**→**Perfis de dados**.
- 2 Em **Geral**, defina o campo **Tipo de perfil de dados** para **Entroncamento**.
- 3 Na guia **Banda larga**, , defina o seguinte:
 - a Defina o **Nome de host do gateway SmartConnect** de acordo com o FQDN (Fully Qualified Domain Name, nome de domínio totalmente qualificado)/nome de host do gateway baseado em nuvem. Consulte [Nome de Host do Gateway do SmartConnect na página 383](#).
 - b Defina o **Número da porta TLS do gateway SmartConnect** com o valor padrão. Consulte [Número da porta TLS do gateway do SmartConnect na página 383](#).
- 4 Em **Banda larga**, deixe o campo **Número da porta do gateway SmartConnect** vazio.
- 5 Selecione **Configuração de entroncamento**→ **Todo o entroncamento comum**.
- 6 Defina o **Limite de Fallback do RSSI SmartConnect** como **52**.

O valor padrão do [Deixar Limite de RSSI MS-LMR na página 495](#) e do [Retornar ao Limite de RSSI MS-LMR na página 504](#) não pode ser o mesmo para cada usuário. O valor depende da preferência de duração.
- 7 Selecione **Configuração de entroncamento**→**Sistema de entroncamento ASTRO 25**.
- 8 Selecione o sistema usado com o SmartConnect, clique com o botão direito do mouse e selecione **Editar**.
- 9 Na **Seleção do perfil de dados**, selecione o nome do Perfil de dados que foi criado na etapa 1.
- 10 Selecione **Configuração de entroncamento**→**Personalidade de entroncamento do ASTRO 25**.
- 11 Selecione o sistema que foi criado na etapa 1, clique com o botão direito do mouse e selecione **Editar**.
- 12 Defina **Operação SmartConnect** como **Somente LMR** (padrão) ou **Preferencialmente LMR**.
- 13 No [Atribuição de zonas e canais na página 666](#), selecione uma zona existente ou crie uma zona para atribuir a personalidade de entroncamento criada na etapa 1 e nos grupos de conversação.

9.2

Configurar Rádios

Procedimento:

- 1 Inicie o Cliente do RadioCentral e faça logon no banco de dados.

Codeplugs padrão de fábrica para todos os rádios estão disponíveis para o usuário em um aplicativo de nuvem seguro. Se o usuário quiser usar um codeplug APX existente, consulte [Conversão de codeplugs APX na página 96](#).

- 2 Em **Visualização de rádio**, configure os Conjuntos RadioCentral. Execute as seguintes ações:
 - a Na tabela **Visualização do rádio**, selecione o rádio relevante.

- b Clique em  **Editar**.

Uma janela **Visualização da configuração** é exibida.

- 3 Configure os recursos dos Conjuntos do RadioCentral.
Consulte [RadioCentral versão 2.22.135](#) para obter mais informações.
- 4 Para salvar a configuração, selecione o ícone **Visualização do rádio**.
- 5 Na caixa de diálogo **Sair da configuração**, clique em **Salvar esta configuração** e em **OK** para salvar a configuração.
Se o usuário optar por não salvar as alterações atuais, clique em **Descartar alterações a esta configuração** e em **OK**.
- 6 Na caixa de diálogo **Salvar como nova configuração**, digite o nome da configuração no campo **Nome**.
- 7 Se o usuário quiser excluir a configuração anterior, ative a caixa de seleção **Excluir configuração anterior caso nenhum rádio a utilize** e clique em **OK**.
Essa configuração é por padrão.
- 8 Se o usuário quiser manter a configuração anterior, desative a caixa de seleção **Excluir configuração anterior caso nenhum rádio a utilize** e clique em **OK**.
Se a configuração tiver sido aplicada a algum rádio, os rádios afetados aparecerão abaixo da seção **Número de série**.
- 9 Programe uma tarefa de gravação para o dispositivo para que a configuração entre em vigor.
Consulte [Agendamento de tarefas no RadioCentral na página 97](#).

9.3

Conversão de codeplugs APX

Procedimento:

- 1 No menu **Ações**, selecione **Migração do codeplug**.
- 2 Na caixa de diálogo **Migração do codeplug**, clique em **Procurar** e selecione o arquivo `.mc` relevante.
- 3 Selecione o rádio alvo na seção **Selecionar dispositivo de destino** e clique em **OK**.

O processo de conversão é iniciado. Para monitorar o progresso da conversão, acesse **Visualização da tarefa**→**Tarefas operacionais**. As colunas de **Status** mudarão de **Em execução** para **Realizada**.

9.4

Agendamento de tarefas no RadioCentral

O agendamento de tarefas é realizado na janela **Agendar Tarefa** da **Visualização de Rádio**. As tarefas podem ser agendadas para ocorrer imediatamente ou dentro de uma janela de tempo específica.

ATENÇÃO:

Ao atualizar o firmware do rádio e modificar a configuração, usando o método de conexão **Sem Fio (LAN)**, é altamente recomendado executar duas tarefas de gravação separadas. Executar essas tarefas em uma única tarefa de gravação faz com que o rádio seja reiniciado duas vezes.

Primeiro, atualize o firmware do rádio programando uma tarefa de gravação. Quando a tarefa de gravação do firmware for concluída, registre o novo recurso, defina as configurações do rádio para o novo recurso e, em seguida, programe uma segunda tarefa de gravação. ss

Procedimento:

- 1 Na **Visualização do rádio**, selecione os rádios relevantes.
- 2 Selecione o menu **Agenda**.

OBSERVAÇÃO:

A janela **Agendar Tarefa** também pode ser aberta clicando com o botão direito nos rádios selecionados e selecionando **Agendar Tarefa** no menu pop-up ou o atalho **Agendar Tarefa** sobre o campo de pesquisa.

- 3 Na seção **Tipo de Tarefa**, execute uma das seguintes ações:
 - Selecione **Gravação** para agendar uma tarefa de gravação para um ou mais rádios.
 - 1 Selecione **Forçar atualização imediata** se necessário (somente um rádio provisionado é selecionado para programação).
 - 2 Revise o aviso de atualização imediata e confirme se desejar continuar.
 - Selecione **Leitura** para agendar uma tarefa de leitura.
 - Selecione **Redefinição de Fábrica** para restaurar o rádio à sua configuração original de fábrica.
- 4 No campo **Nome da Tarefa**, insira um nome relevante para a tarefa.
- 5 No campo **Fuso Horário**, selecione o fuso-horário na lista suspensa.
- 6 **Opcional:** Nos campos **Iniciar após** selecione, a data no formato dias-mês-ano e hora de início no formato de 24 horas.

OBSERVAÇÃO:

Clique no campo de data para habilitar uma seta suspensa que permite que o usuário selecione a data em um calendário. O horário pode ser inserido ou selecionado manualmente, em incrementos de um minuto usando as setas para cima e baixo.

- 7 Nos campos **Concluir após** selecione, a data no formato dias-mês-ano e hora de conclusão no formato de 24 horas.
- 8 Clique em **OK**.

Capítulo 10

Conjuntos RadioCentral para Rádio

O RadioCentral facilita a criação de uma configuração de programação de rádio extremamente eficiente. O RadioCentral permite que o usuário gerencie e programe diversos rádios ao mesmo tempo. Os codeplugs de rádio são armazenados em um servidor central de banco de dados para permitir a configuração remota de dados e a programação remota de rádios. Um único codeplug pode ser usado como uma configuração, que pode ser compartilhada entre diversos rádios. Edições à configuração podem ser facilmente aplicadas a todos os rádios afetados. As alterações em uma configuração ou em parâmetros de um rádio específico podem ser agendadas como uma tarefa de programação. As tarefas de programação podem ser programadas por meio do LTE.

10.1

Informações sobre rádios

Esta seção permite visualizar as informações de identidade do rádio usadas para programar ou solucionar problemas de um rádio.

OBSERVAÇÃO:

As informações do rádio só são visíveis ao editar uma configuração do rádio.

10.1.1

Geral

Esta seção exibe o modelo somente leitura, o número de série e as informações da versão do rádio conectado.

10.1.1.1

Número do modelo

O aplicativo recupera e exibe o número do modelo do rádio conectado somente para leitura.

O número do modelo identifica o tipo de rádio. Essa informação é armazenada no codeplug do rádio.

10.1.1.2

Máximo de canais

O aplicativo recupera e exibe o número máximo de canais de comunicações Convencionais e de Entroncamento somente leitura possíveis para o rádio conectado no momento.

O número máximo de canais se aplica ao definir zonas e canais na janela Atribuição de zonas e canais.

INFORMAÇÕES:

O número máximo de canais é determinado pelo modelo do rádio e só pode ser alterado por meio de uma atualização do FLASHport.

Acessado apenas: Quando o rádio é compatível com o modelo/opção.

10.1.1.3

Número de série

O aplicativo recupera e exibe o número de série somente leitura dos Dispositivos de chave que contém as Chaves (de hardware) avançadas usadas nas últimas operações de programação que exigiram uma Chave avançada.

Somente um Número de Série do dispositivo de chave é armazenado por operação. O Número de Série específico armazenado é do dispositivo de chave que contém o ID do sistema do proprietário ou a chave avançada o ID WACN do Proprietário. O codeplug retém até 25 dos números de série do dispositivo de chave.

OBSERVAÇÃO:

As operações de programação que exigem uma Chave avançada incluem: proteção contra gravação do rádio, gravação em um rádio protegido contra gravação e ativação/desativação do campo ASK Necessário em um rádio.

Sempre que uma operação que requer uma Chave avançada é realizada em um rádio, o novo Número de série do dispositivo de chave é adicionado ao histórico de programação do rádio, e poderá ser revisado lendo o codeplug do rádio depois que as operações de gravação ou clonagem forem concluídas.

10.1.1.4

VHF ativado

Esse campo especifica se a Banda VHF está habilitada no rádio.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.1.1.5

UHF1 habilitado

Esse campo especifica se a Banda UHF1 está habilitada no rádio.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.1.1.6

UHF2 habilitado

Esse campo especifica se a Banda UHF2 está habilitada no rádio.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.1.1.7

700 MHz habilitado

Esse campo especifica se a banda de frequência 700 MHz está habilitada no rádio.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.1.1.8

800 MHz habilitado

Esse campo especifica se a banda de frequência 800 MHz está habilitada no rádio.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.1.1.9

Governança regional

O aplicativo recupera e exibe somente leitura se o rádio está em conformidade com as normas e padrões.

As regras e normas com que o rádio pode estar em conformidade são as da Federal Communications Commission (FCC)/Telecommunications Industry Association (TIA) ou da Radio and Telecommunications Terminal Equipment Directive (RTTE)/do European Telecommunications Standards Institute (ETSI) ou do Australian Communications and Media Authority (ACMA).

OBSERVAÇÃO:

Quando este campo está definido como **ACMA**, o rádio/codeplug oferece suporte ao recurso estendido "Alcance 1 UHF estendido" e o campo Usado no codeplug é definido como **Permanente** **ativamente**. Neste caso, o valor do UHF Alcance 1 se estende para 472 MHz.

10.1.1.10

Versão do codeplug

O aplicativo recupera e exibe o número da versão atual do codeplug do rádio conectado, no modo somente leitura.

Isso é armazenado no codeplug interno do rádio.

10.1.1.11

Versão do firmware

O aplicativo recupera e exibe a versão de firmware somente leitura do rádio conectado no momento.

O firmware é um software que controla os componentes de hardware internos do rádio. O firmware pode ser modificado somente por meio de uma atualização do FLASHport.

Quando o aplicativo lê essas informações em um arquivo de codeplug (não em um rádio), o campo exibe **Desconhecido**.

10.1.1.12

Versão segura

O aplicativo recupera e exibe o número da versão atual do hardware seguro do rádio conectado no modo somente leitura.

10.1.1.13

Tipo de Hardware Seguro

O aplicativo recupera e exibe o tipo de hardware seguro atual do rádio conectado no modo somente leitura.

10.1.1.14

Versão de hardware seguro

O aplicativo recupera e exibe o número da versão atual do hardware seguro do rádio conectado no modo somente leitura.

10.1.1.15

Endereço MAC

O aplicativo recupera e exibe o endereço MAC (Ethernet Media Access Control) exclusivo de 6 bytes. Essas informações são de leitura somente.

Essas informações são armazenadas no codeplug de rádio, que identifica o rádio móvel para a rede.

OBSERVAÇÃO:

Se o campo do endereço MAC Ethernet não estiver atribuído, o endereço MAC Wi-Fi será aplicado. As conexões de Ethernet e Wi-Fi não podem ser usadas na mesma rede simultaneamente.

Aplica-se apenas: Quando o rádio é um rádio móvel.

10.1.2

Rastreamento

Esta seção exibe as informações com o carimbo de data e hora e a versão do codeplug, que são úteis ao programar e solucionar problemas da configuração do rádio.

10.1.2.1

Data e hora da última programação

O aplicativo recupera e permite somente visualizar a hora e data mais recente (em formato dia-mês-ano) na qual o rádio conectado foi programado.

Essa informação pode ser útil na preparação do processo de clonagem. Essa informação é armazenada no codeplug do rádio.

10.1.2.2

Última origem programada

O aplicativo recupera e permite visualizar a origem mais recente usada para programar o rádio que está conectado no momento.

Essa informação é armazenada no codeplug do rádio.

A seguinte origem é exibida:

CPS

Programado por um CPS padrão.

Fábrica

Programado na fábrica.

Laboratório

Programado com a versão de desenvolvimento especial.

Chave de FTR

Programado usando uma Chave do sistema FTR.

10.1.2.3

Data e hora original da programação

O aplicativo recupera e permite somente visualizar a hora e data original (em formato dia-mês-ano) na qual o rádio conectado foi programado pela primeira vez.

Essa informação pode ser útil na preparação do processo de Clonagem. Essa informação é armazenada no codeplug do rádio.

10.1.2.4

Versão original do codeplug programado

O aplicativo recupera e exibe o número da versão do codeplug atual somente leitura do rádio conectado.

Ele é armazenado no codeplug interno do rádio.

10.1.2.5

Origem da programação original

O aplicativo recupera e permite visualizar a fonte original usada para programar o rádio que está conectado no momento.

Essa informação é armazenada no codeplug do rádio.

A seguinte origem é exibida:

CPS

Programado por um CPS padrão.

Fábrica

Programado na fábrica.

Laboratório

Programado com a versão de desenvolvimento especial.

Chave de FTR

Programado usando uma Chave do sistema FTR.

Hosted

Programado usando o software Hosted Depot.

10.1.3

FLASHport

Esta seção exibe informações somente leitura sobre o processo de atualização do FLASHport mais recente.

O processo do FLASHport (também conhecido como FLASHing) permite que o programador atualize o pacote do sistema, as opções do sistema, o firmware e os recursos de criptografia segura do rádio conectado no momento.

10.1.3.1

FLASHcode

O aplicativo recupera e exibe o número somente leitura que identifica o Conjunto de funções para o FLASHcode adquirido no rádio atualmente conectado.

Essa informação é armazenada no codeplug do rádio.

INFORMAÇÕES:

Na família de rádios APX™ da Motorola Solutions, certas funções/opções adquiríveis nos modelos de séries iniciais e intermediárias estão incluídas nos modelos de séries avançadas. Somente os recursos que foram adquiridos aparecem no FLASHcode.

10.1.3.2

Número de piscadas

O aplicativo recupera e exibe o número total de vezes que o rádio conectado foi atualizado no modo somente leitura.

Essa informação é armazenada no codeplug do rádio.

10.1.3.3

Botão I

O aplicativo recupera e exibe o número de série somente leitura do Dispositivo de chave — chave FLASH ou Chave de depósito que piscou por último no rádio conectado atualmente.

Esta informação é armazenada no codeplug do rádio e se aplica somente ao rádio atualizado. Antes da atualização, este número serial contém todos os zeros.

10.1.3.4

Origem da última atualização

O aplicativo recupera e exibe a fonte de atualização mais atual no modo somente leitura para o rádio conectado atualmente.

Essa informação é armazenada no codeplug do rádio.

10.1.3.5

Data e hora da última piscada

O aplicativo recupera e exibe a hora e a data mais recentes somente leitura (no formato dia-mês-ano) em que o rádio conectado no momento foi atualizado (também conhecido como FLASHing).

Essa informação é armazenada no codeplug do rádio.

10.1.4

Informações de chave de sistema avançada

Esta seção exibe o histórico de programação somente leitura do rádio para operações que exigem uma Chave avançada.

Os dados históricos da programação incluem: a data da programação e o Número de série do dispositivo da chave (da Chave avançada) que permitiu que a operação fosse realizada. É possível utilizar até 25 datas de programação.

INFORMAÇÕES:

As operações de programação que exigem uma Chave avançada incluem: proteção contra gravação do rádio, gravação em um rádio protegido contra gravação e ativação/desativação do campo ASK Necessário em um rádio.

As operações de programação que não exigem uma Chave avançada não gravam dados.

Essa função é útil ao observar um histórico de programa de um rádio que foi roubado e recuperado. Isso é válido desde que o número de série e as informações de Chave avançada do Dispositivo de chave usado para programar o rádio tenham sido gravados para fins de monitoramento.

10.1.4.1

Data e hora da última programação

O aplicativo exibe as horas/datas de programação somente leitura (no formato dia-mês-ano) do codeplug atual para operações que exigiam uma Chave avançada.

O codeplug retém até 25 datas e horas das programações mais recentes.

INFORMAÇÕES:

- As operações de programação que exigem uma Chave avançada incluem: proteção contra gravação do rádio, gravação em um rádio protegido contra gravação e ativação/desativação do campo ASK Necessário em um rádio.
- Sempre que uma operação que requer uma Chave avançada é realizada em um rádio, as novas data e hora são adicionadas ao histórico de programação do rádio, e poderão ser revisadas por leitura do codeplug do rádio depois que as operações de gravação ou clonagem forem concluídas.

10.1.4.2

Número de série

O aplicativo recupera e exibe o número de série somente leitura dos Dispositivos de chave que contém as Chaves (de hardware) avançadas usadas nas últimas operações de programação que exigiram uma Chave avançada.

Somente um Número de série do dispositivo de chave é armazenado por operação. O Número de série específico armazenado é do Dispositivo de chave que contém o ID do sistema do proprietário ou a Chave avançada do ID WACN do proprietário.

Até 25 dos últimos números de série do dispositivo de chave são retidos no codeplug.

INFORMAÇÕES:

- As operações de programação que exigem uma Chave avançada incluem: proteção contra gravação do rádio, gravação em um rádio protegido contra gravação e ativação/desativação do campo ASK Necessário em um rádio.
- Sempre que uma operação que requer uma Chave avançada é realizada em um rádio, o novo Número de série do dispositivo de chave é adicionado ao histórico de programação do rádio, e poderá ser revisado lendo o codeplug do rádio depois que as operações de gravação ou clonagem forem concluídas.

10.1.5

Labtool

Esta seção exibe informações somente leitura para recursos adquiridos.

10.1.5.1

Opção H ATAK

Este campo indica se o recurso ATAK foi adquirido.

10.1.5.2

QA08887 – Ativação de HW LTE

Este campo indica se o recurso de hardware LTE (Long Term Evolution, evolução de longo prazo) foi adquirido.

10.1.5.3

QA08676–Volume do alto-falante adaptivo

Este campo indica se o recurso Volume do alto-falante adaptável foi adquirido.

A opção H disponível é QA08676 para volume do alto-falante adaptável.

10.1.5.4

QA09006–Supressão adaptativa de ruído

Este campo indica se o recurso de supressão de ruído adaptável foi adquirido.

10.2

Todos os Rádios

Esta seção permite que você visualize ou defina a funcionalidade de todo o rádio que se aplica aos modos de comunicação convencional e troncalizado.

Todos os recursos não são comuns aos dois modos de comunicação.

10.2.1

Nome do Conjunto

O campo **Nome do conjunto** permite inserir um nome que identifica exclusivamente o conjunto definido em uma lista de conjuntos similares. Uma mensagem de erro é exibida ao tentar salvar um nome de conjunto já em uso especificado pelo usuário.

10.2.2

Data da última modificação

Este campo somente leitura exibe a data e a hora de quando o conjunto foi salvo pela última vez.

10.2.3

Comentários

Esse campo permite inserir um comentário para o conjunto que está sendo configurado. O comentário aparece na lista inicial de Conjuntos de uma determinada Categoria de Conjunto.

10.2.4

Geral

Esta seção permite visualizar ou definir a funcionalidade básica de todos os rádios.

10.2.4.1

Alias do Codeplug

Esse campo permite definir nomes reconhecíveis para o codeplug.

Além disso, o número de série do rádio aparece na parte superior no modo de exibição de árvore.

Esse alias permanece com um codeplug mesmo quando o codeplug está clonado em outro rádio.

OBSERVAÇÃO:

É possível usar caracteres, números, espaços e caracteres especiais. Para caracteres unicode não identificados, como emojis, o visor superior do rádio mostra "quadrados" para esses caracteres.

São permitidos até 31 caracteres.

10.2.4.2

Ativação de ligações de transmissão de log

Quando este campo está ativado, os IDs recebidos durante o despacho ou a varredura são registrados na lista de chamadas recentes. Quando desabilitada, somente os IDs recebidos por uma Ligação Privada ou Alerta de Ligação são registrados.

Essa função se aplica a todos os rádios.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.2.4.3

Filtro de freq. intermediária ultra estreita

Esse campo seleciona o valor de Largura de banda do filtro de frequência intermediária ultra estreito a ser usado em todos os rádios.

As seleções a seguir são compatíveis:

7,8 kHz

Projetado para rádios que operam em canais com largura de banda estreita em ambientes em que a interferência do canal adjacente não é um grande problema.

5,76 kHz

Projetado para fornecer níveis maiores de proteção contra a interferência do canal adjacente para rádios que operam com larguras de banda estreitas.

10.2.4.4

Região de regulamentação de Wi-Fi

Este campo especifica a região de regulamentação de Wi-Fi usada pelo controlador de Wi-Fi no rádio.

Os seguintes canais serão usados no espectro de 2 GHz:

- Federal Communications Commission (FCC) = Canais 1 a 11
- European Telecommunications Standards Institute (ETSI) = Canais 1 a 13

10.2.4.5

Caminho de conexão

Esse campo mostra que o rádio pode ser programado somente pelo RadioCentral e CPS ou CPS apenas.

OBSERVAÇÃO:

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

10.2.5

Tons de alerta

Esta seção permite visualizar ou definir funcionalidades de tons de alerta que se aplicam a todos os rádios.

10.2.5.1

Tons de alerta

Este campo ativa os recursos de Tom de alerta do rádio.

Essa função se aplica a todos os rádios.

10.2.5.2

Desvio de tons de ajuste do volume

Esse campo permite a amostragem do nível de volume para tons de alerta de rádio.

Quando ativado, o botão Tom definido de volume permite que o usuário faça a amostragem do nível de volume dos tons de alerta do rádio. O volume do tom de alerta pode variar conforme a configuração do volume atual para transmissões recebidas com base na configuração da Diferença de Volume (dB). Quando o botão Tom definido de volume é pressionado, um tom soa no nível de volume atual para transmissões recebidas mais ou menos no valor de Desvio do volume do tom de alerta.

OBSERVAÇÃO:

O Tom Definido de Volume segue a quantidade de Desvio do Volume (DB) somente se o tom não for posicionado abaixo da configuração do Volume Mínimo.

Quando desativado, o botão Tom definido de volume permite experimentar o nível de volume atual do rádio para as transmissões recebidas que ativam o alto-falante do rádio.

Acessado apenas: Quando o campo [Tons de alerta na página 106](#) estiver **Ativado**.

10.2.5.3

Tom de alerta do autoteste de energização

Este campo permite que o Tom de alerta do autoteste do rádio seja emitido quando o autoteste for concluído e o rádio estiver pronto para transmitir ou receber.

Essa função se aplica a todos os rádios.

Acessado apenas: Quando o campo [Tons de alerta na página 106](#) está **Ativado** e o rádio está habilitado para o modelo/para a opção.

10.2.5.4

Ativação do tom de alerta de verificação

Esse campo faz com que o rádio emita um tom de alerta sempre que o modo de verificação for acessado ou encerrado pressionando o botão Verificação ou ativando/desativando a Verificação.

Este tom de alerta não é aplicável à seleção do menu Verificação. Essa função se aplica a todos os rádios.

Acessado apenas: Quando o campo [Tons de alerta na página 106](#) estiver **Ativado**.

10.2.5.5

Redefinição automática do tom de alerta de ligação

Este campo faz com que o rádio gere apenas uma sequência do tom de Alerta de chamada.

Normalmente, o Tom de alerta de ligação é um tom repetido. Essa função se aplica a todos os rádios.

10.2.5.6

Operação Emudecer tons Avançada

Este campo seleciona os tipos de tons de alerta, como tons de teclado, que você pode desativar (mudo).

Este recurso Mudo está disponível para você com a alternância de chave Mudo ou com a seleção de menu Mudo. Essa função se aplica a todos os rádios.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Desabilitado

A função Emudecer está desativada.

Tons do teclado

A função Emudecer somente silencia o teclado e outros tons não sinalizados.

Tons VA

A função Emudecer somente silencia quando há Notificações de voz.

Todos os tons

A função Emudecer silencia todos os tons de sinalização e todos os tons não sinalizados, incluindo tons de teclado, Notificações de voz, Tons de permissão para falar, e outros tons.

10.2.5.7

Tom Fora do alcance

Esse campo seleciona o tom de alerta emitido imediatamente após pressionar o botão PTT, sempre que o rádio estiver fora do alcance de cobertura do sistema de entroncamento e não puder ser sincronizado com um canal de controle.

O tom de alerta continua sendo emitido durante todo o tempo em que o botão PTT permanecer pressionado. Consulte também Indicador de Fora do Alcance. Esse recurso se aplica a todos os rádios para comunicações Convencionais do P25 habilitadas para DVRS e Entroncamento.

**INFORMAÇÕES:**

Você pode evitar confusão selecionando um tom desejável diferente do tom de proibição de fala.

Acessado apenas: quando o rádio for compatível com o modelo ou opção.

As seleções a seguir são compatíveis:

OOR Tom 1

O controle giratório do rádio não possui tons de alerta.

OOR Tom 2

Repetir Tom de Alerta de 800 Hz.

10.2.5.8

Tom de proibição de fala

Esse campo seleciona o tom de alerta emitido sempre que transmissões do rádio não são permitidas, imediatamente após pressionar o botão PTT ou quando o contador de tempo limite predefinido tiver expirado e o rádio finalizar a transmissão atual.

O tom de alerta continua sendo emitido durante todo o tempo em que o botão PTT permanecer pressionado. Essa função se aplica a todos os rádios.

Acessado apenas: quando o rádio for compatível com o modelo ou opção.

**INFORMAÇÕES:**

Você pode evitar confusão selecionando um tom desejável que seja diferente do tom Fora do alcance.

As seleções a seguir são compatíveis:

TP Tom 1

Tom de Alerta Contínuo Legado de 300 Hz.

TP Tom 2

Repetir Tom de Alerta de 600 Hz.

10.2.5.9

LED de bateria fraca

Este campo permite que você seja notificado visualmente quando a bateria do rádio estiver fraca.

O LED vermelho fica aceso quando a condição da bateria fraca é detectada e somente enquanto o rádio está transmitindo. A função se aplica a todos os rádios.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.2.5.10

Apito de transmissão

Esse campo permite que o rádio soe um bipe imediatamente após o botão PTT ser liberado, porém somente quando uma condição de bateria fraca é detectada durante a transmissão.

Consulte também [Som agudo no modo em espera \(s\) na página 109](#).

**INFORMAÇÕES:**

Para rádios Móveis, consulte a seleção "Alerta de Bateria Fraca" da Entrada DEK VIP ou das Entradas VIPs do rádio.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.2.5.11

Som agudo no modo em espera (s)

Este campo seleciona quantas vezes o rádio emite o som agudo de alerta de Standby da bateria fraca (um tom curto e agudo).

Suas entradas diretas válidas também são permitidas.

INFORMAÇÕES:

Para os Rádios móveis, consulte a seleção **Alerta de bateria fraca** da Entrada DEK VIP ou da Entrada VIP do rádio.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 23: Alcance

Mínimo	Máximo	Incrementos
0 segundo	930 segundos	30 seconds

10.2.5.12

Alerta de bateria fraca inteligente

Esse campo seleciona o ponto em que o nível de energia da bateria do rádio faz com que um som de bateria fraca seja ouvido.

Essa função se aplica a todos os rádios.

Acessado apenas: quando o rádio for compatível com o modelo ou opção.

As seleções a seguir são compatíveis:

Padrão

Resta 10% de energia da bateria.

Aviso precoce

Resta 15% de energia da bateria.

10.2.5.13

Sinal sonoro de aviso de PTT

Esse campo seleciona o tom de alerta que é emitido sempre que as seguintes condições forem atendidas:

- O contador de tempo de aviso de PTT (Push-To-Talk) atinge o tempo limite.
- O PTT é pressionado enquanto o rádio está executando a sequência de ISD (Inbound Signal Data, dados de sinal de entrada) ou o contador de tempo de resposta pendente está ativo.

O sinal sonoro de alerta começa a soar a qualquer momento após as condições serem atendidas. O tom de alerta é interrompido quando ocorre uma das seguintes situações:

- Você libera o PTT depois que o contador de tempo de aviso de PTT atinge o tempo limite.
- O rádio recebe a concessão apropriada.
- O rádio estará ocupado após o contador de tempo de aviso de PTT atingir o tempo limite.

As seleções a seguir são compatíveis:

Sinal sonoro de aviso de PTT 1

O rádio reproduz o tom de proibição de fala.

Sinal sonoro de aviso de PTT 2

O rádio reproduz um tom de alerta repetido de 500 Hz com 100 ms (ligado) e 700 ms (desligado).

10.2.5.14

Sinais sonoros de ajuste de volume de RSM

Este campo permite selecionar o sinal sonoro de alerta ao pressionar o botão ou a tecla para ajuste de volume do RSM (Remote Speaker Microphone, microfone com alto-falante remoto) de um rádio portátil.

Essa função se aplica a todos os rádios.

Acima 24: Tipos de seleção de sinais sonoros

Tipos de seleção de sinal sonoro	Descrição
Sinal sonoro de ajuste de volume 1	Compatível com sinal sonoro de alerta de feedback de 911 Hz. Comportamento legado.
Sinal sonoro de ajuste de volume 2	Compatível com sinal sonoro de alerta de feedback de 410 Hz. Igual ao sinal sonoro de ajuste de volume móvel.

OBSERVAÇÃO:

Você pode selecionar o Sinal sonoro de ajuste de volume 2 para diferenciar da campanha lateral do MDC PTT-ID. Alguns RSMs não são afetados por esse campo e sempre reproduzem o Sinal sonoro de ajuste de volume 2.

10.2.6

Informações de usuário e senhas

Esta seção permite visualizar ou definir a funcionalidade relacionada a **Informações do usuário**, **Proteção de zona**, **Bloqueio do rádio**, **Inibição tática** e **Senha obrigatória**.

10.2.6.1

Ativação do alias do rádio

Esse campo habilita o campo Alias do rádio.

Essa função se aplica a todos os rádios.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.2.6.2

Senha de leitura/gravação

Permite que o usuário insira a senha do codeplug, concedendo acesso às permissões protegidas por senha do codeplug atual.

Permissões protegidas podem incluir qualquer um ou todos os recursos a seguir:

- leitura do rádio
- gravação no rádio
- leitura de um arquivo do codeplug

Essa função se aplica a todos os rádios.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.2.6.3

Ativação da senha de gravação de rádio

Quando ativado, o usuário deverá inserir o conjunto Senha de leitura/gravação para o rádio antes que quaisquer dados possam ser gravados ao rádio.

Essa função se aplica a todos os rádios.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.2.6.4

Ativação da senha de leitura de rádio

Quando ativado, o usuário deverá inserir o conjunto Senha de leitura/gravação para o rádio antes que quaisquer dados possam ser lidos do rádio.

Essa função se aplica a todos os rádios.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.2.6.5

Ativação da senha de leitura de arquivo

Quando habilitada, o conjunto de Senha de leitura/gravação para o rádio pode ser arquivado.

Essa função se aplica a todos os rádios.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.2.7

Funções

Esta seção permite visualizar ou definir a funcionalidade básica de todos os rádios.

10.2.7.1

Bloquear CA/PC pendente

Este campo habilita o bloqueio de chamadas para Alerta de chamada ou Chamada privada.

O primeiro dado recebido por alerta de ligação ou ligação privada recebido pelo rádio inativo é mantido. Dados sucessivos de alerta de ligação ou ligações privadas são ignorados ao menos que as informações de origem da ligação sejam idênticas ao dado recebido da fonte original. Essa função se aplica a todos os rádios.

Quando desabilitada, os dados do último Alerta de Ligação ou da Ligação Privada recebidos são os dados que serão armazenados. Portanto, informações de ligações armazenadas anteriormente são substituídas na memória do rádio.

10.2.7.2

Chave giratória (programa de verificação)

Este campo seleciona qual elemento de modo (**Zonas** ou **Canais**) a chave giratória no rádio e/ou microfone do alto-falante remoto com visor (DRSM) seleciona enquanto você estiver operando o rádio no modo Programação de lista de varredura ou Editar.

Você pode acessar o modo Programação de lista de varredura ou Editar pressionando a tecla do botão Varredura por um período mais longo, alternando a programação da lista de varredura ou com uma seleção de menu da lista de varredura. Essa função se aplica a todos os rádios.

INFORMAÇÕES:

Para rádios que têm um botão multifunção (MFK), essa função é aplicável somente à chave giratória no acessório DRSM opcional.

Acessado apenas: quando o rádio for compatível com o modelo ou opção.

As seleções a seguir são compatíveis:

- Canal
- Zona

10.2.7.3

Desativar Plug and Play

Esse campo desativa todas as tensões de polarização de pinos GCAI se nenhum acessório de GCAI for conectado ao rádio dentro de 1 minuto da inicialização.

INFORMAÇÕES:

Se estiver habilitado e o Adaptador Veicular APX não estiver conectado ao rádio depois ser inicializado, a funcionalidade GCAI fica desabilitada. O rádio não poderá detectar a presença do Adaptador Veicular APX.

Acessado apenas: quando o rádio for compatível com o modelo ou opção.

10.2.7.4

Modulação cíclica

Esse campo ativa a potência de inclinação para cima e para baixo da potência de transmissão para cumprir os requisitos ETS-300 e FTZ de modulação cíclica.

Essa seleção se aplica a todos os rádios.

OBSERVAÇÃO:

A função Modulação cíclica deve ser habilitada somente para os rádios usados na Europa.

10.2.7.5

Contador de Tempo de Perda de Voz

Este campo seleciona o período de tempo, durante uma transmissão de rádio, em que o DSP (Digital Signal Processor, processador de sinal digital) aguarda durante a detecção da falta de voz do microfone antes de declarar um evento Sem voz.

Isso pode ser usado para acionar Finalizar Transmissão por Perda de Voz. Essa seleção se aplica a todos os rádios, para todos os canais de comunicação convencionais e de entroncamento.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 25: Alcance

Mínimo	Máximo	Incrementos
5 segundos (padrão)	60 seconds	1 segundo

10.2.7.6

Roteamento de RF externo

Este campo é utilizado para determinar a banda de RF que será direcionada à antena externa quando o rádio estiver conectado ao adaptador veicular (VA) ou microfone de segurança pública (PSM) com antena.

Essa seleção se aplica a Rádios portáteis que oferecem suporte a várias bandas. Esta função é somente editável para várias bandas e não editável para banda única.

As seleções a seguir são compatíveis:

7/800

É válida somente se 7/800 MHz for uma banda adquirida.

UHF

É válida somente se UHF1 ou UHF2 for uma banda adquirida.

VHF

É válida somente se VHF for uma banda adquirida. VHF só será roteado externamente quando um Adaptador Veicular estiver conectado.

ALL_BANDS

Realiza o roteamento de todas as bandas adquiridas externamente. Somente válido para rádios compatíveis com o Adaptador veicular.

10.2.7.7

Tipo de Certificação do Rádio

Este recurso permite configurar o tipo de certificação do rádio.

Tipo de certificação do rádio está definido como Nenhum por padrão. Se uma bateria não correspondente é conectada, um alerta de bateria incorreta é acionado.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Nenhum

O rádio é compatível com qualquer tipo de bateria.

UL Div 2

O rádio é compatível somente com baterias certificadas pela UL Div 2.

10.2.7.8

ViQi: Prioridade de controle de voz

As seleções a seguir são compatíveis:

Baixa

O áudio LMR tem prioridade. O áudio de recepção LMR cancelará ou bloqueará o recurso de controle por voz quando o rádio estiver recebendo ativamente.

Alta

O controle por voz tem prioridade. Enquanto o botão de controle por voz estiver pressionado (o controle por voz está ativo), o áudio de recepção LMR será silenciado.

Desabilitado

O recurso Controle por voz está desativado.

10.2.7.9

Modo de espera de desligamento (horas)

Este recurso permite que o modem LMR (Land Mobile Radio, rádio móvel terrestre) seja desligado enquanto o processador de aplicativos está em um modo de baixo consumo de energia para permitir uma inicialização mais rápida do dispositivo. Este recurso também permite definir o tempo para o modo de espera de desligamento.

Acima 26: Alcance

Mínimo	Máximo	Incrementos
1 (hora)	8 (horas)	1 (hora)

OBSERVAÇÃO:

Se o rádio permanecer nesse modo durante o período selecionado, ele será desligado automaticamente. Se o valor estiver definido como 0, o rádio será desligado imediatamente. Se for definido um valor diferente de 0, o rádio será mantido no modo de baixa energia pela duração selecionada. Se o botão do rádio estiver ligado enquanto o rádio estiver em espera, ele estará totalmente funcional dentro de alguns segundos.

O rádio exigirá uma inicialização a frio nos seguintes cenários de desligamento:

- A bateria está desconectada.
- A bateria está descarregada.
- O recurso Modo de espera de desligamento está desativado no codeplug.
- O rádio esteve no modo de espera por mais tempo do que o intervalo configurado para o recurso Modo de espera de desligamento.

10.2.7.10

ViQi: Modo do parceiro virtual

OBSERVAÇÃO:

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

As seleções a seguir são compatíveis:

Desabilitado

Desativa a operação do recurso Parceiro virtual.

Banda larga

Todas as solicitações e respostas do parceiro virtual usarão apenas conexões LTE ou Wi-Fi.

LMR

Todas as solicitações e respostas do parceiro virtual usarão apenas canais de voz da infraestrutura APCO 25.

10.2.7.11

ViQi: Prioridade de áudio do parceiro virtual

Configura como o áudio de feedback do Parceiro virtual é priorizado em relação ao áudio LMR.

OBSERVAÇÃO:

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

As seleções a seguir são compatíveis:

Somente ViQi

Reproduz ViQi a 100% e silencia qualquer áudio de recepção LMR.

Prioridade ViQi

Reproduz áudio de recepção LMR e áudio ViQi simultaneamente. O nível de áudio de recepção LMR será atenuado abaixo do nível de áudio ViQi.

Igualdade ViQi

Reproduz áudio de recepção LMR e áudio ViQi simultaneamente nos mesmo níveis de áudio.

Prioridade LMR

Reproduz áudio de recepção LMR e áudio ViQi simultaneamente. O nível de áudio ViQi será atenuado abaixo do nível de áudio de recepção LMR.

10.2.7.12

ViQi: Contador de tempo de inatividade do Parceiro virtual (s)

Seleciona o tempo durante o qual o usuário permanecerá inativo no recurso Parceiro virtual antes de sair e começar a ouvir o canal de despacho selecionado.

**OBSERVAÇÃO:**

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

Acessado apenas: Quando o campo **Banda larga** ou **LMR** está selecionado no campo **ViQi: Modo do parceiro virtual na página 114** e quando o rádio está habilitado para o modelo/para a opção.

Quando o rádio recebe áudio do Parceiro virtual e do LMR, ele reproduz o áudio do Parceiro Virtual. Se o rádio não recebeu o áudio do Parceiro virtual, o usuário ouvirá o áudio do LMR.

Acima 27: Alcance

Mínimo	Máximo	Incrementos
5 segundos (padrão)	255 segundos	1 segundo

**OBSERVAÇÃO:**

Enquanto o usuário estiver usando o recurso Parceiro virtual, haverá perda de todo o tráfego de voz de despacho normal.

10.2.7.13

Modo SmartMessage

Permite que o usuário selecione o tipo de roteamento de transmissão de mensagem.

LMR

As mensagens são transmitidas de acordo com as configurações do canal Convencional ou de Entroncamento.

**OBSERVAÇÃO:**

O LMR é uma rede de banda estreita que tem capacidade limitada para aplicativos com uso intenso de dados.

SmartMessaging

As mensagens são transmitidas por meio do aplicativo de mensagens de banda larga padrão.

**OBSERVAÇÃO:**

O LTE é uma rede de banda larga que pode lidar com aplicativos com uso intenso de dados.

10.2.7.14

Tamanho do buffer de áudio de reprodução de gravação

Este campo especifica o último número de segundos da chamada recebida atual a ser gravada pelo recurso Chamada instantânea.

Essa função se aplica a todos os rádios. O recurso Chamada instantânea é habilitado quando esse campo for definido para qualquer valor diferente do padrão **Desabilitado**.

**AVISO:**

Todas as chamadas são gravadas pelo tempo configurado até o próximo ciclo de inicialização ou até serem substituídas por áudios recebidos mais recentemente.

Acessado apenas: quando o rádio for compatível com o modelo ou opção.

Acima 28: Alcance

Mínimo	Máximo	Incrementos
10 s	60 s	1 s

10.2.7.15

Tom de evacuação

Esse campo ativa o tom de evacuação para ser ouvido pelo rádio transmissor e em qualquer rádio que esteja habilitado a receber a instrução do tom.

O tom é iniciado e é transmitido quando o botão PTT e o "Botão Laranja" são pressionados simultaneamente. Depois que o tom começar a soar, se o botão laranja for liberado, o tom permanecerá soando em todos os rádios dentro do grupo de conversação, até que o botão PTT seja liberado.

OBSERVAÇÃO:

Essa instrução da evacuação do tom é transmitida para todo o grupo de conversação do rádio (para o canal atual); o tipo de grupo de conversação depende do modo de comunicação atual do rádio. Isso se aplica aos canais de voz analógicos e digitais, nos sistemas convencional e de entroncamento e nos sistemas APCO FDMA e TDMA.

AVISO:

Esse recurso só funciona quando o canal atual está operando no modo "Não criptografado" (e não Criptografia segura).

10.2.7.16

Desligamento automático de ignição

Este campo permite selecionar o período que o rádio aguarda antes de ser desligado automaticamente após a tensão no sensor de ignição ser removida.

Este contador é iniciado quando a voltagem no sensor de ignição é removida e quando a falta de interação é determinada pelo rádio posteriormente. Quando o contador está ativo, qualquer liberação de botão no rádio zera o contador. Durante os últimos dois minutos de contagem regressiva do contador, o rádio gerará avisos audíveis e visuais até que o contador expire ou seja zerado. Essa seleção se aplica a todos os rádios, para todos os canais de comunicação convencionais e de entroncamento.

INFORMAÇÕES:

A funcionalidade do contador é baseada no estado da chave de ignição do seu veículo.

Em uma configuração de rádio duplo, esta funcionalidade é configurável somente no **Rádio principal**.

Acessado apenas: Quando o campo **Chave de ignição** estiver definido como **Somente ativação de ignição**, **Necessário** ou **Desligamento suave** e quando o rádio estiver habilitado para o modelo/a opção.

OBSERVAÇÃO:

O Desligamento automático de inatividade é desabilitado quando definido como **0 - Desabilitado** (padrão).

Acima 29: Alcance

Mínimo	Máximo	Incrementos
3 minutos	840 minutos	1 minuto

10.2.7.17

Desativar alerta de desligamento automático da ignição

Quando esse campo é marcado, ele desativa os avisos visuais e sonoros de desligamento automático nos últimos 2 minutos do rádio desligado devido à remoção de tensão no Sensor de ignição.

Este campo pode ser modificado quando o **Desligamento automático da ignição** estiver acessível e não definido como **Desativado**.

10.2.7.18

Ativação personalizada da imagem de inicialização

Se esse campo estiver habilitado, você poderá carregar uma imagem para aparecer no final da sequência de inicialização.

10.2.7.19

Habilitar Fallback de canal

Esse campo habilita o recurso Fallback de canal automático. Essa função permite associar um canal baseado no sistema a um canal Fallback. O rádio pode alternar para um canal Fallback quando não conseguir se comunicar com a rede LMR (Land Mobile Radio, rádio móvel terrestre).

AVISO:

Não é recomendável configurar um canal Fallback como um canal no mesmo sistema. Se o rádio não puder se comunicar automaticamente com o sistema em um grupo de conversação, ele também não poderá se comunicar em um grupo de conversação diferente.

INFORMAÇÕES:

Por padrão, o recurso Fallback de canal automático é desativado para todos os canais. Depois de ativar esse campo, você deve escolher uma Zona de Fallback e um canal Fallback para um determinado canal na Atribuição de canal de zona.

O rádio pode realizar retornos aninhados. Se o canal Fallback selecionado não puder se comunicar com a rede LMR, o rádio poderá realizar um Fallback de canal se um canal Fallback for atribuído a ele.

Depois que o rádio executa um Fallback de canal, ele aguarda um curto período antes de tentar outro Fallback de canal para evitar a comutação com muita frequência.

Em um canal habilitado para Fallback, o recurso pode ser ativado pressionando o botão **Ativar/desativar Fallback de canal automático**. Pressionar e segurar este botão desativa a função e reverte o rádio de volta para o último canal selecionado pelo usuário.

Pressionar o botão **Reversão/Fallback de canal manual** faz com que o rádio alterne manualmente para o canal Fallback atribuído, independentemente das condições atuais da rede e do estado de ativação. Pressionar e segurar este botão reverte o rádio de volta para o último canal selecionado pelo usuário.

Nos seguintes canais baseados no sistema, o rádio não consegue se comunicar com a rede LMR e alterna automaticamente para o canal Fallback. Em qualquer outro tipo de canal, somente Fallback manual de canal está disponível.

- Entroncamento P25
- Entroncamento do tipo II
- PSU habilitada para DVRS

10.2.8

Location

Esta seção permite visualizar ou modificar configurações relacionadas a qualquer tecnologia que determina a localização baseada em rádio (ou em acessório de rádio).

Por exemplo, o GPS é uma tecnologia que determina a localização.

10.2.8.1

Ativação de localização

Este campo ativa o receptor de GPS no rádio para todas as funções de localização, incluindo solicitações de Protocolo de solicitação/resposta de localização (LRRP) a partir do FNE (Fixed Network Equipment, equipamento de rede fixo) e do menu Localização.

O menu Localização está disponível para você pressionando o botão local ou selecionando o item de menu Localização.

OBSERVAÇÃO:

O LRRP é um protocolo de propriedade da Motorola Solutions usado para trocar informações sobre localização (longitude e latitude) entre o rádio e o dispositivo de dados como um computador móvel na CEN (Customer Enterprise Network, rede corporativa do cliente). Essa função se aplica a todos os rádios.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.2.8.2

Relatório de SmartLocate

Este campo permite selecionar a operação do relatório de SmartLocate.

As seleções a seguir são compatíveis:

Somente LMR

Quando o campo [Ativação de localização na página 118](#) está ativado, o rádio é configurado para relatar ao Command Central Aware a localização do dispositivo usando o LRRP (Location Request/Response Protocol, protocolo de solicitação/resposta de localização) da Motorola Solutions pelo sistema ASTRO.

Apenas banda larga

Quando esta seleção está ativada, o rádio é configurado para relatar ao Command Central Aware a localização do dispositivo como mensagens de telemetria de dispositivo para nuvem usando o serviço de banda larga (Wi-Fi ou LTE celular).

Banda larga preferida

Quando o campo [Ativação de localização na página 118](#) estiver ativado e o serviço de banda larga estiver disponível, o rádio será configurado para relatar ao Command Central Aware a localização do dispositivo como mensagens de telemetria de dispositivo para nuvem usando o serviço de banda larga. Se o serviço de banda larga não estiver disponível, o rádio será configurado para relatar ao Command Central Aware a localização do dispositivo usando o LRRP (Location RequestResponse Protocol, protocolo de solicitação/resposta de localização) da Motorola Solutions pelo sistema ASTRO.

Acessado apenas: Quando o campo [Ativação de localização na página 118](#) está ativado e o rádio está habilitado para o modelo/para a opção.

10.2.8.3

Ativação de localização selecionada pelo usuário

Este campo permite ativar ou desativar a funcionalidade de localização do rádio em todos os rádios.

A localização pode ser usada em conjunto com uma tecnologia de determinação de localização, como Sistema de posicionamento global (GPS).

AVISO:

O menu Localização está disponível para você pressionando o botão Localização ou selecionando o menu Localização. Alguns desses controles devem ser programados, caso contrário, este campo será inválido. Essa função se aplica a todos os rádios.

Acessado apenas: Quando o campo [Ativação de localização na página 118](#) está ativado e o rádio está habilitado para o modelo/para a opção.

10.2.8.4

Formato da Tela da Localização

Este campo seleciona o formato para visualização e edição das coordenadas no menu de localização e para exibir os formatos de localização.

AVISO:

O menu Localização está disponível para você pressionando o botão local ou selecionando o item de menu Localização. Essa função se aplica a todos os rádios.

Acessado apenas: Quando o rádio estiver habilitado para o modelo/a opção e quando o campo [Ativação de localização na página 118](#) ou o campo [Exibição da Localização do Par](#) estiver habilitado.

As seleções a seguir são compatíveis:

- Latitude/Longitude (DMD)
- Latitude/Longitude (DMS)
- Latitude/Longitude (DD)
- UTM
- MGRS (Military Grid Reference System, sistema de referência de grade militar)

10.2.8.5

Unidade de distância

Este campo seleciona a unidade de medida a ser usada quando a distância é exibida entre os pontos de caminho no menu Localização do rádio.

O menu Localização está disponível para você pressionando o botão local ou selecionando o item de menu Localização. Essa função se aplica a todos os rádios.

Acessado apenas: Quando o campo [Ativação de localização na página 118](#) está ativado e o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

- Quilômetros
- Milhas

10.2.8.6

Relatório de Localização P25

Este campo permite que o rádio processe mensagens LRRP (Location Request Response Protocol, protocolo de resposta da solicitação de localização) usando o formato de dados P25 (Project 25), além do formato de dados legado de relatórios de localização da Motorola.

É exigido quando o rádio troca informações da localização de LRRP com um Servidor de Localização em uma infraestrutura de comunicações Convencional ou de Entroncamento compatível apenas com as Especificações de Serviços de Localização de Nível 2 do P25 (conforme publicado pela Associação do Setor de Telecomunicações). Essa função se aplica a todos os rádios.

Quando desabilitado, o rádio só possui suporte para mensagens de LRRP utilizando o formato de dados do Relatório de Localização legado da Motorola.

**OBSERVAÇÃO:**

Quando o Servidor de Localização se comunica com o rádio na porta especificada no campo Porta UDP do Relatório de Localização do P25 e o rádio interpreta os dados como sendo do Relatório de Localização do P25 (o número de porta padrão especificado para o P25 para esta porta é 49198).

Quando o Servidor de Localização se comunica com o rádio na porta estática 4001, o rádio interpreta os dados como sendo do "Relatório de Localização Legado da Motorola".

Quando o Servidor de Localização apresenta um pedido de informações de localização de um rádio a uma porta especificada no campo Porta UDP do Relatório de Localização do P25, o rádio interpreta os dados como sendo do Relatório de Localização do P25 (o número de porta padrão especificado para o P25 para esta porta é 49198) e o rádio decodifica ou codifica mensagens LRRP entre o rádio e o servidor de localização usando o formato de dados "Relatórios de Localização do P25".

O recurso Registro de Localização Direto permite que o rádio envie a notificação de presença ao Servidor de Localização quando o aplicativo ARS não estiver presente usando a mensagem LRRP "Mensagem de Versão do Protocolo" codificada com o método "Relatórios de Localização do P25".

Acessado apenas: Quando o campo [Ativação de localização na página 118](#) está ativado e o rádio está habilitado para o modelo/para a opção.

10.2.8.7

Cerca geográfica gerenciada pelo sistema

Este campo permite que o rádio ofereça suporte à cerca geográfica do UNS.

Quando a SU realiza o Login de usuário no ARS com o servidor de presença, as informações para indicar se a SU é capaz de suportar as transmissões da Cerca Geográfica Gerenciada pelo Sistema com o ARS.

**AVISO:**

Ao ativar a Cerca Geográfica de Sistema Gerenciado, o [Modo ARS na página 375](#) deve ser definido como **Servidor Aprimorado** em, pelo menos, um dos registros dos Perfis de Dados para evitar Relatório de Campos inválidos.

Acessado apenas: Quando o rádio está habilitado para modelo/opção, quando o modo ARS é Servidor aprimorado em, pelo menos, um dos perfis de dados, e quando o campo [Ativação de localização na página 118](#) estiver ativado.

10.2.8.8

Modo de mapeamento

O Modo de mapeamento permite visualizar a localização do usuário ou de outras pessoas no mapa.

Acessado apenas: Quando o campo [Ativação de localização na página 118](#) estiver ativado.

As seleções a seguir são compatíveis:

- Nenhum
- recurso

10.2.8.9

Localização assistida por servidor

Quando ativado, o rádio usa uma conexão de Internet de banda larga para fornecer a localização do rádio. Quando o GNSS está indisponível, os dados de telemetria são enviados para o servidor de localização para aproximar a posição do rádio. As localizações são enviadas para o servidor de localização para codificação geográfica reversa.

Acessado apenas: Quando o campo [Ativação de localização na página 118](#) estiver ativado.

10.2.8.10

Formato de Localização Codificado Geograficamente

O Formato de localização codificado geograficamente permite selecionar o formato para codificação geográfica reversa.

Acessado apenas: Quando o campo [Ativação de localização na página 118](#) estiver ativado.

As seleções a seguir são compatíveis:

- Desabilitado
- Endereço da Rua
- Intersecção

10.2.9

Opções de áudio

Esta seção permite visualizar ou definir parâmetros de controle de transmissão e recepção de áudio que se aplicam a todos os rádios.

10.2.9.1

Ativação de recepção simultânea

Esse campo permite que o rádio permaneça com o mudo desativado mesmo com várias transmissões ocorrendo simultaneamente e no mesmo canal.

Isso é verdadeiro apenas quando se opera em canais Direto/Talkaround analógicos. Essas transmissões simultâneas são ouvidas somente quando a intensidade do sinal recebido é relativamente forte e uniforme. Essa função se aplica a todos os rádios.

INFORMAÇÕES:

Ativar esse recurso fará com que alguns sinais fracos normalmente recebidos pelo rádio permaneçam com o mudo ativado; portanto, é recomendável ativar esse recurso somente se a capacidade para receber transmissões simultâneas tiver sido identificada como necessária.

Para modelos de rádio contendo firmware anterior à versão R12.00.00, esse recurso se aplica somente aos canais de 25 kHz (consulte também o campo Espaçamento de canais/Desvio de Tx). Para modelos de rádio com firmware R12.00.00 ou mais tarde, este campo se aplica aos canais de 12,5 kHz e 25 kHz.

OBSERVAÇÃO:

O áudio dessas transmissões simultâneas são, na maioria das vezes, ilegíveis. A recepção de transmissões simultâneas é necessária algumas vezes quando são gerenciados incidentes em que ela pode ser muito importante para receber todas as comunicações. Por exemplo, ter essa função habilitada pode ser crucial no gerenciamento de incidentes em que apenas comunicações analógicas são usadas, condições caóticas são esperadas e qualquer transmissão recebida é melhor do que não receber nenhuma transmissão.

10.2.9.2

Equilíbrio analógico/digital de Tx

Este campo permite que o nível da transmissão de áudio seja equalizado ou equilibrado ao alternar entre analógico e digital.

Essa função pode ser aplicada a todos os rádios ou em uma base de perfil do rádio.

**AVISO:**

Quando **Todos os rádios** for selecionado, AGC digital (rádio), AGC analógico (rádio), AGC digital (acessório) e AGC analógico (acessório) devem ser "Desativados" para cada registro dos perfis de rádio. Caso contrário, esta seleção será considerada inválida.

As seleções a seguir são compatíveis:

Desativado

O recurso está desativado.

Todos os Rádios

O equilíbrio do nível de transmissão de áudio ocorre em todos os rádios.

Por perfil

Com esta seleção, o campo Equilíbrio analógico/digital pode ser ativado ou desativado em qualquer registro de perfil do rádio existente.

10.2.9.3

Nível de configuração do áudio

Esse campo permite configurar o nível de áudio do rádio.

Acessado apenas: Esta é uma configuração disponível apenas na Visualização integral (veja Visualização do codeplug).

As seleções a seguir são compatíveis:

Aprimorado

Ativa o recurso de aprimoramento de áudio.

Se você alterar a seleção de **Avançado** para **Básico**, os valores da Configuração do grupo de sensibilidade de ganho e os valores da Configuração do grupo de equalização de áudio (alto-falante) serão sincronizados da coluna Rádio para a coluna Acessório.

Básico

Escolher **Básico** desabilita o recurso de aprimoramento de áudio, e os campos a seguir não se aplicam:

Os seguintes campos não são aplicáveis:

- **Banda de baixa frequência digital para rádio e acessório**
- **Banda de média frequência digital para rádio e acessório**
- **Banda de baixa frequência para rádio e acessório**
- **Banda de alta frequência digital para acessório**
- **Banda de média frequência para rádio e acessório**
- **Banda de baixa frequência Securenet para rádio e acessório**
- **Banda de alta frequência para rádio e acessório**
- **Banda de média frequência Securenet para rádio e acessório**
- **Configurações de grupo de equalização de áudio (mic.)**
- **Banda de baixa frequência analógica para rádio e acessório**
- **Configurações de grupo de equalização de áudio (alto-falante)**

- **Banda de média frequência analógica para rádio e acessório**

Os seguintes campos não são editáveis:

- **Saída de controle de ganho AGC para acessório**
- **Controle de ganho total AGC para acessório**
- **Balanço digital/analógico para acessório**
- **Banda de alta frequência analógica para acessório**
- **Banda de alta frequência Securenet para acessório**
- **Banda de alta frequência digital para acessório**

10.2.10

Níveis de potência de transmissão

Essa seção permite visualizar ou definir as configurações de potência alta ou baixa de Tx (Transmit, transmissão), dentro dos limites predefinidos.

INFORMAÇÕES:

Há configurações de Nível de potência de transmissão exclusivas (registros/linhas) para cada uma das possíveis frequências de alcance dentro de determinada banda de frequência. No entanto, apenas as configurações de Nível de potência de transmissão da banda (ou bandas) de frequência compatível com o codeplug atual são aplicáveis e, em alguns casos, podem ser modificadas. Veja também Banda de frequência primária e Banda de frequência secundária para conhecer as bandas de frequência aceitas pelo rádio.

OBSERVAÇÃO:

Para cumprir totalmente os requisitos regulamentares de nível de potência de saída, os usuários marítimos da Parte 80 que operam entre 154-162,025 MHz (banda VHF) e 454-470 MHz (banda UHF) devem programar a potência de transmissão dos padrões para um nível que não exceda os valores fornecidos na tabela abaixo.

Observe que essa restrição de potência reduzida se aplica somente a determinados modelos do rádio e estritamente às frequências marítimas da Parte 80. Além disso, verifique sua licença quanto a quaisquer restrições adicionais sobre a potência de saída.

Descrição da família de produtos	FCC/IC	Faixa de frequência/potência de saída
APX Next	AZ489FT7147/109U-89FT7 147	156 – 162,025 MHz/5 W 454 – 470 MHz/2 W

10.2.10.1

Seleção de plano de banda

Esse campo seleciona a banda de frequência de 7/800 MHz apropriada – plano de banda que o rádio possui licença para operar, que determina qual dos dois tipos de tabela de configuração de Nível de potência de transmissão está disponível para o codeplug do rádio.

Esse valor se aplica a todos os rádios.

**AVISO:**

Em 2007, o plano de banda de 700 MHz da FCC (Federal Communications Commission, Comissão Federal de Comunicações), redefiniu a banda de frequência de 7/800 MHz, em parte para alocar as frequências de Banda larga "Bloco D" de 700 MHz para uso de segurança pública. Entretanto, alguns órgãos dos EUA e do Canadá podem ter licenças/isenções que os permitem utilizar o plano de banda de 700 MHz original.

**INFORMAÇÕES:**

Há configurações específicas de Nível de potência de transmissão (registros/linhas) para cada um dos alcances de frequência dentro de uma banda de frequência específica. Entretanto, apenas as configurações de Nível de potência de transmissão para a banda de frequência (ou bandas) suportadas pelo codeplug atual se aplicarão e, em alguns casos, poderão ser modificadas. Veja também Banda de frequência primária e Banda de frequência secundária para conhecer as bandas de frequência aceitas pelo rádio.

As seleções a seguir são compatíveis:

Antigo

É o plano de banda de 7/800 MHz original (consulte Aviso) e, por esse motivo, as configurações originais de Nível de potência de transmissão são aplicáveis ao codeplug do rádio.

Novo

É o plano de banda de 7/800 MHz mais recente (consulte Aviso) e, por esse motivo, as configurações originais de Nível de potência de transmissão (Novo plano de banda) são aplicáveis ao codeplug do rádio.

Acessado apenas:

- Quando a Banda de frequência primária ou a Banda de frequência secundária for "7/800 MHz".
- Quando **Permitir frequências inválidas** estiver habilitado e quando 7/800 MHz usados no codeplug estiver habilitado.
- Quando **700 MHz habilitado ou 800 MHz habilitado** estiver habilitado.
- Quando **Permitir frequências inválidas** estiver habilitado.
- Quando **700 MHz usados no codeplug ou 800 MHz usados no codeplug** estiver habilitado.
- Quando o rádio está habilitado para o modelo/para a opção.

10.2.10.2**Banda de frequência**

O aplicativo recupera e exibe a banda de frequência somente leitura, no qual cada faixa tem uma configuração exclusiva de nível de potência de transmissão (registro/linha).

A banda de frequência atual é definida por [Início da frequência de alcance \(MHz\) na página 125](#) e [Final da frequência de alcance \(MHz\) na página 125](#). Rádios de banda dupla suportam mais de uma banda de frequência (veja também Banda Primária de Frequência e Banda Secundária de Frequência para ver as bandas de frequência suportadas pelo rádio). Esse valor se aplica a todos os rádios.

**INFORMAÇÕES:**

Há configurações de Nível de potência de transmissão exclusivas (registros/linhas) para cada uma das possíveis frequências de alcance dentro de determinada banda de frequência. No entanto, apenas as configurações de Nível de potência de transmissão da banda (ou bandas) de frequência compatível com o codeplug atual são aplicáveis e, em alguns casos, podem ser modificadas.

10.2.10.3

Início da frequência de alcance (MHz)

O aplicativo recupera e exibe o valor somente leitura de Início da gama de frequências para a banda de frequência do registro ou da linha atual.

Esses valores são fixos para este modelo do rádio. Esse valor se aplica a todos os rádios.

INFORMAÇÕES:

Há configurações de Nível de potência de transmissão exclusivas (registros/linhas) para cada uma das possíveis frequências de alcance dentro de determinada banda de frequência. No entanto, apenas as configurações de Nível de potência de transmissão da banda (ou bandas) de frequência compatível com o codeplug atual são aplicáveis e, em alguns casos, podem ser modificadas. Veja também Banda de frequência primária e Banda de frequência secundária para conhecer as bandas de frequência aceitas pelo rádio.

10.2.10.4

Final da frequência de alcance (MHz)

O aplicativo recupera e exibe o valor somente leitura do Limite da gama de frequências para a banda de frequências do registro ou da linha atual.

Esses valores são fixos para este modelo do rádio. Esse valor se aplica a todos os rádios.

INFORMAÇÕES:

Há configurações de Nível de potência de transmissão exclusivas (registros/linhas) para cada uma das possíveis frequências de alcance dentro de determinada banda de frequência. No entanto, apenas as configurações de Nível de potência de transmissão da banda (ou bandas) de frequência compatível com o codeplug atual são aplicáveis e, em alguns casos, podem ser modificadas. Veja também Banda de frequência primária e Banda de frequência secundária para conhecer as bandas de frequência aceitas pelo rádio.

10.2.10.5

Nível mínimo de potência de transmissão (W)

O aplicativo recupera e exibe o valor do Nível mínimo de potência de transmissão somente leitura.

Esse valor é fixo para esse modelo de rádio e se aplica apenas a canais na banda de frequência do registro ou da linha atual.

INFORMAÇÕES:

Há configurações de Nível de potência de transmissão exclusivas (registros/linhas) para cada uma das possíveis frequências de alcance dentro de determinada banda de frequência. No entanto, apenas as configurações de Nível de potência de transmissão da banda (ou bandas) de frequência compatível com o codeplug atual são aplicáveis e, em alguns casos, podem ser modificadas. Veja também Banda de frequência primária e Banda de frequência secundária para conhecer as bandas de frequência aceitas pelo rádio.

10.2.10.6

Nível baixo de potência de transmissão (W)

Esse campo permite inserir o nível de potência baixo de transmissão (Tx).

Esse valor se aplica apenas a canais na banda de frequência do atual registro/linha.

**AVISO:**

Para ser considerado válido, o Nível de Potência Tx deve ser maior que ou igual a [Nível mínimo de potência de transmissão \(W\) na página 125](#) e menor que ou igual a [Nível alto de potência de transmissão \(W\) na página 126](#) e [Nível máximo de potência de transmissão \(W\) na página 126](#).

**INFORMAÇÕES:**

Há configurações de Nível de potência de transmissão exclusivas (registros/linhas) para cada uma das possíveis frequências de alcance dentro de determinada banda de frequência. No entanto, apenas as configurações de Nível de potência de transmissão da banda (ou bandas) de frequência compatível com o codeplug atual são aplicáveis e, em alguns casos, podem ser modificadas. Veja também Banda de frequência primária e Banda de frequência secundária para conhecer as bandas de frequência aceitas pelo rádio.

10.2.10.7**Nível alto de potência de transmissão (W)**

Esse campo permite inserir o nível alto de potência de transmissão (Tx).

Esse valor se aplica apenas a canais na banda de frequência do atual registro/linha.

**INFORMAÇÕES:**

Há configurações de Nível de potência de transmissão exclusivas (registros/linhas) para cada uma das possíveis frequências de alcance dentro de determinada banda de frequência. No entanto, apenas as configurações de Nível de potência de transmissão da banda (ou bandas) de frequência compatível com o codeplug atual são aplicáveis e, em alguns casos, podem ser modificadas. Veja também Banda de frequência primária e Banda de frequência secundária para conhecer as bandas de frequência aceitas pelo rádio.

Caso a potência alta de transmissão seja aumentada, os limites atuais deverão ser reajustados usando o aplicativo Sintonizador, para que seja possível atingir o nível de potência desejado.

Caso a definição de potência alta de transmissão seja diminuída, os limites atuais poderão ser reajustados para aumentar a proteção do limite atual.

10.2.10.8**Nível máximo de potência de transmissão (W)**

O aplicativo recupera e exibe o valor máximo somente leitura do Nível de potência de Tx.

Esse valor é fixo para esse modelo de rádio e se aplica apenas a canais na banda de frequência do registro ou da linha atual.

**OBSERVAÇÃO:**

Há configurações de Nível de potência de transmissão exclusivas (registros/linhas) para cada uma das possíveis frequências de alcance dentro de determinada banda de frequência. No entanto, apenas as configurações de Nível de potência de transmissão da banda (ou bandas) de frequência compatível com o codeplug atual são aplicáveis e, em alguns casos, podem ser modificadas. Veja também Banda de frequência primária e Banda de frequência secundária para conhecer as bandas de frequência aceitas pelo rádio.

10.2.11

Faixas de frequência

Esta seção permite definir frequências dentro do codeplug que estão fora do recurso da banda de frequência de um rádio específico.

OBSERVAÇÃO:

Isso é útil quando um sistema de Entroncamento ou Convencional suporta bandas de frequência dupla, porém rádios específicos nesse sistema contém banda única. Neste caso, é ainda possível ler e gravar codeplugs e clones entre rádios, mesmo quando algumas bandas de frequência no codeplug estão inválidas.

AVISO:

Quando o campo Permitir frequências inválidas está ativado, nenhum aviso é exibido ao tentar gravar o codeplug (gravar, clonar ou FLASHport) ou serão exibidos canais programados que não funcionarão no rádio.

10.2.11.1

VHF usado no codeplug

Esta caixa de seleção permite a entrada de frequências da banda de frequência VHF no codeplug, independentemente dos recursos do rádio.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

INFORMAÇÕES:

Ativar esse campo e programar frequências de VHF no rádio não vai permitir que o rádio opere dentro de uma faixa de frequência de VHF. O rádio deve ter o hardware exigido e dar suporte ao FLASHcode para ser compatível com essa banda.

OBSERVAÇÃO:

Se a banda de frequência já tiver sido comprada para o rádio como representada no FLASHcode, esse campo estará ativado e não será editável.

Acessado apenas: quando o campo Permitir frequências inválidas estiver **Ativado** e o rádio for compatível com o modelo/opção.

10.2.11.2

UHF1 usado no codeplug

Esta caixa de seleção permite a você inserir frequências com base na banda de frequência UHF 1 para o codeplug, independentemente dos recursos do rádio.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

INFORMAÇÕES:

Ativar esse campo e programar frequências de UHF1 no rádio não vai permitir que o rádio opere dentro de uma faixa de frequência de UHF1. O rádio deve ter o hardware exigido e dar suporte ao FLASHcode para ser compatível com essa banda.

OBSERVAÇÃO:

Se a banda de frequência já tiver sido comprada para o rádio como representada no FLASHcode, esse campo estará ativado e não será editável.

Acessado apenas: quando o campo Permitir frequências inválidas estiver **Ativado** e o rádio for compatível com o modelo/opção.

10.2.11.3

UHF2 usado no codeplug

Esta caixa de seleção permite a entrada de frequências da banda de frequência UHF2 para o codeplug, independentemente dos recursos do rádio.

**AVISO:**

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

**INFORMAÇÕES:**

Ativar esse campo e programar frequências de UHF2 no rádio não vai permitir que o rádio opere dentro de uma faixa de frequência de UHF2. O rádio deve ter o hardware exigido e dar suporte ao FLASHcode para ser compatível com essa banda.

**OBSERVAÇÃO:**

Se a banda de frequência já tiver sido comprada para o rádio como representada no FLASHcode, esse campo estará ativado e não será editável.

Acessado apenas: quando o campo Permitir frequências inválidas estiver **Ativado** e o rádio for compatível com o modelo/opção.

10.2.11.4

700 MHz usados no codeplug

Esta caixa de seleção permite a entrada de frequências da banda de frequência de 700 MHz para o codeplug, independentemente dos recursos do rádio.

**INFORMAÇÕES:**

Ativar esse campo e programar frequências de 700 MHz no rádio não permitirão que o rádio opere dentro da faixa de frequência de 700 MHz. O rádio deve ter o hardware exigido e dar suporte ao FLASHcode para ser compatível com essa banda.

**OBSERVAÇÃO:**

Atualmente, há somente uma opção H QA00569 disponível para 7/800 MHz. Portanto, você deve ativar ou desativar 700 MHz e 800 MHz usados no codeplug ao mesmo tempo.

Se a banda de frequência já tiver sido comprada para o rádio como representada no FLASHcode, esse campo estará ativado e não será editável.

Acessado apenas: quando o campo Permitir frequências inválidas estiver **Ativado** e o rádio for compatível com o modelo/opção.

10.2.11.5

800 MHz usados no codeplug

Esta caixa de seleção permite a entrada de frequências da banda de frequência de 800 MHz para o codeplug, independentemente dos recursos do rádio.

**INFORMAÇÕES:**

Ativar esse campo e programar frequências de 800 MHz no rádio não vai permitir que o rádio opere dentro de uma faixa de frequência de 800 MHz. O rádio deve ter o hardware exigido e dar suporte ao FLASHcode para ser compatível com essa banda.

**OBSERVAÇÃO:**

Atualmente, há somente uma opção H QA00569 disponível para 7/800 MHz. Portanto, você deve ativar ou desativar 700 MHz e 800 MHz usados no codeplug ao mesmo tempo.

Se a banda de frequência já tiver sido comprada para o rádio como representada no FLASHcode, esse campo estará ativado e não será editável.

Acessado apenas: quando o campo Permitir frequências inválidas estiver **Ativado** e o rádio for compatível com o modelo/opção.

10.2.11.6

Faixa de 700 MHz estendida

Esta caixa de seleção permite inserir frequências da banda de frequência de 762 – 763 MHz e 792 – 793 MHz no codeplug, independentemente dos recursos do rádio.

OBSERVAÇÃO:

Atualmente, há uma opção PCI QA07468 disponível para faixa de 700 MHz estendida.

Se a banda de frequência já tiver sido comprada para o rádio como representada no FLASHcode, esse campo estará ativado e não será editável.

10.2.12

Segurança pública tática

Essa seção permite visualizar ou modificar os parâmetros da TPS (Tactical Public Safety, segurança pública tática).

OBSERVAÇÃO:

As configurações de TPS são então definidas em cada Personalidade convencional individualmente. Consulte a Personalidade convencional, nos campos Tipo de sinalização de incidente e Ativação da IU de segurança pública tática.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.2.12.1

Tom de Término de Transmissão de Voz

Esse campo permite que o rádio emita um tom de alerta no término de uma transmissão de voz.

Esse tom é emitido depois de soltar o botão PTT para ambos os modos convencionais analógico e digital (consulte o campo Tipo de sinal/voz de transmissão), independentemente de qualquer seleção de Tipo de sinalização de incidente, inclusive "Desabilitado". Essa função se aplica a todos os rádios.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.2.12.2

Indicador sonoro de emergência

Este campo permite gerar tons de alerta de emergência durante uma transmissão no modo de emergência e permite selecionar o tempo entre esses tons repetidos exclusivos.

Estes tons de alerta são reproduzidos no alto-falante do rádio para fornecer um mecanismo de busca e resgate audível que continua até que você cancele a emergência: consulte também Roteamento do indicador sonoro de emergência. Essa seleção se aplica a todos os rádios. O tempo é medido em segundos.

INFORMAÇÕES:

Para rádios Móveis, o Indicador de Emergência soa no nível de volume atual do rádio.

Para Rádios portáteis, o Indicador de Emergência soa na configuração de nível máximo de volume do rádio.

Aplica-se apenas:

- Quando o rádio estiver operando em Modo de emergência e apenas quando estiver operando em uma Personalidade convencional em que o campo Ativação da UI de segurança pública tática estiver ativado.
- (Somente para Rádios móveis) Quando a Função Estendida "Sinal de Emergência Audível" é exibida no campo Nome do Recurso Estendido.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

O Sinal de Emergência Audível será desabilitada quando estiver definido para **0 -Desativado** (padrão).

Acima 30: Alcance

Mínimo	Máximo	Incrementos
1 (segundos)	255 (segundos)	1 segundo

10.2.12.3

Roteamento do Indicador Sonoro de Emergência

Esse campo seleciona o roteamento dos tons de alerta do "Indicador sonoro de emergência" e do áudio recebido para um alto-falante específico quando uma transmissão de modo de Emergência está ativa.

Essa seleção se aplica a todos os rádios.

Aplica-se apenas: Quando o rádio estiver operando em Modo de emergência e apenas quando estiver operando em uma Personalidade convencional em que o campo Ativação da UI de segurança pública táctica estiver ativado.

Acessado apenas:

- Quando o Recurso Estendido "Roteamento do Indicador Sonoro de Emergência" aparece no campo Nome do Recurso Estendido.
- Quando o campo [Indicador sonoro de emergência na página 129](#) não estiver definido como **Desabilitado**.
- Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Alto-falante externo

Os tons de alerta Indicador de Emergência são direcionados para um Alto-falante Externo (se conectado, senão o Alto-falante Interno é usado)

Somente Alto-falante Interno

Os tons de alerta Indicador de Emergência são reproduzidos apenas no Alto-falante Interno (independentemente da disponibilidade do Alto-falante Externo).

10.2.12.4

Taxa de Novas Tentativas de Alarme de Emergência

Este campo seleciona quanto tempo o rádio deve esperar entre as transmissões de novas tentativas do alarme de emergência. Essa seleção se aplica a todos os rádios.

OBSERVAÇÃO:

Depois de entrar no modo de emergência em uma personalidade convencional, este tempo de espera se aplica às novas tentativas de emergência polida e não polida definidas no perfil de emergência convencional mencionado do sistema convencional mencionado da personalidade.

As tentativas do alarme de emergência continuam até que a confirmação (Conf.) de uma transmissão de emergência bem-sucedida seja recebida de volta no rádio ou até que o número de tentativas de emergência polida e não polida tenha se esgotado.

Aplica-se apenas: Quando o rádio estiver operando em Modo de emergência e apenas quando estiver operando em uma Personalidade convencional em que o campo Ativação da UI de segurança pública táctica estiver ativado.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

A Taxa de Tentativas do Alarme de Emergência será desabilitada quando estiver definida para **4 -Desativado** (padrão).

Acima 31: Alcance

Mínimo	Máximo	Incrementos
5 (segundos)	64 (segundos)	1 segundo

10.2.12.5

Campainha Lateral de Desligamento de Chamada de Emergência

Esse campo permite que o rádio emita um único tom de alerta para lembrá-lo que o modo Emergência ainda está ativo.

Esse tom de alerta é emitido quando você solta o botão PTT de uma transmissão de chamada de emergência.

INFORMAÇÕES:

Para rádios Móveis, a Campainha Lateral de Emergência soa no nível de volume atual do rádio.

Para rádios portáteis, esses sons de Tons Laterais de Emergência soam na configuração Volume Máximo do rádio (consulte também Desvio de Volume (dB)).

Aplica-se apenas: Quando o rádio estiver operando em Modo de emergência e apenas quando estiver operando em uma Personalidade convencional em que o campo Ativação da UI de segurança pública táctica estiver ativado.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.2.12.6

Transmissão PTT de TPS

Esse campo seleciona quando um pacote de TPS (Tactical Public Safety, segurança pública táctica) é transmitido em relação a uma transmissão de voz não emergencial.

Essa função se aplica a todos os rádios nos canais habilitados para TPS.

Aplica-se apenas: Quando o rádio estiver operando em uma Personalidade convencional cujo campo Tipo de sinalização de incidente esteja definido como **Segurança pública táctica**.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Nenhum

Nenhum pacote de TPS é transmitido.

Frente principal

O pacote de TPS é transmitido depois que o botão PTT é pressionado e antes de qualquer transmissão de chamada voz.

Extremidade traseira

O pacote de TPS é transmitido logo após soltar o botão PTT.

Ambos

O pacote de TPS é transmitido depois que o botão PTT é pressionado e antes de qualquer transmissão de chamada voz e, novamente, logo após soltar o botão PTT.

10.2.12.7

Transmissão PTT de emergência de TPS

Este campo seleciona quando um pacote de TPS (Segurança pública tática) é transmitido em relação à transmissão de uma "chamada" de emergência (voz) (consulte também Tipo de emergência).

Esse recurso se aplica em todos os rádios a transmissões de "chamadas" de emergência (voz) em canais habilitados para TPS.

Aplica-se apenas: Quando o rádio está operando em modo de emergência e apenas quando está operando em uma personalidade convencional, onde o campo Tipo de sinalização de incidente está definido como **Segurança pública tática**.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Nenhum

Nenhum pacote de TPS é transmitido.

Frente principal

O pacote de TPS é transmitido depois que o botão PTT é pressionado e antes de qualquer transmissão de chamada de emergência (voz).

Extremidade traseira

O pacote de TPS é transmitido logo após soltar o botão PTT em qualquer transmissão de chamada de emergência (voz).

Ambos

O pacote de TPS é transmitido depois que o botão PTT é pressionado e antes de qualquer transmissão de chamada de emergência (voz) e novamente logo após soltar o botão PTT.

10.2.13

Responsabilidade pela equipe

A seção **Responsabilidade pela equipe** de **Todos os rádios** permite que o usuário visualize ou modifique os parâmetros de responsabilidade pela equipe.

OBSERVAÇÃO:

Ao operar no modo direto/talkaround e próximo a outros rádios, recomenda-se configurar o preâmbulo adicional de 160 para o Sistema ASTRO configurado com os canais habilitados para Responsabilidade pela equipe.

10.2.13.1

Temporizador de Atualização Periódica

Esse campo seleciona a quantidade de tempo que determina a frequência (em minutos) com que o rádio envia um pacote de PA (Personnel Accountability, responsabilidade pela equipe) não solicitado e sem necessidade de confirmação para o ICT (Incident Command Terminal, terminal de comando de incidente).

Isso se aplica depois que um registro de PA bem-sucedido já tiver ocorrido. Se a tentativa de registro de PA tiver falhado, esse temporizador é então utilizado para determinar a frequência (em minutos) com que o rádio tentará fazer o registro de PA novamente. Essa função se aplica a todos os rádios nos canais habilitados para Responsabilidade pela equipe.

Aplica-se apenas: Quando o rádio estiver operando em uma Personalidade Convencional em que o campo Tipo de Sinalização de Incidente está definido como **Responsabilidade de Equipe** e o campo Registro de Responsabilidade de Equipe está habilitado.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

O Contador de Atualização Periódica é desabilitado quando definido como **0 -Desativado** (padrão). O rádio não envia pacotes de Responsabilidade de Equipe (PA) não solicitados ou sem necessidade de confirmação, nem tenta fazer o registro do PA novamente.

Acima 32: Alcance

Mínimo	Máximo	Incrementos
1 minuto	20 minutos	1 minuto

10.2.13.2

Responder a Chamadas

Esse campo permite ao rádio enviar de volta uma resposta logo após receber uma sondagem de Responsabilidade pela equipe.

A sondagem de Responsabilidade pela equipe é iniciada pelo CI (Incident Commander, comandante de incidente) e é usada para consultar rádios e confirmar sua capacidade de comunicação. Essa função se aplica a todos os rádios nos canais habilitados para Responsabilidade pela equipe.

Aplica-se apenas: Quando o rádio estiver operando em uma Personalidade convencional em que o campo Tipo de sinalização de incidente estiver definido como **Responsabilidade pela equipe**.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.2.13.3

Reconhecimento de evacuação

Esse campo seleciona as formas como o rádio responde às mensagens de evacuação de Responsabilidade pela equipe.

As mensagens de Evacuação de responsabilidade pela equipe são enviadas pelo CI (Incident Commander, comandante de incidente). Essa função se aplica a todos os rádios nos canais habilitados para Responsabilidade pela equipe.

Aplica-se apenas: Quando o rádio estiver operando em uma Personalidade convencional em que o campo Tipo de sinalização de incidente estiver definido como **Responsabilidade pela equipe**.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Desabilitado

O rádio não responde a uma mensagem de evacuação.

Manual

O rádio responde a uma mensagem de evacuação com a sua intervenção por meio do pressionamento do botão PTT.

10.2.13.4

Transmissão PTT de Responsabilidade de Equipe

Este campo seleciona quando um pacote de responsabilidade de equipe (PA) não confirmado (nenhuma confirmação esperada) é transmitido em relação à transmissão de uma chamada de voz que não é de emergência.

Essa função se aplica a todos os rádios nos canais habilitados para Responsabilidade pela equipe.

Aplica-se apenas: Quando o rádio estiver operando em uma Personalidade convencional em que o campo Tipo de sinalização de incidente estiver definido como **Responsabilidade pela equipe**.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Nenhum

Nenhum pacote de PA é transmitido.

Frente principal

O pacote de PA é transmitido depois que o botão PTT é pressionado e antes de qualquer transmissão de chamada de voz que não é de emergência.

Extremidade traseira

O pacote de PA é transmitido logo após soltar o botão PTT.

Ambos

O pacote de PA é transmitido depois que o botão PTT é pressionado e antes de qualquer transmissão de chamada de voz que não é de emergência e novamente logo após soltar o botão PTT.

10.2.13.5

Transmissão PTT de emergência de responsabilidade pela equipe

Este campo seleciona quando um pacote de responsabilidade de equipe (PA) não confirmado (nenhuma confirmação esperada) é transmitido em relação a uma emergência.

Este recurso se aplica a todos os rádios para transmissões de Chamadas de emergência em canais habilitados para responsabilidade de equipe.

Aplica-se apenas: Quando o rádio está operando em modo de emergência e somente quando está operando em uma personalidade convencional, onde o campo Tipo de sinalização de incidente está definido como **Responsabilidade de equipe**.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Nenhum

Nenhum pacote de PA é transmitido.

Frente principal

O pacote de PA é transmitido depois que o botão PTT é pressionado e antes de qualquer transmissão de chamada de emergência.

Extremidade traseira

O pacote de PA é transmitido logo após soltar o botão PTT.

Ambos

O pacote de PA é transmitido depois que o botão PTT é pressionado e antes de qualquer transmissão de chamada de emergência e novamente logo após soltar o botão PTT.

10.2.13.6

Confirmar Alertas no PTT

Este campo permite configurar o botão PTT para confirmar os alertas de fireground.

Quando ativado, o PTT, botão lateral superior (roxo) no rádio portátil ou acessórios e o botão programável de 1 ponto no RSM podem ser usados para confirmar esses alertas.

Há 16 alertas programáveis que podem ser enviados a partir do cliente e recebidos pelos rádios. Os alertas incluem tom, luz de fundo, vibração, notificação de voz, texto, LED, etc.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.2.14

Bluetooth

Essa seção permite visualizar ou modificar as configurações relacionadas à tecnologia Bluetooth.

INFORMAÇÕES:

Consulte o Guia do Usuário do rádio para ver a lista de dispositivos COTS aprovados e novos perfis compatíveis.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.2.14.1

Ativação de Bluetooth

Esse campo permite ativar o recurso de Bluetooth no rádio.

A Ativação de Bluetooth permite que o rádio seja emparelhado e se comunique com um acessório compatível com Bluetooth, como um fone de ouvido. Essa função se aplica a todos os rádios.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.2.14.2

Tons de Bluetooth

Esse campo permite habilitar os tons do Bluetooth.

Essa função se aplica a todos os rádios.

Acessado apenas: Quando o campo [Ativação de Bluetooth na página 135](#) está **Ativado** e o rádio está habilitado para o modelo/para a opção.

10.2.14.3

Nome Amigável Editável do Bluetooth

Esse campo permite editar o conteúdo do campo Nome amigável do Bluetooth por meio do menu ou teclado do rádio.

Essa função se aplica a todos os rádios.

Acessado apenas: Quando o campo [Ativação de Bluetooth na página 135](#) está **Ativado** e o rádio está habilitado para o modelo/para a opção.

10.2.14.4

LED Bluetooth do microfone com alto-falante remoto

O LED de Bluetooth do RSM (Remote Speaker Microphone, microfone com alto-falante remoto) acende quando há conectividade Bluetooth do rádio.

10.2.14.5

Emparelhamento de PIN Bluetooth legado

Este campo permite que você ative o emparelhamento de PIN do Bluetooth legado.

Você pode emparelhar o rádio com um acessório habilitado para a especificação principal do Bluetooth 2.0 e anteriores.

Essa função se aplica a todos os rádios.

10.2.15

Sensor

Esta seção permite visualizar ou definir as funcionalidades do Sensor.

10.2.15.1

Tempo de Desativação de Eventos do Sensor

Esse campo permite que você especifique o tempo de espera necessário para que um evento ocorra enquanto estiver no modo de desativação temporária.

Se o evento não ocorrer, a desativação temporária será cancelada. O valor padrão é 30.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 33: Alcance

Mínimo	Máximo	Incrementos
5 segundos	300 segundos	5 segundos

10.2.15.2

Ativação de notificações de eventos do sensor

Esse campo permite habilitar a notificação local se houver qualquer evento de contexto dos dispositivos sensores conectados.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.2.16

Divisão da frequência de recepção

Este campo exibe a frequência inicial e final da Divisão de frequência de Recepção. Cada linha é aplicável à banda de frequência especificada.

Esses valores são fixos para o modelo de rádio em todos os rádios.

10.2.17

Divisão da frequência da transmissão

Este campo exibe a frequência inicial e final da Divisão de frequência de transmissão. Cada linha é aplicável à banda de frequência especificada.

Esses valores são fixos para o modelo de rádio em todos os rádios.

10.3

Substituições de Fábrica

As **Substituições de fábrica** são usadas para inserir informações de substituição de fábrica para certos algoritmos de sinal de rádio em todos os rádios.

AVISO:

As substituições de fábrica não devem ser inseridas, a menos que seja considerado necessário. Os procedimentos para inserir informações de substituição de fábrica só devem ser executados por pessoal qualificado para o serviço. A não execução adequada dos procedimentos pode comprometer seriamente o desempenho do rádio e/ou sistema.

10.3.1

Geral

Esta seção permite inserir informações de substituição de fábrica.

10.3.1.1

Ativação de substituições de fábrica

Esse campo permite inserir informações de substituição de fábrica nas listas Substituições de fábrica.

Essa seleção se aplica a todos os rádios. Quando desativadas, todas as configurações de Substituições de Fábrica são descartadas.

AVISO:

Este campo não deve ser ativado, a menos que seja considerado necessário. A inserção de informações de substituição de fábrica no menu Substituições de fábrica deve ser realizada apenas por uma equipe de serviço qualificada. A não execução adequada dos procedimentos pode comprometer seriamente o desempenho do rádio e/ou sistema.

Acessado apenas: esta é uma configuração avançada disponível apenas na Visualização avançada.

10.3.2

Lista de taxa de relógio SSI de transmissão

Essa seção permite inserir frequências de transmissão e seus respectivos valores de divisor de referência para frequências nas quais ocorre um fenômeno de diafonia.

A diafonia ocorre quando um sinal transmitido em um canal cria um efeito indesejado em outro canal. Esses campos se aplicam a todos os rádios.

AVISO:

As substituições de fábrica não devem ser inseridas, a menos que seja considerado necessário. Os procedimentos para inserir informações de substituição de fábrica só devem ser executados por pessoal qualificado para o serviço. A não execução adequada dos procedimentos pode comprometer seriamente o desempenho do rádio e/ou sistema.

10.3.2.1

Frequência de transmissão

Esse campo permite inserir uma frequência de transmissão (Tx) (em MHz) para o respectivo valor de Frequência do relógio SSI de transmissão em que um fenômeno de diafonia ocorre.

Essa seleção se aplica ao registro/linha atual, que se aplica a todos os rádios.

**AVISO:**

Este campo não deve ser ativado, a menos que seja considerado necessário. A inserção de informações de substituição de fábrica no menu Substituições de fábrica deve ser realizada apenas por uma equipe de serviço qualificada. A não execução adequada dos procedimentos pode comprometer seriamente o desempenho do rádio e/ou sistema.

Tamanho de etapa de 6.25 kHz para a faixa de frequência de 800 MHz:

Para atender à conformidade regulamentar de alguns países (não FCC), a partir da versão R09.01.00, o aplicativo permite um degrau de 6,25 kHz de frequências convencionais na banda de frequência de 800 MHz. No entanto, dois rádios que operam em canais adjacentes separados por apenas 6,25 kHz podem experimentar um indesejável fenômeno de diafonia.

**INFORMAÇÕES:**

Frequências duplicadas não são permitidas. Portanto, ao selecionar uma frequência, se ela já tiver sido inserida na lista, ela não será mais uma opção válida para o campo atual.

Consulte as folhas de catálogo/páginas de preço da Motorola Solutions ou o manual para obter as frequências válidas para o modelo atual.

Para obter o desempenho ideal, as frequências deverão ser inseridas em ordem crescente.

Acessado apenas: Quando o campo [Ativação de substituições de fábrica na página 137](#) está **Ativado** e o rádio está habilitado para o modelo/para a opção. Esta é uma configuração avançada disponível apenas no Expert View (consulte Visão do codeplug).

10.3.2.2

Taxa de Relógio SSI de Transmissão

Esse campo seleciona a Frequência de relógio SSI do sintetizador de transmissão (Tx) (em MHz) para a respectiva frequência de transmissão em que o fenômeno de diafonia ocorre.

Essa seleção se aplica ao registro/linha atual, que se aplica a todos os rádios.

**AVISO:**

Este campo não deve ser ativado, a menos que seja considerado necessário. A inserção de informações de substituição de fábrica no menu Substituições de fábrica deve ser realizada apenas por uma equipe de serviço qualificada. A não execução adequada dos procedimentos pode comprometer seriamente o desempenho do rádio e/ou sistema.

Acessado apenas: Quando o campo [Ativação de substituições de fábrica na página 137](#) está **Ativado** e o rádio está habilitado para o modelo/para a opção. Esta é uma configuração avançada disponível apenas no Expert View (consulte Visão do codeplug).

As seleções a seguir são compatíveis:

- 2,40 MHz
- 3,36 MHz
- 8,40 MHz
- 1,92 MHz

10.3.3

Lista da Frequência do Relógio SSI de Recepção

Essa seção permite inserir frequências de transmissão e seus respectivos valores de divisor de referência para frequências nas quais ocorre um fenômeno de diafonia.

A diafonia ocorre quando um sinal transmitido em um canal cria um efeito indesejado em outro canal. Esses campos se aplicam a todos os rádios.

AVISO:

As substituições de fábrica não devem ser inseridas, a menos que seja considerado necessário. Os procedimentos para inserir informações de substituição de fábrica só devem ser executados por pessoal qualificado para o serviço. A não execução adequada dos procedimentos pode comprometer seriamente o desempenho do rádio e/ou sistema.

10.3.3.1

Frequência de Rx

Esse campo permite inserir uma frequência de recepção (Rx) (em MHz) para o respectivo valor de Frequência do relógio SSI de recepção em que um fenômeno de diafonia ocorre.

Essa seleção se aplica ao registro ou à linha atual que se aplica a todos os rádios.

AVISO:

Este campo não deve ser ativado, a menos que seja considerado necessário. A inserção de informações de substituição de fábrica no menu Substituições de fábrica deve ser realizada apenas por uma equipe de serviço qualificada. A não execução adequada dos procedimentos pode comprometer seriamente o desempenho do rádio e/ou sistema.

A partir da versão R09.01.00, o degrau de 6,25 kHz de frequências convencionais na banda de frequência de 800 MHz pode atender à conformidade regulamentar em determinados países (não FCC). Dois rádios que operam em canais adjacentes separados por 6,25 kHz podem experimentar somente fenômenos indesejáveis de diafonia.

INFORMAÇÕES:

Frequências duplicadas não são permitidas. Portanto, ao selecionar uma frequência, se ela já tiver sido inserida na lista, ela não será mais uma opção válida para o campo atual.

Consulte as folhas de catálogo/páginas de preço da Motorola Solutions ou o manual para obter as frequências válidas para o modelo atual.

Para obter o desempenho ideal, as frequências deverão ser inseridas em ordem crescente.

Acessado apenas quando o campo [Ativação de substituições de fábrica na página 137](#) estiver **Habilitado** e quando o rádio estiver habilitado para o modelo/a opção.

10.3.3.2

Frequência do Relógio das SSI de Recepção

Esse campo seleciona a Frequência do relógio SSI do sintetizador de recepção (Rx) (em MHz) para a respectiva frequência de recepção em que o fenômeno de diafonia ocorre.

Essa seleção se aplica ao registro/linha atual, que se aplica a todos os rádios.

AVISO:

Este campo não deve ser ativado, a menos que seja considerado necessário. A inserção de informações de substituição de fábrica no menu Substituições de fábrica deve ser realizada apenas por uma equipe de serviço qualificada. A não execução adequada dos procedimentos pode comprometer seriamente o desempenho do rádio e/ou sistema.

Acessar apenas: Quando o campo [Ativação de substituições de fábrica na página 137](#) está ativado e o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

- 1,2 MHz
- 1,5 MHz
- 1,8 MHz

- 6,4 MHz
- 9,6 MHz

10.3.4

Lista de taxa de relógio SSI de Rx: Modo de Tx

Essa seção permite inserir frequências de transmissão e seus respectivos valores de divisor de referência para frequências nas quais ocorre um fenômeno de diafonia.

A diafonia ocorre quando um sinal transmitido em um canal cria um efeito indesejado em outro canal. Esses campos se aplicam a todos os rádios.

**AVISO:**

As substituições de fábrica não devem ser inseridas, a menos que seja considerado necessário. Os procedimentos para inserir informações de substituição de fábrica só devem ser executados por pessoal qualificado para o serviço. A não execução adequada dos procedimentos pode comprometer seriamente o desempenho do rádio e/ou sistema.

10.3.4.1

Frequência de transmissão

Esse campo permite inserir uma frequência de transmissão (Tx) (em MHz) para o respectivo valor de Frequência do relógio SSI de transmissão em que um fenômeno de diafonia ocorre.

Essa seleção se aplica ao registro/linha atual, que se aplica a todos os rádios.

**AVISO:**

Este campo não deve ser ativado, a menos que seja considerado necessário. A inserção de informações de substituição de fábrica no menu Substituições de fábrica deve ser realizada apenas por uma equipe de serviço qualificada. A não execução adequada dos procedimentos pode comprometer seriamente o desempenho do rádio e/ou sistema.

A partir da versão R09.01.00, o degrau de 6,25 kHz de frequências convencionais na banda de frequência de 800 MHz pode atender à conformidade regulamentar em determinados países (não FCC). Dois rádios que operam em canais adjacentes separados por 6,25 kHz podem experimentar somente fenômenos indesejáveis de diafonia.

**INFORMAÇÕES:**

Frequências duplicadas não são permitidas. Portanto, ao selecionar uma frequência, se ela já tiver sido inserida na lista, ela não será mais uma opção válida para o campo atual.

Consulte as folhas de catálogo/páginas de preço da Motorola Solutions ou o manual para obter as frequências válidas para o modelo atual.

Para obter o desempenho ideal, as frequências deverão ser inseridas em ordem crescente.

Acessado apenas: Quando o campo [Ativação de substituições de fábrica na página 137](#) está **Ativado** e o rádio está habilitado para o modelo/para a opção. Esta é uma configuração avançada disponível apenas no Expert View (consulte Visão do codeplug).

10.3.4.2

Frequência do Relógio das SSI de Recepção

Esse campo seleciona a Frequência do relógio SSI do sintetizador de recepção (Rx) (em MHz) para a respectiva frequência de recepção em que o fenômeno de diafonia ocorre.

Essa seleção se aplica ao registro/linha atual, que se aplica a todos os rádios.

AVISO:

Este campo não deve ser ativado, a menos que seja considerado necessário. A inserção de informações de substituição de fábrica no menu Substituições de fábrica deve ser realizada apenas por uma equipe de serviço qualificada. A não execução adequada dos procedimentos pode comprometer seriamente o desempenho do rádio e/ou sistema.

Acessado apenas: Quando o campo [Ativação de substituições de fábrica na página 137](#) estiver **Ativado**, quando o rádio está habilitado para o modelo/a opção e quando o rádio está habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

- 6,4 MHz
- 9,6 MHz

10.3.5

Segunda lista de frequência de injeção de LO

Essa seção permite visualizar ou modificar frequências de Rx (recepção) individuais para as quais a segunda frequência de injeção de LO oposta será usada em vez da padrão.

Essa função se aplica a todos os rádios.

AVISO:

As substituições de fábrica não devem ser inseridas, a menos que seja considerado necessário. Os procedimentos para inserir informações de substituição de fábrica só devem ser executados por pessoal qualificado para o serviço. A não execução adequada dos procedimentos pode comprometer seriamente o desempenho do rádio e/ou sistema.

10.3.5.1

Segunda frequência de injeção de LO

Esse campo permite inserir uma frequência de recepção (Rx) individual (em MHz) para a qual a Segunda frequência de injeção de LO oposta será usada em vez da padrão.

Essa seleção se aplica ao registro/linha atual, que se aplica a todos os rádios.

AVISO:

Este campo não deve ser ativado, a menos que seja considerado necessário. A inserção de informações de substituição de fábrica no menu Substituições de fábrica deve ser realizada apenas por uma equipe de serviço qualificada. A não execução adequada dos procedimentos pode comprometer seriamente o desempenho do rádio e/ou sistema.

A partir da versão R09.01.00, o degrau de 6,25 kHz de frequências convencionais na banda de frequência de 800 MHz pode atender à conformidade regulamentar em determinados países (não FCC). Dois rádios que operam em canais adjacentes separados por 6,25 kHz podem experimentar somente fenômenos indesejáveis de diafonia.

Acessado apenas: Quando o campo [Ativação de substituições de fábrica na página 137](#) está **Ativado** e o rádio está habilitado para o modelo/para a opção.

10.3.6

Lista de rejeição fora de banda

A rejeição fora de banda especifica um valor de rejeição centralizado em torno de dB. É definido em relação à eficiência máxima de um filtro.

10.3.6.1

Frequência da recepção (MHz)

Permite que o usuário insira uma frequência de Rx (Receive, recepção) (em MHz) na qual ocorre um fenômeno de diafonia para o respectivo valor de frequência da Lista de rejeição fora de banda.

Essa seleção se aplica ao registro ou à linha atual que se aplica a todos os rádios.

AVISO:

Este campo não deve ser ativado, a menos que seja considerado necessário. A inserção de informações de substituição de fábrica no menu Substituições de fábrica deve ser realizada apenas por uma equipe de serviço qualificada. A não execução adequada dos procedimentos pode comprometer seriamente o desempenho do rádio e/ou sistema.

Tamanho de etapa de 6.25 kHz para a faixa de frequência de 800 MHz:

Ao iniciar com a versão R09.01.00, o RadioCentral permite um tamanho de etapa de 6,25 kHz para frequências convencionais na banda de frequência de 800 MHz com o intuito de atender à conformidade regulamentar em alguns países (não FCC). No entanto, dois rádios operando em canais adjacentes separados por apenas 6,25 kHz podem sofrer um indesejável fenômeno de diafonia.

INFORMAÇÕES:

Frequências duplicadas não são permitidas. Portanto, ao selecionar uma frequência, se ela já tiver sido inserida na lista, ela não será mais uma opção válida para o campo atual.

Consulte as folhas de catálogo/páginas de preço da Motorola Solutions ou o manual para obter as frequências válidas para o modelo atual.

Para obter o desempenho ideal, as frequências deverão ser inseridas em ordem crescente.

Acessado apenas quando o campo [Ativação de substituições de fábrica na página 137](#) estiver **Habilitado** e quando o rádio estiver habilitado para o modelo/a opção.

10.4

Ergonomia do rádio

Esta seção permite que você visualize ou defina a funcionalidade de todo o rádio que se aplica aos modos de comunicação convencional e troncalizado.

10.4.1

Modo inicial

Esta seção permite selecionar uma zona e um canal específicos que são considerados o modo inicial do rádio.

Modo é outro nome de uma determinada zona e canal. As zonas e os canais devem ser definidos primeiro na janela Atribuição de Zonas e Canais. Então, essa função se aplica a todos os rádios.

OBSERVAÇÃO:

Você pode acessar esse modo inicial programado pressionando por um período mais longo a tecla do botão Início do rádio. Um pressionamento curto de tecla do botão Início do rádio também pode fazer a verificação de uma seleção de rádio atual quando se utiliza recursos como mudar de canal, alterar as zonas ou selecionar os membros/canais prioritários para obter uma lista de varredura.

10.4.1.1

Seleção do modo inicial

Este campo ativa o recurso Modo inicial, permitindo que o rádio salte facilmente para a zona e o canal de modo inicial programados.

Modo é outro nome de uma determinada zona e canal. Essa seleção se aplica a todos os rádios.

OBSERVAÇÃO:

Você pode então acessar facilmente este modo inicial programado pressionando a tecla do botão Início do rádio por um período mais longo. Um pressionamento curto de tecla do botão Início do rádio também pode fazer a verificação de uma seleção de rádio atual quando se utiliza recursos como mudar de canal, alterar as zonas ou selecionar os membros/canais prioritários para obter uma lista de varredura.

Se o rádio for dos modelos mais recentes dos padrões de serviço de incêndio, o modo Inicial é marcado e esmaecido por padrão. A **Zona e o canal** do modo Inicial devem ser definidos para um canal vinculado a uma personalidade do modo de zona de perigo (o campo Personalidade do modo de zona de perigo é marcado).

O modelo mais recente de rádio dos padrões de serviço de incêndio é ligado ao canal do modo de zona de perigo. A **Zona e o canal** do modo Inicial serão selecionados se o canal anterior não for um canal do modo de zona de perigo.

Acessado apenas: Quando o rádio é compatível com o modelo ou opção.

10.4.1.2

Zona do modo inicial

Este campo permite selecionar a zona do modo inicial para o rádio.

Quando a Zona está selecionada, então o Canal de modo inicial pode ser selecionado. Modo é outro nome de uma determinada zona e canal. Essa seleção se aplica a todos os rádios.

OBSERVAÇÃO:

Você pode então acessar facilmente este modo inicial programado pressionando a tecla do botão Início do rádio por um período mais longo. Um pressionamento curto de tecla do botão Início do rádio também pode fazer a verificação de uma seleção de rádio atual quando se utiliza recursos como mudar de canal, alterar as zonas ou selecionar os membros/canais prioritários para obter uma lista de varredura.

AVISO:

Zonas Dinâmicas são inválidas e não podem ser selecionadas (zonas que tenham Habilitar Zona Dinâmica habilitada).

As zonas de interface de site remoto (RSI) são inválidas e não podem ser selecionadas (zonas que têm o modo RSI ativado).

Acessado apenas: Quando o campo Seleção de modo inicial estiver ativado e quando o rádio estiver habilitado para o modelo/a opção.

10.4.1.3

Canal de modo inicial

Este campo seleciona um canal de modo inicial para o rádio.

A zona do modo inicial deve ser selecionada primeiro. Modo é outro nome de uma determinada zona e canal. Essa seleção se aplica a todos os rádios.

OBSERVAÇÃO:

Você pode então acessar facilmente este modo inicial programado pressionando a tecla do botão Início do rádio por um período mais longo. Um pressionamento curto de tecla do botão Início do rádio também pode fazer a verificação de uma seleção de rádio atual quando se utiliza recursos como mudar de canal, alterar as zonas ou selecionar os membros/canais prioritários para obter uma lista de varredura.

Acessado apenas: Quando o campo estiver [Seleção do modo inicial na página 142](#) habilitado, e quando o campo [Zona do modo inicial na página 143](#) não estiver definido como **Zona Dinâmica**, e quando o rádio estiver habilitado para o modelo/a opção.

10.4.2

Avançado

Esta seção permite visualizar ou definir várias funcionalidades que se aplicam a todos os rádios.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.4.2.1

Duração curta do pressionamento de teclas

Este campo seleciona o tempo que se deve manter pressionado um botão de rádio para que a ação seja reconhecida como um pressionamento curto de tecla pelo rádio.

O tempo é medido em milissegundos (ms). Essa seleção se aplica a todos os rádios.

INFORMAÇÕES:

A duração curta do pressionamento de tecla sempre deve ser um período menor do que a configuração do campo Duração longa do pressionamento de teclas.

As seleções a seguir são compatíveis:

Acima 34: Alcance

Mínimo	Máximo	Incrementos
0 (ms)	6200 (ms)	50 (ms)

10.4.2.2

Duração curta do pressionamento de teclas para emergência

Este campo seleciona o tempo que se deve pressionar e segurar o botão de Emergência antes que o rádio ative a operação do modo de emergência.

Pressionar o mesmo botão de Emergência por um período longo desativará o modo de emergência do rádio. O tempo é medido em milissegundos (ms). Essa função se aplica a todos os rádios.

OBSERVAÇÃO:

Essa duração curta do pressionamento de teclas deve ter sempre um período menor que o valor do campo Duração longa do pressionamento de teclas para emergência ou a Duração longa do pressionamento de teclas para emergência deve estar desativada (definida como **0**).

As seleções a seguir são compatíveis:

Acima 35: Alcance

Mínimo	Máximo	Incrementos
50 (ms)	6200 (ms)	50 (ms)

10.4.2.3

Duração longa do pressionamento de teclas

Este campo seleciona o tempo que se deve manter pressionado um botão programável antes que o rádio reconheça um pressionamento longo válido.

O botão programado Inicial do rádio é um exemplo de botão que funciona com o pressionamento longo de tecla. O tempo é medido em milissegundos (ms). Essa função se aplica a todos os rádios.

INFORMAÇÕES:

A duração do pressionamento de teclas longo sempre deve ser um período mais longo do que a configuração do campo [Duração curta do pressionamento de teclas na página 144](#).

As seleções a seguir são compatíveis:

Acima 36: Alcance

Mínimo	Máximo	Incrementos
250 (ms)	6350 (ms)	250 (ms)

10.4.2.4

Duração longa do pressionamento de teclas para emergência

Este campo seleciona o tempo que se deve pressionar e segurar um botão de Emergência antes que o rádio desative a operação do modo de emergência do rádio.

Pressionar o botão de Emergência brevemente ativará o modo de emergência do rádio. Essa função se aplica a todos os rádios. O tempo é medido em milissegundos (ms).

INFORMAÇÕES:

Quando não definido como **0**, essa duração longa do pressionamento de teclas deve ter um período maior do que o valor do campo Duração curta do pressionamento de teclas para emergência.

Selecionar **0** faz com que a saída do modo de emergência por meio de um pressionamento longo de tecla seja desativada. A saída do modo de emergência pode ainda ser acompanhada pelo desligamento do rádio.

As seleções a seguir são compatíveis:

Acima 37: Alcance

Mínimo	Máximo	Incrementos
0 (ms)	63750 (ms)	250 (ms)

10.4.2.5

Função de desligamento

Este campo seleciona um botão do rádio específico que deve ser pressionado (após o botão de energia ser colocado na posição "Desligado") para desligar o rádio.

Essa seleção se aplica a todos os rádios.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Desabilitado

Ao colocar o botão Liga/Desliga na posição "Desligar" o rádio é desligado.

Botão lateral 1

Para desligar o rádio, o botão lateral superior deve ser pressionado depois que o botão de energia é colocado na posição "Desligado". O Guia do usuário refere-se a ele como Botão superior lateral (seleção).

Botão lateral 2

Para desligar o rádio, o botão lateral do meio deve ser pressionado depois que o botão de energia é colocado na posição "Desligado". O Guia do usuário refere-se a ele como Botão lateral 1.

Botão lateral 3

Para desligar o rádio, o botão lateral inferior deve ser pressionado depois que o botão de energia é colocado na posição "Desligado". O Guia do usuário refere-se a ele como Botão lateral 2.

10.4.2.6

Último canal selecionado por ativação de zona

Este campo permite que o canal selecionado mais recentemente de cada zona apareça de modo automático no visor do rádio.

Ao percorrer as zonas do rádio, o último canal selecionado de cada zona é memorizado pelo rádio e fica imediatamente disponível para você. É possível selecionar qualquer outro canal desejado dentro de uma zona. Essa função se aplica de acordo com sua preferência.

Quando desativado, o rádio permanece no número de canal selecionado atualmente ao mudar para uma nova zona. Por exemplo: o rádio está no canal 14 da zona 3; se a zona mudar para a zona 15, o canal será canal 14 na zona 15. Observação: se a zona 15 não tiver um canal 14, **NÃO PROGRAMADO** aparecerá no display do rádio; o usuário deverá mudar para um canal disponível na nova zona.

OBSERVAÇÃO:

Quando essa função for ativada, os campos [Ativar nos últimos canal e zona selecionados na página 146](#) e [Canal de modo inicial na página 143](#) também se tornarão ativados e somente para visualização/não modificáveis.

10.4.2.7

Ativar nos últimos canal e zona selecionados

Quando esse campo está ativado, faz com que as posições atuais da chave de zona e canal do rádio sejam ignoradas durante a inicialização.

Esse campo também faz com que o rádio seja inicializado nas últimas posições selecionadas da chave de zona e canal do rádio pouco antes de o rádio ser desligado. Quando desativado, o rádio é ativado nas posições da chave de Zona e Canal do rádio selecionadas no momento. Essa função se aplica a todos os rádios.

AVISO:

A seleção de zona e a seleção de canal giratório/alternância de chave devem ser programadas.

Acessado apenas: Quando o último canal selecionado por ativação de zona estiver **Desativado** e quando o rádio estiver habilitado para o modelo/a opção.

OBSERVAÇÃO:

Quando Último canal selecionado por ativação de zona está **Ativado**, esse campo torna-se ativado e somente para visualização/não modificável.

10.4.2.8

Bloqueio de controle de volume com Acessório de

Este campo seleciona quais controles de volume podem definir o nível de volume do rádio quando um acessório é conectado ao rádio.

Essa função se aplica a todos os rádios.

Acessado apenas: quando o microfone estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Nenhum

Tanto os controles de volume com acessórios quanto do rádio podem selecionar o volume do rádio.

Bloquear somente rádio

Quando um acessório com controle de volume está ligado, o controle de volume do rádio se torna inoperável e o controle de volume do acessório seleciona o volume do rádio.

10.4.2.9

Bloqueio do controle de canal com acessório

Este campo permite que o "controle de canal" de um acessório de rádio substitua e bloqueie o controle de canal do rádio.

Essa função se aplica a todos os rádios.

OBSERVAÇÃO:

Esse campo não deverá ser ativado se o microfone RMN5067 estiver em uso, pois o microfone não tem botão de controle de canal.

Acessado apenas: quando o microfone está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Nenhum

Tanto os controles de canal com acessórios quanto do rádio podem selecionar os canais do rádio.

Bloquear somente rádio

Quando um acessório com controle de canal está ligado, o controle de canais de rádio se torna inoperável e o canal de controle com acessório seleciona os canais do rádio.

10.4.2.10

Mic. Ativo para PTT do rádio

Este campo seleciona o microfone ativo quando você pressiona o botão PTT.

Essa função se aplica a todos os rádios.

INFORMAÇÕES:

A configuração desse campo não é compatível com acessórios de terceiros. Qualquer alteração nas configurações deve ser feita por meio do desenvolvedor do acessório.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Mic. do rádio

O microfone interno do rádio será ativado.

Mic. RSM

O RSM (Remote Speaker Microphone, microfone com alto-falante remoto) ficará ativo.

O microfone interno do rádio fornecerá operação de contingência se um RSM não estiver disponível no pressionamento do botão PTT.

Quando o rádio estiver conectado a um VA (Vehicular Adapter, adaptador veicular) com um microfone conectado à sua MMP (Mobile Microphone Port, porta de microfone móvel), o microfone será ativado.

Mic. sem fio

O microfone sem fio será ativado.

O microfone interno do rádio fornecerá operação de contingência se um microfone sem fio não estiver disponível no pressionamento do botão PTT.

10.4.2.11

Microfone Ativo para PTT com RSM

Esse campo seleciona o microfone ativo quando você pressiona o botão PTT no RSM (Remote Speaker Microphone, microfone com alto-falante remoto).

Essa função se aplica a todos os rádios.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Mic. do rádio

O microfone interno do rádio será ativado.

Mic. RSM

O RSM será ativado.

O microfone interno do rádio fornecerá operação de contingência se um RSM não estiver disponível no pressionamento do botão PTT.

Quando o rádio estiver conectado a um VA (Vehicular Adapter, adaptador veicular) com um microfone conectado à sua MMP (Mobile Microphone Port, porta de microfone móvel), o microfone será ativado.

Mic. sem fio

O microfone sem fio será ativado.

O microfone interno do rádio fornecerá operação de contingência se um microfone sem fio não estiver disponível no pressionamento do botão PTT.

10.4.2.12

Ativar bloqueio da tela sensível ao toque

Esse campo permite habilitar a opção de desbloqueio e bloqueio da tela sensível ao toque.

10.4.2.13

Trava dos botões laterais e da grade do alto-falante ativada

Esse campo habilita o recurso de travamento dos botões lateral superior, lateral intermediário, lateral inferior e grade do alto-falante do rádio.

OBSERVAÇÃO:

Os botões programados com os recursos ViQi Voice Control e ViQi Virtual Partner permanecem desbloqueados.

É possível iniciar esse recurso ativando e desativando o botão e pressionando o botão de bloqueio de teclado/controles ou botão de alternância de bloqueio de teclado/controles. Essa função se aplica a todos os rádios.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.4.3

Cabeça de controle

Essa seção permite visualizar ou modificar configurações relacionadas a uma configuração de várias cabeças de controle para um transceptor.

Acessado apenas: quando o rádio for compatível com o modelo ou opção.

10.4.3.1

Brilho de inicialização da cabeça de controle

Este recurso permite que cada cabeça de controle seja ligada com o brilho selecionado anteriormente ou com o brilho mínimo.

Se o usuário anterior tiver selecionado brilho mínimo ou o brilho mais alto, a cabeça de controle será ligada com o mesmo brilho.

Cada cabeça de controle liga pelo menos com o brilho mínimo. Se o brilho selecionado pelo usuário anterior de qualquer cabeça de controle for igual ao mínimo, a cabeça de controle será ligada com o brilho mínimo. Se o brilho selecionado pelo usuário anterior de qualquer cabeça de controle estiver acima do mínimo, a cabeça de controle será ligada com o último brilho selecionado pelo usuário.

**OBSERVAÇÃO:**

Este campo não estará disponível se **Rádio secundário** estiver selecionado no campo **Rádio duplo - seleção de rádio**.

Último modo (padrão)

A cabeça de controle liga e mantém o último brilho selecionado.

Mínimo

A cabeça de controle liga com o brilho mínimo se estiver no **Modo escuro** ou mantiver o nível em que estava antes.

10.5

Responsabilidade pela equipe

Responsabilidade pela Equipe permite a você visualizar ou definir a funcionalidade com relação ao recurso de responsabilidade pela equipe. Essas configurações se aplicam em todos os rádios a canais habilitados para a Responsabilidade de Equipe.

Quando o rádio receber o comando Evacuação (EVAC) ou o Relatório de Responsabilidade pela equipe (PAR) no canal de voz ou no canal de dados, o rádio fará com que a tela fique visível e emitirá um tom audível para o primeiro socorrista. Quando o primeiro socorrista pressionar o botão PTT, o rádio transmitirá uma resposta de confirmação ("Ack") para informar que o comando foi recebido.

**OBSERVAÇÃO:**

As configurações de Responsabilidade pela equipe devem ser definidas em cada Personalidade convencional. Consulte a Personalidade convencional, nos campos Tipo de sinalização de incidente, Registro de Responsabilidade de Equipe e Tipo de voz de transmissão.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.5.1

Seleção da Lista AC

Esse campo permite a seleção de 0 a 16 consolidações da ação da lista de responsabilidade pela equipe.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

**AVISO:**

Este campo deve fazer referência a uma Consolidação da ação na qual o **Tipo de Ação** seja **Responsabilidade pela Equipe**.

10.5.2

Nome da Lista de responsabilidade da equipe

Este campo permite criar um nome reconhecível para a lista de responsabilidade pela equipe atual.

A lista de alerta de responsabilidade pela equipe é selecionada no campo Seleção da Lista de responsabilidade pela equipe do sistema de entroncamento ou convencional.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.6

Consolidação da ação

A janela **Consolidação da ação** é usada para visualizar e definir sequências específicas de ações do rádio, conhecidas como Ações consolidadas. Dentro de uma ação consolidada, essas ações individuais podem ser projetadas para executar (no rádio) um a um em uma ordem específica. Várias Ações de consolidação podem ser criadas. Uma sequência de ações do rádio da Ação consolidada pode ser facilmente executada pelo usuário do rádio.

INFORMAÇÕES:

Quando o rádio é ligado, qualquer Ação consolidada atribuída à posição atual do Seletor de resposta é executada.

Independentemente de uma Ação consolidada estar concluída ou cancelada, se houver quaisquer alterações de canal/modo necessárias na ação, o rádio sempre retornará ao canal/modo original.

Depois de iniciada, uma Ação consolidada poderá ser cancelada. Porém, as ações individuais normalmente acontecem muito rápido e a probabilidade de encerrar qualquer parte da ação é mínima.

- Para encerrar uma Ação consolidada, pressione o botão Início, use o menu Sair, pressione um botão PTT (se o modo Auto-falante externo não estiver ativo) ou use o modo Emergência.
- O Padrão do transmissor, o tipo de sirene ou as ações do relatório de GPS são os primeiros a serem carregados e, portanto, quase imediatos.

OBSERVAÇÃO:

O usuário de rádio pode executar uma Ação consolidada com a seleção de Consolidação da ação definida no Seletor de resposta ou ao pressionar um botão.

Recomenda-se que a posição do Seletor de resposta "0" receba uma ação consolidada que coloque todos os padrões do transmissor, tons de sirene, relatórios de GPS, alterações de modo e status direto em um estado "Não atribuído" ou TODOS DESLIGADOS. é também recomendado atribuir essa ação a um pressionamento de botão.

10.6.1

Geral (Consolidação da Ação)

A seção **Geral** de **Consolidação da ação** contém os seguintes campos:

10.6.1.1

Tipo de ação

Esse campo determina o tipo de Consolidação da ação atual que será usada.

As seguintes seleções estão disponíveis:

Geral

A Consolidação da ação é aplicada para entrar na ação da cerca geográfica de missão crítica.

Sair da cerca geográfica

A Consolidação da ação é aplicada para sair da ação ou entrar na ação da cerca geográfica de missão crítica.

Responsabilidade pela equipe

A Consolidação da ação é aplicada como seleção da lista AC em responsabilidade pela equipe ou entrar na ação em missão crítica de cerca geográfica.

Parceiro virtual

A Consolidação da ação é aplicada quando o rádio recebe um Alerta de parceiro virtual do sistema.

ViQi: Parceiro virtual

A Consolidação da ação é aplicada quando o rádio recebe um Alerta de parceiro virtual do sistema.

10.6.1.2

Ação permitida no seletor de resposta

O aplicativo recupera e permite visualizar apenas a disponibilidade da ação consolidada atual da atribuição no seletor de resposta.

Se algum ID de ação (registro/linha) for definido como **Modo** na atual ação consolidada, este campo será desmarcado, indicando que o seletor de resposta não está disponível para ela. Quando este campo é marcado, indica que o seletor de resposta está disponível para a atual ação consolidada.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção e o campo [Tipo de ação na página 150](#) está definido como **Controle**.

10.6.1.3

Cor da luz de fundo

Este campo permite a seleção de uma luz de fundo quando a ação consolidada é acionada.

As opções a seguir são compatíveis:

- Desabilitado
- Vermelho
- Âmbar
- Verde

10.6.1.4

Nome da ação consolidada

Este campo permite definir nomes reconhecíveis para a Ação consolidada atual.

Ele também é utilizado como alias do alerta de Responsabilidade pela equipe para destacar o texto no visor quando a Consolidação da ação é um tipo de ação de Responsabilidade pela equipe.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

É possível usar caracteres, números, espaços e caracteres especiais.

São permitidos no máximo 14 caracteres.

Exemplos: Suspensão de tráfego, em busca, #510

10.6.2

Lista de Ações de Consolidação (Consolidação da Ação)

A seção **Lista de ações de consolidação**.

10.6.2.1

ID da ação

Este campo seleciona o tipo de ação no ID da ação (registro/linha) da ação consolidada atual.

Vários IDs da ação (status direto e alterações de modo) podem ser definidos dentro de uma única ação consolidada. Vários IDs da ação permitem que o rádio envie automaticamente um status direto para o modo rádio apropriado. Ao definir vários IDs da ação, cada ação é executada em uma ordem superior/inferior. É possível executar uma ação consolidada com a seleção da consolidação da ação definida no seletor de resposta ou com o pressionamento de um botão.

Exemplo: Este exemplo mostra uma consolidação da ação contendo vários IDs da ação. Neste caso, o rádio tem três canais (Entroncamento 800 MHz, Entroncamento VHF e Convencional do ASTRO) e o objetivo é transmitir automaticamente o status **Em cena** para todos os três canais da mesma ação consolidada.

Acima 38: Exemplos

Configuração do ID da ação:	Mais configuração do ID da ação:	Ação do rádio
Linha 1 = "Modo"	Modo para o canal de entroncamento de 800 MHz desejado	Alterações do rádio para o modo desejado
Linha 2 = "Direcionar status"	Direcionar status para "Em cena"	Rádio transmite status para o modo desejado
Linha 3 = "Modo"	Modo para o canal de entroncamento VHF desejado	Alterações do rádio para o modo desejado
Linha 4 = "Direcionar status"	Direcionar status para "Em cena"	Rádio transmite status para o modo desejado
Linha 5 = "Modo"	Modo para o canal convencional do ASTRO desejado	Alterações do rádio para o modo desejado
Linha 6 = "Direcionar status"	Direcionar status para "Em cena"	Rádio transmite status para o modo desejado
Linha 7 = "Modo"	Modo para o canal de entroncamento de 800 MHz desejado	Alterações do rádio para o modo desejado

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Status direto

Transmite um status para a ação consolidada atual. A seleção de Índice da ação consolidada (registro/linha) atual determina qual status direto é transmitido.

- Ao operar no modo Convencional, a seleção do número de Índice corresponde ao mesmo Número de status na Lista de alias de status Convencional. Há apenas uma lista de alias de status para comunicações convencionais, por isso os números de status da lista de alias de status se aplicam a todas as personalidades convencionais.
- Ao operar no modo de entroncamento, a seleção do número do índice corresponde ao mesmo número de status da lista de alias de status do modo de entroncamento. O entroncamento permite uma lista de alias de status por sistema de entroncamento, portanto o texto do status pode variar por causa do mesmo número de status para cada sistema de entroncamento.

Modo

Faz com que o rádio altere o canal/modo como parte da Ação consolidada atual. As seleções de Zona e Canal determinam os modos atuais disponíveis para o usuário. Quando a ação consolidada for finalizada, o rádio retornará ao modo (zona/canal) em que estava operando antes da ação consolidada ter sido iniciada.

OBSERVAÇÃO:

Quando a ação consolidada for finalizada, o rádio retornará ao modo (zona/canal) em que estava operando antes da ação consolidada ter sido iniciada.

Mensagem direta

Faz com que o rádio transmita a mensagem definida na Lista de alias de mensagem convencional ou de entroncamento como parte da atual ação consolidada.

Anúncio de voz

Faz com que o rádio reproduza um anúncio de voz como parte da atual ação consolidada.

Mensagem de texto

Permite a definição de uma mensagem de texto, que será exibida quando a atual ação consolidada for acionada.

Nível de potência de transmissão

Faz com que o rádio altere o nível de potência de transmissão como parte da atual ação consolidada.

Silenciar alerta selecionável de site

Faz com que o rádio silencie o alerta selecionável de site como parte da atual ação consolidada.

10.6.2.2

Índice

Este campo seleciona o status ou a mensagem a ser automaticamente transmitido(a) para o atual ID da ação (registro/linha) da atual ação consolidada.

É possível executar uma ação consolidada com a seleção da consolidação da ação definida no seletor de resposta ou com o pressionamento de um botão, no acionador da entrada/saída da SU (Subscriber Unit, unidade de rádio) da cerca geográfica de missão crítica ou no comando EVAC/PAR da responsabilidade pela equipe.

INFORMAÇÕES:

- Ao operar no modo Convencional, esta seleção do número de índice corresponde ao mesmo número de status dentro da lista de alias de status convencional. Há apenas uma lista de alias de status para comunicações convencionais, por isso os números de status da lista de alias de status se aplicam a todas as personalidades convencionais.
- Ao operar no modo de entroncamento, a seleção do número do índice corresponde ao mesmo número de status da lista de alias de status do modo de entroncamento. O entroncamento permite uma lista de alias de status por sistema de entroncamento, portanto o texto do status pode variar com o mesmo número de status para cada sistema de entroncamento.

Exemplo: Este exemplo mostra uma consolidação da ação contendo vários IDs da ação. Neste caso, o rádio tem três canais (Entroncamento 800 MHz, Entroncamento VHF e Convencional do ASTRO) e o objetivo é transmitir automaticamente o status **Em cena** para todos os três canais da mesma ação consolidada.

Acima 39: Exemplos

Configuração do ID da ação:	Mais configuração do ID da ação:	Ação do rádio
Linha 1 = "Modo"	Modo para o canal de entroncamento de 800 Mhz desejado	Alterações do rádio para o modo desejado
Linha 2 = "Direcionar status"	Direcionar status para "Em cena"	Rádio transmite status para o modo desejado
Linha 3 = "Modo"	Modo para o canal de entroncamento VHF desejado	Alterações do rádio para o modo desejado
Linha 4 = "Direcionar status"	Direcionar status para "Em cena"	Rádio transmite status para o modo desejado
Linha 5 = "Modo"	Modo para o canal convencional do ASTRO desejado	Alterações do rádio para o modo desejado
Linha 6 = "Direcionar status"	Direcionar status para "Em cena"	Rádio transmite status para o modo desejado
Linha 7 = "Modo"	Modo para o canal de entroncamento de 800 Mhz desejado	Alterações do rádio para o modo desejado

OBSERVAÇÃO:

Quando a ação consolidada for finalizada, o rádio retornará ao modo (zona/canal) em que estava operando antes da ação consolidada ter sido iniciada.

Acessado apenas: Quando o campo ID da ação do registro/linha atual está definido como **Status direto**,

quando o campo Tipo de ação está definido como **Geral**

quando o campo ID da ação do registro/linha atual está definido como **Status direto** ou **Mensagem direta**,

quando o campo Tipo de ação está definido como **Geral**

e quando o rádio está habilitado para o modelo/para a opção.

10.6.2.3

Zona

Este campo seleciona a alteração de zona para o ID da ação atual (registro/linha) da ação consolidada atual.

Depois de selecionar a zona, o canal deverá estar no atual registro/linha. É possível executar uma ação consolidada com a seleção da consolidação da ação definida no seletor de resposta, com o pressionamento de um botão ou no acionador da unidade de rádio da cerca geográfica de missão crítica.

AVISO:

As zonas de interface de site remoto (RSI) são inválidas e não podem ser selecionadas (zonas que têm o modo RSI ativado).

Acessado apenas: Quando o campo **ID da ação na página 152** do registro/linha atual está definido como **Modo**, o campo **Tipo de ação na página 150** está definido como **Geral** ou **Controle** e o rádio está habilitado para o modelo/para a opção.

10.6.2.4

Canal

Este campo seleciona a alteração de canal no ID da ação atual (registro/linha) da ação consolidada atual.

A seleção de zona do atual registro/linha deve ser feita antes de o canal ser definido.

Acessado apenas: Quando o campo ID da ação do registro/linha atual está definido como **Modo**, quando o campo Zona do registro/linha não está atribuído, quando o campo Tipo de ação está selecionado como **Geral** ou **Controle** e quando o rádio está habilitado para o modelo/para a opção.

10.6.2.5

Arquivo de Áudio de Alerta

Este campo permite a seleção de um arquivo *.MVA (Motorola Voice Announcement, anúncio de voz da Motorola) como o atual alerta de responsabilidade pela equipe (registro/linha) da lista de responsabilidade pela equipe.

O prompt de alerta é emitido quando o rádio recebe o comando EVAC (Evacuation, evacuação) ou PAR (Personnel Accountability Report, relatório de responsabilidade pela equipe) do comandante de incidente.

Acessado apenas: Quando [Tipo de ação na página 150](#) for **Geral**, **Sair da Cerca Geográfica** ou **Responsabilidade pela Equipe**, o campo [ID da ação na página 152](#) do registro/linha atual estiver definido como **Notificação de voz** e o rádio estiver habilitado para o modelo/a opção.

10.6.2.6

Intervalo entre Alertas

Este campo permite a seleção do período de tempo entre os alertas repetidos de responsabilidade pela equipe.

Acessado apenas: Quando [Tipo de ação na página 150](#) está definido como **Geral**, **Sair da cerca geográfica** ou **Responsabilidade pela equipe**, quando o campo [ID da ação na página 152](#) do registro/linha atual está definido como **Anúncio de voz** e quando o rádio está habilitado para o modelo/para a opção.

**AVISO:**

Na atual consolidação da ação, apenas 1 ação é permitida, que consiste no intervalo de 1 a 254 ou "Contínuo".

As seleções a seguir são compatíveis:

255

Momentâneo

0

Contínuo

Acima 40: Alcance

Mínimo	Máximo	Incrementos
1 segundo	254 segundos	1 segundo

10.6.2.7

Mensagem de texto

Este campo permite que você visualize ou defina a mensagem de texto para o ID da ação atual (registro/linha) da ação consolidada atual.

10.6.2.8

Nível de potência de transmissão

Se um Nível de Potência de Transmissão é selecionado ao entrar na Cerca Geográfica, o nível de energia alterna para o nível de potência especificado (alto ou baixo).

Ao sair da Cerca Geográfica, se o Nível de Potência de Transmissão da Unidade de Rádio foi alterado na entrada, ele retornará para o último nível de potência de transmissão selecionado pelo usuário.

Acessado apenas: Quando o campo [ID da ação na página 152](#) para o registro/a linha atual estiver definido como **Nível de potência de transmissão**, o [Tipo de ação na página 150](#) estiver definido como **Geral** e o rádio estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Alternar para baixo

Alternar o Nível de Potência de Transmissão para baixo.

Alternar para alto

Alternar o Nível de Potência de Transmissão para alto.

10.6.2.9

Silenciar alerta selecionável de site

Se o Alerta Selecionável do Site em Mudo é selecionado no campo ID da Ação ao entrar no Cerca Geográfica, a unidade do rádio (SU) coloca o atual alerta selecionável do site em mudo.

Ao sair da cerca geográfica, se a SU já tiver colocado o alerta selecionável do site em mudo devido às ações de entrada, ela deverá reativá-lo.

Acessado apenas: Quando o campo [ID da ação na página 152](#) do registro/linha atual está definido como **Silenciar alerta selecionável de site**, o [Tipo de ação na página 150](#) está definido como **Geral** e o rádio está habilitado para o modelo/para a opção.

10.6.2.10

Estratégia de erro

Este campo seleciona a estratégia de erro desejada para o ID da ação atual (registro/linha) da ação consolidada atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Sair mediante erro

Após um erro, o rádio sai imediatamente da ação consolidada atual sem executar o restante das ações.

Continuar mediante erro

Após um erro, o rádio não sairá da ação consolidada atual; portanto, as ações restantes serão executadas.

10.7

Cerca geográfica de missão crítica

A **Cerca geográfica de missão crítica** permite visualizar e definir perfis de cerca geográfica de missão crítica, incluindo Nome do alias da cerca geográfica, Prioridade, Raio (metros), Ação de entrada, Ação de saída, Longitude e Latitude.

O recurso Cerca geográfica de missão crítica define um perímetro virtual para uma área geográfica real.

Coordenadas da cerca geográfica (latitude/longitude) e ações de entrada ou saída associadas são programadas diretamente no rádio.

Depois de configurado, o rádio realiza verificações de cerca geográfica internamente e ações toda vez que recebe uma nova localização de GPS, o que ocorre a cada segundo.

A Cerca geográfica de missão crítica tem duas formas na área geográfica: **Círculo** e **Polígono**. Se houver apenas uma coordenada na tabela de coordenadas, ela será considerada como centro da cerca geográfica de círculo e você poderá inserir manualmente o raio.

Se houver apenas duas coordenadas na tabela Coordenada, a 1ª coordenada é considerada o centro da cerca geográfica de círculo, e a distância entre a 1ª e a 2ª coordenadas é calculada automaticamente e considerada o raio.

Se houver de 3 a 100 coordenadas na tabela Coordenada, a cerca é considerada uma cerca geográfica de polígono, conectada pelas coordenadas de uma a uma.

OBSERVAÇÃO:

Você pode editar os perfis de cerca geográfica de missão crítica manualmente.

Você pode clicar em **Importar arquivo de mapa**  para importar o arquivo do Google Earth com o formato KML (Keyhole Markup Language) ou KMZ (Keyhole Markup Language) do disco local para a cerca geográfica de missão crítica.

Você pode clicar em **Exportar arquivo de mapa**  para exportar o perfil da cerca geográfica de missão crítica para o disco local com formato KML.

Acessado apenas: Quando o rádio for compatível com modelo/opção e quando o campo Ativar localização estiver **Ativado**.

Consulte [Função Missão crítica de Cerca geográfica](#)

10.7.1

Nome da Cerca Geográfica de Missão Crítica

Este campo permite visualizar ou definir nomes reconhecíveis para a cerca geográfica de missão crítica atual.

Acessado apenas: Quando o rádio estiver habilitado para o modelo/a opção e quando o campo Ativação de localização estiver ativado.

10.7.2

Prioridade

Este campo permite determinar a cerca geográfica que é executada quando há mais de uma sobreposição de áreas de cerca geográfica.

INFORMAÇÕES:

- A prioridade de cada perfil de cerca geográfica deve ser mutuamente exclusiva.

Acima 41: Alcance

Mínimo	Máximo	Incrementos
1 (baixa prioridade)	100 (alta prioridade)	1

Acessado apenas: Quando o rádio estiver habilitado para o modelo/a opção e quando o campo Ativação de localização estiver ativado.

10.7.3

Raio (metros)

Este campo permite determinar o raio da Cerca geográfica do círculo.

INFORMAÇÕES:

- **Cerca Geográfica de Círculo:** Somente uma ou duas coordenadas estão listadas na tabela de Coordenadas.
Cerca geográfica de círculo com apenas uma coordenada: a coordenada é considerada como o centro da cerca geográfica de círculo e você pode inserir o raio manualmente.
Cerca geográfica de círculo com duas coordenadas: a primeira coordenada é considerada como o centro da cerca geográfica de círculo. A distância entre a primeira e a segunda coordenada é calculada automaticamente e considerada como o raio desta cerca geográfica de círculo.
- **Cerca Geográfica de Polígono:** Três ou mais coordenadas estão listadas na tabela Coordenadas.
O raio é definido como **Desativado** automaticamente quando a cerca geográfica é uma forma poligonal.

Acima 42: Alcance

Alcance	Incrementos	Desabilitado
10 a 500.000 metros	1 (metro)	Nenhum raio utilizado para o Círculo da Cerca Geográfica

Acessado apenas: Quando o rádio estiver habilitado para o modelo/a opção e quando o campo Ativação de localização estiver ativado.

10.7.4

Ação de entrada

Este campo seleciona a consolidação da ação a ser usada com a cerca geográfica de missão crítica atual para o evento acionado quando a US está inserindo uma cerca geográfica.

As seleções a seguir são compatíveis:

Não atribuído

Nenhuma Ação de Entrada será acionada.

Consolidações da ação disponíveis

Todas as consolidações de ação cujo Tipo de Ação NÃO seja **Controle**.

Acessado apenas: Quando o rádio estiver habilitado para modelo/opção e quando o campo Ativação de localização estiver ativado.

10.7.5

Ação de saída

Este campo seleciona a consolidação da ação a ser usada com a cerca geográfica de missão crítica atual para o evento acionado quando a US estiver saindo de uma cerca geográfica.

As seleções a seguir são compatíveis:

Não atribuído

Nenhuma Ação de Saída será acionada.

Consolidações da ação disponíveis

Todas as consolidações de ação cujo Tipo de Ação seja **Sair da Cerca Geográfica**.

Acessado apenas: Quando o rádio estiver habilitado para o modelo/a opção e quando o campo Ativação de localização estiver ativado.

10.7.6

Longitude

Este campo permite inserir um valor de longitude para uma coordenada.

As seleções a seguir são compatíveis:

Mínimo

-180,0000000.

Máximo

180,0000000.

Acessado apenas: Quando o rádio estiver habilitado para modelo/opção e quando o campo Ativação de localização estiver ativado.

10.7.7

Latitude

Este campo permite inserir um valor de latitude para uma coordenada.

As seleções a seguir são compatíveis:

Mínimo

-90,0000000.

Máximo

90,0000000.

Acessado apenas: Quando o rádio estiver habilitado para modelo/opção e quando o campo Ativação de localização estiver ativado.

10.8

Controle Portátil

As seções **Botões**, **Switches**, **Itens de menu**, **Teclado**, **Botões de chaveiro inteligente** ou **Botões dos Acessórios** são usadas para visualizar ou selecionar a funcionalidade dos botões programáveis de todo o rádio para os modos de comunicação convencional e de entroncamento.

INFORMAÇÕES:

Para as seções **Botões**, **Botões de chaveiro inteligente** e **Botões dos Acessórios**, a funcionalidade dos botões é selecionada e opera separadamente para cada um dos dois modos de comunicação de rádio. Ou seja, quando o rádio está operando em um canal convencional, somente as funções convencionais selecionadas estão disponíveis para o usuário do rádio. Da mesma forma, quando o rádio está operando em um canal de entroncamento, somente as funções de entroncamento selecionadas estão disponíveis para o usuário de rádio. No **Teclado**, a funcionalidade dos botões é selecionada uma vez e opera para os dois modos de comunicações do rádio.

OBSERVAÇÃO:

Algumas seleções variam de acordo com o modelo ou a opção do rádio.

10.8.1

Botões (Controle Portátil)

A seção **Botões** permite que o usuário visualize ou selecione a funcionalidade do botão programável de todos os rádios para os modos de comunicações Convencionais e de Entroncamento. A funcionalidade do Botão é selecionada e opera separadamente para cada um dos modos de

comunicações de rádio. Ou seja, quando o rádio está operando em um canal Convencional, somente os recursos Convencionais selecionados estão disponíveis para o usuário do rádio. Da mesma forma, quando o rádio está operando em um canal de Entroncamento, somente os recursos de Entroncamento selecionados estão disponíveis para o usuário do rádio.

**OBSERVAÇÃO:**

Algumas seleções variam de acordo com o modelo ou a opção do rádio.

Os campos a seguir são suportados:

10.8.1.1**Botão Superior (Convencional)**

Seleciona a função para o Botão superior.

Essas seleções se aplicam ao operar no modo de comunicações Convencionais ou de Entroncamento, conforme mostra a tabela abaixo.

**AVISO:**

O usuário não deve duplicar uma função em vários controles, como em mais de um botão, mais de uma chave ou combinando ambos. Isso pode causar uma operação incorreta do rádio.

Consulte [Seleção de botões \(parte superior e lateral\) na página 162](#) para obter uma lista seleções compatíveis:

10.8.1.2**Botão Superior (Entroncamento)**

Seleciona a função para o Botão superior.

Consulte [Botão Superior \(Convencional\) na página 160](#) para notas e avisos.

Consulte [Seleção de botões \(parte superior e lateral\) na página 162](#) para obter uma lista seleções compatíveis:

10.8.1.3**Botão Lateral Superior (Convencional)**

Seleciona a função para o Botão Lateral Superior.

Consulte [Botão Superior \(Convencional\) na página 160](#) para notas e avisos.

Consulte [Seleção de botões \(parte superior e lateral\) na página 162](#) para obter uma lista seleções compatíveis:

10.8.1.4**Botão Lateral Superior (Entroncamento)**

Seleciona a função para o Botão Lateral Superior.

Consulte [Botão Superior \(Convencional\) na página 160](#) para notas e avisos.

Consulte [Seleção de botões \(parte superior e lateral\) na página 162](#) para obter uma lista seleções compatíveis:

10.8.1.5**Botão Lateral do Meio (Convencional)**

Seleciona a função para o Botão Lateral do Meio.

Consulte [Botão Superior \(Convencional\) na página 160](#) para notas e avisos.

Consulte [Seleção de botões \(parte superior e lateral\) na página 162](#) para obter uma lista seleções compatíveis:

10.8.1.6

Botão Lateral do Meio (Entroncamento)

Seleciona a função para o Botão Lateral do Meio.

Consulte [Botão Superior \(Convencional\) na página 160](#) para notas e avisos.

Consulte [Seleção de botões \(parte superior e lateral\) na página 162](#) para obter uma lista seleções compatíveis:

10.8.1.7

Botão lateral inferior (Convencional)

Seleciona a função para o Botão Lateral Inferior.

Consulte [Botão Superior \(Convencional\) na página 160](#) para notas e avisos.

Consulte [Seleção de botões \(parte superior e lateral\) na página 162](#) para obter uma lista seleções compatíveis:

10.8.1.8

Botão lateral inferior (Entroncamento)

Seleciona a função para o Botão Lateral Inferior.

Consulte [Botão Superior \(Convencional\) na página 160](#) para notas e avisos.

Consulte [Seleção de botões \(parte superior e lateral\) na página 162](#) para obter uma lista seleções compatíveis:

10.8.1.9

Botão de grade do alto-falante (convencional)

Seleciona o funcionamento do botão de grade do alto-falante.

Consulte [Botão Superior \(Convencional\) na página 160](#) para notas e avisos.

Consulte [Seleção de botões \(parte superior e lateral\) na página 162](#) para obter uma lista seleções compatíveis:

10.8.1.10

Botão de grade do alto-falante (entroncamento)

Seleciona o funcionamento do botão de grade do alto-falante.

Consulte [Botão Superior \(Entroncamento\) na página 160](#) para notas e avisos.

Consulte [Seleção de botões \(parte superior e lateral\) na página 162](#) para obter uma lista seleções compatíveis:

10.8.1.11

Nome do botão

Este campo indica o nome do botão programável.

10.8.1.12

Botões (convencionais)

Esse campo determina o recurso selecionado para o botão programável correspondente no Modo Convencional.

Consulte [Seleções de botões](#) para obter uma lista de seleções compatíveis.

10.8.1.13

Botões (Entroncamento)

Esse campo determina o recurso selecionado para o botão programável correspondente no Modo Entroncamento.

Consulte [Seleções de botões](#) para obter uma lista de seleções compatíveis.

10.8.1.14

Seleção de botões (parte superior e lateral)

A seção de Controle Portátil permite que o usuário selecione a função para os botões do rádio Portátil na parte Superior e Lateral.

Acima 43: Funções do Rádio Portátil na Parte Superior e Lateral

Seleções de botão:	Esta seleção só é válida no RadioCentral e/ou disponível para o usuário:	As seleções estão disponíveis no RadioCentral com base na disponibilidade do Hardware atual:
Reprodução de Áudio na página 179	Quando selecionado, está sempre disponível ao usuário. Portanto, não depende de nenhum recurso ou seleção do RadioCentral.	<ul style="list-style-type: none"> • Teclado/Visor duplo • Visor superior • Visor frontal e Botões de menu/navegação • Visor frontal e Botões de menu • Acessório • Botões de chaveiro inteligente
Ativar/Desativar Fallback automático de canal	Quando o campo Ativar Fallback de canal estiver ativado.	<ul style="list-style-type: none"> • Teclado/Visor duplo • Visor superior • Visor frontal e Botões de menu/navegação • Visor frontal e Botões de menu • Acessório • Botões de chaveiro inteligente

10.8.1.14.1

Habilitar/Desabilitar Fallback automático de canal

Em um canal habilitado para Fallback de canal, pressionar esse botão ativa o Fallback automático de canal. Pressionar e segurar este botão desativa a função e reverte o rádio de volta para o último canal selecionado pelo usuário.

10.8.1.14.2

Reprodução de Áudio

A Reprodução de áudio reproduz o áudio selecionado.

Esse recurso está disponível para o modo comunicações convencionais ou de entroncamento.

10.8.1.14.3

Sinal

O pressionamento desse botão permite verificar os detalhes de quaisquer sinais de emergência recebidos recentemente.

Esse recurso está disponível para o modo comunicações convencionais ou de entroncamento.

10.8.1.14.4

Em branco

Selecione esta função para um botão do rádio que não está em uso.

Você ouvirá um tom de bipe ao pressionar esse botão. Esse recurso está disponível para o modo comunicações convencionais ou de entroncamento.

10.8.1.14.5

Redirecionamento de Áudio Bluetooth

O pressionamento desse botão permite alternar o áudio do alto-falante ativo entre auto-falante interno ou externo do rádio portátil (RSM/DRSM) e os alto-falantes sem fio de um acessório Bluetooth.

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

10.8.1.14.6

Configuração de Bluetooth

O pressionamento deste botão fornece uma lista de status/informações e opções de Bluetooth.

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

Os seguintes recursos estão incluídos:

Status do Bluetooth

Permite ligar e desligar a funcionalidade de rádio Bluetooth para dispositivo Bluetooth.

Dispositivo Ativo

Permite visualizar uma lista de todos os dispositivos Bluetooth atualmente ativos (emparelhados).

Alto-falante do Bluetooth

Permite ligar e desligar o alto-falante do dispositivo Bluetooth.

10.8.1.14.7

PPT de fone de ouvido Bluetooth

O pressionamento deste botão serve como botão principal ou como um botão PTT adicional de um fone de ouvido sem fio Bluetooth. Portanto, o pressionamento deste botão permite aumentar o volume do rádio enquanto o microfone do fone de ouvido Bluetooth está sendo usado como fonte de áudio.

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

10.8.1.14.8

Bluetooth Ativado/Desativado

Este botão de pressionar ativa e desativa as funções Bluetooth do rádio.

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

10.8.1.14.9

Alerta de Chamada.

O pressionamento desse botão permite a transmissão de um alerta de chamada nos modos convencionais ou uma página/alerta de chamada nos modos de entroncamento.

OBSERVAÇÃO:

A página/alerta de chamada permite que um despachador ou chamador de rádio notifique você (ou grupo de usuários) sobre uma chamada perdida.

Os rádios de recepção são direcionados com base nas informações de rádio e sistema gerenciadas pelos IDs de chamada e contatos nas Listas de prioridades de chamada do rádio. Você pode inserir ou selecionar IDs de chamada diretamente da lista de prioridades do canal.

O rádio receptor responde com tons de alerta e alertas visuais para você. O alerta visual (LED piscando) persiste até que você interaja com o rádio.

10.8.1.14.10

Resposta da Ligação

Pressionar esse botão permite atender (e desligar) uma Chamada telefônica recebida (Convencional ou de Entroncamento) ou uma Chamada privada. (Entroncamento somente).

10.8.1.14.11

Anúncio de canal

O pressionamento deste botão permite que você ouça o arquivo de áudio Anúncio de voz que é atribuído ao canal/modo atual do rádio.

INFORMAÇÕES:

Arquivos de voz estão atribuídos a canais a partir de Atribuição de zonas e canais, campo Anúncio de canal [Anúncio de canal na página 671](#).

10.8.1.14.12

Canal para Baixo

Pressionar este botão no rádio portátil APX™ 3000 permite rolar para baixo pelos canais do rádio.

É possível rolar mais rapidamente com um [Duração longa do pressionamento de teclas na página 144](#) do botão. Ao atingir o último canal da lista, navegação contínua levará ao primeiro canal. Os canais são definidos na página Canais da janela Atribuição de zonas e canais.

10.8.1.14.13

Reversão/Fallback de canal manual

Em um canal habilitado para Fallback de canal, pressionar esse botão faz com que o rádio alterne para o canal Fallback atribuído, independentemente das condições atuais da rede e do estado de ativação. Pressionar e segurar este botão reverte o rádio de volta para o último canal selecionado pelo usuário.

10.8.1.14.14

Canal para cima

Pressionar esse botão no rádio portátil APX™ 3000 permite rolar para cima pelos canais do rádio.

É possível rolar mais rapidamente com um [Duração longa do pressionamento de teclas na página 144](#) do botão. Ao atingir o último canal da lista, navegação contínua levará ao primeiro canal. Os canais são definidos na página Canais da janela Atribuição de zonas e canais.

10.8.1.14.15

Contacts

Este botão de pressionar permite visualizar ou editar os contatos do canal atual do rádio.

Os contatos devem ser programados na Lista de ligações unificadas. Os contatos compõem os membros das Listas de favoritos de ligações. Os membros/contatos da lista de prioridades podem ser selecionados por você, o que permite realizar tipos de chamada como chamadas telefônicas, chamadas seletivas, alertas de chamada, chamadas privadas e páginas para rádios individuais ou para grupos de rádio.

INFORMAÇÕES:

Esta função não está disponível para rádios portáteis com somente um visor superior.

10.8.1.14.16

Tom DTMF

Este botão de pressionar permite que você envie o código DTMF do valor DTMF atribuído.

Há 12 tons DTMF; especificamente Tom DTMF 0 a 9, Tom DTMF * e Tom DTMF #. Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

10.8.1.14.17

ID Dinâmico

O pressionamento deste botão permite entrar no modo de edição do ID dinâmico, o que permite visualizar e/ou editar o ID individual e/ou o ID principal do MDC do rádio no Sistema ASTRO e/ou MDC atual.

Essa função está disponível durante a operação no modo de comunicações convencionais.

10.8.1.14.18

Prioridade dinâmica

O pressionamento desse botão permite selecionar a atribuição de verificação de Prioridade dinâmica.

Essa função está disponível durante a operação no modo de comunicações convencionais.

10.8.1.14.19

Limpar o Supervisor de Emergência

Este pressionamento de botão é selecionado para Botão lat. do meio ou Ac. 1 ponto. O Controle de Saída de Emergência está definido como "Supervisor".

Essa função está disponível durante a operação no modo Comunicações de entroncamento.

10.8.1.14.20

Emergência

O pressionamento desse botão permite entrar e sair da operação do modo de emergência.

Consulte também o [Duração curta do pressionamento de teclas para emergência na página 144](#) e os recursos [Duração longa do pressionamento de teclas para emergência na página 145](#). Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

AVISO:

Quando o campo Seleção de rádio de Rádio duplo estiver definido como **Rádio principal** ou **Rádio secundário**, essa seleção será inválida para o botão lateral superior (roxo) em um

10.8.1.14.21

Informações

O pressionamento desse botão permite recuperar e visualizar as informações básicas do rádio, como informações de IP e mapeamento de controle de botões/chaves, como também visualizar ou modificar o ID virtual.

Essa função se aplica somente ao operar em Sistemas Convencionais ASTRO. Essa é uma função exclusiva de rádios portáteis.

INFORMAÇÕES:

Modificar o ID Virtual altera o Nome do Usuário do rádio para o servidor de Serviço de Registro Automático ou um logon de servidor UNS (Unified Network Services, serviços de rede unificada) da Autenticação do Usuário. Ao editar o Nome do Usuário dessa forma, o PIN/a Senha e o ID da Unidade ficam em branco. Portanto, isso só pode ser usado quando o servidor estiver esperando um PIN/senha em branco e você não quiser usar o ID da unidade.

Esta função não está disponível para rádios portáteis com somente um visor superior.

10.8.1.14.22

Endereço de Protocolo da Internet (IP)

O pressionamento deste botão permite recuperar e visualizar (no visor do rádio) o endereço IP atual do rádio, o nome do dispositivo e o status.

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

10.8.1.14.23

Bloqueio de teclado/controles

Pressionar este botão permite bloquear (ou desbloquear) o teclado do rádio (quando disponível).

Está disponível uma função adicional de bloqueio de controle (para todos os modelos) quando o campo [Ativação do bloqueio da chave giratória](#) e/ou o campo [Trava dos botões laterais e da grade do alto-falante ativada na página 148](#) estiverem **Ativados**.

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

INFORMAÇÕES:

Quando Ativação do Bloqueio da Chave Giratória é **Ativada** nos rádios com uma chave giratória, esse recurso também bloqueia a [Seleções Giratórias na página 194](#) (zona ou canal) em operação atualmente no rádio, mesmo quando a chave giratória é movida para outra posição.

Quando o campo Ativação do Bloqueio dos Botões Laterais estiver **Ativado**, esse recurso também bloqueia o Botão Lateral Superior, o Botão Lateral do Meio e o Botão Lateral Inferior.

10.8.1.14.24

Luz/Flip (Tela)

A função Luz de duração curta do pressionamento de teclas deste botão ativa e desativa as luzes que iluminam a chave giratória, o visor, o visor superior e o teclado do rádio.

A função Inverter a [Duração longa do pressionamento de teclas na página 144](#) (Visor) deste botão permite alternar a perspectiva de visualização do visor superior do rádio em 180 graus. Isso é particularmente útil para visualizar o visor superior enquanto o rádio ainda está no porta-rádio.

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

INFORMAÇÕES:

O [Tempo da luz do display na página 231](#) determina o período em que as luzes permanecem acesas. Quando definida como **Infinito**, pressionar o botão novamente desligará as luzes.

Para todos os modelos de rádio portátil, os recursos de Luz e Flip (Visor) também se aplicam a um Acessório portátil que possui um visor, como um Microfone de Alto-Falante Remoto do Visor (DRSM).

10.8.1.14.25

Location

Pressionar esse botão permite determinar a localização atual (latitude, longitude, hora e data) e também a distância e coordenada para outra localização.

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

INFORMAÇÕES:

Se o campo [Ativação de localização selecionada pelo usuário na página 118](#) para todos os rádios estiver **Ativado**, também será possível ativar ou desativar a funcionalidade de localização externa/GPS para todos os canais de comunicações Convencionais ou de Entroncamento habilitados para localização/GPS.

10.8.1.14.26

LTE

Pressionar esse botão ativa e desativa os recursos de dados de Banda larga de LTE do rádio.

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

INFORMAÇÕES:

Esta seleção de botão só pode ser realizada quando um canal configurado para a operação Banda larga LTE for selecionado. Quando um canal não LTE for selecionado, você não verá o menu.

Um canal é compatível com LTE quando seu campo [Tipo de perfil de dados na página 370](#) do Perfil de Dados estiver definido como **Convencional e banda larga** ou **Entroncamento e banda larga** ou **Somente banda larga**.

10.8.1.14.27

Remoção de Man Down

Este botão de pressionar permite remover (desativar) o alarme do modo de emergência Man Down.

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

10.8.1.14.28

Message

Pressionar esse botão permite selecionar na lista de alias de mensagem do canal/modo atual.

INFORMAÇÕES:

Ao operar no modo de comunicações Convencionais com a Sinalização do MDC/ASTRO/DVRS, a Lista de alias de mensagem convencional será usada.

Ao operar no modo Comunicações de entroncamento, o sistema de entroncamento - lista de aliases de mensagem selecionado na personalidade de entroncamento atual será utilizado.

10.8.1.14.29

Monitoramento

O pressionamento deste botão permite que você ouça parte ou toda a atividade da operadora no canal atual do rádio.

A seleção do campo [Tipo de Monitor na página 395](#) determina se somente o requisito canal-recepção de uma combinação codificada da Linha Privada (PL) está temporariamente cancelado ou se o requisito da PL e silenciador da operadora está temporariamente cancelado. Essa função está disponível durante a operação no modo de comunicações convencionais.

INFORMAÇÕES:

Ao segurar o botão Monitor pela duração [Tempo de Ativação da Trava na página 396](#), o rádio é travado no modo monitor contínuo. O rádio permanece travado no modo Monitor até ser liberado com um botão Monitor de pressionar brevemente. Iniciar emergência, telefone, verificação ou um alerta de chamada ou chamada seletiva também cancela o modo monitor contínuo. Consulte também o campo [Tom de ativação da trava na página 396](#).

10.8.1.14.30

MS01-MS13

Essas atribuições de botão permitem programar esses botões com uma combinação de zona e canal ou qualquer combinação usada com frequência.

A programação e o uso desses botões são muito parecidos com a programação e o uso de botões predefinidos do rádio de um carro. Ou seja, um pressionamento longo programa um botão com a zona e os canais atuais do rádio; depois de programado, o pressionamento curto desse botão leva o

rádio para a zona e canal programados. Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

INFORMAÇÕES:

A [Duração curta do pressionamento de teclas na página 144](#) e a [Duração longa do pressionamento de teclas na página 144](#) são programadas.

O portátil APX™ 3000 só suporta MS01 e MS02.

10.8.1.14.31

Linha privada múltipla (MPL)

O pressionamento desse botão permite acessar a relação de listas de MPL disponíveis.

INFORMAÇÕES:

Cada lista é representada por um nome reconhecível . Em seguida, você poderá selecionar as configurações desejadas de alias/PL. Essa função está disponível durante a operação no modo de comunicações convencionais.

10.8.1.14.32

Excluir perturbações

O pressionamento desse botão permite remover temporariamente o canal da verificação ativa atual quando ele gera ruído indesejado da portadora de forma contínua.

Isso é realizado ao pressionar o botão Exclusão de ocorrências enquanto o Modo de verificação do canal no Membro da lista de verificações é removido. Essa função se aplica à lista de verificação atual durante a operação no modo de comunicações convencionais e de entroncamento.

INFORMAÇÕES:

Alternar para outro canal no seletor de canais do rádio, desligar e ligar o modo de verificação novamente ou desligar e ligar o rádio novamente leva efetivamente o canal Membro da lista de verificações temporariamente removido de volta para um status ativamente verificado.

Excluir perturbações não é possível:

- Para um canal do Membro da lista de verificações da Prioridade #1 ou Prioridade #2.
- Quando o campo [Tipo de membro de transmissão de voz designado na página 686](#) está definido como **Canal Selecionado** e a Frequência de Transmissão do canal de Verificação Selecionado é a mesma que a Frequência de Transmissão do canal do rádio selecionado no momento.
- Se a Lista de verificações atuais não contém, pelo menos, dois membros antes de ocorrer uma Exclusão de ocorrências.

10.8.1.14.33

One Touch 1–4

Esses quatro botões de pressionar programados separadamente permitem acionar um recurso específico com somente um pressionamento de botão.

O pressionamentos desses botões permite que você entre em recursos de um toque, como Status, Mensagem, Chamada seletiva/privada, Alerta de chamada/Página, telefone, RAC (Repeater Access, Acesso de repetidor), e botão de acesso MDC RTT com o toque de um botão. Um a quatro botões podem ser programados para cada Personalidade convencional e um a quatro botões podem ser programados para cada Sistema de entroncamento.

INFORMAÇÕES:

Pressionar um botão One Touch enquanto o rádio já está na função selecionada faz com que esse rádio anule essa função.

10.8.1.14.34

Phone

O pressionamento desse botão permite iniciar o modo Telefone ao operar no modo de comunicações convencionais ou de entroncamento.

10.8.1.14.35

Canal de prioridade PTT

Se o rádio estiver funcionando no Modo de varredura e houver um Membro da lista de varredura do membro de prioridade 1 na Lista de varredura do canal atual, pressionar esse botão fará com que o rádio ative o canal do Membro da lista de varredura de prioridade 1, permitindo a transmissão de comunicações de voz. Caso contrário, o rádio bloqueará a transmissão e emitirá o Tom de proibição de fala.

Essa função está disponível durante a operação no modo de comunicações convencionais.

INFORMAÇÕES:

A operação do Canal de prioridade PTT é mutuamente exclusiva com as funções Intercomunicadore Endereço público (PA).

Para todos os rádios APX, a operação PTT do canal de prioridade não realizará a operação de envio/ligação quando alguma das seguintes funções estiver ativa no rádio:

- Emergência
- Alerta de Chamada.
- Chamada seletiva
- Chamada recente
- Phone
- Paralisar/interromper
- TMS
- Status/mensagem
- Sirene
- Endereço público (PA)
- Lista de chamadas unificada
- Solicitação de rechaveamento
- Tom de evacuação

Para a cabeça de controle móvel O3, o PTT do canal de prioridade não realizará a operação de envio do Teclado direto. Isso se deve ao fato de a cabeça de controle móvel O3 não ter suporte a pressionamento de múltiplos botões entre o botão lateral, a tecla programável do menu, a tecla de seta ou o teclado. Essa limitação também impacta outros recursos que precisam de dois ou mais pressionamentos de botão ao mesmo tempo.

O rádio considera a primeira operação de pressionamento e liberação do PTT e ignora a segunda operação de pressionamento e liberação do PTT quando as duas ações são de tipos diferentes. Em outras palavras:

- sempre que o rádio já estiver transmitindo em virtude de uma primeira operação de pressionamento do botão PTT, uma nova operação de pressionamento do botão PTT do canal de prioridade é ignorada pelo rádio.
- por outro lado, sempre que o rádio já estiver transmitindo pelo canal do Membro da lista de varredura de prioridade 1 em virtude de uma operação de pressionamento do botão PTT do canal de prioridade, a primeira operação de pressionamento do botão PTT será ignorada pelo rádio.

O botão PTT do canal de prioridade não deve ser usado no canal DVRS.

10.8.1.14.36

Perfis de rádio

Pressionar este botão permite selecionar um dos Perfis de rádio programados.

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

10.8.1.14.37

Chamadas recentes

Pressionar este botão permite acessar informações sobre chamadas recentes que foram efetuadas e recebidas dos seguintes tipos: Alerta de chamada, Chamadas seletivas, Chamadas privadas e Chamadas telefônicas (somente efetuadas).

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

10.8.1.14.38

Solicitação de rechaveamento

Este botão de pressionar permite transmitir uma solicitação de OTAR (Over-The-Air-Rekeying, alteração de chave Over The Air) para o console do despachador (KMF ou KMC) ao operar no modo de comunicações convencionais ou de entroncamento.

INFORMAÇÕES:

Para MDC OTAR (Comunicações Convencionais), o protocolo de solicitação é determinado pelo campo [Modo de solicitação de alteração de chave na página 301](#).

Para ASTRO OTAR (Comunicações Convencionais ou de Entroncamento), o campo [Solicitação de rechaveamento selecionado pelo usuário na página 321](#) deve ser **Ativado** e o protocolo de solicitação é determinado pelo campo [Nível de segurança de transmissão do OTAR na página 319](#).

10.8.1.14.39

Emergência remota

Esse pressionamento de botão ativa o recurso Ativação de emergência remota para que um usuário autorizado codifique esse comando possa fazer com que um rádio de destino inicie o recurso de Emergência sem a intervenção do usuário de destino.

OBSERVAÇÃO:

A Emergência remota só é compatível com os canais ASTRO Convencional e ASTRO 25 Entroncamento.

10.8.1.14.40

Botão 1 de Acesso Repetido (RAB1)

Permite que o usuário envie manualmente um código de acesso de repetidor.

Essa função está disponível durante a operação no modo de comunicações convencionais.

10.8.1.14.41

Botão 2 de Acesso Repetido (RAB2)

Permite que o usuário envie manualmente um código de acesso de repetidor.

Essa função está disponível durante a operação no modo de comunicações convencionais.

10.8.1.14.42

Solicitação de reprogramação

O pressionamento deste botão permite enviar uma solicitação ao despachador para atribuir novamente o Reagrupamento dinâmico.

Os recursos e as configurações disponíveis do grupo de conversação Reagrupamento dinâmico são definidos e transmitidos novamente pelo despachador ou pelo console. Assim, o rádio altera

automaticamente a Zona de reagrupamento dinâmico e o Canal de reagrupamento dinâmico. Essa função está disponível durante a operação no modo Comunicações de entroncamento.

**INFORMAÇÕES:**

Para os Sistemas de entroncamento, esta zona e canal são definidos ao configurar um campo [Grupo de conversação de entroncamento na página 670](#) da Atribuição de zonas e canais para **DYN**. A Personalidade de entroncamento considerada neste cenário deve ter o mesmo [Sistema na página 549](#) de entroncamento selecionado no campo Sistema. Portanto, somente um canal do Reagrupamento dinâmico pode ser definido pelo Sistema de entroncamento.

10.8.1.14.43

Solicitação para falar (RTT)

Pressionar este botão permite enviar um o pacote de sinalização RTT (Request-To-Talk, solicitação para falar) ao despachador/console solicitando a capacidade de transmissão de voz.

Esta seleção se aplica somente ao operar no modo de comunicação Convencional de um Sistema MDC.

10.8.1.14.44

Varredura

Ao pressionar este botão, é possível ativar e desativar o Modo de varredura do canal atual do rádio.

Ao manter este botão pressionado, é possível inserir o modo Edição da lista de varredura da Lista de varredura do canal atual do rádio, que permite adicionar/remover canais do Membro da lista de varredura individual e modificar a prioridade de varredura.

10.8.1.14.45

Selecionar chamada

Pressionar esse botão permite que o usuário do rádio transmita uma chamada Convencional.

10.8.1.14.46

Exibição do site/busca

A **Exibição do site** da Duração do pressionamento curto de teclas deste botão permite visualizar momentaneamente o ID do site atual e seu RSSI correspondente no visor do rádio.

A **Pesquisa de site** da Duração do pressionamento longo de teclas deste botão ativa a Pesquisa de site para a operação SmartZone. Essa função está disponível durante a operação no modo Comunicações de entroncamento.

10.8.1.14.47

Bloquear/desbloquear o site

Este **Site** de Duração do pressionamento curto de teclas permite visualizar o status de bloqueio do site de Entroncamento atual.

A opção **Bloquear/Desbloquear Site** da Duração do pressionamento longo de teclas permite alternar entre os modos bloquear e desbloquear quando a opção SmartZone é utilizada.

**INFORMAÇÕES:**

Bloquear um site inibe o roaming para outro site em um Sistema de área ampla. Essa função está disponível durante a operação no modo Comunicações de entroncamento.

10.8.1.14.48

Status

O pressionamento deste botão permite selecionar na lista de alias de status do canal/modo atual.

**OBSERVAÇÃO:**

Para a sua conveniência, como parte desse recurso, o visor mostra inicialmente a última Chamada de status reconhecida ou o primeiro Status na lista. Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

**INFORMAÇÕES:**

Ao operar no modo de comunicações Convencionais com a Sinalização do MDC/ASTRO/DVRS, a Lista de alias de status convencional será usada.

Ao operar no modo Comunicações de entroncamento, o sistema de entroncamento - lista de alias de status selecionado na personalidade de entroncamento atual é utilizado.

10.8.1.14.49

Modo Direto

Este botão de pressionar permite ativar ou desativar o modo Direto/Talkaround no perfil de opções de canal atual.

Essa função está disponível durante a operação no modo de comunicações convencionais.

10.8.1.14.50

Grupo de conversação

Este botão de pressionar permite alternar do Grupo de conversação predefinido para outro Grupo de conversação a partir da Lista de grupos de conversação atual da Personalidade convencional.

Todas as Personalidades convencionais com a mesma Lista de grupo de conversação são automaticamente alternadas para o Grupo de conversação selecionado.

10.8.1.14.51

Serviço de mensagens de texto (TMS)

O **TMS** de Duração curta do pressionamento de botão permite acessar o modo TMS do rádio, visto na tela do rádio.

A Duração longa do pressionamento de botão permite entrar na **Caixa de entrada** do TMS diretamente para visualizar as mensagens de texto recebidas e acessar as entradas de [Mensagem de texto rápida na página 369](#) programadas (vistas na tela do rádio). Consulte também o Sistema de Entroncamento ou Sistema Convencional , função Serviço de mensagens de texto.

10.8.1.14.52

Periférico de terceiros

Este botão de pressionar permite iniciar a funcionalidade em acessórios de terceiros, como sirenes Whelen® compatíveis.

**AVISO:**

Quando o campo [Seleção de rádio](#) do Rádio duplo estiver definido como **Rádio principal** ou **Rádio secundário**, esta seleção deverá ser feita para Convencional e Entroncamento, onde aplicável, para que seja considerada válida.

10.8.1.14.53

Consulta TMS

Este botão de pressionar conduz diretamente às entradas programadas de Mensagem de consulta do recurso Serviço de mensagens de texto.

Você poderá, então, selecionar da lista de entradas predefinidas e transmitir facilmente uma Consulta, com o mínimo de esforço.

OBSERVAÇÃO:

Uma Consulta TMS permite especificar informações em um modelo de consulta pré-formatado e enviá-las como uma Mensagem a um Servidor de consulta; o Servidor responde com uma mensagem de texto contendo as informações solicitadas.

Quando o recurso de Serviço de mensagens de texto do Sistema de entroncamento ou do Sistema convencional estiver ativado no canal atual do rádio e o Serviço de consulta TMS estiver disponível no rádio no momento.

10.8.1.14.54

Texto rápido de TMS

Pressionar esse botão leva você diretamente para as entradas de mensagem rápida de texto do recurso Serviço de mensagens de texto.

Você poderá, então, selecionar uma mensagem rápida de texto na lista de entradas predefinidas e transmiti-la facilmente, com o mínimo de esforço.

Quando é o Sistema de entroncamento ou o Sistema convencional, o recurso de Serviço de mensagens de texto é ativado no canal atual do rádio.

10.8.1.14.55

Não programada

Selecione esta função para um botão do rádio que não está em uso.

Você ouvirá um tom de bipe ao pressionar esse botão. Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

10.8.1.14.56

ViQi: Parceiro virtual

Este botão permite o acesso ao recurso Parceiro virtual.

Esse recurso só estará disponível para Entroncamento se estiver definido como operação **LMR** no [ViQi: Modo do parceiro virtual na página 114](#). Esse recurso está disponível para os modos de comunicações Convencional e de Entroncamento se estiver definido como **Desativado** e Banda larga em [ViQi: Modo do parceiro virtual na página 114](#).

10.8.1.14.57

ViQi: Controle por voz

Este botão permite o acesso aos recursos Controle por voz e Parceiro virtual.

Quando o rádio não estiver no recurso Parceiro virtual, todos os pressionamentos desse botão ativarão o recurso Controle por voz. Quando o usuário entrar no recurso Parceiro virtual por meio de um comando de Controle por voz, os pressionamentos subsequentes do botão serão aplicados somente ao recurso Parceiro virtual. Quando a sessão do Parceiro virtual terminar, este botão será aplicado ao Controle por voz.

Esse recurso está disponível para o modo comunicações convencionais ou de entroncamento.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.8.1.14.58

Usuário

Este botão de pressionar permite fazer login em um servidor específico do Automatic Registration Service ou em um servidor UNS (Unified Network Services, serviços de rede unificada) de autenticação do usuário com a combinação correta de Nome do usuário, PIN/Senha e ID da unidade de login de Usuário.

Você pode selecionar nomes de usuário e IDs de unidade nas entradas programadas da Lista de usuários dos dados ou inserir Nomes de usuário, PINs/Senha e IDs de unidade manualmente pelo teclado do rádio.

AVISO:

Esse recurso funcionará somente quando o canal atual do rádio (Convencional ou de Entroncamento) tiver seu campo [Modo ARS na página 375](#) do Perfil de Dados mencionado definido como **Servidor**.

10.8.1.14.59

Silenciar voz

Ao pressionar esse botão, você poderá ativar e desativar a função Silenciar voz dos canais habilitados para Alerta do usuário de chamada recebida.

Quando a função Silenciar voz estiver ativa, o rádio ficará emudecido para todas as chamadas de comunicações convencionais e chamadas do Grupo de conversação de entroncamento afiliado. Páginas/alertas de chamadas em grupo ou individuais realmente silenciam o rádio para os tons de alerta; além disso, quando a função Silenciar voz está ativa, o rádio não emudece para chamadas individuais de rádio para rádio, como chamadas seletivas/privadas e chamadas interconectadas (modo telefone).

10.8.1.14.60

Tom definido de volume

Este botão de pressionar causa um ou o outro dos comportamentos do rádio a seguir.

Ao pressionar esse botão quando o campo [Desvio de tons de ajuste do volume na página 106](#) estiver **Desativado**, você poderá testar o nível de volume atual das transmissões recebidas do rádio desativando o modo silencioso do alto-falante do rádio. Quando esse botão é pressionado, os tons soam na configuração atual do rádio pelo período de tempo em que o botão é pressionado; quando você ajusta o volume, o nível de áudio do tom é ajustado simultaneamente.

10.8.1.14.61

Wi-Fi ativado/desativado

Ao pressionar esse botão, você poderá ativar e desativar o recurso Wi-Fi.

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

10.8.1.14.62

Banco de zonas para baixo

Pressione este botão para navegar para baixo (rolar a lista em ordem decrescente) pelos Bancos de zonas do rádio.

Quando o campo Operação do banco de zonas está definido como **Avançado**, é possível navegar mais rapidamente (em ordem crescente) com um [Duração longa do pressionamento de teclas na página 144](#) do botão.

OBSERVAÇÃO:

O botão programável [Banco de zonas ativo na página 193](#) permite navegar para cima (em ordem crescente) pelos Bancos de zonas do rádio. Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

INFORMAÇÕES:

Ao atribuir Banco de zonas para cima ou Banco de zonas para baixo a um botão programável, a [Seleção de zonas na página 203](#) é atribuída automaticamente à chave de alternância de três posições A/B/C.

O botão giratório poderá, então, ser definido apenas para a seleção [Seleção de canais na página 200](#). Apenas 16 canais são permitidos por zona ao usar o botão giratório como o seletor de canais.

10.8.1.14.63

Banco de zonas ativo

Pressione este botão para navegar para cima (em ordem crescente) pelos Bancos de zonas do rádio.

Quando o campo Operação do banco de zonas está definido como **Avançado**, é possível navegar mais rapidamente (em ordem crescente) com um [Duração longa do pressionamento de teclas na página 144](#) do botão.

OBSERVAÇÃO:

O botão programável [Banco de zonas para baixo na página 192](#) permite navegar para baixo (em ordem decrescente) pelos Bancos de zonas do rádio. Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

INFORMAÇÕES:

Ao atribuir Banco de zonas para cima ou Banco de zonas para baixo a um botão programável, a [Seleção de zonas na página 203](#) é atribuída automaticamente à chave de alternância de três posições A/B/C.

O botão giratório poderá, então, ser definido apenas para a seleção [Seleção de canais na página 200](#). Apenas 16 canais são permitidos por zona ao usar o botão giratório como o seletor de canais.

10.8.1.14.64

Zona para baixo

Pressionar este botão permite navegar para baixo na lista de zonas do rádio.

É possível rolar mais rapidamente com um [Duração longa do pressionamento de teclas na página 144](#) do botão. Quando você chegar à primeira zona da lista, se continuar rolando a tela, a lista mostrará a última zona. As zonas são definidas na janela Atribuição de zonas e canais.

OBSERVAÇÃO:

Em determinados rádios portáteis, zonas também podem ser agrupadas em bancos de zonas, nos quais os bancos individuais podem ser selecionados com o pressionamento do botão [Banco de zonas ativo na página 193](#) ou [Banco de zonas para baixo na página 192](#).

10.8.1.14.65

Zona para cima

Esse pressionamento de botão permite rolar para cima pelas zonas do rádio.

É possível rolar mais rapidamente com um [Duração longa do pressionamento de teclas na página 144](#) do botão. Ao atingir a última Zona na lista, a navegação contínua fará com que a lista se envolva

com a primeira Zona. As zonas são definidas na página Zona da janela Atribuição de zonas e canais. Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

**OBSERVAÇÃO:**

Em determinados rádios portáteis, zonas também podem ser agrupadas em bancos de zonas, nos quais os bancos individuais podem ser selecionados com o pressionamento do botão [Banco de zonas ativo na página 193](#) ou [Banco de zonas para baixo na página 192](#).

10.8.1.15

Botões de Chaveiro inteligente (convencional)

Este campo seleciona a função dos botões de Chaveiro inteligente (SKF) que são programáveis.

**AVISO:**

Não duplique uma função em vários controles, como em mais de um botão, mais de uma chave ou combinando ambos. Isso pode causar uma operação incorreta do rádio.

Consulte [Seleções de botões](#) para obter a lista de seleções compatíveis.

10.8.1.16

Botões de Chaveiro inteligente (entroncamento)

Este campo seleciona a função dos botões de Chaveiro inteligente (SKF) que são programáveis.

**AVISO:**

Não duplique uma função em vários controles, como em mais de um botão, mais de uma chave ou combinando ambos. Isso pode causar uma operação incorreta do rádio.

Consulte [Seleções de botões](#) para obter a lista de seleções compatíveis.

10.8.2

Switches

Essa sessão permite atribuir funcionalidade às chaves giratórias, de alternância, multifunção e concêntricas do rádio.

A atribuição Giratória e Botão multifunção (MFK) é aplicada enquanto o rádio está em funcionamento no modo de comunicações convencional ou de entroncamento. Para chaves concêntricas e de alternância do rádio, há seleções separadas para modos convencional e de entroncamento.

**OBSERVAÇÃO:**

Essas seleções são dependentes do modelo/da opção do rádio.

10.8.2.1

Seleções Giratórias

Seleciona a funcionalidade da chave giratória do modo de comunicações convencional e de entroncamento.

**AVISO:**

Você não deve duplicar uma função em controles múltiplos, como em mais de um botão, mais de uma chave ou combinando ambos. Isso pode causar uma operação incorreta do rádio.

As seleções a seguir são compatíveis:

[Em branco na página 200](#)

(Destina-se a controles que não estão em uso.)

Seleção Canal/sub (Seleção de canais na página 200)

Quando o rádio está habilitado para o modelo/para a opção.

**AVISO:**

Essa seleção não pode estar definida simultaneamente como Chave giratória, Chaves concêntricas e Chave de alternância.

Seleção zona/sis. (Seleção de zonas na página 203)

Quando o rádio está habilitado para o modelo/para a opção.

**AVISO:**

Essa seleção não pode estar definida simultaneamente como Chave giratória, Chaves concêntricas e Chave de alternância.

Essa não é uma seleção válida quando o [Banco de zonas ativo na página 193](#) ou o [Banco de zonas para baixo na página 192](#) estiver definido em um botão programável.

**OBSERVAÇÃO:**

Essas seleções dependem da opção ou do modelo do rádio e são aplicáveis aos modos de comunicações convencionais e de entroncamento.

10.8.2.2

Posição A da Chave concêntrica (Convencional)

Seleciona a função para a Posição A da chave concêntrica do rádio portátil A.

Essas atribuições podem ser selecionadas como modo de comunicações Convencionais e de Entroncamento.

**AVISO:**

Não duplique uma função em vários controles, como em mais de um botão, mais de uma chave ou combinando ambos. Isso pode causar uma operação incorreta do rádio.

Consulte [Seleções de chave na página 197](#) para obter uma lista de seleções compatíveis.

**OBSERVAÇÃO:**

Essas seleções são dependentes da opção/do modelo do rádio e aplicáveis aos modos de comunicações Convencional e de Entroncamento, a não ser que seja indicada outra maneira.

10.8.2.3

Posição A da Chave concêntrica (Entroncamento)

Seleciona a função para a Posição A da chave concêntrica do rádio portátil A.

**AVISO:**

Não duplique uma função em vários controles, como em mais de um botão, mais de uma chave ou combinando ambos. Isso pode causar uma operação incorreta do rádio.

Consulte [Posição A da Chave concêntrica \(Convencional\) na página 195](#) para notas e avisos.

Consulte [Seleções de chave na página 197](#) para obter uma lista de seleções compatíveis.

10.8.2.4

Posição B da Chave concêntrica (Convencional)

Seleciona a função para a Posição B da Chave concêntrica do rádio portátil.

**AVISO:**

Não duplique uma função em vários controles, como em mais de um botão, mais de uma chave ou combinando ambos. Isso pode causar uma operação incorreta do rádio.

Consulte [Posição A da Chave concêntrica \(Convencional\) na página 195](#) para notas e avisos.

Consulte [Seleções de chave na página 197](#) para obter uma lista de seleções compatíveis.

10.8.2.5

Posição B da Chave concêntrica (Entroncamento)

Seleciona a função para a Posição B da chave concêntrica do rádio portátil.

AVISO:

Não duplique uma função em vários controles, como em mais de um botão, mais de uma chave ou combinando ambos. Isso pode causar uma operação incorreta do rádio.

Consulte [Posição A da Chave concêntrica \(Convencional\) na página 195](#) para notas e avisos.

Consulte [Seleções de chave na página 197](#) para obter uma lista de seleções compatíveis.

10.8.2.6

Posição A da Chave Momentânea (Convencional)

Seleciona a função para a Posição A da chave de alternância do rádio portátil A.

AVISO:

Não duplique uma função em vários controles, como em mais de um botão, mais de uma chave ou combinando ambos. Isso pode causar uma operação incorreta do rádio.

Consulte [Posição A da Chave concêntrica \(Convencional\) na página 195](#) para notas e avisos.

Consulte [Seleções de chave na página 197](#) para obter uma lista de seleções compatíveis.

10.8.2.7

Posição A da Chave Momentânea (Entroncamento)

Seleciona a função para a Posição A da chave de alternância do rádio portátil A.

AVISO:

Não duplique uma função em vários controles, como em mais de um botão, mais de uma chave ou combinando ambos. Isso pode causar uma operação incorreta do rádio.

Consulte [Posição A da Chave concêntrica \(Convencional\) na página 195](#) para notas e avisos.

Consulte [Seleções de chave na página 197](#) para obter uma lista de seleções compatíveis.

10.8.2.8

Posição B da Chave Momentânea (Convencional)

Seleciona a função para a Posição A da chave de alternância do rádio portátil B.

AVISO:

Não duplique uma função em vários controles, como em mais de um botão, mais de uma chave ou combinando ambos. Isso pode causar uma operação incorreta do rádio.

Consulte [Posição A da Chave concêntrica \(Convencional\) na página 195](#) para notas e avisos.

Consulte [Seleções de chave na página 197](#) para obter uma lista de seleções compatíveis.

10.8.2.9

Posição B da Chave Momentânea (Entroncamento)

Seleciona a função para a Posição A da chave de alternância do rádio portátil B.

AVISO:

Não duplique uma função em vários controles, como em mais de um botão, mais de uma chave ou combinando ambos. Isso pode causar uma operação incorreta do rádio.

Consulte [Posição A da Chave concêntrica \(Convencional\) na página 195](#) para notas e avisos.

Consulte [Seleções de chave na página 197](#) para obter uma lista de seleções compatíveis.

10.8.2.10

Posição C da Chave Momentânea (Convencional)

Selecione a função para a Posição C da chave de alternância do rádio portátil.

**AVISO:**

Não duplique uma função em vários controles, como em mais de um botão, mais de uma chave ou combinando ambos. Isso pode causar uma operação incorreta do rádio.

Consulte [Posição A da Chave concêntrica \(Convencional\) na página 195](#) para notas e avisos.

Consulte [Seleções de chave na página 197](#) para obter uma lista de seleções compatíveis.

10.8.2.11

Posição C da Chave Momentânea (Entroncamento)

Selecione a função para a Posição C da chave de alternância do rádio portátil.

**AVISO:**

Não duplique uma função em vários controles, como em mais de um botão, mais de uma chave ou combinando ambos. Isso pode causar uma operação incorreta do rádio.

Consulte [Posição A da Chave concêntrica \(Convencional\) na página 195](#) para notas e avisos.

Consulte [Seleções de chave na página 197](#) para obter uma lista de seleções compatíveis.

10.8.2.12

Seleções de chave

Este tópico lista as seleções de chave quando as mesmas estiverem disponíveis para os usuários.

Seleções de chave:	Esta seleção só é válida no RadioCentral e/ou disponível para o usuário:
Em branco na página 200	(Destina-se a controles que não estão em uso.)

Seleções de chave:	Esta seleção só é válida no RadioCentral e/ou disponível para o usuário:
<p>Seleção de canais na página 200</p>	<p>Quando selecionado, está sempre disponível ao usuário. Portanto, não depende de nenhum recurso ou seleção do RadioCentral.</p> <p> AVISO: Essa seleção não pode estar definida simultaneamente como chave giratória, chave concêntrica e chave de alternância.</p> <p>Essa seleção deve ser atribuída aos modos de comunicações convencionais e de entroncamento e para todas as posições da chave escolhida.</p> <p>Essa não é uma seleção válida para a chave de alternância de duas ou três posições, nem para a chave concêntrica quando o Banco de zonas ativo na página 193 ou o Banco de zonas para baixo na página 192 estiver definido em um botão programável.</p> <p> INFORMAÇÕES: Quando a Posição A da chave concêntrica convencional estiver definida como Seleção de canais, a Posição B da chave concêntrica convencional e a Posição A e a Posição B da chave concêntrica de entroncamento serão definidas automaticamente como Seleção de canais e serão somente para visualização. Portanto, somente a Posição A da chave concêntrica convencional poderá ser modificada.</p> <p>Quando a Posição A da chave de alternância convencional estiver definida como Seleção de canais, a Posição B e a Posição C da chave de alternância convencional e a Posição A, a Posição B e a Posição C da chave de alternância de entroncamento serão definidas automaticamente como Seleção de canais e serão somente para visualização. Portanto, somente a Posição A da chave de alternância convencional poderá ser modificada.</p>
<p>Bloqueio de teclado/controles na página 201</p>	<p>Quando o campo Ativação do bloqueio da chave giratória de Toda a ergonomia do rádio está Ativado (todos os modelos), ou quando o campo Ativação do bloqueio dos botões laterais de Toda a ergonomia do rádio está Ativado (todos os modelos) ou quando o rádio tem um teclado (específico de modelo).</p> <p> AVISO: Essa seleção não deve ser definida simultaneamente na Posição A e na Posição B da chave concêntrica, ou em todas as posições da chave de alternância. Caso contrário, os botões, os itens de menu e o botão giratório ficarão inoperáveis pelo usuário do rádio.</p>
<p>Desativação de PL na página 201</p>	<p>Ao operar no modo de comunicações convencional. Disponível somente para Convencional.</p>
<p>Varredura na página 202</p>	<p>Para Convencional, quando o Tipo de varredura na página 679 não estiver definido como Verificação de ponderação, o campo Seleção da lista de varredura na página 470 da Personalidade convencional não estiver definido como Nenhum e o campo Varredura automática na página 472 da Personalidade convencional estiver Desabilitado no canal atual do rádio.</p>

Seleções de chave:	Esta seleção só é válida no RadioCentral e/ou disponível para o usuário:
	<p>Para Entroncamento, quando o campo Seleção da lista de varredura na página 568 da Personalidade de entroncamento não estiver definido como Nenhum e o campo Varredura automática na página 569 da Personalidade de entroncamento estiver Desabilitado no canal atual do rádio.</p> <p> AVISO: Essa seleção não pode estar definida simultaneamente em botões, chaves e itens de menu. No entanto, ela pode ser definida simultaneamente em botões de aparelhos portáteis e de acessórios.</p> <p> INFORMAÇÕES: Essa seleção pode ser definida na chave concêntrica convencional (apenas uma posição) ou na chave de alternância convencional (até duas posições), mas não em ambas. A mesma restrição se aplica às chaves de entroncamento.</p> <p>Essa seleção pode estar definida simultaneamente em chaves concêntricas e/ou de alternância convencional e de entroncamento, observando a restrição anterior.</p>
Programação da lista de varredura na página 202	<p>Para Convencional, quando o campo Seleção da lista de varredura na página 470 da Personalidade convencional não estiver definido como Nenhum no canal atual do rádio.</p> <p>Para Entroncamento, quando o campo Seleção da lista de varredura na página 568 da Personalidade de entroncamento não estiver definido como Nenhum no canal atual do rádio.</p>
Modo Direto na página 202	<p>Ao operar no modo de comunicação Convencional e quando o campo Personalidade convencional, Direto/Talkaround na página 433 estiver Habilitado no canal atual do rádio. Disponível somente para Convencional.</p> <p> AVISO: Essa seleção não pode estar definida de forma simultânea em botões, chaves e itens de menu. No entanto, ela pode estar definida de forma simultânea em botões de acessórios e do portátil.</p> <p>Essa seleção só pode ser definida em uma chave.</p>
Baixa Energia de Transmissão na página 203	<p>Quando selecionado, está sempre disponível ao usuário. Portanto, não depende de nenhum recurso ou seleção do RadioCentral.</p>
Não programada na página 203	<p>(Destina-se a controles que não estão em uso.)</p>

Seleções de chave:	Esta seleção só é válida no RadioCentral e/ou disponível para o usuário:
<p>Seleção de zonas na página 203</p>	<p>Quando selecionado, está sempre disponível ao usuário. Portanto, não depende de nenhum recurso ou seleção do RadioCentral.</p> <p> AVISO: Essa seleção deve ser definida para os modos de comunicações convencional e de entroncamento e para todas as posições da chave selecionada.</p> <p>Essa seleção não pode estar definida simultaneamente como chave giratória, chave concêntrica e chave de alternância.</p> <p>Essa não é uma seleção válida para a chave concêntrica quando o Banco de zonas ativo na página 193 ou o Banco de zonas para baixo na página 192 estiver definido em um botão.</p> <p> INFORMAÇÕES: Ao atribuir Banco de zonas ativo ou Banco de zonas inativo a um botão programável, a Seleção de zonas será atribuída automaticamente à chave de alternância de três posições A/B/C.</p> <p>Quando a Posição A da chave concêntrica convencional estiver definida como Seleção de zonas, a Posição A e a Posição B da chave concêntrica de entroncamento e a Posição B da chave concêntrica convencional serão definidas automaticamente como Seleção de zonas e serão somente para visualização. Portanto, somente a Posição A da chave concêntrica convencional poderá ser modificada.</p> <p>Quando a Posição A da chave convencional de alternância estiver definida como Seleção de zonas, a Posição A, a Posição B e a Posição C da chave de alternância de entroncamento e a Posição B e a Posição C da chave de alternância convencional serão definidas automaticamente como Seleção de zonas e serão somente para visualização. Portanto, somente a Posição A da chave de alternância convencional poderá ser modificada.</p>

10.8.2.12.1

Em branco

Selecione este recurso para uma chave giratória, concêntrica ou de alternância de chave ou um botão multifunção (MFK) que não estiver em uso.

Esse recurso está disponível para o modo comunicações convencionais ou de entroncamento.

10.8.2.12.2

Seleção de canais

Essa seleção de chave giratória/de alternância ou MFK (Multi-Function Knob, botão de multifunção) permite alterar o canal do rádio.

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

INFORMAÇÕES:

Quando uma chave giratória for definida, somente os 16 primeiros canais (consulte a página Canais) definidos para cada zona estarão disponíveis no botão Giratório.

Quando definido como Chave de 2 posições ou de 3 posições, somente os dois ou três primeiros canais (consulte a Página de canais) definidos para cada zona estão disponíveis na chave.

Quando selecionada como Chave de duas ou três posições, deve ser selecionada como Convencional e de Entroncamento e para todas as posições da chave.

Essa seleção somente poderá ser definida como chave Giratória quando o **Banco de zonas ativo** ou o **Banco de zonas inativo** estiver definido como um botão programável. Apenas 16 canais são permitidos por zona ao usar o botão giratório como o seletor de canais.

Quando selecionada como Função primária para um MFK, a **Seleção de volume** deve ser feita como Função secundária para que seja considerada válida.

10.8.2.12.3

Limpar seleção de transmissão

Essa alternância de chave permite desativar transmissões seguras.

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

10.8.2.12.4

Bloqueio de teclado/controles

A alternância de chave permite que você bloqueie ou desbloqueie o teclado do rádio (quando disponível).

A funcionalidade de bloqueio de controle adicional é possível para todos os modelos quando o campo Ativar bloqueio do botão giratório e/ou o campo Ativar bloqueio dos botões laterais estiver **Ativado** (consulte Nota importante). Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

INFORMAÇÕES:

Quando o campo Ativação do Bloqueio da Chave Giratória estiver **Ativado**, essa função também bloqueia o canal que estiver em funcionamento no momento, mesmo quando a chave giratória estiver em outra posição.

Quando o campo Ativação do Bloqueio dos Botões Laterais estiver **Ativado**, esse recurso também bloqueia o Botão Lateral Superior, o Botão Lateral do Meio e o Botão Lateral Inferior.

10.8.2.12.5

Silenciar

A alternância de chave permite ativar ou desativar determinados tons de rádio (por exemplo, os tons do teclado), conforme configurado pela seleção Operação emudecer tons avançada.

Esse recurso está disponível para o modo comunicações convencionais ou de entroncamento.

10.8.2.12.6

Desativação de PL

Essa alternância de chave permite desativar o silenciador de portadora de PL/DPL.

Essa função está disponível durante a operação no modo de comunicações convencionais.

10.8.2.12.7

Varredura

A alternância de chave permite selecionar as listas de varredura e ativar ou desativar o modo de varredura ao operar no modo de comunicações convencional ou de entroncamento.

10.8.2.12.8

Programação da lista de varredura

Esta alternância de chave coloca o rádio no modo **Edição da lista de verificação**.

Enquanto estiver nesse modo de edição, você pode adicionar ou remover membros individuais da Lista de verificação e modificar a prioridade de verificação de qualquer membro. Comunicações Over-the-Air não são possíveis neste modo de edição da Lista de verificação. Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

INFORMAÇÕES:

O botão do lado superior do rádio se torna automaticamente o botão designado Selecionar durante a edição de um canal da lista de verificação. Isso somente é verdadeiro quando o rádio está operando no modo Programação da lista de verificação.

10.8.2.12.9

Seleção de Transmissão Segura

Essa alternância de chave permite escolher transmissões criptografadas seguras (ou não criptografadas).

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

10.8.2.12.10

Modo Direto

Essa alternância de chave permite habilitar ou desabilitar o modo Direto/Talkaround no perfil de opções de canal atual.

Essa função está disponível durante a operação no modo de comunicações convencionais.

10.8.2.12.11

Inibição de transmissão

Essa alternância de chave permite desativar todas as transmissões do rádio ao operar no modo de comunicação Convencional ou de Entroncamento.

INFORMAÇÕES:

Essa ação pode ser necessária ao entrar em ambientes perigosos com alta sensibilidade a campos de RF em que a transmissão de rádio possa iniciar uma explosão ou outras reações adversas.

OBSERVAÇÃO:

Se você tentar ligar o rádio enquanto a inibição de Tx estiver **Ativada**, o rádio emitirá um tom de proibição de fala longo e grave, indicando que as transmissões não são permitidas no momento.

10.8.2.12.12

Inibição de transmissão desativada

Essa alternância de chave permite ativar todas as transmissões do rádio ao operar no modo de comunicação Convencional ou de Entroncamento.

10.8.2.12.13

Baixa Energia de Transmissão

Essa alternância de chave permite alterar a potência de transmissão do rádio de baixa para alta e vice-versa em todos os rádios.

Uma vez iniciada, essa configuração de baixa potência tem precedência sobre todas as configurações individuais de [Nível de potência de transmissão na página 429](#) com Personalidade convencional e [Nível de potência de TX na página 520](#) com Sistema de entroncamento. A configuração de energia do rádio também mudará para alta potência em todos os rádios quando a chave for movida para outra seleção programada. Desligar e ligar o rádio reinicia as configurações de energia programadas de todos os canais do rádio.

10.8.2.12.14

Não programada

Selecione esta função para trocar para uma chave que não está em uso.

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

10.8.2.12.15

Seleção de zonas

Essa alternância de chave/botão giratório/MFK (Multi-Function Knob, botão Multifunção) permite que o usuário selecione uma zona.

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

INFORMAÇÕES:

Quando definida por uma chave, somente as duas ou três primeiras zonas definidas na Atribuição de zonas e canais estarão disponíveis na chave. Consulte também Banco de zonas, Banco de zonas ativo e Banco de zonas inativo.

Quando selecionada como Chave de duas ou três posições, deve ser selecionada como Convencional e de Entroncamento e para todas as posições da chave.

Esta seleção está automaticamente definida como Chave de Alternância de três posições A/B/C quando o **Banco de zonas ativo** ou o **Banco de zonas inativo** está definido como um botão programável. Consulte também o Conceito keystone do banco de zonas.

Quando selecionada como Função primária para um MFK, a **Seleção de volume** deve ser feita como Função secundária para que seja considerada válida.

10.8.2.12.16

Seleção de volume

Esta seleção do MFK (Multi-Function Knob, botão multifunção) permite alterar o volume do rádio.

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

**AVISO:**

Para operação de função dupla:

- Se a **Seleção de zonas** ou a **Seleção de canais** for atribuída à função primária do MFK, a **Seleção de volume** deverá ser atribuída à função secundária para que seja considerada válida.
- Se a **Seleção de volumes** for atribuída à Função primária do MFK, a **Seleção de zonas** ou a **Seleção de canais** deverá ser atribuída à Função secundária para que seja considerada válida.

Para operação de função única: Você deve selecionar a **Seleção de volumes** como Função primária e **Em branco** como Função secundária para que seja considerada válida.

10.8.3

Itens de menu

A seção **Itens do menu** permite visualizar ou escolher as seleções que definem a funcionalidade do menu ou recursos disponíveis no visor do rádio.

A funcionalidade do menu Rádio é definida e opera separadamente para cada um dos modos de comunicações de rádio, convencional e de entroncamento. Ou seja, quando o rádio está operando em um canal convencional, somente as funções convencionais selecionadas estão disponíveis para você. Da mesma forma, quando o rádio está operando em um canal de entroncamento, somente os recursos de entroncamento selecionados estão disponíveis.

**INFORMAÇÕES:**

Algumas seleções do item de menu são removidas automaticamente da coluna do item do menu **Selecionado** se estiverem duplicadas em Seleções de botão ou Seleções de chaves; no entanto, certas seleções de itens de menu podem ser duplicadas para acomodar sua preferência ou conveniência.

Os modelos Portáteis APX™ 1000 1.5, APX™ 2000 1.5 e APX™ 4000Li 1.5 suportam no máximo três (3) seleções de tecla de função de menu (o limite normal é 24). Ao modificar os codeplugs desses modelos no aplicativo, se você tentar selecionar mais de três itens de menu, o campo **Selecionado** se tornará inválido.

**OBSERVAÇÃO:**

Algumas seleções variam de acordo com o modelo ou a opção do rádio.

10.8.3.1

Disponível/Selecionado (convencional)

Este campo permite adicionar ou remover o item de menu Recursos convencionais.

Na coluna **Itens disponíveis**, selecione os recursos no visor do rádio que estão disponíveis para uso, enquanto estiver operando no modo de comunicação Convencional.

**OBSERVAÇÃO:**

Clicar no botão **Adicionar** ou **Remover** permite adicionar ou remover itens de menu selecionados na coluna **Selecionado**.

Deve haver pelo menos um item de menu na coluna **Selecionados**.

Consulte [Seleções de menu na página 205](#) para obter uma lista seleções compatíveis:

10.8.3.2

Disponível/selecionado (Entroncamento)

Este campo permite adicionar ou remover recursos de entroncamento do item de menu.

Na coluna **Itens disponíveis**, selecione os recursos que aparecerão no visor do rádio, que estão disponíveis para uso, enquanto estiver operando no modo de comunicação Entroncamento.

**OBSERVAÇÃO:**

Clicar no botão **Adicionar** ou **Remover** permite adicionar ou remover itens de menu selecionados na coluna **Selecionado**.

Deve haver pelo menos um item de menu na coluna **Selecionados**.

Consulte [Seleções de menu na página 205](#) para obter uma lista seleções compatíveis:

10.8.3.3

Seleções de menu

Este tópico lista as seleções de itens de menu e quando ele está disponível para os usuários.

Seleções de item de menu:	Esta seleção só é válida no RadioCentral e/ou disponível para o usuário:
Bateria na página 210 (BATT)	Quando selecionada, está sempre disponível ao usuário. Portanto, não depende de nenhum recurso ou seleção.
Bluetooth na página 210 (BT)	Quando o campo Ativação de Bluetooth na página 135 estiver Ativado .
Sinal na página 210 (BCON)	Quando o rádio está ativado para o modelo/para a opção.
Selecionar/Ligação privada na página 211 (CALL)	Para convencional, quando a Recepção/transmissão de chamada seletiva na página 462 ASTRO da Personalidade convencional estiver definida como Codificação ou Codificação e decodificação ou a Recepção/transmissão de chamada seletiva na página 457 Não ASTRO da Personalidade convencional estiver definido como Codificação ou Codificação e decodificação no canal atual do rádio. Para Entroncamento, quando o Tipo de chamada privada na página 565 da Personalidade de entroncamento não estiver definido como Desabilitado no canal atual do rádio.
Canal para Baixo na página 211 (CHDN)	Quando selecionada, está sempre disponível ao usuário. Portanto, não depende de nenhum recurso ou seleção.
Busca de Canais na página 211 (CHSR)	Quando selecionada, está sempre disponível ao usuário. Portanto, não depende de nenhum recurso ou seleção.
Seleção de canais na página 211 (CHAN)	Quando selecionada, está sempre disponível ao usuário. Portanto, não depende de nenhum recurso ou seleção.
Canal para cima na página 211 (CHUP)	Quando selecionada, está sempre disponível ao usuário. Portanto, não depende de nenhum recurso ou seleção.
Clock na página 212 (CLCK)	Quando o campo Formato de hora de Todos os rádios não estiver definido como Desativado .

Seleções de item de menu:	Esta seleção só é válida no RadioCentral e/ou disponível para o usuário:
Contacts na página 212 (CNTS)	Quando selecionada, está sempre disponível ao usuário. Portanto, não depende de nenhum recurso ou seleção.
Discador	Quando o rádio está ativado para o modelo/para a opção.
Direto/Talkaround na página 212 (DIR)	Ao operar no modo de comunicação Convencional e quando o campo Personalidade convencional, Direto/Talkaround na página 433 estiver Ativado no canal atual do rádio.  INFORMAÇÕES: Essa seleção não pode ser programada simultaneamente em botões, chaves e itens de menu.
ID Dinâmico na página 212 (DYID)	Ao operar no modo de comunicação Convencional e quando o campo Ativação de ID dinâmico do Sistema convencional estiver Habilitado no canal atual do rádio.
Prioridade dinâmica na página 212 (DYNP) 	Quando o modo Verificação estiver ativado, quando o Tipo de varredura na página 679 for Convencional e quando o campo Prioridade dinâmica na página 683 da Lista de verificação estiver ativado no canal de verificação em espera atual do rádio.
Apagar na página 212 (ERAS)	Quando o campo Operação segura na página 294 de Proteção total estiver definido como Hardware ou Software e Padrão de criptografia avançada (AES256) na página 295 estiver ativado.
Informações na página 213 (INFO)	Quando selecionada, está sempre disponível ao usuário. Portanto, não depende de nenhum recurso ou seleção.
Endereço de protocolo da Internet na página 213 (IP)	Quando selecionada, está sempre disponível ao usuário. Portanto, não depende de nenhum recurso ou seleção.
Chave na página 213 (KEY)	Quando o campo Ligação de Chave de Voz na página 480 de Voz da Personalidade convencional estiver definido como Selecionar no canal do rádio atual.
Conjunto de chaves na página 213 (KSET)	Quando o campo Operação segura na página 294 de Proteção total estiver definido como Hardware ou Software , o Padrão de criptografia avançada (AES256) na página 295 estiver habilitado e Selecionável pelo usuário (conjunto de chaves) estiver habilitado.
Location na página 214 (LOC)	Quando o campo Todos os rádios, Ativação de localização na página 118 estiver Ativado .
LTE na página 214 (LTE)	Para Convencional, quando o Tipo de perfil de dados na página 370 do Perfil de dados de referência do Sistema convencional for Convencional e banda larga ou Somente banda larga . Para entroncamento, quando o Tipo de perfil de dados do Perfil de dados de referência do Sistema de entroncamento for Entroncamento e banda larga ou Somente banda larga .

Seleções de item de menu:	Esta seleção só é válida no RadioCentral e/ou disponível para o usuário:
Message na página 214 (MSG)	Para Convencional, quando o campo Mensagem do Sistema convencional estiver Ativado no canal atual do rádio. Para Entroncamento, quando o campo Ativação da mensagem na página 570 da Personalidade de entroncamento estiver Ativado no canal do rádio atual.
Seleção de modo na página 214 (MS01–MS05)	Quando selecionada, está sempre disponível ao usuário. Portanto, não depende de nenhum recurso ou seleção.
Linha privada múltipla na página 215 (MPL)	Quando o campo Tipo de voz/sinal de recepção na página 424 da Personalidade convencional estiver definido como Não ASTRO ou Modo misto e o campo PM (MPL) selecionável pelo usuário da Personalidade convencional estiver Habilitado no canal atual do rádio. Disponível somente para Convencional.
Silenciar na página 215 (MUTE)	Quando o campo Operação Emudecer tons Avançada na página 107 de Todos os rádios não está Desativado .
Identificação do meu rádio (MEID) na página 215 (MYID)	Quando o campo Alias do rádio de Todos os rádios tem um nome de alias definido.
Excluir perturbações na página 215 (NUIS)	Quando o modo Verificação está Ativado .
Página na página 216 (PAGE)	Para Convencional, quando o campo Recepção/Transmissão de alerta de chamada na página 464 do ASTRO da Personalidade convencional estiver definido como Codificação ou Codificação e decodificação ou o campo Recepção/Transmissão de alerta de chamada na página 459 do Não ASTRO da Personalidade convencional estiver definido como Codificação ou Codificação e decodificação no canal atual do rádio. Para Entroncamento, quando o campo Alerta de chamada/operação da página na página 566 da Personalidade de entroncamento estiver definido como Somente lista ou Ilimitado no canal atual do rádio.
Senha na página 216 (PSWD)	Quando o campo Ativar (Bloqueio de rádio) de Todos os rádios estiver Ativado .
Phone na página 216 (PHON)	Para Convencional, quando o campo Operação do telefone na página 568 da Personalidade convencional não estiver definido como Nenhum no canal atual do rádio. Para entroncamento, quando o campo Operação do telefone na página 568 da Personalidade de entroncamento não estiver definido como Desativado no canal atual do rádio.
Alimentação na página 216 (PWR)	Quando selecionada, está sempre disponível ao usuário. Portanto, não depende de nenhum recurso ou seleção.

Seleções de item de menu:	Esta seleção só é válida no RadioCentral e/ou disponível para o usuário:
Quik-Call II na página 217 (QCII)	<p>Quando selecionada, a QCII é iniciada pressionando o botão PTT, que transmite os tons pela rede de rádio.</p> <p>Para Convencional, quando o campo Lista de sinalização de tom na página 642 da Personalidade convencional estiver definido para uma Lista de sinalização de tom específica e o rádio for compatível com o modelo/opção.</p> <p>Para entroncamento, quando o campo Lista de sinalização de tom na página 642 da Personalidade de entroncamento estiver definido para uma Lista de sinalização de tom específica, e o rádio for compatível com o modelo/opção.</p>
Perfis de rádio na página 217 (PRFL)	Quando selecionada, está sempre disponível ao usuário. Portanto, não depende de nenhum recurso ou seleção.
Chamadas recentes na página 217 (RCNT)	Quando selecionada, está sempre disponível ao usuário. Portanto, não depende de nenhum recurso ou seleção.
Solicitação de rechaveamento na página 217 (REKY)	Quando Informações sobre o ASTRO OTAR, Solicitação de rechaveamento selecionado pelo usuário na página 321 não estiver definido como Desativado ou quando o MDC OTAR, Modo de solicitação de alteração de chave na página 301 não estiver definido como Desativado .
Emergência remota na página 188 (REMG)	Quando selecionado, sempre disponível para você, e por isso não dependente de nenhuma função ou seleção.
Varredura na página 218 (SCAN)	<p>Para Convencional, quando o Tipo de varredura na página 679 não estiver definido como Verificação de ponderação, o campo Seleção da lista de varredura na página 470 da Personalidade convencional não estiver definido como Nenhum e o campo Varredura automática na página 472 da Personalidade convencional estiver Desativada no canal atual do rádio.</p> <p>Para Entroncamento, quando o campo Seleção da lista de varredura na página 568 da Personalidade de entroncamento não estiver definido como Nenhum e o campo Varredura automática na página 569 da Personalidade de entroncamento estiver Desativado no canal atual do rádio.</p> <p> INFORMAÇÕES: Essa seleção não pode estar definida de forma simultânea em botões, chaves e itens de menu. No entanto, ela pode estar definida de forma simultânea em botões de acessórios e do portátil.</p>
Lista de varredura na página 218 (SCNL)	Para Convencional, quando o campo Seleção da lista de varredura na página 470 da Personalidade convencional não estiver definido como Nenhum no canal atual do rádio.

Seleções de item de menu:	Esta seleção só é válida no RadioCentral e/ou disponível para o usuário:
	Para Entroncamento, quando o campo Seleção da lista de varredura na página 568 da Personalidade de entroncamento não estiver definido como Nenhum no canal atual do rádio.
Sensor na página 218 (SNSR)	Quando o rádio está ativado para o modelo/para a opção.
Status na página 218 (STS)	Para Convencional, quando o campo Status na página 412 do Sistema convencional estiver Ativado no canal atual do rádio. Para Entroncamento, quando o campo Ativação do alias na página 570 da Personalidade de entroncamento estiver Ativado no canal atual do rádio.
Grupo de conversação na página 219 (TGRP)	Quando o campo Tipo de seleção na página 467 Grupo de conversação ASTRO da Personalidade convencional estiver definido como Selecionável no canal do rádio atual. Disponível somente para Convencional.
Serviço de mensagens de texto na página 219 (TMS)	Para Convencional, quando o campo Serviço de mensagens de texto na página 415 do Sistema convencional estiver definido como Somente lista ou Ilimitado e a Seleção de Perfil de dados na página 411 desse sistema não estiver definida como Dados desativados no canal atual do rádio. Para Entroncamento, quando o campo Serviço de mensagens de texto na página 526 do Sistema de entroncamento estiver definido como Somente lista ou Ilimitado e a Seleção de Perfil de dados na página 581 desse Sistema não estiver definida como Dados desativados no canal atual do rádio.
Inibição de transmissão na página 219 (TxIN)	Para um codeplug móvel: quando o campo Seleção de rádio não estiver definido como Rádio secundário ou o campo Habilitar Transmissão de Rádio Secundário estiver Habilitado .  INFORMAÇÕES: Para um codeplug portátil: essa seleção não pode ser definida simultaneamente com uma seleção de chave Inibição de transmissão na página 202 .
Usuário na página 219 (USER)	Quando selecionada, está sempre disponível ao usuário. Portanto, não depende de nenhum recurso ou seleção.
Silenciar voz na página 220 (VMUT) 	Para Convencional, quando o campo Ativação do alerta do usuário de chamada recebida de chamada ASTRO da Personalidade convencional estiver Ativado no canal atual ou o campo (Não ASTRO) Ativação do alerta do usuário de chamada recebida de chamada não ASTRO da Personalidade convencional estiver Ativado no canal atual.

Seleções de item de menu:	Esta seleção só é válida no RadioCentral e/ou disponível para o usuário:
	Quando o campo Alerta do usuário de chamada recebida ativado na página 567 da Personalidade de entroncamento estiver Habilitado no canal atual do rádio.
Wi-Fi ativado/desativado na página 192 (WIFI)	Selecionar esse item de menu fornece informações e opções Wi-Fi ao usuário. Esse campo só é ativado quando o campo Wi-Fi Ativado na página 358 está Ativado .
Zona para baixo na página 220 (ZNDN)	Quando selecionada, está sempre disponível ao usuário. Portanto, não depende de nenhum recurso ou seleção.
Programação da Zona Dinâmica na página 220 (ZNPR)	Quando o campo Zona dinâmica ativada da Atribuição de zonas e canais estiver Ativado para uma ou mais zonas do rádio.
Seleção de zonas na página 220 (ZONE)	Quando selecionada, está sempre disponível ao usuário. Portanto, não depende de nenhum recurso ou seleção.
Zona para cima na página 220 (ZNUP)	Quando selecionada, está sempre disponível ao usuário. Portanto, não depende de nenhum recurso ou seleção.

10.8.3.3.1

Bateria

Esta seleção de menu permite verificar o nível de potência da bateria ao operar no modo de comunicações Convencionais ou de Entroncamento.

10.8.3.3.2

Bluetooth

Selecionar esse item de menu fornece uma lista de status/informações de Bluetooth e opções de Bluetooth.

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

As funções de Configuração de Bluetooth incluem:

Status do Bluetooth

Permite ligar e desligar a funcionalidade de rádio Bluetooth para dispositivo Bluetooth.

Dispositivo Ativo

Permite visualizar uma lista de todos os dispositivos Bluetooth atualmente ativos (emparelhados).

Alto-falante do Bluetooth

Permite ligar e desligar o alto-falante do dispositivo Bluetooth.

10.8.3.3.3

Sinal

Esta seleção de menu permite verificar os detalhes de quaisquer sinais de Emergência recebidos recentemente.

Esse recurso está disponível para o modo comunicações convencionais ou de entroncamento.

10.8.3.3.4

Selecionar/Ligação privada

Esta seleção de menu permite que o usuário transmita uma Chamada seletiva — convencional ou uma Chamada privada — entroncamento.

É necessário selecionar o Contato/ID de chamada necessário e pressionar o botão PTT para iniciar a chamada.

Chamadas seletivas e privadas são normalmente usadas quando a maioria das transmissões ocorre entre você e um despachador ou um grupo de usuários.

É possível inserir ou selecionar diretamente as chamadas direcionadas com base no ID de chamada da Lista de prioridades de chamada do canal. Selecionar chamadas e Chamadas privadas não se destinam tanto para garantir a privacidade, mas para eliminar o incômodo de receber o tráfego que não se refere a elas. Consulte também: Convencional - Recepção/Transmissão de Ligação Seletiva e Entroncamento - Ligação Privada.

10.8.3.3.5

Canal para Baixo

Esta seleção de menu permite rolar para baixo até outros canais dentro da zona atual do rádio.

Os canais são definidos na janela Atribuição de zonas e canais. Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

10.8.3.3.6

Busca de Canais

Selecionar esse menu permite procurar um canal/modo com base no nome do canal programado e mudar diretamente para o canal encontrado.

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

OBSERVAÇÃO:

Esses [Nome do canal na página 668](#) podem ser exibidos na Página Canais da Janela Atribuição de Zonas e Canais com base na zona.

10.8.3.3.7

Seleção de canais

Essa seleção de menu permite pular para um canal no rádio digitando o número do canal no teclado do rádio.

Esse recurso é aplicável durante a operação no modo de comunicações Convencionais ou de Entroncamento.

OBSERVAÇÃO:

Esses números de canal devem ser programados e podem ser visualizados na página Canais da janela Atribuição de zonas e canais com base na zona.

10.8.3.3.8

Canal para cima

Essa seleção de menu permite rolar para cima até outros canais dentro da zona atual do rádio.

Os canais são definidos na janela Atribuição de zonas e canais. Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

10.8.3.3.9

Clock

Esta opção de menu permite visualizar e modificar as definições do relógio.

O formato de hora define o modo de hora padrão no display do rádio. Esse recurso é aplicável durante a operação no modo de comunicações Convencionais ou de Entroncamento.

INFORMAÇÕES:

O recurso Relógio aparece na tela do rádio somente quando o campo Todos os rádios, Formato de hora não está definido como **Desabilitado**.

10.8.3.3.10

Contacts

Esta opção do menu permite visualizar ou editar os contatos do canal atual do rádio.

Os contatos são programados na Lista de ligações unificadas. Os contatos compõem os membros das Listas de favoritos de ligações.

É possível selecionar os membros/contatos da lista de prioridades, permitindo tipos de chamada como chamadas telefônicas, chamadas seletivas/privadas, alertas de chamadas/páginas para rádios individuais ou para grupos de rádio. Esse recurso é aplicável durante a operação no modo de comunicações Convencionais ou de Entroncamento.

INFORMAÇÕES:

Esta função não está disponível para rádios portáteis com somente um visor superior.

10.8.3.3.11

Direto/Talkaround

Essa seleção de menu permite ativar ou desativar o modo Direto/Talkaround no perfil de opções de canal atual.

Essa função está disponível durante a operação no modo de comunicações convencionais.

10.8.3.3.12

ID Dinâmico

Essa seleção de menu permite entrar no modo de edição do ID dinâmico, o que permite visualizar e/ou editar o ID individual e/ou o ID principal do MDC do rádio no Sistema ASTRO e/ou MDC atual.

Essa função está disponível durante a operação no modo de comunicações convencionais.

10.8.3.3.13

Prioridade dinâmica

Essa seleção de item de menu permite selecionar a atribuição de verificação de Prioridade dinâmica.

Essa função está disponível durante a operação no modo de comunicações convencionais.

10.8.3.3.14

Apagar

Selecionar esse item de menu permite remover a chave de criptografia segura atual que o rádio está usando ou todas as chaves de criptografia atuais do rádio.

Essa seleção se aplica ao operar no modo de comunicações convencionais ou de entroncamento.

10.8.3.3.15

Informações

Essa seleção de menu permite recuperar e visualizar as informações básicas do rádio, como informações de IP e mapeamento de controle de botões/chaves, como também visualizar ou modificar o ID virtual.

Essa função se aplica somente ao operar em Sistemas Convencionais ASTRO. Essa é uma função exclusiva de rádios portáteis.

INFORMAÇÕES:

Modificar o ID Virtual altera o Nome do Usuário do rádio para o servidor de Serviço de Registro Automático ou um logon de servidor UNS (Unified Network Services, serviços de rede unificada) da Autenticação do Usuário. Ao editar o Nome do Usuário dessa forma, o PIN/a Senha e o ID da Unidade ficam em branco. Portanto, isso só pode ser usado quando o servidor estiver esperando um PIN/senha em branco e você não quiser usar o ID da unidade.

Esta função não está disponível para rádios portáteis com somente um visor superior.

10.8.3.3.16

Endereço de protocolo da Internet

Esta seleção de menu permite recuperar e visualizar (no visor do rádio) o endereço IP atual do rádio, o nome do dispositivo e o status.

Esse recurso é aplicável durante a operação no modo de comunicações Convencionais ou de Entroncamento.

10.8.3.3.17

Chave

Esta seleção de menu permite alterar a chave de criptografia segura para o canal de comunicações Convencional atual.

INFORMAÇÕES:

Essas Chaves selecionáveis são definidas exclusivamente com o campo [Número de CKR na página 311](#).

Quando você seleciona uma nova chave, todos os canais Convencionais do rádio com o campo [Ligação de Chave de Voz na página 480](#) definido como **Selecionar** são automaticamente recodificados com a mesma chave selecionada.

A mudança de chaves algumas vezes é útil quando sabe-se que uma chave de criptografia está comprometida

10.8.3.3.18

Conjunto de chaves

Esta seleção de menu permite alterar para um Conjunto de teclas de criptografia segura alternativo ao operar no modo de comunicações Convencionais ou de Entroncamento.

O conjunto de chaves selecionado se aplica a modos de comunicação convencionais e de entroncamento em todos os rádios.

INFORMAÇÕES:

Os Conjuntos de teclas alternativos estão disponíveis por causa da compatibilidade do [Gerenciamento de Chaves PID para o Modo ASN na página 309](#) Gerenciamento de chaves PID ou OTAR.

A mudança do conjunto de chaves algumas vezes é útil quando sabe-se que uma chave de criptografia está comprometida.

10.8.3.3.19

Location

Esta seleção de menu permite determinar a localização atual (latitude, longitude, hora e data) e também a distância e coordenada para outra localização ("ponto de rota").

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

INFORMAÇÕES:

Se o campo [Ativação de localização selecionada pelo usuário na página 118](#) para todos os rádios estiver **Ativado**, também será possível ativar ou desativar a funcionalidade de localização externa/GPS para todos os canais de comunicações Convencionais ou de Entroncamento habilitados para localização/GPS.

10.8.3.3.20

LTE

Essa seleção de botão ativa e desativa os recursos de dados de Banda Larga LTE do rádio.

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

INFORMAÇÕES:

Essa seleção de menu só funciona quando um canal que está configurado para a operação Banda larga LTE é selecionado. Quando um canal não LTE for selecionado, você não verá o menu.

Um canal é compatível com LTE quando seu campo [Tipo de perfil de dados na página 370](#) do Perfil de dados estiver definido como **Convencional e banda larga** ou **Entroncamento e banda larga** ou **Somente banda larga** e [Fonte de banda larga](#) estiver definido como **Modem LTE interno**.

10.8.3.3.21

Message

Esta seleção de menu permite exibir a última mensagem transmitida pelo rádio e reconhecida pela estação base durante a operação no modo de comunicações convencional ou de entroncamento.

10.8.3.3.22

Seleção de modo

Estas cinco seleções de menu (MS01 – MS05) permitem que você programe os usados com frequência ou qualquer combinação de zona e canal desejados. Se MSPR estiver selecionado, é possível predefinir a configuração para MS01–MS05 no rádio.

Cada uma das seleções de menu pode ser programada por meio de uma combinação de zona/canal diferente para recuperação posterior. A programação e o uso dessas seleções de menu são muito parecidos com a programação e o uso de botões predefinidos do rádio de um carro. Ou seja, depois de navegar para uma opção MSx no menu, um pressionamento do botão Selecionar menu por um tempo mais longo programa a zona e os canais atuais do rádio para essa opção de menu Msx. Em seguida, uma vez programado, um pressionamento curto do botão Selecionar menu leva o rádio para a zona e o canal programados.

Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

INFORMAÇÕES:

O [Duração curta do pressionamento de teclas na página 144](#) e o [Duração longa do pressionamento de teclas na página 144](#) são ambos definidos pelo RadioCentral.

10.8.3.3.23

Linha privada múltipla

A seleção desse menu permite acessar a relação de listas de MPL (Multiple Private Line, linha privada múltipla) disponíveis.

OBSERVAÇÃO:

Cada lista é representada por um nome reconhecível . Em seguida, você poderá selecionar as configurações desejadas de alias/PL. Essa função está disponível durante a operação no modo de comunicações convencionais.

10.8.3.3.24

Silenciar

Essa seleção de menu permite ativar ou desativar determinados tons do rádio (por exemplo, tons do teclado), conforme configurado pela seleção Operação emudecer tons avançada.

Esta função está disponível para os modos de comunicações Convencionais e de Entroncamento.

10.8.3.3.25

Identificação do meu rádio (MEID)

Selecionar esse item de menu permite fazer com que o alias do ID do rádio apareça no visor do rádio.

Esse recurso é aplicável durante a operação no modo de comunicações Convencionais ou de Entroncamento.

10.8.3.3.26

Excluir perturbações

Selecionar esse item de menu permite remover temporariamente um canal Membro da lista de verificação que gera continuamente ruído indesejado da portadora a partir da Verificação ativa atual.

Esse recurso é aplicável durante a operação no modo de comunicações Convencionais ou de Entroncamento.

INFORMAÇÕES:

Alternar para outro canal no seletor de canais do rádio, desligar e ligar o modo de verificação novamente ou desligar e ligar o rádio novamente leva efetivamente o canal Membro da Lista de Verificações temporariamente removido de volta para um status ativamente verificado.

Excluir perturbações não é possível:

- Para um canal do Membro da lista de verificações da Prioridade #1 ou Prioridade #2.
- Quando o campo [Tipo de membro de transmissão de voz designado na página 686](#) está definido como **Canal Selecionado** e a Frequência de Transmissão do canal de Verificação Selecionado é a mesma que a Frequência de Transmissão do canal do rádio selecionado no momento.
- Se a Lista de verificações atuais não contém, pelo menos, dois membros antes de ocorrer uma Exclusão de ocorrências.

10.8.3.3.27

Página

Selecionar esse item de menu permite que você transmita um Alerta de chamada nos modos convencionais ou um Alerta de chamada/Página nos modos de entroncamento.

**OBSERVAÇÃO:**

O Alerta de chamada/Página permite que um despachador ou chamador de rádio notifique você (ou um grupo de usuários) sobre uma chamada perdida. Os rádios de recepção são direcionados com base nas informações de rádio e sistema gerenciadas pelos IDs de chamada e contatos nas Listas de prioridades de chamada do rádio. Você pode inserir ou selecionar IDs de chamada diretamente da lista de prioridades do canal. O rádio receptor responde com tons de alerta e alertas visuais. O alerta visual (LED piscando) persiste até que você interaja com o rádio.

10.8.3.3.28

Senha

Selecionar esse item de menu permite modificar a senha de desbloqueio de Paralisação de inibição tática/Bloqueio do rádio e modificar a Senha de codificação de inibição tática.

Esse recurso é aplicável durante a operação no modo de comunicações Convencionais ou de Entroncamento.

**INFORMAÇÕES:**

Essa senha deve ser composta apenas de valores numéricos que podem ser facilmente digitados no teclado do rádio. O maior valor de senha possível é determinado pelo campo Tamanho máximo da senha.

Na versão de criptografia segura do recurso Bloqueio de rádio (veja a nota Importante no tópico Habilitar (Bloqueio do rádio)), a senha deve ser definida manualmente no módulo de criptografia de hardware por meio do teclado do rádio e da seleção do item de menu Senha.

Na versão de Inibição tática/Liberada do recurso Bloqueio do rádio, a senha inicial deve ser programada no campo Senha de desbloqueio.

10.8.3.3.29

Phone

Selecionar esse item de menu permite iniciar o modo Telefone ao operar no modo de comunicações convencionais ou de entroncamento.

10.8.3.3.30

Alimentação

Esse item de menu permite alternar a potência de transmissão do rádio de baixa para alta e vice-versa em todas as Personalidades convencionais ou Sistemas de entroncamento referenciados em todos os rádios.

**INFORMAÇÕES:**

Depois que a configuração da tela do rádio tiver sido alterada, essa configuração de potência alta ou baixa terá precedência sobre todas as configurações [Nível de potência de transmissão na página 429](#) convencionais individuais ou configurações [Nível de potência de TX na página 520](#) de entroncamento. Ou seja, ao selecionar o item de menu **PWR** do rádio, o rádio exibirá *Potência alta* ou *Potência baixa*, dependendo do status do canal atual do rádio. Você poderá, então, selecionar a transmissão em alta ou baixa potência na tela do rádio.

Desligar e ligar o rádio reinicia as configurações de energia programadas de todos os canais do rádio.

10.8.3.3.31

Quik-Call II

Esta opção permite iniciar o aplicativo QCII e escolher o tom a ser transmitido.

Esse recurso é aplicável durante a operação no modo de comunicações Convencionais ou de Entroncamento.

10.8.3.3.32

Perfis de rádio

Esta seleção de menu permite selecionar um dos Perfis de rádio programados na Atribuição de zonas e canais, desde que o campo Seleção de perfil do rádio esteja definido como Selecionado por último.

Esse recurso é aplicável durante a operação no modo de comunicações Convencionais ou de Entroncamento.

10.8.3.3.33

Swap do rádio

Esta seleção de menu permite alternar entre dois rádios (conhecido como o “bloco” do rádio) conectados na mesma cabeça de controle em uma configuração de Rádio duplo.

Esse recurso é aplicável durante a operação no modo de comunicações Convencionais ou de Entroncamento.

INFORMAÇÕES:

Se o campo Menu troca fixa estiver **Ativado**, uma seleção do menu **Troca de rádio** sempre será exibida na posição de menu mais à esquerda, mesmo quando você percorre os botões do menu programável e independentemente de esse recurso estar programado ou não; no entanto, quando o campo Menu de troca fixa está **Desativado**, essa seleção de menu pode ser acessada com o menu de rolagem padrão.

10.8.3.3.34

Chamadas recentes

Esta seleção de menu permite acessar informações sobre chamadas recentes, que foram recebidas e efetuadas, dos seguintes tipos: Alertas de chamada, Chamadas seletivas/privadas e Chamadas telefônicas (somente efetuadas).

Esse recurso é aplicável durante a operação no modo de comunicações Convencionais ou de Entroncamento.

10.8.3.3.35

Solicitação de rechaveamento

Esta opção do menu permite transmitir uma solicitação de OTAR (Over-The-Air-Rekeying, alteração de chave Over The Air) para o console do despachador (KMF ou KMC) ao operar no modo de comunicações convencionais ou de entroncamento.

INFORMAÇÕES:

Para MDC OTAR (Comunicações Convencionais), o protocolo de solicitação é determinado pelo campo [Modo de solicitação de alteração de chave na página 301](#).

Para ASTRO OTAR (Comunicações Convencionais ou de Entroncamento), o campo [Solicitação de rechaveamento selecionado pelo usuário na página 321](#) deve ser **Ativado** e o protocolo de solicitação é determinado pelo campo [Nível de segurança de transmissão do OTAR na página 319](#).

10.8.3.3.36

Emergência remota

Esse pressionamento de botão ativa o recurso Ativação de emergência remota para que um usuário autorizado codifique esse comando possa fazer com que um rádio de destino inicie o recurso de Emergência sem a intervenção do usuário de destino.

OBSERVAÇÃO:

A Emergência remota só é compatível com os canais ASTRO Convencional e ASTRO 25 Entroncamento.

10.8.3.3.37

Varredura

Esta seleção de menu permite selecionar Listas de varredura e ativar/desativar o modo de varredura ao operar no modo de comunicações Convencionais ou de Entroncamento.

10.8.3.3.38

Lista de varredura

Esta seleção de menu permite visualizar membros da Lista de varredura individual na Lista de varredura e também coloca o rádio no modo de Edição da lista de varredura.

Nesse modo de edição, é possível adicionar ou remover membros da lista de varredura e modificar a prioridade de varredura de qualquer membro. Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

INFORMAÇÕES:

O botão do lado superior do rádio se torna automaticamente o botão designado Selecionar durante a edição de um canal da lista de verificação. Isso somente é verdadeiro quando o rádio está operando no modo Programação da lista de verificação.

10.8.3.3.39

Sensor

Pressionar este botão permite selecionar o tempo de operação do Tempo de desativação de eventos do sensor.

O [Tempo de Desativação de Eventos do Sensor na página 136](#) é um campo de todos os Rádios. Esse recurso é aplicável durante a operação no modo de comunicações Convencionais ou de Entroncamento.

10.8.3.3.40

Status

Esta seleção de menu permite selecionar itens na Lista de alias de status do canal/modo atual.

OBSERVAÇÃO:

Para a sua conveniência, como parte desse recurso, o visor mostra inicialmente a última Chamada de status reconhecida ou o primeiro Status na lista. Esse recurso está disponível durante a operação no modo de comunicação Convencional ou de Entroncamento.

INFORMAÇÕES:

Ao operar no modo de comunicações Convencionais com a Sinalização do MDC/ASTRO/DVRS, a Lista de alias de status convencional será usada.

Ao operar no modo Comunicações de Entroncamento, o Sistema de Entroncamento - Lista de alias de status selecionado na Personalidade de entroncamento atual é utilizado.

10.8.3.3.41

Paralisar

A seleção desse menu permite transmitir um comando de Paralisação de inibição tática para um rádio específico ou para um grupo de rádios.

INFORMAÇÕES:

Isso só é possível quando a Personalidade convencional do aplicativo, campo Operação de paralisação de inibição tática, é definida como **Codificação** ou **Decodificação e Codificação**. A Operação de paralisação de inibição tática é definida conforme a Personalidade convencional.

10.8.3.3.42

Grupo de conversação

Essa opção de menu permite alternar do Grupo de conversação predefinido por outro Grupo de conversação a partir da Lista de grupos de conversação atual da Personalidade convencional.

Todas as Personalidades convencionais com a mesma Lista de grupo de conversação são automaticamente alternadas para o Grupo de conversação selecionado.

10.8.3.3.43

Serviço de mensagens de texto

Esta seleção de menu permite acessar o modo TMS do rádio, visto no visor do rádio.

Consulte também o Sistema de Entroncamento ou Sistema Convencional , função Serviço de mensagens de texto.

10.8.3.3.44

Inibição de transmissão

Esta seleção de menu permite desativar todas as transmissões do rádio ao operar no modo de comunicações convencional ou de entroncamento.

INFORMAÇÕES:

Essa ação pode ser necessária ao entrar em ambientes perigosos com alta sensibilidade a campos de RF em que a transmissão de rádio possa iniciar uma explosão ou outras reações adversas.

OBSERVAÇÃO:

Se você tentar ligar o rádio enquanto a inibição de Tx estiver **Ativada**, o rádio emitirá um tom de proibição de fala longo e grave, indicando que as transmissões não são permitidas no momento.

10.8.3.3.45

Usuário

Ao selecionar esse menu, você poderá fazer login em diferentes servidores de ARS (Automatic Registration Service, serviço de registro automático) com a combinação apropriada de nome de usuário e senha (PIN).

Os nomes de usuário e PINs podem ser digitados manualmente no teclado do rádio. Os nomes de usuários também podem ser selecionados nas entradas de [Lista de usuários dos dados na página 367](#) (o PIN é digitado manualmente). Esse recurso está disponível durante a operação no modo de

comunicação Convencional ou de Entroncamento. Veja também o campo Nome de usuário/ID do software.

**AVISO:**

Esta função funciona somente quando o campo [Modo ARS na página 375](#) dos Perfis de dados não é definido como **Desativado**.

10.8.3.3.46

Silenciar voz

Ao selecionar esse menu, você poderá ativar e desativar a função Silenciar voz dos canais habilitados para Alerta do usuário de chamada recebida.

Quando a função Silenciar voz estiver ativa, o rádio ficará emudecido para todas as chamadas de comunicações convencionais e chamadas do Grupo de conversação de entroncamento afiliado. Páginas/alertas de chamadas em grupo ou individuais realmente silenciam o rádio para os tons de alerta; além disso, quando a função Silenciar voz está ativa, o rádio não emudece para chamadas individuais de rádio para rádio, como chamadas seletivas/privadas e chamadas interconectadas (modo telefone).

10.8.3.3.47

Zona para baixo

Esta seleção de menu permite navegar para baixo na lista de zonas do rádio.

Quando você chegar à primeira zona da lista, se continuar rolando a tela, a lista mostrará a última zona. As zonas são definidas na janela Atribuição de zonas e canais.

10.8.3.3.48

Programação da Zona Dinâmica

Essa seleção de menu permite visualizar ou editar os canais nas Zonas dinâmicas do rádio.

As zonas dinâmicas são ativadas na página Zona da janela Atribuição de zonas e canais.

10.8.3.3.49

Seleção de zonas

Esta seleção de menu permite escolher uma Zona ao operar no modo de comunicações Convencional ou de Entroncamento.

As zonas são definidas na janela Atribuição de zonas e canais.

10.8.3.3.50

Zona para cima

Esta seleção de menu permite avançar para cima pelas zonas do rádio.

Ao atingir a última Zona na lista, a navegação contínua fará com que a lista se envolva com a primeira Zona. As zonas são definidas na janela Atribuição de zonas e canais.

10.8.4

Teclado (Controle Portátil)

A seção **Teclado** permite que o usuário visualize ou selecione a funcionalidade do botão programável de todos os rádios para os modos de comunicações Convencionais e de Entroncamento. A

funcionalidade dos botões é selecionada uma vez e opera para os dois modos de comunicações de rádio.

OBSERVAÇÃO:

Algumas seleções variam de acordo com o modelo ou a opção do rádio.

10.8.4.1

Um (1)

Selecione a função para o botão Um (1) do Teclado em um Rádio portátil, Cabeçote de controle móvel ou Microfone do teclado (KPM).

Consulte [Zero \(0\) na página 222](#) para notas e avisos.

Consulte [Seleções de Botão do Teclado na página 223](#) para obter uma lista de seleções compatíveis:

10.8.4.2

Dois (2)

Selecione a função para o botão Dois (2) do Teclado em um Rádio portátil, Cabeçote de controle móvel ou Microfone do teclado (KPM).

Consulte [Zero \(0\) na página 222](#) para notas e avisos.

Consulte [Seleções de Botão do Teclado na página 223](#) para obter uma lista de seleções compatíveis:

10.8.4.3

Três (3)

Selecione a função para o botão Três (3) do Teclado em um Rádio portátil, Cabeçote de controle móvel ou Microfone do teclado (KPM).

Consulte [Zero \(0\) na página 222](#) para notas e avisos.

Consulte [Seleções de Botão do Teclado na página 223](#) para obter uma lista de seleções compatíveis:

10.8.4.4

Quatro (4)

Selecione a função para o botão Quatro (4) do Teclado em um Rádio portátil, Cabeçote de controle móvel ou Microfone do teclado (KPM).

Consulte [Zero \(0\) na página 222](#) para notas e avisos.

Consulte [Seleções de Botão do Teclado na página 223](#) para obter uma lista de seleções compatíveis:

10.8.4.5

Cinco (5)

Selecione a função para o botão Cinco (5) do Teclado em um Rádio portátil, Cabeçote de controle móvel ou Microfone do teclado (KPM).

Consulte [Zero \(0\) na página 222](#) para notas e avisos.

Consulte [Seleções de Botão do Teclado na página 223](#) para obter uma lista de seleções compatíveis:

10.8.4.6

Seis (6)

Seleciona a função para o botão Seis (6) do Teclado em um Rádio portátil, Cabeçote de controle móvel ou Microfone do teclado (KPM).

Consulte [Zero \(0\) na página 222](#) para notas e avisos.

Consulte [Seleções de Botão do Teclado na página 223](#) para obter uma lista seleções compatíveis:

10.8.4.7

Sete (7)

Seleciona a função para o botão Sete (7) do Teclado em um Rádio portátil, Cabeçote de controle móvel ou Microfone do teclado (KPM).

Consulte [Zero \(0\) na página 222](#) para notas e avisos.

Consulte [Seleções de Botão do Teclado na página 223](#) para obter uma lista seleções compatíveis:

10.8.4.8

Oito (8)

Seleciona a função para o botão Oito (8) do Teclado em um Rádio portátil, Cabeçote de controle móvel ou Microfone do teclado (KPM).

Consulte [Zero \(0\) na página 222](#) para notas e avisos.

Consulte [Seleções de Botão do Teclado na página 223](#) para obter uma lista seleções compatíveis:

10.8.4.9

Nove (9)

Seleciona a função para o botão Nove (9) do Teclado em um Rádio portátil, Cabeçote de controle móvel ou Microfone do teclado (KPM).

Consulte [Zero \(0\) na página 222](#) para notas e avisos.

Consulte [Seleções de Botão do Teclado na página 223](#) para obter uma lista seleções compatíveis:

10.8.4.10

Asterisco (*)

Seleciona a função para o botão Asterisco (*) do Teclado em um Rádio portátil, Cabeçote de controle móvel ou Microfone do teclado (KPM).

Consulte [Zero \(0\) na página 222](#) para notas e avisos.

Consulte [Seleções de Botão do Teclado na página 223](#) para obter uma lista seleções compatíveis:

10.8.4.11

Zero (0)

Seleciona a função para o botão Zero (0) do Teclado em um Rádio portátil, Cabeçote de controle móvel ou Microfone do teclado (KPM).

Estas seleções se aplicam durante a operação nos modos de comunicação Convencional e Entroncamento.

INFORMAÇÕES:

Quando um rádio vem equipado de fábrica com uma Cabeça de controle O7 que possui Teclado com sirene e luzes opcionais, as atribuições do botão do teclado padrão são pré-configuradas para corresponder aos gráficos do teclado.

AVISO:

Para uma configuração de rádio duplo:
As funções de botão do recurso Todos os rádios (botões relacionados à sirene, Controle auxiliar (1 a 3), Dim, GunLock (1, 2, 3 ou Todos), Padrão do transmissor, Swap de rádio e Terceiros) devem ser configuradas da mesma forma para os rádios Principal e Secundário; além disso, é altamente recomendável configurar todas as funções do botão da mesma forma em ambos os rádios para evitar confusão.

Consulte [Seleções de Botão do Teclado na página 223](#) para obter uma lista seleções compatíveis:

10.8.4.12

Hash (#)

Seleciona a função para o botão Libra / Cerquilha (#) do Teclado em um Rádio portátil, Cabeçote de controle móvel ou Microfone do teclado (KPM).

Consulte [Zero \(0\) na página 222](#) para notas e avisos.

Consulte [Seleções de Botão do Teclado](#) para obter uma lista seleções compatíveis:

10.8.4.13

Seleções de Botão do Teclado

Este tópico lista as seleções de botão e quando estão disponíveis para os usuários.

Seleções de botão:	Esta seleção só é válida no RadioCentral e/ou disponível para o usuário:
Dígito do Teclado na página 223	Quando selecionada, está sempre disponível ao usuário. Portanto, não depende de nenhum recurso ou seleção.
MS01–MS13 na página 184 (Seleção de modo)	Quando selecionada, está sempre disponível ao usuário. Portanto, não depende de nenhum recurso ou seleção.
Periférico de terceiros na página 190	Quando selecionada, está sempre disponível ao usuário. Portanto, não depende de nenhum recurso ou seleção.

10.8.4.13.1

Dígito do Teclado

Selecione essa função para reter a operação padrão do botão do Teclado associado.

INFORMAÇÕES:

Em um Rádio portátil, essa é a única função disponível para os botões Estrela (*) e Sustenido (#).

10.8.5

Botões de Acessório (Controle Portátil)

A seção **Botões de Acessório** permite que o usuário visualize ou selecione a funcionalidade do botão programável de todos os rádios para os modos de comunicações Convencionais e de Entroncamento. A funcionalidade do Botão é selecionada e opera separadamente para cada um dos modos de comunicações de rádio. Ou seja, quando o rádio está operando em um canal Convencional, somente os recursos Convencionais selecionados estão disponíveis para o usuário do rádio. Da mesma forma, quando o rádio está operando em um canal de Entroncamento, somente os recursos de Entroncamento selecionados estão disponíveis para o usuário do rádio.

**OBSERVAÇÃO:**

Algumas seleções variam de acordo com o modelo ou a opção do rádio.

10.8.5.1

Ac. laranja (Convencional)

Seleciona a função para o Botão Ac. laranja.

**INFORMAÇÕES:**

A seleção do botão Ac. Laranja do Acessório automaticamente segue a seleção do Botão Superior do Portátil.

Consulte [Seleção de botões \(parte superior e lateral\) na página 162](#) para obter uma lista seleções compatíveis:

10.8.5.2

Ac. laranja (Entroncamento)

Seleciona a função para o Botão Ac. laranja.

**INFORMAÇÕES:**

A seleção do botão Ac. Laranja do Acessório automaticamente segue a seleção do Botão Superior do Portátil.

Consulte [Seleção de botões \(parte superior e lateral\) na página 162](#) para obter uma lista seleções compatíveis:

10.8.5.3

Ac. sem pontos (Convencional)

Seleciona a função para o Botão Ac. sem pontos.

Essas seleções se aplicam ao operar no modo de comunicações Convencionais ou de Entroncamento, conforme mostra a tabela abaixo.

**AVISO:**

O usuário não deve duplicar uma função em controles múltiplos, como em mais de um botão, mais de uma chave ou combinando ambos. Isso pode causar uma operação incorreta do rádio.

**INFORMAÇÕES:**

Ao selecionar uma função Convencional para Cima ou para Baixo, o recurso de Entroncamento é automaticamente definido à função oposta no modo somente de visualização. A seleção de qualquer outra função Convencional permite que a função de Entroncamento seja selecionada.

Consulte [Seleção de botões \(parte superior e lateral\) na página 162](#) para obter uma lista seleções compatíveis:

10.8.5.4

Ac. sem pontos (Entroncamento)

Selecione a função para o Botão Ac. sem pontos.

Consulte [Ac. sem pontos \(Convencional\)](#) na página 224 para notas e avisos.

Consulte [Seleção de botões \(parte superior e lateral\)](#) na página 162 para obter uma lista de seleções compatíveis:

10.8.5.5

Ac. 1 ponto (Convencional)

Selecione a função para o Botão Ac. 1 ponto.

Consulte [Ac. sem pontos \(Convencional\)](#) na página 224 para notas e avisos.

Consulte [Seleção de botões \(parte superior e lateral\)](#) na página 162 para obter uma lista de seleções compatíveis:

10.8.5.6

Ac. 1 ponto (Entroncamento)

Selecione a função para o Botão Ac. 1 ponto.

Consulte [Ac. sem pontos \(Convencional\)](#) na página 224 para notas e avisos.

Consulte [Seleção de botões \(parte superior e lateral\)](#) na página 162 para obter uma lista de seleções compatíveis:

10.8.5.7

Ac. 2 ponto (Convencional)

Selecione a função para o Botão Ac. 2 ponto.

Consulte [Ac. sem pontos \(Convencional\)](#) na página 224 para notas e avisos.

Consulte [Seleção de botões \(parte superior e lateral\)](#) na página 162 para obter uma lista de seleções compatíveis:

10.8.5.8

Ac. 2 ponto (Entroncamento)

Selecione a função para o Botão Ac. 2 ponto.

Consulte [Ac. sem pontos \(Convencional\)](#) na página 224 para notas e avisos.

Consulte [Seleção de botões \(parte superior e lateral\)](#) na página 162 para obter uma lista de seleções compatíveis:

10.8.5.9

Ac. 3 pontos (convencional)

Selecione o funcionamento do botão Ac. 3 pontos do acessório.

Consulte [Ac. sem pontos \(Convencional\)](#) na página 224 para notas e avisos.

Consulte [Seleção de botões \(parte superior e lateral\)](#) na página 162 para obter uma lista de seleções compatíveis:

10.8.5.10

Ac. 3 pontos (entroncamento)

Seleciona o funcionamento do botão Ac. 3 pontos do acessório.

Consulte [Ac. sem pontos \(Convencional\) na página 224](#) para notas e avisos.

Consulte [Seleção de botões \(parte superior e lateral\) na página 162](#) para obter uma lista seleções compatíveis:

10.9

Visor

A janela **Visor** permite visualizar ou modificar as configurações relacionadas ao visor do rádio e às opções de menu para todos os rádios.

10.9.1

Geral

Esta seção permite visualizar ou definir configurações básicas de todos os rádios relacionadas à aparência e à funcionalidade do visor do rádio.

10.9.1.1

Tamanho do texto da zona

Esse campo seleciona o número máximo de caracteres alocados no visor frontal do rádio para Nomes de zona.

Essa seleção se aplica a todos os rádios.

OBSERVAÇÃO:

Os nomes/as descrições de zonas são definidos no campo [Nomes da zona na página 666](#) de Atribuição de Zonas e Canais.

Você pode selecionar zonas com uma alternância de chave [Seleção de zonas na página 203](#) ou seleção de menu Seleção de zona.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Números inteiros de 0 a 14 são aceitos.

10.9.1.2

Tamanho do texto do canal

Esse campo seleciona o número máximo de caracteres alocados no visor frontal do rádio para os nomes do Canal.

Essa seleção se aplica a todos os rádios.

OBSERVAÇÃO:

Os nomes/descrições de canais são definidos no campo Nome da zona de atribuição de zonas e canais. É possível selecionar canais pressionando o botão Seleção de canais, ativando/desativando a chave Seleção de canais ou selecionando o menu Seleção de canais.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Alcance

Números inteiros de 1 a 14.

10.9.1.3

Orientação da visualização superior

Este campo seleciona a orientação padrão do visor superior do rádio, permitindo inverter a disposição visual em 180 graus, dependendo de sua preferência.

A seleção do botão programável Luz/Inverter (visor) permite alterar essa orientação quando necessário. Essa seleção se aplica a todos os rádios.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

- Normal
- Invertida

10.9.1.4

Taxa de rolagem lenta

Esse campo seleciona a taxa com que o visor faz a Rolagem lenta em uma lista.

O rádio primeiro faz a Rolagem lenta, em seguida a Rolagem rápida após a Contagem de rolagem lenta expirar. Essa função se aplica a todos os rádios nos modos de comunicação Convencionais e de Entroncamento.

Acima 44: Alcance

Mínimo	Máximo	Incrementos
250 (ms)	6250 (ms)	250 (ms)

OBSERVAÇÃO:

A Taxa de rolagem lenta deve ser maior ou igual à Taxa de rolagem rápida.

10.9.1.5

Taxa de rolagem rápida

Esse campo seleciona a taxa com que o visor faz a Rolagem rápida em uma lista.

O rádio primeiro faz a Rolagem lenta, em seguida a Rolagem rápida após a Contagem de rolagem lenta expirar. Essa função se aplica a todos os rádios nos modos de comunicação Convencionais e de Entroncamento.

Acima 45: Alcance

Mínimo	Máximo	Incrementos
250 (ms)	6250 (ms)	250 (ms)

OBSERVAÇÃO:

A taxa de rolagem rápida deve ser menor ou igual à Taxa de rolagem lenta.

10.9.1.6

Contagem de rolagem lenta

Esse campo seleciona o número de menus rolados no visor antes do rádio mudar para a Taxa de rolagem rápida.

Essa função se aplica a todos os rádios nos modos de comunicação Convencionais e de Entroncamento.

Acima 46: Alcance

Mínimo	Máximo
0 menus	255 menus

10.9.1.7

Indicador Fora de alcance

Esse campo seleciona o tipo de alerta usado pelo rádio para indicar quando o aparelho sai da área de cobertura do Sistema de entroncamento.

Esta função se aplica a comunicações Convencionais do P25 habilitadas para Entroncamento e DVRS.

As seleções a seguir são compatíveis:

Sem indicação

Recurso desativado (em outras palavras, nenhuma indicação é fornecida quando o rádio está em uma condição fora de alcance).

Somente alertar

Somente indicadores sonoros. Consulte também Tom Fora do Alcance.

Display Only

O visor do rádio se alterna entre mostrar **NO SYS** (Sem sistema) e zona e canal atuais do rádio.

Alertar e exibir

Indicadores visuais e sonoros (consulte "Somente alertar" e "Somente exibir" acima).

10.9.1.8

Indicador de busca de site

Esse campo permite selecionar os tipos de alerta quando o rádio está se conectando ao SmartConnect.

Acima 47: Tipos de seleções de alerta

Tipos de seleção de alerta	Descrição
Sem indicação	A função é desabilitada e nenhuma indicação é exibida quando o rádio está se conectando ao SmartConnect.
Display Only	O visor mostra <code>Buscando site</code> .

10.9.1.9

Detecção precoce fora de alcance

Se esse campo estiver marcado, o rádio realizará uma detecção mais rápida de uma condição fora de alcance em menos de um minuto.

Se esse campo estiver desmarcado, o rádio realizará a detecção tradicional de uma condição fora de alcance.

10.9.1.10

Temporizador de retenção fora de alcance

Seleciona a quantidade de tempo de espera para os indicadores fora de alcance serem solicitados.

10.9.1.11

Indicador de cobertura não equilibrada

Esse campo seleciona o tipo de alerta usado pelo rádio para indicar as comunicações reduzidas devido ao status não afiliado do rádio.

O status não afiliado ocorre quando o rádio opera em uma área de cobertura não equilibrada. Esta condição é detectada ao recuperar falha de comunicações de entrada. A cobertura não equilibrada pode demorar alguns minutos para ser restabelecida. Esta função se aplica a comunicações Convencionais do P25 habilitadas para Entroncamento e DVRS.

OBSERVAÇÃO:

Um Indicador de fora de alcance deve ser habilitado ao usar esta função para indicar que os alertas de Indicadores de cobertura não equilibrada foram interrompidos porque o rádio está fora de alcance.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Sem indicação

A função desativada Nenhuma indicação é fornecida quando o rádio está em uma condição de cobertura não equilibrada.

Somente alertar

Somente indicadores sonoros.

Display Only

O visor do rádio se alterna entre mostrar **NO COMMS** (Sem comunicações) e zona e canal atuais do rádio.

Alertar e exibir

Indicadores visuais e sonoros (consulte "Somente alerta" e "Somente display" acima).

10.9.1.12

indicador de entroncamento de local

Esse campo seleciona o tipo de Indicador de entroncamento de site. O Entroncamento de site é considerado um modo de entroncamento exclusivo intermediário entre o modo SmartZone e o Failsoft.

Em uma sistema de SmartZone, se o controlador de zona cair, o local atual envia uma mensagem indicando que agora está no modo Entroncamento de local. Ele continuará a enviar esta mensagem até o controlador de zona voltar online. Essa seleção se aplica na operação do SmartZone para todos os Sistemas de entroncamento e Personalidades de entroncamento.

INFORMAÇÕES:

Se as comunicações de Entroncamento de site também falharem, o rádio entrará em um modo Failsoft.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Sem indicação

A função está desativada.

Somente alertar

Somente indicadores sonoros.

Display Only

Permite que a mensagem "Entroncamento de local" apareça no display do rádio.

Alertar e exibir

Indicadores visuais e sonoros (consulte "Somente alerta" e "Somente display" acima).

10.9.1.13

Indicador de registro do sistema

Esse campo seleciona o tipo de alerta utilizado pelo rádio para indicar o status do processo de registro do sistema no caso do rádio não se registrar no sistema.

Essa função se aplica às comunicações de Entroncamento APCO P25 (ASTRO 25).

As seleções a seguir são compatíveis:

Sem indicação

A função está desativada.

Somente alertar

Somente indicadores sonoros.

Display Only

O display do rádio mostra uma das duas mensagens possíveis: "Sys Reg Refused" (Registro de sistema recusado) ou "Sys Auth Failed" (Falha na autenticação do sistema).

Alertar e exibir

Indicadores visuais e sonoros (consulte "Somente alertar" e "Somente exibir" acima).

10.9.1.14

Indicador Somente Local DVRS

Este campo seleciona o tipo de alerta usado pelo rádio para indicar uma condição **Modo Local** do DVRS (Digital Vehicular Repeater System, Sistema repetidor veicular digital).

Essa função se aplica a Comunicações convencionais do DVRS.

Seleções

Sem indicação

A função está desativada.

Somente alertar

Somente indicadores sonoros.

Display Only

O visor do rádio mostra uma das duas mensagens possíveis.

Alertar e exibir

Indicadores visuais e sonoros (consulte "Somente alertar" e "Somente exibir" acima).

10.9.2

Avançado

Esta seção permite visualizar ou definir funcionalidades diversas e complexas do visor do rádio em todos os rádios.

10.9.2.1

Luz automática

Esse campo faz com que a tela frontal do rádio, o teclado, o botão giratório e a luz de fundo da tela superior se acendam sempre que um botão, uma chave ou botão do teclado for pressionado (exceto o botão PTT, o botão de emergência ou o monitor).

As luzes permanecem acesas pelo tempo especificado no campo [Tempo da luz do display na página 231](#). Quando desativado, a seleção Luz/Inverter (Tela) liga e desliga a luz do teclado e das telas.

Essa seleção também se aplica a um acessório portátil que tiver uma tela, como o DRSM (Display Remote Speaker Microphone, microfone com alto-falante remoto da tela). Essa seleção se aplica a todos os rádios.

Acessado apenas: Quando o campo [Tempo da luz do display na página 231](#) estiver definido como **Infinito** e o rádio estiver habilitado para o modelo/a opção.

10.9.2.2

Tempo da luz do display

Este campo seleciona o tempo em que as luzes da chave giratória, dos visores e do teclado do rádio permanecerão acesas depois que o usuário pressionar o botão Luz/Inverter (visor).

OBSERVAÇÃO:

Essa função também se aplica à luz do visor no acessório DRSM (Display Remote Speaker Microphone, microfone com alto-falante remoto no visor). O tempo é medido em segundos. Essa seleção se aplica a todos os rádios.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

Quando definido como **Infinito**, as luzes do visor e do teclado permanecem acesas até que o botão [Luz/Flip \(Tela\) na página 183](#) seja pressionado.

Acima 48: Alcance

Mínimo	Máximo	Incrementos
0 s	60 s	5 s

10.9.2.3

Tempo do display alternativo

Esse campo seleciona o tempo pelo qual as mensagens alternadas aparecem no visor do rádio.

O campo Tipo de indicador de recepção de alarme de emergência é um exemplo de um recurso que usa a funcionalidade de visor de alternância, mas somente quando está definida para **Apenas Visor** ou **Alerta e Visor**. Essa seleção se aplica a todos os rádios.

Acima 49: Seleções

Mínimo	Máximo	Incrementos
250 (ms)	6250 (ms)	250 (ms)

OBSERVAÇÃO:

ms = milissegundos

10.9.2.4

Tempo de visualização da mensagem temporária

Esse campo seleciona o período de tempo pelo qual uma mensagem temporária aparece no visor do rádio.

Essa seleção se aplica a todos os rádios.

Acima 50: Alcance

Mínimo	Máximo	Incrementos
250 (ms)	6250 (ms)	250 (ms)

10.9.2.5

Seleção do tom de alerta de inatividade da função

Este campo seleciona o tipo de tom de alerta de inatividade da função para os menus de configuração de recursos do rádio.

Essa seleção se aplica a todos os rádios.

INFORMAÇÕES:

Atualmente, o **Tom de alerta inativo** periódico se aplica aos menus de configuração Página/alerta de chamada, Selecionar/chamada privada, Telefone, Status, Mensagem e TMS. Atualmente, a seleção de **Tom de saída de inatividade do recurso** se aplica aos menus de configuração Página/alerta de chamada, Selecionar/chamada privada, Telefone, Status, Mensagem, TMS, Seleção de zonas, Seleção de canais, Local, Informações, Perfis de rádio, chamadas recentes e Contatos.

As seleções a seguir são compatíveis:

Desabilitado

Os Tons de alerta da função estão desativados. Esta seleção só é válida quando o campo Tempo limite de inatividade do recurso não está definido para **Infinito**.

Somente sair

Ativa um tom de saída de inatividade do recurso para notificá-lo quando o menu do recurso sair após o menu ficar ocioso pela duração definida no tempo limite de inatividade do recurso. Esta seleção só é válida quando o campo Tempo limite de inatividade do recurso não está definido para **Infinito**.

Somente inatividade (padrão de fábrica)

Ativa um tom de alerta inativo periódico para notificá-lo de que o menu do recurso está ocioso.

Inatividade & sair

Ativa o Tom de Alerta de Inatividade e um Tom de Alerta de Inatividade da Função. Esta seleção só é válida quando o campo Tempo limite de inatividade do recurso não está definido para **Infinito**.

10.9.2.6

Status de Saída automática

Este campo seleciona o método de como o rádio sai do menu de configuração Status em O status foi enviado ao despachador.

Essa seleção se aplica a todos os rádios.

As seleções a seguir são compatíveis:

Na confirmação bem-sucedida

O menu Status será encerrado e o rádio retornará à operação normal de despacho somente após uma confirmação bem-sucedida do FNE (Fixed Network Equipment, equipamento de rede fixo)/despachador; o menu Status permanecerá ativo se uma confirmação não for recebida ou o Status for negado.

Sempre

O menu Status é encerrado automaticamente após a confirmação ser recebida ou (no caso de despacho Convencional) após todos os Status de Número de Tentativas serem concluídos.

10.9.3

Display de ID

Esta seção permite visualizar ou modificar a funcionalidade do ID do PTT e do grupo de conversação no visor do rádio.

Um ID de PTT é transmitido quando o botão PTT é pressionado para um tipo MDC ou ASTRO de sistema convencional; por isso estes recursos de ID de PTT se aplicam apenas a canais de comunicações convencionais.

10.9.3.1

Display de ID de PTT

Esse campo seleciona o tipo de transmissão de entrada que se qualifica para a exibição de ID do PTT.

O Display de ID de PTT ativa o ID do chamador de um Nome do Contato da Lista de chamadas para ser mostrado no visor do rádio. Se não existir um nome de contato da lista de chamadas, o ID do PTT do chamador atual é exibido. Essa função se aplica a todos os rádios nos canais de comunicação convencionais.

As seleções a seguir são compatíveis:

- Desabilitado
- Dispatch
- Transmitir e verificar

10.9.3.2

Contador de fim da voz

Esse campo seleciona por quanto tempo um ID de PTT de outro rádio aparece no visor do rádio quando a transmissão é encerrada.

Essa função se aplica a todos os rádios nos canais de comunicação convencionais.

INFORMAÇÕES:

Quando esse campo é configurado para **0** segundos, um ID de PTT definido como **Extremidade traseira** enviado de outros rádios não tem tempo de ser visto dentro do visor atual do rádio.

Acessado apenas: Quando o campo [Display de ID de PTT na página 233](#) estiver definido como **Transmitir** ou **Transmitir e verificar** ou o campo Exibição da localização do par estiver ativado.

Acima 51: Alcance

Mínimo	Máximo	Incrementos
0 segundo	7 segundos	1 segundo

10.9.3.3

Tamanho do texto do ID do prefixo

Esse campo seleciona o número de caracteres a serem usados em números de IDs de rádio, Alertas de chamada e modo Emergência.

Essa função se aplica a todos os rádios nos canais de comunicação convencionais.

Acessado apenas: Quando o campo Display de ID de PTT estiver definido como **Despacho** ou **Despacho e Varredura**

Números inteiros de 1 a 6 são aceitos.

10.9.3.4

Display do grupo de conversação em PTT

Esse campo habilita a exibição da Lista do grupo de conversação ASTRO, o Texto do alias do grupo de conversação ou o ID do grupo de conversação quando o botão PTT é pressionado.

Se a função Alias do grupo de conversação estiver ativada, então o Texto do alias do grupo de conversação será exibido. Caso contrário, o ID do grupo de conversação será exibido. A ativação deste campo terá precedência sobre a configuração do campo Exibir em PTT. Essa função se aplica a todos os rádios nos canais de comunicação convencionais.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.9.3.5

Grupo de conversação\Display na alteração do modo

Esse campo habilita o visor da Lista do grupo de conversação ASTRO, o Texto de alias do grupo de conversação ou o ID do grupo de conversação mediante alteração do canal.

Se a função Alias do grupo de conversação estiver ativada, então o Texto do alias do grupo de conversação será exibido. Caso contrário, o ID do grupo de conversação será exibido. A ativação deste campo terá precedência sobre a configuração do campo Alteração do modo de exibição. Essa função se aplica a todos os rádios nos canais de comunicação convencionais.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.9.3.6

Display do grupo de conversação na recepção

Esse campo habilita o visor da Lista do grupo de conversação ASTRO, o Texto de alias do grupo de conversação ou o ID do grupo de conversação na desativação da função mudo para uma chamada.

Se a função Alias do grupo de conversação estiver ativada, então o Texto do alias do grupo de conversação será exibido. Caso contrário, o ID do grupo de conversação será exibido. Essa função se aplica a todos os rádios nos canais de comunicação convencionais.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.9.3.7

Tabela de Display de ID (Visor)

A seção **Tabela de display de ID do Visor** contém os seguintes campos:

10.9.3.7.1

Nome da Funcionalidade

Exibe o nome somente leitura do recurso listado na tabela de Display de ID do ID de PTT, ID de Emergência ou ID de Alerta de Ligação.

Acessado apenas: Quando o campo [Display de ID de PTT na página 233](#) estiver definido como **Transmitir** ou **Transmitir e Verificar**.

10.9.3.7.2

Visor

Esse campo permite definir um texto reconhecível que fixa o ID de PTT, ID de emergência ou número de ID de alerta de chamada exibido no registro/linha atual da Tabela de exibição de ID.

A extensão do campo é determinada pelo campo Tamanho do Texto do ID do Prefixo. Essa função se aplica a todos os rádios nos canais de comunicação convencionais.

Acessado apenas: Quando o campo Display de ID de PTT está definido como **Despacho** ou **Despacho e varredura**.

OBSERVAÇÃO:

Até seis (6) caracteres (conforme determinado pelo campo Tamanho do texto do ID do prefixo), incluindo números, letras e caracteres especiais podem ser usados.

Exemplos: ID, EMERG, Elec01, LIGAÇÃO

10.10

Conjunto Perfil de redução de ruído mic. interno

O conjunto **Perfil de redução de ruído mic. interno** permite visualizar ou definir parâmetros de redução de ruído de transmissão para microfones internos que visam as condições de ruído específicos.

Estas configurações se aplicam a todos os rádios.

OBSERVAÇÃO:

A redução de ruído melhora a clareza da voz reduzindo o ruído de fundo. A redução de ruído ocorre no rádio transmissor antes da transmissão (em modo analógico) e antes da codificação de voz (no modo digital). A redução do ruído de fundo não só melhora a clareza de voz para uma transmissão de modo analógico. No modo digital, um sinal de voz mais nítido no codificador de voz (vocoder) resulta em uma voz mais nítida recebida e decodificada no receptor.

AVISO:

Estas configurações personalizadas são aplicadas apenas quando o campo Redução de ruído personalizada (rádio) é selecionado no Perfil de rádio referenciado.

O usuário não deve modificar as configurações de redução de ruído a menos que faça parte da equipe de serviço qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

Os campos a seguir são suportados:

10.10.1

Nome do Perfil de Redução de Ruído do Rádio

Esse campo permite visualizar ou definir nomes reconhecíveis para o perfil de redução de ruído do rádio atual.

INFORMAÇÕES:

As [Perfis de rádio na página 693](#) - Configurações de Redução de Ruído do Microfone Interno são recomendadas para a maioria dos ambientes de ruído.

AVISO:

Estas configurações personalizadas são aplicadas apenas quando o campo Redução de ruído personalizada (rádio) é selecionado no Perfil de rádio referenciado.

Não modifique as configurações de redução de ruído, a menos que você faça parte da equipe de serviço qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

OBSERVAÇÃO:

Exemplos: PER-001, #500, Mic. externo NR 3, # A5

É possível usar caracteres, números, espaços e caracteres especiais.

No máximo 14 caracteres no total.

10.10.1.1

QA09006–Supressão adaptativa de ruído

Este campo indica se o recurso de supressão de ruído adaptável foi adquirido.

10.10.2

E Wind VETOR MAXS

Essas configurações permitem ajustar os parâmetros de redução de ruído para as condições específicas de ruído.

INFORMAÇÕES:

Os [Perfis de rádio na página 693](#) - configurações de Redução de ruído do rádio são recomendados para a maioria dos ambientes ruidosos.

Este parâmetro tem um alcance efetivo de 31 valores do coeficiente de 16 bits cada, que se traduz em 124 caracteres BCH (nibble de 4 bits). No entanto, é necessário inserir 32 valores de coeficiente. Quando são inseridos os coeficientes para esse vetor, o 32º valor é o valor mais à direita (ou menos significativo) – em outras palavras, os últimos quatro caracteres BCH. Certifique-se de deixar esse 32º valor igual ao 31º. O processador de sinal digital (DSP) do rádio ignora o 32º valor.

AVISO:

Estas configurações personalizadas são aplicadas apenas quando o campo Redução de ruído personalizada (rádio) é selecionado no Perfil de rádio referenciado.

Não modifique as configurações de redução de ruído, a menos que você faça parte da equipe de serviço qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

VETOR DE EQ. DE SAÍDA DINC

Esta configuração permite que você altere o parâmetro DINC (Cancelador de ruído de entrada dupla) parâmetro OUTPUT EQ VECTOR para o microfone interno.

AVISO:

Estas configurações personalizadas são aplicadas apenas quando o campo Redução de ruído personalizada (Rádio) é selecionado no Perfil de rádio referenciado.

Não modifique as configurações de redução de ruído, a menos que você faça parte da equipe de serviço qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação. Vá para a janela Redução de Ruído do Rádio

10.10.15

VETOR DE EP. DINC.

Esta configuração permite que você altere o parâmetro interno DINC (Cancelador de ruído de entrada dupla) parâmetro EP VECTOR para o microfone interno.

AVISO:

Estas configurações personalizadas são aplicadas apenas quando o campo Redução de ruído personalizada (Rádio) é selecionado no Perfil de rádio referenciado.

Não modifique as configurações de redução de ruído, a menos que você faça parte da equipe de serviço qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação. Vá para a janela Redução de Ruído do Rádio

10.10.16

DBQ8 DOS LIMITES DE RUÍDOS AUTOMÁTICOS DO RÁDIO

Este par de números define os limites superior e inferior de ruído (em dB relativos a escala completa) para o controle automático de níveis de redução de ruído.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

As seleções a seguir são compatíveis:

- O comprimento dos DBQ8 DOS LIMITES DE RUÍDOS AUTOMÁTICOS DO RÁDIO deve ser igual a 8 e
- [X] dos DBQ8 DOS LIMITES DE RUÍDOS AUTOMÁTICOS DO RÁDIO deve ser de "-23040" a "0" e
- [Y] dos DBQ8 DOS LIMITES DE RUÍDOS AUTOMÁTICOS DO RÁDIO deve ser de "-23040" a "0" e
- [X] NÃO deve ser maior que [Y].

OBSERVAÇÃO:

Os DBQ8 DOS LIMITES DE RUÍDOS AUTOMÁTICOS DO RÁDIO são um vetor de dois números inteiros de 16 bits.

Cada quatro números hexadecimais representam um número integral de 16 bits, tanto negativo quanto positivo. A faixa para cada um dos dois números ([X] e a [Y]) é de -23040 a 0 incluso.

Acessado apenas: Quando o rádio estiver habilitado para o modelo e a opção.

10.10.17

VETOR DE GANHO MÍN. AUTOMÁTICO DO RÁDIO

Este vetor define os limites do ganho mínimo para o modo automático da supressão de ruído.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

As seleções a seguir são compatíveis:

- O comprimento do VETOR DE GANHO MÍN. AUTOMÁTICO DO RÁDIO deve ser igual a 8 e
- [X] do VETOR DE GANHO MÍN. AUTOMÁTICO DO RÁDIO deve ser de "0" a "32767" e
- [Y] do VETOR DE GANHO MÍN. AUTOMÁTICO DO RÁDIO deve ser de "0" a "32767" e
- [Y] NÃO deve ser maior que [X].

OBSERVAÇÃO:

O VETOR DE GANHO MÍN. AUTOMÁTICO DO RÁDIO é um vetor de dois números inteiros de 16 bits:

Cada quatro números hexadecimais representam um número integral de 16 bits, tanto negativo quanto positivo. A faixa para cada um dos dois números ([X] e a [Y]) é de 0 a 32767 em números decimais.

Acessado apenas: Quando o rádio estiver habilitado para o modelo e a opção.

10.10.18

LIMITES DE RELAXAMENTO AUTOMÁTICO DO RÁDIO

Este vetor define os limites do relaxamento com a frequência para o modo automático da supressão de ruído.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

As seleções a seguir são compatíveis:

- O comprimento dos LIMITES DE RELAXAMENTO AUTOMÁTICO DO RÁDIO deve ser igual a 4 e
- [X] dos LIMITES DE RELAXAMENTO AUTOMÁTICO DO RÁDIO deve ser de "0" a "10" e
- [Y] dos LIMITES DE RELAXAMENTO AUTOMÁTICO DO RÁDIO deve ser de "0" a "10" e
- [X] NÃO deve ser maior que [Y].

OBSERVAÇÃO:

Os LIMITES DE RELAXAMENTO AUTOMÁTICO DO RÁDIO são um vetor de dois números inteiros de 8 bits.

Cada dois números hexadecimais representam um número integral de 8 bits, tanto negativo quanto positivo. A faixa para cada um dos dois números ([X] e a [Y]) é de 0 a 10 incluso.

Acessado apenas: Quando o rádio estiver habilitado para o modelo e a opção.

10.10.19

RADIO PASS FILTER START

Esse campo define a frequência aplicada pelo filtro de PASSAGEM automática.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 74: Alcance

Mínimo	Máximo	Incrementos
1	3999	1

10.10.20

RADIO SAM MIX MODE

Esse parâmetro controla como o sinal de entrada do áudio do Alto-falante como microfone é formado.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 75: Alcance

Mínimo	Máximo	Incrementos
0	2	1

10.10.21

RADIO SAM CUTOVER FREQUENCY

Esse campo define a frequência usada pela entrada Alto-falante como microfone.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 76: Alcance

Mínimo	Máximo	Incrementos
1	3999	1

10.10.22

RADIO HOT BEAM MIX RATE

Este campo controla a detecção do hot-beam automático. O número mais alto se altera lentamente

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 77: Alcance

Mínimo	Máximo	Incrementos
1	250	1

10.10.23

ATENUAÇÃO DBQ8 MÁX HOTBEAM DO RÁDIO

Este campo define o nível máximo de atenuação que pode ser aplicado a qualquer um dos feixes.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 78: Alcance

Mínimo	Máximo	Incrementos
1	7680	1

10.11

Conjunto Perfil de redução de ruído mic. externo

O conjunto **Perfil de redução de ruído mic. externo** permite visualizar ou definir parâmetros de redução de ruído de transmissão para microfones externos que visam as condições de ruído específicos.

Estas configurações se aplicam a todos os rádios.

OBSERVAÇÃO:

A redução de ruído melhora a clareza da voz reduzindo o ruído de fundo. A redução de ruído ocorre no rádio transmissor antes da transmissão (em modo analógico) e antes da codificação de voz (no modo digital). A redução do ruído de fundo não só melhora a clareza de voz para uma transmissão de modo analógico. No modo digital, um sinal de voz mais nítido no codificador de voz (vocoder) resulta em uma voz mais nítida recebida e decodificada no receptor.

AVISO:

Essas configurações personalizadas são aplicadas apenas quando o campo Redução de ruído personalizada (acessório) é selecionado no perfil de rádio referido.

Não modifique as configurações de redução de ruído, a menos que você faça parte da equipe de serviço qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

Os campos a seguir são suportados:

10.11.1

Nome do Perfil de Redução de Ruído do Acessório

Esse campo permite visualizar ou definir nomes reconhecíveis para o Perfil de redução de ruído do acessório atual.

**AVISO:**

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

**INFORMAÇÕES:**

Perfis de rádio - As Configurações de redução de ruído do microfone externo são recomendadas para a maioria dos ambientes ruidosos.

**AVISO:**

Essas configurações personalizadas são aplicadas apenas quando o campo Redução de ruído personalizada (acessório) é selecionado no perfil de rádio referido.

Não modifique as configurações de redução de ruído, a menos que você faça parte da equipe de serviço qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

**OBSERVAÇÃO:**

Exemplos: NRP-001, #500, Mic. externo NR 3, # A5

É possível usar caracteres, números, espaços e caracteres especiais.

No máximo 14 caracteres no total.

Bad Mic SDIFF THRESH DBQ8

Essas configurações permitem ajustar os parâmetros de redução de ruído para as condições específicas de ruído. Os Perfis de rádio - configurações de redução de ruído do acessório são recomendadas para a maioria dos ambientes ruidosos.

AVISO:

Estas configurações personalizadas são aplicadas apenas quando o campo Redução de ruído personalizada (acessório) é selecionado no Perfil de rádio referenciado.

Não modifique as configurações de redução de ruído, a menos que você faça parte da equipe de serviço qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

Há dois valores separados que definem a faixa.

10.11.13

Mic. inválido R THRESH DBQ8

Essas configurações permitem ajustar os parâmetros de redução de ruído para as condições específicas de ruído.

INFORMAÇÕES:

Os Perfis de rádio - configurações de redução de ruído do acessório são recomendadas para a maioria dos ambientes ruidosos.

Embora este campo mostra o valor como um valor assinado sem sinal o firmware de rádio interpreta o valor hexadecimal como um valor com sinal. Por isso, introduza o valor desejado, com sinal na caixa Hexadecimal (mais à direita), não na caixa Decimal. Por exemplo, se você quiser inserir -1E00 (-7680), digite E200 (o complemento de 2) na caixa Hexadecimal. A caixa Decimal ainda mostra 57856, mas o firmware interpreta E200 como um número negativo no rádio.

AVISO:

Estas configurações personalizadas são aplicadas apenas quando o campo Redução de ruído personalizada (acessório) é selecionado no Perfil de rádio referenciado.

Não modifique as configurações de redução de ruído, a menos que você faça parte da equipe de serviço qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

Há dois valores separados que definem a faixa.

10.11.14

VETOR DE EQ. DE SAÍDA DINC

Esta configuração permite que você altere o parâmetro interno DINC (Cancelador de ruído de entrada dupla) parâmetro OUTPUT EQ VECTOR para o microfone externo.

AVISO:

Estas configurações personalizadas são aplicadas apenas quando o campo Redução de ruído personalizada (acessório) é selecionado no Perfil de rádio referenciado.

Não modifique as configurações de redução de ruído, a menos que você faça parte da equipe de serviço qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

10.11.15

VETOR DE EP. DINC.

Esta configuração permite alterar o parâmetro EP VECTOR do DINC (Dual Input Noise Canceller, cancelador de ruído de entrada dupla) do microfone externo.

**AVISO:**

Estas configurações personalizadas são aplicadas apenas quando o campo Redução de ruído personalizada (acessório) é selecionado no Perfil de rádio referenciado.

Não modifique as configurações de redução de ruído, a menos que você faça parte da equipe de serviço qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

10.11.16

DBQ8 DOS LIMITES DE RUÍDOS AUTOMÁTICOS DO ACESSÓRIO

Este par de números define os limites superior e inferior de ruído (em dB relativos a escala completa) para o controle automático de níveis de redução de ruído.

**AVISO:**

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

As seleções a seguir são compatíveis:

- O comprimento dos DBQ8 DOS LIMITES DE RUÍDOS AUTOMÁTICOS DO ACESSÓRIO deve ser igual a 8 e
- [X] dos DBQ8 DOS LIMITES DE RUÍDOS AUTOMÁTICOS DO ACESSÓRIO deve ser de "-23.040" a "0" e
- [Y] dos DBQ8 DOS LIMITES DE RUÍDOS AUTOMÁTICOS DO ACESSÓRIO deve ser de "-23.040" a "0" e
- [X] NÃO deve ser maior que [Y].

**OBSERVAÇÃO:**

Os DBQ8 DOS LIMITES DE RUÍDOS AUTOMÁTICOS DO ACESSÓRIO são um vetor de dois números inteiros de 16 bits.

Cada quatro números hexadecimais representam um número integral de 16 bits, tanto negativo quanto positivo. A faixa para cada um dos dois números ([X] e a [Y]) é de -23040 a 0 incluso.

Acessado apenas: Quando o rádio estiver habilitado para o modelo e a opção.

10.11.17

VETOR DE GANHO MÍN. AUTOMÁTICO DO ACESSÓRIO

Este vetor define os limites do ganho mínimo para o modo automático da supressão de ruído.

**AVISO:**

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

As seleções a seguir são compatíveis:

- O comprimento do VETOR DE GANHO MÍN. AUTOMÁTICO DO ACESSÓRIO deve ser igual a 8 e
- [X] do VETOR DE GANHO MÍN. AUTOMÁTICO DO ACESSÓRIO deve ser de "0" a "32767" e
- [Y] do VETOR DE GANHO MÍN. AUTOMÁTICO DO ACESSÓRIO deve ser de "0" a "32767" e

- [Y] NÃO deve ser maior que [X].

OBSERVAÇÃO:

O VETOR DE GANHO MÍN. AUTOMÁTICO DO ACESSÓRIO é o vetor de dois números inteiros de 16 bits:

Cada quatro números hexadecimais representam um número integral de 16 bits, tanto negativo quanto positivo. A faixa para cada um dos dois números ([X] e a [Y]) é de 0 a 32767 em números decimais.

Acessado apenas: Quando o rádio estiver habilitado para o modelo e a opção.

10.11.18

LIMITES DE RELAXAMENTO AUTOMÁTICO DO ACESSÓRIO

Este vetor define os limites do relaxamento com a frequência para o modo automático da supressão de ruído.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

As seleções a seguir são compatíveis:

- O comprimento dos LIMITES DE RELAXAMENTO AUTOMÁTICO DO ACESSÓRIO deve ser igual a 4 e
- [X] dos LIMITES DE RELAXAMENTO AUTOMÁTICO DO ACESSÓRIO deve ser de "0" a "10" e
- [Y] dos LIMITES DE RELAXAMENTO AUTOMÁTICO DO ACESSÓRIO deve ser de "0" a "10", e
- [X] NÃO deve ser maior que [Y].

OBSERVAÇÃO:

Os LIMITES DE RELAXAMENTO AUTOMÁTICO DO ACESSÓRIO são um vetor de dois números inteiros de 8 bits.

Cada dois números hexadecimais representam um número integral de 8 bits, tanto negativo quanto positivo. A faixa para cada um dos dois números ([X] e a [Y]) é de 0 a 10 incluso.

Acessado apenas: Quando o rádio estiver habilitado para o modelo e a opção.

10.11.19

INÍCIO DO FILTRO DE PASSAGEM DO ACESSÓRIO

Esse campo define a frequência aplicada pelo filtro de PASSAGEM automática.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

Acima 101: Alcance

Mínimo	Máximo	Incrementos
1	3999	1

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.12

Lista de redução de ruídos global

Perfil de Redução de Ruído Global permite ao usuário visualizar ou definir parâmetros DINC (Dual Input Noise Canceller, cancelamento de ruído de entrada dupla) personalizados.

Estas configurações se aplicam a todos os rádios.

OBSERVAÇÃO:

A redução de ruído melhora a clareza da voz reduzindo o ruído de fundo. A redução de ruído ocorre no rádio transmissor antes da transmissão (em modo analógico) e antes da codificação de voz (no modo digital). A redução do ruído de fundo não só melhora a clareza de voz para uma transmissão de modo analógico. No modo digital, um sinal de voz mais nítido no codificador de voz (vocoder) resulta em uma voz mais nítida recebida e decodificada no receptor.

AVISO:

Estas configurações personalizadas são aplicadas apenas quando o campo Habilitar redução de ruído global personalizada é selecionado no perfil de rádio referenciado.

O usuário não deve modificar as configurações de redução de ruído a menos que faça parte da equipe de serviço qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

Os campos a seguir são suportados:

10.12.1

VETOR DINC SPATIAL EQ1

Esta configuração permite que você altere o parâmetro interno DINC (Dual Input Noise Canceller, cancelador de ruído de entrada dupla) SPATIAL EQ1 VECTOR.

AVISO:

Esta configuração personalizada se aplica apenas quando o campo Ativação da redução de ruídos global personalizada está selecionado no [Perfis de rádio na página 693](#) referenciado.

Não modifique as configurações de redução de ruído, a menos que você faça parte da equipe de serviço qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

10.12.2

CONT. DO VETOR DINC SPATIAL EQ1

Esta configuração permite que você altere o parâmetro interno DINC (Dual Input Noise Canceller, cancelador de ruído de entrada dupla) SPATIAL EQ1 VECTOR.

O valor deste campo será incluído no valor do parâmetro [VETOR DINC SPATIAL EQ1 na página 256](#) para criar os sessenta e seis coeficientes completos do vetor espacial.

AVISO:

Esta configuração personalizada se aplica apenas quando o campo Ativação da redução de ruídos global personalizada está selecionado no [Perfis de rádio na página 693](#) referenciado.

Não modifique as configurações de redução de ruído, a menos que você faça parte da equipe de serviço qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

10.12.3

VETOR DINC SPATIAL EQ2

Esta configuração permite que você altere o parâmetro interno DINC (Dual Input Noise Canceller, cancelador de ruído de entrada dupla) SPATIAL EQ2 VECTOR.

**AVISO:**

Esta configuração personalizada se aplica apenas quando o campo Ativação da redução de ruídos global personalizada está selecionado no [Perfis de rádio na página 693](#) referenciado.

Não modifique as configurações de redução de ruído, a menos que você faça parte da equipe de serviço qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

10.12.4

CONT. DO VETOR DINC SPATIAL EQ2

Esta configuração permite que você altere o parâmetro interno DINC (Dual Input Noise Canceller, cancelador de ruído de entrada dupla) SPATIAL EQ2 VECTOR.

O valor deste campo será incluído no valor do parâmetro [VETOR DINC SPATIAL EQ2 na página 257](#) para criar os sessenta e seis coeficientes completos do vetor espacial.

**AVISO:**

Esta configuração personalizada se aplica apenas quando o campo Ativação da redução de ruídos global personalizada está selecionado no [Perfis de rádio na página 693](#) referenciado.

Não modifique as configurações de redução de ruído, a menos que você faça parte da equipe de serviço qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

10.12.5

VETOR DE EQ. DINC BF

Esta configuração permite que você altere o parâmetro interno DINC (Dual Input Noise Canceller, cancelador de ruído de entrada dupla) BF EQ VECTOR.

**AVISO:**

Esta configuração personalizada se aplica apenas quando o campo Ativação da redução de ruídos global personalizada está selecionado no [Perfis de rádio na página 693](#) referenciado.

Não modifique as configurações de redução de ruído, a menos que você faça parte da equipe de serviço qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

10.12.6

HISTERESE DINC HOTBEAM

Esta configuração permite que você altere o parâmetro interno DINC (Dual Input Noise Canceller, cancelador de ruído de entrada dupla) HISTERESE DE HOTBEAM.

**AVISO:**

Esta configuração personalizada se aplica apenas quando o campo Ativação da redução de ruídos global personalizada está selecionado no [Perfis de rádio na página 693](#) referenciado.

Não modifique as configurações de redução de ruído, a menos que você faça parte da equipe de serviço qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

Há dois valores separados que definem a faixa.

10.13

Lista de sinalização de tom

Esta seção permite que você defina Listas de sinalização de tom individuais. Podem ser adicionados, no máximo, 1000 registros a todas as Listas de sinalização de tom.

OBSERVAÇÃO:

Quando um Tipo de lista de tom for **Quik-Call II**, serão possíveis 10 Listas de sinalização de tom, com no máximo 100 registros cada.

As Listas de sinalização de tom individuais são então selecionadas para as personalidades Convencional e Entroncamento com seus respectivos campos de Lista de sinalização de tom.

Para comunicações de entroncamento, a sinalização de tom se aplica apenas a personalidades de entroncamento que referenciam um sistema de entroncamento com o campo Tipo de sistema definido para **ASTRO 25**.

Quando um Tipo de lista de tom for **Tom único**, serão permitidas no máximo 100 entradas em uma Lista de sinalização de tons. Em seguida, os registros de Listas de sinalização de tom único e Alias de tom poderão ser selecionados para Personalidades convencionais com o respectivo campo Seleção de sinalização de tom.

OBSERVAÇÃO:

O rádio pode decodificar de 1 a 10 tons em cada conjunto de listas e codificar todos os tons quando o Tipo de lista de tom for **Quik-Call II**.

10.13.1

Alias da Lista de Tons

Esse campo permite definir nomes reconhecíveis para a Lista de sinalização de tom atual.

Uma vez definidas, as listas de Sinalização de Tom são então selecionadas para as Personalidades ASTRO Convencional e Entroncamento ASTRO 25 com seus respectivos campos de Lista de Sinalização de Tom.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

OBSERVAÇÃO:

EMT-001, #500, Electric1, # A5.

É possível usar caracteres, números, espaços e caracteres especiais.

São permitidos no máximo 14 caracteres.

10.13.2

Tipo de Lista do Tom

Esse campo seleciona o tipo de sinalização de tom na Lista de sinalização de tom atual.

A Lista de sinalização de tom é selecionada na Lista de sinalização de tom de Personalidades convencionais/de entroncamento ou na Seleção de lista de tom único de RAC (Repeater Access, acesso repetido) de Personalidades convencionais.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Tom Único

Uma das sinalizações de tom que permite acessar seletivamente os repetidores em todas as sinalizações analógicas convencionais.

Quik-Call II

Uma das Sinalizações de Tom individuais.

10.13.3

Alias de Tom

Esse campo permite definir o texto do Tom de um único tom na Tabela de sinalização de tom.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.13.4

Frequência do tom 1

Este campo seleciona a frequência de recepção do Tom 1 para a Lista de sinalização de tom (registro/linha) atual.

Uma vez selecionada, uma sequência de dois tons exige a seleção da Frequência do tom 2.

Essa seleção se aplica somente a comunicações de ASTRO Convencional e Entroncamento ASTRO 25.

AVISO:

A tecnologia digital do AMBE Vocoder usada pelo console de despacho e pelo rádio não codifica/decodifica com precisão as frequências de Quik-Call II (analógica) correspondentes; em vez disso, dentro da faixa de frequências relevantes disponíveis para Frequência de tom 1 e Frequência de tom 2 (265,625 Hz – 3109,375 Hz), o Vocoder transforma os grupos de frequências distribuídos uniformemente em um conjunto de frequências "padrão", no qual cada grupo tem uma faixa de frequência permitida, e uma frequência padrão é definida no centro de cada grupo.

Portanto, quando uma frequência de tom programada está dentro da faixa permitida de uma das frequências padrão, ela é decodificada pelo rádio como essa frequência.

Idealmente, as frequências de tom programadas do rádio devem corresponder às frequências de tom programadas no console de despacho para evitar a possibilidade de perder uma chamada.

Definições do grupo de frequência de tom específico dependem do Tipo de canal e, portanto, dos canais TDMA (Time Division Multiple Access, acesso múltiplo por divisão de tempo) em relação aos FDMA (Frequency Division Multiple Access, acesso múltiplo por divisão de frequência).

- Para canais TDMA, existem 91 grupos, em que cada grupo cobre uma faixa de 31,25 Hz.
- Para canais FDMA, existem 72 grupos, em que alguns grupos cobrem uma faixa de 31,25 Hz e alguns grupos cobrem uma faixa de 62,5 Hz.

Ao configurar frequências de tom:

- Para um único registro de frequência de dois tons, uma combinação em que a Frequência de tom 1 e a Frequência de tom 2 são configuradas como o mesmo tom deve ser evitada, uma vez que a entrada de dois tons não pode ser decodificada pelo rádio.
- Para um único registro de frequência de dois tons, uma combinação em que a Frequência de tom 1 e a Frequência de tom 2 estão no mesmo grupo de frequência deve ser evitada, uma vez que elas são decodificadas como o mesmo tom. Por exemplo, um registro de frequência de dois tons de 927 Hz e 940 Hz é decodificado como sendo de 937,5 Hz.
- Para registros de dois tons separados, uma combinação em que Frequência de tom 1 e Frequência de tom 2 estão, nos dois registros, respectivamente no mesmo grupo de frequência deve ser evitada, pois eles serão decodificados como sendo a mesma sequência de tom. Por exemplo, se o primeiro registro for de 927 Hz e 1240 Hz e o segundo registro for de 940 Hz e 1260 Hz, os dois registros serão decodificados como 937,5 Hz e 1250 Hz.
- Em alguns casos, uma frequência de tom digital não pode ser consistentemente decodificada para um valor de frequência específico e, em vez disso, é decodificada aleatoriamente para um de dois valores diferentes. A tabela relaciona as frequências de tom que devem ser evitadas para ambos os canais FDMA e TDMA.

Consulte [Lista de Frequências de Tom não Compatíveis na página 262](#).

Acessado apenas: Quando [Tipo de Lista do Tom na página 259](#) está definido como **Quik-Call II** e o rádio está habilitado para o modelo/a opção.

[Acima 106: Alcance](#)

Mínimo	Máximo	Incrementos
288,5 Hz	3086,0 Hz	0,1 Hz

Consulte [Frequências Padrão e Alcances de Grupo aplicáveis a TDMA na página 262](#).

Consulte [Frequências Padrão e Alcances de Grupo aplicáveis a FDMA na página 265](#).

10.13.4.1

Lista de Frequências de Tom não Compatíveis

Frequências não Compatíveis (Hz) para TDMA/FDMA.

NÃO tente programar as seguintes frequências:

Frequências (Hz)			
296,8	578,1	1140,6	1953,1

Índice	Faixa de frequência (Hz)	Frequência Decodificada (Hz)	Índice	Faixa de frequência (Hz)	Frequência Decodificada (Hz)	Índice	Faixa de frequência (Hz)	Frequência Decodificada (Hz)
30	1.171,9 – 1.203,1	1187,5	61	2.140,7 – 2.171,8	2156,25			
31	1.203,2 – 1.234,3	1218,75	62	2171,9 – 2203,1	2187,5			

INFORMAÇÕES:

Quando recebida pelo rádio, qualquer frequência de tom dentro de um grupo específico (alcance) será decodificada como a frequência padrão para esse grupo. Por exemplo, 937,5 Hz é uma frequência de tom padrão para a qual o codificador de voz possui suporte (Para canais TDMA), portanto, qualquer frequência de tom recebida entre 921,875 Hz e 953,125 Hz será decodificada como um tom de 937,5 Hz.

O alcance da frequência de tom Quik-Call II é de 288,5 Hz – 3086 Hz. De acordo com a tabela acima, o alcance de 288,5 Hz – 296,875 Hz é decodificado pelo rádio como 281,25 Hz, enquanto o alcance de 3046,875 Hz – 3086 Hz é decodificado pelo rádio como 3093,75 Hz.

10.13.4.3

Frequências Padrão e Alcances de Grupo aplicáveis a FDMA

Para canais FDMA, existem 72 grupos de frequências, onde alguns grupos cobrem um alcance de 31,25 Hz e alguns grupos cobrem um alcance de 62,5 Hz (presentes no texto destacado abaixo). A tabela lista as frequências padrão e as frequências mínima e máxima correspondentes para cada grupo:

Acima 108: Frequências

Índice	Faixa de frequência (Hz)	Frequência Decodificada (Hz)	Índice	Faixa de frequência (Hz)	Frequência Decodificada (Hz)	Índice	Faixa de frequência (Hz)	Frequência Decodificada (Hz)
1	265,7 – 296,8	283	25	1.015,7 – 1.046,8	1.032,5	49	1.828,2 – 1.859,3	1838,25

18	796,9 – 828,1	806,25	42	1.546,9 – 1.609,3	1.579,25	66	2.671,9 – 2.734,3	2697

Índice	Faixa de frequência (Hz)	Frequência Decodificada (Hz)	Índice	Faixa de frequência (Hz)	Frequência Decodificada (Hz)	Índice	Faixa de frequência (Hz)	Frequência Decodificada (Hz)
19	828,2 – 859,3	849	43	1.609,4 – 1.640,6	1.616,75	67	2.734,4 – 2.796,8	2.763,75
20	859,4 – 890,6	880,5	44	1.640,7 – 1.671,8	1.650	68	2.796,9 – 2.859,3	2.813,25
21	890,7 – 921,8	914,25	45	1.671,9 – 1.703,1	1.684,75	69	2.859,4 – 2.921,8	2.875,5
22	921,9 – 953,1	932	46	1.703,2 – 1.734,3	1.721	70	2.921,9 – 2.984,3	2.941,25
23	953,2 – 984,3	970	47	1.734,4 – 1.765,6	1.758,25	71	2.984,4 – 3.046,8	3.010
24	984,4 – 1.015,6	1011	48	1.765,7 – 1.828,1	1.797,25	72	3.046,9 – 3.109,3	3.082,25

INFORMAÇÕES:

Quando recebida pelo rádio, qualquer frequência do tom dentro de um grupo específico (faixa) será decodificada como a frequência padrão para esse grupo. Por exemplo, 932 Hz é uma frequência de tom padrão para a qual o codificador de voz possui suporte (para canais FDMA), portanto, qualquer frequência de tom recebida entre 921,875 Hz e 953,125 Hz será decodificada como um tom de 932 Hz.

O alcance da frequência de tom Quik-Call II é de 288,5 Hz – 3086 Hz. De acordo com a tabela acima, o alcance de 288,5 Hz – 296,875 Hz é decodificado pelo rádio como 283 Hz, enquanto o alcance de 3046,875 Hz – 3086 Hz é decodificado pelo rádio como 3082,25 Hz.

10.13.5

Frequência do tom 2

Este campo seleciona a frequência de recepção do Tom 2 para a Lista de sinalização de tom (registro/linha) atual.

Isso só é necessário quando uma sequência de dois tons na qual a Frequência de tom 1 e a Frequência de tom 2 definam coletivamente a sequência desejada de tons na atual Lista de sinalização de tom.

Essa seleção se aplica somente a comunicações de ASTRO Convencional e Entroncamento ASTRO 25.

**AVISO:**

A tecnologia digital do AMBE Vocoder usada pelo console de despacho e pelo rádio não codifica/decodifica com precisão as frequências de Quik-Call II (analógica) correspondentes; em vez disso, dentro da faixa de frequências relevantes disponíveis para Frequência do tom 1 e Frequência do tom 2 (265,625 Hz – 3109,375 Hz), o Vocoder transforma os grupos de frequências distribuídos uniformemente em um conjunto de frequências "padrão", no qual cada grupo tem uma faixa de frequência permitida e uma frequência padrão é definida no centro de cada grupo.

Portanto, quando uma frequência de tom programada está dentro da faixa permitida de uma das frequências padrão, ela é decodificada pelo rádio como essa frequência.

Idealmente, as frequências de tom programadas do rádio devem corresponder às frequências de tom programadas no console de despacho para evitar a possibilidade de perder uma chamada.

Definições do grupo de frequência de tom específico dependem do Tipo de canal e, portanto, dos canais TDMA (Time Division Multiple Access, acesso múltiplo por divisão de tempo) em relação aos FDMA (Frequency Division Multiple Access, acesso múltiplo por divisão de frequência).

- Para canais TDMA, existem 91 grupos, em que cada grupo cobre uma faixa de 31,25 Hz.
- Para canais FDMA, existem 72 grupos, em que alguns grupos cobrem uma faixa de 31,25 Hz e alguns grupos cobrem uma faixa de 62,5 Hz.

Ao configurar frequências de tom:

- Para um único registro de frequência de dois tons, uma combinação em que a Frequência de tom 1 e a Frequência de tom 2 são configuradas como o mesmo tom deve ser evitada, uma vez que a entrada de dois tons não pode ser decodificada pelo rádio.
- Para um único registro de frequência de dois tons, uma combinação em que a Frequência de tom 1 e a Frequência de tom 2 estão no mesmo grupo de frequência deve ser evitada, uma vez que elas são decodificadas como o mesmo tom. Por exemplo, um registro de frequência de dois tons de 927 Hz e 940 Hz é decodificado como sendo de 937,5 Hz.
- Para registros de dois tons separados, uma combinação em que Frequência de tom 1 e Frequência de tom 2 estão, nos dois registros, respectivamente no mesmo grupo de frequência deve ser evitada, pois eles serão decodificados como sendo a mesma sequência de tom. Por exemplo, se o primeiro registro for de 927 Hz e 1240 Hz e o segundo registro for de 940 Hz e 1260 Hz, os dois registros serão decodificados como 937,5 Hz e 1250 Hz.
- Em alguns casos, uma frequência de tom digital não pode ser consistentemente decodificada para um valor de frequência específico e, em vez disso, é decodificada aleatoriamente para um de dois valores diferentes. A tabela relaciona as frequências de tom que devem ser evitadas para ambos os canais FDMA e TDMA.

Consulte [Lista de Frequências de Tom não Compatíveis na página 262](#).

Acessado apenas: Quando [Tipo de Lista do Tom na página 259](#) está definido como **Quik-Call II** e o rádio está habilitado para o modelo/a opção.

**OBSERVAÇÃO:**

Quando definido como **Desativado**, apenas um tom (Frequência de tom 1) é aplicável ao membro atual da Lista de sinalização de tom.

Acima 109: Alcance

Mínimo	Máximo	Incrementos
288,5 Hz	3086,0 Hz	0,1 Hz

Consulte [Frequências Padrão e Alcances de Grupo aplicáveis a TDMA na página 262](#).

Consulte [Frequências Padrão e Alcances de Grupo aplicáveis a FDMA na página 265](#).

10.13.6

Ativação do recurso de desativação do modo silencioso

Este campo permite que o rádio permaneça silenciado para todas as chamadas de despacho Convencional e chamadas de grupo de Entroncamento afiliado recebidas até que o rádio decodifique os tons de Sinalização de tom definidos no registro/na linha atual.

Essa seleção se aplica somente a comunicações de ASTRO Convencional e Entroncamento ASTRO 25.

OBSERVAÇÃO:

- Em situações nas quais o despacho precisa transmitir em sequência vários tons de sinalização (por exemplo, durante uma Chamada para todos), o primeiro tom único (ou par de tons) qualificado que corresponde ao tom definido ativa o áudio do rádio, e é possível ouvir quaisquer tons subsequentes antes da mensagem de voz.
- Essa função opera apenas em canais habilitados para Alerta do usuário de chamada recebida nos quais o recurso Silenciar voz está ativado.
- Pressionar o botão Silenciar voz ou selecionar o menu Silenciar voz permite ativar/desativar essa funcionalidade para canais habilitados para Alerta do usuário de chamada recebida.
- O rádio pode decodificar de 1 a 10 tons e codificar todos os tons.

Acessado apenas: Quando [Tipo de Lista do Tom na página 259](#) está definido como **Quik-Call II** e o rádio está habilitado para o modelo/a opção.

10.13.7

Tom de alerta

Esse campo seleciona um tom de alerta específico para ser emitido ao receber os tons da Sinalização de tom definidos no registro ou na linha atual.

Quando o rádio decodifica os tons, ativa o som do alto-falante e emite o tom de alerta associado, seguido por qualquer áudio de voz remanescente.

Essa seleção se aplica somente a comunicações de ASTRO Convencional e Entroncamento ASTRO 25.

Acessado apenas: Quando [Tipo de Lista do Tom na página 259](#) está definido como **Quik-Call II** e o rádio está habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

- Desabilitado
- Padrão
- Contínuo
- Tom 1 a Tom 8

OBSERVAÇÃO:

O rádio pode decodificar de 1 a 10 tons e codificar todos os tons.

10.13.8

Frequência do tom

Permite definir a frequência do tom único da Lista de sinalização de tom.

Acessado apenas: Quando [Tipo de Lista do Tom na página 259](#) estiver definido como **Tom único** e quando o rádio estiver habilitado para o modelo/a opção.

Acima 110: Alcance

Mínimo	Máximo	Incrementos
288,5 Hz	3086,0 Hz	0,1 Hz

10.13.9

Duração do tom

Este campo permite definir o tempo durante o qual o rádio transmite um tom de frequência de Tom único.

Acessado apenas: Quando [Tipo de Lista do Tom na página 259](#) estiver definido como **Tom único** e quando o rádio estiver habilitado para o modelo/a opção.

Acima 111: Alcance

Mínimo	Máximo	Incrementos
25 ms	6375 ms	25 ms

10.13.10

Pré-tempo do tom

Esse campo permite definir o tempo que o rádio aguarda para enviar um tom de frequência de Tom único.

Acessado apenas: Quando [Tipo de Lista do Tom na página 259](#) estiver definido como **Tom único** e quando o rádio estiver habilitado para o modelo/a opção.

Acima 112: Alcance

Mínimo	Máximo	Incrementos
25 ms	6375 ms	25 ms

10.14

Definição de Idioma

O conjunto **Idioma** permite que o usuário defina uma lista de idiomas para o rádio.

10.14.1

Seleção do Idioma

Este campo permite que você selecione o idioma a ser usado no visor do rádio. Essa seleção se aplica a todos os rádios.

O aplicativo é compatível com os seguintes idiomas: Os rádios são compatíveis com os seguintes idiomas:

- Inglês (Austrália)

- Inglês (Estados Unidos)
- Francês (Canadá)
- Português (Brasil)
- Espanhol (Argentina)
- Espanhol (Chile)
- Espanhol (Colômbia)
- Espanhol (México)

**OBSERVAÇÃO:**

Quando o Idioma de visualização do rádio é definido primeiro como um idioma diferente do inglês, os tempos de Gravação, Clonagem e Gravação na memória demoram perceptivelmente mais.

Dependendo da configuração de Atualizar idioma do rádio, as atualizações subsequentes poderão ser mais rápidas.

10.15

ViQi: Alerta de Parceiro Virtual

O **ViQi**: O conjunto de **Alertas do parceiro virtual** permite que os usuários criem uma lista de Alertas de parceiro virtual com os as Ações de alerta correspondentes, definidas em **Consolidação da ação**. O Parceiro virtual ViQi lida com o início de uma Chamada de parceiro virtual ViQi por um usuário e permanece ativo até o fim da chamada.

**OBSERVAÇÃO:**

A lista de Alertas é um conjunto fixo de 16 alertas que correspondem aos Alertas de parceiro virtual ViQi do sistema.

Cada Alerta tem uma Ação de alerta que é uma ação do Parceiro virtual ViQi na tabela Consolidação da ação, e é realizado no rádio quando o Alerta de parceiro virtual ViQi correspondente é recebido do sistema.

10.15.1

Nome da lista de alertas de parceiro virtual

Este campo permite visualizar ou definir o nome reconhecível pelo usuário para a lista de alertas do parceiro virtual atual.

**OBSERVAÇÃO:**

O valor padrão é "Lista 1 do parceiro virtual".

É possível usar caracteres, números, espaços e caracteres especiais.

No máximo 14 caracteres no total.

10.15.1.1

Alias do aAlerta

Este campo permite definir o nome reconhecível pelo usuário do rádio quando um alerta do parceiro virtual é recebido do sistema.

**OBSERVAÇÃO:**

É possível usar caracteres, números, espaços e caracteres especiais.

No máximo 14 caracteres no total.

10.15.1.2

Ação de alerta

Este campo permite especificar a ação a ser executada no rádio quando um alerta do parceiro virtual é recebido do sistema.

INFORMAÇÕES:

Este campo é uma referência para um registro de ação de Parceiro Virtual na tabela Consolidação da Ação. O valor padrão é **Não Atribuído**.

10.16

Todas os anúncios de voz

Essa seção permite visualizar ou atribuir os arquivos *.MVA a funções específicas do rádio.

Você pode ouvir essas instruções por voz quando uma das funções atribuídas for selecionada. Essas seleções se aplicam a todos os rádios.

OBSERVAÇÃO:

Lista de anúncios de voz permite que você carregue arquivos *.MVA no codeplug atual.

10.16.1

Geral (Todas as Notificações de Voz)

A seção **Geral** do conjunto Todas as Notificações de Voz permite ao usuário visualizar ou atribuir arquivos de Notificação de Voz da Motorola (*.MVA) para recursos específicos do rádio. Assim, o usuário do rádio pode ouvir essas instruções por voz quando uma das funções atribuídas for selecionada. Essas seleções se aplicam a todos os rádios.

10.16.1.1

Prioridade de anúncio de voz

Este campo determina se a reprodução do áudio de anúncios de voz terá prioridade sobre o áudio de recepção (Rx) normal do rádio.

Essa seleção se aplica a todos os rádios.

INFORMAÇÕES:

Essa configuração não influencia as interações de Anúncio de voz com os tons de alerta. Tons de alerta momentâneos têm prioridade maior que o áudio de Anúncio de voz, enquanto a Anúncio de voz tem maior prioridade do que os tons de alerta contínuos.

As seleções a seguir são compatíveis:

Baixa

O áudio de recepção normal do rádio tem prioridade.

Isso também é conhecido como Emergência tática.

Alta

A reprodução do áudio de Anúncio de voz tem prioridade.

10.16.1.2

Varredura ativada

Este campo seleciona qual arquivo de anúncio de voz da Motorola (.MVA), se houver, está atribuído a uma operação no Modo de varredura ATIVADA.

Quando você alterna para o Modo de varredura ativa, uma instrução por voz é reproduzida.

É possível alternar para o Modo de varredura ativada pressionando o botão Varredura, ativando/desativando a opção Varredura ou selecionando o menu Varredura. Se o TTS (Text-to-Speech, texto

para fala) for selecionado, o texto no campo Comando de voz correspondente será convertido em fala e reproduzido como áudio. Esse recurso não é aplicável quando a Varredura automática está ativada no canal operacional do rádio.

Essa seleção se aplica a todos os rádios.

OBSERVAÇÃO:

A página Lista de anúncios de voz permite carregar arquivos *.MVA (Motorola Voice Announcement, anúncio de voz da Motorola) no codeplug atual do aplicativo.

As seleções a seguir são compatíveis:

Nenhum

Nenhuma instrução por voz é necessária para essa função do rádio.

TTS

Quando o recurso Controle por voz está ativado, o texto no campo Comando de voz para Varredura ativada é reproduzido como áudio.

Arquivo *.MVA (Motorola Voice Announcement, anúncio de voz da Motorola)

Lista todos os arquivos de voz possíveis definidos na página Lista de arquivos de anúncio de voz.

10.16.1.3

Anúncio de TTS de Varredura ativada

Uma palavra comumente falada para fazer referência ao campo Varredura ativada em anúncios TTS (Text-to-Speech, texto para fala).

OBSERVAÇÃO:

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

Ao clicar no botão **Reproduzir** , o aplicativo converte o texto no campo de comando de voz em fala e o reproduz pelo alto-falante.

Acessado apenas:

- [ViQi: Prioridade de controle de voz na página 113](#) não está definido como **Desativado**.
- [Varredura ativada na página 272](#) está definido como **TTS**.
- O rádio é habilitado de acordo com o modelo ou a opção.

OBSERVAÇÃO:

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.4

Varredura desativada

Este campo seleciona qual arquivo de notificação de voz da Motorola (.MVA), se houver, será atribuído a uma operação no Modo de varredura DESATIVADA.

Quando você alterna para o Modo de varredura desativada, uma instrução por voz é reproduzida.

É possível alternar para o Modo de varredura desativada pressionando o botão Varredura, ativando/desativando a opção Varredura ou selecionando o menu Varredura. Se o TTS (Text-to-Speech, texto para fala) for selecionado, o texto no campo Comando de voz correspondente será convertido em fala e reproduzido como áudio. Esse recurso não é aplicável quando a Varredura automática está ativada no canal operacional do rádio.

Essa seleção se aplica a todos os rádios.

**OBSERVAÇÃO:**

A página Lista de notificações de voz permite carregar arquivos de notificação de voz da Motorola (.MVA) no codeplug atual do aplicativo.

As seleções a seguir são compatíveis:

Nenhum

Nenhuma instrução por voz é necessária para essa função do rádio.

TTS

Quando o recurso Controle por voz está ativado, o texto no campo Comando de voz para Varredura desativada é reproduzido como áudio.

Arquivo de anúncio de voz da Motorola (.MVA)

Lista todos os arquivos de voz possíveis definidos na página Lista de arquivos de anúncio de voz.

10.16.1.5**Anúncio de TTS de Varredura desativada**

Uma palavra comumente falada para fazer referência ao campo Varredura desativada em anúncios TTS (Text-to-Speech, texto para fala).

**OBSERVAÇÃO:**

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

Ao clicar no botão **Reproduzir** , o aplicativo converte o texto no campo de comando de voz em fala e o reproduz pelo alto-falante.

Acessado apenas:

- [ViQi: Prioridade de controle de voz na página 113](#) não está definido como **Desativado**.
- [Varredura desativada na página 273](#) está definido como **TTS**.
- O rádio é habilitado de acordo com o modelo ou a opção.

**OBSERVAÇÃO:**

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.6**Monitor ativado**

Este campo seleciona qual arquivo de anúncio de voz da Motorola (.MVA), se houver, será atribuído à operação no modo Monitor ativado.

Se o TTS (Text-to-Speech, texto para fala) for selecionado, o texto no campo Comando de voz correspondente será convertido em fala e reproduzido como áudio. O Modo Monitor é conhecido também como Desativar PL. O modo Monitor permite que você monitore toda a atividade do silenciador de portadora no canal atual do rádio.

Quando você alterna para o Modo monitor/Desativar PL ativado, uma instrução por voz é reproduzida. Essa seleção se aplica somente às comunicações Convencionais.

AVISO:

- Para rádios móveis, o arquivo Voice Announcement é iniciado somente com o pressionamento do botão Monitor ou com a seleção do menu Monitor.
- Para rádios portáteis, o arquivo Voice Announcement é iniciado somente ao alternar a chave Desativar PL.

OBSERVAÇÃO:

- A página Lista de notificações de voz permite carregar arquivos de notificação de voz da Motorola (.MVA) no codeplug atual do aplicativo.
- Em rádios móveis, é possível desativar o Modo monitor pressionando o botão Monitor ou selecionando o menu Monitor.
- Em rádios portáteis, é possível desativar a opção Desativar PL ao alternar a chave Desativar PL.

As seleções a seguir são compatíveis:

Nenhum

Nenhuma instrução por voz é necessária para essa função do rádio.

TTS

Quando o recurso Controle por voz está ativado, o texto no campo Comando de voz para Monitor ativado é reproduzido como áudio.

Arquivo de anúncio de voz da Motorola (.MVA)

Lista todos os arquivos de voz possíveis definidos na página Lista de arquivos de anúncio de voz.

10.16.1.7

Anúncio de TTS de Monitor ativado

Uma palavra comumente falada para fazer referência ao campo Monitor ativado em anúncios TTS (Text-to-Speech, texto para fala).

OBSERVAÇÃO:

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

Ao clicar no botão **Reproduzir** , o aplicativo converte o texto no campo de comando de voz em fala e o reproduz pelo alto-falante.

Acessado apenas:

- [ViQi: Prioridade de controle de voz na página 113](#) não está definido como **Desativado**.
- [Monitor ativado na página 274](#) está definido como **TTS**.
- O rádio é habilitado de acordo com o modelo ou a opção.

OBSERVAÇÃO:

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.8

Monitor desativado

Este campo seleciona qual arquivo de anúncio de voz da Motorola (.MVA), se houver, será atribuído à operação do modo Monitor DESATIVADO.

Se o TTS (Text-to-Speech, texto para fala) for selecionado, o texto no campo Comando de voz correspondente será convertido em fala e reproduzido como áudio. O Modo Monitor é conhecido também como Desativar PL. O modo Monitor permite que você monitore toda a atividade do silenciador de portadora no canal atual do rádio.

Quando você alterna entre os modos Monitor/Desativar PL, um prompt de voz é reproduzido. Essa seleção se aplica somente às comunicações Convencionais.

**AVISO:**

- Para rádios móveis, o arquivo Voice Announcement é iniciado somente com o pressionamento do botão Monitor ou com a seleção do menu Monitor.
- Para rádios portáteis, o arquivo Voice Announcement é iniciado somente ao alternar a chave Desativar PL.

**OBSERVAÇÃO:**

- A página Lista de notificações de voz permite carregar arquivos de notificação de voz da Motorola (.MVA) no codeplug atual do aplicativo.
- Em rádios móveis, é possível desativar o Modo monitor pressionando o botão Monitor ou selecionando o menu Monitor.
- Em rádios portáteis, é possível desativar a opção Desativar PL ao alternar a chave Desativar PL.

As seleções a seguir são compatíveis:

Nenhum

Nenhuma instrução por voz é necessária para essa função do rádio.

TTS

Quando o recurso Controle de voz está ativado, o texto no campo Comando de voz para Monitor desligado é reproduzido como áudio.

Arquivo de anúncio de voz da Motorola (.MVA)

Lista todos os arquivos de voz possíveis definidos na página Lista de arquivos de anúncio de voz.

10.16.1.9**Anúncio de TTS de Monitor desativado**

Uma palavra comumente falada para fazer referência ao campo Monitor desativado em anúncios TTS (Text-to-Speech, texto para fala).

**OBSERVAÇÃO:**

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

Ao clicar no botão **Reproduzir** , o aplicativo converte o texto no campo de comando de voz em fala e o reproduz pelo alto-falante.

Acessado apenas:

- [ViQi: Prioridade de controle de voz na página 113](#) não está definido como **Desativado**.
- [Monitor desativado na página 275](#) está definido como **TTS**.
- O rádio é habilitado de acordo com o modelo ou a opção.

**OBSERVAÇÃO:**

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.10

Modo direto ativado

Esta campo seleciona qual arquivo de anúncio de voz da Motorola (.MVA), se houver, será atribuído a uma operação de modo direto ATIVADO.

Se o TTS (Text-to-Speech, texto para fala) for selecionado, o texto no campo Comando de voz correspondente será convertido em fala e reproduzido como áudio. Quando você alterna para o Modo direto ativado, uma instrução por voz é reproduzida. Você pode alternar para o Modo direto ativado pressionando o botão DEK (Direct Entry Keypad, teclado de entrada direta) do Modo direto.

Essa seleção se aplica a todos os rádios.

OBSERVAÇÃO:

A página Lista de notificações de voz permite carregar arquivos de notificação de voz da Motorola (.MVA) no codeplug atual do aplicativo.

As seleções a seguir são compatíveis:

Nenhum

Nenhuma instrução por voz é necessária para essa função do rádio.

TTS

Quando o recurso Controle de voz está ativado, o texto no campo Comando de voz para Modo direto ativado é reproduzido como áudio.

Arquivo de anúncio de voz da Motorola (.MVA)

Lista todos os arquivos de voz possíveis definidos na página Lista de arquivos de anúncio de voz.

10.16.1.11

Anúncio de TTS de Modo direto ativado

Uma palavra comumente falada para fazer referência ao campo Modo direto ativado em anúncios TTS (Text-to-Speech, texto para fala).

OBSERVAÇÃO:

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

Ao clicar no botão **Reproduzir** , o aplicativo converte o texto no campo de comando de voz em fala e o reproduz pelo alto-falante.

Acessado apenas:

- [ViQi: Prioridade de controle de voz na página 113](#) não está definido como **Desativado**.
- [Modo direto ativado na página 277](#) está definido como **TTS**.
- O rádio é habilitado de acordo com o modelo ou a opção.

OBSERVAÇÃO:

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.12

Modo direto desativado

Este campo seleciona qual arquivo de anúncio de voz da Motorola (.MVA), se houver, será atribuído a uma operação de modo direto DESATIVADO.

Se o TTS (Text-to-Speech, texto para fala) for selecionado, o texto no campo Comando de voz correspondente será convertido em fala e reproduzido como áudio. Quando você alterna para o

Modo direto desativado, uma instrução por voz é reproduzida. Você pode alternar para o Modo direto desativado pressionando o botão DEK (Direct Entry Keypad, teclado de entrada direta) do Modo direto.

Essa seleção se aplica a todos os rádios.

**OBSERVAÇÃO:**

A página Lista de anúncios de voz da Motorola permite carregar arquivos de anúncio de voz da Motorola (.MVA) no codeplug atual.

As seleções a seguir são compatíveis:

Nenhum

Nenhuma instrução por voz é necessária para essa função do rádio.

TTS

Quando o recurso Controle de voz está ativado, o texto no campo Comando de voz para Modo direto desativado é reproduzido como áudio.

Arquivo de anúncio de voz da Motorola (.MVA)

Lista todos os arquivos de voz possíveis definidos na página Lista de arquivos de anúncio de voz.

10.16.1.13**Anúncio de TTS de Modo direto desativado**

Uma palavra comumente falada para fazer referência ao campo Modo direto desativado em anúncios TTS (Text-to-Speech, texto para fala).

**OBSERVAÇÃO:**

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

Ao clicar no botão **Reproduzir** , o aplicativo converte o texto no campo de comando de voz em fala e o reproduz pelo alto-falante.

Acessado apenas:

- [ViQi: Prioridade de controle de voz na página 113](#) não está definido como **Desativado**.
- [Modo direto desativado na página 277](#) está definido como **TTS**.
- O rádio é habilitado de acordo com o modelo ou a opção.

**OBSERVAÇÃO:**

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.14**Emergência ativada**

Este campo seleciona qual arquivo de anúncio de voz da Motorola (.MVA), se houver, será atribuído a uma operação no modo de emergência ATIVADA.

Se o TTS (Text-to-Speech, texto para fala) for selecionado, o texto no campo Comando de voz correspondente será convertido em fala e reproduzido como áudio. Ao ativar o Modo de emergência, uma instrução por voz é reproduzida.

É possível iniciar uma transmissão de emergência pressionando o botão de Emergência, pressionando um pedal ou mesmo sem a sua interação direta com o recurso de alarme de emergência Man Down.

Essa seleção se aplica a todos os rádios.

OBSERVAÇÃO:

A página Lista de notificações de voz permite carregar arquivos de notificação de voz da Motorola (.MVA) no codeplug atual do aplicativo.

As seleções a seguir são compatíveis:

Nenhum

Nenhuma instrução por voz é necessária para essa função do rádio.

TTS

Quando o recurso Controle por voz está ativado, o texto no campo Comando de voz de Emergência ativada é reproduzido como áudio.

Arquivo de anúncio de voz da Motorola (.MVA)

Lista todos os arquivos de voz possíveis definidos na página Lista de arquivos de anúncio de voz.

10.16.1.15

Anúncio de TTS de Emergência ativada

Uma palavra comumente falada para fazer referência ao campo Emergência ativada em anúncios TTS (Text-to-Speech, texto para fala).

OBSERVAÇÃO:

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

Ao clicar no botão **Reproduzir** , o aplicativo converte o texto no campo de comando de voz em fala e o reproduz pelo alto-falante.

Acessado apenas:

- [ViQi: Prioridade de controle de voz na página 113](#) não está definido como **Desativado**.
- [Emergência ativada na página 278](#) está definido como **TTS**.
- O rádio é habilitado de acordo com o modelo ou a opção.

OBSERVAÇÃO:

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.16

Seleção de transmissão segura ativada

Este campo seleciona qual arquivo de anúncio de voz da Motorola (.MVA), se houver, será atribuído para ATIVAR transmissões criptografadas seguras.

Se o TTS (Text-to-Speech, texto para fala) for selecionado, o texto no campo Comando de voz correspondente será convertido em fala e reproduzido como áudio. Ao ativar as transmissões criptografadas seguras, a instrução por voz é reproduzida.

É possível ativar/desativar as transmissões criptografadas seguras pressionando o botão Seleção de transmissão segura, ativando/desativando a Seleção de transmissão segura ou selecionando o menu Seguro.

Essa seleção se aplica a todos os rádios.

OBSERVAÇÃO:

A página Lista de notificações de voz permite carregar arquivos de notificação de voz da Motorola (.MVA) no codeplug atual do aplicativo.

As seleções a seguir são compatíveis:

Nenhum

Nenhuma instrução por voz é necessária para essa função do rádio.

TTS

Quando o recurso Controle por voz está ativado, o texto no campo Comando de voz de Seleção de transmissão segura ativada é reproduzido como áudio.

Arquivo de anúncio de voz da Motorola (.MVA)

Lista todos os arquivos de voz possíveis definidos na página Lista de arquivos de anúncio de voz.

10.16.1.17

Anúncio de TTS de Seleção de transmissão segura ativada

Uma palavra comumente falada para fazer referência ao campo Seleção de transmissão segura ativada em anúncios TTS (Text-to-Speech, texto para fala).

OBSERVAÇÃO:

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

Ao clicar no botão **Reproduzir** , o aplicativo converte o texto no campo de comando de voz em fala e o reproduz pelo alto-falante.

Acessado apenas:

- [ViQi: Prioridade de controle de voz na página 113](#) não está definido como **Desativado**.
- [Seleção de transmissão segura ativada na página 279](#) está definido como **TTS**.
- O rádio é habilitado de acordo com o modelo ou a opção.

OBSERVAÇÃO:

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.18

Seleção de transmissão segura desativada

Este campo seleciona qual arquivo de voz da Motorola (.MVA), se houver, será atribuído para DESATIVAR transmissões criptografadas seguras (em outras palavras, habilitar transmissões "claras").

Se o TTS (Text-to-Speech, texto para fala) for selecionado, o texto no campo Comando de voz correspondente será convertido em fala e reproduzido como áudio. Ao desativar as transmissões criptografadas seguras, uma instrução por voz é reproduzida.

É possível desativar as transmissões criptografadas seguras pressionando o botão Seleção de transmissão segura, ativando/desativando a Seleção de transmissão segura ou selecionando o menu Seguro.

Essa seleção se aplica a todos os rádios.

OBSERVAÇÃO:

A página Lista de notificações de voz permite carregar arquivos de notificação de voz da Motorola (.MVA) no codeplug atual do aplicativo.

As seleções a seguir são compatíveis:

Nenhum

Nenhuma instrução por voz é necessária para essa função do rádio.

TTS

Quando o recurso Controle por voz está ativado, o texto no campo Comando de voz de Seleção de transmissão segura desativada é reproduzido como áudio.

Arquivo de anúncio de voz da Motorola (.MVA)

Lista todos os arquivos de voz possíveis definidos na página Lista de arquivos de anúncio de voz.

10.16.1.19

Anúncio de TTS de Seleção de transmissão segura desativada

Uma palavra comumente falada para fazer referência ao campo Seleção de transmissão segura desativada em anúncios TTS (Text-to-Speech, texto para fala).

OBSERVAÇÃO:

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

Ao clicar no botão **Reproduzir** , o aplicativo converte o texto no campo de comando de voz em fala e o reproduz pelo alto-falante.

Acessado apenas:

- [ViQi: Prioridade de controle de voz na página 113](#) não está definido como **Desativado**.
- [Seleção de transmissão segura desativada na página 280](#) está definido como **TTS**.
- O rádio é habilitado de acordo com o modelo ou a opção.

OBSERVAÇÃO:

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.20

Alerta selecionável do site permitido fora do alcance

Esse campo permite ao rádio continuar fornecendo feedback ergonômico associado ao último SSA recebido no caso de, durante o alerta, o rádio sair da área de cobertura do site.

O feedback ergonômico do SSA decodificado inclui soar a Notificação de voz recorrente associada ao SSA e exibir seu Alias de alerta com luzes inteligentes, se habilitadas. Essa seleção se aplica às comunicações de Entroncamento.

Quando desativada, o rádio para de fornecer feedback ergonômico associado ao último Alerta selecionável de site, pois o rádio saiu da área de cobertura.

OBSERVAÇÃO:

- Uma Lista de alerta selecionável do site é atribuída a um Sistema de entroncamento do ASTRO 25 por meio do campo Seleção da lista de alertas selecionáveis de site.
- É possível ativar e desativar os Alertas selecionáveis de site que tenham o campo **Codificável por rádio ativado** selecionando o menu Alerta selecionável de site. Tanto um único site como todos os disponíveis na Zona podem ser selecionados para ativar ou desativar um Alerta de Site Selecionável.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.16.1.21

Anúncio de TTS de Inibição de transmissão ativada

Uma palavra comumente falada para fazer referência ao campo Inibição de transmissão ativada em anúncios TTS (Text-to-Speech, texto para fala).

**OBSERVAÇÃO:**

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

Ao clicar no botão **Reproduzir** , o aplicativo converte o texto no campo de comando de voz em fala e o reproduz pelo alto-falante.

Acessado apenas:

- [ViQi: Prioridade de controle de voz na página 113](#) não está definido como **Desativado**.
- O campo Anúncio de voz correspondente está definido como **TTS**.
- O rádio é habilitado de acordo com o modelo ou a opção.

**OBSERVAÇÃO:**

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.22

Anúncio de TTS de Inibição de transmissão desativada

Uma palavra comumente falada para fazer referência ao campo Inibição de transmissão desativada em anúncios TTS (Text-to-Speech, texto para fala).

**OBSERVAÇÃO:**

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

Ao clicar no botão **Reproduzir** , o aplicativo converte o texto no campo de comando de voz em fala e o reproduz pelo alto-falante.

Acessado apenas:

- [ViQi: Prioridade de controle de voz na página 113](#) não está definido como **Desativado**.
- O campo Anúncio de voz correspondente está definido como **TTS**.
- O rádio é habilitado de acordo com o modelo ou a opção.

**OBSERVAÇÃO:**

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.23

Anúncio de TTS de Alerta do usuário de chamada recebida desativado

Uma palavra comumente falada para fazer referência ao campo Alerta do usuário de chamada recebida desativado em anúncios TTS (Text-to-Speech, texto para fala).

**OBSERVAÇÃO:**

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

Ao clicar no botão **Reproduzir** , o aplicativo converte o texto no campo de comando de voz em fala e o reproduz pelo alto-falante.

Acessado apenas:

- [ViQi: Prioridade de controle de voz na página 113](#) não está definido como **Desativado**.
- O campo Anúncio de voz correspondente está definido como **TTS**.
- O rádio é habilitado de acordo com o modelo ou a opção.

OBSERVAÇÃO:

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.24

Anúncio de TTS de Alerta do usuário de chamada recebida ativado

Uma palavra comumente falada para fazer referência ao campo Alerta do usuário de chamada recebida ativado em anúncios TTS (Text-to-Speech, texto para fala).

OBSERVAÇÃO:

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

Ao clicar no botão **Reproduzir** , o aplicativo converte o texto no campo de comando de voz em fala e o reproduz pelo alto-falante.

Acessado apenas:

- [ViQi: Prioridade de controle de voz na página 113](#) não está definido como **Desativado**.
- O campo Anúncio de voz correspondente está definido como **TTS**.
- O rádio é habilitado de acordo com o modelo ou a opção.

OBSERVAÇÃO:

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.25

Anúncio de TTS de Modo primário do botão multifuncional

Uma palavra comumente falada para fazer referência ao campo Modo primário do botão multifuncional em anúncios TTS (Text-to-Speech, texto para fala).

OBSERVAÇÃO:

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

Ao clicar no botão **Reproduzir** , o aplicativo converte o texto no campo de comando de voz em fala e o reproduz pelo alto-falante.

Acessado apenas:

- [ViQi: Prioridade de controle de voz na página 113](#) não está definido como **Desativado**.
- O campo Anúncio de voz correspondente está definido como **TTS**.
- O rádio é habilitado de acordo com o modelo ou a opção.

OBSERVAÇÃO:

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.26

Anúncio de TTS de Modo secundário do botão multifuncional

Uma palavra comumente falada para fazer referência ao campo Modo secundário do botão multifuncional em anúncios TTS (Text-to-Speech, texto para fala).

**OBSERVAÇÃO:**

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

Ao clicar no botão **Reproduzir** , o aplicativo converte o texto no campo de comando de voz em fala e o reproduz pelo alto-falante.

Acessado apenas:

- [ViQi: Prioridade de controle de voz na página 113](#) não está definido como **Desativado**.
- O campo Anúncio de voz correspondente está definido como **TTS**.
- O rádio é habilitado de acordo com o modelo ou a opção.

**OBSERVAÇÃO:**

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.27

Anúncio de TTS de Bloqueio de teclado/controles ativado

Uma palavra comumente falada para fazer referência ao campo Bloqueio de teclado/controles ativado em anúncios TTS (Text-to-Speech, texto para fala).

**OBSERVAÇÃO:**

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

Ao clicar no botão **Reproduzir** , o aplicativo converte o texto no campo de comando de voz em fala e o reproduz pelo alto-falante.

Acessado apenas:

- [ViQi: Prioridade de controle de voz na página 113](#) não está definido como **Desativado**.
- O campo Anúncio de voz correspondente está definido como **TTS**.
- O rádio é habilitado de acordo com o modelo ou a opção.

**OBSERVAÇÃO:**

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.28

Anúncio de TTS de Bloqueio de teclado/controles desativado

Uma palavra comumente falada para fazer referência ao campo Bloqueio de teclado/controles desativado em anúncios TTS (Text-to-Speech, texto para fala).

**OBSERVAÇÃO:**

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

Ao clicar no botão **Reproduzir** , o aplicativo converte o texto no campo de comando de voz em fala e o reproduz pelo alto-falante.

Acessado apenas:

- [ViQi: Prioridade de controle de voz na página 113](#) não está definido como **Desativado**.
- O campo Anúncio de voz correspondente está definido como **TTS**.
- O rádio é habilitado de acordo com o modelo ou a opção.

OBSERVAÇÃO:

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.29

Alerta do usuário da lig. recebida ativado

Este campo seleciona qual arquivo de anúncio de voz da Motorola (.MVA), será atribuído quando a funcionalidade Silenciar for ATIVADA para os canais habilitados para alerta do usuário de chamada recebida.

Se o TTS (Text-to-Speech, texto para fala) for selecionado, o texto no campo Comando de voz correspondente será convertido em fala e reproduzido como áudio. Ao ativar Emudecer voz de um canal habilitado para Alerta do usuário de chamada recebida, a instrução por voz é reproduzida.

É possível ativar Emudecer voz pressionando o botão Emudecer voz ou selecionando o menu Emudecer voz. Essa seleção se aplica a todos os rádios.

As seleções a seguir são compatíveis:

Nenhum

Nenhuma instrução por voz é necessária para essa função do rádio.

TTS

Quando o recurso Controle por voz está ativado, o texto no campo Comando de voz de Alerta do usuário de chamada recebida ativado é reproduzido como áudio.

Arquivo de anúncio de voz da Motorola (.MVA)

Lista todos os arquivos de voz possíveis definidos na página Lista de arquivos de anúncio de voz.

10.16.1.30

Alerta do usuário da lig. recebida desligado

Este campo seleciona qual arquivo de anúncio de voz da Motorola (.MVA), se houver, será atribuído quando a funcionalidade Silenciar for DESATIVADA para os canais habilitados para alerta do usuário de chamada recebida.

Se o TTS (Text-to-Speech, texto para fala) for selecionado, o texto no campo Comando de voz correspondente será convertido em fala e reproduzido como áudio. Ao desativar Emudecer voz de um canal habilitado para Alerta do usuário de chamada recebida, uma instrução por voz é reproduzida.

É possível desativar Emudecer voz pressionando o botão Emudecer voz ou selecionando o menu Emudecer voz.

Essa seleção se aplica a todos os rádios.

OBSERVAÇÃO:

A página Lista de notificações de voz permite carregar arquivos de notificação de voz da Motorola (.MVA) no codeplug atual do aplicativo.

As seleções a seguir são compatíveis:

Nenhum

Nenhuma instrução por voz é necessária para essa função do rádio.

TTS

Quando o recurso Controle por voz está ativado, o texto no campo Comando de voz de Alerta do usuário de chamada recebida desativado é reproduzido como áudio.

Arquivo de anúncio de voz da Motorola (.MVA)

Lista todos os arquivos de voz possíveis definidos na página Lista de arquivos de anúncio de voz.

10.16.1.31

Desligamento

Esse campo permite selecionar o arquivo Motorola Voice Announcement (.MVA) predefinido atribuído ao evento Desligamento. O rádio avisa o anúncio de voz quando o evento ocorre.

OBSERVAÇÃO:

Para os modelos mais recentes de padrões de serviço de incêndio, a seleção **NENHUM** está desativada.

10.16.1.32

TTS de desligamento

Uma palavra falada comum para referenciar ao campo Desligamento para anúncios TTS (Text-to-Speech, texto para fala).

OBSERVAÇÃO:

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.33

Fora de alcance

Esse campo permite selecionar o arquivo Motorola Voice Announcement (.MVA) predefinido atribuído ao evento Fora de alcance. O rádio avisa o anúncio de voz quando o evento ocorre.

OBSERVAÇÃO:

Para os modelos mais recentes de padrões de serviço de incêndio, a seleção **NENHUM** está desativada.

O comando de Voz é ouvido quando o indicador de fora de alcance estiver definido como **Alerta ou Alerta e visor**.

Quando fora de alcance está no canal **Modo de zona de perigo**, o rádio avisa o anúncio de voz quando o evento ocorre.

10.16.1.34

TTS de fora de alcance

Uma palavra falada comum para referenciar o campo Fora de alcance para anúncios TTS (Text-to-Speech, texto para fala).

OBSERVAÇÃO:

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.35

Falha de autoverificação

Esse campo permite selecionar o arquivo Motorola Voice Announcement (.MVA) predefinido atribuído à operação Falha de autoverificação. O rádio avisa o anúncio de voz quando qualquer uma das operações falha.

A operação Autoverificação verifica o seguinte:

- Conexão RSM com o dispositivo de RF.
- Perda de conexão da antena com o dispositivo de RF.
- A temperatura está acima da temperatura de superaquecimento recomendada pelo fabricante.
- Bateria com pelo menos 50% da capacidade total disponível (somente inicialização).

OBSERVAÇÃO:

Para os modelos mais recentes de padrões de serviço de incêndio, a seleção **NENHUM** está desativada.

10.16.1.36

TTS de falha de autoverificação

Uma palavra falada comum para referenciar o campo Falha de autoverificação para anúncios TTS (Text-to-Speech, texto para fala).

OBSERVAÇÃO:

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.37

Falha de acessório

Esse campo permite selecionar o arquivo Motorola Voice Announcement (.MVA) predefinido atribuído ao evento Falha de acessório. O rádio avisa o anúncio de voz quando o evento ocorre.

OBSERVAÇÃO:

Para os modelos mais recentes de padrões de serviço de incêndio, a seleção **NENHUM** está desativada.

10.16.1.38

TTS de falha de acessório

Uma palavra falada comum para referenciar o campo Falha de acessório para anúncios Text-to-Speech (texto para fala).

OBSERVAÇÃO:

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.39

Falha da antena

Esse campo permite selecionar o arquivo Motorola Voice Announcement (.MVA) predefinido atribuído à operação Falha da antena. O rádio avisa o anúncio de voz quando as operações ocorrem.

OBSERVAÇÃO:

Este campo se aplica apenas aos rádios APX NEXT NFPA.

10.16.1.40

TTS de falha da antena

Uma palavra falada comum para referenciar o campo TTS de falha da antena para anúncios TTS (Text-to-Speech, texto para fala).

OBSERVAÇÃO:

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.41

Superaquecimento

Esse campo permite selecionar o arquivo Motorola Voice Announcement (.MVA) predefinido atribuído ao evento Acima da temperatura. O rádio avisa o anúncio de voz quando o evento ocorre.

OBSERVAÇÃO:

Para os modelos mais recentes de padrões de serviço de incêndio, a seleção **NENHUM** está desativada.

10.16.1.42

TTS de acima da temperatura

Uma palavra falada comum para referenciar o campo TTS acima da temperatura para anúncios TTS (Text-to-Speech, texto para fala).

OBSERVAÇÃO:

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.43

Temperatura cumulativa do dispositivo RF

Esse campo permite selecionar o arquivo Motorola Voice Announcement (.MVA) predefinido atribuído ao evento Temperatura cumulativa do dispositivo RF. O rádio avisa o anúncio de voz quando o evento ocorre.

**OBSERVAÇÃO:**

Este campo se aplica apenas a rádios APX NEXT XN.

Para os modelos mais recentes de padrões de serviço de incêndio, a seleção **NENHUM** está desativada.

10.16.1.44

TTS de temperatura cumulativa do dispositivo RF

Uma palavra falada comum para referenciar o campo Temperatura cumulativa do dispositivo RF para anúncios TTS (Text-to-Speech, texto para fala).

**OBSERVAÇÃO:**

Este campo se aplica apenas a rádios APX NEXT XN.

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.45

Temperatura cumulativa do componente opcional

Esse campo permite selecionar o arquivo Motorola Voice Announcement (.MVA) predefinido atribuído à operação Temperatura cumulativa do componente opcional. O rádio avisa o anúncio de voz quando a operação ocorre.

**OBSERVAÇÃO:**

Este campo se aplica apenas a rádios APX NEXT XN.

Para os modelos mais recentes de padrões de serviço de incêndio, a seleção **NENHUM** está desativada.

10.16.1.46

TTS de temperatura cumulativa do componente opcional

Uma palavra falada comum para referenciar o campo Temperatura cumulativa do componente opcional para anúncios TTS (Text-to-Speech, texto para fala).

**OBSERVAÇÃO:**

Este campo se aplica apenas a rádios APX NEXT XN.

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.47

Sair do modo de zona de perigo

Esse campo permite selecionar o arquivo Motorola Voice Announcement (.MVA) predefinido atribuído ao evento Sair do modo de zona de perigo.

O rádio avisa o anúncio de voz quando você alterna o interruptor concêntrico bidirecional para sair do modo.

**OBSERVAÇÃO:**

Para os modelos mais recentes de padrões de serviço de incêndio, a seleção **NENHUM** está desativada.

10.16.1.48

TTS de sair do modo de zona de perigo

Uma palavra falada comum para referenciar o campo Sair do Modo de zona de perigo para anúncios TTS (Text-to-Speech, texto para fala).

**OBSERVAÇÃO:**

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.49

Acessório de modo sem perigo

Esse campo permite selecionar o arquivo Motorola Voice Announcement (.MVA) predefinido atribuído ao evento Acessório de modo não perigoso. O rádio avisa o anúncio de voz quando o evento ocorre.

**OBSERVAÇÃO:**

Este campo se aplica apenas a rádios APX NEXT XN.

Para os modelos mais recentes de padrões de serviço de incêndio, a seleção **NENHUM** está desativada.

10.16.1.50

TTS de acessório de modo sem perigo

Uma palavra falada comum para referenciar o campo Acessório de modo não perigoso para anúncios TTS (Text-to-Speech, texto para fala).

**OBSERVAÇÃO:**

Este campo se aplica apenas a rádios APX NEXT XN.

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.1.51

Temperatura cumulativa da bateria

Esse campo permite selecionar o arquivo Motorola Voice Announcement (.MVA) predefinido atribuído ao evento Temperatura cumulativa da bateria. O rádio avisa o anúncio de voz quando o evento ocorre.

**OBSERVAÇÃO:**

Este campo se aplica apenas a rádios APX NEXT XN.

Para os modelos mais recentes de padrões de serviço de incêndio, a seleção **NENHUM** está desativada.

10.16.1.52

TTS de temperatura cumulativa da bateria

Uma palavra falada comum para referenciar o campo Temperatura cumulativa da bateria para anúncios TTS (Text-to-Speech, texto para fala).

OBSERVAÇÃO:

Este campo se aplica apenas a rádios APX NEXT XN.

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.16.2

Lista de anúncios de voz

Essa seção permite que você carregue arquivos *.MVA (Motorola Voice Announcement, anúncio de voz da Motorola) no codeplug atual.

OBSERVAÇÃO:

Durante uma operação de comparação entre codeplugs, essa lista de anúncios de voz é compatível somente com a funcionalidade **Copiar todos os campos** (isto é, não haverá botões de cópia individuais ao lado dos nomes dos arquivos). Quando a função **Copiar todos os campos** for iniciada, todos os arquivos de voz no codeplug secundário serão copiados para o codeplug principal.

OBSERVAÇÃO:

Um arquivo Motorola Voice Announcement (*.MVA) pode ser gerado apenas a partir de um arquivo *.WAV que usa o Utilitário conversor de anúncio de voz.

Depois de carregados nessa lista, os arquivos de voz/áudio ficarão disponíveis para seleção em qualquer campo do anúncio de voz, no conjunto Todos os anúncios de voz, no campo Arquivo de áudio de alerta da lista de alertas selecionáveis de site e nos campos Anúncio de canal e Anúncio de zona da Atribuição e canais de zona.

OBSERVAÇÃO:

Adicionar um arquivo de voz:

- O botão de adição na barra de ferramentas de Vários registros - Visualização de tabela permite adicionar um ou mais arquivos de voz/áudio (e registro/linhas) ao atual codeplug do aplicativo.
- Uma caixa de diálogo de seleção de arquivos do Windows será aberta permitindo procurar os arquivos de voz desejados no sistema de arquivos de seu computador

10.16.2.1

Nome do arquivo de voz

Esse campo permite visualizar ou renomear nomes reconhecíveis para o arquivo *.MVA de voz ou áudio (registro/linha).

Por padrão, cada registro do arquivo de voz/áudio herda o nome do arquivo *.mva que foi originalmente carregado.

Clicar e digitar o texto nesse campo **Nome do arquivo de voz** permite alterar o nome dado ao registro do arquivo de voz ou áudio.

No entanto, isso não altera os dados do arquivo de voz ou áudio selecionado originalmente.

10.17

Lista de Alertas de Site Seleccionáveis

Esta seção permite visualizar ou definir Alertas seleccionáveis de site individuais para as comunicações de entroncamento ASTRO 25.

Essa função se aplica a todas as Comunicações de entroncamento.

**INFORMAÇÕES:**

Até quinze SSAs (Site Selectable Alerts, alertas seleccionáveis de site) diferentes por Lista podem ser definidos para codificação e/ou decodificação pelo rádio. No entanto, só é possível seleccionar um SSA que tenha seu campo Codificável por rádio **ativado** para codificação (enviando para o FNE). Quando o FNE recebe um SSA do rádio, ele o envia a todos os rádios no site usando um OSP de Transmissão de sistemas de propriedade da Motorola Solutions no Canal de controle de saída.

O áudio de uma Notificação de Voz padrão (evento único) sempre tem prioridade sobre o áudio do Alerta de Site Seleccionável (evento recorrente).

Somente um Alerta de Site Seleccionável pode estar ativo em um site em determinado momento.

**OBSERVAÇÃO:**

Primeiro, os arquivos Motorola Voice Announcement Files (*.MVA) adequados devem ser carregados na Lista de notificações de voz antes de serem seleccionados para um registro/linha da Lista de alertas seleccionáveis de site pelo campo correspondente de Arquivo de áudio do alerta.

Uma Lista de Alerta Seleccionável do Site é atribuída a um Sistema de Entroncamento por meio de seu campo Seleção da Lista de Alertas de Site Seleccionáveis.

É possível ativar e desativar Alertas seleccionáveis de site que tenham seu campo Codificável por rádio **ativado** seleccionando o menu Alerta seleccionável de site. Tanto um único site como todos os disponíveis na Zona podem ser seleccionados para ativar ou desativar um Alerta de Site Seleccionável.

10.17.1

Nome da Lista de Alerta Seleccionável do Site

Esse campo permite visualizar ou definir nomes reconhecíveis para o Alerta seleccionável de site atual na Lista de alertas seleccionáveis de site.

As Listas de Alertas Seleccionáveis de Site são escolhidas no campo de seleção **Lista de Alerta Seleccionável do Site** do Sistema de Entroncamento.

**OBSERVAÇÃO:**

Iron Ore Mine, Copper Mine, Lista SSA #3.

É possível usar caracteres, números, espaços e caracteres especiais.

No máximo 14 caracteres no total.

10.17.2

Alias do aAlerta

Este campo permite definir nomes reconhecíveis para o alerta seleccionável de site atual (registro/linha) da lista de alertas seleccionáveis de site atual.

Este alias aparece no visor do rádio quando você percorre a lista de alertas seleccionáveis do site ou quando o rádio recebe uma transmissão de alerta seleccionável do site do equipamento de rede fixo (FNE).

Essa seleção se aplica às comunicações de Entroncamento.

OBSERVAÇÃO:

Evacuar, Estacionar, Sirene de Tornado, Alerta #1.

É possível usar caracteres, números, espaços e caracteres especiais.

No máximo 14 caracteres no total.

O Alias do Alerta será exibido no display.

10.17.3

Arquivo de Áudio de Alerta

Este campo seleciona qual arquivo de notificação de voz da Motorola (*.MVA), se houver, será atribuído ao alerta selecionável de site (registro/linha) atual da lista de alertas selecionáveis de site atual.

Quando o rádio recebe uma transmissão de Alerta Selecionável do Site vinda do FNE (Fixed Network Equipment, equipamento de rede fixa), o prompt correspondente de áudio/voz é reproduzido.

Essa seleção se aplica às comunicações de Entroncamento.

OBSERVAÇÃO:

Primeiro, os Arquivos de Notificação de Voz da Motorola (*.MVA) adequados devem ser carregados na Lista de Notificações de Voz antes de serem selecionados para um registro/linha da Lista de Alerta Selecionável do Site.

As seleções a seguir são compatíveis:

Nenhum

Nenhum alerta de áudio/voz é necessário para essa função do rádio.

Arquivo *.MVA (Motorola Voice Announcement, anúncio de voz da Motorola)

Lista todos os arquivos de áudio/voz possíveis carregados na Página da Lista de Arquivos de Notificação de Voz.

10.17.4

Período de alerta

Esse campo seleciona o tempo que o rádio aguarda antes de reproduzir o arquivo de áudio de alerta do atual Alerta selecionável de site (registro/linha) na Lista de alertas selecionáveis de site.

Essa seleção se aplica às comunicações de Entroncamento.

AVISO:

E quanto menor o valor de Período de alerta, maior será a frequência de áudio. A reprodução constante do áudio por horas/dias pode, eventualmente, diminuir a duração da bateria do rádio.

Acima 113: Alcance

Mínimo	Máximo	Incrementos	Valor padrão
5 segundos	255 segundos	1 segundo	15 segundos

10.17.5

Rádio codificável

Permite que o alias de alerta do Alerta selecionável de site atual (registro/linha) seja exibido no visor do rádio (unidade de rádio), tornando o alerta selecionado passível de codificação para transmissão.

Ao selecionar o menu Alertas selecionáveis de site, você poderá percorrer por todos os alertas codificáveis na Lista de alertas selecionáveis de site e ativar, ou então desativar, um alerta selecionado.

Essa seleção se aplica às comunicações de Entroncamento.

10.18

Segurança total

Esta seção permite visualizar e definir funcionalidades para transmitir e receber comunicações de uma codificação segura.

OBSERVAÇÃO:

Quando um campo Proteger/remover ligação estiver definido como **Selecionar** para determinado canal, pressionar o botão Seleção de transmissão segura, ativar/desativar a Seleção de transmissão segura ou selecionar o menu Proteger permitirá alternar entre as comunicações Seguras ou Não criptografadas para esse canal.

Acessado apenas: Quando o rádio for compatível com o modelo ou opção.

10.18.1

Geral

Esta seção permite visualizar ou definir a funcionalidade de criptografia segura básica.

OBSERVAÇÃO:

Quando um campo Proteger/remover ligação estiver definido como **Selecionar** para determinado canal, pressionar o botão Seleção de transmissão segura, ativar/desativar a Seleção de transmissão segura ou selecionar o menu Proteger permitirá alternar entre as comunicações Seguras ou Não criptografadas para esse canal.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.18.1.1

Operação segura

Este campo seleciona o modo de comunicações de criptografia segura que é usado em todos os rádios.

OBSERVAÇÃO:

Quando um campo [Proteger/remover proteção na página 384](#) estiver definido como **Selecionar** para um determinado canal, pressionar o botão Seleção de transmissão segura, ativar e desativar [Seleção de Transmissão Segura na página 202](#) ou selecionar o menu Seguro permite alternar entre as comunicações Proteger ou Remover para esse canal.

AVISO:

Quando o campo Ativação da Inibição Tática estiver ativado, ele só pode ser definido como **Desativado** ou **Hardware**. Caso contrário, o aplicativo o considera inválido.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Desabilitado

A criptografia segura não é possível.

Hardware

Os serviços de criptografia são realizados por um IC de hardware separado que está certificado em FIPS (Federal Information Processing Standard) 140-2, níveis 2 e 3, dependendo da configuração do parâmetro Red Key Fill e pode suportar vários algoritmos de criptografia para maior segurança.

Software

AVISO:

Não é possível para Entroncamento tipo II.

Os dois métodos de criptografia de software a seguir são compatíveis:

Privacidade digital avançada (ADP)

Os serviços de criptografia são realizados por uma implementação do algoritmo RC-4 que não está sujeito a qualquer nível de certificação FIPS.

10.18.1.2

Privacidade digital avançada (ADP)

Este campo permite que o rádio utilize o algoritmo ADP de SW para voz criptografada.

AVISO:

Quando o campo [Operação segura na página 294](#) estiver definido como **Software**, ative a ADP (Advanced Digital Privacy, privacidade digital avançada), [Padrão de criptografia avançada \(AES256\) na página 295](#) ou [Padrão de Dados Criptografia \(DES\) na página 296](#).

Acessado apenas: quando o campo [Operação segura na página 294](#) estiver definido como **Software** e o rádio for compatível com o modelo/opção.

10.18.1.3

Padrão de criptografia avançada (AES256)

Este campo permite que o rádio transmita e receba voz e dados criptografados.

AVISO:

Quando o campo [Operação segura na página 294](#) estiver definido como **Software**, ative [Privacidade digital avançada \(ADP\) na página 295](#), [Padrão de Dados Criptografia \(DES\) na página 296](#) ou [Padrão de criptografia avançada \(AES256\)](#).

Acessado apenas: quando o campo [Operação segura na página 294](#) estiver definido como **Software** e o rádio for compatível com o modelo/opção.

10.18.1.4

Fonte de Carregamento de Chave

Este campo permite selecionar a Fonte de carregamento de chave.

As seleções a seguir são compatíveis:

Lista de chaves de criptografia

Permite inserir chaves seguras na Lista de chaves de criptografia. Disponível somente para ADP (Advanced Digital Privacy, privacidade digital avançada).

KVL

Permite carregar chaves de software.

Acessado apenas: quando o campo [Operação segura na página 294](#) estiver definido como **Software** e o rádio for compatível com o modelo/opção.

10.18.1.5

Ativação do OTAR

Ativa o recurso ASTRO OTAR convencional e/ou o MDC OTAR convencional e/ou ASTRO 25 OTAR de entroncamento em todos os rádios.

**AVISO:**

O campo Ativação do ASTRO OTAR ou o campo Ativação do MDC OTAR devem ser ativados; caso contrário, ambos se tornam inválidos.

**OBSERVAÇÃO:**

Para cada Personalidade Convencional individual, ASTRO OTAR e/ou MDC OTAR é ativado com os campos ASTRO OTAR e Transmissão de OTAR da Personalidade.

Em um Sistema de Entroncamento individual, o OTAR é ativado nos campos ASTRO OTAR e Transmissão de OTAR.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** e o rádio for compatível com o modelo/a opção, ou quando o campo [Operação segura na página 294](#) estiver definido como **Software** e o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) estiver ativado.

10.18.1.6

Funcionalidade Apagar Chave SW Inibida no Rádio

Quando ativado, o rádio excluirá todas as chaves de criptografia de ADP (Advanced Digital Privacy, privacidade digital avançada) ou de AES (Advanced Encryption Standard, padrão de criptografia avançada) quando entrar no estado Inibição de rádio.

A Inibição de rádio será ativada de acordo com o Sistema convencional e/ou de entroncamento.

Quando ele está desativado, todas as chaves de criptografia ADP ou AES serão retidas pelo rádio ao entrar no estado de Inibição do Rádio.

**AVISO:**

Este campo é mutuamente exclusivo com [Ativação do OTAR na página 296](#).

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Software** e o rádio for compatível com o modelo/a opção, e

quando o campo [Privacidade digital avançada \(ADP\) na página 295](#) estiver ativado, ou

quando o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) está ativado, mas o campo Operação OTAR está **Desativado**.

10.18.1.7

Padrão de Dados Criptografia (DES)

Este campo permite que o rádio transmita e receba voz e dados criptografados.

**AVISO:**

Quando o campo [Operação segura na página 294](#) estiver definido como **Software**, ativa [Privacidade digital avançada \(ADP\) na página 295](#), [Padrão de criptografia avançada \(AES256\) na página 295](#) ou DES (Data Encryption Standard, padrão de criptografia de dados).

Acessado apenas: quando o campo [Operação segura na página 294](#) estiver definido como **Software** e o rádio for compatível com o modelo/opção.

10.18.2

ASTRO OTAR

A seção do **ASTRO OTAR** permite visualizar ou definir recursos de comunicações OTAR (Over-The-Air-Rekeying, alteração de chave Over the Air) ASTRO — convencional e ASTRO 25 — entroncamento.

ASTRO usa um protocolo digital com segurança criptografada. Além das Solicitações de rechaveamento, as transmissões OTAR incluem: Confirmações atrasadas e confirmações de energização.

AVISO:

Algumas das opções selecionadas também podem ser necessárias para serem definidas no site de KMF (Key Management Facility, local de gerenciamento de chaves) para funcionar adequadamente.

OBSERVAÇÃO:

O ASTRO OTAR é ativado para cada Personalidade convencional com base no campo [Tipo de voz/sinal de recepção na página 424](#). O rádio também é configurado para iniciar os comandos OTAR ativando os campos do ASTRO OTAR dessa Personalidade e/ou [Transmissão de OTAR na página 483](#).

O ASTRO OTAR é habilitado por Sistema de entroncamento pelos campos ASTRO OTAR e [Transmissão de OTAR na página 612](#).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.18.2.1

Ativação do ASTRO OTAR

Ativa o recurso ASTRO OTAR convencional e/ou o MDC OTAR convencional e/ou ASTRO 25 OTAR de entroncamento em todos os rádios.

AVISO:

O campo Ativação do ASTRO OTAR ou o campo Ativação do MDC OTAR devem ser ativados; caso contrário, ambos se tornam inválidos.

OBSERVAÇÃO:

Para cada Personalidade Convencional individual, ASTRO OTAR e/ou MDC OTAR é ativado com os campos ASTRO OTAR e Transmissão de OTAR da Personalidade.

Em um Sistema de Entroncamento individual, o OTAR é ativado nos campos ASTRO OTAR e Transmissão de OTAR.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware**, o campo [Ativação do OTAR na página 296](#) for ativado e o rádio for compatível com o modelo/a opção, ou

Quando o campo [Operação segura na página 294](#) estiver definido como **Software**; o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) estiver ativado; o campo [Ativação do OTAR na página 296](#) estiver ativado e o rádio for compatível com o modelo/opção.

10.18.2.2

Inibição de rádio via ASTRO OTAR

Este campo permite que o rádio receba e responda a um comando de inibição de rádio por ASTRO OTAR (Over-The-Air-Rekeying).

Este comando geralmente é transmitido de um operador de despacho ou um operador de KMF, deixando o rádio inoperável. Esta função se aplica ao modo criptografado de segurança para comunicações ASTRO - Convencional e ASTRO 25 - Entroncamento.

**AVISO:**

Quando este campo estiver ativado e o campo [Ativação do ASTRO OTAR na página 297](#) for ativado para qualquer Sistema de entroncamento, a Inibição de rádio é realizada "via ASTRO OTAR".

Quando este campo está ativado e o campo [Ativação do ASTRO OTAR na página 297](#) está desativado para qualquer Sistema de entroncamento, os campos de Inibição de rádio para esses Sistemas de entroncamento devem estar ativados. Isso garante que a Inibição de rádio seja possível via Entroncamento padrão "Remove" (sem criptografia segura) ASTRO 25.

Quando o campo [Ativação do ASTRO OTAR na página 297](#) estiver ativado para qualquer Sistema de entroncamento, e o campo Inibição de rádio para esses Sistemas de entroncamento estiver desativado, esse campo fica bloqueado para somente visualização em um estado ativado. Isso garante que para esses sistemas, a Inibição de rádio seja realizada "via ASTRO OTAR".

**INFORMAÇÕES:**

Para apagar o estado de inibição do rádio, envie um comando de desinibição para o rádio ou refaça o processo Ler/Gravar do rádio.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware**, o campo [Ativação do OTAR na página 296](#) estiver ativado, o campo [Ativação do ASTRO OTAR na página 297](#) estiver ativado e o rádio for compatível com o modelo/a opção ou

Quando o campo [Operação segura na página 294](#) estiver definido como **Software**, o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) estiver ativado, o campo [Ativação do OTAR na página 296](#) estiver ativado, o campo [Ativação do ASTRO OTAR na página 297](#) estiver ativado e o rádio for compatível com o modelo/a opção.

10.18.2.3

TKP ativado

Este campo permite que o rádio execute o TKP (Touchless Key Provisioning, provisionamento de chave sem toque) que fornece chaves de criptografia de ponta a ponta para rádios de um KMF (Key Management Facility, local de gerenciamento de chaves) sem primeiro exigir a configuração do KVL (Key Variable Loader, carregador variável de chave) do rádio.

**OBSERVAÇÃO:**

O rádio deve ter sido provisionado na fábrica da Motorola para poder executar essa função. Alguns rádios podem não funcionar, mesmo se o recurso estiver habilitado, se os rádios forem enviados antes da introdução do recurso na fábrica.

O operador de KMF deve habilitar o Provisionamento de chave sem contato para esse rádio na configuração de KMF.

Quando esse campo está habilitado, o servidor de KMF é notificado durante o Registro de OTAR.

10.18.2.4

Período de número de mensagens (Message Number Period)

O MNP (Message Number Period, período do número da mensagem) define uma janela de mensagens aceitáveis de um KMF (Key Management Facility, local de gerenciamento de chaves). O rádio é programado com o valor MNP neste campo.

O recurso OTAR usa esse valor durante as operações.

O propósito de uma janela pequena é impedir que um invasor faça a configuração incorreta das chaves do rádio capturando mensagens enviadas do KMF e reenviando-as posteriormente para o rádio.

Se a janela for muito pequena e as mensagens se perderem no KMF devido ao rádio estar fora da cobertura do sistema de rádio ou desligado, o rádio ignorará as mensagens do KMF e o forçará a iniciar um procedimento de recuperação.

Acima 114: Alcance

Mínimo	Máximo	Padrão
2	65535	65535

OBSERVAÇÃO:

O valor 65535 desativa a proteção contra reprodução.

10.18.2.5

RSI do KMF

O KMF RSI (Key Management Facility Radio Set Indicator, identificador do conjunto de rádios do local de gerenciamento de chaves) é o identificador do KMF do OTAR e deve corresponder ao valor atribuído no KMF. O rádio que tiver uma configuração inadequada desse valor terá suas mensagens ignoradas pelo KMF.

O rádio é programado com o valor KMF RSI neste campo. O recurso OTAR usa esse valor durante as operações.

Acima 115: Alcance

Mínimo	Máximo	Padrão
1	9999999	9999999

10.18.2.6

Origem de parâmetros do OTAR

Quando esse campo estiver definido como **KVL**, o RSI de KMF e o MNP (Message Number Period, período de número de mensagem) do rádio só poderão ser atualizados por meio do KVL (Key Variable Loader, carregador de chave variável).

Quando estiver definido como **Gerenciamento de parâmetros**, o rádio será atualizado com os valores RSI e MNP do RadioCentral KMF, substituindo os valores atuais do rádio. Uma atualização do KVL subsequente substitui os valores fornecidos pelo Radio Central novamente.

10.18.3

MDC OTAR

Esta seção permite visualizar ou definir os recursos de alteração de chave (OTAR) Over the air do MDC.

As funções de MDC OTAR se aplicam somente ao operar no modo de criptografia segura e somente para comunicações Convencionais. Além das Solicitações de rechaveamento, as transmissões OTAR incluem: Confirmações atrasadas e Confirmações de energização.

**OBSERVAÇÃO:**

O MDC OTAR é habilitado para cada Personalidade convencional por meio do campo Tipo de sinalização não ASTRO. O rádio é ainda configurado para iniciar os comandos OTAR ativando o campo Transmissão de OTAR dessa Personalidade.

Quando um campo Proteger/remover ligação estiver definido como **Selecionar** para determinado canal, pressionar o botão Seleção de transmissão segura, ativar/desativar a Seleção de transmissão segura ou selecionar o menu Proteger permitirá alternar entre as comunicações Seguras ou Não criptografadas para esse canal.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.18.3.1

Ativação do MDC OTAR

Ativa a versão de sinalização do MDC da função OTAR.

Essa função se aplica ao modo de criptografia segura para comunicações MDC OTAR.

**AVISO:**

Quando o campo [Ativação do OTAR na página 296](#) estiver ativado, o Gerenciamento do rádio precisará que este campo ou o campo [Ativação do ASTRO OTAR na página 297](#) esteja ativado. Caso contrário, ambos se tornarão inválidos. Isso garante que o OTAR seja possível a partir de um canal Convencional MDC ou ASTRO.

**OBSERVAÇÃO:**

O MDC OTAR é habilitado para cada Personalidade convencional por meio do campo Tipo de sinalização não ASTRO. O rádio é ainda configurado para iniciar os comandos OTAR ativando o campo Transmissão de OTAR dessa Personalidade.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware**, o campo [Ativação do OTAR na página 296](#) estiver ativado e o rádio for compatível com o modelo/a opção.

10.18.3.2

Inibição de Rádio via MDC OTAR

Este campo permite que o rádio receba e responda a um comando de inibição de rádio por MDC OTAR, que fará com que o rádio fique inoperável temporariamente.

Esse comando é geralmente transmitido a partir de um transmissor ou de um operador do Controlador de gerenciamento de chaves (KMC). Este recurso se aplica ao modo de criptografia segura das comunicações MDC OTAR.

**INFORMAÇÕES:**

Para apagar o estado de inibição do rádio, envie um comando de desinibição para o rádio ou refaça o processo Ler/Gravar do rádio.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware**, o campo operação do OTAR estiver definido como **Somente MDC** ou **ASTRO e MDC** e o rádio for compatível com o modelo/a opção.

10.18.3.3

Ativação das Confirmações do OTAR

Este campo permite que o rádio confirme todas as mensagens do MDC OTAR que solicitem uma confirmação.

Este recurso se aplica ao modo de criptografia segura das comunicações MDC OTAR.

AVISO:

Quando desativado, você deve garantir que todos os recursos de estado de alerta também estejam desativados para evitar comprometer a segurança. Funções de Alerta de Estado incluem: Verificação do Rádio, Modo de Rádio Remoto; Transmissão de Ligação de Seleção Automática de MDC, Recepção/Transmissão de Alerta de Ligação e Recepção/Transmissão de Ligação Seletiva.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware**, o campo operação do OTAR estiver definido como **Somente MDC** ou **ASTRO e MDC** e o rádio for compatível com o modelo/a opção.

10.18.3.4

Confirmações do OTAR Somente Criptografado

Este campo permite que o rádio criptografe todas as confirmações do MDC OTAR.

Este recurso se aplica ao modo de criptografia segura das comunicações MDC OTAR. Quando desativada, o rádio envia o MDC OTAR criptografado ou apaga as confirmações, conforme elas são direcionadas pelo Controlador de gerenciamento de chaves (KMC, Key Management Controller) do transmissor de chaves.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware**, o campo Operação OTAR é definido como **Somente MDC** ou **ASTRO e MDC**, e quando o campo [Ativação das Confirmações do OTAR na página 300](#) estiver ativado e o rádio for compatível com o modelo/a opção.

10.18.3.5

Energização das Confirmações do OTAR

Este campo seleciona exatamente quando o rádio envia uma confirmação de energização do MDC OTAR para o KMC (Key Manager Controller, controlador de gerenciamento de chaves).

Essa confirmação (Ack, Acknowledgement) permite que o rádio entre no KMC para os propósitos do OTAR. Este recurso se aplica ao modo de criptografia segura das comunicações MDC OTAR.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware**, o campo operação do OTAR estiver definido como **Somente MDC** ou **ASTRO e MDC** e o rádio for compatível com o modelo/a opção.

As seleções a seguir são compatíveis:

Desabilitado

Nenhuma confirmação de energização é enviada.

Imediato

A confirmação de energização é enviada quando o rádio é ligado e quando ele conclui a sequência de inicialização.

Atrasado

O rádio transmite a confirmação de energização quando uma transmissão do botão PTT é enviada a um canal habilitado para o OTAR.

10.18.3.6

Modo de solicitação de alteração de chave

Este campo seleciona o protocolo que é usado quando o rádio transmite a solicitação de alteração de chave de MDC OTAR.

Uma transmissão de dados é enviada ao console do KMC do despachador solicitando a alteração de chave OTAR do rádio. Essas funções se aplicam às comunicações de MDC OTAR no modo de criptografia segura.

**OBSERVAÇÃO:**

Você pode iniciar uma Solicitação de alteração de chave pressionando o botão ou selecionando o menu [Solicitação de rechaveamento na página 217](#).

Acessado apenas:

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware**, o campo operação do OTAR estiver definido como **Somente MDC** ou **ASTRO e MDC** e o rádio for compatível com o modelo/a opção.

As seleções a seguir são compatíveis:

Criptografado

A Solicitação de alteração de chave é protegida por criptografia.

Apagar

A Solicitação de alteração de chave não é criptografada.

Desabilitado

O procedimento de Alteração de chave só pode ser iniciado pelo operador do KMC.

10.18.3.7

Tom de alerta de status da solicitação de rechaveamento

Este campo permite que o rádio gere um tom de alerta de êxito ou falha após a conclusão do processo de Solicitação de alteração de chave.

A seleção para ativar esse recurso só afeta a emissão de som do tom de alerta quando a seção Solicitação de alteração de chave do menu do rádio é encerrada antes da conclusão do processo de solicitação de alteração de chave. Observe que, quando não se sai da seção de Solicitação de Rechaveamento do menu do rádio antes da conclusão do processo de solicitação de rechaveamento, o tom de alerta de status é emitido, independentemente da configuração deste campo. O status do processo de Rechaveamento também aparece como um alerta visual no visor do rádio. Essas funções se aplicam às comunicações de MDC OTAR no modo de criptografia segura.

**OBSERVAÇÃO:**

Você pode iniciar o comando de Solicitação de alteração de chave com a seleção do menu Alteração de chave.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware**, o campo operação do OTAR estiver definido como **Somente MDC** ou **ASTRO e MDC** e o rádio for compatível com o modelo/a opção.

10.18.3.8

Apagar Anterior na Alteração do Usuário

Este campo permite apagar TODAS as chaves de criptografia segura no conjunto de chaves anteriormente ativo (veja slot A, slot B e campos indexados) após iniciar a alteração do conjunto de chaves.

Você pode iniciar a alteração do conjunto de chaves com uma seleção de menu do Conjunto de chaves. Essa função se aplica a todos os rádios.

**AVISO:**

Quando esse campo estiver ativado e quando Apagar índice anterior na alteração do índice MDC OTAR estiver ativado, é possível apagar os conjuntos de chave e ficar momentaneamente sem nenhuma chave de criptografia segura.

EXEMPLO:

O rádio está operando no momento no Conjunto de Chaves 1 quando ocorre uma Alteração de Conjunto de Chaves OTAR. Ela altera o rádio para o Conjunto de Chaves 2 e apaga o Conjunto de Chaves 1 anterior do rádio. Em seguida, se você voltar a mudar para o Conjunto de chaves 1 manualmente que foi apagado, e o recurso Apagar anterior na alteração do usuário apagar o Conjunto de chaves 2 anterior, o rádio permanecerá sem chave até que você carregue novas chaves manualmente ou solicite uma alteração de chave OTAR manual.

Acessado apenas: Quando o rádio for compatível com o modelo/a opção.

10.18.3.9

ID de KMC

Este campo seleciona o ID do KMC permitindo que o rádio seja identificado exclusivamente pelo KMC.

Cada rádio em um sistema deve ter um ID do KMC exclusivo, permitindo que cada rádio comunique comandos MDC OTAR para e do KMC individualmente. Este recurso se aplica ao modo de criptografia segura das comunicações MDC OTAR.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware**, o campo operação do OTAR estiver definido como **Somente MDC** ou **ASTRO e MDC** e o rádio for compatível com o modelo/a opção.

Acima 116: Alcance

Mínimo	Máximo
0000 Hex	FFFF Hex

10.18.3.10

Sistema MDC OTAR

Este campo seleciona o Sistema convencional do MDC a ser usado pelos comandos MDC OTAR.

Esse recurso se aplica às comunicações convencionais no modo de criptografia segura.

**INFORMAÇÕES:**

Um Sistema MDC OTAR deve ter seu recurso Alcance do ID de MDC Expandido **Desativado**. Caso contrário, a seleção será considerada inválida. Esses dois recursos são incompatíveis.

**OBSERVAÇÃO:**

Somente Sistemas Convencionais do tipo MDC poderão ser selecionados (consulte o campo Tipo de Sistema). Uma vez definidos, os Sistemas Convencionais são referenciados como Personalidades Convencionais.

O MDC OTAR é ativado para cada personalidade convencional por meio do campo Tipo de sinalização não ASTRO. O rádio é ainda configurado para iniciar os comandos OTAR ativando o campo Transmissão de OTAR dessa personalidade.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware**, o campo operação do OTAR estiver definido como **Somente MDC** ou **ASTRO e MDC** e o rádio for compatível com o modelo/a opção.

10.18.4

Funções

Essa seção permite visualizar ou definir configurações de criptografia segura diferentes e, em alguns casos, complexas.

OBSERVAÇÃO:

Quando um campo Proteger/remover ligação estiver definido como **Selecionar** para determinado canal, pressionar o botão Seleção de transmissão segura, ativar/desativar a Seleção de transmissão segura ou selecionar o menu Proteger permitirá alternar entre as comunicações Seguras ou Não criptografadas para esse canal.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.18.4.1

Retenção da Chave Infinita

Se este campo estiver habilitado, o rádio armazena permanentemente as chaves de criptografia, mesmo quando a bateria do rádio é removida ou quando o rádio é reprogramado. Esse recurso requer criptografia de hardware.

Quando desativadas, as chaves de criptografia exclusiva UKEK (Unique Key Encryption Key) são apagadas ou guardadas conforme a configuração do campo Retenção de UKEK Infinita.

AVISO:

Quando esse recurso está desabilitado, a ativação do campo Retenção da UKEK infinita faz com que esse campo se torne inválido. Esses dois recursos são mutuamente exclusivos.

As alterações feitas na configuração desse campo podem afetar o modo de operação FIPS no dispositivo. Esse impacto faz com que todos os parâmetros críticos de segurança (material de chave e senha) sejam apagados. Consulte Modos de operação FIPS para obter mais informações.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** e o rádio for compatível com o modelo/opção.

10.18.4.2

Tom de Alerta de Keyfail Periódico

Este campo permite que um tom de alerta periódico seja emitido sempre que o canal de rádio atual perder a chave de criptografia segura.

E, quando uma das seguintes condições for atendida: A opção [Proteger/remover proteção na página 384](#) do canal atual estiver definida como **Proteger**. Ou quando a opção [Proteger/remover proteção na página 384](#) do canal atual estiver definida como **Selecionar** e o pressionamento do botão de Seleção de Transmissão Segura, a alternância da chave de Seleção de Transmissão Segura ou a seleção do menu Proteger do rádio estiver definido como modo Proteger (não apagar).

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software** e o rádio for compatível com o modelo/a opção.

10.18.4.3

Limpar Tons de Alerta

Este campo ativa um tom de alerta relacionado à transmissão e/ou recebimento das comunicações de modo de criptografia segura versus comunicações de modo não criptografado.

O modo Limpeza se refere às comunicações sem criptografia padrão. Essa seleção se aplica a todos os rádios.

OBSERVAÇÃO:

Quando um campo Proteger/remover ligação estiver definido como **Selecionar** para um determinado canal, pressionar o botão Seleção de transmissão segura, ativar e desativar a Seleção de transmissão segura ou selecionar o menu Proteger permite alternar entre comunicações Proteger ou Remover para esse canal.

AVISO:

Quando o campo Ativação da Inibição Tática estiver ativado, ele só pode ser definido como **Somente Recepção** ou **Tx e Rx**. Caso contrário, o aplicativo o considera inválido.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software** e o rádio for compatível com o modelo/a opção.

As seleções a seguir são compatíveis:

Nenhum

Nenhum tom de alerta de limpeza está ativado.

Somente transmissão

Permite que um tom de alerta soe quando o botão PTT é pressionado, alertando você quando o rádio está prestes a transmitir no modo não criptografado.

Somente recepção

Para sinalização analógica Convencional (MDC, DTMF, Quik-Call II), essa função se aplica somente quando os Sistemas Convencionais analógicos do canal atual em operação no rádio têm sua Hora Prévia do Sistema definida para menos de 1500 ms.

Tx & Rx

Consulte as definições de "Somente transmissão" e "Somente recepção" acima.

10.18.4.4

Ignorar chave proteger/remover quando ligado

Este campo permite que o rádio ignore a configuração de ativação/desativação da Seleção de transmissão segura.

Isso faz com que o modo de transmissão do rádio tenha como base a configuração do campo [Proteger/remover proteção na página 384](#) como **Proteger** ou **Remover** do canal atual. Essa função se aplica a todos os rádios.

AVISO:

Se este recurso estiver desativado e o modo/canal ativo do rádio estiver ligado ao modo **Proteger** ou **Remover** (não selecionável), o rádio verifica a posição da chave **Seleção de transmissão segura**. Se o valor vinculado do canal ativo não corresponder à configuração da chave, o rádio não fará a transmissão. O padrão de fábrica é Desativado.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**, uma Chave concêntrica de "Posição A" convencional ou de entroncamento estiver definida como **Seleção de transmissão segura** e o rádio for compatível com o modelo/a opção.

10.18.4.5

Duração da Desativação do Silenciador de Verificação Não XL

Este campo seleciona a quantidade de tempo que o rádio espera no modo de verificação ativo para um sinal SecureNet criptografado sem XL (sem faixa estendida) Cipher Feedback ser detectado seguindo uma detecção de portadora.

Essa função se aplica às comunicações convencionais em todos os rádios. O tempo é medido em milissegundos.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software** e o rádio for compatível com o modelo/a opção.

Acima 117: Alcance

Mínimo	Máximo	Incrementos
0 (ms)	6375 (ms)	25 (ms)

10.18.4.6

Duração da Desativação do Silenciador de Verificação XL

Este campo seleciona a quantidade de tempo que o rádio espera no modo de verificação ativo para um sinal SecureNet criptografado sem XL (sem faixa estendida) Cipher Feedback ser detectado seguindo uma detecção de portadora.

Essa função se aplica às comunicações Convencionais em todos os rádios. O tempo é medido em milissegundos.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Privacidade digital avançada** e o rádio estiver habilitado para o modelo/a opção.

Acima 118: Alcance

Mínimo	Máximo	Incrementos
0 (ms)	6375 (ms)	25 (ms)

10.18.4.7

Retenção de UKEK Infinita

Este campo permite ao rádio armazenar permanentemente as chaves UKEK (Unique Key Encryption Key, chave de criptografia de chave exclusiva) mesmo quando a bateria do rádio é removida.

Um rádio que possui somente UKEKs pode receber um OTAR (rechaveamento via ar), mas não pode transmitir nem receber nenhuma outra chamada de voz ou de dados segura. Quando desativadas, as chaves de criptografia são apagadas ou mantidas de acordo com a configuração do campo Retenção da Chave Infinita. Quando ambos os campos estiverem desativados, todas as chaves de criptografia são apagadas sempre que a bateria do rádio é removida ou quando o rádio é reprogramado.

AVISO:

Quando o campo [Retenção da Chave Infinita na página 304](#) estiver ativado, este campo deverá ser desativado. Caso contrário, o aplicativo o considera inválido. Esses dois recursos são mutuamente exclusivos.

AVISO:

Alterações na configuração desse campo podem afetar o modo de operação FIPS no dispositivo, o que fará com que todos os parâmetros críticos de segurança (material de chave e senha) sejam apagados. Consulte Modos de operação FIPS para obter mais informações.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** e o rádio for compatível com o modelo/opção.

10.18.4.8

Desabilitar Exclusão da Chave de Encryption do Hardware

Este campo permite zerar as chaves de criptografia em um rádio ao pressionar simultaneamente o botão Lateral superior (roxo) e o botão Laranja.

Pressione o botão Lateral Superior (Roxo) para evitar o início de uma chamada de emergência.

Acessado apenas: Quando o campo Operação segura estiver definido como **Hardware**, e quando o campo [Retenção da Chave Infinita na página 304](#) estiver definido como **Ativado**, e quando o campo [Inibição tática habilitada](#) estiver definido como **Desativado**,

Ou o campo Operação segura estiver definido como **Software**, e quando o campo [Inibição tática habilitada](#) estiver definido como **Desativado**.

10.18.5

Multitecla

Essa seção permite visualizar ou definir parâmetros de multiteclas que afetam as operações de criptografia segura.

**OBSERVAÇÃO:**

Quando um campo Proteger/remover ligação estiver definido como **Selecionar** para determinado canal, pressionar o botão Seleção de transmissão segura, ativar/desativar a Seleção de transmissão segura ou selecionar o menu Proteger permitirá alternar entre as comunicações Seguras ou Não criptografadas para esse canal.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.18.5.1

Exibir seleção de chave segura ativa

Este campo seleciona o tipo de informação que aparece no visor do rádio quando você "alterna" o canal atual do rádio para o modo de criptografia segura.

Quando um campo Proteger/remover ligação estiver definido como **Selecionar** para um determinado canal, pressionar o botão Seleção de transmissão segura ou ativar/desativar [Seleção de Transmissão Segura na página 202](#) ou selecionar o menu Seguro para o modo seguro faz com que esta informação apareça no visor do rádio. Essa seleção se aplica a todos os rádios.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Privacidade digital avançada** e o modelo estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Nome da chave

O conteúdo definido no campo Nome da chave aparece no visor do rádio.

**AVISO:**

Esta seleção só será válida quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**.

Nome do conjunto de chaves

O Nome do conjunto de chaves aparece no visor do rádio. As atribuições do conjunto de chaves são normalmente organizadas por um operador de KMF e transmitidas por OTAR. Nomes do conjunto de chaves são, por padrão, "kset 1" e "kset 2".

**AVISO:**

Esta seleção só será válida quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software** com o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) ativado.

Desabilitado

Nada aparece no visor do rádio.

10.18.5.2

Exibir PPT ativado

Este campo seleciona o tipo de informação que aparece no visor do rádio quando você pressiona o botão PTT enquanto o canal atual do rádio está operando no modo de criptografia segura.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software** e o rádio for compatível com o modelo/a opção.

As seleções a seguir são compatíveis:

Nome da chave

O conteúdo definido no campo Nome da chave aparece no visor do rádio.

AVISO:

Esta seleção só será válida quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**.

Nome do conjunto de chaves

O Nome do conjunto de chaves aparece no visor do rádio. As atribuições do conjunto de chaves são normalmente organizadas por um operador de KMF e transmitidas por OTAR. Nomes do conjunto de chaves são, por padrão, "kset 1" e "kset 2".

AVISO:

Esta seleção só será válida quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software** com o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) ativado.

Desabilitado

Nada aparece no visor do rádio.

10.18.5.3

Exibir na alteração do modo

Este campo seleciona o tipo de informação que aparece no visor do rádio quando você altera o canal ou o modo do rádio para um canal que esteja ligado ao modo de criptografia segura (consulte Proteger/remover ligação).

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software** e o rádio for compatível com o modelo/a opção.

As seleções a seguir são compatíveis:

Nome da chave

O conteúdo definido no campo Nome da chave aparece no visor do rádio.

AVISO:

Esta seleção só será válida quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**.

Nome do conjunto de chaves

O Nome do conjunto de chaves aparece no visor do rádio. As atribuições do conjunto de chaves são normalmente organizadas por um operador de KMF e transmitidas por OTAR. Nomes do conjunto de chaves são, por padrão, "kset 1" e "kset 2".

AVISO:

Esta seleção só será válida quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software** com o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) ativado.

Desabilitado

Nada aparece no visor do rádio.

10.18.5.4

Gerenciamento de Chaves PID para o Modo ASN

Quando esse campo é selecionado, ele permite o uso do Gerenciamento de chave de ID físico (PID) no rádio.

Este campo é ativado automaticamente e se torna visível quando o campo [Ativação do MDC OTAR na página 300](#) estiver ativado. Essa função se aplica ao modo de criptografia segura em todos os rádios. O gerenciamento de chave PID é um mecanismo antigo de gerenciamento de chaves que limita o rádio a 16 chaves com IDs físicos. Quando desativado, o Gerenciamento de Chave CKS (Common Key Reference, referência de gerenciamento comum) é usado somente pelo rádio durante as comunicações criptografadas seguras. O Gerenciamento de chave CKR permite que mais de 16 chaves sejam referenciadas e precisa ser usado com o ASTRO OTAR (Over-The-Air-Rekeying, alteração de chave Over the Air).

INFORMAÇÕES:

Ao usar o modo ASN (Advanced SecureNet, SecureNet avançado) no dispositivo KVL 3000 ou KVL 3000 Plus, as chaves de criptografia só podem ser carregadas para o rádio caso o Gerenciamento de chave PID tenha sido ativado no rádio.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** e o rádio for compatível com o modelo/opção.

10.18.5.5

ID da chave - Tempo de desconexão de recepção

Este campo seleciona o tempo que o rádio espera após uma chamada segura recebida ser finalizada antes de recarregar a última chave de criptografia selecionada ou salva.

INFORMAÇÕES:

Esse tempo de desconexão é necessário apenas quando o rádio precisou alternar temporariamente para outra chave de criptografia para receber uma chamada que foi transmitida com uma chave diferente. Esse recurso se aplica ao modo de criptografia segura das comunicações Convencionais. O tempo é medido em milissegundos.

OBSERVAÇÃO:

Esse recurso se aplica ao modo de criptografia segura ([Segurança total na página 294](#)) para as comunicações Convencional e de Entroncamento quando a opção [Recepção de ID de Chave Automática na página 619](#) estiver ativada.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software** e o rádio for compatível com o modelo/a opção.

Acima 119: Alcance

Mínimo	Máximo	Incrementos
0 (ms)	10000 (ms)	250 (ms)

10.18.5.6

ID do conjunto de chaves – Tempo de desconexão de transmissão

Este campo seleciona o tempo que o rádio espera após a transmissão de chamada segura ser finalizada antes de recarregar a última chave de criptografia selecionada ou salva.

INFORMAÇÕES:

Esse tempo de desconexão só é necessário quando o rádio precisou alternar temporariamente para outra chave de criptografia para receber uma chamada que foi transmitida com uma chave diferente e depois continuou a usar essa chave de criptografia alternada para a transmissão de retorno. O tempo é medido em milissegundos.

OBSERVAÇÃO:

Esse recurso se aplica ao modo de criptografia segura ([Segurança total na página 294](#)) para as comunicações Convencional e de Entroncamento quando a opção [Recepção de ID de Chave Automática na página 619](#) estiver ativada.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software** e o rádio for compatível com o modelo/a opção.

Acima 120: Alcance

Mínimo	Máximo	Incrementos
0 (ms)	10000 (ms)	250 (ms)

10.18.6

Lista de chaves de criptografia

Essa seção permite configurar várias chaves de criptografia de hardware ou software para garantir comunicações criptografadas de voz e dados protegidas.

OBSERVAÇÃO:

O número de chaves de criptografia disponíveis depende do nível do modelo do rádio: Nível alto = 128, Nível intermediário = 64 e Nível baixo = 48.

Quando um campo Proteger/remover ligação estiver definido como **Selecionar** para determinado canal, pressionar o botão Seleção de transmissão segura, ativar/desativar a Seleção de transmissão segura ou selecionar o menu Proteger permitirá alternar entre as comunicações Seguras ou Não criptografadas para esse canal.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.18.6.1

Nome da chave

Este campo permite definir nomes de chave reconhecíveis para a chave atual (registro/linha) na Lista de chaves de criptografia.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software** e o rádio for compatível com o modelo/a opção.

As seleções a seguir são compatíveis:

- É possível usar caracteres, números, espaços e caracteres especiais.
- O número de caracteres possíveis depende do modelo do rádio.

10.18.6.2

Número de CKR

Este campo permite definir um número de chave para a chave atual de CKR (registro/linha) na Lista de chaves de criptografia.

Este número de CKR é usado como referência para personalidades, grupos de conversação ou funções, independentemente da localização física de armazenamento da chave. Isso elimina a necessidade do programador de rádio de mapear as chaves de criptografia para locais físicos de armazenamento para dispositivos de segurança diferentes no mesmo sistema de comunicações do campo.

**AVISO:**

O aplicativo atribui automaticamente um valor "número CKR" padrão "em branco". Cada Número de CKR que existir deve ser definido como um valor numérico para gravar ou salvar no codeplug atual.

Cada Número de CKR deve ter um valor exclusivo.

Acessado apenas: Quando o rádio for compatível com o modelo/a opção, e quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou

Quando o rádio for compatível com o modelo/opção, o campo [Operação segura na página 294](#) estiver definido como **Software** e o campo [Fonte de Carregamento de Chave na página 295](#) estiver definido como **KVL**.

Acima 121: Alcance

Mínimo	Máximo
0001	4095

10.18.6.3

Indexado

Esse campo ativa a indexação da chave de criptografia de hardware atual (registro/linha) na Lista de chaves de criptografia.

A indexação permite que dois conjuntos exclusivos de chaves (Conjuntos de Chaves) existam no rádio. Um Conjunto de Chave existe no campo Slot A e o outro existe no campo Slot B. Assim que a indexação é ativada para a chave atual (linha/registro), uma segunda chave de criptografia exclusiva é preenchida no "Slot B" do conjunto de chaves alternativo. A indexação também permite que duas chaves exclusivas existam por canal de rádio, em vez de uma chave.

**INFORMAÇÕES:**

Quando a seleção de menu da Chave convencional estiver programada e quando um par de chaves "Indexadas" for selecionado para determinado canal, você poderá alternar da chave de criptografia do Conjunto de chaves A para a chave de criptografia do Conjunto de chaves B (e vice-versa) sem alterar o canal do rádio. Isso só é possível para canais Convencionais.

Quando a seleção do menu do Conjunto de chaves for programada em comunicações Convencional ou de Entroncamento, a alteração de chave do conjunto de chaves atual do rádio só será possível nesse tipo de canal de comunicações. Um Conjunto de chaves se aplica a todos os rádios e, portanto, aos dois tipos de canais.

Quando as duas seleções – do Conjunto de chaves Convencional e de Entroncamento – forem programadas, você poderá alterar o Conjunto de chaves de todo o rádio, independentemente do canal em que o rádio estiver operando no momento.

Somente oito chaves podem ser indexadas ao slot B e somente o total de 16 chaves é possível entre o Slot A e o Slot B.

Acessado apenas: Quando o rádio for compatível com o modelo/a opção, e quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou

Quando o rádio for compatível com o modelo/opção, o campo [Operação segura na página 294](#) estiver definido como **Software** e o campo [Fonte de Carregamento de Chave na página 295](#) estiver definido como **KVL**.

10.18.6.4

Slot A

O aplicativo recupera e permite visualizar o número de chave de Hardware de PID (Physical Identification, identificação física) para a chave atual (registro/linha) na Lista de chaves de criptografia.

Este valor é afetado pela configuração do campo Indexado para o registro/linha atual, ativado ou desativado. O campo Indexado ativado permite a existência de dois conjuntos exclusivos de chaves ("Conjuntos de chaves"): um no slot A e um no slot B.

INFORMAÇÕES:

Quando a seleção de menu da Chave convencional estiver programada e quando um par de chaves "Indexadas" for selecionado para determinado canal, você poderá alternar da chave de criptografia do Conjunto de chaves A para a chave de criptografia do Conjunto de chaves B (e vice-versa) sem alterar o canal do rádio. Isso só é possível para canais convencionais.

Quando a seleção de menu do Conjunto de chaves Convencional ou de Entroncamento for programada, você poderá alterar o Conjunto de chaves em todos os rádios.

Quando as duas seleções – do Conjunto de chaves Convencional e de Entroncamento – forem programadas, você poderá alterar o Conjunto de chaves de todo o rádio, independentemente do canal em que o rádio estiver operando no momento.

Somente oito chaves podem ser indexadas ao slot B e somente o total de 16 chaves é possível entre o Slot A e o Slot B.

Acessado apenas:

Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**, e quando o campo [Fonte de Carregamento de Chave na página 295](#) estiver definido como **KVL** e o campo [Gerenciamento de Chaves PID para o Modo ASN na página 309](#) estiver ativado

e

Quando o número de registros na Lista de chaves de criptografia for menor do que 9 ou quando o número de registro da chave no [Lista de referências de chave de criptografia segura de hardware na página 315](#) estiver entre 9 e 16 e

- Se algum dos oito primeiros campos [Indexado na página 311](#) estiver "Ativado", então o slot A do registro 16 não será aplicável ou
- Se quaisquer dois dos oito campos indexados estiverem "Ativados", então o slot A dos registros 15 e 16 não será aplicável ou
- Se quaisquer três dos primeiros oito campos indexados estiverem "Ativados", então o slot A dos registros 14, 15 e 16 não será aplicável (os registros remanescentes seguem a mesma regra

Ou

quando o número do registro da chave na Lista de referências de chave de criptografia segura for maior que 16, o slot A desse registro não poderá ser acessado),

E quando o rádio for compatível com o modelo/a opção.

10.18.6.5

Slot B

O aplicativo recupera e permite visualizar o número de chave de Hardware de PID (Physical Identification, identificação física) para a chave atual (registro/linha) na Lista de chaves de criptografia.

Este valor é afetado pela configuração do campo Indexado para o registro/linha atual, ativado ou desativado. O campo Indexado ativado permite a existência de dois conjuntos exclusivos de chaves ("Conjuntos de chaves"): um no slot A e um no slot B.

INFORMAÇÕES:

Quando a seleção de menu da Chave convencional estiver programada e quando um par de chaves "Indexadas" for selecionado para determinado canal, você poderá alternar da chave de criptografia do Conjunto de chaves A para a chave de criptografia do Conjunto de chaves B (e vice-versa) sem alterar o canal do rádio. Isso só é possível para canais Convencionais.

Quando a seleção de menu do Conjunto de chaves Convencional ou de Entroncamento for programada, você poderá alterar o Conjunto de chaves em todos os rádios.

Quando as duas seleções – do Conjunto de chaves Convencional e de Entroncamento – forem programadas, você poderá alterar o Conjunto de chaves de todo o rádio, independentemente do canal em que o rádio estiver operando no momento.

Somente oito chaves podem ser indexadas ao slot B e somente o total de 16 chaves é possível entre o Slot A e o Slot B.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.18.6.6

Dados de Chave ADP Selecionável

Este campo permite definir o padrão de chave ADP para a chave atual (registro/linha) na Lista de chave de criptografia.

Os padrões de chave são um elemento necessário no algoritmo seguro ADP para que comunicações de criptografia por voz bem-sucedidas sejam possíveis.

**AVISO:**

As chaves ADP não são clonadas no rádio de destino quando o codeplug de origem é lido a partir de um rádio. Quando um codeplug contendo Chaves ADP é lido a partir de um rádio, as Chaves ADP não são carregadas, o que faz com que essas chaves ADP sejam exibidas com asteriscos (*). Nessa situação, os dados da chave não serão clonados em um rádio de destino. Se desejar enviar Dados de chave ADP para o rádio alvo, você deve reinserir as Chaves ADP apropriadas antes de iniciar o processo de Clonagem de rádio. Os Dados de chave ADP do codeplug de origem substituirão os dados de chave ADP do rádio de destino quando estiverem presentes.

Quando um arquivo de codeplug contendo Chaves ADP é aberto, as Chaves ADP são carregadas e podem ser clonadas no rádio de destino. Os Dados de chave ADP do codeplug de origem substituirão os dados de chave ADP do rádio de destino quando estiverem presentes.

**INFORMAÇÕES:**

Quando este campo mostra dez (10) asteriscos *********, não há padrão definido.

Para inserir nenhum padrão de Dados de chave, digite dez (10) asteriscos *********.

Por questões de segurança, quando um codeplug é lido de um rádio, ********* é exibido neste campo, não importa o padrão de dados que pode ser salvo no rádio.

Sempre que o ID de Chave ADP Seleccionável é modificado, o padrão de Dados da Chave para a mesma linha/registro fica inválido e deve ser redefinido.

É possível utilizar até 64 chaves de criptografia.

Não há mecanismo para apagar uma chave ADP do rádio. Um campo com ********* simplesmente significa que qualquer chave no rádio não será substituída.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Software** e o campo [Fonte de Carregamento de Chave na página 295](#) estiver definido como **Lista de chaves de criptografia** e o rádio for compatível com o modelo/a opção.

Acima 122: Alcance

Mínimo	Máximo
0000000000 Hex	FFFFFFFFFFFF Hex

10.18.6.7

ID de Chave ADP Seleccionável

Este campo permite definir o número de ID que representa a chave de privacidade digital avançada (ADP) para a chave atual (registro/linha) na Lista de chaves de criptografia.

A ID de Chave é transmitida com as comunicações de voz criptografada. Os rádios de recepção que recuperam a ID de chave são capazes de carregar o padrão de Dados de chave ADP selecionável e assim descriptografar a ligação de voz.

**INFORMAÇÕES:**

Todas as IDs de chave ADP selecionável devem ser exclusivas.

É possível utilizar até 64 chaves de criptografia.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Software** e o campo [Fonte de Carregamento de Chave na página 295](#) estiver definido como **Lista de chaves de criptografia** e o rádio for compatível com o modelo/a opção.

Acima 123: Alcance

Mínimo	Máximo
0000 Hex	FFFF Hex

10.18.6.8

Algoritmo

Este campo permite que os dados de chave ADP da entrada selecionada sejam enviados ao HSM (Hardware Security Module, módulo de segurança do hardware) do rádio.

Atualmente, é possível programar somente chaves ADP no HSM por meio do RadioCentral. Todas as outras chaves devem ser entregues ao rádio por meio de um KVL (Key Variable Loader, carregador variável de chave) ou KMF (Key Management Facility, local de gerenciamento de chaves).

10.19

Conjunto Perfil do KMF Seguro

O conjunto **Perfil do local de gerenciamento de chaves (KMF)** permite visualizar ou definir os parâmetros do ASTRO OTAR (Over-The-Air-Rekeying) que pertencem aos Perfis do KMF. Os Perfis do KMF são configurados para se comunicar com KMFs específicos. É possível utilizar até cinco (5) Perfis do KMF Seguro. Esse nó inteiro e todos os seus recursos estão disponíveis apenas quando o campo Ativação do ASTRO OTAR de segurança total está **Habilitado**.

INFORMAÇÕES:

A finalidade dos Perfis do KMF é permitir que o rádio opere com KMFs diferentes, possivelmente em sistemas diferentes. A desvantagem dessa funcionalidade é que o hardware de criptografia subjacente não gerencia várias versões da mesma chave, por exemplo, você não pode ter o mesmo Número de CKR gerenciado pelo KMF N° 1 e pelo KMF N° 2. Dessa forma, os operadores do KMF N° 1 e do KMF N° 2, neste exemplo, teriam que concordar em não gerenciar os mesmos números de CKR (Common Key Reference, referência de chave comum).

OBSERVAÇÃO:

Depois de definidos, os Perfis do KMF Seguro são selecionados pelos campos Índice do Perfil de KMF do Entroncamento, Índice do Perfil de KMF Convencional e Índice do Perfil de KMF da Lista de Grupos de Conversação do ASTRO.

O ASTRO OTAR é ativado para cada Personalidade convencional com base no campo Tipo de voz/sinal de recepção. O rádio também é configurado para iniciar os comandos OTAR ativando os campos ASTRO OTAR e/ou Transmissão de OTAR da Personalidade.

O ASTRO OTAR é habilitado por Sistema de entroncamento pelos campos ASTRO OTAR e Transmissão de OTAR.

10.19.1

Lista de referências de chave de criptografia segura de hardware

A seção **Referências de chave de criptografia segura de hardware** do Perfil de KMF seguro permite visualizar ou definir o conjunto de CKRs (Common Key References, referências de chave comum) que esse Perfil de KMF seguro pode acessar.

Assim, as chaves de criptografia são mencionadas para uso por meio de uma Lista de referências de chave de criptografia segura de hardware do Perfil de KMF que, por sua vez, faz referência às chaves subjacentes de hardware da Lista de chaves de criptografia segura. Cada Lista de Referências de Chaves atribuída a um perfil de KMF é configurada para se comunicar com um KMF específico. Quando um KMF mantém os mesmos CKRs, o operador do KMF pode controlar o rádio a partir de

uma perspectiva de ASTRO OTAR (Troca de Chave de Criptografia Via Ar). Outros perfis de KMF se comunicam com outros KMFs que podem controlar conjuntos diferentes de CKRs para o rádio.

**INFORMAÇÕES:**

O número máximo possível de Chaves de criptografia segura de hardware é igual ao número atual de Chaves seguras de hardware disponíveis na Lista de chaves de criptografia segura.

Depois de definidos, os perfis de KMF são selecionados pelos campos Índice do perfil de KMF do entroncamento, Índice do perfil de KMF convencional e Índice do perfil de KMF da Lista de grupos de conversação do ASTRO.

Para os canais convencionais que têm o campo Ligação de chave de voz definido como **Selecionar**, você pode selecionar uma nova Chave de criptografia na seleção do menu.

10.19.1.1**Número de CKR**

O aplicativo recupera e exibe apenas visualização de valores de CKR (Common Key Reference, referência de chave comum).

Cada valor de CKR é baseado na seleção do campo [Referência de Chaves de Criptografia na página 316](#) feita para o mesmo registro/linha da Lista de Referências de chaves de criptografia segura atual, que se aplica ao [Perfil ASTRO OTAR atual](#).

**OBSERVAÇÃO:**

Esse valor de CKR é definido no campo [Lista de Chaves de Criptografia Segura - N° CKR](#).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.19.1.2**Referência de Chaves de Criptografia**

Este campo seleciona uma chave AES ou de hardware na Lista de chaves de criptografia segura.

Essa seleção se aplica ao registro/linha da Lista de referências de chaves de criptografia segura atual, que se aplica ao [Perfil ASTRO OTAR atual](#).

**INFORMAÇÕES:**

Todas as seleções de Chave de AES e Hardware devem ser exclusivas para o Perfil ASTRO OTAR atual. Dessa forma, o número máximo de Chaves de criptografia segura (registros/linhas) possível é igual ao número atual de Chaves seguras disponíveis na [Lista de chaves de criptografia segura](#).

Uma vez definidos, os Perfis ASTRO OTAR são selecionados a partir do [Índice de perfil ASTRO OTAR na página 612](#) de Entroncamento, Índice de Perfil ASTRO OTAR convencional, Seleção de perfil ASTRO OTAR do Perfil de dados e dos campos [Índice de perfil ASTRO OTAR na página 406](#) da Lista de grupos de conversação ASTRO.

Acessado apenas: Quando o campo [Operação segura na página 294](#) está definido como **Hardware** ou **Software**, quando o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) está definido como **Ativado**, quando o campo [Operação de OTAR \(Over-The-Air Rekeying\)](#) está definido como **Somente ASTRO** ou **ASTRO e MDC** e quando o rádio está habilitado para o modelo/para a opção.

10.19.2

Informações sobre ASTRO OTAR

A seção **Informações do ASTRO OTAR (Over-The-Air-Rekeying, troca de chave de criptografia via ar)** do Perfil KMF seguro permite que você visualize ou defina parâmetros para Perfis KMF seguros individuais.

OBSERVAÇÃO:

Depois de definidos, os perfis de KMF são selecionados pelos campos Índice do perfil de KMF do entroncamento, Índice do perfil de KMF convencional e Índice do perfil de KMF da Lista de grupos de conversação do ASTRO.

O ASTRO OTAR é ativado para cada Personalidade convencional com base no campo Tipo de voz/sinal de recepção. O rádio também é configurado para iniciar os comandos OTAR ativando os campos ASTRO OTAR e/ou Transmissão de OTAR da Personalidade.

O ASTRO OTAR é habilitado por Sistema de entroncamento pelos campos ASTRO OTAR e Transmissão de OTAR.

10.19.2.1

Perfil ASTRO OTAR

Este campo permite criar nomes reconhecíveis para o Perfil ASTRO OTAR (Over-The-Air-Rekeying, rechaveamento Over The Air) atual.

OBSERVAÇÃO:

Uma vez definidos, os Perfis do ASTRO OTAR são selecionados nos campos [Índice de perfil ASTRO OTAR na página 406](#) Entroncamento, [Índice de perfil ASTRO OTAR na página 406](#) Convencional e [Índice de perfil ASTRO OTAR na página 406](#) Lista de grupos de conversação do ASTRO.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

OBSERVAÇÃO:

Exemplos: Perfil-05, Electric1, #510

É possível usar caracteres, números, espaços e caracteres especiais.

São permitidos no máximo 14 caracteres.

10.19.2.2

Apagar conjunto de chaves anterior na transição do OTAR

Este campo permite apagar TODAS as chaves de criptografia do conjunto de chaves ativo anteriormente depois de uma alteração do conjunto de chaves ASTRO OTAR (Over-The-Air-Rekeying, rechaveamento Over the Air).

Essa função se aplica à operação do ASTRO OTAR para o [Perfil ASTRO OTAR atual](#).

OBSERVAÇÃO:

É possível iniciar uma alteração de conjunto de chaves OTAR a partir do KMF (Key Management Facility, local de gerenciamento de chaves) ou de uma seleção de menu de Rechaveamento programável.

INFORMAÇÕES:

Quando o campo Apagar conjunto de teclas anterior na alteração do OTAR está habilitado e quando a opção Apagar conjunto de teclas anterior na alteração do usuário está habilitada, é possível apagar os dois conjuntos de chave e ficar momentaneamente sem chaves de criptografia seguras.

Exemplo: O rádio está operando no Conjunto de chaves 1 quando ocorre uma Alteração de conjunto de chaves OTAR. Ela altera o rádio para o Conjunto de chaves 2 e apaga o Conjunto de chaves 1 anterior do rádio. Em seguida, se você mudar de volta para o Conjunto de chaves 1 manualmente (o qual foi apagado), e a função Apagar anterior na alteração do usuário apagar o Conjunto de chaves 2 anterior, o rádio permanecerá sem chave até você carregue novas chaves manualmente ou solicite um Rechaveamento OTAR manual.

Acessado apenas: Quando o campo [Operação segura na página 294](#) está definido como **Hardware**, quando o campo [Operação de OTAR \(Over-The-Air Rekeying\)](#) está definido como **Somente ASTRO** ou **ASTRO e MDC** e quando o rádio está habilitado para o modelo/para a opção.

10.19.2.3

Número de tentativas

Este campo seleciona o número de tentativas que o rádio faz enquanto aguarda a confirmação de registro do KMF (Key Management Facility, local de gerenciamento de chaves).

Essa função se aplica à operação do ASTRO OTAR para o [Perfil ASTRO OTAR atual](#).

Acessado apenas: Quando o campo [Operação segura na página 294](#) está definido como **Hardware** ou **Software**, quando o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) está definido como **Ativado**, quando o campo [Operação de OTAR \(Over-The-Air Rekeying\)](#) está definido como **Somente ASTRO** ou **ASTRO e MDC**, quando o campo [Tipo de resposta na página 320](#) está definido como **Confirmado** e quando o rádio está habilitado para o modelo/para a opção.

Acima 124: Alcance

Mínimo	Máximo
1	10

10.19.2.4

Contador de inatividade OTAR

Este campo seleciona o tempo que o KMF (Key Management Facility, local de gerenciamento de chaves) tem para se comunicar com o rádio.

Se o rádio não receber nenhuma informação do KMF quando o timer expirar, ele tentará restabelecer a comunicação.

Essa função se aplica à operação do ASTRO OTAR para o [Perfil ASTRO OTAR atual](#).

Acessado apenas: Quando o campo [Operação segura na página 294](#) está definido como **Hardware** ou **Software**, quando o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) está definido como **Ativado**, quando o campo [Operação de OTAR \(Over-The-Air Rekeying\)](#) está definido como **Somente ASTRO** ou **ASTRO e MDC** e quando o rádio está habilitado para o modelo/para a opção.

Acima 125: Alcance

Mínimo (horas)	Máximo (horas)
1	10

10.19.2.5

Nível de segurança de recepção do OTAR

Este campo seleciona os níveis de política de segurança para KMMs (Key Management Messages, mensagens de gerenciamento de chaves).

Essa função se aplica à operação do ASTRO OTAR para o [Perfil ASTRO OTAR atual](#).

OBSERVAÇÃO:

Nesse momento, Solicitação de chaveamento, Registro e Incapaz de descriptografar KMMs são sempre **Criptografado e Autenticado**.

Acessado apenas: Quando o campo [Operação segura na página 294](#) está definido como **Hardware** ou **Software**, quando o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) está definido como **Ativado**, quando o campo [Operação de OTAR \(Over-The-Air Rekeying\)](#) está definido como **Somente ASTRO** ou **ASTRO e MDC** e quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Básico

O rádio recebe qualquer formato de KMM permitido pelo padrão do Projeto 25.

Aprimorado

Essa seleção será inválida quando [Operação segura na página 294](#) estiver definido como **Software**.

O rádio recebe somente as seguintes KMMs:

- **Criptografado e autenticado**
- **Somente criptografado**
- **Somente autenticado**

10.19.2.6

Nível de segurança de transmissão do OTAR

Este campo seleciona os níveis de política de segurança para KMMs (Key Management Messages, mensagens de gerenciamento de chaves).

Essa função se aplica à operação do ASTRO OTAR para o [Perfil ASTRO OTAR atual](#).

OBSERVAÇÃO:

Nesse momento, Solicitação de chaveamento, Registro e Incapaz de descriptografar KMMs são sempre **Criptografado e Autenticado**.

Acessado apenas: Quando o campo [Operação segura na página 294](#) está definido como **Hardware** ou **Software**, quando o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) está definido como **Ativado**, quando o campo [Operação de OTAR \(Over-The-Air Rekeying\)](#) está definido como **Somente ASTRO** ou **ASTRO e MDC** e quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Básico

O rádio recebe qualquer formato de KMM permitido pelo padrão do Projeto 25.

Aprimorado

Essa seleção será inválida quando [Operação segura na página 294](#) estiver definido como **Software**.

O rádio recebe somente as seguintes KMMs:

- Criptografado e autenticado
- Somente criptografado
- Somente autenticado

10.19.2.7

Tom de alerta de status da solicitação de rechaveamento

Este campo permite que o rádio gere um tom de alerta de êxito ou falha com relação à conclusão da solicitação de rechaveamento.

Esse recurso só afeta a emissão de som do tom de alerta quando a seção de Solicitação de rechaveamento do menu do rádio é encerrada antes da conclusão do processo de solicitação de rechaveamento. Quando a seção de Solicitação de Rechaveamento do menu do rádio não for encerrada antes de o processo de solicitação de rechaveamento ser concluído, esse tom de alerta de status será emitido, independentemente da configuração deste campo. Essa função se aplica à operação do ASTRO OTAR para o [Perfil ASTRO OTAR atual](#).

OBSERVAÇÃO:

O status do processo de rechaveamento também aparece como um alerta visual no visor do rádio.

Uma operação de rechaveamento de criptografia via OTAR é executada a partir do Local de gerenciamento de chaves (KMF) pelo despachador ao receber uma Solicitação de rechaveamento do usuário do rádio.

É possível iniciar uma Solicitações de rechaveamento pressionando um botão [Solicitação de rechaveamento na página 217](#) ou uma seleção de menu [Solicitação de rechaveamento na página 217](#).

Acessado apenas: Quando o campo [Operação segura na página 294](#) está definido como **Hardware**, quando o campo [Operação de OTAR \(Over-The-Air Rekeying\)](#) está definido como **Somente ASTRO** ou **ASTRO e MDC** e quando o rádio está habilitado para o modelo/para a opção.

10.19.2.8

Tipo de resposta

Este campo seleciona o tipo de resposta usado quando o rádio se comunica com o KMF (Key Management Facility, local de gerenciamento de chaves).

Essa função se aplica à operação do ASTRO OTAR para o [Perfil ASTRO OTAR atual](#).

As seleções a seguir são compatíveis:

Não confirmado

As transmissões de ASTRO OTAR enviadas para o KMF (do rádio) não são confirmadas/lidas indicando uma transmissão recebida com êxito.

Confirmado

As transmissões de ASTRO OTAR enviadas para o KMF (do rádio) exigem que uma confirmação/leitura seja enviada de volta para o rádio indicando uma transmissão recebida com êxito.

Quando o campo [Transporte de OTAR na página 323](#) estiver definido como **Somente banda larga** ou **Banda larga preferida** e o rádio executa OTAR (Over-the-Air-Rekeying, troca de chave de criptografia via ar) usando banda larga, o rádio usa **Confirmado** como o tipo de resposta.

Quando o rádio executa OTAR sobre LMR (Land Mobile Radio, rádio móvel terrestre), o rádio usa o valor desse campo como o tipo de resposta.

Acessado apenas: Quando as seguintes condições forem atendidas:

- O campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**.

- O campo [Padrão de criptografia avançada \(AES256\) na página 295](#) estiver definido como **Ativado**.
- O campo [Operação de OTAR \(Over-The-Air Rekeying\)](#) estiver definido como **Somente ASTRO** ou **ASTRO e MDC**.
- O rádio é habilitado de acordo com o modelo ou a opção.

10.19.2.9

Tempo entre tentativas

Este campo seleciona o período que o rádio aguarda antes de tentar reenviar a última mensagem.

Essa função se aplica à operação do ASTRO OTAR para o [Perfil ASTRO OTAR atual](#).

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**, quando o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) estiver definido como **Ativado**, quando o campo [Operação de OTAR \(Over-The-Air Rekeying\)](#) estiver definido como **Somente ASTRO** ou **ASTRO e MDC**, quando o campo [Tipo de resposta na página 320](#) estiver definido como **Confirmado** e o rádio estiver habilitado para o modelo/a opção.

Acima 126: Alcance

Mínimo	Máximo	Incrementos
5 segundos	90 segundos	5 segundos

10.19.2.10

Solicitação de rechaveamento selecionado pelo usuário

Este campo permite que o rádio transmita a solicitação de rechaveamento do ASTRO OTAR (Over-The-Air-Rekeying, rechaveamento Over the Air).

A solicitação é enviada para o console do KMF (Key Management Facility, local de gerenciamento de chaves) do despachador. Essa função se aplica à operação do ASTRO OTAR para o [Perfil ASTRO OTAR atual](#).

OBSERVAÇÃO:

É possível iniciar uma Solicitações de rechaveamento pressionando um botão [Solicitação de rechaveamento na página 188](#) ou uma seleção de menu [Solicitação de rechaveamento na página 217](#).

Acessado apenas: Quando o campo [Operação segura na página 294](#) está definido como **Hardware** ou **Software**, quando o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) está definido como **Ativado**, quando o campo [Operação de OTAR \(Over-The-Air Rekeying\)](#) está definido como **Somente ASTRO** ou **ASTRO e MDC** e quando o rádio está habilitado para o modelo/para a opção.

10.19.3

Transferência de dados

A seção **Transporte de dados** do Perfil KMF seguro permite que você visualize ou defina as configurações a serem usadas no envio e recebimento de KMMs (Key Management Facility,

mensagens de gerenciamento de chaves) de e para o KMF (Key Management Facility, recurso de gerenciamento de chaves).

INFORMAÇÕES:

Essas configurações de Transferência de Dados se aplicam apenas ao ASTRO OTAR (Over-The-Air-Rekeying, troca de chave de criptografia via ar) de Entroncamento, que é um aplicativo de dados baseado em IP no rádio. O ASTRO OTAR Convencional se comunica com o rádio usando o protocolo CAI (Common Air Interface, interface aérea comum) P25 e não é baseado em IP. Os arquivos desta seção se aplicam a Perfis do KMF Seguro individuais.

Depois de definidos, os perfis de KMF são selecionados pelos campos Índice do perfil de KMF do entroncamento, Índice do perfil de KMF convencional e Índice do perfil de KMF da Lista de grupos de conversação do ASTRO.

10.19.3.1

Endereço KMF IP

Este campo seleciona o endereço IP (Internet Protocol, protocolo da Internet) do KMF (Key Management Facility, local de gerenciamento de chaves).

Essa seleção se aplica à funcionalidade ASTRO OTAR Over-The-Air-Rekeying (OTAR) e ao [Perfil ASTRO OTAR atual](#).

Acessado apenas: Quando o campo [Operação segura na página 294](#) está definido como **Hardware** ou **Software**, quando o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) está definido como **Ativado**, quando o campo [Operação de OTAR \(Over-The-Air Rekeying\)](#) está definido como **Somente ASTRO** ou **ASTRO e MDC** e quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

- Endereços IP válidos cujos valores para cada octeto estão entre: [0-223] . [0-255] . [0-255] . [0-255]

10.19.3.2

Porta UDP do KMF

Este campo seleciona o número da porta UDP (User Datagram Protocol, protocolo de datagrama do usuário).

O rádio transmite KMMs (Key Management Messages, mensagens de gerenciamento de chaves) para essa porta quando está se comunicando com o KMF (Key Management Facility, local de gerenciamento de chaves). Essa seleção se aplica à funcionalidade ASTRO OTAR (Over-The-Air-Rekeying, rechaveamento Over The Air) e ao [Perfil ASTRO OTAR atual](#).

Acessado apenas: Quando o campo [Operação segura na página 294](#) está definido como **Hardware** ou **Software**, quando o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) está definido como **Ativado**, quando o campo [Operação de OTAR \(Over-The-Air Rekeying\)](#) está definido como **Somente ASTRO** ou **ASTRO e MDC** e quando o rádio está habilitado para o modelo/para a opção.

Acima 127: Alcance

Mínimo	Máximo
0	65535

10.19.3.3

Porta OTAR do rádio

Este campo seleciona o número da porta do OTAR (Over-The-Air-Rekeying, rechaveamento Over The Air) da MSU (Mobile Subscriber Unit, unidade de rádio móvel) a ser usada.

O rádio recebe KMMs (Key Management Messages, Mensagens de gerenciamento de chaves) nessa porta quando está se comunicando com o KMF (Key Management Facility, Local de gerenciamento de chaves). Essa seleção se aplica à funcionalidade ASTRO OTAR e ao [Perfil ASTRO OTAR](#) atual.

Acessado apenas: Quando o campo [Operação segura na página 294](#) está definido como **Hardware** ou **Software**, quando o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) está definido como **Ativado**, quando o campo [Operação de OTAR \(Over-The-Air Rekeying\)](#) está definido como **Somente ASTRO** ou **ASTRO e MDC** e quando o rádio está habilitado para o modelo/para a opção.

Acima 128: Alcance

Mínimo	Máximo
0	65535

10.19.3.4

Transporte de OTAR

Esse campo seleciona o tipo de transporte para OTAR (Over-the-Air-Rekeying, troca de chave de criptografia via ar).

As seguintes opções estão disponíveis:

Somente LMR

O OTAR é executado somente em LMR (Land Mobile Radio, rádio móvel terrestre).

Apenas banda larga

O OTAR é realizado por LTE (Cellular Long Term Evolution, evolução de longo prazo celular) ou Wi-Fi.

Acessado apenas: Quando as seguintes condições forem atendidas:

- O modelo do rádio oferece suporte a OTAR, como o modelo Próximo rádio.
- O campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**.
- O campo [Padrão de criptografia avançada \(AES256\) na página 295](#) estiver ativado.
- O campo [Ativação do OTAR na página 296](#) estiver ativado.
- O campo [Ativação do ASTRO OTAR na página 297](#) estiver ativado.

10.19.3.5

ID de banda larga KMF

Esse campo permite inserir um identificador globalmente exclusivo do KMF (Key Management Facility, local de gerenciamento de chaves). O rádio se comunica com o KMF para OTAR (Over-the-Air-Rekeying, redefinição de chave de criptografia via ar) usando banda larga.

Acessado apenas: Quando as seguintes condições forem atendidas:

- O modelo do rádio oferece suporte a OTAR, como o modelo Próximo rádio.
- O campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**.
- O campo [Padrão de criptografia avançada \(AES256\) na página 295](#) estiver ativado.
- O campo [Ativação do OTAR na página 296](#) estiver ativado.
- O campo [Ativação do ASTRO OTAR na página 297](#) estiver ativado.
- O campo [Transporte de OTAR na página 323](#) não estiver definido como **Somente LMR**.

10.20

Certificado CA

Esta seção permite carregar arquivos de Certificado CA no codeplug atual.

O número máximo de arquivos de Certificado CA que podem ser adicionados a um codeplug é 20. Arquivos de Certificado CA no codeplug do rádio são usados pelo rádio para autenticar o servidor de Gateway do SmartConnect durante uma sessão TLS.

10.20.1

Nome do certificado

Este campo permite definir nomes reconhecíveis do arquivo de certificado CA.

As seleções a seguir são compatíveis:

OBSERVAÇÃO:

Exemplos: EMT-001, #500, Electric1, # A5.

É possível usar no máximo 50 caracteres ASCII, números, espaços e caracteres especiais.

10.20.2

Nome do Arquivo de Certificado

Este campo permite visualizar ou renomear o arquivo de certificado CA.

As seleções a seguir são compatíveis:

OBSERVAÇÃO:

Exemplos: EMT-001, #500, Electric1, # A5.

É possível usar no máximo 255 caracteres, números, espaços e caracteres especiais.

10.21

Emergências

Esta seção permite visualizar ou definir a funcionalidade do modo de emergência que se aplica aos perfis de emergência convencionais e aos perfis de emergência de entroncamento.

Esses Perfis de emergência podem ser aplicados durante a operação em comunicações convencionais e de entroncamento.

OBSERVAÇÃO:

Perfis de emergência convencionais são selecionados para uso a partir do campo Seleção do Perfil de Emergência do Sistema Convencional.

Perfis de emergência de entroncamento são selecionados no campo Seleção de perfil de emergência da Personalidade de entroncamento.

É possível iniciar a funcionalidade do modo de emergência por meio de um rádio programado ou iniciando o recurso.

10.21.1

Geral

Esta seção permite visualizar ou definir a funcionalidade do modo de emergência que se aplica aos perfis de emergência convencionais e aos perfis de emergência de entroncamento.

Esses Perfis de Emergência podem ser aplicados durante a operação em comunicações Conconvencionais e/ou de Entroncamento.

OBSERVAÇÃO:

Perfis de emergência convencionais são selecionados pelo campo Seleção de perfil de emergência do sistema Convencional.

Perfis de emergência de entroncamento são selecionados no campo Seleção de perfil de emergência da Personalidade de entroncamento.

É possível iniciar a funcionalidade do modo de emergência por meio de um rádio programado ou iniciando o recurso.

10.21.1.1

Tipo de indicador de recepção do alarme de emergência

Esse campo seleciona o tipo de notificação que você ouve ou vê quando um alarme de emergência é recebido de outro rádio.

Esse recurso também deve ser ativado (quando apropriado) para o Sistema MDC individual ou Sistema ASTRO no campo Indicador de recepção do alarme de emergência, ou para o sistema de entroncamento no campo Indicador de recepção do alarme de emergência. Essa seleção é aplicável durante a operação no Modo de emergência tanto para as comunicações convencionais como para as de entroncamento.

INFORMAÇÕES:

O tempo do Indicador de recepção do alarme de emergência é de 10 segundos. Durante esses 10 segundos, você pode desativar o indicador pressionando qualquer um dos botões do rádio, exceto os botões **Volume** e **Luz**.

Assim que o indicador apagar ou for removido, os alarmes de emergência repetidos com o mesmo ID principal do MDC ou ID individual do sistema ASTRO ou ID da unidade de entroncamento serão ignorados nos próximos 20 segundos.

Os alarmes de emergência não são detectados enquanto o rádio está no modo de varredura.

Os alarmes de emergência não são detectados quando o rádio está ativo em um canal de voz.

As seleções a seguir são compatíveis:

Sem indicação

Nenhum alerta é ouvido ou visto.

Somente alertar

Emite um alerta de áudio.

Display Only

Exibe um alerta visual. O alerta visual é aplicável somente aos modelos de rádio com tela.

Alertar e exibir

Os alarmes de emergência não são detectados quando o rádio está ativo em um canal de voz.

OBSERVAÇÃO:

Para as seleções **Somente exibir** e **Alertar e exibir**, o seguinte se aplica:

- Quando o rádio detecta um Alarme de Emergência, EA-RCVD (Alarme de Emergência Recebido) é exibido na tela do rádio.
- Quando o rádio detecta um sinal de emergência, BCON RX (Sinal recebido: Emergência, encontre-me) é exibido na tela do rádio.

AE-REC é exibido alternadamente com o ID principal do MDC, o ID individual do sistema ASTRO ou o ID da unidade de entroncamento do rádio que enviou o Alarme de emergência e continua por dez segundos. Alias Reverso/ID de Chamada também é possível.

10.21.1.2

Manter Ativo

Esse campo permite que o rádio permaneça ligado durante uma transmissão no modo Emergência, independentemente da posição do botão Liga/desliga.

Se o botão Liga/Desliga do rádio estiver na posição **DESLIGADO**, ele desligará quando você sair do modo Emergência com o pressionamento longo do botão Emergência. Essa seleção é aplicável durante a operação no modo Emergência para comunicações convencionais e de entroncamento.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.21.1.3

Campo Desativar Indicações de Chamada de Emergência

Esse campo permite que todas as indicações (tela, alertas de LED e tons) normalmente associadas a uma Chamada de emergência (consulte Tipo de emergência) estejam desativadas ao operar no modo Alarme silencioso.

Apenas as indicações audíveis e visuais que ocorrem durante uma chamada de Grupo de Conversação/Convencional estão disponíveis; portanto, durante uma chamada de Emergência, ela é exibida como uma chamada de despacho comum. Essa seleção é aplicável durante a operação no modo Emergência para comunicações convencionais e de entroncamento.

AVISO:

Esse modo de Chamada de emergência silenciosa continua até que você pressione e segure o botão Emergência para que a duração do pressionamento longo de teclas programado para Emergência saia do modo Emergência.

INFORMAÇÕES:

Quando esta seleção está ativada, o Recurso Estendido Desativar indicações de Chamada de emergência é **Usado no codeplug = Sim**.

Acessado apenas: Quando o recurso estendido **Desativar indicações de chamada de emergência** aparecer no campo Nome do recurso estendido e quando o campo Alarme silencioso estiver habilitado (se desabilitado, esta seleção deverá ser desabilitada. Caso contrário, este campo se tornará inválido).

10.21.1.4

Opção Não mudo

Esse campo permite que o rádio desative o mudo do tráfego de voz ao operar no modo Alarme silencioso.

A Opção desativar mudo permite que o despachador forneça feedback ao estado de emergência iniciado por meio de palavras de código e sem chamar atenção indesejável.

Essa seleção é aplicável durante a operação no Modo de emergência tanto para as comunicações convencionais como para as de entroncamento.

AVISO:

Quando o campo [Campo Desativar Indicações de Chamada de Emergência na página 326](#) estiver ativado, o campo Opção desativar mudo deverá estar ativado. Caso contrário, o aplicativo considerará o valor inválido.

Acessado apenas: Quando o campo Alarme silencioso estiver ativado.

10.21.1.5

Atraso de Canais

Esse campo seleciona o tempo que o rádio aguarda para começar a transmitir dados do modo Emergência quando você está alterando o canal do rádio.

Esse recurso impede que o rádio transmita inadvertidamente dados de emergência em canais quando estiver no modo Emergência e quando você estiver alterando o canal do rádio. Essa seleção é aplicável durante a operação no modo Emergência para transmissões convencionais e de entroncamento. O tempo é medido em segundos.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 129: Alcance

Mínimo	Máximo	Incremento
0 s	7 s	1 s

10.21.1.6

Distinguir Tipo de Emergência

Esse campo permite que o rádio envie diferentes mensagens de LRRP (Location Request/Response Protocol, protocolo de solicitação/resposta de localização) para Man Down, Detecção de impacto e outra emergência.

Esse recurso permite diferenciar entre alarmes falsos e situações de emergência reais.

Os eventos de status do rádio incluem a exibição textual da condição, e um tom de emergência diferente é emitido no alto-falante selecionado pela duração dos alarmes.

Acessado apenas: Quando o campo Tipo de indicador de recepção do alarme de emergência é Somente exibir ou Alertar e exibir.

10.21.2

Man Down

Esta seção permite visualizar ou definir a funcionalidade do modo de emergência Man Down.

O recurso Man Down com problemas transmite uma emergência com base na suspeita de um rádio portátil e seu operador estarem em posição horizontal ou em posição horizontal e sem movimento.

Portanto, o modo de emergência Man Down alerta os despachadores e outros rádios sobre ocorrências de Man Down.

**INFORMAÇÕES:**

A função Man Down pode ser configurada para operar em todos os rádios ou por Perfil de Emergência, que inclui os Tons de Alerta personalizáveis. Consulte o campo Nível de Configuração de Man Down e a Página de Tons de Emergência Personalizáveis.

**OBSERVAÇÃO:**

O campo Acionador de Man Down habilita o recurso e determina se um limite de sensibilidade de movimento também é necessário para realizar a condição de Man Down. A capacidade de configuração de Man Down, o temporizador de pré-alerta, o tom de pré-alerta e o temporizador de pós-alerta também devem ser definidos.

No campo: Você é alertado de forma sonora e visual de que as condições de Man Down programadas no rádio foram atendidas para a duração do temporizador do pré-alerta. Quando o temporizador de pré-alerta expira, o temporizador pós-alerta é iniciado. Quando o temporizador pós-alerta expira, o rádio inicia a transmissão no Modo de emergência.

- A qualquer momento durante o período em que as condições necessárias de Man Down são consideradas verdadeiras, se elas forem interrompidas por causa do reposicionamento do rádio, ou iniciadas pelo pressionamento do botão Remoção de Man Down, o recurso Man Down será automaticamente reiniciado e nenhuma transmissão de emergência será enviada.
- Se a emergência já tiver começado a ser transmitida, porém ainda não confirmada, e as condições de Man Down forem interrompidas por causa da reparação do rádio ou pelo pressionamento do botão Remoção de Man Down, a transmissão de emergência será cancelada.

Os ângulos de operação que determinam a posição vertical do rádio e sua posição horizontal são programados pela fábrica.

O limite de sensibilidade de movimento é programado pela fábrica.

**OBSERVAÇÃO:**

Perfis de emergência convencionais são selecionados pelo campo Seleção de perfil de emergência do sistema Convencional.

Perfis de emergência de entroncamento são selecionados no campo Seleção de perfil de emergência da Personalidade de entroncamento.

É possível iniciar a funcionalidade do modo de emergência por meio de um rádio programado ou iniciando o recurso.

10.21.2.1

Acionador de Man Down

Esse campo seleciona o tipo de condição de Man Down que inicia o recurso Man Down do modo Emergência.

Essa seleção se aplica às comunicações convencionais e de entroncamento.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Desabilitado

Desabilita o recurso Usuário com problemas.

Somente horizontal

Uma emergência é transmitida quando o rádio é inclinado em posição horizontal aparente.

Imóvel e na horizontal

Uma emergência é transmitida se o rádio for inclinado para uma posição horizontal aparente e o movimento medido do rádio não atingir o limite de sensibilidade de movimento conforme a programação de fábrica. Qualquer movimento de rádio que não atenda ao limite de movimento é considerado "Imóvel".

OBSERVAÇÃO:

O limite de sensibilidade de movimento é programado pela fábrica.

OBSERVAÇÃO:

Os ângulos de operação que determinam a posição vertical do rádio e sua posição horizontal são programados pela fábrica.

10.21.2.2

Contador pré-alerta

Esse campo seleciona por quanto tempo uma condição de Man Down deve estar presente até que você seja notificado pelo tom de pré-alerta selecionado.

Este tom de alerta também é complementado visualmente pelo texto *Man Down*, que aparece no visor do rádio. Esses alertas são para avisá-lo de que um modo Emergência está prestes a ser ativado, permitindo que você coloque o rádio em uma posição mais vertical e possivelmente evite uma falsa transmissão de emergência.

Essa seleção se aplica às comunicações convencionais e de entroncamento.

INFORMAÇÕES:

No campo: Se a condição de Man Down for interrompida devido ao reposicionamento do rádio ou porque o botão Remoção de Man Down foi pressionado, a condição de Man Down, os contadores e os alertas serão reiniciados, e a transmissão do modo Emergência será cancelada.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção e quando o campo [Accionador de Man Down na página 328](#) não está **Desativado**.

Acima 130: Alcance

Mínimo	Máximo	Incremento
5 segundos	120 segundos	1 segundo

10.21.2.3

Timer Pós-alerta

Esse campo seleciona o tempo que o rádio precisa permanecer em condição Man Down a partir do momento em que o Contador pré-alerta expira até começar a transmitir no modo Emergência.

Essa seleção se aplica às comunicações Convencionais e de Entroncamento com relação à operação. O tempo é medido em segundos.

INFORMAÇÕES:

No campo: Se a condição Man Down for interrompida devido ao reposicionamento do rádio ou porque o botão Remoção de Man Down foi pressionado, a condição Man Down, os contadores e os alertas serão reiniciados e a transmissão do modo Emergência será cancelada.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção e quando o campo [Accionador de Man Down na página 328](#) não está **Desativado**.

Acima 131: Alcance

Mínimo	Máximo	Incremento
1 segundo	120 segundos	1 segundo

10.21.2.4

Tom de pré-alerta

Esse campo seleciona o tipo de tom de alerta a ser emitido quando o Contador pré-alerta expira.

O Contador pré-alerta começa assim que a condição de Man Down programada é atendida (consulte [Acionador de Man Down na página 328](#)). Quando esse período do contador expirar, esse tom de alerta selecionado será emitido. Este tom de alerta também é complementado visualmente pelo texto `Man Down`, que aparece no visor do rádio.

Esses alertas sonoros e visuais servem para avisá-lo que um modo Emergência está prestes a ser ativado, permitindo que você coloque o rádio em uma posição vertical para evitar uma falsa transmissão de emergência. Essa seleção se aplica às comunicações convencionais e de entroncamento.

INFORMAÇÕES:

Para assegurar que você ouça este tom quando o volume estiver baixo, recomenda-se aumentar a configuração Volume mínimo ou Diferença de volume (dB).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção e quando o campo [Acionador de Man Down na página 328](#) não está **Desativado**.

As seleções a seguir são compatíveis:

Tom de aviso único

Um tom é emitido quando o [Contador pré-alerta na página 329](#) expira.

Tom de aviso contínuo

Um tom contínuo é emitido quando o [Contador pré-alerta na página 329](#) expira ou enquanto o [Timer Pós-alerta na página 329](#) está em execução. Portanto, esse tom de alerta é finalizado quando a transmissão do modo Emergência inicia.

10.21.2.5

Nível de Configuração de Man Down

Este campo seleciona se a função Man Down do modo de emergência é definida com base no rádio ou de acordo com o perfil de emergência.

Essa seleção se aplica às comunicações convencionais e de entroncamento.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção e quando o campo [Acionador de Man Down na página 328](#) não está **Desativado**.

As seleções a seguir são compatíveis:

Todos os Rádios

A função Usuário com Problemas se aplica a todos os rádios.

Por Perfil

Permite que a função Usuário com Problemas seja habilitada por Perfil de Emergência Convencional ou de Entroncamento ao selecionar o campo correspondente de Habilitar Usuário com Problemas. Consulte também o [Acionador de tom de Man Down na página 331](#).

10.21.3

Tons de emergência personalizáveis

Essa seção permite visualizar ou definir a funcionalidade Man Down do modo Emergência, relacionada à Lista de tons de emergência de acordo com o perfil de emergência.

OBSERVAÇÃO:

Perfis de emergência convencionais são selecionados pelo campo Seleção de perfil de emergência do sistema Convencional.

Perfis de emergência de entroncamento são selecionados no campo Seleção de perfil de emergência da Personalidade de entroncamento.

É possível iniciar a funcionalidade do modo de emergência por meio de um rádio programado ou iniciando o recurso.

10.21.3.1

Acionador de tom de Man Down

Esse campo permite que uma Lista de tons de emergência personalizável seja usada, de acordo com o Perfil de emergência, quando o modo Emergência tiver sido iniciado por uma situação de Man Down.

Essa seleção é aplicável durante a operação no Modo de emergência tanto para as comunicações convencionais como para as de entroncamento.

Acessado apenas: Quando o campo [Acionador de Man Down na página 328](#) não estiver **Desativado**, quando o campo [Nível de Configuração de Man Down na página 330](#) estiver definido como **De acordo com o perfil de emergência** e quando o rádio for compatível com o modelo/a opção.

10.22

Perfis de emergência convencionais

Os **Perfis de emergência convencionais** permite visualizar ou modificar a funcionalidade Convencional – modo Emergência.

As transmissões de emergência permitem a definição de muitas configurações. Uma variedade de perfis de emergência pode ser criada.

OBSERVAÇÃO:

Os recursos e as configurações de [Emergências na página 324](#) se aplicam a esses perfis. Perfis de Emergência Convencionais são selecionados pelo campo Seleção de Perfil de Emergência convencional do sistema.

Sistemas Convencionais são referenciados como Personalidades Convencionais pelo campo Sistema ASTRO ou o campo Sistema Não ASTRO; somente o ASTRO e o MDC têm capacidade para as transmissões no modo de emergência.

A funcionalidade do modo Emergência é iniciada com um rádio programado ou por você.

10.22.1

Geral

Esta seção permite visualizar e modificar recursos de emergência convencional para perfis de emergência convencionais individuais.

**OBSERVAÇÃO:**

Os recursos e as configurações de [Emergências na página 324](#) se aplicam a esses perfis. Perfis de Emergência Convencionais são selecionados pelo campo Seleção de Perfil de Emergência convencional do sistema.

Sistemas Convencionais são referenciados como Personalidades Convencionais pelo campo Sistema ASTRO ou o campo Sistema Não ASTRO; somente o ASTRO e o MDC têm capacidade para as transmissões no modo de emergência.

É possível iniciar a funcionalidade do modo de emergência por meio de um rádio programado ou iniciando o recurso.

10.22.1.1

Nome do Perfil de Emergência

Este campo permite criar nomes reconhecíveis para os Perfis de emergência convencionais atuais.

Perfis de emergência convencionais são selecionados para uso a partir do campo Seleção do Perfil de Emergência do Sistema Convencional.

**OBSERVAÇÃO:**

Exemplos: EMT-001, #500, Electric1, # A5.

É possível usar caracteres, números, espaços e caracteres especiais.

São permitidos no máximo 14 caracteres.

10.22.1.2

Tipo de Emergência

Esse campo seleciona a funcionalidade de rádio desejada que ocorrerá quando você iniciar o modo de emergência.

Esta seleção se aplica ao [Perfis de emergência convencionais na página 331](#) atual.

**INFORMAÇÕES:**

Ambas as seleções suportam Canal de reversão de emergência, ou seja, transmitir emergência em um canal predeterminado.

Quando o rádio tiver iniciado a operação de Chamada de emergência, somente um pressionamento longo do botão de emergência (consulte o campo Duração longa do pressionamento de teclas para emergência) ou o desligamento do rádio cessa este recurso.

As seleções a seguir são compatíveis:

Somente alarme

Com um pressionamento do botão de Emergência, um pacote de dados de alarme de emergência iniciando uma comunicação de emergência é enviado repetidamente para a estação de base até que seja cancelado por uma das opções a seguir:

- Tanto o [Tentativas Polidas na página 334](#) programado como o [Tentativas Não Polidas na página 334](#) foram esgotados.
- Um reconhecimento confirmando a transmissão bem-sucedida do pacote de dados de emergência é recebido na estação base.
- O pressionamento do botão PTT.

- Um pressionamento longo do botão de emergência (consulte o campo Duração longa do pressionamento de teclas para emergência).

Alarme e Ligação

Com um pressionamento do botão de Emergência, um pacote de dados de alarme de emergência iniciando uma comunicação de emergência é enviado repetidamente para a estação de base até que seja cancelado por uma das opções a seguir:

- Tanto o [Tentativas Polidas na página 334](#) programado como o [Tentativas Não Polidas na página 334](#) foram esgotados.
- Um reconhecimento confirmando a transmissão bem-sucedida do pacote de dados de emergência é recebido na estação base.
- O pressionamento do botão PTT.

Quando o pacote de dados de Alarme tiver cessado, então é possível transmitir voz (Chamada) no canal.

10.22.1.3

Rec. do console necessário (DVRS)

Este campo faz com que uma resposta extra de confirmação do console ("confirmação do console") seja necessária ao iniciar o modo de emergência.

Quando um alarme de emergência for enviado (consulte o campo Tipo de emergência), o rádio sempre exigirá um reconhecimento do FNE (Fixed Network Equipment, equipamento de rede fixa); essa função requer que um Reconhecimento de console adicional seja necessário no aplicativo de transmissão/console.

O recebimento de um Rec do FNE confirma que o site atual do rádio recebeu o pacote de alarme de emergência; o recebimento de um Rec do console garante que o aplicativo de despacho/console está exibindo a condição de emergência ao operador de envio. Quando o Rec do console é recebido, o rádio toca um tom de alerta de quatro bips.

Esta seleção se aplica ao Perfil de Emergência Convencional atual.

INFORMAÇÕES:

Esse campo é aplicável apenas quando o atual canal do rádio está operando em DVRS (Digital Vehicular Repeater System, sistema repetidor veicular digital) convencional (ou seja, a atual personalidade convencional referencia um sistema DVRS convencional). Este campo não causa impacto sobre um Sistema Convencional não DVRS.

Esta função deve ser desativada para **Emergência de microfone ativo** ou **Emergência via áudio silencioso** para funcionar adequadamente. Consulte o campo [Modo de transmissão automática de emergência na página 335](#).

10.22.1.4

Tom de alerta de reconhecimento

Este campo permite que o rádio toque um sinal de áudio quando uma mensagem de modo de emergência tiver sido recebida e uma confirmação da mensagem recebida tiver retornado ao rádio pela estação base.

Uma confirmação de emergência é uma confirmação de que o Alarme de emergência do rádio (consulte [Tipo de Emergência na página 332](#)) foi recebido com êxito pela estação base. Esta função se aplica ao Perfil de emergência convencional atual.

10.22.1.5

Tentativas Polidas

Este campo seleciona o número de vezes que o rádio tenta transmitir uma Chamada polida do modo de emergência (veja Tipo de emergência).

Uma chamada polida é quando o rádio aguarda que um canal seja liberado de tráfego de rádio antes de tentar transmitir. Tentativas Polidas são interrompidas quando uma confirmação (Conf) de uma transmissão de emergência bem-sucedida é recebida no rádio.

Esta seleção se aplica ao [Perfis de emergência convencionais na página 331](#) atual.

INFORMAÇÕES:

Se tentativas não polidas de emergência são concluídas antes de o temporizador da Paciência Limitada expirar, o rádio irá utilizar transmissão polida até o temporizador expirar. Depois que o temporizador expirar, qualquer resíduo de tentativas polidas será enviado de forma não polida.

Acima 132: Alcance

Mínimo	Máximo	Incremento
0 tentativas	15 tentativas	1 tentativa

Acima 133: Alcance

Mínimo	Máximo
0 tentativas	14 ou infinitas tentativas

10.22.1.6

Tentativas Não Polidas

Este campo seleciona o número de vezes que o rádio tenta transmitir uma Chamada do modo de emergência não polida (consulte as seleções do campo Tipo de emergência).

Uma chamada não polida é quando o rádio envia uma transmissão mesmo que o canal esteja ocupado com outro tráfego de rádio. Essas transmissões invadem o tráfego de outro canal. Tentativas Não Polidas são interrompidas quando uma confirmação (Conf) de uma transmissão de emergência bem-sucedida é recebida no rádio.

Esta seleção se aplica ao [Perfis de emergência convencionais na página 331](#) atual.

INFORMAÇÕES:

Se tentativas não polidas de emergência são concluídas antes de o temporizador da Paciência Limitada expirar, o rádio irá utilizar transmissão polida até o temporizador expirar. Depois que o temporizador expirar, qualquer resíduo de tentativas polidas será enviado de forma não polida.

Acima 134: Alcance

Mínimo	Máximo	Incremento
1 tentativa	15 tentativas	1 tentativa

10.22.1.7

Mudança no Canal de Saída de Emergência

Este campo permite que o rádio saia da Emergência na mudança do modo.

10.22.1.8

Ativar Man Down

Este campo habilita a operação Man Down do modo de emergência para o conjunto atual de Perfis de emergência convencionais.

Acessado apenas: Quando o campo Acionador de Man Down não estiver definido como **Desativado**, e quando o campo Nível de configuração de Man Down estiver definido como **Por perfil de emergência** e quando o rádio estiver habilitado para o modelo/a opção.

10.22.1.9

Modo de transmissão automática de emergência

Esse campo seleciona uma operação de transmissão adicional e específica de emergência para o conjunto de perfis convencionais de emergência atual.

O Microfone ativo de emergência e o Áudio silencioso do microfone ativo são possíveis.

AVISO:

Quando este recurso não estiver desativado, a funcionalidade selecionada substituirá/ melhorará a funcionalidade de emergência descrita na seleção **Alarme e chamada de emergência** do campo [Tipo de Emergência na página 332](#).

As seleções a seguir são compatíveis:

Desabilitado

Nenhuma funcionalidade adicional de Transmissão automática está selecionada.

Microfone ativo de emergência

Depois pressionar o botão Emergência para iniciar o modo Emergência, após apenas uma transmissão não polida de alarme de emergência, essa seleção faz com que o rádio ligue automaticamente e transmita uma Chamada de emergência (consulte [Tipo de Emergência na página 332](#)). O rádio transmite com o microfone automaticamente não silenciado/aberto durante o tempo selecionado no campo Período de Tx do microfone ativo. O rádio fica no modo normal de Chamada de emergência. Isto também é conhecido como Emergência com voz a seguir.

Quando o pressionamento longo da tecla do campo Emergência não estiver definido como **0**, o modo Chamada de emergência é encerrado com o pressionamento longo do botão Emergência.

Disponível para: ASTRO e MDC – sistemas convencionais.

AVISO:

O campo Tipo de emergência do perfil atual deve ser definido como **Alarme e chamada**. Caso contrário, essa seleção se torna inválida.

Em Personalidades convencionais que usam o Microfone ativo, é necessário definir um valor maior do que o Período de Tx do microfone ativo no Contador de tempo limite de transmissão. Caso contrário a transmissão do Microfone ativo será interrompida quando o Contador de tempo limite expirar.

OBSERVAÇÃO:

As configurações [Tentativas Polidas na página 334/Tentativas Não Polidas na página 334](#) são ignoradas ao entrar no estado Microfone ativo. Quando o Microfone ativo ou o estado de chamada de emergência é finalizado, os valores dos campos Tentativas polidas/Tentativas não polidas são restaurados para o canal do perfil/rádio.

Emergência via Áudio silencioso

Ao iniciar o modo Emergência com o pressionamento do botão Emergência, após apenas uma transmissão não polida de alarme de emergência, essa seleção faz com que o rádio entre automaticamente no modo Emergência com o microfone silenciado/fechado. Esta transmissão continua pelo período de tempo especificado no campo Período de Tx de áudio silencioso. O rádio fica no modo normal de Chamada de emergência.

Quando o pressionamento longo da tecla do campo Emergência não estiver definido como **0**, o modo Chamada de emergência é encerrado com o pressionamento longo do botão Emergência.

Disponível para: ASTRO – somente sistemas convencionais.

AVISO:

O campo Tipo de emergência do perfil atual deve ser definido como **Alarme e chamada**. Caso contrário, essa seleção se torna inválida.

Personalidades convencionais que usam este recurso devem definir um valor maior do que o [Período de transmissão de áudio silencioso na página 336](#) para o Contador de tempo limite. Caso contrário, a transmissão será interrompida quando o Contador de tempo limite expirar.

OBSERVAÇÃO:

As configurações [Tentativas Polidas na página 334/Tentativas Não Polidas na página 334](#) são ignoradas ao entrar no estado Áudio silencioso. Quando o estado Áudio silencioso ou Chamada de emergência é finalizado, os valores dos campos Tentativas polidas/Tentativas não polidas são restaurados para o canal do perfil/rádio.

10.22.1.10

Período de transmissão de mic. direto

Este campo seleciona o período de tempo durante o qual o rádio é ativado automaticamente e transmite enquanto opera no modo de emergência de Microfone ativo (consulte Modo de transmissão automática de emergência).

Esta seleção se aplica ao [Perfis de emergência convencionais na página 331](#) atual.

INFORMAÇÕES:

Personalidades convencionais que usam este recurso devem definir um valor maior do que o [Período de transmissão de áudio silencioso na página 336](#) para o Contador de tempo limite. Caso contrário, a transmissão será interrompida quando o Contador de tempo limite expirar.

Acessado apenas: Quando o campo [Tipo de Emergência na página 332](#) estiver definido como **Alarme e Ligação** e quando o campo [Modo de transmissão automática de emergência na página 335](#) estiver definido como **Emergência de Mic. Direto**.

INFORMAÇÕES:

A versão mais antiga do codeplug deve usar os parâmetros abaixo:

Acima 135: Alcance

Mínimo	Máximo	Incrementos
10 seconds	120 segundos	10 seconds

INFORMAÇÕES:

Aplicável à versão 19.00.00 ou posterior do codeplug:

Acima 136: Alcance

Mínimo	Máximo	Incrementos
1 segundos	120 segundos	10 seconds

10.22.1.11

Período de transmissão de áudio silencioso

Esse campo seleciona o tempo durante o qual o rádio automaticamente ativará e transmitirá enquanto opera no Modo ativar emergência, **Emergência via áudio silencioso**.

Consulte [Modo de transmissão automática de emergência na página 335](#).

Essa seleção se aplica aos [Perfis de emergência convencionais na página 331](#) atuais e só é possível para sistemas de sinalização ASTRO.

Acessado apenas: Quando o campo [Tipo de Emergência na página 332](#) definido como **Alarme e Ligação** e quando o campo [Modo de transmissão automática de emergência na página 335](#) estiver definido como **Emergência via Áudio Silencioso**.

Acima 137: Alcance

Mínimo	Máximo	Incremento
1 segundos	5 segundos	1 segundos

Acima 138: Alcance

Mínimo	Máximo
1 segundos	5 segundos

10.22.1.12

Ativação do multiplicador de transmissão

Este campo faz com que o valor do fator multiplicador de transmissão selecionado seja dobrado, o que em seguida determina por quanto tempo o rádio automaticamente continua a acionar e transmitir uma chamada de emergência não polida (consulte Tipo de emergência).

Esta seleção se aplica ao [Perfis de emergência convencionais na página 331](#) atual.

10.22.1.13

Fator Multiplicador de Transmissão

Este campo seleciona por quanto tempo o rádio automaticamente continua a acionar e transmitir uma Chamada de emergência não polida (consulte Tipo de emergência).

Este tempo inicia somente quando o rádio esgotar as [Tentativas Polidas na página 334](#) de Emergência e as [Tentativas Não Polidas na página 334](#) sem receber uma confirmação.

Esta seleção se aplica ao [Perfis de emergência convencionais na página 331](#) atual.

INFORMAÇÕES:

Quando o campo Modo de Rádio Remoto estiver definido como **Rastreamento de Rádio** ou **Monitor de Rádio**, este número será multiplicado pelo Tempo de Base de Transmissão para dar um valor em segundos.

As seleções a seguir são

Acima 139: Alcance

Mínimo	Máximo
0	3

10.22.1.14

Emergência, encontre-me

O recurso Emergência, encontre-me fornece uma indicação que notifica você quando alguém nas proximidades tem uma ativação de emergência.

Quando este recurso estiver ativado, você poderá executar as seguintes ações:

- Transmitir um sinal de BLE (Bluetooth Low Energy, bluetooth de baixa energia) a cada dois segundos enquanto o rádio estiver no recurso de Emergência.
- Receber sinais de emergência e visualizar a notificação de Sinal recebido.
- Receber um tom de alerta quando algum sinal tiver sido recebido nos últimos dez segundos.
- Entrar na opção de menu para visualizar todos os sinais de recepção.
- Ignorar a notificação para parar de receber os tons e exibir.

Para ativar o recurso Emergência, encontre-me, você deve ativar os campos **Ativação da transmissão** e **Ativação da recepção** na seção Emergência, encontre-me do perfil de emergência convencional.

10.22.1.15

Ativação da transmissão

Quando esse campo está ativado, o rádio pode transmitir o sinal de Emergência, encontre-me durante uma emergência.

A transmissão do sinal de Emergência, encontre-me é acionada por meio do recurso Emergência, pressionando a chave ou botão de emergência e emergência de Alerta de queda (Man Down). Quando você entra em emergência, nenhuma ação adicional é necessária. Quando o rádio entra no modo de emergência, o Bluetooth é ligado automaticamente e os sinais são enviados. Os sinais de Emergência são enviados a cada dois segundos enquanto o rádio está no modo de emergência.

Para obter mais informações sobre o recurso Emergência, encontre-me, consulte [Emergência, encontre-me na página 337](#).

Acessado apenas: Quando o rádio está ativado para o modelo/para a opção.

10.22.1.16

Ativação da recepção

Quando esse campo é ativado, o rádio recebe o sinal de Emergência, encontre-me durante uma emergência.

Quando você muda para um canal no qual a opção Recepção de sinal está ativada, o Bluetooth é ativado automaticamente. Quando você recebe um sinal de emergência, o rádio emite um tom e exibe *Sinal recebido* no widget de controle do Rádio do visor superior e do visor dianteiro. O rádio continua a reproduzir um tom a cada dez segundos enquanto recebe sinais ativamente.

Se o receptor ignorar a notificação ou se nenhum sinal for recebido por quatro minutos, a notificação de Sinal recebido desaparecerá. Se vários sinais estiverem disponíveis, o visor mostra o ID ou o alias do dispositivo que tiver entrado em emergência mais recentemente.

Para obter mais informações sobre o recurso Emergência, encontre-me, consulte [Emergência, encontre-me na página 337](#).

OBSERVAÇÃO:

Em rádios APX padrão com visor frontal, você pode usar o menu para visualizar o ID do rádio transmissor e o nível do RSSI (Received Signal Strength Indicator, indicador de intensidade do sinal recebido) do Bluetooth.

Nos RÁDIOS APX NEXT, você pode ignorar o sinal tocando em **DISPENSAR** na notificação. Você também pode exibir a lista de remetentes tocando em **DETALHES**.

Acessado apenas: Quando o rádio está ativado para o modelo/para a opção.

10.22.1.17

Ativação remota de emergência

Este campo seleciona a funcionalidade específica do recurso Ativação de emergência remota para o Perfil de emergência definido no momento. Esse recurso permitirá que um rádio de origem (codificação) ative o recurso Emergência em um rádio de destino (decodificação) por meio da comunicação aérea como se o usuário de destino pressionasse o botão Emergência.

Esse campo só é válido quando o rádio é compatível com o modelo ou opção com operação Convencional APCO 25 e/ou Entroncamento APCO 25.

As seleções a seguir são compatíveis:

Desativado

Nenhuma funcionalidade de Ativação de emergência remota está selecionada.

Apenas codificação

Um rádio só tem permissão para iniciar comunicações de Emergência remota para um rádio de destino.

Apenas decodificação

Um rádio só tem permissão para receber comunicações de Emergência remota de um rádio de origem e, ao decodificar as comunicações, o rádio iniciará imediatamente o recurso de Emergência.

Codificação e decodificação

Um rádio pode iniciar comunicações de Emergência remota para um rádio de destino e receber comunicações de Emergência remota de um rádio de origem.

OBSERVAÇÃO:

Este campo está desativado por padrão.

10.22.2

MDC

Esta seção permite visualizar ou modificar os recursos do MDC - emergência convencional para perfis de emergência convencionais individuais.

OBSERVAÇÃO:

Os recursos e as configurações de Todas as emergências se aplicam a esses perfis.

Perfis de Emergência Convencionais são selecionados pelo campo Seleção de Perfil de Emergência convencional do sistema.

Sistemas convencionais tipo MDC são referidos como Personalidades convencionais no campo Sistema não ASTRO.

É possível iniciar a funcionalidade do modo de emergência por meio de um rádio programado ou iniciando o recurso.

10.22.2.1

Campainha lateral PTT-ID de emergência

Esse campo permite que um tom de alerta seja emitido ao transmitir um ID de PTT de emergência e quando o rádio estiver em modo emergência.

O tom de alerta soa assim que o botão PTT é pressionado e continuará até que o ID de PTT de Emergência tenha sido transmitido. Durante este breve tempo, o microfone do rádio e, portanto, a transmissão de voz, são automaticamente desativados. Quando o tom de alerta é interrompido, é para notificar que o alto-falante do rádio está pronto para aceitar voz para transmissão.

Esta seleção se aplica ao [Perfis de emergência convencionais na página 331](#) atual.

AVISO:

Este recurso se aplica somente quando o campo ID de PTT de Emergência não ASTRO está ativado na Personalidade Convencional que referencia o Sistema Convencional que referencia este Perfil de emergência Convencional.

Acessado apenas: quando o campo [Tipo de Emergência na página 332](#) estiver definido como **Alarme e chamada**.

10.22.2.2

Tempo base de Tx do Monitor remoto de emergência

Este campo seleciona um número usado pelo rádio para calcular o período de tempo em que o rádio automaticamente ativa no modo Monitor remoto de emergência do MDC.

Quando este tempo de transmissão tiver expirado, o rádio então será desativado pelo período de tempo definido pelo [Tempo base de recepção do monitor remoto de emergência na página 340](#). Esta função se aplica ao Perfil de emergência convencional atual. O tempo é medido em segundos.

INFORMAÇÕES:

O rádio usa o valor do Multiplicador de transmissão (entregue ao rádio em uma Confirmação de chamada de emergência **Conf** ou em um Comando de monitor remoto enviado pelo transmissor) multiplicado por este Tempo base de transmissão para determinar o período de tempo de transmissão do Monitor remoto de emergência.

E se o Multiplicador global (entregue ao rádio em uma Confirmação de chamada de emergência **Conf**, ou em um Comando de monitor remoto enviado pelo transmissor) estiver definido como **Verdadeiro**, o tempo calculado dessa transmissão será dobrado.

Acessado apenas: Quando o campo Tipo de emergência estiver definido como **Alarme e chamada** e quando o rádio estiver habilitado para o modelo/a opção.

Acima 140: Alcance

Mínimo	Máximo	Incrementos
10 s	120 s	10 s

10.22.2.3

Tempo base de recepção do monitor remoto de emergência

Esse campo seleciona um número usado pelo rádio para calcular o período de tempo em que o rádio é automaticamente desativado e aguarda no modo Monitor remoto de emergência.

Este tempo de recepção/espera é iniciado quando o [Tempo base de Tx do Monitor remoto de emergência na página 340](#) expira. Esta função se aplica ao Perfil de emergência convencional atual. O tempo é medido em segundos.

INFORMAÇÕES:

O rádio usa o valor do Multiplicador de recepção (entregue ao rádio dentro de uma Confirmação de chamada de emergência **Conf**, ou dentro de um Comando de monitor remoto enviado pelo despachador) multiplicado por este Tempo base de recepção para determinar o período de tempo de recepção/espera do Monitor remoto de emergência.

E se o Multiplicador global (entregue ao rádio em uma Confirmação de chamada de emergência **Conf** ou em um Comando de monitor remoto enviado pelo despachador) estiver definido como **Verdadeiro**, o tempo de recepção/espera calculado será dobrado.

Acessado apenas: Quando o campo Tipo de emergência estiver definido como **Alarme e chamada** e quando o rádio estiver habilitado para o modelo/a opção.

Acima 141: Alcance

Mínimo	Máximo	Incrementos
10 s	120 s	10 s

10.22.2.4

Ativação do Monitor Remoto de Emergência

Esse campo permite a operação do Monitor remoto no modo emergência.

O Monitor remoto de emergência ocorre no rádio quando um dos dois cenários a seguir se concretiza. Primeiro, quando um Alarme de emergência (consulte a seção Alarme e chamada em [Tipo de Emergência na página 332](#)) é recebido com sucesso pelo despachador/console e um Reconhecimento de alarme de emergência é recebido no rádio. Segundo, quando um Comando de monitor remoto do MDC é recebido (pelo rádio) durante o modo emergência. Quando o rádio está no modo Monitor remoto de emergência, ele automaticamente ativa e transmite o áudio ambiente a partir de seu microfone "ativo". Esta função se aplica aos [Perfis de emergência convencionais na página 331](#) atuais.

AVISO:

O campo [Tipo de Emergência na página 332](#) deve ser definido como **Alarme e chamada** para que esta seleção seja válida.

INFORMAÇÕES:

Os comandos "Conf" e "Comando do monitor remoto" contêm um valor Multiplicador de transmissão, um valor Multiplicador de recepção e um Multiplicador global (definidos como **Verdadeiro** ou **Falso**). Esses valores são definidos pelo despachador/console.

O rádio usa o Multiplicador de transmissão (entregue pelo comando Conf ou Monitor Remoto) multiplicado pelo Tempo base de transmissão programado para determinar o período de tempo desta transmissão pelo microfone "ativo". Se o Multiplicador global (entregue pelos Comandos Conf ou Monitor Remoto) for definido como **Verdadeiro**, o tempo de transmissão calculado será dobrado.

Quando este tempo de transmissão expirar, o rádio será desativado pelo tempo de recepção/espera específico. Este tempo de recepção/espera é determinado multiplicando o Multiplicador de recepção (entregue pelos Comandos Conf ou Monitor Remoto) pelo Tempo de Base de Recepção programado. Novamente, se o Multiplicador global (entregue pelos Comandos Conf ou Monitor remoto) for definido como **Verdadeiro**, o tempo de recepção/espera calculado será dobrado.

Quando os períodos de tempo de transmissão e de recepção/espera tiverem decorrido, o rádio entrará em uma sequência de Alarme de emergência (consulte Tipo de emergência **Alarme e chamada**).

O ciclo do Monitor remoto de emergência começa novamente quando um Reconhecimento do alarme de emergência for recebido pelo rádio ou um Comando de Monitor remoto for recebido pelo rádio (durante o modo Emergência).

Esse ciclo do Monitor remoto de emergência é encerrado pelo despachador enviando um Reconhecimento de alarme de emergência com um valor **0** de Multiplicador de transmissão e um valor **0** de Multiplicador de recepção (também conhecido como **Valores do console de despacho**) ou quando você pressiona o botão PTT que é detectado pelo rádio.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.22.3

Lista de Tons de Emergência

Essa seção permite visualizar ou modificar os recursos Acionador do modo de emergência e Tom de alerta para Perfis de emergência convencionais individuais.

OBSERVAÇÃO:

Os recursos e as configurações de Todas as emergências se aplicam a esses perfis.

Perfis de Emergência Convencionais são selecionados pelo campo Seleção de Perfil de Emergência convencional do sistema.

Sistemas convencionais tipo MDC são referidos como Personalidades convencionais no campo Sistema não ASTRO.

É possível iniciar a funcionalidade do modo de emergência por meio de um rádio programado ou iniciando o recurso.

10.22.3.1

Acionador

Esse campo seleciona a condição ou o acionador que inicia o modo Emergência no Perfil de emergência convencional atual.

Dependendo do tipo de Tom de emergência selecionado, o Volume mínimo do tom, o Período do tom e o Roteamento de áudio também podem ser configurados no mesmo registro/linha da Lista de tons de emergência.

Acessado apenas: Quando o campo Acionador para usuário com problemas não estiver definido como **Desativado**, e quando o campo Acionador de tom de Man Down estiver **Ativado**, e quando o rádio estiver habilitado para modelo/opção.

A seleção a seguir é suportada:

Man Down

Uma condição de Usuário com Problemas inicia o Modo de Emergência no atual [Perfis de emergência convencionais na página 331](#).

Aplica-se apenas: Quando o campo [Ativar Man Down na página 335](#) está Ativado no atual Perfil de Emergência Convencional.

10.22.3.2

Tom

Esse campo seleciona o tipo de tom de alerta que será emitido quando uma transmissão do modo Emergência for iniciada com a seleção do acionador correspondente.

Esta seleção se aplica ao Perfil de Emergência Convencional atual.

Acessado apenas: Quando o campo Acionador de Man Down não estiver definido como **Desabilitado**, quando o campo Acionador do tom de emergência de Man Down estiver habilitado e quando o modelo ou a opção do rádio for compatível.

As seleções a seguir são compatíveis:

Tom de emergência existente

São usados o Tom de alerta de emergência existente e os níveis de áudio.

Tom de emergência crítico

O Tom de alerta de emergência crítico é reproduzido. Volume mínimo do tom, Período do tom e Roteamento de áudio também devem ser definidos.

10.22.3.3

Volume mínimo do tom

Esse campo seleciona o nível mínimo de áudio para soar o tom de alerta do modo Emergência correspondente.

Se o valor for maior do que o atual volume do rádio, ele será usado. Caso contrário, o volume atual do rádio será usado. Esta função se aplica aos [Perfis de emergência convencionais na página 331](#) atuais.

Acessado apenas: Quando o campo [Tom na página 342](#) estiver definido como **Tom de emergência crítica** e quando o modelo ou a opção do rádio for compatível.

Acima 142: Alcance

Mínimo	Máximo	Incrementos
0	255	1

10.22.3.4

Período do tom

Esse campo permite selecionar o Tom de alerta do modo Emergência especificado para um tom temporário ou repetitivo.

O usuário pode determinar o contador periódico do tom repetitivo. Esta função se aplica ao Perfil de emergência convencional atual.

Acessado apenas: Quando o campo [Tom na página 342](#) estiver definido como **Tom de emergência crítica** e quando o modelo ou a opção do rádio for compatível.

OBSERVAÇÃO:

Quando definido como **0-Uma vez** (tempo zero), o tom de alerta especificado no campo Tom soa apenas uma vez enquanto o modo Emergência estiver ativo.

Acima 143: Alcance

Mínimo	Máximo	Incremento
5	255	1

10.22.3.5

Roteamento de áudio

Esse campo seleciona o roteamento do tom de alerta e áudio de entrada para um alto-falante específico quando uma transmissão do modo Emergência começa por meio da seleção do acionador correspondente.

Essa seleção se aplica ao Conjunto do perfil de emergência convencional atual.

Acessado apenas: Quando o campo [Tom na página 342](#) estiver definido como **Tom de Emergência Crítica**, e quando o campo [Período do tom na página 343](#) não estiver definido como **Uma vez**, e quando o rádio estiver habilitado para modelo/opção.

As seleções a seguir são compatíveis:

Roteamento de áudio normal

O Tom do Alerta e todos os áudios recebidos são encaminhados conforme a seleção do áudio do alto-falante do rádio (veja também Roteamento de Áudio do Alto-falante e o botão Redirecionamento de Áudio Bluetooth)

Roteamento de áudio do alto-falante interno

O Tom de alerta e todos os áudios recebidos são encaminhados para o alto-falante interno do rádio, independentemente de algum acessório externo que esteja conectado ou da seleção de canal atual do Roteamento de áudio do alto-falante.

10.22.4

Opções de Compatibilidade de Emergência

Essa seção destina-se à interoperabilidade do sistema Harris.

Ela permite controlar o cancelamento da chamada de emergência (por você, console ou ambos) e reiniciar o microfone ativo.

OBSERVAÇÃO:

Os recursos e as configurações de [Emergências na página 324](#) se aplicam a esses perfis. Perfis de Emergência Convencionais são selecionados pelo campo Seleção de Perfil de Emergência convencional do sistema.

Sistemas Convencionais são referenciados como Personalidades Convencionais pelo campo Sistema ASTRO ou o campo Sistema Não ASTRO; somente o ASTRO e o MDC têm capacidade para as transmissões no modo de emergência.

É possível iniciar a funcionalidade do modo de emergência por meio de um rádio programado ou iniciando o recurso.

10.22.4.1

Controle de saída de emergência

Esse campo permite que a configuração do rádio saia da emergência por meio de uma ação sua, do console ou de ambos.

As seleções a seguir são compatíveis:

Somente rádio

Valor padrão

Somente console

Selecionável se a Operação de emergência estiver definida para Alarme de Emergência e Chamada, o Tipo de Sistema for DVRS e o Tipo de Sinal for ASTRO.

Rádio e console

Selecionável se a Operação de emergência estiver definida para Alarme de Emergência e Chamada, o Tipo de Sistema for DVRS e o Tipo de Sinal for ASTRO.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.22.4.2

Reinicialização de emergência do microfone ativo

Esse campo permite que o áudio do microfone ativo seja retransmitido ao pressionar o botão de emergência durante uma emergência.

Acessado apenas: Quando o campo [Tipo de Emergência na página 332](#) estiver definido como **Alarme e chamada**, quando o campo Tipo de sistema estiver definido como **DVRS**, quando o campo Tipo de sinal/voz de recepção e Tipo de sinal/voz de transmissão estiver definido como **ASTRO** e quando o modelo ou a opção do rádio for compatível.

10.23

Perfis de emergência de entroncamento

Os **Perfis de emergência de entroncamento** permitem visualizar ou modificar a funcionalidade Entroncamento — modo de emergência.

As transmissões de emergência têm muitas configurações programadas possíveis. Uma variedade de perfis de emergência pode ser criada. Os dois tipos de protocolo de comunicações de entroncamento, **ASTRO 25** e **Tipo II**, podem fazer transmissões no modo de emergência.

10.23.1

Geral

Esta seção permite visualizar ou modificar as funções de emergência de entroncamento de perfis de emergência de entroncamento individuais.

Os dois tipos de protocolo de comunicações de entroncamento, **ASTRO 25** e **Tipo II**, podem fazer transmissões no modo de emergência.

OBSERVAÇÃO:

Os recursos e as configurações de [Emergências na página 324](#) se aplicam a esses perfis. Os Perfis de emergência de entroncamento são selecionados do campo Seleção do perfil de emergência da personalidade de entroncamento.

É possível iniciar a funcionalidade do modo de emergência por meio de um rádio programado ou iniciando o recurso.

10.23.1.1

Nome dos perfis de emergência

Esse campo permite criar nomes reconhecíveis para o Perfil de emergência de entroncamento atual.

Os Perfis de emergência de entroncamento são selecionados do campo Seleção do perfil de emergência da personalidade de entroncamento.

OBSERVAÇÃO:

Exemplos: EMT-001, #500, Electric1, # A5.

É possível usar caracteres, números, espaços e caracteres especiais.

São permitidos no máximo 14 caracteres.

10.23.1.2

Operação de emergência

Esse campo seleciona a funcionalidade de rádio desejada que ocorrerá quando você iniciar o modo de emergência.

Essa seleção se aplica ao Perfil de emergência de entroncamento atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Somente alarme

Com o pressionamento do botão Emergência, um pacote de Alarme de emergência é transmitido ao operador de despacho. O pacote de alarme de emergência é repetido até que uma confirmação seja recebida ou até que o número de tentativas especificado pelo Contador de tentativas esgote. O tipo de confirmação esperado é controlado pelo campo **Confirmação obrigatória do console**.

Somente chamada

Com o pressionamento do botão Emergência, o rádio entra no modo Chamada de emergência. Nesse modo, as suas solicitações PTT e as transmissões de voz ou as de outros rádios

são marcadas como Emergência e recebem prioridade de nível de emergência no Grupo de conversação de entroncamento atual.

Alarme e chamada

Com o pressionamento do botão Emergência, quando a sequência do Alarme de emergência tiver sido reconhecida ou as repetições tiverem se esgotado, o rádio entrará no modo Chamada de emergência.

10.23.1.3

Contador de novas tentativas

Esse campo seleciona quantas vezes o alarme de emergência é transmitido quando a confirmação "Conf" de uma transmissão de alarme de emergência bem-sucedida não for recebida.

OBSERVAÇÃO:

Para uma chamada de Entroncamento normal, se o rádio não obtiver êxito em enviar uma transmissão, ele tentará novamente por uma sequência de ISD (Inbound Signal Data, dados de sinal de entrada) antes de desistir. Para Alarmes de emergência, o rádio tenta novamente pelo número de sequências de ISD selecionadas para o contador.

Essa seleção se aplica ao Perfil de emergência de entroncamento atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 144: Alcance

Mínimo	Máximo	Incrementos
1	255	1

OBSERVAÇÃO:

Quando definido como **Infinito**, o Número de rediscagens é ilimitado.

10.23.1.4

Confirmação de console obrigatória

Esse campo faz com que uma resposta adicional de confirmação do console ("confirmação do console") seja obrigatória.

Quando um alarme de emergência é enviado, o rádio sempre requer uma confirmação do Equipamento de rede fixo (FNE). Essa função requer uma confirmação adicional do aplicativo de despacho. Uma confirmação de FNE certifica que o site atual do rádio recebeu o pacote de alarme de emergência. O recebimento de confirmação do console garante que o aplicativo de despacho esteja exibindo a condição de emergência ao distribuidor. Quando a confirmação do console é recebida, o rádio toca um tom de alerta de quatro bips. Essa seleção se aplica ao Perfil de emergência de entroncamento atual.

INFORMAÇÕES:

Esta função deve ser desativada para **Emergência de microfone ativo** ou **Emergência via áudio silencioso** para funcionar adequadamente.

Acessado apenas: Quando o campo Operação de emergência estiver definido como **Somente alarme** ou **Alarme e chamada** e quando o rádio estiver habilitado para o modelo/a opção.

10.23.1.5

Talkback de emergência

Seleciona o canal de transmissão/tipo de canal desejado (tático ou não tático) que o rádio usa enquanto opera no modo Emergência.

Essa seleção se aplica ao Perfil de emergência de entroncamento atual.

INFORMAÇÕES:

Ao entrar no modo de emergência a partir de um Grupo de notificação ou um Reagrupamento dinâmico, o Grupo de conversação da reversão de resposta de emergência (da Personalidade de entroncamento que faz referência a esse Perfil de emergência de entroncamento) é usado para essas transmissões, independentemente de o campo estar definido como Emergência **tática** ou Emergência não tática de **reversão**.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Tático

Alarmes de emergência e chamadas de emergência são transmitidos no canal/grupo de conversação atualmente selecionado do rádio.

Isso também é conhecido como Emergência tática.

AVISO:

A tática não funciona se o canal atual de Entroncamento do rádio tiver seu campo Modo de transmissão definido como **TG/AG desativados**.

Reversão (não tático)

Alarmes de emergência e chamadas de emergência são transmitidos em um canal específico. Este canal é determinado pela seleção do campo Tipo de reversão de emergência da Personalidade de entroncamento que referencia este Perfil de emergência de entroncamento.

OBSERVAÇÃO:

Isso também é conhecido como Emergência não tática.

10.23.1.6

Reverter ID do PTT

Esse campo faz com que o Grupo de conversação da reversão de resposta de emergência da Personalidade de entroncamento, que faz referência a esse Perfil de emergência de entroncamento, use o tipo de conversação "PTT-ID" durante o modo Chamada de emergência.

Essa seleção se aplica ao Perfil de emergência de entroncamento atual.

Quando desativado e em operação no modo Chamada de emergência, se a Personalidade de entroncamento que faz referência a esse Perfil de emergência estiver usando o Tipo de conversa "Transmissão", o rádio forçará o Tipo de conversa "ID de PTT". Essa seleção se aplica ao Perfil de emergência de entroncamento atual ou ao Grupo de notificação selecionado desta personalidade.

OBSERVAÇÃO:

Essa função também é conhecida como "ID de PTT padrão".

AVISO:

Essa função se aplica somente quando o campo Talkback de emergência está definido como **Reverter**.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.23.1.7

Mudança no Canal de Saída de Emergência

Este campo permite que o rádio saia da Emergência na mudança do modo.

10.23.1.8

Ativar Man Down

Este campo ativa a operação Man Down do Modo de emergência para o Perfil de emergência de entroncamento atual.

Acessado apenas: Quando o campo Acionador de Man Down não estiver definido como **Desativado**, e quando o campo Nível de configuração de Man Down estiver definido como **Por perfil de emergência** e quando o rádio estiver habilitado para o modelo/a opção.

10.23.1.9

Modo de transmissão automática de emergência

Esse campo seleciona uma operação de transmissão adicional e específica de modo de emergência para o Perfil de emergência de entroncamento atual.

Microfone ativo de emergência ou Áudio silencioso de microfone ativo são opções possíveis.

AVISO:

Quando esse recurso não estiver desativado, a funcionalidade selecionada substituirá/melhorará a função de emergência descrita na seleção "Alarme e chamada" do campo **Operação de emergência**.

Acessado apenas: Para modelos de rádio com R16.00.00 ou versão do software posterior, quando o campo [Operação de emergência na página 345](#) estiver definido como **Alarme e chamada** e quando o campo [Confirmação de console obrigatória na página 346](#) estiver **Desativado** e quando o campo [Reverter ID do PTT na página 347](#) estiver **Ativado**.

As seleções a seguir são compatíveis:

Desabilitado

Nenhuma funcionalidade adicional de Transmissão automática está selecionada.

Microfone ativo de emergência

Quando o modo de emergência for iniciado ao pressionar o botão Emergência e, em seguida, uma confirmação do alarme de emergência retornar ao rádio (pelo operador/console) ou todas as tentativas de alarme forem esgotadas, a Emergência de microfone ativo fará com que o rádio ative e transmita automaticamente uma Chamada de emergência. O rádio faz a transmissão com o microfone que permanece automaticamente não silenciado/aberto durante o período selecionado no campo **Período de Tx de microfone ativo**. O rádio fica no modo normal de Chamada de emergência. Isto também é conhecido como Emergência com voz a seguir.

Quando o pressionamento longo da tecla do campo Emergência não estiver definido como **0**, o modo Chamada de emergência é encerrado com o pressionamento longo do botão Emergência.

OBSERVAÇÃO:

Isso também é conhecido como "Emergência de entroncamento com voz a seguir".

AVISO:

Outro pressionamento do botão de Emergência não reinicia outra transmissão de Microfone ativo de emergência. O Modo de emergência deve ser fechado e reiniciado para que a transmissão de Microfone de "ativação automática" ocorra novamente.

*A saída do modo de emergência é realizada por meio de uma duração do pressionamento de teclas longo do botão Emergência ou desligando-se o rádio.

Emergência via Áudio silencioso

Quando o modo de emergência for iniciado ao se pressionar o botão Emergência e, em seguida, uma confirmação do alarme de emergência retornar ao rádio (pelo operador/console) ou todas as tentativas de alarme forem esgotadas, o rádio será automaticamente ativado nesse modo de emergência, e seu microfone permanecerá mudo/fechado. Esta transmissão continua pelo período

de tempo especificado no campo Período de Tx de áudio silencioso. O rádio fica no modo normal de Chamada de emergência.

Quando o pressionamento longo da tecla do campo Emergência não estiver definido como **0**, o modo Chamada de emergência é encerrado com o pressionamento longo do botão Emergência.

INFORMAÇÕES:

Disponível SOMENTE para comunicações de entroncamento ASTRO 25.

10.23.1.10

Período de transmissão de mic. direto

Esse campo seleciona a fração de tempo que o rádio usa para ativar/transmitir automaticamente durante a operação "Emergência de mic. direto".

Seleciona uma operação de transmissão específica de modo de emergência para o Perfil de emergência de entroncamento atual.

Acessado apenas: Quando o campo Modo de transmissão automática de emergência estiver definido como **Emergência de mic. direto**, e quando o campo Operação de emergência for **Alarme e chamada**, e quando o campo Reverter ID de PTT estiver **Ativado**, e quando o campo Reconhecimento de console obrigatório estiver **Desativado**, e quando o rádio estiver habilitado para modelo/opção.

INFORMAÇÕES:

A versão mais antiga do codeplug deve usar os parâmetros abaixo:

Acima 145: Alcance

Mínimo	Máximo	Incremento
10 seconds	120 segundos	10 seconds

INFORMAÇÕES:

Aplicável à versão 19.00.00 ou posterior do codeplug:

Acima 146: Alcance

Mínimo	Máximo	Incremento
1 segundos	120 segundos	10 seconds

10.23.1.11

Período de transmissão de áudio silencioso

Esse campo seleciona a fração de tempo que o rádio usa para ativar/transmitir automaticamente (com seu microfone permanecendo fechado/silencioso) durante a operação **Emergência via áudio silencioso**.

Seleciona uma operação de transmissão específica de modo de emergência para o Perfil de emergência de entroncamento atual.

Acessado apenas: Quando o campo Modo de transmissão automática de emergência estiver definido como **Emergência via áudio silencioso**, e quando o campo Operação de emergência for **Alarme e chamada**, e quando o campo Reverter ID de PTT estiver **Ativado**, e quando o campo Reconhecimento de console obrigatório estiver **Desativado**, e quando o rádio estiver habilitado para modelo/opção.

Acima 147: Alcance

Mínimo	Máximo
1 s	5 s

10.23.1.12

Emergência, encontre-me

O recurso Emergência, encontre-me fornece uma indicação que notifica você quando alguém nas proximidades tem uma ativação de emergência.

Quando este recurso estiver ativado, você poderá executar as seguintes ações:

- Transmitir um sinal de BLE (Bluetooth Low Energy, bluetooth de baixa energia) a cada dois segundos enquanto o rádio estiver no recurso de Emergência.
- Receber sinais de emergência e visualizar a notificação de Sinal recebido.
- Receber um tom de alerta quando algum sinal tiver sido recebido nos últimos dez segundos.
- Entrar na opção de menu para visualizar todos os sinais de recepção.
- Ignorar a notificação para parar de receber os tons e exibir.

Para ativar o recurso Emergência, encontre-me, você deve ativar os campos **Ativação da transmissão** e **Ativação da recepção** na seção Emergência, encontre-me do perfil de emergência de entroncamento.

10.23.1.13

Ativação da transmissão

Quando esse campo está ativado, o rádio pode transmitir o sinal de Emergência, encontre-me durante uma emergência.

A transmissão do sinal de Emergência, encontre-me é acionada por meio do recurso Emergência, pressionando a chave ou botão de emergência e emergência de Alerta de queda (Man Down). Quando você entra em emergência, nenhuma ação adicional é necessária. Quando o rádio entra no modo de emergência, o Bluetooth é ligado automaticamente e os sinais são enviados. Os sinais de Emergência são enviados a cada dois segundos enquanto o rádio está no modo de emergência.

Para obter mais informações sobre o recurso Emergência, encontre-me, consulte [Emergência, encontre-me na página 350](#).

Acessado apenas: Quando o rádio está ativado para o modelo/para a opção.

10.23.1.14

Ativação da recepção

Quando esse campo é ativado, o rádio recebe o sinal de Emergência, encontre-me durante uma emergência.

Quando você muda para um canal no qual a opção Recepção de sinal está ativada, o Bluetooth é ativado automaticamente. Quando você recebe um sinal de emergência, o rádio emite um tom e exibe *Sinal recebido* no widget de controle do Rádio do visor superior e do visor dianteiro. O rádio continua a reproduzir um tom a cada dez segundos enquanto recebe sinais ativamente.

Se o receptor ignorar a notificação ou se nenhum sinal for recebido por quatro minutos, a notificação de Sinal recebido desaparecerá. Se vários sinais estiverem disponíveis, o visor mostra o ID ou o alias do dispositivo que tiver entrado em emergência mais recentemente.

Para obter mais informações sobre o recurso Emergência, encontre-me, consulte [Emergência](#), encontre-me na página 350.

OBSERVAÇÃO:

Em rádios APX padrão com visor frontal, você pode usar o menu para visualizar o ID do rádio transmissor e o nível do RSSI (Received Signal Strength Indicator, indicador de intensidade do sinal recebido) do Bluetooth.

Nos RÁDIOS APX NEXT, você pode ignorar o sinal tocando em **DISPENSAR** na notificação. Você também pode exibir a lista de remetentes tocando em **DETALHES**.

Acessado apenas: Quando o rádio está ativado para o modelo/para a opção.

10.23.1.15

Ativação remota de emergência

Este campo seleciona a funcionalidade específica do recurso Ativação de emergência remota para o Perfil de emergência definido no momento. Esse recurso permitirá que um rádio de origem (codificação) ative o recurso Emergência em um rádio de destino (decodificação) por meio da comunicação aérea como se o usuário de destino pressionasse o botão Emergência.

Esse campo só é válido quando o rádio é compatível com o modelo ou opção com operação Convencional APCO 25 e/ou Entroncamento APCO 25.

As seleções a seguir são compatíveis:

Desativado

Nenhuma funcionalidade de Ativação de emergência remota está selecionada.

Apenas codificação

Um rádio só tem permissão para iniciar comunicações de Emergência remota para um rádio de destino.

Apenas decodificação

Um rádio só tem permissão para receber comunicações de Emergência remota de um rádio de origem e, ao decodificar as comunicações, o rádio iniciará imediatamente o recurso de Emergência.

Codificação e decodificação

Um rádio pode iniciar comunicações de Emergência remota para um rádio de destino e receber comunicações de Emergência remota de um rádio de origem.

OBSERVAÇÃO:

Este campo está desativado por padrão.

10.23.2

Lista de Tons de Emergência

Essa seção permite visualizar ou modificar os recursos Acionador do modo de emergência e Tom de alerta em Perfis de emergência de entroncamento individuais.

OBSERVAÇÃO:

Os recursos e as configurações de [Emergências na página 324](#) se aplicam a esses perfis. Os Perfis de emergência de entroncamento são selecionados do campo Seleção do perfil de emergência da personalidade de entroncamento.

É possível iniciar a funcionalidade do modo de emergência por meio de um rádio programado ou iniciando o recurso.

10.23.2.1

Acionador

Esse campo seleciona a condição/acionador que inicia o modo Emergência no Perfil de emergência de entroncamento atual.

Dependendo do tipo de Tom de emergência selecionado, o Volume mínimo do tom, o Período do tom e o Roteamento de áudio também podem ser configurados no mesmo registro/linha da Lista de tons de emergência.

Acessado apenas: Quando o campo Acionador de Man Down não estiver definido como **Desabilitado**, quando o campo Acionador do tom de emergência de Man Down estiver definido como **Habilitado**, e quando o modelo ou a opção do rádio for compatível.

As seleções a seguir são compatíveis:

Man Down

Uma condição de Usuário com Problemas inicia o Modo de Emergência no atual Perfil de Emergência de Entroncamento.

Aplica-se apenas: Quando o campo Habilitar Usuário com Problemas é **Ativado** no atual Perfil de Emergência de Entroncamento.

10.23.2.2

Tom

Esse campo seleciona o tipo de tom de alerta que será emitido quando uma transmissão do modo Emergência for iniciada com a seleção do acionador correspondente.

Essa seleção se aplica ao Perfil de emergência de entroncamento atual.

Acessado apenas: Quando o campo Acionador para usuário com problemas não estiver definido como **Desativado**, e quando o campo Acionador de tom de Man Down estiver **Ativado**, e quando o rádio estiver habilitado para modelo/opção.

Tom de emergência existente

São usados o Tom de alerta de emergência existente e os níveis de áudio.

Tom de emergência crítico

O Tom de alerta de emergência crítico é reproduzido. Volume mínimo do tom, Período do tom e Roteamento de áudio também devem ser definidos.

10.23.2.3

Volume mínimo do tom

Esse campo seleciona o nível mínimo de áudio para soar o tom de alerta do modo Emergência correspondente.

Se este valor for maior do que o atual volume do rádio, ele será usado; caso contrário, o volume atual do rádio é que será usado. Essa função se aplica ao Perfil de emergência de entroncamento atual.

Acessado apenas: Quando o campo Tom estiver definido como **Tom de emergência crítico** e quando o rádio estiver habilitado para o modelo/a opção.

Acima 148: Alcance

Mínimo	Máximo	Incrementos
0	255	1

10.23.2.4

Período do tom

Esse campo seleciona se o tom de alerta do modo Emergência especificado será um tom temporário ou repetitivo.

Você pode determinar o temporizador periódico do tom repetitivo.

Essa função se aplica ao Perfil de emergência de entroncamento atual.

Acessado apenas: Quando o campo Tom estiver definido como **Tom de emergência crítico** e quando o rádio estiver habilitado para o modelo/a opção.

OBSERVAÇÃO:

Quando definido como **0 = Uma vez** (tempo zero), o tom de alerta especificado no campo Tom é reproduzido apenas uma vez enquanto o modo Emergência está ativo.

Acima 149: Alcance

Mínimo	Máximo	Incrementos
5	255	1

10.23.2.5

Roteamento de áudio

Esse campo seleciona o roteamento do tom de alerta e do áudio de entrada para um alto-falante específico quando uma transmissão do modo Emergência é iniciada com a seleção do acionador correspondente.

Essa seleção se aplica ao Perfil de emergência de entroncamento atual.

Acessado apenas: Quando o campo Tom estiver definido como **Tom de emergência crítico**, e quando o campo Período de tom não estiver definido como **Uma vez**, e quando o rádio estiver habilitado para modelo/opção.

Roteamento de áudio normal

O Tom de alerta e todos os áudios recebidos são transferidos de acordo com as seleções de roteamento de áudio do alto-falante atual do rádio.

Roteamento de áudio do alto-falante interno

O Tom do alerta e todos os áudios recebidos são encaminhados para o alto-falante interno do rádio, seja qual for o acessório externo conectado ou a atual seleção de canal do Roteamento de áudio do alto-falante.

10.23.3

Opções de Compatibilidade de Emergência

Essa seção destina-se à interoperabilidade do sistema Harris.

Ela permite controlar o cancelamento da chamada de emergência (por você, console ou ambos) e reiniciar o microfone ativo.

OBSERVAÇÃO:

Os recursos e as configurações de [Emergências na página 324](#) se aplicam a esses perfis. Os Perfis de emergência de entroncamento são selecionados do campo Seleção do perfil de emergência da personalidade de entroncamento.

É possível iniciar a funcionalidade do modo de emergência por meio de um rádio programado ou iniciando o recurso.

10.23.3.1

Controle de saída de emergência

Esse campo permite que a configuração do rádio saia da emergência por meio de uma ação sua, do console ou de ambos.

As seleções a seguir são compatíveis:

Somente rádio

Valor padrão

Somente console

Selecionável caso o campo Operação de emergência esteja definido como **Somente chamada** ou **Alarme e chamada de emergência**, no sistema de entroncamento P25, e caso Recursos de propriedade da Motorola esteja desabilitado.

Rádio e console

Selecionável caso o campo Operação de emergência esteja definido como **Somente chamada** ou **Alarme e chamada de emergência**, no sistema de entroncamento P25, e caso Recursos de propriedade da Motorola esteja desabilitado.

Supervisor

Selecionável caso o campo Operação de emergência esteja definido como **Somente chamada** ou **Alarme e chamada** no sistema de entroncamento P25, Recursos de propriedade da Motorola esteja desativado e a Seleção de perfil DVRS seja **DVRS desabilitado**. Para o rádio duplo, a Seleção de rádio é definida como **Radio independente** ou **Rádio principal**.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.23.3.2

Reinicialização de emergência do microfone ativo

Esse campo permite que o áudio do microfone ativo seja retransmitido ao pressionar o botão de emergência durante uma emergência.

Acessado apenas: Quando o campo [Tipo de Emergência na página 332](#) estiver definido como **Somente chamada**, **Alarme e chamada**, quando o campo Modo de transmissão automática de emergência estiver definido como **Emergência de microfone Ativo**, quando o campo Tipo de sistema estiver definido como **ASTRO 25**, quando o campo Recursos de propriedade da Motorola estiver desabilitado e quando o modelo ou a opção do rádio for compatível.

10.24

Todos os dados

Esta seção permite visualizar ou modificar as configurações de dados que se aplicam a todos os perfis de dados.

Os Perfis de dados são definidos para comunicarem dados de rádio nos canais Convencional ou de Entroncamento e por uma rede de Banda larga LTE.

INFORMAÇÕES:

Os Perfis de dados são selecionados pelo campo Seleção do perfil de dados do sistema de entroncamento ou pelo campo Seleção do perfil de dados do sistema convencional.

Nas comunicações Convencionais, os Perfis de dados se aplicam apenas aos Sistemas convencionais que têm o campo Tipo de sistema definido como **ASTRO**.

Nas comunicações de Entroncamento, os Perfis de dados se aplicam apenas aos Sistemas de entroncamento que têm o campo Tipo de sistema definido como **ASTRO 25**.

10.24.1

Geral

Esta seção permite visualizar ou modificar as configurações de dados que se aplicam a todos os perfis de dados.

INFORMAÇÕES:

Os Perfis de dados são selecionados pelo campo Seleção do perfil de dados do sistema de entroncamento ou pelo campo Seleção do perfil de dados do sistema convencional.

Nas comunicações Convencionais, os Perfis de dados se aplicam apenas aos Sistemas convencionais que têm o campo Tipo de sistema definido como **ASTRO**.

Nas comunicações de Entroncamento, os Perfis de dados se aplicam apenas aos Sistemas de entroncamento que têm o campo Tipo de sistema definido como **ASTRO 25**.

10.24.1.1

Interceptações SNMP

Quando este campo for selecionado, ele ativa a geração de interceptação SNMP (Simple Network Management Protocol) pelo link serial.

Essa função se aplica a todos os Perfis de dados.

Quando não estiver selecionado, o rádio não gerará interceptações, exceto se solicitado via MIB (Management Information Base, base de informações de gerenciamento) do registro de interceptação.

10.24.1.2

Tom de alerta de desativação de contexto

Este campo permite que o rádio emita um tom de alerta quando uma sessão de dados for encerrada.

Uma sessão de dados é considerada ativa quando as comunicações forem estabelecidas. Essa função se aplica a todos os Perfis de dados.

10.24.1.3

Eco ICMP

Este campo permite que o rádio envie de volta uma confirmação (Conf) quando uma solicitação de eco (ping) ICMP (Internet Control Message Protocol) for recebida.

Para rádios APX NEXT e APX N70, esse recurso se aplica apenas a dados LMR.

Essa função se aplica a todos os Perfis de dados.

10.24.1.4

Tipo 1 de atribuição do endereço IP da pessoa remota

Este campo seleciona o método de atribuição do Endereço IP (Internet Protocol) atribuído à extremidade da SU (Subscriber Unit, unidade de rádio) do link serial 1.

Essa função se aplica a todos os casos, exceto aos Sistemas convencionais que possuam um Perfil de dados selecionado. Quando um Sistema convencional tem um Perfil de dados selecionado, o

Sistema convencional usa o Endereço IP da pessoa remota definido no campo Endereço IP da pessoa remota do Perfil de dados.

OBSERVAÇÃO:

Ao atribuir um endereço IP, certifique-se de que ele não entre em conflito com qualquer outro endereço IP ou Sub-rede utilizada pelo rádio. Dispositivos externos, como Wi-Fi , Modem de dados externos e Si500, podem atribuir Endereços IP a algumas interfaces. Se endereços IP ou Sub-redes conflitantes estiverem em uso, não será possível garantir que as funções de dados funcionem corretamente.

169. 254. X. X. A sub-rede está reservada para o recurso Clonagem zona a zona, portanto, nenhum endereço IP pode começar com 169. 254. X. X. caso contrário, este campo ficará inválido.

As seleções a seguir são compatíveis:

Dinâmico

O rádio atribui o Endereço IP da pessoa remota ao MC no estabelecimento do link serial.

Estático

O MC insere um Endereço IP a ser usado no estabelecimento do link serial. Esta seleção se aplica somente aos links seriais baseados em RS-232/PPP.

10.24.1.5

Exibição do conteúdo de TMS direto

Este campo permite que o rádio acesse diretamente sua caixa de entrada do TMS (Text Messaging Service, serviço de mensagens de texto) e veja imediatamente o conteúdo da mensagem de texto sem sua interação.

Essa função se aplica a todos os Perfis de dados.

OBSERVAÇÃO:

O ícone de **Não lido** do visor será removido assim que o conteúdo da mensagem de texto for exibido.

Quando o rádio está neste estado de exibição e recebe outra mensagem de texto, a tela é atualizada para exibir a mensagem mais recente recebida. Você ainda pode navegar para outras mensagens na caixa de entrada do rádio.

O rádio sai desse estado quando há uma alteração de modo, quando você inicia outro recurso de configuração do Menu ou quando você pressiona o botão **Início** ou seleciona o menu programável **Sair**.

Quando desativado, você deve seguir os procedimentos padrão de TMS para acessar mensagens de texto na caixa de entrada do rádio.

10.24.1.6

Sub-rede do Rádio Interno

Este campo permite definir a sub-rede do rádio interno (três primeiros octetos) do Endereço IP usado na inicialização do rádio para estabelecer comunicações internas entre o rádio e a Placa opcional.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

Essa seleção se aplica às comunicações de Banda Larga.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Os valores a seguir são compatíveis:

- Os três octetos desta Sub-rede de Endereço IP devem estar no intervalo de 193.0.0 a 207.255.255.

- Essa sub-rede de endereço IP não pode ser igual aos três primeiros octetos de quaisquer outros endereços IP definidos para o rádio. Caso contrário, o aplicativo considera esse valor inválido.
- Este Valor Padrão da Sub-rede = 199.0.0

10.24.1.7

Relatórios do Sensor de Medição

Esse campo permite que o rádio processe mensagens de dados do sensor.

É obrigatório quando o rádio troca informações de dados do sensor com um servidor de dados do sensor dentro de uma infraestrutura de comunicação Convencional e de Entroncamento. Essa função se aplica a todos os rádios.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.24.1.8

Ativação confirmada do relatório de eventos acionados por armas

Este recurso permite que eventos acionados por armas sejam transmitidos no canal de controle.

Acessado apenas: Quando o rádio for compatível com o modelo/a opção e quando o campo Relatório de medição do sensor estiver ativado.

10.24.2

LTE

A seção LTE (Long Term Evolution, evolução em longo prazo) permite visualizar ou definir a funcionalidade LTE.

Essas configurações se aplicam a todos os Tipos de Perfil de dados — perfis de dados **Banda larga**.

INFORMAÇÕES:

Os Perfis de dados são selecionados pelo campo Seleção do perfil de dados do sistema de entroncamento ou pelo campo Seleção do perfil de dados do sistema convencional.

Nas comunicações Convencionais, os Perfis de dados se aplicam apenas aos Sistemas convencionais que têm o campo Tipo de sistema definido como **ASTRO**.

Nas comunicações de Entroncamento, os Perfis de dados se aplicam apenas aos Sistemas de entroncamento que têm o campo Tipo de sistema definido como **ASTRO 25**.

10.24.2.1

Limite de Tempo Fora de Faixa de LTE

Este campo seleciona a quantidade de tempo em que um sinal de Banda larga LTE é perdido antes de determinar que o rádio está fora de alcance da cobertura de LTE.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

Essa seleção se aplica a todos os Perfis de Dados do Tipo Perfil de Dados de banda Larga. O tempo é medido em segundos.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Essa seleção só está disponível na Visualização de Especialistas (consulte Visualização do Codeplug).

Acima 150: Alcance

Mínimo	Máximo
60 (segundos)	3600 (segundos)

10.24.2.2

Dados em roaming

Os dados em roaming permitem que o usuário habilite os dados do usuário (não anexar) em roaming.

10.24.2.3

Nome do ponto de acesso

Este campo permite definir nomes reconhecíveis usados pelo rádio para uma conexão LTE Classe 3.

**AVISO:**

O valor neste campo deve ser modificado somente por uma Equipe de serviço qualificada mediante a solicitação da operadora de LTE. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

**AVISO:**

Esse valor só deve ser modificado pelos técnicos do campo mediante solicitação pela operadora de LTE.

Essa seleção se aplica a todos os Perfis de Dados do Tipo Perfil de Dados de banda Larga.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Essa seleção só está disponível na Visualização de Especialistas (consulte Visualização do Codeplug).

10.24.3

Wi-Fi

Esta seção permite visualizar ou modificar as configurações de Wi-Fi que se aplicam a todos os Perfis de dados.

**INFORMAÇÕES:**

Os Perfis de dados são selecionados pelo campo Seleção do perfil de dados do sistema de entroncamento ou pelo campo Seleção do perfil de dados do sistema convencional.

Nas comunicações Convencionais, os Perfis de dados se aplicam apenas aos Sistemas convencionais que têm o campo Tipo de sistema definido como **ASTRO**.

Nas comunicações de Entroncamento, os Perfis de dados se aplicam apenas aos Sistemas de entroncamento que têm o campo Tipo de sistema definido como **ASTRO 25**.

Por motivos de segurança, será possível atribuir modelos e importar arquivos *.csv se você inserir as senhas corretas de cada entrada de rede na tabela de Wi-Fi. Os usuários devem também inserir as senhas corretas no aplicativo independente para tarefas de clonagem/ clonagem expressa e programação em lote.

10.24.3.1

Wi-Fi Ativado

Este campo especifica se o Wi-Fi está ativado ou desativado no rádio.

Essa função se aplica a todos os Perfis de dados.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.24.3.2

Permitir controle do usuário

Esse campo permite que o usuário controle o Wi-Fi.

Essa função se aplica a todos os Perfis de dados.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.24.3.3

Prioridade de Rede

Este campo define a prioridade das redes Wi-Fi disponíveis.

Quanto menor o número, maior a prioridade.

Acessado apenas: Quando o campo [Wi-Fi Ativado na página 358](#) estiver **Ativado** e o rádio estiver habilitado para o modelo/a opção.

Acima 151: Alcance

Mínimo	Máximo	Incrementos
1	255	1

10.24.3.4

SSID da Rede

Este campo especifica o nome da rede (SSID) de uma rede Wi-Fi na lista de redes configuradas.

**OBSERVAÇÃO:**

O SSID não pode ser salvo se for deixado em branco ou vazio.

O SSID deve ter caracteres ASCII. SSIDs duplicados não são aceitos.

Acessado apenas: Quando o campo [Wi-Fi Ativado na página 358](#) estiver **Ativado** e o rádio estiver habilitado para o modelo/a opção.

10.24.3.5

Tipo de segurança

Este campo especifica o protocolo de segurança usado para a rede Wi-Fi.

As seleções a seguir são compatíveis:

- **NENHUMA**
- **WEP**
- **WPA2/WPA**

Acessado apenas: Quando o campo [Wi-Fi Ativado na página 358](#) estiver **Ativado** e o rádio estiver habilitado para o modelo/a opção.

10.24.3.6

Senha de rede criptografada

A senha de 63 caracteres para a rede Wi-Fi.

OBSERVAÇÃO:

Para o **WEP** de Tipo de segurança, a senha terá 5 ou 13 caracteres. Para todos os outros tipos, a senha terá ao menos 8 caracteres e não poderá ficar em branco ou nula. Para todos os tipos de segurança, ASCII são permitidos.

Unidade do Assinante (SU) suporta configuração de chave WEP no modo ASCII para a segurança do WEP. Portanto, a configurações ASCII WEP40 (chave de 5 caracteres tais como "abcde") ou WEP104 (chave de 13 caracteres tais como "1234567890123") são compatíveis para SU. A SU não dá suporte para a configuração de chave Hexadecimal WEP.

Acessado apenas: Quando o campo [Wi-Fi Ativado na página 358](#) estiver **Ativado**, o [Tipo de segurança na página 359](#) for qualquer valor diferente de **Nenhum** e o rádio estiver habilitado para o modelo/a opção.

10.24.4

Lista NAT

Essa seção permite visualizar ou definir até 16 conjuntos de regras de NAT (Network Address Translation, conversão de endereço de rede) baseadas em portas estáticas para a lista de NAT.

Essas configurações se aplicam a todos os [Perfis de Dados na página 369](#) de entroncamento ou a todos os [Perfis de Dados na página 369](#) convencionais quando Perfil de dados, campo Ativar NAT estiver definido como **Habilitado**.

INFORMAÇÕES:

Quando qualquer um dos 5 recursos a seguir estiver ativado, uma das 16 regras de NAT possíveis (registro/linhas) será usada pelo RadioCentral:

- Serviço de mensagem de texto (TMS)
- Automatic Registration Service (ARS): veja o campo Modo ARS
- [Ativação de localização na página 118](#)
- OTAR (Over-The-Air-Rekeying): veja o campo OTAR habilitado

Os Perfis de dados são selecionados pelo campo Seleção do perfil de dados do sistema de entroncamento ou pelo campo Seleção do perfil de dados do sistema convencional.

Nas comunicações Convencionais, os Perfis de dados se aplicam apenas aos Sistemas convencionais que têm o campo Tipo de sistema definido como **ASTRO**.

Nas comunicações de Entroncamento, os Perfis de dados se aplicam apenas aos Sistemas de entroncamento que têm o campo Tipo de sistema definido como **ASTRO 25**.

10.24.4.1

Porta LAN

Este campo seleciona a Porta LAN (Local Area Network, rede de área local) para a regra de NAT atual (registro/linha) da Lista NAT.

Exemplo: A conversão NAT estática pode encaminhar todas as solicitações externas que chegam na porta 90 do rádio para a porta 80 do MC. Nesse exemplo, o Endereço IP NAT estático seria o Endereço IP do MC, a Porta LAN seria a porta do MC (80), e a porta WAN seria a porta externa do rádio (90).

Aplica-se apenas:

- Para todos Perfis de Dados - Entroncamento

- A todos os Perfis de dados convencionais quando o campo Ativar NAT de perfis de dados for **Ativado**.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 152: Alcance

Mínimo	Máximo
1	65535

AVISO:

O padrão "0" será considerado inválido pelo Gerenciamento do Rádio e deverá ser definido de forma adequada.

10.24.4.2

Endereço IP NAT estático

Este campo seleciona o endereço IP da LAN de NAT que fornece um mapeamento entre os Endereços IP do aplicativo interno ou do MC e os Endereços IP atribuídos pelo sistema.

Esta seleção se aplica à regra de NAT atual (registro/linha) da Lista NAT.

Exemplo: A conversão NAT estática pode encaminhar todas as solicitações externas que chegam na porta 90 do rádio para a porta 80 do MC. Nesse exemplo, o Endereço IP NAT estático seria o Endereço IP do MC, a Porta LAN seria a porta do MC (80), e a porta WAN seria a porta externa do rádio (90).

Aplica-se apenas:

- A todos os Perfis de dados - Entroncamento
- A todos os Perfis de dados convencionais quando o campo Ativar NAT de perfis de dados estiver **Ativado**

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

Cada Octeto do Endereço IP deve estar entre: [0-223] . [0-255] . [0-255] . [0-255]

AVISO:

O Padrão de 0.0.0.0 será considerado inválido pelo Gerenciador de rádio e deverá ser definido adequadamente.

10.24.4.3

Porta WAN

Este campo seleciona a Porta WAN (Wide Area Network, rede de área ampla) para a regra de NAT atual (registro/linha) da Lista NAT.

Exemplo: A conversão NAT estática pode encaminhar todas as solicitações externas que chegam na porta 90 do rádio para a porta 80 do computador móvel. Nesse exemplo, o Endereço IP NAT estático seria o Endereço IP do MC, a Porta LAN seria a porta do MC (80), e a porta WAN seria a porta externa do rádio (90).

Aplica-se apenas:

- A todos os Perfis de dados - Entroncamento
- A todos os Perfis de dados convencionais quando o campo Ativar NAT de perfis de dados estiver **Ativado**

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 153: Alcance

Mínimo	Máximo
1	65535

AVISO:

O padrão "0" será considerado inválido pelo Gerenciamento do Rádio e deverá ser definido de forma adequada.

10.24.5

Configuração do protocolo de dados

Esta seção permite visualizar ou modificar as configurações relacionadas aos algoritmos de compressão de cabeçalho IP (Internet Protocol).

Essas seleções se aplicam a todos os Perfis de Dados.

INFORMAÇÕES:

Os Perfis de dados são selecionados pelo campo Seleção do perfil de dados do sistema de entroncamento ou pelo campo Seleção do perfil de dados do sistema convencional.

Nas comunicações Convencionais, os Perfis de dados se aplicam apenas aos Sistemas convencionais que têm o campo Tipo de sistema definido como **ASTRO**.

Nas comunicações de Entroncamento, os Perfis de dados se aplicam apenas aos Sistemas de entroncamento que têm o campo Tipo de sistema definido como **ASTRO 25**.

AVISO:

Essas configurações devem ser modificadas quando necessário por Equipe de serviço qualificada. A falha em definir com precisão a Configuração do protocolo de dados pode comprometer seriamente o desempenho do rádio e/ou do sistema.

10.24.5.1

Nº máximo de contextos de compressão de cabeçalho não TCP IP

Esse campo seleciona o número máximo de contextos de compressão de cabeçalho não TCP IP (Transmission Control Protocol/Internet Protocol) permitido por assinante.

As diretrizes estão de acordo com o documento RFC2507 criado e mantido pela IETF (Internet Engineering Task Force). O documento RFC2507 descreve padrões para algoritmos de compactação de cabeçalho de IP. Essa seleção se aplica a todos os perfis de dados.

AVISO:

Esse campo deve ser modificado somente quando necessário pelo pessoal de serviço qualificado. A falha em definir com precisão a Configuração do protocolo de dados pode comprometer seriamente o desempenho do rádio e/ou do sistema.

Acima 154: Alcance

Mínimo	Máximo
0	16

10.24.5.2

Nº máximo de cabeçalhos compactados entre cabeçalhos inteiros

Esse campo seleciona o número máximo de cabeçalhos compactador não TCP IP (Transmission Control Protocol - Internet Protocol) enviados entre cabeçalhos completos.

As diretrizes estão de acordo com o documento RFC2507 criado e mantido pela IETF (Internet Engineering Task Force). O documento RFC2507 descreve padrões para algoritmos de compactação de cabeçalho de IP. Essa seleção se aplica a todos os perfis de dados.

**AVISO:**

Esse campo deve ser modificado somente quando necessário pelo pessoal de serviço qualificado. A falha em definir com precisão a Configuração do protocolo de dados pode comprometer seriamente o desempenho do rádio e/ou do sistema.

Acima 155: Alcance

Mínimo	Máximo	Incrementos
0	4080	16

10.24.5.3

Tamanho máximo de cabeçalho permitido para compressão

Esse campo seleciona o tamanho máximo do cabeçalho que pode ser compactado para compressão de cabeçalho.

As diretrizes estão de acordo com o documento RFC2507 criado e mantido pela IETF (Internet Engineering Task Force). O documento RFC2507 descreve padrões para algoritmos de compactação de cabeçalho de IP. Essa seleção se aplica a todos os perfis de dados.

**AVISO:**

Esse campo deve ser modificado somente quando necessário pelo pessoal de serviço qualificado. A falha em definir com precisão a Configuração do protocolo de dados pode comprometer seriamente o desempenho do rádio e/ou do sistema.

Acima 156: Alcance

Mínimo	Máximo
60	255

10.24.5.4

Tempo máximo entre cabeçalhos completos

Este campo seleciona o tempo máximo entre contextos de compressão de cabeçalhos completos.

Os cabeçalhos não TCP compactados não podem ser enviados com essa quantidade de tempo expirada depois do envio do último cabeçalho completo. As diretrizes estão de acordo com o documento RFC2507 criado e mantido pela IETF (Internet Engineering Task Force). O documento RFC2507 descreve padrões para algoritmos de compactação de cabeçalho de IP. Essa seleção se aplica a todos os perfis de dados. O tempo é medido em segundos.

**AVISO:**

Esse campo deve ser modificado somente quando necessário pelo pessoal de serviço qualificado. A falha em definir com precisão a Configuração do protocolo de dados pode comprometer seriamente o desempenho do rádio e/ou do sistema.

Acima 157: Alcance

Mínimo	Máximo	Incrementos
0 (segundos)	1275 (segundos)	5 (segundos)

10.24.5.5

Tempo máximo de configuração para acesso de canal controlado

Esse campo seleciona o tempo necessário para acessar o canal de dados do pacote de acesso de canal controlado para transmissão de dados em slots.

O rádio usa esse campo para determinar se o tempo de acesso ao canal de dados do pacote pode atrasar a transmissão além do slot necessário. Se isso ocorrer, os procedimentos de acesso de canal controlado não serão iniciados. Essa seleção se aplica a todos os perfis de dados. O tempo é medido em milissegundos.

AVISO:

Esse campo deve ser modificado somente quando necessário pelo pessoal de serviço qualificado. A falha em definir com precisão a Configuração do protocolo de dados pode comprometer seriamente o desempenho do rádio e/ou do sistema.

Acima 158: Alcance

Mínimo	Máximo
0 (ms)	65535 (ms)

10.24.5.6

Variação da fonte do tempo

Esse campo seleciona a quantidade de tempo (microslots), antes e depois do microslot zero, durante a qual duas fontes de relógio que geram o tempo de transmissão de sincronização estão desalinhadas.

Todo esse período é considerado uma janela de vulnerabilidade durante a qual transmissões de sincronização podem conter informações com falha ou imprecisas. Todas as transmissões de sincronização recebidas durante esse período são ignoradas pelo processador de sinal digital (DSP, Digital Signal Processor) e não são usadas para estabelecer ou manter a sincronização com a hora do sistema. Essa seleção se aplica a todos os perfis de dados.

AVISO:

Esse campo deve ser modificado somente quando necessário pelo pessoal de serviço qualificado. A falha em definir com precisão a Configuração do protocolo de dados pode comprometer seriamente o desempenho do rádio e/ou do sistema.

Acima 159: Alcance

Mínimo	Máximo	Incrementos
0 (microslots)	268 (microslots)	2 (microslots)

OBSERVAÇÃO:

Um microslot corresponde a 7,5 milissegundos.

10.24.6

Configuração de porta

Essa seção permite visualizar ou definir as configurações usadas na transferência de chaves entre um KVL (Key Variable Loader, carregador variável de chave) e um rádio. Essas configurações se aplicam a todos os Perfis de Dados.

INFORMAÇÕES:

Os Perfis de dados são selecionados pelo campo Seleção do perfil de dados do sistema de entroncamento ou pelo campo Seleção do perfil de dados do sistema convencional.

Nas comunicações de Entroncamento, os Perfis de dados se aplicam apenas aos Sistemas de entroncamento que têm o campo Tipo de sistema definido como **ASTRO 25**.

10.24.6.1

Porta UDP de autenticação

Esse campo seleciona o número da porta UDP para a porta usada para comunicação com o KVL (Key Variable Loader, carregador variável de chave).

Um KVL é usado para fornecer Chaves de autenticação para o rádio. Essa função se aplica a todos os sistemas de entroncamento APCO P25 (ASTRO 25).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 160: Alcance

Mínimo	Máximo
49152	65535

10.24.6.2

Porta UDP de Relatórios de Localização do P25

Este campo seleciona o número de porta de UDP (User Datagram Protocol) para o Servidor de localização ao qual o rádio escuta e para o qual transmite os dados de Relatórios de localização P25.

Esse recurso se aplica a todos os Sistemas de entroncamento ASTRO 25 (APCO P25).

AVISO:

Esta seleção só é válida quando não for igual ao valor da Porta UDP de autenticação, Porta LAN, Porta WAN, Porta de destino PAD, Porta OTAR do rádio, Porta UDP do KMF ou a Porta do servidor KMF/OTAR (64414) e quando não for igual aos valores reservados para a Porta UDP utilizados por qualquer outro serviço, da seguinte forma:

- Aplicação do agente SNMP 0161 – OBTER/DEFINIR
- Agente SNMP 0162 - Interceptações relatadas
- Porta de Loopback UDP 4000 (para testes internos)
- Aplicação de Serviços de Posição 4001 na Plataforma de Núcleo Global
- Aplicação de Diagnóstico 4002 - para lidar com diagnóstico entregues por componentes internos do rádio a um Computador Móvel.
- Aplicação do Sistema 4003 - disponibiliza serviços para acessar funções internas da unidade do rádio, tais como teclas de função, visores, comunicações, etc.
- Um número de porta "proxy" 4004 que o Aplicativo do sistema inicia em nome de um aplicativo de terceiro executado em um dispositivo periférico não compatível com IP.
- Servidor PN 4005 (ARS)
- Servidor DHCP 4006 (Dynamic Host Configuration Protocol)
- Serviço de Mensagens de Texto APCO 4007
- Resposta de Solicitação de Diagnóstico UDP 4011
- Transmissão de Diagnóstico UDP 4012
- Aplicação OTAR 4050
- Enviar/receber mensagens de Autenticação de usuário 49223

Acessado apenas: Quando o campo Ativação de localização estiver habilitado, o campo Relatório de Localização P25 estiver habilitado e o rádio estiver habilitado para o modelo/a opção.

Acima 161: Alcance

Mínimo	Máximo
1	65535

10.24.6.3

Porta UDP do relatório de medição do sensor

Esse campo seleciona o número de porta UDP (User Datagram Protocol, protocolo de datagrama do usuário) para o servidor de dados do sensor do qual o rádio escuta e transmite os dados de Relatório do sensor.

Esse campo se aplica à infraestrutura de comunicação Convencional e de Entroncamento.

OBSERVAÇÃO:

Esse campo será aplicável quando [Relatórios do Sensor de Medição na página 357](#) estiver habilitado.

O valor da Porta UDP do relatório de gerenciamento do sensor não deve ser igual a qualquer valor destes campos (RadioCentral configurável): Porta LAN, Porta WAN, Porta UDP de autenticação, Porta UDP do relatório de Localização P25, Porta TCP da programação sem fio, Número da porta, Porta OTAR do rádio, Porta UDP do KMF e Porta de destino PAD.

Acima 162: Alcance

Mínimo	Máximo
49625	65535

Acessado apenas: quando o rádio for compatível com o modelo/opção e o campo Relatório de medição do sensor estiver ativado.

10.24.6.4

Porta UDP de Carregamento de Chave KVL

Este campo permite inserir o número da porta UDP (User Datagram Protocol, protocolo de datagrama para o usuário) para o carregamento de chave KVL (Key-Variable Loader, carregador variável de chave).

AVISO:

O valor da porta UDP de carregamento de chave KVL não deve ser igual a nenhum dos campos a seguir:

- [Porta LAN na página 360](#)
- [Porta WAN na página 361](#)
- [Porta UDP de autenticação na página 365](#)
- [Porta UDP de Relatórios de Localização do P25 na página 365](#)
- [Porta TCP de Programação Sem Fio](#)
- [Número da porta na página 395](#)
- [Porta OTAR do rádio na página 322](#)
- [Porta UDP do KMF na página 322](#)
- [Porta de Destino PAD na página 381](#)
- [Porta UDP do relatório de medição do sensor na página 366](#)

Acima 163: Alcance

Mínimo	Máximo	Incremento
49152	65535	1

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Software**, e quando o [Fonte de Carregamento de Chave na página 295](#) estiver definido como **KVL**, e quando o rádio for compatível com o modelo/a opção.

10.25

Lista de usuários dos dados

Esta seção permite visualizar ou definir o Automatic Registration Service e os nomes de usuários e IDs de unidades de autenticação do usuário a serem selecionados para uso quando são necessárias credenciais de login de servidor alternativo.

Além disso, os IDs de rádio alvo (consulte Sistema convencional – ASTRO – IDs individuais e Sistema de entroncamento – ASTRO 25 – IDs de unidades) também podem ser definidos para seleção. Esses

nomes de usuários e IDs de unidades e de rádios são usados em aplicativos relacionados a dados, como o serviço de mensagens de texto.

**OBSERVAÇÃO:**

Os valores padrão de Nomes de usuário e ID de unidade podem ser programados.

Os perfis de dados podem ser selecionados pelo campo Seleção do perfil de dados do sistema de entroncamento.

Os perfis de dados podem ser selecionados pelo campo Seleção do perfil de dados do sistema convencional.

O pressionamento do botão Usuário e a seleção do menu Usuário permitem o login em um servidor Automatic Registration Service ou um servidor UNS (Unified Network Services, serviços de rede unificada) de autenticação do usuário com a combinação apropriada de nome de usuário, PIN/senha e ID de unidade. Os nomes de usuários, os PINs e os IDs de unidades devem ser inseridos manualmente pelo teclado do rádio.

10.25.1

Nome do Usuário dos Dados

Este campo permite visualizar ou definir o Automatic Registration Service e os nomes de usuários e IDs de unidades de autenticação do usuário a serem selecionados para uso quando são necessárias credenciais de login de servidor alternativo.

Além disso, os IDs de rádio alvo (consulte Sistema convencional – ASTRO – IDs individuais e Sistema de entroncamento – ASTRO 25 – IDs de unidades) também podem ser definidos para seleção. Esses Nomes de usuário, IDs de Unidade e de IDs de Rádio são usados para aplicativos relacionados a dados, como o serviço de Mensagens de Texto.

**OBSERVAÇÃO:**

Os valores padrão de Nomes de usuário e ID de unidade podem ser programados.

Os perfis de dados podem ser selecionados pelo campo Seleção do perfil de dados do sistema de entroncamento.

Os perfis de dados podem ser selecionados pelo campo Seleção do perfil de dados do sistema convencional.

O pressionamento do botão Usuário e a seleção do menu Usuário permitem o login em um servidor Automatic Registration Service ou um servidor UNS (Unified Network Services, serviços de rede unificada) de autenticação do usuário com a combinação apropriada de nome de usuário, PIN/senha e ID de unidade. Os nomes de usuários, os PINs e os IDs de unidades devem ser inseridos manualmente pelo teclado do rádio.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

**OBSERVAÇÃO:**

Exemplos: EMT-001, #500, DATAUSER 1, # A5

A a Z, a a z, 0 a 9, -, *, #, &, \$, /, +, % e espaço podem ser usados para Nomes de usuário.

São permitidos no máximo 40 caracteres.

O número mínimo de entradas na Lista é 1, e o máximo, 100.

10.26

Conjunto Lista de mensagens de texto rápidas

O conjunto **Lista de mensagens de texto rápidas** permite visualizar ou definir mensagens rápidas de texto/consulta que contêm informações usadas com frequência no Serviço de mensagens de texto. O usuário do rádio poderá selecionar uma mensagem na lista de Mensagens rápidas de texto/consulta e transmitir a mensagem com o mínimo de esforço. Depois de selecionadas, as mensagens rápidas

de texto/consulta podem ser editadas pelo usuário do rádio antes da transmissão (desde que o Serviço de mensagens de texto esteja definido como **Ilimitado**). As edições se aplicam apenas a essa transmissão. A mensagem original permanece conforme definida na Lista de mensagens de texto rápidas. Uma Consulta TMS (Text Messaging Service, Serviço de mensagens de texto) permite ao usuário do rádio especificar informações em um modelo de consulta pré-formatado, enviando-as como uma mensagem a um servidor de consulta; o servidor então responde com uma mensagem de texto que contém as informações solicitadas.

Acessado apenas: Quando o Serviço de consulta TMS está disponível apenas com Autenticação do usuário de fator único ou duplo e o Modo SmartMessaging está definido como **LMR**.

OBSERVAÇÃO:

O recurso de TMS é habilitado conforme o Sistema de entroncamento ou Sistema convencional.

O usuário do rádio deve acessar a mensagem de texto pressionando o botão Serviço de mensagens de texto ou selecionando o menu Serviço de mensagens de texto.

Pressionar os botões Texto rápido de TMS e Consulta TMS permite o acesso direto do usuário do rádio aos recursos Texto rápido e Mensagem de consulta.

O campo a seguir é suportado:

10.26.1

Mensagem de texto rápida

Este campo permite visualizar ou definir Texto rápido/Mensagens de consulta que contém informações usadas com frequência no Serviço de mensagens de texto.

Desse modo, é possível selecionar na lista de Mensagens de texto rápidas/de consulta e transmitir a mensagem com o mínimo de esforço.

Depois de selecionadas, você pode editar as mensagens rápidas de texto/consulta antes da transmissão (desde que o Serviço de mensagens de texto esteja definido como **Ilimitado**). As edições se aplicam apenas a essa transmissão. A original permanece conforme definida. Uma consulta TMS permite especificar informações em um modelo de consulta pré-formatado, enviando-as como uma Mensagem a um Servidor de consulta. Em seguida, o servidor responde com uma mensagem de texto que contém as informações solicitadas.

Acessado apenas: Quando o rádio está habilitado para modelo/opção e quando o Serviço de consulta TMS está apenas disponível com Autenticação de usuário de Fator único ou duplo.

OBSERVAÇÃO:

A função Serviço de mensagens de texto é ativada no [Sistema de entroncamento](#) ou no [Sistema convencional na página 408](#).

É possível acessar mensagens de texto pressionando o botão [Serviço de mensagens de texto](#) ou selecionando o menu [Serviço de mensagens de texto na página 219](#).

Pressionar o botão [Texto rápido de TMS na página 191](#) e [Consulta TMS na página 190](#) permite acesso direto aos recursos Texto rápido e Mensagem de consulta. Os valores padrão de Nomes de usuário e ID de unidade podem ser programados.

10.27

Perfis de Dados

A janela **Perfis de dados** permite definir perfis de dados individuais para os diferentes tipos e requisitos de comunicações de dados.

Por fim, os perfis de dados são definidos para comunicar dados de rádio por meio de canais convencionais ou de entroncamento e/ou por meio de uma rede de banda larga de LTE.

**INFORMAÇÕES:**

Todas as Funções e Seleções de Dados podem se aplicar a todos os Perfis de Dados.

Dependendo da seleção do tipo de perfil de dados, os perfis de dados são selecionados no campo Seleção de perfil de dados do sistema de entroncamento e/ou no campo Seleção de perfil de dados do sistema convencional.

Nas comunicações Convencionais, os Perfis de dados se aplicam apenas aos Sistemas convencionais que têm o campo Tipo de sistema definido como **ASTRO**.

Nas comunicações de Entroncamento, os Perfis de dados se aplicam apenas aos Sistemas de entroncamento que têm o campo Tipo de sistema definido como **ASTRO 25**.

10.27.1**Geral**

Esta seção permite visualizar ou modificar as configurações de dados dos perfis de dados individuais.

**OBSERVAÇÃO:**

Os Perfis de dados são selecionados pelo campo Seleção do perfil de dados do sistema de entroncamento ou pelo campo Seleção do perfil de dados do sistema convencional.

Nas comunicações Convencionais, os Perfis de dados se aplicam apenas aos Sistemas convencionais que têm o campo Tipo de sistema definido como **ASTRO**.

Nas comunicações de Entroncamento, os Perfis de dados se aplicam apenas aos Sistemas de entroncamento que têm o campo Tipo de sistema definido como **ASTRO 25**.

10.27.1.1**Nome do perfil de dados**

Este campo permite criar um nome reconhecível para o Perfil de dados atual.

Os Perfis de dados são selecionados pelo campo Seleção do perfil de dados do sistema de entroncamento ou pelo campo Seleção do perfil de dados do sistema convencional.

As seguintes seleções estão disponíveis:

- É possível usar caracteres, números, espaços e caracteres especiais.
- São permitidos no máximo 14 caracteres.
- **Exemplos:** EMT-001, #500, Electric1, # A5
- Veja também: Validação de dados do campo Nome.

10.27.1.2**Tipo de perfil de dados**

Esse campo seleciona os recursos de comunicação de dados do rádio do Perfil de dados atual.

Os Perfis de dados são selecionados pelo campo Seleção do perfil de dados do sistema de entroncamento ou pelo campo Seleção do perfil de dados do sistema convencional.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seguintes seleções estão disponíveis:

Convencional

O rádio envia e recebe dados (e voz) somente por um Sistema FNE (Equipamento de Rede Fixa) Convencional ASTRO.

Entroncamento

O rádio envia e recebe dados (e voz) somente por um Sistema IV&D (Voz e Dados Integrados) de Entroncamento ASTRO 25.

Somente Banda Larga

O rádio envia e recebe dados apenas por uma rede de dados Banda Larga LTE (as operações de voz continuam pelo Sistema de Entroncamento ASTRO Convencional ou ASTRO 25).

Banda Larga e Convencional

O rádio pode enviar e receber dados por um sistema FNE ASTRO Convencional ou por uma rede de dados de Banda Larga LTE (as operações de voz continuam pelo Sistema FNE ASTRO Convencional). Quando os dois sistemas/redes estão disponíveis para as transmissões de dados, a rede de LTE tem prioridade.

**AVISO:**

Quando selecionado, o campo Modo de Dados do Pacote deve estar definido como "FNE".

Entroncamento e Banda Larga

O rádio pode enviar e receber dados por um Sistema IV&D de Entroncamento ASTRO 25 ou por uma rede de dados de Banda Larga LTE (as operações de voz continuam pelo Sistema de Entroncamento ASTRO 25). Quando os dois sistemas/redes estão disponíveis para as transmissões de dados, a rede de LTE tem prioridade.

10.27.1.3

Contador de permanência em fila

Este campo seleciona o tempo durante o qual um datagrama IP (Internet Protocol, protocolo de Internet) permanece na fila do rádio.

Essa configuração determina por quanto tempo os dados podem esperar, sem serem transmitidos antes de serem eliminados da fila. Quando os dados são enviados de um MC (Mobile Computer, computador móvel) para o rádio, o rádio às vezes recebe os dados mais rápido do que pode enviá-los, e os dados precisam esperar na fila do rádio. Essa seleção se aplica ao Perfil de dados atual. O tempo é medido em segundos.

Acessado apenas: Quando o campo [Tipo de perfil de dados na página 370](#) não estiver definido como **Banda larga apenas** e o rádio estiver habilitado para o modelo/a opção.

Acima 164: Alcance

Mínimo	Máximo
15 segundos	120 segundos

10.27.1.4

Dados de interrupções de voz de recepção

Este campo permite que uma transmissão de voz recebida (Rx) interrompa uma comunicação de dados.

As comunicações de dados são interrompidas sempre que uma transmissão de voz apropriada recebida for detectada pelo rádio. Este recurso se aplica ao perfis de dados de entroncamento atual.

Acessado apenas: Quando o campo [Tipo de perfil de dados na página 370](#) for definido como **Entroncamento** ou **Entroncamento e banda larga** e o rádio estiver habilitado para o modelo/a opção.

**INFORMAÇÕES:**

Se o rádio estiver na Verificação do Monitor de Prioridade (consulte Tipo de Verificação), apenas a atividade do grupo de conversação selecionado interromperá uma comunicação de dados.

10.27.1.5

Dados de Interrupções de Voz de Recepção

Este campo permite que uma transmissão de voz recebida (Rx) interrompa uma comunicação de dados quando o rádio está na verificação do monitor de prioridade e recebendo a atividade do membro prioritário.

Acessado apenas: Quando a opção [Tipo de perfil de dados na página 370](#) estiver definida como **Entroncamento** ou **Entroncamento e Banda larga** e [Dados de interrupções de voz de recepção na página 371](#) estiver habilitado.

10.27.1.6

Difusão limitada

Este campo permite que o rádio roteie datagramas de transmissão limitados do MC (Mobile Computer, computador móvel) Over The Air.

Esta função se aplica ao Perfil de dados atual.

Quando desativados, os datagramas de difusão limitada do MC são impedidos de serem enviados via Over The Air.

Acessado apenas: Quando o campo [Tipo de perfil de dados na página 370](#) não estiver definido como **Banda larga apenas** e quando o rádio estiver habilitado para o modelo/a opção.

10.27.1.7

Dados entre sistemas

Esse campo permite que um rádio tente automaticamente a ativação de contexto durante o roaming em um sistema de entroncamento externo.

Facilita o acesso a serviços de dados (como, por exemplo, Localização e OTAR) nesse sistema (consulte também Roaming inter-WACN). Se aplica somente aos sistemas ASTRO 25 ISSI 8000 conectados que operam em uma CEN (Customer Enterprise Network, rede corporativa do cliente) combinada (externa + sistema local). A seleção se aplica ao Entroncamento atual - Perfil de dados.

INFORMAÇÕES:

Se a ativação de contexto for bem-sucedida em um Sistema de entroncamento externo, geralmente, o rádio poderá acessar todos os serviços de dados disponíveis no sistema. Não responde a transmissões de dados em todo o sistema.

Acessado apenas: Quando o campo [Tipo de perfil de dados na página 370](#) estiver definido como **Entroncamento** ou **Entroncamento e banda larga** e o rádio estiver habilitado para o modelo/a opção.

10.27.1.8

Tempo de interrupção aleatória

Esse campo permite que o rádio calcule um valor de interrupção aleatória entre 0 (zero) e o tempo de interrupção da ativação de contexto que foi usado durante a ativação de contexto do sistema.

Essa função se aplica somente ao Entroncamento - Perfil de dados atual. Quando estiver desativado, o valor do Tempo de interrupção da ativação de contexto será usado.

Acessado apenas: Quando a [Tipo de perfil de dados na página 370](#) estiver definida como **Entroncamento** ou **Entroncamento e banda larga**.

10.27.1.9

Tempo de interrupção da ativação de contexto

Esse campo seleciona o tempo máximo que o rádio pode interromper as tentativas na ativação de contexto do sistema.

O contador é iniciado após a primeira solicitação de ativação de contexto recusada. O campo Tempo de interrupção aleatória pode definir como esse valor será utilizado. A seleção Modo de interrupção de ativação do contexto pode determinar quando esse valor será utilizado. Essa seleção se aplica somente ao Entroncamento - Perfil de dados atual. O tempo é medido em minutos.

Acessado apenas: Quando a [Tipo de perfil de dados na página 370](#) estiver definida como **Entroncamento** ou **Entroncamento e banda larga**.

Acima 165: Alcance

Desabilitado	Mínimo	Máximo
0 - Desabilitado	1 min	60 min

10.27.1.10

Versão do registro de dados do pacote

Este campo seleciona entre duas versões do SNDCP (Sub Network Dependent Convergence Protocol, protocolo de convergência dependente de sub-rede) para dados em slots.

Essa seleção se aplica somente ao Entroncamento - Perfil de dados atual.

Acessado apenas: Quando a [Tipo de perfil de dados na página 370](#) estiver definida como **Entroncamento** ou **Entroncamento e banda larga**.

As seguintes seleções estão disponíveis:

SNDCPv1

A versão 1 do SNDCP permite que mensagens de registros de dados do pacote sejam trocadas com um sistema ASTRO 25 com uma versão anterior à 7.3. Essa seleção será inválida se o cenário a seguir ocorrer: O Tipo de perfil de dados estiver definido como **Entroncamento** ou **Entroncamento e banda larga** e Dados avançados - seleção da lista de portas não estiver **Desativado**.

SNDCPv3

A versão 3 do SNDCP permite que mensagens de registros de dados do pacote sejam trocadas com um sistema ASTRO 25 versão 7.3 ou posterior.

10.27.1.11

Ativação da compressão de cabeçalho IP

Esse campo permite que o rádio ofereça uma transferência mais eficiente de mensagens reduzindo um número relativamente grande de usuários de dados ativos por canal de dados do pacote.

O excesso de cabeçalhos UDP (User Datagram Protocol, protocolo de datagramas do usuário)/IP é compactado antes da transmissão para seus destinos. Essa seleção se aplica somente ao Entroncamento - Perfil de dados atual.

AVISO:

Esse recurso não é compatível com Proteger/remover ligação sendo definido como **Seguro**.

Acessado apenas: Quando o campo [Tipo de perfil de dados na página 370](#) estiver definida como **Entroncamento** ou **Entroncamento e banda larga** e o campo [Versão do registro de dados do pacote na página 373](#) estiver definido como **SNDCPv3**.

10.27.2

Funções

Esta seção permite visualizar ou modificar as configurações de dados dos perfis de dados individuais.

**OBSERVAÇÃO:**

Os Perfis de dados são selecionados pelo campo Seleção do perfil de dados do sistema de entroncamento ou pelo campo Seleção do perfil de dados do sistema convencional.

Nas comunicações Convencionais, os Perfis de dados se aplicam apenas aos Sistemas convencionais que têm o campo Tipo de sistema definido como **ASTRO**.

Nas comunicações de Entroncamento, os Perfis de dados se aplicam apenas aos Sistemas de entroncamento que têm o campo Tipo de sistema definido como **ASTRO 25**.

10.27.2.1

Dados de terminal

Este campo permite que o MC (Mobile Computer, computador móvel) transmita ou receba dados de pacote Over The Air.

Este recurso se aplica ao perfil de dados atual.

Quando desativado, o MC ainda pode se comunicar com aplicativos de dados internos de rádio, que ainda podem se comunicar Over The Air.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.27.2.2

Modo de interrupção da ativação de contexto

Este campo seleciona as condições para quando o Tempo de interrupção da ativação de contexto é usado pelo rádio.

O contador e esse Modo de interrupção selecionado limitam as solicitações do rádio para a ativação de contexto do sistema. A configuração do campo Tempo de interrupção aleatória determina como o Tempo de interrupção da ativação de contexto é usado para o Sistema de entroncamento atual. Essa seleção se aplica ao Perfil de dados atual.

As seguintes seleções estão disponíveis:

Desativar sempre

O rádio usa o Tempo de interrupção da ativação de contexto: em uma tentativa que falhou na Ativação de contexto do sistema inicial, quando o contexto falhar ou para uma perda de contexto devido a um comando de desativação do contexto recebido pelo sistema e a reativação for necessária.

Desativação na falha

O rádio usa o Tempo de interrupção da ativação de contexto somente depois que a Ativação de contexto do sistema falhar.

10.27.2.3

Contador longo de novas tentativas

Esse campo seleciona quanto tempo o rádio esperará depois que todas as novas tentativas de registro do servidor de registro automático falharem.

Há um total de cinco tentativas de registro embutidas no código (não modificáveis) no rádio, uma tentativa inicial e quatro novas tentativas. O contador é iniciado após a transmissão da quarta tentativa. Essa seleção se aplica ao Perfil de dados atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seguintes seleções estão disponíveis:

OBSERVAÇÃO:

Quando definido como **0-Desabilitado**, o rádio não aguardará mais o registro do servidor ARS ocorrer - 0 (zero minutos)

Acima 166: Alcance

Mínimo	Máximo	Incrementos
5 (minutos)	300 (minutos)	1 (minuto)

Acima 167: Alcance

Desabilitado	Mínimo	Máximo
4 - Desabilitado	5 minutos	300 minutos

10.27.2.4

Contador curto de novas tentativas

Esse campo seleciona o tempo de espera entre o número de novas tentativas.

As novas tentativas às vezes são necessárias para determinados procedimentos de aplicativos de dados. Essa seleção se aplica ao Perfil de dados atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 168: Alcance

Mínimo	Máximo	Incrementos
5 segundos	90 segundos	5 segundos

10.27.2.5

Número de novas tentativas

Este campo seleciona o número de tentativas que o rádio faz (até que seja bem-sucedido) para determinados procedimentos de aplicativos de dados.

A quantidade de tempo que o rádio espera entre essas tentativas é determinada pelo campo [Contador curto de novas tentativas na página 375](#) acima. Essa seleção se aplica ao Perfil de dados atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 169: Alcance

Mínimo	Máximo
1	10

10.27.2.6

Modo ARS

Esse campo seleciona o modo ARS (Automatic Registration Service) o perfil de dados atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seguintes seleções estão disponíveis:

Desabilitado

O modo ARS está desativado.

Servidor

Use essa configuração quando um ARS estiver sendo utilizado no sistema. Essa seleção se aplica a um servidor de PN (Presence Notification, notificação de presença) e a um servidor de autenticação do usuário do ARS.

Não servidor

Use essa configuração quando os serviços de resolução de nome forem necessários e não houver um ARS disponível. Essa seleção é válida apenas: Quando o campo Tipo de perfil de dados estiver definido como **Convencional** ou **Convencional e banda larga** e quando o campo Modo de dados do pacote não estiver definido como **FNE**.

Servidor aprimorado

Permite o registro do ARS aprimorado que é suportado pelo software UNS versão 5.1 ou posterior.

10.27.2.7

Endereço do servidor de registro automático

Esse campo permite definir o endereço IP (Internet Protocol) do ARS (Automatic Registration Server, servidor de registro automático) para o perfil de dados atual.

Acessado apenas: Quando o campo [Modo ARS na página 375](#) for definido como **Servidor** e o rádio estiver habilitado para o modelo/a opção.

As seleções estarão válidas quando as seguintes informações forem verdadeiras:

- Os quatro octetos devem estar no intervalo: [1-223] . [0-255] . [0-255] . [0-255]
- O endereço IP não pode ser o endereço de transmissão limitada: 255.255.255.255

Além disso, o endereço IP precisa ser um endereço válido de classe A, B ou C:

- O endereço IP é considerado de Classe A quando o octeto 1 estiver entre 0 e 127. Então, o ID da rede será o primeiro octeto:
 - Quando o endereço IP for de Classe A, o endereço IP poderá estar entre 1.0.0.1 e 126.255.255.254
 - Quando o endereço IP for de Classe A, o endereço IP não poderá ser 0.xxx.xxx.xxx, xxx.255.255.255, xxx.0.0.0 ou 127.xxx.xxx.xxx
- **O endereço IP será considerado de Classe B quando o octeto 1 estiver entre 128 e 191. Então, o ID da rede serão os primeiros 2 octetos:**
 - quando o endereço IP for de Classe B, o endereço IP poderá estar entre 128.1.0.1 e 191.255.255.254
 - quando o endereço IP for de Classe B, o endereço IP não poderá ser 128.0.xxx.xxx, xxx.xxx.255.255 ou xxx.xxx.0.0
- **O endereço IP será considerado de Classe C quando o octeto 1 estiver entre 192 e 223. Então, o ID da rede serão os primeiros 3 octetos:**
 - quando o endereço IP for de Classe C, o endereço IP poderá estar entre 192.0.1.1 e 223.255.255.254
 - quando o endereço IP for de Classe C, o endereço IP não poderá ser 192.0.0.xxx, xxx.xxx.xxx.255 ou xxx.xxx.xxx.0

10.27.2.8

Registro de localização direto

Este campo permite que o rádio se registre diretamente em um servidor de localização compatível com o formato de dados de relatório de localização P25 (Project 25) (consulte também Relatórios de localização P25).

O rádio notifica o servidor de localização por meio de uma mensagem LRRP (Location Request/Response Protocol, protocolo de solicitação/resposta de localização) sobre sua disponibilidade e, então, efetua o registro no servidor. Este recurso se aplica ao perfil de dados atual.

Acessado apenas: quando o campo Ativação de localização estiver habilitado, o campo Relatório de localização P25 estiver habilitado, o campo [Modo ARS na página 375](#) não estiver definido como **Servidor** e o rádio estiver habilitado para o modelo/a opção.

10.27.2.9

Endereço IP do servidor de localização

Este campo permite definir o endereço IP (Internet Protocol, protocolo de Internet) do servidor de localização no qual o rádio será registrado diretamente quando um servidor ARS (Automatic Registration Server, servidor de registro automático) ou UNS (Unified Network Services, serviços de rede unificada) estiver indisponível (consulte também Registro de localização direto).

Este recurso se aplica ao perfil de dados atual.

OBSERVAÇÃO:

Ao atribuir um endereço IP, certifique-se de que ele não entre em conflito com qualquer outro endereço IP ou Sub-rede utilizada pelo rádio. Dispositivos externos, como Wi-Fi , Modem de dados externos e Si500, podem atribuir Endereços IP a algumas interfaces. Se endereços IP ou Sub-redes conflitantes estiverem em uso, não será possível garantir que as funções de dados funcionem corretamente.

169. 254. Sub-rede X. X. está reservada para Clonagem zona a zona, por isso, nenhum endereço IP pode começar com 169. 254. X. X, caso contrário, o campo será inválido.

Acessado apenas: Quando os seguintes campos estiverem habilitados: Ativação de localização, Relatório de localização P25 e Registro de localização direto. O campo [Modo ARS na página 375](#) não está definido como **Servidor**. O rádio está habilitado para modelo/opção.

As seleções estarão válidas quando as seguintes informações forem verdadeiras:

- Os quatro octetos devem estar no intervalo: [1-223] . [0-255] . [0-255] . [0-255] e
- este Endereço IP não pode ser o Endereço de transmissão limitada: 255.255.255.255

E este endereço IP:

- Não pode ser totalmente igual ao Endereço IP do assinante 1, e
- Não pode ser totalmente igual ao Endereço IP do assinante, e
- Não pode ser totalmente igual ao Endereço IP da interface aérea do assinante, e
- Não pode ser igual ao Endereço IP do assinante de Bluetooth, e
- Não pode ser igual ao Endereço de base da rede PAN de Bluetooth, e
- Não pode ser totalmente igual à Sub-rede do rádio interno do rádio em qualquer Perfil dados.
- Não pode ser igual ao Endereço IP do link de série 1 e Endereço IP do link de série 2

Além disso, o Endereço IP deve ser um endereço válido de classe A, B ou C:

- **O endereço IP é considerado de Classe A quando o octeto 1 estiver entre 0 e 127. Então, o ID da rede será o primeiro octeto:**

- quando o Endereço IP for de Classe A, o Endereço IP poderá estar entre 1.0.0.1 e 126.255.255.254
- quando o Endereço IP for de Classe A, o Endereço IP não poderá ser 0.xxx.xxx.xxx, xxx.255.255.255, xxx.0.0.0 ou 127.xxx.xxx.xxx
- **O endereço IP será considerado de Classe B quando o octeto 1 estiver entre 128 e 191. Então, o ID da rede serão os primeiros 2 octetos:**
 - quando o Endereço IP for de Classe B, o Endereço IP poderá estar entre 128.1.0.1 e 191.255.255.254
 - quando o endereço IP for de Classe B, o endereço IP não poderá ser 128.0.xxx.xxx, xxx.xxx.255.255 ou xxx.xxx.0.0
- **O endereço IP será considerado de Classe C quando o octeto 1 estiver entre 192 e 223. Então, o ID da rede serão os primeiros 3 octetos:**
 - quando o endereço IP for de Classe C, o endereço IP poderá estar entre 192.0.1.1 e 223.255.255.254
 - quando o endereço IP for de Classe C, o endereço IP não poderá ser 192.0.0.xxx, xxx.xxx.xxx.255 ou xxx.xxx.xxx.0

10.27.2.10

Modo PAD

Este campo seleciona o modo de operação para o aplicativo do PAD (Protocol Assembler/Disassembler, montador/desmontador de protocolo).

O [Endereço de Destino PAD na página 380](#) e o [Porta de Destino PAD na página 381](#) devem ser definidos sempre que o campo não estiver **Desabilitado**. Essa seleção se aplica ao Perfil de dados atual.

AVISO:

Quando o [Tipo de perfil de dados na página 370](#) é **Banda Larga Apenas** ou **Convencional e Banda Larga** ou **Entroncamento e Banda Larga**, este campo deve ser definido como **Desabilitado**. Caso contrário, o aplicativo considera como inválido.

As seleções a seguir são compatíveis:

Desabilitado

O Modo PAD não é usado.

Contínuo

Usado para dispositivos/aplicativos que precisam transmitir dados de pacote com tamanho fixo.

Sentença

Usado para enviar dados de pacote com base em determinados caracteres de início e interrupção (como uma sentença em dados de GPS). As Sequências de início e de interrupção do PAD devem ser definidas.

Imediato

Uma transferência de dados não processados na qual todos os dados (independentemente do tamanho) são transmitidos como estão.

10.27.2.11

Sequência de Início PAD

Este campo permite inserir a Sequência de início para o modo de **Sentença** do PAD.

Essa entrada é usada pelo Aplicativo PAD de Rede para detectar o início da 'Sentença' nos dados, com a correspondência dessa sequência de valores de byte. A Sequência de Início e [Sequência de](#)

[Interrupção PAD na página 379](#) devem ser definidas para o Modo PAD "Sentença". Essa seleção se aplica ao Perfil de dados atual.

Acessado apenas: Quando o campo [Modo PAD na página 378](#) estiver definido como **Sentença**.

As seleções a seguir são compatíveis:

- As entradas devem ser hexadecimais, (0 a 9 e A a F)
- As entradas devem ter um número par de caracteres
- As entradas devem ter:
 - no mínimo 2 caracteres
 - no máximo 18 caracteres

10.27.2.12

Sequência de Interrupção PAD

Este campo permite inserir a Sequência de interrupção para o modo de **Sentença** do PAD.

Essa entrada é usada pelo Aplicativo PAD de Rede para detectar a interrupção da 'Sentença' nos dados, com a correspondência dessa sequência de valores de byte. A [Sequência de Início PAD na página 378](#) e a Sequência de Interrupção devem ser definidas para o Modo PAD "Sentença". Essa seleção se aplica ao Perfil de dados atual.

Acessado apenas: Quando o campo [Modo PAD na página 378](#) estiver definido como **Sentença**.

As seleções a seguir são compatíveis:

- As entradas devem ser hexadecimais, (0 a 9 e A a F)
- As entradas devem ter um número par de caracteres
- As entradas devem ter:
 - no mínimo 2 caracteres
 - no máximo 18 caracteres

10.27.2.13

Sequência de Fugas PAD

Este campo permite inserir a Sequência de fugas para o modo de **Sentença** do PAD.

Essa sequência de bytes opcional é usada para 'fugir' da detecção de qualquer sequência de início e de interrupção, caso ela ocorra como parte de dados comuns, para que não seja confundida com uma sequência de início ou de interrupção. Essa seleção se aplica ao Perfil de dados atual.

Acessado apenas: Quando o campo [Modo PAD na página 378](#) estiver definido como **Sentença**.

As seleções a seguir são compatíveis:

- As entradas devem ser hexadecimais, (0 a 9 e A a F)
- As entradas devem ter um número par de caracteres
- As entradas devem ter:
 - no mínimo 0 caracteres
 - no máximo 10 caracteres

10.27.2.14

Tempo limite de inatividade da recepção de PAD

Este campo seleciona o valor de tempo limite usado nos modos **Contínuo** e **Sentença** do PAD.

No **Contínuo Modo PAD na página 378**, esse tempo limite é usado para acionar a transmissão dos dados coletados no aplicativo PAD, mesmo se ele não tiver alcançado o limite de buffer Máximo. Essa seleção se aplica ao Perfil de dados atual. O tempo é medido em milissegundos.

Acessado apenas: Quando o campo **Modo PAD na página 378** estiver definido como **Sentença ou Contínuo**.

Acima 170: Alcance

Mínimo	Máximo
0 (ms) (0 = Desativado)	15000 (ms)

10.27.2.15

Valor de Inibição de Transmissão PAD

Este campo seleciona o tempo que uma transmissão de fragmentos de dados (enviada do aplicativo PAD) é atrasada em relação à transmissão de fragmento de dados anterior, espaçando uniformemente essas transmissões (controle de fluxo).

Portanto, o aplicativo PAD só pode enviar (no máximo) um fragmento de dados nesse período. Esse período é usado para atrasar as transmissões em todos os Modos PAD. Essa seleção se aplica ao Perfil de dados atual.

Acessado apenas: Quando o campo **Modo PAD na página 378** não estiver definido como **Desabilitado**.

Acima 171: Alcance

Mínimo	Máximo
0 (ms) (0=Desativado)	15000 (ms)

10.27.2.16

Limite máximo de buffer

Este campo seleciona o limite máximo de buffer (em bytes) que é usado para acionar transmissões no Modo PAD "contínuo".

Essa seleção representa o tamanho dos dados coletados no Modo PAD "Contínuo" antes do envio dos dados. Assim que esse limite de dados em buffer for atingido, o aplicativo PAD envia o buffer (se aplica apenas ao Modo Contínuo). Essa seleção se aplica ao Perfil de dados atual.

Acessado apenas: Quando o campo **Modo PAD na página 378** estiver definido como **Sentença ou Contínuo**.

Acima 172: Alcance

Mínimo	Máximo
1 byte	3.000 bytes

10.27.2.17

Endereço de Destino PAD

Este campo permite inserir o Endereço de destino IP (extremidade remota) para o aplicativo PAD (Protocol Assembler/Disassembler, montador/desmontador de protocolo).

Essa entrada representa a parte do endereço na combinação de endereço e porta que forma o destino (extremidade remota) para os pacotes de dados gerados pelo aplicativo PAD. Essa seleção se aplica ao Perfil de dados atual.

Acessado apenas: Quando o campo [Modo PAD na página 378](#) não estiver definido como **Desabilitado**.

OBSERVAÇÃO:

O endereço IP pode ser qualquer endereço válido inserido no formato com pontos decimais.

10.27.2.18

Porta de Destino PAD

Este campo permite inserir a Porta de destino IP (extremidade remota) para o aplicativo PAD.

Essa entrada representa a parte da porta na combinação de endereço e porta que forma o destino (extremidade remota) para os pacotes de dados gerados pelo aplicativo PAD. Essa seleção se aplica ao Perfil de dados atual.

Acessado apenas: Quando o campo [Modo PAD na página 378](#) não estiver definido como **Desabilitado**.

Acima 173: Alcance

Mínimo	Máximo
1	65535

INFORMAÇÕES:

O Valor Padrão de "0" é uma entrada inválida. Quando o campo for aplicável, o valor deverá ser alterado para uma entrada válida.

10.27.3

ID do grupo de entroncamento

Esta seção permite visualizar ou modificar os IDs de grupo de dados de CAI do ASTRO 25, de 1 a 8.

Esses IDs de grupo são usados para a decodificação de endereços destinados apenas ao recebimento de dados.

OBSERVAÇÃO:

Os grupos de dados permitem que o rádio receba as mensagens de dados agrupadas, enviadas para esses IDs de grupos de dados, e os pacotes de transmissão enviados para o ID DE TODAS AS LIGAÇÕES (IP = 255.255.255.255) do rádio. Essas seleções se aplicam somente ao Entroncamento — Perfil de dados atual.

INFORMAÇÕES:

Os Perfis de dados de entroncamento são selecionados no campo Seleção do perfil de dados do Sistema de entroncamento.

Nas comunicações de Entroncamento, os Perfis de dados se aplicam apenas aos Sistemas de entroncamento que têm o campo Tipo de sistema definido como **ASTRO 25**.

10.27.3.1

ID do Grupo de dados do ASTRO 25

Este campo seleciona (no formato decimal ou hexadecimal) o ID do grupo de dados da CAI (Common Air Interface, interface aérea comum) do ASTRO 25 para o registro/linha atual (1 a 8).

Esse ID de grupo é usado para a decodificação de endereços destinados apenas ao recebimento de dados. Os grupos de dados permitem que o rádio receba as mensagens de dados agrupadas,

enviadas para esses IDs de grupos de dados e os pacotes de transmissão enviados para o ID DE TODAS AS CHAMADAS (IP = 255.255.255.255) do rádio. Essa seleção se aplica somente ao Entroncamento - Perfil de dados atual.

INFORMAÇÕES:

6777215 (0xFFFFF Hex) é o ID DE TODAS AS CHAMADAS. Esse ID não pode ser inserido porque ele já existe no rádio.

Acessado apenas: Quando a [Tipo de perfil de dados na página 370](#) estiver definida como **Entroncamento** ou **Entroncamento e banda larga**.

Acima 174: Alcance

Mínimo	Máximo
10000000 (989680 Hex)	16777214 (FFFFFE Hex)

10.27.4

Banda larga

Essa seção permite visualizar ou definir a funcionalidade LTE (Long Term Evolution, Evolução em longo prazo). Essas configurações só se aplicam a Perfis de dados individuais.

INFORMAÇÕES:

Os Perfis de dados são selecionados no campo Seleção do perfil de dados do Sistema de entroncamento.

Nas comunicações de Entroncamento, os Perfis de dados se aplicam apenas aos Sistemas de entroncamento que têm o campo Tipo de sistema definido como **ASTRO 25**.

A Banda larga LTE é outra solução de infraestrutura de dados sem fio para serviços e aplicações de dados de LMR (Land Mobile Radio, rádio móvel terrestre). O recurso de banda larga LTE pode aumentar muito a capacidade de dados e a velocidade de dados para o aplicativo sem fio para OTAP (Over The Air Programming) do rádio. A Banda larga LTE também pode ser usada para aplicações de dados e serviços de dados, como Serviço de mensagens de texto (TMS), Localização de GPS, Automatic Registration Service (ARS) e Over-The-Air-Rekeying (OTAR). Interfaces de banda larga com infraestrutura de telefone celular padrão para fornecer conexões sem fio de alta velocidade com base em endereço IP. A criptografia segura para dados de banda larga de rádio é realizada com as tecnologias programadas de VPN (Virtual Private Network, rede virtual privada). Comunicações de voz por rádio não são possíveis com a Banda larga LTE. Portanto, comunicações de voz digitais continuam sendo realizadas através da infraestrutura LMR de entroncamento ASTRO 25 ou ASTRO convencional.

AVISO:

Rádios capacitados para LTE não têm suporte para dispositivos Bluetooth COTS (commercial-off-the-shelf, comercialmente disponível). No entanto, o Tipo de emparelhamento com Bluetooth, LF MPP (Low Frequency Motorola Proprietary Pairing, emparelhamento de baixa frequência de propriedade da Motorola), é possível em canais habilitados para Banda larga LTE.

OBSERVAÇÃO:

Atualmente, a LTE só está disponível para rádios portáteis APX 7000L.

10.27.4.1

Habilitar LTE

Permite a operação de dados de Banda Larga de LTE (Evolução a Longo Prazo) do Perfil de Dados atual.

**AVISO:**

Quando o campo [Tipo de perfil de dados na página 370](#) for definido como **Convencional e Banda Larga, Entroncamento e Banda Larga**, ou **Banda Larga Apenas**, este campo deve ser **Habilitado**. Caso contrário, o RadioCentral considera essa seleção inválida.

Acessado apenas: Quando o campo [Tipo de perfil de dados na página 370](#) estiver definido como **Banda Larga Apenas** ou **Convencional e Banda Larga** ou **Entroncamento e Banda Larga** e o rádio estiver habilitado para o modelo/a opção.

10.27.4.2

Nome de Host do Gateway do SmartConnect

O Nome de host do SmartConnect define o local do Gateway do SmartConnect na forma de um nome de host de domínio totalmente qualificado (FQDN).

O número máximo de caracteres ASCII é 63.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.27.4.3

Número da porta TLS do gateway do SmartConnect

Este campo permite selecionar o número da porta TLS usada para o recurso SmartConnect.

O número da porta TLS do gateway SmartConnect deve ser exclusivo para qualquer outra porta configurável no aplicativo.

Acima 175: Alcance

Padrão	Mínimo	Máximo	Incrementos
49665	1	65535	1

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.27.5

Segurança da Camada de Rede

Essa seção permite visualizar ou modificar as configurações de dados de comunicações de dados criptografadas seguras e de comunicações de dados criptografadas seguras com uma Rede privada virtual (VPN).

Consulte também [Recurso de banda larga LTE](#).

Essas configurações se aplicam a Perfis de Dados individuais.

**OBSERVAÇÃO:**

Os Perfis de dados são selecionados pelo campo Seleção do perfil de dados do sistema de entroncamento ou pelo campo Seleção do perfil de dados do sistema convencional.

Nas comunicações Convencionais, os Perfis de dados se aplicam apenas aos Sistemas convencionais que têm o campo Tipo de sistema definido como **ASTRO**.

Nas comunicações de Entroncamento, os Perfis de dados se aplicam apenas aos Sistemas de entroncamento que têm o campo Tipo de sistema definido como **ASTRO 25**.

10.27.5.1

Proteger/remover proteção

Este campo seleciona a criptografia segura ou não para dados do pacote sendo transmitidos e recebidos.

Os dados de pacotes criptografados seguros são transmitidos dentro da camada de rede (camada três) do modelo de sete camadas da OSI (Open Systems Interconnection, interconexão de sistemas abertos) para comunicações em camadas. Este recurso se aplica ao perfis de dados de entroncamento atual.

Acessado apenas: Quando [Operação segura na página 294](#) está definido como **Hardware** ou **Software**, quando o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) está ativado, e

quando o [Tipo de perfil de dados na página 370](#) está definido como **Entroncamento** ou **Entroncamento e banda larga** e o rádio está habilitado para o modelo/para a opção.

As seguintes seleções estão disponíveis:

Apagar

Liga ou confirma a transmissão de dados do pacote APCO 25 de Entroncamento como normal (limpa/não criptografada).

Proteger

Liga ou confirma as transmissões de Dados de Pacote APCO 25 de Entroncamento para que sejam criptografadas.

**AVISO:**

Válida somente quando o campo Ativação da Compactação de Cabeçalho de IP estiver desativado e todos os Modos de operação DAC - registros não estiverem definidos como **Acesso de Canal Controlado**.

10.27.5.2

Seleção de perfil KMF

Seleciona o Perfil KMF seguro a ser associado ao Perfil de dados do entroncamento atual.

Os Dados de Pacotes criptografados seguros são transmitidos dentro da Camada de Rede (Camada Três) do Modelo de Sete Camadas da Interconexão de Sistemas Abertos (OSI, Open Systems Interconnection) para comunicações em camadas.

**AVISO:**

Este campo é inválido quando o campo Endereço IP do KMF do Perfil de KMF Seguro estiver definido como 0 . 0 . 0 . 0

**INFORMAÇÕES:**

Quando esse campo não estiver definido como **Desativado**, o campo [Seleção de Chave na página 385](#) do perfil de dados atual só poderá selecionar chaves da Lista de referências de chave de criptografia de hardware do Perfil KMF seguro selecionado.

O aplicativo, na verdade, aponta para as chaves da Lista de chaves de criptografia desta seleção. As chaves individuais da Lista de referências de chave de criptografia de hardware segura se referem a chaves da Lista de chaves de criptografia do campo Referência de chave de criptografia. Todas as chaves selecionadas quando o ASTRO OTAR estiver habilitado deverão ser definidas primeiramente na Lista de referências de chave de criptografia de hardware segura.

Quando esse campo estiver definido como **Desabilitado**, o valor da [Seleção de Chave na página 385](#) para o Perfil de dados atual será diretamente escolhido da Lista de chaves de criptografia da janela Segurança total.

Acessado apenas: Quando [Tipo de perfil de dados na página 370](#) estiver definido como **Entroncamento** ou **Entroncamento e banda larga**, o campo [Proteger/remover proteção na página 384](#) for aplicável e definido como **Seguro** e o rádio estiver habilitado para o modelo/a opção.

As seguintes seleções estão disponíveis:

Desabilitado

Veja a Nota importante abaixo.

Pesquisar

As seleções disponíveis de Perfis do KMF Seguro - Perfil de KMF Seguro se aplicam somente quando o campo Ativação do OTAR de Segurança total estiver habilitado e o campo Ativação do ASTRO OTAR de Segurança total estiver habilitado.

10.27.5.3

Seleção de Chave

Este campo seleciona a chave de criptografia segura a ser usada para os dados do pacote que estão sendo transmitidos e recebidos.

Os dados de pacotes criptografados seguros são transmitidos dentro da camada de rede (camada três) do modelo de sete camadas da OSI (Open Systems Interconnection, interconexão de sistemas abertos) para comunicações em camadas. Essa seleção se aplica ao Entroncamento atual - Perfil de Dados.

INFORMAÇÕES:

Quando o campo Seleção de perfil do ASTRO OTAR não estiver definido como **Desativado**, o campo do perfil de dados atual só poderá selecionar chaves da Lista de referências de chave de criptografia segura de hardware do perfil de ASTRO OTAR seguro selecionado.

O aplicativo está, na verdade, indicando as chaves da lista de chaves de criptografia para essa seleção; as chaves individuais da lista de referências de chaves de criptografia segura fazem referência às chaves da lista de chaves de criptografia do campo Referência de chave de criptografia. Portanto, todas as chaves selecionadas quando o campo Índice de perfil ASTRO OTAR está ativado devem ser definidas primeiramente na Lista de referências de chaves de criptografia segura. Chaves retiradas do Perfil ASTRO OTAR com campo Lista de chaves independentes ativado estão disponíveis.

Quando o campo Seleção de perfil ASTRO OTAR não estiver definido como **Desativado**, esse valor do perfil de dados atual será diretamente selecionado na Lista de chaves de criptografia da Janela segurança total.

Acessado apenas: Quando [Tipo de perfil de dados na página 370](#) estiver definido como **Entroncamento** ou **Entroncamento e banda larga**, o campo [Proteger/remover proteção na página 384](#) for aplicável e definido como **Seguro** e o rádio estiver habilitado para o modelo/a opção.

As seguintes seleções estão disponíveis:

Tecla de segurança 1

Veja a Nota importante abaixo.

Pesquisar

Seleções de Segurança total disponíveis

10.27.5.4

Endereço IP do gateway criptografado

Este campo permite inserir o endereço de destino do IPv4 (Internet Protocol version 4, protocolo da Internet versão 4) do gateway de dados do pacote criptografado.

Este recurso se aplica ao perfis de dados de entroncamento atual.

Acessado apenas: Quando o [Tipo de perfil de dados na página 370](#) está definido como **Entroncamento** ou **Entroncamento e banda larga**, o campo [Proteger/remover proteção na página 384](#) é aplicável e definido como **Seguro** e o rádio está habilitado para o modelo/para a opção.

As seleções estarão válidas quando as seguintes informações forem verdadeiras:

- Os quatro octetos devem estar no intervalo: [1-223] . [0-255] . [0-255] . [0-255]
- Esse endereço IP não pode ser o endereço de transmissão limitada: 225 . 255 . 255 . 255

O endereço IP deve ser um endereço válido de Classe A, B ou C:

- O endereço IP é considerado de Classe A nas seguintes circunstâncias:
 - O octeto 1 está entre 0 e 127; o ID da rede é, portanto, o primeiro octeto
 - Se o endereço IP for de Classe A, ele poderá estar entre 1 . 0 . 0 . 0 e 126 . 255 . 255 . 255
 - O endereço IP não poderá ser 0 . xxx . xxx . xxx ou 127 . xxx . xxx . xxx
- O endereço IP é considerado de Classe B nas seguintes circunstâncias:
 - O octeto 1 está entre 128 e 191; o ID da rede é, portanto, os 2 primeiros octetos
 - O Endereço IP pode ser 128 . 0 . 0 . 0 a 191 . 255 . 255 . 255
 - O Endereço IP não poderá ser x . x . 255 . 255
- O endereço IP é considerado de Classe C nas seguintes circunstâncias:
 - O octeto 1 está entre 192 e 223; o ID da rede é, portanto, os 3 primeiros octetos
 - Se o endereço IP for de Classe C, o IP poderá estar entre 192 . 0 . 0 . 0 e 223 . 255 . 255 . 255
 - O Endereço IP não poderá ser x . x . x . 255

10.27.5.5

Permitir recepção aberta dados de pacotes

Este campo permite o recebimento de dados do pacote (não criptografados), mesmo quando a ligação **Segura** tiver sido selecionada no campo Dados do pacote\Proteger/remover ligação.

Este recurso se aplica ao perfis de dados de entroncamento atual.

Acessado apenas: Quando o [Tipo de perfil de dados na página 370](#) está definido como **Entroncamento** ou **Entroncamento e banda larga**, [Proteger/remover proteção na página 384](#) a opção é aplicável e definida como **Segura** e o rádio está habilitado para o modelo/para a opção.

10.27.5.6

VPN segura/remover ligação

Este campo seleciona uma criptografia segura ou não para dados de banda larga LTE sendo transmitidos e recebidos por uma VPN (Virtual Private Network, rede privada virtual).

OBSERVAÇÃO:

Após a autenticação usando uma chave segura durante as negociações do IKE (Internet Key Exchange, troca de chaves da Internet) (consulte [Seleção de teclas de VPN na página 387](#)), os dados de banda larga são criptografados com segurança usando protocolos IPsec (Internet Protocol Security, segurança de protocolo da Internet) e transmitidos pela rede LTE por meio de um túnel VPN seguro que conecta o rádio a um gateway VPN residente na CEN (Customer Enterprise Network, rede corporativa do cliente). Este recurso se aplica ao perfil de dados atual.

Acessado apenas: Quando o campo Operação Segura estiver definido como **Hardware**; quando o campo [Tipo de perfil de dados na página 370](#) estiver definido como **Banda Larga Apenas**, **Convencional e Banda Larga** ou **Entroncamento e Banda Larga** e o rádio estiver habilitado para o modelo/a opção.

As seguintes seleções estão disponíveis:

Apagar

Liga ou confirma a transmissão de dados de banda larga LTE como normal (limpa/não criptografada).

Proteger

Liga ou confirma as transmissões de dados de Banda Larga LTE para que sejam criptografadas.

10.27.5.7

Seleção de teclas de VPN

Este campo seleciona a chave de criptografia segura que será usada na fase Autenticação do protocolo IKE (Internet Key Exchange, troca de chaves na Internet) ao estabelecer um túnel seguro com o Gateway VPN (Virtual Private Network, rede privada virtual).

Não é a chave que será usada para proteger o túnel com o gateway de VPN, uma vez que essas chaves são chaves de sessão derivadas que fazem parte de padrão IKE. Essa seleção se aplica à criptografia segura para as comunicações de dados de banda larga LTE e somente para o atual perfil de dados.

INFORMAÇÕES:

Essa chave deve ser um Chave de Padrão de Criptografia Avançada AES-256 para que essa função funcione. Caso contrário, será exibida uma mensagem de erro ao tentar estabelecer o túnel com o Gateway de VPN. O valor da Seleção de Chave de VPN para o Perfil de Dados atual será diretamente escolhido na Lista de Chaves de Criptografia da Janela Segurança Total.

Acessado apenas: Quando o campo Operação Segura estiver definido como **Hardware**; quando o campo [Tipo de perfil de dados na página 370](#) estiver definido como **Banda Larga Apenas, Convencional e Banda Larga** ou **Entroncamento e Banda Larga**, [VPN segura/remover ligação na página 386](#) estiver definido como **Seguro** e o rádio estiver habilitado para o modelo/a opção.

10.27.5.8

Endereço IP do gateway de VPN

Este campo permite inserir o endereço de destino do IPv4 (Internet Protocol version 4, protocolo da Internet versão 4) do gateway de VPN (Virtual Private Network, rede privada virtual) que reside na CEN (Customer Enterprise Network, rede corporativa do cliente).

Essa seleção se aplica à criptografia segura para as comunicações de dados de Banda Larga LTE e somente para o atual perfil de dados.

OBSERVAÇÃO:

Ao atribuir um endereço IP, certifique-se de que ele não entre em conflito com qualquer outro endereço IP ou Sub-rede utilizada pelo rádio. Dispositivos externos, como Wi-Fi, Modem de dados externos e Si500, podem atribuir Endereços IP a algumas interfaces. Se endereços IP ou Sub-redes conflitantes estiverem em uso, não será possível garantir que as funções de dados funcionem corretamente.

169. 254. X. X. A sub-rede está reservada para o recurso Clonagem zona a zona, portanto, nenhum endereço IP pode começar com 169. 254. X. X. caso contrário, este campo ficará inválido.

Acessado apenas: Quando o campo Operação segura está definido como **Hardware**, quando o campo [Tipo de perfil de dados na página 370](#) está definido como **Banda larga apenas** ou **Convencional e banda larga** ou **Entroncamento e banda larga**, [VPN segura/remover ligação na página 386](#) está definido como **Proteger** e o rádio está habilitado para o modelo/para a opção.

As seleções estarão válidas quando as seguintes informações forem verdadeiras:

- Os quatro octetos devem estar no intervalo: [1-223] . [0-255] . [0-255] . [0-255]

- O valor padrão desse endereço IP = 0.0.0.0 e deve ser definido.

O endereço IP deve ser um endereço válido de Classe A, B ou C:

- O endereço IP é considerado de Classe A nas seguintes circunstâncias:
 - O octeto 1 está entre 0 e 127; o ID da rede é, portanto, o primeiro octeto
 - Se o endereço IP for de Classe A, ele poderá estar entre 1.0.0.1 e 126.255.255.254
 - O endereço IP não poderá ser 0.xxx.xxx.xxx ou 127.xxx.xxx.xxx
- O endereço IP é considerado de Classe B nas seguintes circunstâncias:
 - O octeto 1 está entre 128 e 191; o ID da rede é, portanto, os 2 primeiros octetos
 - Se o endereço IP for de Classe B, ele poderá estar entre 128.1.1.0 e 191.255.255.254
- O endereço IP é considerado de Classe C nas seguintes circunstâncias:
 - O octeto 1 está entre 192 e 223; o ID da rede é, portanto, os 3 primeiros octetos
 - Se o endereço IP for de Classe C, o IP poderá estar entre 192.0.1.1 e 223.255.255.254
 - O endereço IP não poderá ser x.x.x.0 ou x.x.x.255

10.27.5.9

Tempo de Retransmissão de Mensagem de VPN

Este campo seleciona a tentativa de retransmissão de mensagem da VPN (Virtual Private Network, rede privada virtual) e o intervalo de repetição.

Consulte [Tentativas de Retransmissão de Mensagem por VPN na página 388](#).

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

Essa seleção se aplica à criptografia segura para as comunicações de dados de banda larga LTE e somente para o atual perfil de dados.

Acessado apenas: Quando o campo Operação Segura estiver definido como **Hardware**; o campo [Tipo de perfil de dados na página 370](#) estiver definido como **Banda Larga Apenas, Convencional e Banda Larga** ou **Entroncamento e Banda Larga**, [VPN segura/remover ligação na página 386](#) estiver definido como **Seguro** e o rádio estiver habilitado para o modelo/a opção.

Acima 176: Alcance

Mínimo	Máximo	Incrementos
10 (segundos)	60 (segundos)	1 (segundo)

10.27.5.10

Tentativas de Retransmissão de Mensagem por VPN

Este campo seleciona o número máximo de vezes que uma mensagem de VPN (Virtual Private Network, rede privada virtual) é retransmitida em intervalos antes de considerar o final remoto como não responsivo.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

Essas tentativas continuam até a confirmação do recebimento da transmissão ou até que o número selecionado de tentativas seja atingido. Essa seleção se aplica à criptografia segura para as comunicações de dados de banda larga LTE e somente para o atual perfil de dados.

Acessado apenas: Quando o campo Operação Segura estiver definido como **Hardware**; o campo [Tipo de perfil de dados na página 370](#) estiver definido como **Banda Larga Apenas, Convencional e Banda Larga** ou **Entroncamento e Banda Larga**, [VPN segura/remover ligação na página 386](#) estiver definido como **Seguro** e o rádio estiver habilitado para o modelo/a opção.

Acima 177: Alcance

Mínimo	Máximo
2	10

10.27.5.11

Intervalo de Detecção de Ponto Inativo de VPN

Este campo seleciona o tempo máximo de inatividade antes da constatação de que a conexão por VPN (Virtual Private Network, rede privada virtual) foi perdida.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

Essa seleção se aplica à criptografia segura para as comunicações de dados de Banda Larga LTE e somente para o atual perfil de dados. O tempo é medido em minutos.

Acessado apenas: Quando o campo Operação segura está definido como **Hardware**, quando o campo [Tipo de perfil de dados na página 370](#) está definido como **Banda larga apenas, Convencional e banda larga** ou **Entroncamento e banda larga**, o campo [VPN segura/remover ligação na página 386](#) está definido como **Proteger** e o rádio está habilitado para o modelo/para a opção.

Acima 178: Alcance

Mínimo	Máximo	Incrementos
5 (minutos)	60 (minutos)	1 (minuto)

10.27.5.12

Margem de Rechaveamento de VPN

Este campo seleciona o tempo antes da tentativa de renegociação da conexão/do rechaveamento depois de a conexão por VPN (Virtual Private Network, rede privada virtual) ou do chaveamento de canal terminar.

Consulte [Tentativas de Rechaveamento por VPN na página 390](#).

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

Essa seleção se aplica à criptografia segura para as comunicações de dados de banda larga LTE e somente para o atual perfil de dados. O tempo é medido em minutos.

Acessado apenas: Quando o campo Operação Segura estiver definido como **Hardware**; quando o campo [Tipo de perfil de dados na página 370](#) estiver definido como **Banda Larga Apenas, Convencional e Banda Larga** ou **Entroncamento e Banda Larga**, [VPN segura/remover ligação na página 386](#) estiver definido como **Seguro** e o rádio estiver habilitado para o modelo/a opção.

OBSERVAÇÃO:

Essa função só está disponível na Visualização de especialistas (consulte Visualização do codeplug)

Acima 179: Alcance

Mínimo	Máximo	Incrementos
1 (minuto)	9 (minutos)	1 (minuto)

10.27.5.13

Tentativas de Rechaveamento por VPN

Este campo seleciona o número de tentativas de negociação de uma conexão por VPN (Virtual Private Network, rede privada virtual), ou a substituição de uma, antes de uma desistência.

Consulte [Margem de Rechaveamento de VPN na página 389](#).

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

Essa seleção se aplica à criptografia segura para as comunicações de dados de banda larga LTE e somente para o atual perfil de dados.

Acessado apenas: Quando o campo Operação Segura estiver definido como **Hardware**; o campo [Tipo de perfil de dados na página 370](#) estiver definido como **Banda Larga Apenas, Convencional e Banda Larga** ou **Entroncamento e Banda Larga**, [VPN segura/remover ligação na página 386](#) estiver definido como **Seguro** e o rádio estiver habilitado para o modelo/a opção.

OBSERVAÇÃO:

Essa função só está disponível na Visualização de especialistas (consulte Visualização do codeplug)

Acima 180: Alcance

1	10

10.27.6

Lista de desvio

Essa seção permite visualizar ou modificar o endereço de origem do protocolo de internet versão 4 (Ipv4), o endereço de destino ou os dois, dos pacotes de dados que devem ignorar o processamento seguro.

O recurso Lista de desvio se aplica somente aos Tipos de perfil de dados **Entroncamento, Somente banda larga e Entroncamento e banda larga** cujos perfis estejam definidos para comunicar dados de rádio em canais de entroncamento e/ou comunicar dados de rádio em uma rede de banda larga LTE.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção e

- Quando o [Tipo de perfil de dados na página 370](#) estiver definido como **Entroncamento** e quando o campo [Proteger/remover proteção na página 384](#) estiver definido como **Proteger** ou
- Quando o Tipo de perfil de dados estiver definido como **Somente banda larga** ou **Convencional e banda larga** e quando o campo [VPN segura/remover ligação na página 386](#) estiver definido como **Proteger** ou
- Quando o Tipo de perfil de dados estiver definido como **Entroncamento e banda larga** e quando o campo Proteger/Remover ligação estiver definido como **Proteger** ou o campo Proteger/Remover ligação do VPN estiver definido como **Proteger**.

10.27.6.1

Endereço IP

Este campo permite definir endereços IPv4 (Internet Protocol Version 4) de bypass para o perfil de dados atual.

Os Endereços IP de bypass são desenvolvidos para pacotes de dados com permissão para desbloquear o processamento seguro. Vários endereços IP de bypass (registro/linhas) podem ser criados para a lista/tabela de bypass de cada perfil de dados.

OBSERVAÇÃO:

Ao atribuir um endereço IP, certifique-se de que ele não entre em conflito com qualquer outro endereço IP ou Sub-rede utilizada pelo rádio. Dispositivos externos, como Wi-Fi , Modem de dados externos e Si500, podem atribuir Endereços IP a algumas interfaces. Se endereços IP ou Sub-redes conflitantes estiverem em uso, não será possível garantir que as funções de dados funcionem corretamente.

169. 254. X. X. A sub-rede está reservada para o recurso Clonagem zona a zona, portanto, nenhum endereço IP pode começar com 169. 254. X. X. caso contrário, este campo ficará inválido.

Acessado apenas: Quando o rádio é compatível com o modelo/a opção e

- O [Tipo de perfil de dados na página 370](#) estiver definido como **Entroncamento** e o campo [Proteger/remover proteção na página 384](#) estiver definido como **Seguro**, ou
- O [Tipo de perfil de dados na página 370](#) estiver definido como **Banda larga apenas** ou **Convencional e banda larga** e o campo [VPN segura/remover ligação na página 386](#) estiver definido como **Seguro** ou
- O [Tipo de perfil de dados na página 370](#) estiver definido como **Entroncamento e banda larga** e o campo [Proteger/remover proteção na página 384](#) estiver definido como **Seguro** ou o campo [VPN segura/remover ligação na página 386](#) estiver definido como **Seguro**

As seleções estarão válidas quando as seguintes informações forem verdadeiras:

- Os quatro octetos devem estar no intervalo: [1-223] . [0-255] . [0-255] . [0-255]
- Esse endereço IP pode ser o endereço de transmissão limitada: 255.255.255.255
- O endereço IP deve ser um endereço válido de Classe A, B ou C:
 - O endereço IP é considerado de Classe A quando:
 - + O octeto 1 está entre 0 e 127; o ID da rede é, portanto, o primeiro octeto
 - + O endereço IP pode ser 1.0.0.0 a 126.255.255.255
 - + O endereço IP não pode ser 0. XXX. XXX. XXX ou 127. XXX. XXX. XXX
 - O endereço IP será considerado de Classe B quando o octeto 1 estiver entre 128 e 191; o ID de rede será composto, então, pelos primeiros 2 octetos
 - + Se o endereço IP for de Classe B, o endereço IP poderá estar entre 128.0.0.0 e 191.255.255.255
 - O endereço IP será considerado de Classe C quando o octeto 1 estiver entre 192 e 223; o ID de rede será composto pelos primeiros 3 octetos
 - + Se o endereço IP for de Classe B, o endereço IP poderá estar entre 192.0.0.0 e 223.255.255.255

10.27.6.2

Tipo de endereço

Este campo seleciona o Tipo de endereço IP de bypass para o endereço IP de bypass atual (registro/linha).

Os Endereços IP de bypass são desenvolvidos para pacotes de dados com permissão para desbloquear o processamento seguro. Vários endereços IP de bypass (registro/linhas) podem ser criados na lista/tabela de bypass de cada perfil de dados.

Acessado apenas: Quando o rádio é compatível com o modelo/a opção e:

- O [Tipo de perfil de dados na página 370](#) estiver definido como **Entroncamento** e o campo [Proteger/remover proteção na página 384](#) estiver definido como **Seguro** ou
- O [Tipo de perfil de dados na página 370](#) estiver definido como **Banda larga apenas** ou **Convencional e banda larga** e o campo [VPN segura/remover ligação na página 386](#) estiver definido como **Seguro** ou
- O [Tipo de perfil de dados na página 370](#) estiver definido como **Entroncamento e banda larga** e o campo [Proteger/remover proteção na página 384](#) estiver definido como **Seguro** ou o campo [VPN segura/remover ligação na página 386](#) estiver definido como **Seguro**

As seleções a seguir são compatíveis:

Fonte

Permite que o endereço IP de bypass atual (registro/linha) não precise de criptografia de segurança ao receber pacotes de dados. Portanto, os pacotes de dados podem ser recebidos em modo descriptografado.

Destino

Permite que o endereço IP de bypass atual (registro/linha) não precise de criptografia de segurança ao transmitir pacotes de dados. Portanto, os pacotes de dados podem ser transmitidos em modo descriptografado.

Ambos

Permite que o endereço IP de bypass atual (registro/linha) não precise de criptografia de segurança ao transmitir e receber pacotes de dados. Portanto, os pacotes de dados podem ser transmitidos e recebidos em modo descriptografado.

10.27.7

Dados aprimorados

Essa seção permite visualizar ou modificar a funcionalidade de Dados aprimorados.

OBSERVAÇÃO:

Dados aprimorados fornece um canal de comunicações segmentado P25 fase 2 TDMA (time-division multiple access, acesso múltiplo por divisão de tempo), que oferece mais capacidade e confiabilidade em comparação com o canal fase 1 FDMA (frequency-division multiple access, acesso múltiplo por divisão de frequência) de dados.

INFORMAÇÕES:

Os procedimentos de Dados aprimorados se aplicam apenas a mensagens recebidas curtas (rádio para infraestrutura), como atualizações de local do GPS, usando slots reservados, atribuídos por FNE (Fixed Network Equipment, equipamento de rede fixo). Essas configurações são aplicáveis apenas a Perfis de dados individuais usados para comunicações de entroncamento.

INFORMAÇÕES:

Nas comunicações de Entroncamento, os Perfis de dados se aplicam apenas aos Sistemas de entroncamento que têm o campo Tipo de sistema definido como **ASTRO 25**.

Os Perfis de dados são selecionados no campo Seleção do perfil de dados do Sistema de entroncamento.

10.27.7.1

Seleção da Lista de Portas

Este campo permite selecionar a Lista de portas de Dados aprimorados apropriada a ser usada com o Perfil de dados atual.

OBSERVAÇÃO:

Os nomes que aparecem para seleção são definidos no campo Alias da Lista de Portas.

Acessado apenas: Quando o campo [Tipo de perfil de dados na página 370](#) for definido como **Entroncamento** ou **Entroncamento e banda larga** e o rádio estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

- Desabilitado
- Pesquisar (Listas Disponíveis de Portas dos Dados Aprimorados)

10.27.7.2

Permitir dados avançados no canal de dados clássico

Este campo permite que um datagrama de entrada destinado a uma das Portas de dados aprimorados programadas seja enviado por um canal de Dados clássicos P25.

Ocorre quando um canal de Dados avançados não está disponível ou quando o rádio já está em um canal de dados P25 clássico. Essa função se aplica ao Perfil de dados atual.

Quando desabilitado, o datagrama é descartado quando:

- O rádio já estiver em um canal de dados P25 clássico e quando o datagrama de Dados avançados de entrada for forçado por um canal de Dados avançados ou
- Quando um canal de Dados avançados não estiver disponível

Acessado apenas: Quando [Tipo de perfil de dados na página 370](#) estiver definido como **Entroncamento** ou **Entroncamento e banda larga**, [Seleção da Lista de Portas na página 393](#) não estiver **Desabilitado** e o rádio estiver habilitado para o modelo/a opção.

10.27.7.3

Contador de Permanência em Fila dos Dados Aprimorados

Esse campo seleciona o tempo que um datagrama de Dados aprimorados pode esperar na fila do rádio sem ser transmitido até ser eliminado da fila.

OBSERVAÇÃO:

Quando os dados são enviados de um aplicativo interno ou de um Computador Móvel para o rádio, às vezes o rádio recebe os dados mais rápido do que pode enviá-los. Eventualmente, os dados precisam esperar na fila do rádio. Essa seleção se aplica ao Perfil de dados atual. O tempo é medido em segundos.

Acessado apenas: Quando [Tipo de perfil de dados na página 370](#) estiver definido como **Entroncamento** ou **Entroncamento e banda larga**, [Seleção da Lista de Portas na página 393](#) não estiver **Desabilitado** e o rádio estiver habilitado para o modelo/a opção.

Acima 181: Alcance

Mínimo	Máximo	Incrementos
5 segundos	120 segundos	1 segundo

10.27.7.4

Enviar dados durante o tempo de espera de emergência

Permite que os dados sejam enviados durante uma condição de tempo de espera de emergência.

10.27.8

Ativar/Desativar dados ATAK

Esse campo ativa ou desativa os dados ATAK do aplicativo ATAK no rádio.

10.28

Lista de Portas de Dados Aprimorados

Lista de portas de dados aprimorados permite visualizar ou definir listas de portas de destino UDP (User Datagram Protocol, protocolo de datagrama do usuário) para as quais a transmissão de dados aprimorada é permitida. É possível ter até 12 Listas de Portas de Dados Aprimorados.

OBSERVAÇÃO:

Assim que definida, uma Lista da Portas de Dados Avançados é selecionada por cada Perfil de Dados do campo [Seleção da Lista de Portas](#).

10.28.1

Alias da lista de portas

Esse campo permite definir nomes reconhecíveis para a lista atual de portas de dados aprimorados.

Assim que definida, uma Lista de portas de dados aprimorados é selecionada por [Perfis de Dados na página 369](#) pelo campo [Seleção da Lista de Portas na página 393](#).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

Exemplos: GPS 5, Port List 1, Enh Data #14

É possível usar caracteres, números, espaços e caracteres especiais.

São permitidos no máximo 14 caracteres.

10.28.2

Número da porta

Este campo seleciona um número de porta de destino UDP (User Datagram Protocol, protocolo de datagrama do usuário) referente a uma porta associada ao envio de dados aprimorados do registro/linha atual da Lista de portas de dados aprimorados.

Assim que definida, uma Lista de portas de dados aprimorados é selecionada por [Perfis de Dados na página 369](#) pelo campo [Seleção da Lista de Portas na página 393](#).

**AVISO:**

Essa seleção é válida apenas:

Quando o valor é exclusivo para cada registro/linha da Lista de portas de dados aprimorados e

Quando ele não é igual ao valor do [Porta UDP de autenticação na página 365](#), [Porta OTAR do rádio na página 322](#), ou [Porta UDP do KMF na página 322](#), e

Quando ele não é igual ao valor de uma porta utilizada por qualquer outro serviço: **4005** (servidor PN (ARS)), **4007** (serviço de mensagens de texto), **4000** (porta de loopback UDP), **64414** (servidor do KMF (OTAR)), **162** (agente SNMP (Simple Network Management Protocol, protocolo de gerenciamento de rede simples)), **49223** (autenticação do usuário) e **49165** (autenticação de rádio).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Acima 182: Alcance

Mínimo	Máximo	Incrementos
1	65535	1

10.29

Todos os convencionais

Esta seção permite visualizar ou definir a funcionalidade aplicável a todos os rádios para todas as Personalidades convencionais.

Essa funcionalidade não é aplicada durante a operação no modo de comunicação de entroncamento.

10.29.1

Geral

Esta seção permite visualizar ou definir a funcionalidade básica de todos os rádios, aplicando-se apenas ao modo de comunicação convencional.

10.29.1.1

Tipo de Monitor

Esse campo seleciona a forma como o rádio ativa o som quando o botão Monitor é pressionado. O Monitor silencioso, também chamado de Desativar PL, permite monitorar o canal antes da transmissão.

Essa seleção se aplica às comunicações Convencionais.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Silencioso

Desativa o PL ou DPL

Silenciador aberto

Desativa o silenciador, que desativa a função mudo do alto-falante do rádio para qualquer sinal da operadora atualmente no canal, independente da intensidade do sinal. Se não houver um sinal da operadora presente, o rádio desativa o modo mudo.

10.29.1.2

Ativação da frequência direta

Esse campo permite que os parâmetros Direto/Talkaround e Talkaround direto sejam definidos individualmente para todos os perfis de Opções de frequência.

Quando estão desativados, todos os parâmetros Direto/Talkaround são revertidos para as configurações dos campos de parâmetros de Recepção para a funcionalidade Direto/Talkaround. Esse recurso se aplica a todos os rádios somente durante a operação no modo de comunicação Convencional.

OBSERVAÇÃO:

O campo Direto/Talkaround de Personalidade Convencional alterna entre ativar ou desativar o modo Direto/Talkaround de acordo com as Opções de Frequência da Personalidade Convencional.

É possível selecionar o modo Direto/Talkaround pressionando o botão Direto/Talkaround, selecionando a chave Talkaround/Direto ou selecionando o menu Direto/Talkaround.

10.29.1.3

Tom de ativação da trava

Esse campo faz com que o rádio emita um tom de alerta toda vez que o recurso "Monitor" é travado (consulte o recurso Tipo de monitor).

Pressionar o botão Monitor para Tempo de ativação da trava faz com que o recurso Monitor seja travado; esse tom de alerta indica que ocorreu o travamento. Após o travamento do "Monitor", ao pressionar o botão Monitor novamente, o modo de travamento será cancelado. Esse recurso também se aplica às comunicações Convencionais.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.29.1.4

Tempo de Ativação da Trava

Esse campo seleciona o tempo que você deve pressionar o botão Monitor para que o recurso **Monitor** permaneça travado continuamente.

Quando esse limite de tempo for atingido, você poderá soltar o botão Monitor e o modo "Monitor" permanecerá ativo. Se o limite de tempo não for alcançado, a liberação do botão Monitor encerrará o modo Monitor (não ocorrerá o travamento), e o rádio voltará à operação normal. Após o travamento do "Monitor", ao pressionar o botão Monitor novamente, o modo de travamento será cancelado. Esse recurso também se aplica às comunicações Convencionais.

Consulte a seleção [Tipo de Monitor na página 395](#) para obter mais referência.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

Quando definido como Desativado, não há contador - 0 (zero segundo). O "Monitor" é travado imediatamente ao pressionar o botão Monitor.

Acima 183: Alcance

Mínimo	Máximo	Incrementos
0,5 s	6 s	0,5 s

10.29.2

Funções

Essa seção permite visualizar ou modificar a funcionalidade que pode ser aplicada a todas as Personalidades convencionais.

10.29.2.1

Contador de Chave Rápida Smart PTT

Esse campo seleciona o tempo máximo entre os pressionamentos do botão PTT que determina a velocidade com que se deve pressionar o botão PTT para efetuar um pressionamento de tecla rápida.

Uma Chave Rápida (pressionamento duplo) do botão PTT pode substituir o Tipo de Smart PTT, **Inibição de Transmissão** ativada para uma Personalidade Convencional escolhida, permitindo, assim, que o rádio transmita quando o canal atual estiver ocupado (consulte também Contador de Nova Tentativa do Smart PTT).

Acima 184: Alcance

Mínimo	Máximo	Incrementos
100 ms	5000 ms	100 ms

10.29.2.2

Contador de Nova Tentativa Smart PTT

Esse campo seleciona o tempo durante o qual o rádio obtém amostras para um canal vazio (sem operadora).

Esse temporizador é usado quando uma das seleções de **Inibição de Transmissão** ativada do Tipo de Smart PTT for escolhida para uma Personalidade Convencional. Quando o botão PTT é pressionado, e o tempo de amostragem determina que o canal atual está ocupado, o rádio automaticamente emite um tom de alerta contínuo até o botão PTT ser liberado.

INFORMAÇÕES:

O campo Anulação da tecla rápida é uma função de cancelamento que permite transmitir independentemente da regra de Tipo de Smart PTT, "Inibição de transmissão ativada" selecionada no momento. Consulte também Temporizador da Tecla Rápida do PTT Inteligente.

Acima 185: Alcance

Mínimo	Máximo	Incrementos
0 ms	5000 ms	25 ms

10.29.2.3

Status Número de tentativas

Esse campo seleciona o número máximo de vezes que o rádio tenta enviar um status definido pelo RadioCentral.

O rádio continuará essas tentativas até receber uma confirmação de recebimento bem-sucedido da transmissão ou até que o número selecionado de tentativas de Status seja atingido. Consulte também Saída automática de status. Esta seleção se aplica a todos os Sistemas convencionais.

Acima 186: Alcance

Mínimo	Máximo
1 tentativa	14 tentativas

10.29.3

Conjunto de ID do grupo ASTRO

O conjunto do **ID do Grupo ASTRO** permite que o usuário visualize ou modifique a funcionalidade que pode ser aplicada a todos os Sistemas Convencionais do tipo ASTRO e, portanto, a todas as Personalidades Convencionais que possuem a funcionalidade Sistema ASTRO.

Acessado apenas: quando o rádio for compatível com o modelo ou opção.

O campo a seguir é suportado:

10.29.3.1

ID de grupo

Esse campo seleciona (no formato decimal ou hexadecimal) o ID do grupo de dados da CAI (Common Air Interface, interface aérea comum) usado somente ao decodificar endereço no recebimento de dados.

O número desta ID do Grupo associa o rádio a um grupo de dados específico para endereçamento de grupo de mensagens de dados. Quando os dados são transmitidos pelo rádio, a ID do Grupo de Dados não é usada. Essa seleção se aplica ao ID do grupo atual (registro/linha), que se aplica a todos os Sistemas convencionais do tipo ASTRO.

10.29.4

Dados do ASTRO

Esta seção permite visualizar ou modificar a funcionalidade que pode ser aplicada a todos os Sistemas convencionais do tipo ASTRO e, portanto, a todas as Personalidades convencionais com a funcionalidade Sistema ASTRO.

OBSERVAÇÃO:

Para obter mais detalhes sobre a operação de acesso aos canais de dados, consulte a Descrição operacional da Interface aérea comum APCO 25 para canais de comunicação Convencionais.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.29.4.1

Máx. de Tentativas de Transmissão de Dados de CAI

Esse campo seleciona o número máximo de vezes que o rádio tenta enviar uma transmissão de pacote de dados de CAI.

O rádio prosseguirá com essas tentativas até receber uma confirmação do recebimento da transmissão, ou até que o número selecionado de Tentativas de Transmissão seja alcançado.

OBSERVAÇÃO:

Essa seleção se aplica a todos os Sistemas convencionais do tipo ASTRO.

Acima 187: Alcance

Mínimo	Máximo	Incremento
2 tentativas	10 tentativas	1 tentativa

10.29.4.2

Contador de Respostas de Dados de CAI

Esse campo seleciona o tempo mínimo que o rádio deverá aguardar pela confirmação de uma transmissão bem-sucedida de CAI, antes de reenviar outro pacote de dados de CAI.

OBSERVAÇÃO:

Essa seleção se aplica a todos os Sistemas convencionais do tipo ASTRO.

Acima 188: Alcance

Mínimo	Máximo	Incrementos
100 ms	5000 ms	100 ms

10.29.4.3

Contador de Respostas Mín. de Dados de CAI

Esse campo seleciona o tempo mínimo que o rádio deverá aguardar pela confirmação do envio de uma CAI bem-sucedida a ser enviada pelo canal.

Este parâmetro deve ser ligeiramente maior que o Atraso na taxa de transferência de dados do RNC (Radio Network Controller, controlador de rede do rádio) para o rádio. Essa seleção se aplica a todos os Sistemas convencionais do tipo ASTRO.

INFORMAÇÕES:

Não tente alterar essa configuração sem primeiro verificar a taxa de transferência específica do sistema.

Acima 189: Alcance

Mínimo	Máximo	Incrementos
50 ms	2000 ms	50 ms

10.29.4.4

Tamanho máximo do pacote

Esse campo seleciona o número máximo de bytes que pode ser transportado em um único pacote de dados de CAI. Essa seleção se aplica a todos os Sistemas convencionais do tipo ASTRO.

Acima 190: Alcance

Mínimo	Máximo	Incrementos
16 bytes	512 bytes	16 bytes

10.29.4.5

Período de Busca de Sinc. Quadro

Esse campo seleciona o tempo que o rádio escuta para uma Sequência de sincronização de quadros. Uma Sequência de sincronização de quadros no canal indica que há atividade no canal.

Se uma Sequência de sincronização de quadros não for detectada nesse tempo, o rádio presume que o canal está ocioso e transmite o próximo pacote de CAI na fila para transmissão. Essa seleção se aplica a todos os Sistemas convencionais do tipo ASTRO. O tempo é medido em milissegundos.

**INFORMAÇÕES:**

Esse valor deve ser definido para a Duração máxima do pacote de dados OTA. Exemplo: para o tamanho máximo do pacote de CAI de 512 bytes, esse valor deve ser definido para 750ms. Para a operação adequada em um canal com voz ASTRO presente, devido ao tamanho do quadro da voz ASTRO, esse valor deve ser definido acima de 200ms.

Acima 191: Alcance

Mínimo	Máximo	Incrementos
0 ms	5000 ms	50 ms

10.29.4.6

Alcance Aleatório Curto de Transmissão

Esse campo seleciona o tempo máximo que o rádio deverá aguardar para transmitir depois que a primeira Sequência de sincronização de quadros for recebida indicando que o canal está livre.

O rádio verifica de forma aleatória o status de acesso ao canal com base no tempo de espera máximo. Essa seleção se aplica a todos os Sistemas convencionais do tipo ASTRO. O tempo é medido em milissegundos.

**INFORMAÇÕES:**

Aumentar esse valor reduz o potencial de colisão com outros rádios que estejam tentando transmitir dados (captura o canal), mas também aumenta o atraso de acesso ao canal.

Acima 192: Alcance

Mínimo	Máximo	Incrementos
50 ms	500 ms	50 ms

10.29.4.7

Alcance Aleatório Longo de Transmissão

Esse campo seleciona o tempo máximo que o rádio deverá aguardar antes de verificar novamente o status do canal quando o símbolo de Status de Canal Ocupado é recebido.

Quando um status de canal livre é recebido, o rádio consegue transmitir o próximo pacote de Interface Aérea Comum (CAI, Common Air Interface) em fila para transmissão. O rádio verifica de forma aleatória o status de acesso ao canal com base no tempo de espera máximo. Essa seleção se aplica a todos os Sistemas convencionais do tipo ASTRO. O tempo é medido em milissegundos.

Acima 193: Alcance

Mínimo	Máximo	Incrementos
50 ms	5000 ms	50 ms

10.29.4.8

Alcance Aleatório de Resp. de Transmissão

Seleciona o tempo máximo que o rádio deverá aguardar antes de verificar novamente o status do canal quando o Símbolo de status de canal ocupado é recebido.

Essa seleção se aplica somente às conformações de CAI. Quando um status de canal livre é recebido, o rádio consegue transmitir a próxima confirmação de CAI em fila para transmissão. O rádio verifica de forma aleatória o status de acesso ao canal com base no tempo de espera máximo. Essa seleção se aplica a todos os Sistemas convencionais do tipo ASTRO. O tempo é medido em milissegundos.

**INFORMAÇÕES:**

Aumentar esse valor reduz o potencial de conflito com outros rádios que estejam tentando transmitir dados (captura o canal), mas também aumenta o atraso de acesso ao canal.

Acima 194: Alcance

Mínimo	Máximo	Incrementos
50 ms	1000 ms	50 ms

10.29.4.9

Paciência Limitada de Transmissão

Esse campo seleciona o tempo máximo que o rádio tentará transmitir um pacote de dados de CAI.

Quando esse tempo expira, o rádio interrompe as tentativas de transmissão. Essa seleção se aplica a todos os Sistemas convencionais do tipo ASTRO. O tempo é medido em segundos.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

**OBSERVAÇÃO:**

quando definido como **Infinito**, nenhum contador é utilizado, portanto, não há limite de tempo de transmissão.

Acima 195: Alcance

Mínimo	Máximo	Incrementos
2s	255s	1 s

10.29.4.10

Profundidade do cache ARP

Esse campo seleciona quantas entradas são armazenadas na Tabela ARP (Address Resolution Protocol, protocolo de resolução de endereço) do rádio.

A Tabela ARP do rádio é um cache de memória que armazena mapeamentos entre endereços IP e IDs individuais. A Profundidade do cache ARP permite que o rádio seja mais eficiente quando o número selecionado pelo RadioCentral é igual ao número esperado de dispositivos (com endereços IP exclusivos) com o qual o rádio se comunica. Essa seleção se aplica a todos os Sistemas convencionais do tipo ASTRO.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 196: Alcance

Mínimo	Máximo
0	50

**OBSERVAÇÃO:**

A seleção da Profundidade do cache "0" indica que os Endereços IP podem ser armazenados em cache, desse modo, o cache do ARP é efetivamente desativado.

10.29.4.11

Tempo do Cache ARP

Esse campo seleciona o tempo durante o qual as entradas de cache são armazenadas na profundidade do cache ARP. Se todos os dispositivos de comunicação de uma rede tiverem endereços IP estáticos/fixos, recomenda-se definir esse Tempo de cache como **Infinito** (um tempo de cache infinito), o que permite que as entradas do Cache ARP permaneçam continuamente armazenadas em cache.

Se o Tempo do cache ARP não estiver definido como **Infinito**, as entradas do Cache ARP serão apagadas quando o contador expirar. Essa seleção se aplica a todos os Sistemas convencionais do tipo ASTRO. O tempo é medido em horas.

Acessado apenas: quando o rádio for compatível com o modelo/opção e o campo Profundidade do cache ARP não estiver definido como **0**.

OBSERVAÇÃO:

quando definido como Infinito, as entradas do Cache ARP permanecem armazenadas em cache por tempo indeterminado.

Acima 197: Alcance

Mínimo	Máximo	Incrementos
1 hora	24 horas	1 hora

10.29.4.12

ID de cliente convencional (hex)

Esse campo seleciona um número de "ID do sistema" de Chave convencional avançada (ACK) (consulte Relatório de chaves do sistema) que permite o comando Operação de serviços táticos - Inibição.

Um número de "ID do sistema" ACK só pode ser selecionado quando a ACK estiver atualmente carregada no RadioCentral. As ACKs são carregadas no RadioCentral por meio da porta USB do computador com o uso de Dispositivos de chave inseridos em um Leitor do dispositivo de chave da porta USB. Essa seleção se aplica a todos os rádios de todos Sistemas convencionais - ASTRO.

AVISO:

Quando o campo Operação de serviços táticos estiver **Decodificação** ou **Decodificação e codificação** e a Ação de decodificação de desinibição do rádio estiver **desativada**, esse campo deverá conter um número de ACK válido.

Depois que um número ACK válido é inserido, uma gravação de codeplug no rádio só poderá ocorrer quando essa ACK estiver atualmente carregada no RadioCentral (consulte Relatório de chaves de sistema).

Acessado apenas: Quando o campo Ativação da inibição tática estiver **Ativado** e o rádio for compatível com o modelo/opção. E, depois que um número de ACK válido tiver sido inserido nesse campo e salvo, esse valor não poderá ser modificado, a menos que seu número ACK esteja carregado atualmente no RadioCentral (consulte Relatório de chaves de sistema).

A seleção a seguir é suportada:

- O valor padrão de fábrica é **0000**.

10.30

Lista de Alias de Status Convencional

A **Lista de alias de status convencionais** permite visualizar ou definir Status convencionais.

Seu status só pode ser transmitido de uma unidade de rádio para um despachante (unidade de base). Seu status torna o uso de um canal mais eficiente em comparação com uma transmissão de voz. Essa função se aplica apenas à operação no modo Comunicações convencionais.

OBSERVAÇÃO:

O Alias de status deve ser configurado de forma idêntica (ou com o mesmo significado) para o transmissor e as unidades de rádio. Ou seja, o alias de status 1 da unidade de transmissão deve ser idêntico ao alias de status 1 da unidade de rádio (ou ter o mesmo significado).

As mensagens MDC, DVRS e ASTRO são ativadas individualmente por [Sistema convencional na página 408](#) no campo [Status na página 412](#).

Você pode ativar o recurso Status pressionando o botão Status, pressionando o botão Status direto ou selecionando o menu Status (consulte também [Status Número de tentativas na página 397](#) e [Status de Saída automática na página 232](#)).

10.30.1

Número do alias de status

Este campo seleciona um número exclusivo para o Status atual (registro/linha).

Este número é a correspondência entre os rádios de transmissão e de recepção, que determina qual Texto de alias de status aparece na tela do rádio de recepção.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.30.2

Texto do alias de status

Este campo permite definir nomes reconhecíveis para o Status atual (registro/linha).

O [Número do alias de status na página 403](#) é o mesmo para os rádios de transmissão e de recepção; essa correspondência define o Texto do alias de status que aparece na tela do rádio de recepção.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

Exemplos: MESSAGE-5, #510, Electric1

É possível usar caracteres, números, espaços e caracteres especiais.

No máximo 14 caracteres no total.

Consulte também: [Validação de dados do campo de nome do CPS](#)

10.31

Lista de IDs repetidos

A **lista de IDs de repetidores** permite visualizar ou definir IDs para acessar repetidores enquanto opera no modo de comunicação convencional.

Isso só será válido quando um ou ambos os campos de tipo de código de acesso ao repetidor da personalidade convencional estiverem definidos como **MDC** para qualquer personalidade convencional individual.

OBSERVAÇÃO:

Os IDs de repetidores são selecionados para uso nos campos ID de repetidor do MDC da personalidade convencional.

10.31.1

ID do repetidor

Este campo seleciona o ID do repetidor (registro/linha) que é transmitido pelo rádio para obter acesso do repetidor a um canal de comunicação Convencional.

Os IDs dos repetidores devem ser selecionados para uso com canais convencionais específicos dos campos de ID do repetidor de MDC da Personalidade convencional. Um RAC (Repeater Access Code, código de acesso do repetidor) permite que o rádio acesse repetidores específicos.

INFORMAÇÕES:

Isso só é verdadeiro quando um ou ambos os campos Tipo de código de acesso do repetidor (Botão de acesso do repetidor 1/PTT) e Tipo de código (Botão de acesso do repetidor 2) da Personalidade convencional estão definidos como **MDC** para qualquer [Personalidade convencional na página 422](#) individual.

Acima 198: Alcance

Mínimo	Máximo	Incrementos
1	9999	1

10.31.2

Tom (Hz)

Seleciona o Tom Único (frequência) que é transmitido pelo rádio para obter acesso de repetidor a um canal de comunicações convencionais.

Em seguida, é necessário selecionar Tons únicos (frequências) para uso com canais convencionais específicos dos campos de frequência de Tom único da Personalidade convencional. Cada "código de acesso repetido" (RAC) permite que o rádio acesse um repetidor específico.

INFORMAÇÕES:

Isso só será válido quando um ou ambos os campos de Tipo de código de acesso ao repetidor da Personalidade convencional estiverem definidos como **Tom único** para qualquer [Personalidade convencional na página 422](#) individual dentro da seção do RAC (Personalidade convencional).

Acima 199: Alcance

Mínimo	Máximo	Incrementos
300 Hz	3000 Hz	0,1 Hz

10.32

Lista de grupos de conversação do ASTRO

A **Lista de grupos de conversação do ASTRO** permite definir a funcionalidade dos membros individuais da lista de grupos de conversação do ASTRO atual. Os grupos de conversação do ASTRO só são usados com personalidades convencionais, por meio dos sistemas convencionais do tipo ASTRO.

**OBSERVAÇÃO:**

Uma lista de grupos de conversação pode ser referenciada a uma personalidade convencional com o campo Lista de grupos de conversação.

Uma vez que uma lista de grupos de conversação é selecionada para uma personalidade, um grupo de conversação padrão pode ser selecionado para essa mesma personalidade no campo ID do grupo de conversação do ASTRO da opção de frequência.

Dependendo do campo Tipo de seleção da personalidade convencional escolhido, será possível acessar uma lista de grupos de conversação inteira ou um único grupo de conversação ligado a esse canal.

10.32.1

Geral

Esta seção permite definir a funcionalidade das listas de grupos de conversação do ASTRO individuais, bem como dos membros do grupo de conversação dentro de cada lista.

Os grupos de conversação do ASTRO só são usados com personalidades convencionais, por meio dos sistemas convencionais do tipo ASTRO. Os membros da lista de grupos de conversação do ASTRO estão disponíveis para operações de chamada seletiva ou alerta de chamada. Dependendo do campo Tipo de seleção da personalidade convencional escolhido, será possível acessar uma lista de grupos de conversação inteira ou um único grupo de conversação ligado a esse canal.

**OBSERVAÇÃO:**

Uma lista de grupos de conversação pode ser referenciada a uma personalidade convencional com o campo Lista de grupos de conversação. Uma vez que uma Lista de Grupos de Conversação é selecionada para uma personalidade, um Grupo de Conversação padrão pode ser selecionado para essa mesma personalidade a partir do campo Grupo de Conversação do ASTRO da Opção de Canal

10.32.1.1

Nome da Lista de Grupos de Conversação do ASTRO

Este campo permite criar nomes reconhecíveis para a lista de grupos de conversação do ASTRO atual.

A Lista de grupos de conversação do ASTRO é selecionada para ser usada a partir do campo Lista de Grupos de conversação da personalidade convencional do ASTRO.

**OBSERVAÇÃO:**

É possível usar caracteres, números, espaços e caracteres especiais.

São permitidos no máximo 14 caracteres.

10.32.1.2

Alias do Grupo de Conversação

Esse campo permite que as informações de texto do alias do grupo de conversação sejam exibidas na tela.

Esse recurso se aplica à lista de grupos de conversação do ASTRO atual.

O Alias do grupo de conversação permite que seu nome reconhecível apareça quando você estiver rolando pela Lista de grupos de conversação do ASTRO.

Quando desativado, os IDs dos grupos de conversação aparecem na tela do rádio.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.32.1.3

Índice de perfil ASTRO OTAR

Este campo seleciona o Perfil KMF seguro a ser utilizado na lista de grupos de conversação atual do ASTRO.

**INFORMAÇÕES:**

Quando este campo não estiver definido como **Desativado**, o campo Seleção de chaves para a lista de grupos de conversação atual do ASTRO pode selecionar somente chaves da lista de referências de chave de criptografia segura de hardware deste Perfil KMF seguro selecionado

Esteja ciente de que o RadioCentral está na verdade apontando para as chaves da lista de chaves de criptografia para esta seleção; chaves individuais da Lista de referências de chave de criptografia segura de hardware fazer referência às chaves da lista de chaves de criptografia do campo Referência de chave de criptografia . Portanto, qualquer chave selecionada quando este campo não está definido como **Desativado** deve primeiro ser definido na lista de referências da chave de criptografia de hardware segura .

Quando este campo estiver definido como **Desativado** ou não for aplicável (esmaecido), o valor do campo Seleção de chaves é escolhido diretamente da Lista de chaves de criptografia da janela Segurança total

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software** e [Padrão de criptografia avançada \(AES256\) na página 295](#) estiver ativado e quando o campo [Ativação do OTAR na página 296](#) está ativado, quando o campo [Ativação do ASTRO OTAR na página 297](#) está ativado e quando o rádio for compatível com o modelo/opção.

10.32.2

Lista de grupos de conversação

Essa seção permite definir a funcionalidade de membros individuais do grupo de conversação dentro da Lista de grupos de conversação atual do ASTRO.

Os grupos de conversação do ASTRO só são usados com personalidades convencionais, por meio dos sistemas convencionais do tipo ASTRO.

**OBSERVAÇÃO:**

Uma lista de grupos de conversação pode ser referenciada a uma personalidade convencional com o campo Lista de grupos de conversação. Uma vez que uma lista de grupos de conversação é selecionada para uma personalidade, um grupo de conversação padrão pode ser selecionado para essa mesma personalidade no campo ID do grupo de conversação do ASTRO da opção de frequência.

Dependendo do campo Tipo de seleção da personalidade convencional escolhido, será possível acessar uma lista de grupos de conversação inteira ou um único grupo de conversação ligado a esse canal.

10.32.2.1

Alias do Grupo de Conversação

Esse campo permite que as informações de texto do alias do grupo de conversação sejam exibidas na tela.

Esse recurso se aplica à lista de grupos de conversação do ASTRO atual.

O Alias do grupo de conversação permite que seu nome reconhecível apareça quando você estiver rolando pela Lista de grupos de conversação do ASTRO.

Quando desativado, os IDs dos grupos de conversação aparecem na tela do rádio.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.32.2.2

ID do grupo de conversação

Esse campo seleciona (em formato decimal ou hexadecimal) um número de identificação exclusivo para o grupo de conversação atual.

Essa seleção se aplica ao grupo de conversação atual (registro/linha) da [Lista de grupos de conversação do ASTRO na página 404](#) atual.

Acima 200: Alcance

Mínimo	Máximo
0	65535

**INFORMAÇÕES:**

O Grupo de conversação "65535" (FFFF Hex) é um Grupo de conversação em "todas as ligações" de todos os sistemas. Todos os outros grupos de conversação desativam o mudo para uma transmissão do grupo de conversação "65535" e um grupo de conversação definido como "65535" desativa o mudo para qualquer ID de grupo de conversação.

O Grupo de conversação "0" é "apenas para recepção" de todo o sistema que recebe as transmissões de "Todas as ligações" enviadas ao grupo de conversação "65535". O grupo de conversação "0" também recebe transmissões de chamada seletiva enviadas para seu ID individual específico do ASTRO. Isso só é possível quando a Regra de desativação da função mudo da recepção do ASTRO de um canal/personalidade que tenha esse ID de grupo de conversação estiver definida como **Silenciador seletivo**.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.32.2.3

Privacidade de voz/Remover ligação

Esse campo seleciona o modo de transmissão para o grupo de conversação atual.

Essa seleção se aplica ao grupo de conversação atual (registro/linha) da [Lista de grupos de conversação do ASTRO na página 404](#) atual.

As seleções a seguir são compatíveis:

Selecionar

Permite ativar ou desativar as comunicações protegidas por criptografia.

**OBSERVAÇÃO:**

O pressionamento do botão Seleção de transmissão segura, a ativação/desativação da Seleção de transmissão segura ou a seleção do menu Proteger permite o acesso às comunicações por criptografia segura.

Apagar

Liga ou confirma o canal para a operação de comunicações Convencionais normais (não protegidas).

Proteger

Liga ou confirma o canal para operação com criptografia segura.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**.

10.32.2.4

Seleção de chave

Esse campo seleciona a chave de criptografia segura a ser usada no modo de criptografia segura para o grupo de conversação atual (registro/linha).

Essa seleção se aplica ao grupo de conversação atual da Personalidade de entroncamento atual.

INFORMAÇÕES:

Quando o campo [Índice de perfil ASTRO OTAR na página 406](#) não está desabilitado para a Lista de grupos de conversação ASTRO atual, este valor de seleção de chave é escolhido a partir da [Lista de referências de chave de criptografia segura de hardware na página 315](#) do perfil KMF seguro selecionado no campo Índice de perfil KMF.

AVISO:

Esteja ciente que o RadioCentral está, na verdade, apontando para as chaves da [Lista de chaves de criptografia na página 310](#) para essa seleção. Chaves individuais da Lista de referências de chave de criptografia segura de hardware fazem referência às chaves da Lista de chaves de criptografia do campo [Referência de Chaves de Criptografia na página 316](#). Portanto, qualquer chave selecionada quando ASTRO OTAR estiver habilitado deve ser definida primeiro na Lista de referências de chave de criptografia segura de hardware.

Quando o campo Índice de perfil KMF estiver desabilitado ou não for aplicável (cinza) à Lista de grupos de conversação ASTRO, esse valor de seleção de chave será diretamente escolhido da Lista de chaves de criptografia segura.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software** e quando o campo [Privacidade de voz/Remover ligação na página 407](#) estiver definido como **Proteger** ou **Selecionar** e quando o modelo ou a opção do rádio for compatível.

10.33

Sistema convencional

Sistemas Convencionais permite visualizar ou definir sistemas de sinalização individuais.

Os tipos de sistema de sinalização incluem: **ASTRO**, **MDC**, **DVRS** e **Quik-Call II**. Os sistemas de sinalização individuais são selecionados para uso com as Personalidades convencionais.

OBSERVAÇÃO:

Os Sistemas convencionais são selecionados para uso no campo Sistema ASTRO ou Sistema não ASTRO da Personalidade convencional.

10.33.1

Geral

A seção **Geral** permite visualizar ou definir funcionalidades básicas para sistemas de sinalização de comunicação convencionais.

OBSERVAÇÃO:

Os campos compatíveis dependem do conjunto de valores para o Tipo de Sistema.

Os Sistemas convencionais são selecionados para uso no campo Sistema ASTRO ou Sistema não ASTRO da Personalidade convencional.

10.33.1.1

Sistema ASTRO ou DVRS

Os campos a seguir são compatíveis quando o Tipo de Sistema é definido como **ASTRO** ou **DVRS**:

10.33.1.1.1

Nome do Sistema convencional

Este campo permite criar nomes reconhecíveis para o Sistema convencional atual.

Os Sistemas convencionais são selecionados para uso no campo Sistema ASTRO ou Sistema não ASTRO da Personalidade convencional.

OBSERVAÇÃO:

Exemplos: Byrne004, Power03, #510

É possível usar caracteres, números, espaços e caracteres especiais.

São permitidos no máximo 14 caracteres.

10.33.1.1.2

Tipo de sistema

Esse campo permite selecionar o Tipo de sistema desejado no Sistema convencional atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

- ASTRO
- MDC
- DVRS
- DTMF
- Quik-Call II
- Tom Único

OBSERVAÇÃO:

Essas seleções são dependentes da opção/do modelo.

10.33.1.1.3

Número do grupo do sistema

Esse campo permite definir um Número de grupo do sistema para um Sistema convencional ASTRO não definido no codeplug atual.

O número de grupo do sistema fornece um caminho para agrupar de forma lógica vários Sistemas convencionais no codeplug que é o mesmo sistema OTA.

INFORMAÇÕES:

Esta seleção apenas se aplica quando o campo Nome do sistema está definido como **Personalizado** no registro/linha atual. Portanto, essa seleção corresponde a um Sistema convencional do ASTRO no campo. Esta seleção se aplica ao conjunto de IDs de chamada atual (registro/linha) do Contato atual da Lista de ligações unificadas. Esse conjunto de IDs de chamada pode então ser selecionado no campo [ID de chamada na página 664](#).

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **Personalizado** ou o rádio for compatível com o modelo/opção.

10.33.1.1.4

Tempo de Travamento do Grupo de Conversação em Todo o Sistema

Este campo seleciona o tempo que o rádio aguarda quando uma chamada de grupo de conversação em todo o sistema é encerrada.

Durante esse período de espera, o ID do grupo de conversação 65535 (FFFF Hex) é usado para todas as chamadas do grupo de conversação do ASTRO. Esta seleção se aplica somente à operação no Sistema convencional ASTRO. O tempo é medido em segundos.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **ASTRO** e quando o modelo ou a opção do rádio for compatível.

As seleções a seguir são compatíveis:

- Desabilitado
- 12 horas
- 24 horas

OBSERVAÇÃO:

O tempo é em segundos.

10.33.1.1.5

Duração do preâmbulo

Este campo seleciona o período de tempo que determina o número mínimo de pacotes de preâmbulo de sincronização de bits enviados no início de todas as transmissões do ASTRO.

Esses pacotes permitem que os rádios transmissores e receptores se sincronizem entre si antes de uma transmissão de sistemas ASTRO. O período de tempo é igual à configuração desta Duração do preâmbulo multiplicada por 0,2083 milissegundos (ms). Esta seleção se aplica somente à operação no Sistema convencional ASTRO.

INFORMAÇÕES:

Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou de **ADP (Advanced Digital Privacy, privacidade digital avançada)**, o rádio transmitirá pelo menos 50 milissegundos de preâmbulo devido aos atrasos encontrados durante a criptografia do fluxo de dados.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **ASTRO** ou **DVRS**.

Acima 201: Alcance

Mínimo	Máximo
0	1275

10.33.1.1.6

Paciência limitada

Este campo seleciona o tempo que o rádio espera de forma polida que o tráfego do canal atual seja limpo.

Exemplos de transmissões que usam esse valor: Transmissões de Alertas de Chamada, Chamadas seletivas, Mensagens, Status e Emergência. Essa seleção se aplica ao Sistema convencional atual. No caso de emergência, o rádio educadamente aguarda após as Tentativas não polidas expirarem.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **ASTRO** ou **DVRS** ou **MDC**.

OBSERVAÇÃO:

Quando definido como Infinito, nenhum contador é utilizado, portanto, há um tempo de espera infinito.

Acima 202: Alcance

Mínimo	Máximo	Incrementos
1 s	255 s	1

10.33.1.1.7

Seleção de perfil de emergência

Este campo permite selecionar o Perfil de emergência convencional adequado a ser usado com o Sistema convencional atual.

Você pode iniciar o Modo de emergência pressionando o botão Emergência

OBSERVAÇÃO:

Os nomes que aparecem para a seleção são definidos no campo Nome do perfil de emergência.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **DVRS** ou **MDC** ou (quando o campo Tipo de sistema estiver definido como **ASTRO** e quando o campo Sistema de interface de site remoto estiver desativado).

As seleções a seguir são compatíveis:

- Transmissão de emergência desativada
- Perfis de emergência convencional disponíveis

10.33.1.1.8

Seleção de Perfil de dados

Este campo permite a seleção do Perfil de dados apropriado a ser usado com o Sistema convencional ASTRO ou DVRS atual.

AVISO:

Para o Tipo de sistema **DVRS**, um Perfil de dados só é válido quando o Tipo de perfil de dados está definido como **Entroncamento**, quando os Dados de interrupções de voz de recepção estão **Ativados**, quando a Transmissão limitada está **Desativada**, quando a Ativação da compressão do cabeçalho IP está **Desativada**, quando os Dados do terminal estão **Desativados**, quando o Modo PAD está definido como **Desativado**, quando todas as entradas da Lista DAC têm o Modo operacional definido como **APCO 25 clássico**, quando (dados do pacote APCO 25) Proteger/Remover chamada está definido como **Remover** ou **Proteger** e quando a Seleção da lista de portas estiver definida como **Desativada**.

Quando o campo Rádio duplo - Seleção de rádio for definido como **Rádio secundário** e o campo Habilitar transmissão de rádio secundária estiver **Desabilitado**, esse campo deverá ser definido como **Dados desabilitados** para ser considerado válido.

INFORMAÇÕES:

Sistemas convencionais ASTRO e DVRS são selecionados para serem usados a partir do campo Sistema ASTRO da Personalidade convencional.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **DVRS**, ou (quando o campo Tipo de sistema estiver definido como **ASTRO** e quando o campo Sistema de interface de site remoto estiver desativado).

As seleções a seguir são compatíveis:

- Dados desativados
- Perfis de dados disponíveis

10.33.2

Funções

Essa seção permite que você visualize ou defina a funcionalidade básica de sistemas de sinalização ASTRO individuais.

OBSERVAÇÃO:

Os Sistemas convencionais são selecionados para uso no campo Sistema ASTRO ou Sistema não ASTRO da Personalidade convencional.

10.33.2.1

Inibição de rádio

Este campo permite que o rádio receba um sinal de inibição remoto enquanto opera no Sistema convencional atual.

Esse sinal de inibição é um comando de desligamento enviado pela unidade transmissora. Ao receber esse comando, o rádio transmite uma breve notificação para o equipamento de transmissão. O rádio então entra em um estado de inatividade durante o qual o áudio receptor se torna mudo e o caminho do áudio de transmissão é bloqueado. Durante a inibição, todos os seus controles de ficam inoperantes, o Modo de varredura é interrompido no modo/canal operacional que recebeu o comando, e todos os LEDs do rádio serão desligados.

INFORMAÇÕES:

Para apagar o estado de inibição do rádio, envie um comando de desinibição para o rádio ou refaça o processo Ler/Gravar do rádio.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **DVRS** ou **MDC**) ou (quando o campo Tipo de sistema estiver definido como **ASTRO** e quando o campo Sistema de interface de site remoto estiver desativado.)

10.33.2.2

Verificação do rádio

Este campo permite que o rádio decodifique e responda automaticamente a uma Verificação de rádio.

As verificações de rádio permitem que os operadores verifiquem o estado do rádio (ligado ou desligado), contanto que o mesmo esteja dentro do alcance do sistema. Essa função se aplica ao Sistema convencional atual.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **DVRS** ou **MDC**) ou (quando o campo Tipo de sistema estiver definido como **ASTRO** e quando o campo Sistema de interface de site remoto estiver desativado.)

10.33.2.3

Status

Este campo ativa o recurso Status para o Sistema convencional atual.

O recurso Status permite selecionar e transmitir um Status específico da janela Lista de alias de status programado. Você pode ativar o recurso Status pressionando o botão Status ou Status direto ou selecionando o menu Status (consulte também Número de tentativas de status e Saída automática de status).

Acessado apenas: Quando o rádio estiver habilitado para o modelo/a opção, e ((quando o campo Tipo de sistema estiver definido como **DVRS** ou **MDC**), ou (quando o campo Tipo de sistema estiver definido como **ASTRO** e quando o Sistema de interface de site remoto estiver desativado)).

10.33.2.4

Solicitação de status

Esse campo permite que o rádio responda automaticamente a uma interrogação de status remoto com a última tentativa de status. Essa função se aplica ao Sistema convencional atual.

Acessado apenas: Quando o rádio estiver habilitado para o modelo/a opção, e quando o campo Status estiver ativado, e ((quando o campo Tipo de sistema estiver definido como **DVRS** ou **MDC**), ou (quando o campo Tipo de sistema estiver definido como **ASTRO** e quando o Sistema de interface de site remoto estiver desativado)).

10.33.2.5

Indicador de Rx do alarme de emergência

Esse campo seleciona o tipo de notificação que você ouve e vê quando um alarme de Emergência é recebido de outro rádio.

Esse recurso também deve ser ativado (quando apropriado) para o Sistema MDC individual ou Sistema ASTRO no campo Indicador de recepção do alarme de emergência, ou para o sistema de entroncamento no campo Indicador de recepção do alarme de emergência. Essa seleção é aplicável durante a operação no Modo de emergência tanto para as comunicações convencionais como para as de entroncamento.

INFORMAÇÕES:

O tempo do Indicador de recepção do alarme de emergência é de 10 segundos. Durante esses 10 segundos, você pode desativar o indicador pressionando qualquer um dos botões do rádio, exceto **volume** e **luz**.

Assim que o indicador apaga ou é apagado, os alarmes de emergência repetidos do mesmo ID principal do MDC, ou do ID individual do sistema ASTRO são ignorados por 20 segundos que sucedem.

Os alarmes de emergência não são detectados enquanto o rádio está no modo de varredura.

Os alarmes de emergência não são detectados quando o rádio está ativo em um canal de voz.

As seleções a seguir são compatíveis:

Sem indicação

Nenhum alerta é ouvido ou visto.

Somente alertar

Emite um alerta de áudio.

Display Only

Exibe um alerta visual. O alerta visual é aplicável somente aos modelos de rádio com tela.

Alertar e exibir

Emite um alerta de áudio e exibe um alerta visual. O alerta visual é aplicável somente aos modelos de rádio com tela.

OBSERVAÇÃO:

Para as seleções **Somente exibir** e **Alertar e exibir**, o seguinte se aplica: Quando um Alarme de emergência é detectado pelo rádio, o aviso **AE-REC** (Emergency Alarm Received, alarme de emergência recebido) é exibido na tela do rádio. Quando um Sinal de emergência "Encontre-me" é detectado pelo rádio, o aviso **BCON RX** (Emergency Beacon Received, sinal de emergência recebido) é exibido no visor do rádio.

AE-REC é exibido alternadamente com o ID principal do MDC, o ID individual do sistema ASTRO ou o ID da unidade de entroncamento do rádio que enviou o Alarme de emergência e continua por dez segundos. Alias reverso/ID de chamada também é possível.

10.33.2.6

Ativação do POP25

Este campo permite que o rádio receba comunicações via POP25 (Programming Over Project 25, programação via projeto 25) durante a operação no Sistema convencional ASTRO atual.

O POP25 também é conhecido como OTAP.

**INFORMAÇÕES:**

Para poder usar o POP25 em um Sistema ASTRO, uma ACK (Advanced Conventional Key, chave convencional avançada) ou uma ASK (Advanced System Key, chave de sistema avançada) com acesso OTAP/POP25 deve ser carregada no RadioCentral.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware**, quando o campo Tipo de sistema estiver definido como **ASTRO**, quando um Perfil de dados referenciado tiver sido selecionado para o Sistema atual, quando o campo Sistema de interface de site remoto estiver desativado e quando o rádio estiver habilitado para o modelo/a opção.

10.33.2.7

Registro de dados CAI

Este campo permite que o rádio se registre na porção de dados da infraestrutura FNE (Fixed Network Equipment, equipamento de rede fixa); o FNE também é referido como "O sistema".

Em seguida, a porção de dados do sistema envia uma resposta de registro de dados CAI (Common Air Interface, interface aérea comum) ou uma notificação confirmando o registro de volta ao rádio. Os eventos do rádio que impulsionam esse registro incluem: inicialização do rádio, troca de modo, verificação de saída e desligamento do rádio. Essa função se aplica ao Sistema convencional atual.

**AVISO:**

Esse campo será inválido se um dos cenários a seguir ocorrer:

- Quando o Tipo de sistema estiver definido como **ASTRO**, quando o Tipo do Perfil de dados do Perfil de dados referenciado for **Somente banda larga**, e quando este campo estiver definido como **Ativado**.
- Quando o Tipo de sistema estiver definido como **ASTRO**, e quando o Tipo do Perfil de dados do Perfil de dados referenciado for **Banda larga e convencional** e quando este campo estiver definido como **Desativado**.

**INFORMAÇÕES:**

O rádio somente tenta fazer o registro de dados CAI quando existe uma função de dados ativada na personalidade/canal selecionada do rádio.

Os recursos de dados do rádio estão disponíveis somente quando o rádio consegue se registrar no sistema com sucesso e, em seguida, recebe de volta, do sistema uma confirmação de que o registro foi realizado com sucesso.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **ASTRO**, quando o campo Sistema de interface de site remoto estiver desativado e quando o rádio estiver habilitado para o modelo/a opção.

10.33.2.8

Enviar localização ao par/no PTT

O sistema ASTRO permite que um rádio transmissor codifique suas coordenadas de localização em suas transmissões de voz do ASTRO de modo semelhante ao ID do PTT (consulte também Exibição da localização do par).

**AVISO:**

O Modo ARS deve ser definido como **Servidor aprimorado** no registro do Perfil de dados, para evitar Relatório de campos inválidos quando Tipo de sistema for DVRS.

**INFORMAÇÕES:**

No sistema ASTRO, as transmissões de voz de rádio para rádio possuem suporte para codificação das coordenadas de localização no fluxo de voz. Em outras palavras, Páginas convencionais e Chamadas seletivas possuem suporte para a função Exibir localização do par. No entanto, o DVRS, o modo de telefone e outros recursos dependentes de infraestrutura não possuem suporte para a função Exibição da localização do par. No sistema DVRS, a transmissão de voz de rádio para infraestrutura possui suporte para codificação das coordenadas de localização no fluxo de voz.

Se as coordenadas de localização não forem obtidas pelo receptor de GPS do rádio (porque o sinal de GPS foi interrompido de alguma forma ou o campo Ativação de localização selecionada pelo usuário estiver ativado e você tiver desativado o recurso GPS pressionando o botão Localização ou selecionando o menu Localização), o rádio codificará as coordenadas de localização recém-salvas no fluxo de voz.

Se o intervalo de atualização desde a última atualização de coordenadas de localização exceder o contador interno, o rádio identifica as coordenadas de localização no fluxo de voz como "interrompidas". Se as coordenadas não foram salvas, o rádio envia o fluxo de voz sem quaisquer dados de localização.

Acessado apenas: Quando o rádio estiver habilitado para o modelo/a opção e quando o campo Tipo de sistema estiver definido como **ASTRO**, e quando o campo Tipo de sistema estiver definido como **DVRS**, e o Modo ARS for **Servidor aprimorado** em seu Perfil de dados e quando o campo Ativação de localização estiver ativado.

10.33.2.9

Serviço de mensagens de texto

Este campo seleciona o modo Mensagens de texto para o Sistema ASTRO convencional atual.

**AVISO:**

Quando o Serviço de mensagens de texto é usado enquanto o valor padrão da Varredura de dados e da Duração do preâmbulo de varredura de dados aumenta ou diminui, o Contador curto de tentativas precisa ser aumentado ou diminuído de acordo. Por exemplo, no Modo de dados direto da operação (consulte Modo de dados do pacote), se o valor da Duração do preâmbulo de varredura de dados aumentar para 30 (o padrão é 20), o Contador curto de tentativas deverá ser aumentado para 25 segundos (o padrão é 15). Para cada 10 unidades adicionadas à Duração do preâmbulo de varredura de dados, o Contador curto de tentativas deve aumentar 10 segundos.

**INFORMAÇÕES:**

É possível acessar Mensagem de texto pressionando o botão Serviço de mensagens de texto ou selecionando o menu Serviço de mensagens de texto.

É possível acessar Mensagem de texto rápida pressionando o botão Texto rápido de TMS.

É possível acessar a função Mensagem de consulta pressionando o botão Consulta TMS.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **ASTRO**, quando um Perfil de dados referenciado válido tiver sido selecionado para o sistema atual, quando a seleção

de Perfil de dados não estiver definida como **Dados desativados**, o Modo SmartMessaging estiver definido como **LMR** e o rádio estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Nenhum

Recurso desativado.

Somente lista

Permite selecionar apenas mensagens de texto da Lista de mensagens de texto rápidas programadas.

Ilimitado

Permite selecionar Mensagens de texto rápidas e inserir sua própria mensagem de texto pelo teclado do rádio.

**AVISO:**

Essa seleção fica disponível somente em rádios que têm um teclado ou microfone do teclado.

**OBSERVAÇÃO:**

Esta seleção não se aplica ao APX N70.

10.33.2.10

Serviço de mensagem de texto em grupo

Este campo seleciona o modo Mensagens de texto em grupo para o Sistema convencional ASTRO ou DVRS atual.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **ASTRO** ou **DVRS** e quando o rádio estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Desabilitado

A Mensagem de texto em grupo não será recebida.

Decodificação completa

A Mensagem de texto em grupo será recebida.

10.33.2.11

Selecionar chamada/redefinição da chamada recebida

Este campo seleciona uma Exceção de desativação do modo silencioso manual ou temporizada para a Regra de desativação do modo silencioso da recepção ASTRO da Personalidade convencional programada, bem como uma Exceção de desativação do modo silencioso manual ou temporizada para Alertas de chamada quando você ativa Silenciar voz do canal (consulte o recurso Ativação do alerta do usuário de chamada recebida da Personalidade convencional).

O tempo de exceção (programado ou manual) é conhecido como Estado de liberação do silenciador. Para as duas seleções temporizadas abaixo, o campo Tempo de redefinição automática determina

parcialmente por quanto tempo o Estado de liberação do silenciador continuará. Essa seleção se aplica ao Sistema convencional atual.

OBSERVAÇÃO:

Sistemas convencionais ASTRO e DVRS são selecionados para serem usados a partir do campo Sistema ASTRO da Personalidade convencional.

INFORMAÇÕES:

Para os alertas de chamada, o Estado de liberação do silenciador será iniciado quando o recurso Ativação do alerta do usuário de chamada recebida da função Silenciar voz estiver ativo e o rádio estiver com o modo silencioso desativado.

Para as ligações do Sistema ASTRO, quando a função Alerta do usuário da chamada recebida da função Silenciar voz não estiver ativa, o Estado de liberação do silenciador começará quando a Regra de desativação da função mudo da recepção do ASTRO da Personalidade for cumprida e o rádio estiver com a função mudo desativada. Quando você ativa o recurso Alerta do usuário de chamada recebida da função Silenciar voz, o Estado de liberação do silenciador se aplica somente a Alertas de chamada. Isso é aplicável porque a função Silenciar voz só permite a desativação do modo silencioso do rádio para alertas de chamada.

Acessado apenas:

- Quando o campo Tipo de sistema estiver definido como **DVRS** ou
- Quando o campo Tipo de sistema estiver definido como **ASTRO** e o campo Sistema de interface de site remoto estiver desativado.

As seleções a seguir são compatíveis:

Chamada seletiva: Para as duas seleções temporizadas, durante a execução do Tempo de redefinição automática, sempre que o botão PTT do rádio for pressionado, o temporizador será interrompido e zerado; após a liberação do botão PTT, o temporizador será reiniciado (do zero), estendendo o Estado de liberação do silenciador.

Manual

- Para dispositivo móvel: Atualmente, essa seleção não se aplica a chamadas seletivas.
- Para portátil: Pressionar o botão "Monitor" encerrará o Estado de liberação do silenciador.

Automático

Se o contador expirar, independentemente de o rádio estar silenciado ou não, o Estado de liberação do silenciador será encerrado e as Regras de desativação da função mudo de recepção do ASTRO serão novamente necessárias para desativar a função mudo de quaisquer futuras transmissões.

Auto c/ operadora

Se o modo silencioso do rádio estiver desativado quando o temporizador expirar (devido à substituição da operadora), ele permanecerá com esse modo desativado até que a operadora seja liberada. Após a liberação da operadora e a ativação do modo silencioso do rádio, o temporizador será zerado e reiniciado, estendendo o Estado de liberação do silenciador novamente; se o rádio permanecer com o modo silencioso ativado por um período inteiro do temporizador (sem substituição da operadora), o Estado de liberação do silenciador será encerrado e as Regras de desativação do modo silencioso da recepção ASTRO serão novamente necessárias para desativar o modo silencioso para futuras transmissões.

Alerta de Chamada.

Manual

Os dois métodos manuais a seguir para encerrar o Estado de liberação do silenciador também se aplicam a você quando a opção "Automático" ou "Automático com operadora" estiver selecionada.

- Quando o recurso Ativação do alerta do usuário de chamada recebida da função Silenciar voz estiver ativo, pressionar o botão Silenciar voz ou selecionar o menu Silenciar voz desativa essa função e encerra o Estado de liberação do silenciador.

- Pressionar o botão PTT encerrará o estado de liberação do silenciador.

Automático

Se o temporizador expirar, independentemente de o rádio estar com o modo silencioso ativado ou não, o Estado de liberação do silenciador será encerrado e as regras da Ativação do alerta do usuário de chamada recebida da função Silenciar voz serão novamente necessárias para desativar o modo silencioso de futuras transmissões.

Auto c/ operadora

Se o modo silencioso do rádio estiver desativado quando o temporizador expirar (devido à substituição da operadora), ele permanecerá com esse modo desativado até que a operadora seja liberada. Após a liberação da operadora e a ativação do modo silencioso do rádio, o temporizador será zerado e reiniciado, estendendo o Estado de liberação do silenciador novamente; se o rádio permanecer silenciado por um período inteiro do temporizador (sem substituição da operadora), o Estado de liberação do silenciador será encerrado e as regras de Ativação de alerta de usuário de chamada recebida da função Silenciar voz serão novamente necessárias para ativar o modo silencioso de futuras transmissões.

10.33.2.12

Tempo de redefinição automática

Este campo seleciona o tempo necessário durante a Exceção de desativação do modo silencioso para a Regra de desativação do modo silencioso da recepção ASTRO ou Tipo de desativação do modo silencioso não ASTRO, bem como seleciona o tempo necessário durante a Exceção de desativação do modo silencioso para Alertas de chamada quando você ativa Silenciar voz do canal (consulte o campo Ativação do alerta do usuário de chamada recebida ASTRO ou Ativação do alerta do usuário de chamada recebida não ASTRO).

O tempo de exceção é conhecido como Estado de liberação do silenciador. Esse temporizado é pertinente apenas para as duas seleções programadas Selecionar chamada/Redefinição da chamada recebida. Essa seleção se aplica ao Sistema convencional atual. A medição é feita em segundos.

Acessado apenas: Quando o campo Selecionar chamada/Redefinição da chamada recebida não estiver definido como **Manual**, quando o campo Tipo de sistema estiver definido como **DVRS, MDC, DTMF, Quik-Call II** ou **ASTRO** e quando o campo Sistema de interface de site remoto estiver desativado.

Acima 203: Alcance

Mínimo	Máximo
0 s	255 s

10.33.2.13

Modo de rádio remoto

Este campo permite que o rádio decodifique um comando de Monitor remoto ou de Rastreamento de rádio para o Sistema convencional atual.

OBSERVAÇÃO:

O LED de transmissão do rádio torna-se vermelho sólido indicando que a transmissão do rádio está sendo feita no modo Monitor remoto.

É possível sair do modo Monitor remoto mudando de canal manualmente ou desligando o rádio.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **ASTRO** ou **MDC** e quando o rádio estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Desabilitado

O modo Rádio remoto não está disponível.

Rastreamento de rádio (Não possível para MDC)

O rádio será ativado automaticamente e enviará um sinal sem modulação à operadora. Assim, um rádio perdido ou roubado poderá ser recuperado. O rádio será ativado pelo período de tempo selecionado pelo Tempo base de transmissão.

Monitor remoto

O rádio é ativado automaticamente transmitindo áudio. Isso é especialmente útil em uma situação de emergência de um usuário com problemas. O rádio será ativado pelo período de tempo selecionado pelo Tempo base de transmissão.

10.33.2.14

Tempo base de Tx

Este campo seleciona o tempo pelo qual o rádio permanece ativado uma vez que o comando Modo de rádio remoto é recebido.

Essa seleção se aplica ao Sistema convencional atual. O tempo é medido em segundos.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **ASTRO** ou **MDC**, e quando o campo Modo de Rádio remoto estiver definido como **Rastreamento de rádio** ou **Monitor remoto** e quando o rádio estiver habilitado para o modelo/a opção.

Acima 204: Alcance

Mínimo	Máximo	Incrementos
10 s	120 s	10 s

10.33.2.15

Tipo de alias do rádio OTA

Este campo configura a codificação (transmissão) e a decodificação (recepção) do recurso Alias do rádio OTA (Over-The-Air, over the air).

AVISO:

O rádio não poderá exibir o alias se estiver recebendo IDs duplicados até que a duplicação seja removida. Gravar o codeplug no rádio fará com que a lista de chamadas retorne ao estado original e todas as atualizações de alias de OTA serão perdidas.

INFORMAÇÕES:

Se a atualização de alias de OTA não aparecer no visor, você deverá atualizar a lista de chamadas do rádio no RadioCentral ou no gerenciador de provisionamento.

As seleções a seguir são compatíveis:

Desabilitado

O rádio não transmite nem recebe os dados do alias do rádio.

Apenas Liderando

Os dados do Nome do Rádio são transmitidos apenas antes da voz.

AVISO:

Essa seleção só será válida quando o campo [Tipo de voz/sinal de transmissão na página 427](#) estiver definido como **ASTRO** e quando o Sistema Convencional referenciado não for um DVRS.

Apenas Seguindo

Os dados do Nome do Rádio são transmitidos apenas depois da voz.

**AVISO:**

Essa seleção só será válida quando o campo Tipo de Voz/Sinal de Transmissão estiver definido como **ASTRO** e quando o Sistema Convencional referenciado não for um DVRS.

Liderando e Seguindo

Os dados do Nome do Rádio são transmitidos antes e depois da voz.

**AVISO:**

Essa seleção só será válida quando o campo Tipo de Voz/Sinal de Transmissão estiver definido como **ASTRO** e quando o Sistema Convencional referenciado não for um DVRS.

Apenas decodificação

Os dados do alias do rádio recebem dados sem limitação.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.33.2.16

Atualização de alias do rádio OTA ativada

Este campo permite que o sistema atual atualize o alias do rádio.

Acessado apenas: Quando a Ativação do ID do rádio está ativada, quando [Tipo de voz/sinal de recepção na página 424](#) não é **Não ASTRO**, quando [Sistema ASTRO na página 452](#) faz referência a um sistema DVRS, quando [Tipo de alias do rádio OTA na página 419](#) não está **Desativado** e o rádio está ativado para o modelo/a opção.

10.33.2.17

Seleção da lista responsabilidade de equipe

Este campo permite selecionar uma lista de responsabilidade de equipe a ser usada durante a operação do Sistema convencional.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **ASTRO** ou **DVRS** e quando o rádio estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

- Desabilitado
- Responsabilidade pela equipe disponível

10.33.2.18

Qualificar Alarme de emergência Rx

Se esse campo estiver habilitado, o rádio ficará restrito a receber alarmes de emergência MDC (Motorola Data Communications, comunicações de dados da Motorola) quando a transmissão de entrada for qualificada para PL (Private line, linha privada) ou DPL (Digital Private line, linha privada digital). Essa qualificação significa que a transmissão recebida corresponde ao tipo de silenciador de RX/TA e ao código do silenciador de RX/TA de personalidade convencional.

Quando apropriado, também é preciso habilitar esse recurso no campo **Indicador de recepção do alarme de emergência**. Essa seleção se aplica ao sistema MDC convencional atual.

**INFORMAÇÕES:**

Se esse campo estiver habilitado e o sinal de entrada falhar na qualificação PL ou DPL, os alarmes de emergência não serão detectados.

Acessado apenas: Quando o campo Tipo de sistema é definido como **MDC** e o campo Indicador de recepção de do alarme de emergência está habilitado.

10.33.2.19

Serviço de mensagens de texto

Este campo seleciona o modo Mensagens de texto para o Sistema ASTRO convencional atual.

AVISO:

Quando o Serviço de mensagens de texto é usado enquanto o valor padrão da Varredura de dados e da Duração do preâmbulo de varredura de dados aumenta ou diminui, o Contador curto de tentativas precisa ser aumentado ou diminuído de acordo. Por exemplo, no Modo de dados direto da operação (consulte Modo de dados do pacote), se o valor da Duração do preâmbulo de varredura de dados aumentar para 30 (o padrão é 20), o Contador curto de tentativas deverá ser aumentado para 25 segundos (o padrão é 15). Para cada 10 unidades adicionadas à Duração do preâmbulo de varredura de dados, o Contador curto de tentativas deve aumentar 10 segundos.

INFORMAÇÕES:

É possível acessar Mensagem de texto pressionando o botão Serviço de mensagens de texto ou selecionando o menu Serviço de mensagens de texto.

É possível acessar Mensagem de texto rápida pressionando o botão Texto rápido de TMS.

É possível acessar a função Mensagem de consulta pressionando o botão Consulta TMS.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **ASTRO**, quando um Perfil de dados referenciado válido tiver sido selecionado para o sistema atual, quando a seleção de Perfil de dados não estiver definida como **Dados desativados**, o Modo SmartMessaging estiver definido como **LMR** e o rádio estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Nenhum

Recurso desativado.

Somente lista

Permite selecionar apenas mensagens de texto da Lista de mensagens de texto rápidas programadas.

Ilimitado

Permite selecionar Mensagens de texto rápidas e inserir sua própria mensagem de texto pelo teclado do rádio.

AVISO:

Essa seleção fica disponível somente em rádios que têm um teclado ou microfone do teclado.

OBSERVAÇÃO:

Esta seleção não se aplica ao APX N70.

10.33.3

Quik-Call II

Esta seção permite visualizar ou definir a funcionalidade de Tom Quik-Call II (QCII) para Sistemas convencionais QCII individuais.

OBSERVAÇÃO:

Os Sistemas convencionais Quik-Call II são selecionados para serem usados a partir do campo Sistema Non-ASTRO da Personalidade convencional.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **Quik-Call II** e quando o rádio estiver habilitado para o modelo/a opção.

10.33.3.1

Decodificação QCII

Esse recurso se refere ao sistema Quik-Call II (QCII) disponível que coexistirá com o MDC (Motorola Data Communications, Comunicações de dados da Motorola) selecionado. Esse recurso fornece a capacidade de decodificar e codificar QCII e codificar ou decodificar MDC no mesmo canal.

Se esse recurso estiver ativado, você poderá selecionar Formato de chamada. Também permite selecionar os diferentes tons disponíveis em Sinalização de tom digital em Analógico.

OBSERVAÇÃO:

Este recurso não pode ser ativado com a Rechamada instantânea.

10.34

Personalidade convencional

A **Personalidade convencional** permite criar e excluir Personalidades convencionais e definir Personalidades convencionais individuais. Convencional e Entroncamento são os dois modos de comunicações de rádio.

Os tipos de Personalidades convencionais incluem **ASTRO, DVRS, Modo misto, MDC, Quik-Call II, e Sem sinalização.**

OBSERVAÇÃO:

Após a definição exclusiva das funções das personalidades convencionais, cada personalidade poderá ser atribuída à posição desejada do seletor de canais do rádio. Isso é feito pela atribuição de zonas e canais, na página Canais.

10.34.1

Geral

Esta seção permite visualizar ou definir funcionalidades para as personalidades convencionais individuais.

OBSERVAÇÃO:

Após a definição exclusiva das funções das personalidades convencionais, cada personalidade poderá ser atribuída à posição desejada do seletor de canais do rádio. Isso é feito pela atribuição de zonas e canais, na página Canais.

10.34.1.1

Nome da Personalidade Convencional

Este campo permite definir um nome reconhecível para a personalidade convencional atual.

OBSERVAÇÃO:

Exemplos: Fire005, Electric1, #510.

É possível usar caracteres, números, espaços e caracteres especiais.

São permitidos no máximo 14 caracteres.

10.34.1.2

Tipo de Personalidade Convencional

Este campo exibe o tipo selecionado ao criar a personalidade.

Os tipos de Personalidades convencionais incluem **ASTRO, DVRS, Modo misto, MDC, Quik-Call II, e Sem sinalização.**

10.34.1.3

AGC de RF avançado

Este campo seleciona o tipo de AGC (Automatic Gain Control, controle de ganho automático) de RF (Radio Frequency, radio frequência) que se aplica à personalidade convencional atual.

As seleções a seguir são compatíveis:

Desabilitado

Mesmo quando em **Desativado**, o rádio utiliza uma forma básica do AGC integrada ao receptor do rádio. Essa proteção integrada ajuda a evitar limitação de sinal e saturação do receptor, o que pode danificar os componentes do rádio.

Padrão

Permite uma forma avançada de AGC de RF, que tenta proteger contra interferência de intermodulação (IM) por meio da detecção e da remoção de qualquer interferência recebida em razão de fontes externas.

Aprimorado

Possibilita que o rádio utilize outros esquemas para reduzir a interferência de IM, limpando o sinal.

Inteligente

Permite que o rádio use um esquema exclusivo para melhorar a imunidade à interferência quando próximo às estações base de difusão simultânea linear e de fase 2 APCO. A opção SMART é mutuamente exclusiva da caixa de seleção proteção de banda larga.

**INFORMAÇÕES:**

O AGC de RF avançado **Padrão** e **Aprimorado** pode prejudicar o desempenho dos canais que não sofrem interferência de IM. Por isso, só ative essas seleções nos canais que sabidamente apresentam interferência de IM.

10.34.2

Opções de recepção

Esta seção permite visualizar ou definir a funcionalidade que corresponde somente ao modo Recepção (Rx) do rádio para Personalidades convencionais individuais.

**OBSERVAÇÃO:**

Após a definição exclusiva das funções das personalidades convencionais, cada personalidade poderá ser atribuída à posição desejada do seletor de canais do rádio. Isso é feito pela atribuição de zonas e canais, na página Canais.

10.34.2.1

Receber Somente Personalidade

Este campo faz com que o rádio não tenha capacidade de transmissão ao operar na personalidade convencional atual.

O recebimento de chamadas será a única operação permitida nessa personalidade.

**OBSERVAÇÃO:**

Se a personalidade for criada pela função de Clonagem de zonas, a personalidade não poderá ser Receber somente personalidade.

Acessado apenas: Quando a personalidade não é criada pela função Clonagem de zonas.

10.34.2.2

Tipo de voz/sinal de recepção

Este campo seleciona o modo de sinalização ao receber (Rx) voz para a Personalidade convencional atual.

**AVISO:**

Quando o campo Sistema RSI (Remote Site Interface, interface de site remoto) no Sistema convencional mencionado estiver **Ativado**, este campo deverá ser definido como **ASTRO**, caso contrário, o RadioCentral considerará o valor deste campo como inválido.

Quando o campo Áudio analógico plano estiver **Ativado**, este campo deve ser definido como **Não ASTRO**, caso contrário, o RadioCentral considerará o valor deste campo como inválido.

Quando o campo [Ativação de Varredura de Voto Misto na página 472](#) estiver **Ativado**, este campo deve ser definido como **Não ASTRO** ou **ASTRO**, caso contrário, o RadioCentral considerará o valor deste campo como inválido.

As seleções a seguir são compatíveis:

Não ASTRO

Somente sinais do tipo analógico não ASTRO são recebidos.

Um Tipo de sistema **MDC** ou **QCII** deve ser selecionado no Tipo de sinalização não ASTRO e, em seguida, um Sistema não ASTRO deve ser selecionado.

Modo misto

Os sinais digital ASTRO e analógico Não ASTRO podem ser recebidos.

Um Sistema convencional ASTRO - deve ser selecionado no campo Sistema ASTRO, e um Tipo de sistema **MDC** ou **QCII** deve ser selecionado no Tipo de sinalização não ASTRO e, em seguida, um Sistema não ASTRO deve ser selecionado.

**INFORMAÇÕES:**

Comunicações ASTRO têm prioridade sobre o recebimento de comunicações do Tipo de sinalização não ASTRO.

ASTRO

Somente sinais do tipo digital ASTRO são recebidos.

Um Sistema convencional ASTRO deve ser selecionado no campo [Sistema ASTRO na página 452](#).

10.34.2.3

Tipo de ativação/desativação da função mudo

Este campo seleciona a regra que determina quando um rádio abre e fecha o alto-falante para receber áudio para a Personalidade convencional atual.

As regras de ativação/desativação da função mudo só se aplicam quando PL é o [Tipo de silenciador de recepção/TA na página 439](#) selecionado para o canal Convencional atual.

**OBSERVAÇÃO:**

A desativação da função mudo abre o alto-falante do rádio para receber áudio. A ativação da função mudo fecha o alto-falante do rádio para receber áudio.

As seleções a seguir são compatíveis:

Padrão

Para desativar a função mudo em uma detecção do código de Linha privada (PL) apropriada e para ativar a função mudo em uma perda de código de PL apropriada.

Desativar mudo, mudo padrão

Para desativar a função mudo em uma detecção do código de PL apropriada e do silenciador de portadora, e para ativar a função mudo em uma perda do código de PL apropriada.

Desativar ou ativar mudo

Para desativar a função mudo em uma detecção de código de PL apropriada e do Silenciador de portadora, e para ativar a função mudo em uma perda de código de PL apropriada ou perda de detecção do Silenciador de portadora.

**OBSERVAÇÃO:**

Apropriado se refere à existência de uma correspondência de códigos entre o [Código PL de transmissão na página 448](#) do rádio de transmissão e o [Código de PL de recepção/TA na página 442](#) do rádio de recepção. O Tipo de [Tipo de silenciador de Tx na página 446](#) do rádio de transmissão e o Tipo de silenciador de recepção/TA do rádio de recepção também devem ter uma correspondência; ou seja, TPL de transmissão para TPL de recepção ou DPL de transmissão para DPL de recepção.

10.34.2.4

Atraso da desativação da função mudo da recepção

Este campo seleciona por quanto tempo o rádio fica mudo depois que o silenciador de portadora é detectado para a Personalidade convencional atual.

Esse atraso é, às vezes, necessário para permitir que dados de sinalização cheguem silenciosamente. O tempo é medido em milissegundos.

Acima 205: Alcance

Mínimo	Máximo
0 ms	2150 ms

10.34.2.5

Silenciador (ajuste fino)

Este campo seleciona o valor que é combinado com o valor do silenciador master que determina o limite geral do silenciador de portadora para a Personalidade convencional atual.

Quanto maior for a definição desse número, mais breve será o limite do silenciador. Um limite menor faz com que seja necessário um sinal mais forte da operadora para desativar a função mudo do alto-falante do rádio. Isso ajuda a reduzir a interferência.

Acessado apenas: Quando o campo Silenciador por Personalidade estiver **Ativado**.

Acima 206: Alcance

Mínimo	Máximo
0	15

10.34.2.6

LED ocupado

Este campo permite que o LED amarelo indique a presença de uma portadora (canal ocupado) para a personalidade convencional atual.

10.34.2.7

Cancelamento da ênfase de recepção

Esse campo retira a Ênfase de recepção (Rx) para a Personalidade convencional atual.

**OBSERVAÇÃO:**

O Cancelamento da ênfase reverte um sinal de pré-ênfase quando recebido pelo rádio.

A filtragem de áudio de ênfase de transmissão ([Pré-ênfase de transmissão na página 428](#)) aumenta a relação sinal-ruído para frequências mais altas. Para simplificar, o "ruído" da frequência mais baixa é reduzido e a "voz" da frequência mais alta é aumentada.

10.34.2.8

HearClear

Este campo permite a melhora da clareza do áudio aplicando um algoritmo de compressão/expansão aos sinais transmitidos e recebidos, respectivamente.

Essa função se aplica à Personalidade convencional atual.

**INFORMAÇÕES:**

Com a compressão, a faixa dinâmica do áudio de transmissão é compactada e, em seguida, expandida até seu nível original no áudio de recepção. Portanto, a função de compressão deve estar habilitada nos rádios de transmissão e de recepção para que não o áudio não fique distorcido. Como o algoritmo de compressão/expansão é ativado no áudio de transmissão e recepção, expandir o áudio descompactado ou compactar o áudio sem expandi-lo logo em seguida resultará em uma saída de áudio não natural. O caminho do áudio até o operador também deve ser compactado.

Essa função se aplica somente aos sinais analógicos.

Acessado apenas: Quando o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **Não ASTRO** ou **Modo Misto**, e quando o Sistema Convencional mencionado selecionado no campo Sistema ASTRO não for um Tipo de Sistema DVRS e quando o campo Ativação de Hardware DVRS estiver **Desativado**.

As seleções a seguir são compatíveis:

Desabilitado

Nenhum cancelamento ou compressão de ruído é aplicada aos sinais de transmissão/recepção.

Somente compressor de áudio

A compressão de áudio é aplicada ao áudio de transmissão e recepção (consulte Nota Importante).

Somente cancelamento de ruído

O cancelamento de ruído é aplicado ao áudio de recepção.

Compressor de áudio e cancelamento de ruído

O compressor de áudio é aplicado ao áudio de transmissão e recepção (ver Nota importante) e o cancelamento de ruído é aplicado ao áudio de recepção.

**OBSERVAÇÃO:**

As configurações **Somente cancelamento de ruído** e **Compressor de áudio e cancelamento de ruído** só podem ser aplicadas na personalidade atual se todas as frequências estiverem na frequência de 900 MHz.

10.34.2.9

Ativação de recepção simultânea

Quando esse campo é ativado juntamente com o campo [Ativação de recepção simultânea](#) em todos os rádios, você pode controlar a recepção simultânea com base na personalidade, em vez de em todos os rádios.

**OBSERVAÇÃO:**

Este campo está ativado por padrão.

Acessado apenas: Quando o campo Ativação de Rx simultâneo em todos os Rádios estiver ativado.

10.34.3

Opções de transmissão

Essa seção permite visualizar ou definir a funcionalidade relacionada somente ao modo de transmissão do rádio de Personalidades convencionais individuais.

**OBSERVAÇÃO:**

Após a definição exclusiva das funções das personalidades convencionais, cada personalidade poderá ser atribuída à posição desejada do seletor de canais do rádio. Isso é feito pela atribuição de zonas e canais, na página [Canais](#).

Acessado apenas: Quando o campo Receber apenas personalidade está **Desabilitado**.

10.34.3.1

Tipo de voz/sinal de transmissão

Este campo seleciona o modo de sinalização de transmissão (Tx) de voz que se aplica quando o campo Tipo de voz/sinal de recepção da Personalidade convencional atual estiver definido como **Modo misto**.

**INFORMAÇÕES:**

Quando o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como modo **Não ASTRO** ou **ASTRO**, essa seleção deve seguir exatamente a seleção Tipo de voz/sinal de recepção para a Personalidade convencional atual para ser considerada válida pelo RadioCentral.

Esse campo permanece acessível mesmo quando o campo [Receber Somente Personalidade na página 423](#) dessa personalidade estiver **Ativado**, pois essa personalidade ainda será capaz de iniciar o Modo de emergência quando o [Tipo de reversão de emergência na página 455](#) estiver definido como **Canal de reversão** e atribuições de [Zona de Reversão de Emergência na página 456](#) e [Canal de reversão de emergência na página 456](#) estiverem definidas para essa personalidade.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

ASTRO

Somente os sinais digitais do Sistema ASTRO são transmitidos.

Não ASTRO

Os sinais analógicos são transmitidos.

**OBSERVAÇÃO:**

Dependendo da versão do RadioCentral em uso e/ou dos recursos do rádio, a operação do Modo telefone talvez não esteja disponível no modo **ASTRO**.

10.34.3.2

Contador de tempo limite

Este campo seleciona o tempo durante o qual o rádio consegue transmitir.

Quando esse cronômetro expira, o rádio é desativado automaticamente e um tom de alerta contínuo é emitido enquanto o botão PTT permanecer pressionado. Para continuar transmitindo, o botão PTT deve ser solto, e o rádio reativado. Essa função se aplica à Personalidade convencional atual. O tempo é medido em segundos.

Acessado apenas: Quando o campo [Receber Somente Personalidade na página 423](#) estiver **Desativado**, e (se o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **ASTRO**, então o campo Sistema de interface de site remoto no Sistema convencional mencionado deverá estar **Desativado**).

**OBSERVAÇÃO:**

Quando definido como **Infinito**, nenhum timer é utilizado para Rádios que não são APX4000XH; portanto, há um tempo de conversação infinito. Essa seleção é inválida para Rádios APX4000XH.

Acima 207: Alcance (para Rádios que não são APX4000XH)

Mínimo	Máximo	Incrementos
15 s	465 s	15 s

Acima 208: Alcance (para Rádios APX4000XH)

Mínimo	Máximo	Incrementos
15 s	60 s	15 s

10.34.3.3

Pré-ênfase de transmissão

Este campo ativa a filtragem de áudio pré-ênfase de transmissão (Tx) para a Personalidade convencional atual.

**OBSERVAÇÃO:**

A pré-ênfase aumenta a relação sinal-ruído para frequências mais altas; isto é, o ruído de frequências mais baixas é reduzido, e a voz das frequências mais altas é aumentada.

**OBSERVAÇÃO:**

[Cancelamento da ênfase de recepção na página 426](#) reverte um sinal de pré-ênfase quando recebido pelo rádio.

**AVISO:**

Se esse recurso for ativado, ele se tornará inválido quando o campo Áudio analógico plano também for **Ativado**. Desse modo, as duas funções não podem ser ativadas na mesma personalidade.

Acessado apenas: Quando o campo [Receber Somente Personalidade na página 423](#) estiver **Desativado**.

10.34.3.4

Reverter Código de estouro/desativação

Este campo permite que a TPL (Tone Private Line, linha privada de tom) Amplificação reversa ou a DPL (Digital Private Line, linha privada digital) Código de desativação sejam transmitidas quando o rádio é desligado.

Isso se baseia no [Tipo de silenciador de Tx na página 446](#) (TPL ou DPL) selecionado para a Personalidade Convencional atual.

OBSERVAÇÃO:

Os dois recursos transmitem um tom subaudível que faz com que o rádio receptor ative o modo mudo do alto-falante antes que a perda de uma portadora seja detectada. A desativação do som do alto-falante elimina ruídos indesejáveis (terminação de silenciador) durante a detecção de perda da portadora.

Acessado apenas: Quando o campo [Receber Somente Personalidade na página 423](#) estiver **Desativado**.

10.34.3.5

Nível de potência de transmissão

Este campo seleciona o nível de energia do rádio para a transmissão ao operar na Personalidade convencional atual.

OBSERVAÇÃO:

O pressionamento do botão Baixa energia de transmissão, a alternância da chave Baixa energia de transmissão e a seleção do menu Energia têm prioridade sobre essa configuração quando selecionada por você.

Durante o Modo de emergência, o rádio transmite automaticamente em alta potência.

Acessado apenas: Quando o campo [Receber Somente Personalidade na página 423](#) estiver **Desativado**.

As seleções a seguir são compatíveis:

Baixa

Usado para comunicações próximas e para impedir que o rádio transmita para outros grupos geográficos operando na mesma frequência.

Alta

Utilizada quando um sinal mais forte é necessário para estender distâncias de transmissão.

10.34.3.6

Energia adaptável

Este campo permite que o rádio use um nível de operação de potência média se o relatório de intensidade do sinal da estação de despacho indicar um sinal de recepção forte.

O rádio sempre transmite inicialmente com potência total. Assim que o rádio é desativado, ele procura por uma mensagem de dados da estação. Se a estação informar que a última recepção foi forte, o rádio alterna automaticamente para uma configuração de potência média. Esse recurso se aplica ao operar no modo de Sinalização do ASTRO e na Personalidade convencional atual.

OBSERVAÇÃO:

A energia adaptável só está disponível em canais de transmissão do ASTRO.

Acessado apenas: (Quando o rádio estiver habilitado para o modelo/a opção, e quando o campo [Nível de potência de transmissão na página 429](#) for **Alto**), e ((quando o campo [Tipo de voz/sinal de recepção na página 424](#) for **Modo Misto**), ou (quando o campo Tipo de Voz/Sinal de Recepção for **ASTRO**, e quando o Sistema de Interface de Site Remoto no Sistema Convencional referenciado estiver **Desativado**)).

10.34.4

Opções de frequência

Esta seção permite visualizar ou definir muitas configurações convencionais de transmissão, recepção e Modo Direto/Talkaround dentro de perfis exclusivos da personalidade convencional atual.

**INFORMAÇÕES:**

Se [Ativação de Varredura de Voto Misto na página 472](#) estiver definido como **Ativado** na personalidade atual, todos os registros/linhas das opções de frequência associados à personalidade atual serão usados para formar a lista de varredura de ponderação. O número máximo de Opções de frequência é limitado a 15.

**OBSERVAÇÃO:**

Após a definição exclusiva das funções das personalidades convencionais, cada personalidade poderá ser atribuída à posição desejada do seletor de canais do rádio. Isso é feito na seção [Canais na página 668](#) da [Atribuição de zonas e canais na página 666](#).

Se a personalidade for criada pelo recurso Clonagem de zonas, a Lista de opções de frequência poderá conter apenas um registro.

10.34.4.1

Frequência de interferência de LTE presente

Este campo que ativa esse recurso faz com que o RadioCentral reconheça que esta tabela de Opções de frequência contém uma ou mais frequências de 700 MHz nesta personalidade ou neste canal habilitados para banda larga não LTE.

**AVISO:**

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

Como a LTE também opera na faixa de 700 MHz, pode haver uma interferência na frequência que prejudicará as comunicações por rádio. Essa função se aplica a todos os perfis de Opções de frequência (registro/linhas) da Personalidade convencional atual.

Quando essa personalidade/canal for habilitada para Banda larga LTE, essa função deverá ser **Desativada**, caso contrário, se tornará inválida.

**OBSERVAÇÃO:**

Um canal Convencional é habilitado para LTE quando o Sistema convencional - ASTRO referido da Personalidade tem um Perfil de dados referenciado com um Tipo de perfil de dados igual a **Convencional e banda larga** ou **Apenas banda larga**, e quando a Origem da banda larga desse perfil de dados é **Modem LTE interno**.

**OBSERVAÇÃO:**

Os perfis de Opção de frequência podem ser selecionados para uso na página Canais de atribuição de zonas e canais. Primeiro, a personalidade é selecionada no campo Personalidade, depois, o perfil de Opções de frequência é selecionado no campo Opções de frequência.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.34.4.2

Nome das opções de frequência

Este campo permite modificar o nome padrão atribuído pelo RadioCentral para as Opções de frequência.

**OBSERVAÇÃO:**

Exemplos: Frequencies004, Power03, #510

É possível usar caracteres, números, espaços e caracteres especiais.

No máximo, 14 caracteres são aceitos.

10.34.4.3

Frequência de recepção/TA

Este campo seleciona a frequência usada para receber o sinal da operadora de comunicação de um rádio e, opcionalmente, para transmitir o sinal da operadora quando Direto/Talkaround está ativado no canal.

Esse recurso se aplica somente para o perfil de Opções de frequência atual (registro/linha) da Personalidade convencional.

**AVISO:**

Tamanho de etapa de 6.25 kHz para a faixa de frequência de 800 MHz:

Ao iniciar com a Versão R09.01.00, quando o [Espaçamento de canais/desvio de transmissão na página 435](#) é **2,5 kHz / 12,5 kHz**, o RadioCentral permite um tamanho de etapa de 6.25 kHz para frequências Convencionais na faixa de frequência de 800 MHz para atender à conformidade regulamentar em alguns países (não FCC). No entanto, dois rádios que operam em canais adjacentes separados por apenas 6.25 kHz podem experimentar um indesejável fenômeno de dia fonia.

**OBSERVAÇÃO:**

Os perfis de Opção de Frequência podem ser selecionados para uso na Página Canais de Atribuição de Zonas e Canais; primeiro, a personalidade é selecionada no campo [Personalidade na página 669](#) e, depois, o perfil de Opções de Frequência é selecionado no campo [Opção de frequência convencional na página 671](#).

**INFORMAÇÕES:**

(aplicável à Sinalização ASTRO)

Quando [Direto/Talkaround na página 433](#) está **Ativado** para este perfil de Opções de Frequência e o campo [Ativação da frequência direta na página 396](#) está **Ativado**, o ID de Rede Direta pode ser modificado para cada perfil de Opções de Frequência. Ao iniciar o modo Direto/Talkaround, o rádio transmitirá e receberá sinal nesta Frequência direta, e não na Frequência de recepção/TA.

Quando Direto/Talkaround estiver **Ativado** para este perfil de Opções de frequência e o campo Frequência direta estiver **Desativado**, as configurações da [ID da rede de recepção na página 436](#) são usadas sempre que o modo Direto/Talkaround for iniciado.

Direto/Talkaround deve estar **Ativado** em um perfil de Opções de frequência para ser disponibilizado a você em um canal de rádio. Você pode selecionar o modo Direto/Talkaround pressionando o botão [Modo Direto na página 190](#), selecionando o switch [Modo Direto na página 202](#) ou selecionando o menu [Direto/Talkaround na página 212](#).

**INFORMAÇÕES:**

aplicável à Sinalização não ASTRO (MDC, DTMF, Quik-Call II e Tom único)

Quando Direto/Talkaround está **Ativado** para este perfil de Opções de Frequência e o campo Frequência Direta está **Ativado**, os parâmetros Direto/Talkaround pode ser modificado em uma base de perfil de Opções de Frequência. Ao iniciar o modo Direto/Talkaround, o rádio transmitirá e receberá sinal nesta Frequência direta usando estes parâmetros de frequência.

Quando Direto/Talkaround estiver **Ativado** para este perfil de Opções de frequência e o campo Ativação da frequência direta estiver **Desativado**, as configurações dos campos de parâmetros de recepção são usadas sempre para iniciar o modo Direto/Talkaround.

Direto/Talkaround deve estar **Ativado** em um perfil de Opções de frequência para ser disponibilizado a você em um canal de rádio. É possível selecionar o modo Direto/Talkaround ao pressionar o botão Direto/Talkaround, alternar a chave Talkaround/Direto ou selecionar o menu Direto/Talkaround.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.34.4.4

Frequência de transmissão

Esse campo seleciona a frequência designada usada para transmitir o sinal da operadora de uma comunicação de rádio.

Essa seleção aplica-se somente ao perfil [Opções de frequência na página 430](#) (registro/linha) atual do [Personalidade convencional na página 422](#) atual.

**AVISO:**

Quando o campo [Ativação de Varredura de Voto Misto na página 472](#) está **Ativado** e o campo [Direção de transmissão de varredura de ponderação mista na página 472](#) está **Desativado**, este campo deve ser uma correspondência para todas as Opções de frequência na Personalidade atual; caso contrário, o aplicativo considera o valor do campo inválido.

Tamanho de etapa de 6.25 kHz para a faixa de frequência de 800 MHz:

Ao iniciar com a Versão R09.01.00, quando o [Espaçamento de canais/desvio de transmissão na página 435](#) é **2,5 kHz/12,5 kHz**, o aplicativo permite um tamanho de etapa de 6,25 kHz para frequências Convencionais na banda de frequência de 800 MHz para atender à conformidade regulamentar em alguns países (não FCC). No entanto, dois rádios que operam em canais adjacentes separados por apenas 6,25 kHz podem experimentar um indesejável fenômeno de diafonia.

**OBSERVAÇÃO:**

Os perfis de Opção de frequência podem ser selecionados para uso na página Canais de atribuição de zonas e canais; primeiro, a personalidade é selecionada no campo [Personalidade na página 669](#), depois, o perfil de Opções de frequência é selecionado no campo [Opção de frequência convencional na página 671](#).

Acessado apenas: quando o campo [Receber Somente Personalidade na página 423](#) estiver **Desativado** e o rádio for compatível com o modelo/opção.

10.34.4.5

Direto/Talkaround

Este campo ativa a funcionalidade Direto/Talkaround para o perfil de Opções de frequência atual.

Direto/Talkaround normalmente é iniciado por você para comunicações diretas entre rádios em área próxima ou quando um repetidor não está operacional ou está fora de alcance. Essa função se aplica

somente para o perfil de Opções de frequência (registro/linha) atual da Personalidade convencional atual.

OBSERVAÇÃO:

Os perfis de Opção de frequência podem ser selecionados para uso na página Canais de atribuição de zonas e canais; primeiro, a personalidade é selecionada no campo [Personalidade na página 669](#), depois, o perfil de Opções de frequência é selecionado no campo [Opção de frequência convencional na página 671](#).

INFORMAÇÕES:

(aplicável à Sinalização ASTRO)

Quando Direto/Talkaround está **Ativado** para este perfil de Opções de frequência e o campo [Ativação da frequência direta na página 396](#) está **Ativado**, o ID de rede direta pode ser modificado para cada perfil de Opções de frequência. Quando você inicia o modo Direto/Talkaround, o rádio transmite e recebe o sinal na Frequência direta, e não na [Frequência de recepção/TA na página 431](#).

Quando Direto/Talkaround estiver **Ativado** para este perfil de Opções de frequência e o campo Frequência direta estiver **Desativado**, as configurações da [ID da rede de recepção na página 436](#) são usadas sempre que o modo Direto/Talkaround for iniciado.

Direto/Talkaround deve estar **Ativado** em um perfil de Opções de frequência para ser disponibilizado a você em um canal de rádio. Você pode selecionar o modo Direto/Talkaround pressionando o botão [Modo Direto na página 190](#), selecionando o switch [Modo Direto na página 202](#) ou selecionando o menu [Direto/Talkaround na página 212](#).

INFORMAÇÕES:

aplicável à Sinalização não ASTRO (MDC, DTMF, Quik-Call II e Tom único)

Quando Direto/Talkaround está **Ativado** para este perfil de Opções de frequência e o campo Ativação da frequência direta está **Ativado**, os parâmetros Direto/Talkaround podem ser modificados para cada perfil de Opções de frequência. Ao iniciar o modo Direto/Talkaround, o rádio transmitirá e receberá sinal nesta Frequência direta usando estes parâmetros de frequência.

Quando Direto/Talkaround estiver **Ativado** para este perfil de Opções de frequência e o campo Ativação da frequência direta estiver **Desativado**, as configurações dos campos de parâmetros de recepção são usadas sempre para iniciar o modo Direto/Talkaround.

Direto/Talkaround deve estar **Ativado** em um perfil de Opções de frequência para ser disponibilizado a você em um canal de rádio. É possível selecionar o modo Direto/Talkaround ao pressionar o botão Direto/Talkaround, alternar a chave Talkaround/Direto ou selecionar o menu Direto/Talkaround.

Acessado apenas: Quando o campo [Receber Somente Personalidade na página 423](#) estiver **Desativado**, e (se o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **ASTRO**, então o campo Sistema de interface de site remoto no Sistema convencional referenciado deverá ser **Desativado**), e (quando o campo [Tipo de voz/sinal de transmissão na página 427](#) é **Não ASTRO**, e quando o campo [Frequência de recepção/TA na página 431](#) não é igual ao campo [Frequência de transmissão na página 432](#), ou quando o índice [Tipo de silenciador de recepção/TA na página 439](#) não é igual ao índice [Tipo de silenciador de Tx na página 446](#), ou quando o Tipo de silenciador de recepção/TA não é **CSQ**, e ((quando o Tipo de silenciador de recepção/TA não é PL ou o índice [Frequência de PL de recepção/TA na página 440](#) não é igual ao índice [Frequência de PL de transmissão na página 447](#)), e (quando o Tipo de silenciador de recepção/TA não é **DPL** ou o índice [Código de PL de recepção/TA na página 442](#) não é igual ao índice [Código DPL de transmissão na página 450](#) ou o valor [Inversão de DPL de recepção/TA na página 445](#) não é igual ao valor [Inversão de DPL de transmissão na página 451](#)..))) ou (quando [Tipo de voz/sinal de transmissão na página 427](#) não é **Não ASTRO**, e (a [Frequência de recepção/TA](#) não é igual à [Frequência de transmissão](#), ou [ID da rede de recepção na página 436](#) não é igual a [ID da rede de transmissão na página 437](#)..))

10.34.4.6

Espaçamento de canais/desvio de transmissão

Este campo seleciona o desvio da transmissão (Tx) e o espaçamento de canal correspondente para o perfil de opções de frequência atual (registro/linha) da personalidade convencional atual.

O desvio de Tx é a variação máxima (em kHz) que a operadora - frequência selecionada pode apresentar como diferença ou alteração de sua frequência central não modulada. O espaçamento de canal refere-se à diferença de frequência distribuída entre canais adjacentes em uma faixa de frequências específica.

**OBSERVAÇÃO:**

O rádio também usa os valores de Espaçamento de canais/desvio de transmissão quando essa personalidade estiver operando em modo [Direto/Talkaround na página 433](#).

**AVISO:**

Quando o campo [Ativação de Varredura de Voto Misto na página 472](#) estiver **Ativado** e o campo [Direção de transmissão de varredura de ponderação mista na página 472](#) estiver **Desativado**, este campo deve ser uma correspondência para todas as Opções de frequência na Personalidade em questão; senão, o RadioCentral considerará o valor do campo inválido.

**OBSERVAÇÃO:**

Os perfis de Opção de frequência podem ser selecionados para uso na página Canais de atribuição de zonas e canais; primeiro, a personalidade é selecionada no campo [Personalidade na página 669](#), depois, o perfil de Opções de frequência é selecionado no campo [Opção de frequência convencional na página 671](#).

Acessado apenas: Quando o campo [Receber Somente Personalidade na página 423](#) estiver **Desativado**.

As seleções a seguir são compatíveis:

4 kHz / 20 kHz

Banda de 821 MHz usando espaçamento de canais de 20 kHz.

**AVISO:**

Esta seleção será inválida se o seguinte cenário for verdadeiro quando o mandato de bandas estreitas de FCC de 12,5 kHz se aplicar a este codeplug, e quando o valor da [Frequência de transmissão na página 432](#) ou ([Frequência direta](#) ou [Frequência de recepção/TA na página 431](#) quando ativado para operação de direto/Talkaround) cai em um dos intervalos de requisitos de FCC.

5 kHz / 25 kHz

VHF, UHF e bandas de 800 MHz usando espaçamento de canais de 30/25/25 kHz.

**AVISO:**

Esta seleção será inválida se o seguinte cenário for verdadeiro quando o mandato de bandas estreitas da FCC de 12,5 kHz se aplicar a este codeplug, e quando o valor da frequência de Tx ou (frequência direta ou frequência de TA quando ativado para operação de direto/Talkaround) cair em um dos intervalos de requisitos de FCC.

2,5 kHz / 12,5 kHz

VHF, UHF, banda analógica de 800 MHz e 900 MHz e espaçamento de canais de 12,5 kHz.

**AVISO:**

Quando a frequência de transmissão incidir na banda de 900 MHz, essa é a única seleção válida e esse campo se torna somente exibição.

Esta seleção será inválida se os cenários a seguir forem verdadeiros:

(Quando o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **Modo não ASTRO**, e quando o campo [Operação segura na página 294](#) estiver definido como **Hardware**, e quando o campo [Privacidade de voz/Remover ligação na página 480](#) não estiver definido como **Limpar**) ou (quando o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **Modo misto** ou **Modo ASTRO**, e quando o campo [Tipo de Modulador Digital do ASTRO na página 452](#) ASTRO estiver definido como **Total**).

10.34.4.7

ID da rede de recepção

Este campo seleciona (em formato decimal ou hexadecimal) um ID do código de acesso da rede Rx (Receive, recepção) a ser usado durante a operação no modo Sistema ASTRO (digital).

Isso permite que o rádio acesse de modo seletivo um dos vários repetidores dentro das áreas de cobertura sobrepostas permitindo, assim, que o rádio ouça um repetidor específico. Em última análise, esse ID permite a separação de modos de endereçamento entre cocanais e usuários do canal adjacente; isso serve para a mesma finalidade da Linha privada (PL) usada em modo analógico. Esse recurso se aplica somente para o perfil de Opções de frequência atual (registro/linha) da Personalidade convencional.

**AVISO:**

Quando o campo [Ativação de Varredura de Voto Misto na página 472](#) está **Ativado** e o campo [Direção de transmissão de varredura de ponderação mista na página 472](#) está **Desativado**, este campo deve ser uma correspondência para todas as Opções de frequência na Personalidade atual; caso contrário, o aplicativo considera o valor do campo inválido.

**OBSERVAÇÃO:**

Os perfis de Opção de Frequência podem ser selecionados para uso na Página Canais de Atribuição de Zonas e Canais; primeiro, a personalidade é selecionada no campo [Personalidade na página 669](#), depois, o perfil de Opções de Frequência é selecionado no campo [Opção de frequência convencional na página 671](#).

**INFORMAÇÕES:**

Quando [Direto/Talkaround na página 433](#) está **Ativado** para este perfil de Opções de Frequência e o campo [Ativação da frequência direta na página 396](#) está **Ativado**, o ID de Rede Direta pode ser modificado para cada perfil de Opções de Frequência. Ao iniciar o modo Direto/Talkaround, o rádio transmitirá e receberá na Frequência direta (MHz) em vez de [Frequência de recepção/TA na página 431](#).

Quando Direto/Talkaround estiver **Ativado** para este perfil de Opções de frequência e o campo Frequência Direta estiver **Desativado**, essas configurações da Frequência de recepção/TA e da ID da rede TA/Rx são usadas sempre que o modo Direto/Talkaround é iniciado.

Direto/Talkaround deve estar **Ativado** em um perfil de Opções de frequência para ser disponibilizado a você em um canal de rádio. Você pode selecionar o modo Direto/Talkaround pressionando o botão [Modo Direto na página 190](#), selecionando o switch [Modo Direto na página 202](#) ou selecionando o menu [Direto/Talkaround na página 212](#).

Acessado apenas: Quando o campo [Tipo de voz/sinal de recepção na página 424](#) está no **Modo ASTRO** ou **Modo Misto** e quando o rádio está habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Acima 209: Alcance

Mínimo	Máximo	Monitor NAC
0 Hex	FFF Hex	F7E Hex

INFORMAÇÕES:

Quando este ID de NAC de Recepção está definido como **F7E**, o rádio ativa o áudio em qualquer ligação ASTRO independentemente do ID NAC da ligação ou do conjunto [Regra de desativação da função mudo da recepção do ASTRO na página 453](#) para o perfil de Opções de Frequência atual.

10.34.4.8

ID da rede de transmissão

Esse campo seleciona (em formato decimal ou hexadecimal) um número do ID do Código de NAC (Network Access, acesso à rede) de transmissão (Tx) a ser usado durante a operação no modo Sistema ASTRO (digital).

Isso permite que o rádio acesse de modo seletivo um dos vários repetidores dentro das áreas de cobertura sobrepostas, permitindo que o rádio faça com que um repetidor específico retransmita o sinal. Em última análise, esse ID permite a separação de modos de endereçamento entre cocanais e usuários do canal adjacente; isso serve para a mesma finalidade da Linha privada (PL) usada em modo analógico. Esse recurso se aplica somente para o perfil de Opções de frequência atual (registro/linha) da Personalidade convencional.

AVISO:

Quando o campo [Ativação de Varredura de Voto Misto na página 472](#) estiver **Ativado** e o campo [Direção de transmissão de varredura de ponderação mista na página 472](#) estiver **Desativado**, este campo deve ser uma correspondência para todas as Opções de frequência na Personalidade em questão; senão, o RadioCentral considerará o valor do campo inválido.

OBSERVAÇÃO:

Os perfis de Opção de frequência podem ser selecionados para uso na página Canais de atribuição de zonas e canais; primeiro, a personalidade é selecionada no campo [Personalidade na página 669](#), depois, o perfil de Opções de frequência é selecionado no campo [Opção de frequência convencional na página 671](#).

Acessado apenas: Quando o campo [Tipo de voz/sinal de recepção na página 424](#) for **ASTRO** ou **Modo misto**, e quando o rádio está habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Acima 210: Alcance

Mínimo	Máximo
0 Hex	FFF Hex

AVISO:

F7E é uma seleção inválida. Para obter mais informações, consulte o campo [ID da rede de recepção na página 436](#).

10.34.4.9

ID do grupo de conversação do ASTRO

Este campo seleciona um grupo de conversação padrão na Lista de grupos de conversação do ASTRO selecionada no campo Lista de grupos de conversação desta personalidade.

Esta seleção sempre se aplica quando o campo [Tipo de seleção na página 467](#) do Grupo de conversação está definido como **Amarrado**. No entanto, quando o campo Tipo de seleção está definido como **Selecionável**, este grupo de conversação só se aplicará depois que você escolher outro ID na Lista de grupos de conversação selecionada. Essa seleção se aplica somente para o perfil de Opções de frequência atual (registro/linha) da Personalidade convencional atual.

**OBSERVAÇÃO:**

É possível selecionar perfis de Opção de frequência para uso na seção [Canais na página 668](#) da página [Atribuição de zonas e canais na página 666](#); primeiro, a personalidade é selecionada no campo [Personalidade na página 669](#) e, depois, o perfil de Opções de frequência é selecionado no campo Opções de frequência.

Acessado apenas: Quando o campo [Tipo de voz/sinal de recepção na página 424](#) está definido como **ASTRO** ou **Modo misto**, quando o campo Grupo de conversação está ativado e a personalidade não é criada automaticamente pela função Clonagem de zonas.

As seleções a seguir são compatíveis:

Seleções de grupo de conversação

Os grupos de conversação que aparecem para seleção são baseados na Lista de grupos de conversação do ASTRO selecionada no campo Lista de grupos de conversação dessa personalidade.

DYN (Dynamic Regrouping, reagrupamento dinâmico)**AVISO:**

Uma configuração de Reagrupamento dinâmico só é válida quando Ativação do reagrupamento dinâmico está ativada.

**OBSERVAÇÃO:**

Somente um canal de Reagrupamento dinâmico pode ser definido por Sistema de entroncamento referido.

É possível solicitar uma nova atribuição de Reagrupamento dinâmico do despachador pressionando o botão Solicitação de reprogramação ou selecionando o menu Solicitação de reprogramação. Os recursos e configurações disponíveis do grupo de conversação de Reagrupamento dinâmico são definidos e transmitidos novamente pelo despachador

Para que o grupo de conversação de Reagrupamento dinâmico possa transmitir em modo Seguro, pressione o botão Seleção de transmissão segura, ative/desative a Seleção de transmissão segura ou selecione o menu Proteger; caso contrário, as transmissões do grupo de conversação de Reagrupamento dinâmico ficarão amarradas à transmissão no modo "Não criptografado".

ATG (grupo de notificação)

Não compatível no momento

10.34.4.10

Tipo de silenciador de recepção/TA

Este campo seleciona o tipo de PL (Private Line, Linha privada) de recepção ou silenciador de portadora necessário para se comunicar com outro rádio.

INFORMAÇÕES:

O [Tipo de ativação/desativação da função mudo na página 424](#) selecionado para a personalidade também determina se uma ligação poderá ser recebida. Essa seleção se aplica somente ao perfil de Opções de frequência atual (registro/linha) da Personalidade convencional atual.

AVISO:

Quando o campo [Ativação de Varredura de Voto Misto na página 472](#) estiver **Ativado** e o campo [Direção de transmissão de varredura de ponderação mista na página 472](#) estiver **Desativado**, este campo deve ser uma correspondência para todas as Opções de frequência na Personalidade em questão; senão, o RadioCentral considerará o valor do campo inválido.

OBSERVAÇÃO:

Os perfis de Opção de frequência podem ser selecionados para uso na página Canais de atribuição de zonas e canais; primeiro, a personalidade é selecionada no campo [Personalidade na página 669](#), depois, o perfil de Opções de frequência é selecionado no campo [Opção de frequência convencional na página 671](#).

INFORMAÇÕES:

Quando [Direto/Talkaround na página 433](#) está **Ativado** para este perfil de Opções de Frequência e o campo [Ativação da frequência direta na página 396](#) está **Ativado**, os parâmetros Direto/Talkaround podem ser modificados para cada perfil de Opções de frequência. Ao iniciar o modo Direto/Talkaround, o rádio transmitirá e receberá sinal nesta Frequência direta usando estes parâmetros de frequência.

Quando Direto/Talkaround estiver **Ativado** para este perfil de Opções de frequência e o campo Ativação da frequência direta estiver **Desativado**, as configurações dos campos de parâmetros de recepção são usadas sempre para iniciar o modo Direto/Talkaround.

Direto/Talkaround deve estar **Ativado** em um perfil de Opções de frequência para ser disponibilizado a você em um canal de rádio. Você pode selecionar o modo Direto/Talkaround pressionando o botão [Modo Direto na página 190](#), selecionando o switch [Modo Direto na página 202](#) ou selecionando o menu [Direto/Talkaround na página 212](#).

Acessado apenas: Quando o campo [Tipo de voz/sinal de recepção na página 424](#) está definido como **Não ASTRO** ou **Modo misto** e quando o campo PL selecionável pelo usuário [MPL] está definido como **Desativado** ou **Tx**.

As seleções a seguir são compatíveis:

- Silenciador da operadora (CSQ)
- Linha privada (PL)
- Linha privada digital (DPL)

10.34.4.11

Frequência de PL de recepção/TA

Este campo seleciona uma frequência usada ao receber uma comunicação de PL (Private Line, linha privada) de outro rádio.

**OBSERVAÇÃO:**

Essa frequência se correlaciona diretamente com a [Código de PL de recepção/TA na página 442](#); selecionando um valor para este campo, seleciona automaticamente Um Código de PL de Recepção e vice-versa. Essa seleção se aplica somente ao perfil de Opções de frequência atual (registro/linha) da Personalidade convencional atual.

**AVISO:**

Quando o campo [Ativação de Varredura de Voto Misto na página 472](#) estiver **Ativado** e o campo [Direção de transmissão de varredura de ponderação mista na página 472](#) estiver **Desativado**, este campo deve ser uma correspondência para todas as Opções de frequência na Personalidade em questão; senão, o RadioCentral considerará o valor do campo inválido.

**OBSERVAÇÃO:**

Os perfis de Opção de frequência podem ser selecionados para uso na página Canais de atribuição de zonas e canais; primeiro, a personalidade é selecionada no campo [Personalidade na página 669](#), depois, o perfil de Opções de frequência é selecionado no campo [Opção de frequência convencional na página 671](#).

**INFORMAÇÕES:**

Quando [Direto/Talkaround na página 433](#) está **Ativado** para este perfil de Opções de Frequência e o campo [Ativação da frequência direta na página 396](#) está **Ativado**, os parâmetros Direto/Talkaround podem ser modificados para cada perfil de Opções de frequência. Ao iniciar o modo Direto/Talkaround, o rádio transmitirá e receberá sinal nesta Frequência direta (MHz) usando estes parâmetros de frequência.

Quando Direto/Talkaround estiver **Ativado** para este perfil de Opções de frequência e o campo Ativação da frequência direta estiver **Desativado**, as configurações dos campos de parâmetros de recepção são usadas sempre que o modo Direto/Talkaround for iniciado.

Direto/Talkaround deve estar **Ativado** em um perfil de Opções de frequência para ser disponibilizado a você em um canal de rádio. Você pode selecionar o modo Direto/Talkaround pressionando o botão [Modo Direto na página 190](#), selecionando o switch [Modo Direto na página 202](#) ou selecionando o menu [Direto/Talkaround na página 212](#).

Acessado apenas: Quando o campo [Tipo de silenciador de recepção/TA na página 439](#) está definido como **PL** e quando o campo PL selecionado pelo usuário [MPL] está definido como **Desativado** ou **Tx**.

As seleções a seguir são compatíveis:

[Acima 211: Frequências e códigos do silenciador TPL](#)

Freq (Hz) = Código		Freq (Hz) = Código	
67,0	XZ	159,8	159,8
69,3	WZ	162,2	5B

10.34.4.12

Código de PL de recepção/TA

Este campo seleciona o código específico aceito ao receber uma comunicação de PL (Private Line, linha privada) de outro rádio.

**OBSERVAÇÃO:**

Este código se correlaciona diretamente com a [Frequência de PL de recepção/TA na página 440](#); selecionando um valor para este campo, seleciona automaticamente uma Frequência de PL de recepção/TA e vice-versa. Essa seleção se aplica somente ao perfil de Opções de frequência atual (registro/linha) da Personalidade convencional atual.

**AVISO:**

Quando o campo [Ativação de Varredura de Voto Misto na página 472](#) estiver **Ativado** e o campo [Direção de transmissão de varredura de ponderação mista na página 472](#) estiver **Desativado**, este campo deve ser uma correspondência para todas as Opções de frequência na Personalidade em questão; senão, o RadioCentral considerará o valor do campo inválido.

**OBSERVAÇÃO:**

Os perfis de Opção de frequência podem ser selecionados para uso na página Canais de atribuição de zonas e canais; primeiro, a personalidade é selecionada no campo [Personalidade na página 669](#), depois, o perfil de Opções de frequência é selecionado no campo [Opção de frequência convencional na página 671](#).

**INFORMAÇÕES:**

Quando [Direto/Talkaround na página 433](#) está **Ativado** para este perfil de Opções de Frequência e o campo [Ativação da frequência direta na página 396](#) está **Ativado**, os parâmetros Direto/Talkaround podem ser modificados para cada perfil de Opções de frequência. Ao iniciar o modo Direto/Talkaround, o rádio transmitirá e receberá sinal nesta Frequência direta (MHz) usando estes parâmetros de frequência.

Quando Direto/Talkaround estiver **Ativado** para este perfil de Opções de frequência e o campo Ativação da frequência direta estiver **Desativado**, as configurações dos campos de parâmetros de recepção são usadas sempre para iniciar o modo Direto/Talkaround.

Direto/Talkaround deve estar **Ativado** em um perfil de Opções de frequência para ser disponibilizado a você em um canal de rádio. Você pode selecionar o modo Direto/Talkaround pressionando o botão [Modo Direto na página 190](#), selecionando o switch [Modo Direto na página 202](#) ou selecionando o menu [Direto/Talkaround na página 212](#).

Acessado apenas: Quando o campo [Tipo de silenciador de recepção/TA na página 439](#) está definido como **PL** e quando o campo PL selecionado pelo usuário [MPL] está definido como **Desativado** ou **Tx**.

As seleções a seguir são compatíveis:

10.34.4.13

Código de DPL de recepção/TA

Este campo seleciona o código específico aceito ao receber uma comunicação de DPL (Digital Private Line, linha privada digital) de outro rádio.

Essa seleção se aplica somente ao perfil de Opções de frequência atual (registro/linha) da Personalidade convencional atual.

**AVISO:**

Quando o campo [Ativação de Varredura de Voto Misto na página 472](#) está **Ativado** e o campo [Direção de transmissão de varredura de ponderação mista na página 472](#) está **Desativado**, este campo deve ser uma correspondência para todas as Opções de frequência na Personalidade atual; caso contrário, o aplicativo considera o valor do campo inválido.

**OBSERVAÇÃO:**

Os perfis de Opção de frequência podem ser selecionados para uso na página Canais de atribuição de zonas e canais; primeiro, a personalidade é selecionada no campo [Personalidade na página 669](#) [Opção de frequência convencional na página 671](#).

**INFORMAÇÕES:**

Quando [Direto/Talkaround na página 433](#) está **Ativado** para este perfil de Opções de Frequência e o campo [Ativação da frequência direta na página 396](#) está **Ativado**, os parâmetros Direto/Talkaround podem ser modificados para cada perfil de Opções de frequência. Ao iniciar o modo Direto/Talkaround, o rádio transmitirá e receberá sinal nesta Frequência direta (MHz) usando estes parâmetros de frequência.

Quando Direto/Talkaround estiver **Ativado** para este perfil de Opções de frequência e o campo Ativação da frequência direta estiver **Desativado**, as configurações dos campos de parâmetros de recepção são usadas sempre para iniciar o modo Direto/Talkaround.

Direto/Talkaround deve estar **Ativado** em um perfil de Opções de frequência para ser disponibilizado a você em um canal de rádio. Você pode selecionar o modo Direto/Talkaround pressionando o botão [Modo Direto na página 190](#), selecionando o switch [Modo Direto na página 202](#) ou selecionando o menu [Direto/Talkaround na página 212](#).

Acessado apenas: Quando o campo [Tipo de silenciador de recepção/TA na página 439](#) está configurado como **DPL** e o campo PL selecionável pelo usuário [MPL] está **Desativado** ou configurado como **Tx**.

As seleções a seguir são compatíveis:

**OBSERVAÇÃO:**

Os códigos marcados com um asterisco não fazem parte dos 83 códigos EIA/TIA-603 padrão.

10.34.4.14

Inversão de DPL de recepção/TA

Este campo faz com que os sinais de DPL (Digital Private Line, linha privada digital) sejam invertidos quando recebidos pelo rádio.

**OBSERVAÇÃO:**

A codificação invertida permite mais tráfego/uso nas frequências.

**INFORMAÇÕES:**

A Inversão de DPL deve ser definida nos rádios de recepção e de transmissão para que a comunicação ocorra. Essa função se aplica somente para o perfil de Opções de frequência (registro/linha) atual da Personalidade convencional atual.

**AVISO:**

Quando o campo [Ativação de Varredura de Voto Misto na página 472](#) estiver **Ativado** e o campo [Direção de transmissão de varredura de ponderação mista na página 472](#) estiver **Desativado**, este campo deve ser uma correspondência para todas as Opções de frequência na Personalidade em questão; senão, o RadioCentral considerará o valor do campo inválido.

**OBSERVAÇÃO:**

Os perfis de Opção de frequência podem ser selecionados para uso na página Canais de atribuição de zonas e canais; primeiro, a personalidade é selecionada no campo [Personalidade na página 669](#), depois, o perfil de Opções de frequência é selecionado no campo [Opção de frequência convencional na página 671](#).

**INFORMAÇÕES:**

Quando [Direto/Talkaround na página 433](#) está **Ativado** para este perfil de Opções de Frequência e o campo [Ativação da frequência direta na página 396](#) está **Ativado**, os parâmetros Direto/Talkaround podem ser modificados para cada perfil de Opções de frequência. Ao iniciar o modo Direto/Talkaround, o rádio transmitirá e receberá sinal nesta Frequência direta usando estes parâmetros de frequência.

Quando Direto/Talkaround está **Ativado** para este perfil de Opções de frequência e o campo Frequência direta está **Desativado**, as configurações dos campos de parâmetros de recepção são usadas sempre que você inicia o modo Direto/Talkaround.

Direto/Talkaround deve estar **Ativado** em um perfil de Opções de frequência para ser disponibilizado a você em um canal de rádio. Você pode selecionar o modo Direto/Talkaround pressionando o botão [Modo Direto na página 190](#), selecionando o switch [Modo Direto na página 202](#) ou selecionando o menu [Direto/Talkaround na página 212](#).

Acessado apenas: Quando o campo [Tipo de silenciador de recepção/TA na página 439](#) está configurado como **DPL** e o campo PL selecionável pelo usuário [MPL] está **Desativado** ou configurado como **Tx**.

10.34.4.15

Tipo de silenciador de Tx

Esse campo seleciona o tipo de PL de transmissão ou silenciador de portadora necessário para se comunicar com outro rádio.

INFORMAÇÕES:

O [Tipo de ativação/desativação da função mudo na página 424](#) selecionado para a personalidade também determina se uma ligação poderá ser recebida. Essa seleção se aplica somente ao perfil de Opções de frequência atual (registro/linha) da Personalidade convencional atual.

AVISO:

Quando o campo [Ativação de Varredura de Voto Misto na página 472](#) estiver **Ativado** e o campo [Direção de transmissão de varredura de ponderação mista na página 472](#) estiver **Desativado**, este campo deve ser uma correspondência para todas as Opções de frequência na Personalidade em questão; senão, o RadioCentral considerará o valor do campo inválido.

OBSERVAÇÃO:

Os perfis de Opção de frequência podem ser selecionados para uso na página Canais de atribuição de zonas e canais; primeiro, a personalidade é selecionada no campo [Personalidade na página 669](#), depois, o perfil de Opções de frequência é selecionado no campo [Opção de frequência convencional na página 671](#).

Acessado apenas: Quando o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **Não ASTRO** ou **Modo misto**, o campo [Receber Somente Personalidade na página 423](#) estiver **Desativado** e o campo PL (MPL) selecionável pelo usuário estiver **Desativado** ou **Rx**.

As seleções a seguir são compatíveis:

- Desabilitado
- Linha privada (PL)
- Linha privada digital (DPL)

10.34.4.16

Frequência de PL de transmissão

Esse campo seleciona a frequência designada usada ao transmitir uma comunicação de PL para outro rádio.

**OBSERVAÇÃO:**

Essa frequência se correlaciona diretamente com o [Código PL de transmissão na página 448](#). Selecionar um valor para este campo, seleciona automaticamente um Código de PL de transmissão e vice-versa. Essa seleção se aplica somente ao perfil de Opções de frequência atual (registro/linha) da Personalidade convencional atual.

**AVISO:**

Quando o campo [Ativação de Varredura de Voto Misto na página 472](#) estiver **Ativado** e o campo [Direção de transmissão de varredura de ponderação mista na página 472](#) estiver **Desativado**, este campo deve ser uma correspondência para todas as Opções de frequência na Personalidade em questão; senão, o RadioCentral considerará o valor do campo inválido.

**OBSERVAÇÃO:**

Os perfis de Opção de frequência podem ser selecionados para uso na página Canais de atribuição de zonas e canais; primeiro, a personalidade é selecionada no campo [Personalidade na página 669](#), depois, o perfil de Opções de frequência é selecionado no campo [Opção de frequência convencional na página 671](#).

Acessado apenas: Quando o campo [Receber Somente Personalidade na página 423](#) estiver **Desativado** e quando o campo [Tipo de silenciador de Tx na página 446](#) for **PL** e quando o campo PL [MPL] selecionado pelo usuário estiver **Desativado** ou **Rx**.

As seleções a seguir são compatíveis:

Código	Código	Código	Código
132	311	525*	
134	315	532	
143	331	546	

**OBSERVAÇÃO:**

Os códigos marcados com um asterisco não fazem parte dos 83 códigos EIA/TIA-603 padrão.

10.34.4.19

Inversão de DPL de transmissão

Esse campo faz com que os sinais de DPL sejam invertidos antes de serem transmitidos.

**OBSERVAÇÃO:**

A codificação invertida permite mais tráfego/uso nas frequências.

**INFORMAÇÕES:**

A Inversão de DPL de transmissão deve ser definida nos rádios de recepção e de transmissão para que a comunicação ocorra. Essa função se aplica somente para o perfil de Opções de frequência (registro/linha) atual da Personalidade convencional atual.

**AVISO:**

Quando o campo [Ativação de Varredura de Voto Misto na página 472](#) estiver **Ativado** e o campo [Direção de transmissão de varredura de ponderação mista na página 472](#) estiver **Desativado**, este campo deve ser uma correspondência para todas as Opções de frequência na Personalidade em questão; senão, o RadioCentral considerará o valor do campo inválido.

**OBSERVAÇÃO:**

Os perfis de Opção de frequência podem ser selecionados para uso na página Canais de atribuição de zonas e canais; primeiro, a personalidade é selecionada no campo [Personalidade na página 669](#), depois, o perfil de Opções de frequência é selecionado no campo [Opção de frequência convencional na página 671](#).

Acessado apenas: Quando o campo [Receber Somente Personalidade na página 423](#) estiver **Desativado** e quando o campo [Tipo de silenciador de Tx na página 446](#) for **DPL** e quando o campo PL [MPL] selecionado pelo usuário estiver **Desativado** ou **Rx**.

10.34.4.20

Membro Persistente de Varredura de Voto Misto

Esse campo faz com que o rádio sempre verifique a frequência de Rx/TA (desse registro/linha) ao operar no modo Verificação e ao verificar ativamente essa Personalidade convencional de Verificação de ponderação mista.

Isso é válido quando há frequências/canais mais fortes encontrados na mesma Lista de verificação em que essa Personalidade convencional está selecionada. Essa função se aplica somente ao perfil Opções de frequência atual (registro/linha) da Personalidade convencional.

**OBSERVAÇÃO:**

Os perfis de Opção de frequência podem ser selecionados para uso na página Canais de atribuição de zonas e canais. Primeiro, a personalidade é selecionada no campo Personalidade, depois, o perfil de Opções de frequência é selecionado no campo Opções de frequência.

Acessado apenas: Quando o campo [Ativação de Varredura de Voto Misto na página 472](#) estiver **Ativado**.

10.34.5

integrada

Esta seção permite visualizar ou definir a funcionalidade de Sinalização ASTRO e Não ASTRO (MDC, DTMF, Quik-Call II e Tom único) para cada Personalidade convencional.

**OBSERVAÇÃO:**

Após a definição exclusiva das funções das personalidades convencionais, cada personalidade poderá ser atribuída à posição desejada do seletor de canais do rádio. Isso é feito pela atribuição de zonas e canais, na página Canais.

10.34.5.1

Sistema ASTRO

Este campo seleciona o Sistema de sinalização ASTRO ou DVRS desejado que será usado para a Personalidade convencional atual.

Este Sistema convencional previamente definido e todas as configurações programadas se aplicam a este canal.

**INFORMAÇÕES:**

Somente Sistemas Convencionais com um tipo de Sistema ASTRO ou DVRS (previamente definido no campo Tipo de Sistema do Sistema) podem ser selecionados neste campo.

**OBSERVAÇÃO:**

O valor do Sistema ASTRO é referente ao primeiro registro do Sistema convencional se a personalidade não for criada automaticamente pelo recurso de Clonagem de zonas. O valor não pode ser alterado.

Acessado apenas: Quando o campo [Tipo de voz/sinal de recepção na página 424](#) for **ASTRO** ou **Modo misto**, e quando o rádio está habilitado para o modelo/a opção.

10.34.5.2

Tipo de Modulador Digital do ASTRO

Este campo seleciona o Tipo de modulador digital durante a operação no modo sinalização ASTRO na Personalidade convencional atual.

Acessado apenas: Quando o campo [Tipo de voz/sinal de recepção na página 424](#) for **ASTRO** ou **Modo misto**, e quando o rádio está habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

C4FM

Modulação de frequência do nível 4 contínua para operação que não é de difusão simultânea.

CQPSK

Chaveamento de fase em quadratura compatível para operação de difusão simultânea em banda estreita. Disponível quando o modelo do rádio for equipado para Operação digital CAI (Common Air Interface, interface aérea comum).

TOTAL

Operação de difusão simultânea de banda larga. Disponível quando o campo [Espaçamento de canais/desvio de transmissão na página 435](#) não estiver definido como **2,5 kHz**.

**AVISO:**

Esta seleção será inválida se as seguintes opções forem verdadeiras quando o campo Tipo de voz/sinal de recepção for **ASTRO** ou **Modo misto**, e ((quando a Banda de frequência principal for **900 MHz**), ou (quando o campo Permitir frequências inválidas estiver **Ativado**, e quando o campo 900 MHz usados no Codeplug estiver **Ativado**)).

10.34.5.3

Regra de desativação da função mudo da recepção do ASTRO

Este campo seleciona o modo de desativação da função mudo da recepção (Rx) do ASTRO do rádio durante a operação no modo de sinalização do ASTRO ou DVRS e quando na Personalidade convencional atual.

**AVISO:**

Quando o ID do grupo de conversação **65535** de "Chamadas para todos" em Todo o sistema for selecionado para o canal/a personalidade atual (selecionado no campo ID do grupo de conversação do ASTRO), e quando o campo [Tipo de seleção na página 467](#) for **Amarrado**, a opção **Silenciador normal** será a única seleção válida para este campo.

Quando o ID do grupo de conversação **0** "Apenas de recepção" em Todo o sistema (Grupo de conversação apenas de recepção) for selecionado para o canal/a personalidade atual, a opção **Silenciador seletivo** será a única seleção válida para este campo.

**OBSERVAÇÃO:**

Ao transmitir no ID do grupo de conversação **65535** de "Chamadas para todos" em Todo o sistema (para o canal/personalidade atual), o rádio receberá automaticamente a voz do ASTRO na configuração **Silenciador normal** seja qual for a configuração deste campo.

Acessado apenas: Quando o campo [Tipo de voz/sinal de recepção na página 424](#) for **ASTRO** ou **Modo misto**, e quando o rádio está habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Silenciador normal

O rádio desativa a função mudo após decodificar uma correspondência [ID da rede de recepção na página 436](#). O rádio desativa a função mudo mesmo quando ele está esperando DES-XL, mas recebe DES-OFB (consulte o campo [Transmissão DES-XL padrão na página 479](#)).

**OBSERVAÇÃO:**

Disponível quando o campo [Grupo de conversação na página 467](#) ou o campo [Recepção/transmissão de chamada seletiva na página 462](#) está **Ativado**.

Silenciador seletivo

O rádio desativa a função mudo após decodificar uma correspondência de ID de rede (seja uma correspondência de ID do grupo de conversação ou uma Ligação seletiva). A seleção de Transmissão DES-XL padrão selecionada determina o tipo de algoritmo de criptografia que o rádio espera receber quando está nesse modo.

**OBSERVAÇÃO:**

Disponível quando o campo Grupo de conversação ou o campo Recepção/transmissão de chamada seletiva estiver **Ativado**.

Dados e silenciador

O rádio desativa a função mudo após decodificar uma correspondência de ID de rede e uma Ligação seletiva.

**OBSERVAÇÃO:**

Disponível quando o campo Recepção/transmissão de ligação seletiva estiver **Ativado**.

CSQ digital

O rádio desativa a função mudo para todos os sinais de voz compatíveis com Operação CAI digital.

10.34.5.4

Entrada Atrasada - Desativação Rápida da Função Mudo do ASTRO

Este campo permite que o rádio desative a função mudo de uma chamada em andamento antes de determinar se é uma chamada Protegida.

Essa função permite que as chamadas desativem a função mudo entre 180 e 360 milissegundos mais rapidamente. Este recurso se aplica ao operar no modo de sinalização ASTRO e na Personalidade convencional atual.

**INFORMAÇÕES:**

É recomendável que esse recurso seja usado somente em canais não seguros porque os rádios que recebem chamadas seguras desativarão a função mudo para áudio ininteligível até a chamada ser reconhecida como segura.

Acessado apenas: Quando o campo [Tipo de voz/sinal de recepção na página 424](#) for **ASTRO** ou **Modo misto**, e quando o rádio está habilitado para o modelo/a opção.

10.34.5.5

Tipo de Sinalização Não ASTRO

Este campo seleciona o tipo de sistema de sinalização analógica usado para comunicações de recepção e transmissão durante a operação na Personalidade convencional atual.

**AVISO:**

Quando o campo Áudio analógico plano estiver **Ativado**, este campo deve ser definido como **Nenhum**, caso contrário, se tornará inválido. Desse modo, as duas funções não podem ser ativadas na mesma personalidade.

Acessado apenas: Quando o campo [Tipo de voz/sinal de recepção na página 424](#) for **Não ASTRO** ou **Modo misto** e a personalidade não for criada automaticamente pelo recurso Clonagem de zonas.

As seleções a seguir são compatíveis:

- Nenhum
- MDC
- DTMF
- Quik-Call II

**OBSERVAÇÃO:**

As seleções são dependentes da opção/do modelo do rádio.

10.34.5.6

Número do sistema

10.34.5.7

ID de PTT não ASTRO

Este campo permite que o ID do PTT MDC ou DTMF seja transmitido com cada comunicação de saída.

**OBSERVAÇÃO:**

O ID der PTT é equivalente ao ID principal definido pelo RadioCentral. A transmissão do ID principal permite a exibição do ID de chamada no rádio receptor. Essa função se aplica à Personalidade convencional atual.

**OBSERVAÇÃO:**

Quando a seleção do campo ID de PTT for **Frente Principal** ou **Ambos**, o ID de PTT será transmitido sempre que o botão PTT for pressionado/ligado.

Quando a seleção do campo ID do PTT for **Extremidade traseira** ou **Ambos**, e

**AVISO:**

O ID do PTT não deve ser definido como **Nenhum** no Sistema convencional de MDC ou DTMF mencionado.

Acessado apenas: Quando o campo [Tipo de voz/sinal de recepção na página 424](#) for **Não ASTRO** ou **Modo Misto**, e quando o campo Tipo de Sinalização Não ASTRO for **MDC** ou **DTMF** e quando o campo [Receber Somente Personalidade na página 423](#) estiver **Desativado**.

10.34.5.8

ID de PTT de emergência

Este campo permite que o ID principal/unidade do MDC do rádio selecionado no momento transmita em cada Chamada de modo de emergência.

Portanto, o ID de PTT de Emergência só se aplica quando o campo Tipo de Emergência está definido como **Alarme e Ligação**. Essa função se aplica à Personalidade convencional atual.

OBSERVAÇÃO:

O ID de PTT de Emergência real é determinado pelo Número do Sistema (MDC somente) selecionado da Personalidade Convencional atual.

Acessado apenas: Quando o campo [Receber Somente Personalidade na página 423](#) estiver **Desativado**, e quando o campo [Tipo de voz/sinal de recepção na página 424](#) for **Não ASTRO** ou **Modo Misto**, e quando o campo Tipo de Sinalização Não ASTRO for **MDC**, e quando um Tipo de Sistema **MDC** referenciado no Sistema Convencional com um Perfil de Emergência Convencional referenciado tiver sido selecionado e quando esse Perfil de Emergência tiver seu campo Tipo de Emergência definido como **Alarme Ligação**.

10.34.5.9

Tipo de reversão de emergência

Este campo seleciona o tipo de reversão de emergência a ser usado para a Personalidade convencional atual.

Acessado apenas: (Quando o campo [Tipo de voz/sinal de transmissão na página 427](#) estiver definido como **ASTRO**, e quando um Tipo de sistema ASTRO mencionado no Sistema convencional com um Perfil de emergência convencional mencionado for selecionado) ou (quando o campo Tipo de voz/sinal de transmissão estiver definido como **Não ASTRO**, e quando o campo Tipo de sinalização não ASTRO estiver definido como **MDC**, e quando um Tipo de sistema MDC mencionado no Sistema convencional com um Perfil de emergência convencional mencionado for selecionado.)

As seleções a seguir são compatíveis:

Canal selecionado

Nenhum Canal de reversão é usado; emergências são transmitidas no canal atualmente selecionado no rádio.

Canal de reversão

A [Zona de Reversão de Emergência na página 456](#) e o [Canal de reversão de emergência na página 456](#) selecionados para esta Personalidade são usados para transmissões de emergência.

Reverter grupo de conversação

O Grupo de conversação de reversão selecionado para esta Personalidade é usado para transmissões de emergência.

Essa seleção é Acessada somente quando o rádio for habilitado para PSU (Portable Subscriber Unit, unidade de rádio portátil) de DVRS.

AVISO:

Essa seleção só é válida quando um Tipo de sistema **DVRS** mencionado no Sistema convencional com um Perfil de emergência convencional mencionado for selecionado, e o campo [Grupo de conversação na página 467](#) estiver **Ativado**.

10.34.5.10

Zona de Reversão de Emergência

Este campo seleciona a Zona que é usada durante uma transmissão de modo de emergência.

Esta seleção se aplica à Personalidade convencional atual.

**OBSERVAÇÃO:**

Após a seleção da zona, o [Canal de reversão de emergência na página 456](#) poderá ser selecionado.

As zonas e os canais devem ser previamente definidos na janela Atribuição de zonas e canais.

**AVISO:**

Apenas as Zonas não dinâmicas (zonas que têm a Ativação da zona dinâmica **Desativada**) podem ser selecionadas, caso contrário, o campo se tornará inválido.

Acessado apenas: Quando o campo [Tipo de reversão de emergência na página 455](#) estiver definido como **Canal de Reversão**, e (quando o campo [Tipo de voz/sinal de transmissão na página 427](#) estiver definido como **ASTRO**, e quando o Tipo de Sistema ASTROS referenciado do Sistema Convencional com um Perfil de Emergência Convencional tiver sido selecionado) ou (quando o campo Tipo de Voz/Sinal de Transmissão estiver definido como **Não ASTRO**, e quando o campo Tipo de Sinalização Não ASTRO estiver definido como **MDC**, e quando o Tipo de Sistema MDC referenciado do Sistema Convencional com Perfil de Emergência Convencional referenciado tiver sido selecionado).

10.34.5.11

Canal de reversão de emergência

Este campo seleciona um canal convencional designado que é usado durante uma transmissão de modo de emergência.

Esta seleção se aplica à Personalidade convencional atual.

**OBSERVAÇÃO:**

O [Zona de Reversão de Emergência na página 456](#) deve ser selecionado antes da seleção deste canal.

As zonas e os canais devem ser previamente definidos na Atribuição de zonas e canais.

**AVISO:**

Para que um canal de Entroncamento seja selecionado como o Canal de reversão de emergência, o Recurso estendido **Reversão de emergência de multigrupo** deve ser exibido no campo Nome do recurso estendido.

Essa seleção de Canal de reversão de emergência só é considerada válida quando o campo Grupo de conversação de entroncamento da Personalidade/canal de entroncamento selecionado não estiver definido como **DYN** ou **ATG**, e quando o campo [Receber Somente Personalidade na página 423](#) da Personalidade/canal convencional estiver **Desativado**, e quando o campo ID do grupo de conversação do ASTRO da Personalidade/canal convencional selecionado não estiver definido como **DYN** ou **ATG**, e quando o campo Modo de transmissão da Personalidade/canal de entroncamento selecionado não estiver definido como **TG/AG desativados (somente escuta)**, e quando a Seleção do perfil de emergência do canal selecionado não estiver como **Transmissão de emergência desativada**.

Acessado apenas: Quando o campo [Tipo de reversão de emergência na página 455](#) estiver definido como **Canal de reversão**, e quando o campo Zona de reversão não estiver definido como Zona dinâmica, e (Quando o campo [Tipo de voz/sinal de transmissão na página 427](#) estiver definido como **ASTRO**, e quando um Tipo de sistema ASTRO mencionado no Sistema convencional com referência no Perfil de emergência convencional for selecionado) ou (quando o campo Tipo de voz/sinal de transmissão estiver definido como **Não ASTRO**, e quando o campo Tipo de sinalização não ASTRO estiver definido como **MDC**, e quando um Tipo de sistema MDC mencionado no Sistema convencional com referência a um Perfil de emergência convencional for selecionado).

10.34.5.12

Lista de sinalização de tom

Esse campo seleciona a Lista de sinalização de tom a ser usada na Personalidade convencional atual.

OBSERVAÇÃO:

A funcionalidade Lista de sinalização de tom é definida na página Lista de sinalização de tom.

Acessado apenas: Quando a Lista de sinalização de tom estiver definida como **Sinalização de tom desativada**, ou quando o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **Não ASTRO**, e quando o Tipo de sinalização estiver definido como **Quik-Call II**, ou quando o campo Tipo de voz/sinal de recepção estiver definido como **Modo misto**, e quando o [Tipo de voz/sinal de transmissão na página 427](#) estiver definido como **Não ASTRO**, e quando o Tipo de sinalização estiver definido como **Quik-Call II** ou quando o campo Tipo de voz/sinal de recepção não estiver definido como **Não ASTRO** ou quando o rádio estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

- Sinalização de tom desativada
- Listas de sinalização de tom disponíveis

10.34.6

Chamada não ASTRO

Essa seção permite visualizar ou definir recursos relacionados à sinalização do modo não ASTRO ou analógico, como: MDC, DTMF e Quick-Call II e Tom único.

OBSERVAÇÃO:

Os Sistemas convencionais definidos com tipo de sistema **MDC**, **DTMF**, **Quick-Call II** ou **Tom único** podem ser selecionados no campo Sistema não ASTRO da Personalidade convencional, permitindo que ocorram comunicações do tipo de sistema específico.

Após a definição exclusiva das funções das personalidades convencionais, cada personalidade poderá ser atribuída à posição desejada do seletor de canais do rádio. Isso é feito pela atribuição de zonas e canais, na página Canais.

10.34.6.1

Recepção/transmissão de chamada seletiva

Este campo seleciona se Chamadas seletivas não ASTRO (MDC, DTMF e Quik-Call II) podem ser transmitidas e/ou recebidas para a Personalidade convencional atual.

AVISO:

Quando o campo Alcance do ID de MDC expandido está **Ativado**, ele deve ser definido como **Desativado**; caso contrário, será considerado inválido pelo RadioCentral. Esses dois recursos são incompatíveis.

Quando o campo Tipo de sinalização não ASTRO é **Quik-Call II**, quando o campo Ativação do hardware de DVRS está **Ativado**, e a Personalidade atual referenciada no Perfil DVRS tem seu campo Ativação remota de DVRS definido como **Via alerta de chamada**, este recurso deve ser **Desativado**, caso contrário, ele será considerado inválido pelo RadioCentral. Esses dois recursos são incompatíveis.

Quando o campo Tipo de sinalização não ASTRO é **Quik-Call II**, este recurso e [Recepção/Transmissão de alerta de chamada na página 459](#) são mutuamente exclusivos; por isso, um deles deve ser **Desativado**, caso contrário, os recursos dois serão considerados inválidos.

OBSERVAÇÃO:

É possível ativar uma codificação (transmissão) de Chamada seletiva pressionando o botão Selecionar/Chamada privada ou selecionando o menu Selecionar/Chamada privada.

Acessado apenas: Quando o campo [Tipo de voz/sinal de recepção na página 424](#) for **Não ASTRO** ou **Modo misto**, e quando o campo Tipo de sinalização não ASTRO for **MDC, DTMF** ou **Quik-Call II** e quando o rádio estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Desabilitado

Nenhum Alerta de chamada é possível na personalidade atual.

Decodificação

As chamadas seletivas podem ser apenas recebidas (decodificadas).

Codificação

As chamadas seletivas podem ser apenas transmitidas (codificadas).

AVISO:

Quando o campo Tipo de sinalização não ASTRO for **Quik-Call II**, essa seleção será inválida.

Codificação e decodificação

As chamadas seletivas podem ser recebidas e transmitidas.

AVISO:

Quando o campo Tipo de sinalização não ASTRO for **Quik-Call II**, essa seleção será inválida.

10.34.6.2

Tipo de desativação da função mudo

Este campo seleciona a condição de reativar o som para a Personalidade convencional não ASTRO (MDC, DTMF ou Quik-Call II) atual.

A regra para reativar o som se aplica apenas à detecção de Chamadas seletivas.

Acessado apenas: Quando o campo [Tipo de voz/sinal de recepção na página 424](#) for **Não ASTRO** ou **Modo misto**, e quando o campo Tipo de sinalização não ASTRO for **MDC, DTMF** ou **Quik-Call II**, e quando o campo [Recepção/transmissão de chamada seletiva na página 457](#) estiver definido como **Decodificação** ou **Codificação e decodificação** e quando rádio estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

e

A regra [Tipo de ativação/desativação da função mudo na página 424](#) selecionada da personalidade atual e a detecção de Chamada seletiva devem ser cumpridas antes da opção de desativação da função mudo ocorrer.

Ou

A regra Tipo de ativação/desativação da função mudo selecionada da personalidade atual ou a detecção de Chamada seletiva ativar a opção de desativação da função mudo do alto-falante do rádio para receber áudio.

10.34.6.3

Recepção/Transmissão de alerta de chamada

Este campo especifica se Alertas de chamada não ASTRO (MDC, DTMF, Quik-Call II e Tom único) podem ser transmitidos ou recebidos (ou ambos) para a Personalidade convencional atual.

AVISO:

Quando o campo Alcance do ID de MDC expandido está **Ativado**, ele deve ser definido como **Desativado**; caso contrário, será considerado inválido pelo RadioCentral. Esses dois recursos são incompatíveis.

Quando o campo Tipo de sinalização não ASTRO é **Quik-Call II**, este recurso e [Recepção/transmissão de chamada seletiva na página 457](#) são mutuamente exclusivos, por isso, um deles deve ser **Desativado**; caso contrário, os dois serão considerados inválidos pelo RadioCentral.

OBSERVAÇÃO:

O alerta de chamada é ativado pelo pressionamento do botão Alerta de chamada ou seleção do menu Página (Alerta de chamada).

Acessado apenas: (Quando o rádio estiver habilitado para o modelo/a opção e quando o campo [Tipo de voz/sinal de recepção na página 424](#) for **Não ASTRO** ou **Modo misto**, e quando o campo Tipo de sinalização não ASTRO for **MDC**, **DTMF** ou **Quik-Call II** para a personalidade atual), e (quando o campo Ativação de hardware DVRS estiver **Desativado**), ou (quando o campo Ativação de hardware DVRS estiver **Ativado** e quando o Perfil DVRS referenciado da Personalidade atual tiver seu campo Ativação remota de DVRS definido como **Desativado**.)

As seleções a seguir são compatíveis:

Desabilitado

Nenhum Alerta de chamada é possível na personalidade atual.

Decodificação

Os Alertas de chamada só podem ser recebidos (decodificados).

Codificação

Os Alertas de chamada só podem ser transmitidos (codificados).

AVISO:

Quando o campo Tipo de sinalização não ASTRO for **Quik-Call II**, essa seleção será inválida.

Codificação e decodificação

Os Alertas de chamada podem ser recebidos e transmitidos.

AVISO:

Quando o campo Tipo de sinalização não ASTRO for **Quik-Call II**, essa seleção será inválida.

10.34.6.4

Acesso ao botão RTT do MDC

Este campo seleciona o modo RTT (Request-To-Talk, solicitação para falar) para a Personalidade convencional atual.

Quando ativado com as seleções **Manual** (o pressionamento do botão RTT do MDC ou a seleção do menu [Solicitação para conversar](#)) ou **Automático** (botão PTT), o rádio envia um pacote de sinalização RTT ao despachador, solicitando a capacidade de transmitir voz no canal. O microfone do rádio será, então, imediatamente ativado dentro de 2 a 3 segundos, para que você tenha tempo de alcançar o

microfone e iniciar uma transmissão de voz. Neste ponto, o rádio tem um acesso de voz "normal" a esse canal.

**OBSERVAÇÃO:**

Essa função permite que o operador gerencie o tráfego de comunicações por voz do canal. Este recurso se aplica ao operar no modo Sistema MDC e na Personalidade convencional atual.

**AVISO:**

Se o campo [Tipo de acesso](#) estiver definido como **Automático**, esse campo não poderá ser definido como **Automático**. Essas duas configurações de campo são mutuamente exclusivas.

Acessado apenas: Quando o [Tipo de voz/sinal de transmissão na página 427](#) estiver definido como **Não ASTRO** e quando o campo Tipo de sinalização não ASTRO para a personalidade atual estiver definido como **MDC**.

As seleções a seguir são compatíveis:

Nenhum

Recurso desativado.

Manual

Cada vez que você pressiona o botão RTT ou seleciona o menu RTT, o pacote de sinalização RTT é transmitido ao despachador/console solicitando a capacidade de transmitir voz.

**AVISO:**

Essa seleção só é válida quando [Receber Somente Personalidade na página 423](#) estiver **Desativada** e quando [Acesso Repetido](#) estiver **Ativado**.

Automático

Cada vez que você pressiona o botão PTT, o pacote de sinalização RTT é transmitido ao despachador/console solicitando a capacidade de transmitir voz.

**AVISO:**

Essa seleção será válida apenas quando a opção Receber somente personalidade estiver **Desativada**, quando o Acesso ao repetidor estiver **Ativado** e quando o [Tipo de acesso](#) não estiver definido como **Automático**.

10.34.6.5**Transmissão de chamada de seleção automática do MDC**

Quando ativada, assim que você escolhe enviar uma Chamada seletiva - MDC e seleciona um destinatário na Lista de prioridades de chamada não ASTRO, um pacote de dados da Chamada seletiva é transmitido sempre que o botão PTT é pressionado no rádio.

Este recurso se aplica ao operar no modo Sistema MDC e na Personalidade convencional atual.

Quando desativada, um pacote de dados de Chamada seletiva do MDC é transmitido somente quando uma Chamada seletiva é iniciada. Ou seja, o pacote de dados de Chamada seletiva é transmitido depois que você seleciona para enviar uma Chamada seletiva, escolhe um destinatário na Lista de chamadas e pressiona o botão PTT. Pressionar o botão PTT várias vezes não envia um pacote de dados de Chamada seletiva.

Acessado apenas: Quando o campo [Tipo de voz/sinal de recepção na página 424](#) for **Não ASTRO** ou **Modo misto**, e quando o Tipo de sinalização não ASTRO para a personalidade atual estiver definido como **MDC**, e quando o campo [Recepção/transmissão de chamada seletiva na página 457](#) estiver definido como **Codificação** ou **Codificação e decodificação** e quando o rádio estiver habilitado para o modelo/a opção.

10.34.6.6

Chamada ilimitada do MDC

Este campo permite inserir manualmente o ID de um rádio alvo para uma Chamada seletiva ou um Alerta de chamada, também conhecido como entrada direta.

Assim que o Tipo de chamada é selecionado e a Lista de prioridades de chamada MDC aparece no visor do rádio, é possível fazer a entrada direta de um ID do rádio MDC desejado (pelo teclado). O pressionamento do botão PTT transmite a chamada para o rádio alvo do ID especificado. Este recurso se aplica ao operar no modo Sistema MDC e na Personalidade convencional atual.

Acessado apenas: Quando o campo [Recepção/transmissão de chamada seletiva na página 457](#) estiver definido como **Codificação** ou **Codificação e decodificação**, ou quando o campo [Recepção/Transmissão de alerta de chamada na página 459](#) estiver definido como **Codificação** ou **Codificação e decodificação**, e quando o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **Não ASTRO** ou **Modo misto**, e quando o campo Tipo de sinalização não ASTRO estiver definido como **MDC** e quando o rádio estiver habilitado para o modelo/a opção.

10.34.6.7

Lista de prioridades de chamada não ASTRO

Este campo seleciona a Lista de prioridades de chamada não ASTRO (MDC, DTMF ou Quik-Call II) a ser usada para a Personalidade convencional atual.

Em seguida, você poderá selecionar membros individuais da Lista de prioridades de chamada ao operar no modo de comunicações Convencional. Os membros da Lista de prioridades de chamada permitem comunicações como Chamada seletiva ou Alerta de chamada para rádios individuais ou para grupos de rádios.

Acessado apenas: Quando o campo [Tipo de voz/sinal de recepção na página 424](#) for **Não ASTRO** ou **Modo misto** e quando o campo Tipo de sinalização não ASTRO não for igual a **Nenhum**.

10.34.6.8

Alerta do usuário de chamada recebida ativado

Este campo faz com que o rádio permaneça silenciado para chamadas de despacho normais sempre que você ativa a funcionalidade Silenciar voz.

Os Alertas de chamada em grupo e individual ativam o áudio do rádio para a emissão do som do tom de alerta. O rádio também ativa o áudio para chamadas individuais entre rádios, como chamadas seletivas e chamadas de interconexão (Modo telefone). Essa função será muito útil quando você preferir não ouvir o tráfego de despacho normal, mas precisar permanecer em contato com o sinal do rádio. Esta função é aplicável ao operar no modo Sistema não ASTRO (MDC, DTMF e QCII) e quando na Personalidade convencional atual.

Quando essa função estiver desativada, não será possível ativá-la para a Personalidade convencional atual.

**OBSERVAÇÃO:**

Pressionar o botão Silenciar voz ou selecionar o menu Silenciar voz permite ativar/desativar essa funcionalidade para um canal habilitado para Alerta do usuário de chamada recebida.

**AVISO:**

Este campo Alerta do usuário de chamada recebida não ASTRO deverá ser **Ativado** quando o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **Modo misto** e quando o campo Tipo de sinalização estiver definido como **MDC**, **DTMF** ou **Quik-Call II**.

**INFORMAÇÕES:**

Quando Silenciar voz está ativo, os alertas de chamada em grupo ou individual decodificados pelo rádio desativam o recurso de silenciar o rádio durante o período de Liberação do silenciador. O período de Liberação do silenciador é definido pela seleção do campo Selecionar chamada/Redefinição da chamada recebida do sistema ASTRO desta personalidade. Assim que o Alerta de chamada (enviado como uma chamada individual ou em grupo) desativa o mudo do rádio, uma chamada de voz que o acompanha pode ser uma chamada em grupo que é ouvida no alto-falante do rádio, mas só até o final do período de Liberação do silenciador.

Se o canal do rádio for alterado, a função Silenciar voz será desativada pelo rádio; a função Silenciar voz deverá ser reativada, se desejado, ao voltar para o canal.

Se você pressionar o botão PTT, se iniciar o Modo de emergência ou se desligar e ligar o rádio, Silenciar voz será desativado pelo rádio.

A funcionalidade Inibição de rádio MDC está disponível.

As funções Modo de varredura e Modo monitor não estão disponíveis.

Outras indicações do visor (de chamadas em grupo), como LED de recepção e PTT-ID (se ativado), funcionam normalmente.

Acessado apenas: Quando o campo [Recepção/Transmissão de alerta de chamada na página 459](#) está definido como **Decodificação** ou **Decodificação e codificação**, quando o campo [Tipo de voz/sinal de recepção na página 424](#) está definido como **Não ASTRO** ou **Modo misto** e quando o campo [Tipo de Sinalização Não ASTRO na página 454](#) está definido como **MDC** ou **Quik-Call II** ou **DTMF**.

10.34.7

Ligação ASTRO

Esta seção permite visualizar ou definir Alerta de chamada ASTRO ou DVRS e a funcionalidade Chamada seletiva para Personalidades convencionais individuais.

**OBSERVAÇÃO:**

Os Sistemas convencionais definidos como tendo o Tipo de Sistema "ASTRO" ou "DVRS" podem ser selecionados do campo Sistema ASTRO da Personalidade convencional, permitindo que ocorram as comunicações dos Sistemas ASTRO.

Após a definição exclusiva das funções das personalidades convencionais, cada personalidade poderá ser atribuída à posição desejada do seletor de canais do rádio. Isso é feito pela atribuição de zonas e canais, na página Canais.

10.34.7.1

Recepção/transmissão de chamada seletiva

Esse campo seleciona se uma Chamada ASTRO/DVRS pode ser transmitida, recebida ou as duas opções.

Esta função é aplicável ao operar no modo Sistema ASTRO ou DVRS e na personalidade convencional atual.

INFORMAÇÕES:

Quando o sistema convencional de referência for um tipo de sistema ASTRO, esse recurso ativará a funcionalidade Chamada seletiva convencional.

Quando o sistema convencional de referência for um tipo de sistema DVRS, esse recurso ativará a funcionalidade Chamada privada de entroncamento.

OBSERVAÇÃO:

Você pode ativar uma chamada seletiva ou privada pressionando o botão Chamada seletiva/privada ou selecionando o menu Chamada seletiva/privada.

Acessado apenas: Quando o rádio é compatível com o modelo/a opção, quando a personalidade não é criada automaticamente pela função Clonagem de zonas e

(quando o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **Modo misto**) ou (quando o campo Tipo de sinal/voz de Rx estiver definido como **ASTRO** e quando o campo Sistema de interface de site remoto no sistema convencional de referência estiver **Desativado**).

As seleções a seguir são compatíveis:

Desabilitado

Nenhuma chamada seletiva/privada é permitida na personalidade atual.

Decodificação

As chamadas seletivas/privadas podem ser apenas recebidas (decodificadas).

Codificação

As chamadas seletivas/privadas podem ser apenas transmitidas (codificadas).

Codificação e decodificação

As chamadas seletivas/privadas podem ser recebidas e transmitidas.

10.34.7.2

Transmissão de Ligação Seletiva Automática

Quando ativado, ao escolher enviar um ASTRO — Chamada seletiva e selecionar um destinatário para a chamada da Lista de prioridades de chamada do ASTRO, um pacote de dados da Chamada seletiva será transmitido sempre que o botão PTT for pressionado.

Este recurso se aplica ao operar no modo Sistema ASTRO e na Personalidade convencional atual.

Quando desativado, um pacote de dados de Chamada seletiva é transmitido somente ao iniciar uma Chamada seletiva. Ou seja, ao escolher enviar uma Chamada seletiva, selecionar um destinatário da Lista de prioridades de chamada e pressionar o botão PTT, o pacote de dados da Chamada seletiva é transmitido uma vez. Pressionar o botão PTT várias vezes não envia um pacote de dados de Chamada seletiva.

OBSERVAÇÃO:

Para ativar a Chamada seletiva, pressione o botão Chamada privada/selecionada ou selecione a opção de menu Chamada privada/selecionada.

Acessado apenas: (Quando o rádio estiver habilitado para o modelo/a opção e quando o campo [Recepção/transmissão de chamada seletiva na página 462](#) estiver definido como **Codificação** ou **Decodificação e Codificação**, e quando o Sistema Convencional referenciado selecionado no campo Sistema ASTRO não é for um Tipo de Sistema **DVRS**), e ((quando o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **Modo Misto**), ou (quando o campo Tipo de Voz/Sinal de Recepção estiver definido como **ASTRO** e quando o campo Sistema de Interface de Site Remoto no Sistema Convencional referenciado estiver **Desativado**)).

10.34.7.3

Recepção/Transmissão de alerta de chamada

Esse campo seleciona se os Alertas de chamada (também conhecidos como Páginas) podem ser transmitidos e/ou recebidos.

Este recurso se aplica ao operar no modo Sistema ASTRO e na Personalidade convencional atual.

**OBSERVAÇÃO:**

Você pode ativar o Alerta de chamada ao pressionar o botão Alerta de chamada ou ao selecionar o item de menu Página (Alerta de chamada).

Acessado apenas: Quando o modelo ou a opção do rádio for compatível, e ((quando o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **Modo misto**), ou (quando o campo Tipo de sinal/voz de recepção estiver definido como **ASTRO**, e quando o campo Sistema de interface de site remoto no Sistema convencional referenciado estiver **Desabilitado**)), e ((quando o campo Hardware de DVRS habilitado estiver **Desabilitado**), ou (quando o campo Hardware de DVRS habilitado estiver **Habilitado**, e quando o campo de Ativação remota de DVRS do Perfil de DVRS referenciado da Personalidade atual estiver definido como **Desabilitado**)).

As seleções a seguir são compatíveis:

Desabilitado

Nenhum Alerta de chamada é possível na personalidade atual.

Decodificação

Os Alertas de chamada só podem ser recebidos (decodificados).

Codificação

Os Alertas de chamada só podem ser transmitidos (codificados).

Codificação e decodificação

Os Alertas de chamada podem ser recebidos e transmitidos.

10.34.7.4

Ligação Ilimitada ASTRO

Este campo permite inserir manualmente o ID de um rádio alvo para uma Chamada seletiva, Alerta de chamada ou Serviços táticos. A ação é conhecida como entrada direta.

Quando o tipo de chamada é selecionado e a Lista de prioridades de chamada do ASTRO aparece no visor do rádio, é possível realizar a entrada direta do ID do rádio ASTRO desejado (pelo teclado). Para Chamada seletiva e Alerta de chamada, pressione o botão **PTT** para transmitir a chamada para um ou mais rádios de destino do ID inserido. Para Serviços táticos, pressione o menu da tecla programável **Enviar** para transmitir o comando Serviços táticos para um ou mais rádios de destino do ID inserido.

O recurso se aplica durante a operação no modo Sistema ASTRO ou DVRS e na Personalidade convencional atual.

**INFORMAÇÕES:**

Quando o Tipo de sistema do Sistema convencional referenciado estiver definido como DVRS, esse recurso ativará a funcionalidade Chamada privada de entroncamento.

Acessado apenas: Esse campo pode ser acessado quando o rádio é compatível com o modelo ou opção e quando uma das seguintes condições for atendida:

- O campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **Modo misto**.
- O campo Tipo de Voz/Sinal de Recepção estiver definido como **ASTRO** e o campo Sistema de interface de site remoto no Sistema convencional de referência estiver **Desativado**.
- O campo [Recepção/transmissão de chamada seletiva na página 462](#) ou o campo [Recepção/Transmissão de alerta de chamada na página 464](#) está definido como **Codificação ou Decodificação e codificação**.

- O campo Operação de inutilização ou o campo Operação de paralisação está definido como **Codificação** ou **Decodificação e codificação**.
- O campo Operação de serviços táticos está definido como **Codificação** ou **Decodificação e codificação**.

10.34.7.5

Lista de Prioridades de Ligação ASTRO

Esse campo seleciona a Lista de prioridades do ASTRO convencional a ser usada pela Personalidade convencional atual.

Você pode selecionar membros da lista de chamadas individuais ao operar no modo de comunicações convencionais. Os membros da lista de chamadas permitem comunicações de Chamada seletiva, Alerta de chamada ou Serviços táticos para um ou mais rádios. Este recurso se aplica ao operar no modo Sistema ASTRO e na Personalidade convencional atual.

Acessado apenas: Esse campo pode ser acessado quando o rádio é compatível com o modelo ou opção e quando uma das seguintes condições for atendida:

- O campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **Modo misto**.
- O campo Tipo de Voz/Sinal de Recepção estiver definido como **ASTRO** e quando o campo Sistema de interface de site remoto no Sistema convencional de referência estiver **Desativado**.

10.34.7.6

Alerta do usuário de chamada recebida ativado

Este campo faz com que o rádio permaneça silenciado para chamadas de despacho normais sempre que você ativa a funcionalidade Silenciar voz.

Os Alertas de chamada em grupo e individual ativam o áudio do rádio para a emissão do som do tom de alerta. O rádio também desativa o modo mudo para ligações individuais entre rádios, como Chamadas seletivas, chamadas de Sinalização de tom e chamadas de Interconexão (modo telefone). Essa função será muito útil quando você preferir não ouvir o tráfego de despacho normal, mas precisar permanecer em contato com o sinal do rádio. Este recurso se aplica ao operar no modo Sistema ASTRO e na Personalidade convencional atual.

Quando essa função estiver desativada, não será possível ativá-la para a Personalidade convencional atual.

**OBSERVAÇÃO:**

Pressionar o botão Silenciar voz ou selecionar o menu Silenciar voz permite ativar/desativar essa funcionalidade para o canal habilitado para Alerta do usuário de chamada recebida.

**AVISO:**

Este campo Alerta do usuário de chamada recebida do ASTRO deverá ser **Ativado** quando o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **Modo misto** e quando o campo Tipo de sinalização estiver definido como **MDC**, **DTMF** ou **Quik-Call II**.

**INFORMAÇÕES:**

Quando Silenciar voz está ativo, os alertas de chamada em grupo ou individual decodificados pelo rádio desativam o recurso de silenciar o rádio durante o período de Liberação do silenciador. O período de Liberação do silenciador é definido pela seleção do campo Selecionar chamada/Redefinição da chamada recebida do sistema ASTRO desta personalidade. Assim que o alerta de chamada (enviado como uma chamada individual ou em grupo) desativa o mudo do rádio, uma chamada de voz que o acompanha e pode ser uma chamada em grupo é ouvida no alto-falante do rádio, mas só até o final do período de Liberação do silenciador.

Se o canal do rádio for alterado e a função Silenciar voz for desativada pelo rádio, a função Silenciar voz precisará ser reativada, se desejado, ao voltar para o canal.

Se você pressionar o botão PTT, iniciar o modo Emergência ou desligar e ligar o rádio, a função Silenciar voz será desativada pelo rádio.

A funcionalidade Inibição de rádio ASTRO está disponível.

As funções Modo de varredura e Modo monitor não estão disponíveis.

Outras indicações do visor de chamada em grupo, como o LED de recepção e PTT-ID (se ativado), funcionam normalmente.

Acessado apenas: Quando o rádio for compatível com o modelo/a opção, (quando o campo [Recepção/Transmissão de alerta de chamada na página 464](#) for **Decodificação** ou **Decodificação e codificação** e quando o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **Modo misto**) ou (quando o campo Rx/Tx de alerta de chamada for **Decodificação** ou **Decodificação e codificação**, quando o campo Tipo de voz/sinal de Rx estiver definido como **ASTRO** e quando o campo Sistema de interface de site remoto no sistema convencional de referência for **Desativado**) ou (quando o campo Tipo de voz/sinal de Rx não estiver definido como **Não ASTRO** e quando o campo Lista de sinalização de tom da personalidade convencional atual fizer referência a uma Lista de sinalização de tom que tenha, ao menos, um registro/uma linha em que o recurso de desativação do modo silencioso esteja **Ativado**).

10.34.8

Grupo de conversação do ASTRO

Esta seção permite visualizar ou definir a funcionalidade Lista de grupos de conversação do ASTRO do sistema ASTRO para personalidades convencionais individuais.

**OBSERVAÇÃO:**

Os sistemas convencionais definidos como tendo o Tipo de sistema **ASTRO** podem ser selecionados do campo Sistema ASTRO da Personalidade convencional, permitindo que as comunicações dos Sistemas ASTRO ocorram.

Após a definição exclusiva das funções das personalidades convencionais, cada personalidade poderá ser atribuída à posição desejada do seletor de canais do rádio. Isso é feito pela atribuição de zonas e canais, na página Canais.

10.34.8.1

Grupo de conversação

Esse campo habilita a funcionalidade Grupo de conversação durante a operação no modo Sistema ASTRO e na atual Personalidade de entroncamento convencional.

OBSERVAÇÃO:

Os sistemas ASTRO são selecionados para Personalidades convencionais individuais a partir do campo Sistema ASTRO.

AVISO:

O [Tipo de voz/sinal de recepção na página 424](#) deve ser definido como **ASTRO** ou **Modo misto** para a Personalidade atual; do contrário, o valor desse campo se tornará inválido.

Acessado apenas: Quando o rádio estiver habilitado para o modelo/a opção, e (quando o campo Sistema de interface de site remoto no sistema convencional referenciado estiver **Desativado**; se estiver **Ativado**, o campo Tipo de voz/sinal de recepção deverá ser definido como **ASTRO**, e essa seleção de Grupo de conversação deve estar **Desativada**; do contrário, este campo se tornará inválido).

10.34.8.2

Tipo de seleção

Este campo permite que você escolha um grupo de conversação na Lista de grupos de conversação ASTRO selecionada ou pode não permitir que você altere o grupo de conversação.

A Lista de grupos de conversação é selecionada na [Lista de grupos de conversação na página 468](#) dessa mesma página. Essa seleção é aplicada durante a operação no modo Sistema ASTRO e na atual Personalidade convencional.

Acessado apenas: Quando o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **ASTRO** ou **Modo misto**, quando o campo [Grupo de conversação na página 467](#) estiver **Ativado** e quando a personalidade não for criada automaticamente pela função Clonagem de zonas.

As seleções a seguir são compatíveis:

Vinculado

O grupo de conversação selecionado pelo campo ID do grupo de conversação ASTRO está vinculado à atual Personalidade convencional e não pode ser alterado.

Selecionável

Você pode alternar do ID do grupo de conversação predefinido para outro ID do grupo de conversação a partir da Lista de grupos de conversação da Personalidade convencional, selecionada nesta mesma página.

O usuário do rádio somente pode trocar de Grupos de conversação pressionando o botão Grupo de conversação ou selecionando o menu Grupo de conversação.

10.34.8.3

Lista de grupos de conversação

Seleciona uma Lista de grupos de conversação ASTRO a ser utilizada ao operar no modo Sistema ASTRO e na Personalidade convencional atual.

**AVISO:**

Quando o campo [ASTRO OTAR na página 485](#) estiver **Ativado** para a Personalidade convencional, somente essas Listas de grupos de conversação ASTRO que fizerem referência ao mesmo Perfil KMF seguro , a partir do campo Índice do perfil KMF da Lista de grupos de conversação, ao qual a Personalidade convencional faz referência (a partir do campo [Índice de perfil ASTRO OTAR na página 485](#) da personalidade) podem ser selecionadas.

Quando o campo ASTRO OTAR está **Desativado** para a Personalidade convencional atual, qualquer Lista de grupos de conversação pode ser selecionada.

Acessado apenas: Quando o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **ASTRO** ou **Modo misto**, quando o campo [Grupo de conversação na página 467](#) estiver **Ativado**, quando a personalidade não for criada automaticamente pela função Clonagem de zonas.

10.34.9

Funções

Essa seção permite que você visualize ou defina diversos recursos de comunicações convencionais.

**OBSERVAÇÃO:**

Após a definição exclusiva das funções das personalidades convencionais, cada personalidade poderá ser atribuída à posição desejada do seletor de canais do rádio. Isso é feito pela atribuição de zonas e canais, na página Canais.

10.34.9.1

Mensagens OTACR/OTACS

Permite as Mensagens OTACR (Over-The-Air-Channel-Reassignment, reatribuição de canal via ar) e OTACS (Over-The-Air-Channel-Steering, mudança de canal via ar).

**AVISO:**

Esse recurso não está disponível no momento.

Esse recurso é aplicado ao operar neste [Personalidade convencional na página 422](#) atual.

**AVISO:**

Quando o [Sistema convencional na página 408](#) referenciado (selecionado no campo [Sistema ASTRO na página 452](#) tiver um [Perfil de dados](#) referenciado cujo [Tipo de perfil de dados na página 370](#) seja **Convencional e banda larga** ou **Somente banda larga**, esse campo deverá ser definido como **Desativado**; caso contrário, ele será considerado inválido.

Acessado apenas: Quando o [Tipo de voz/sinal de recepção na página 424](#) é **ASTRO** ou **Modo misto**, e quando o [Recurso OTACR](#) está **Ativado** ou [Recurso OTACS](#) o está **Ativado**, e quando o [Sistema convencional na página 408](#) referenciado é selecionado no campo [Sistema ASTRO na página 452](#) não é um DVRS [Tipo de sistema na página 409](#), e quando o rádio for compatível com o modelo/a opção.

10.34.9.2

Ativação do rechaveamento tático

Este campo permite que o rádio receba comandos de rechaveamento enviados por outros rádios ou SUs (Subscriber Units, unidades de rádio) e não por um FNE (Fixed Network Equipment, equipamento de rede fixo) ou por um KMF (Key Management Facility, local de gerenciamento de chaves).

O rechaveamento é o processo de mudança das chaves de criptografia segura atuais do rádio. As chaves de criptografia segura permitem que comunicações ocorram com segurança.

OBSERVAÇÃO:

Para usar o rádio como um modem RF para transmitir comandos de rechaveamento tático, consulte o campo Dados do terminal.

Acessado apenas: Quando o campo Operação segura for **Hardware**, e quando o [Tipo de voz/sinal de recepção na página 424](#) for **ASTRO** ou **Modo misto**, e quando o campo [Tipo de voz/sinal de transmissão na página 427](#) for **ASTRO**, e quando o Tipo de sistema ASTRO do Sistema convencional referenciado com um Perfil de dados válido referenciado tiver sido selecionado, e quando o Tipo de perfil de dados for **Convencional** neste Perfil de dados referenciado e quando o rádio estiver habilitado para o modelo/a opção.

10.34.9.3

Teclado direto

Este campo permite digitar números de telefone usando o teclado do rádio, mesmo que ele não esteja no Modo telefone.

O modo de teclado direto é iniciado ao pressionar e segurar o botão PTT enquanto pressiona os números necessários. Essa função se aplica ao operar na Personalidade convencional atual.

Acessado apenas: Quando [Receber Somente Personalidade na página 423](#) o campo está **Desativado** e a opção H de Sinalização de tom está presente e quando o rádio está habilitado para modelo/opção.

10.34.9.4

Microfone DTMF habilitado

Esse campo permite transmitir tons DTMF usando o teclado do rádio, mesmo quando o rádio não estiver no modo Telefone.

Para iniciar o microfone DTMF, mantenha pressionado o botão superior, o lateral ou Cabeça de controle enquanto o número do teclado DTMF necessário é enviado. Esta seleção se aplica à operação na Personalidade convencional atual.

Acessado apenas: Quando [Receber Somente Personalidade na página 423](#) o campo está **Desativado** e a opção H de Sinalização de tom está presente e quando o rádio está habilitado para modelo/opção.

10.34.9.5

Finalizar transmissão por perda da voz

Esse campo permite que, durante uma transmissão de voz Convencional, o rádio seja automaticamente desativado quando o DSP (Digital Signal Processor, processador de sinal digital) detectar a falta de voz do microfone por um período que exceda o do Contador de ausência de voz.

Esta seleção se aplica à operação na Personalidade convencional atual.

AVISO:

A função não funciona quando um rádio no campo:

- Está operando no Modo de emergência e **Emergência de mic. direto** ou **Emergência via áudio silencioso** está ativo (consulte também Modo de transmissão automática de emergência), ou
- Está sendo monitorado de forma remota (consulte também Modo de rádio remoto e Ativação do monitor remoto de emergência).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.34.9.6

Seleção da lista de varredura

Este campo seleciona qual Lista de varredura é utilizada pelo rádio ao operar no Modo de varredura para a Personalidade convencional atual.

Em seguida, essa Lista de varredura determina quais autores da chamada o rádio varre (escuta ativamente) e considera a ativação do áudio para o canal convencional atual.

AVISO:

Quando o campo Áudio analógico plano está **Ativado**, este campo deve ser definido como **Nenhum**; caso contrário, ele se tornará inválido. Desse modo, as duas funções não podem ser ativadas na mesma personalidade.

Quando o campo [Ativação de Varredura de Voto Misto na página 472](#) está **Ativado** para a Personalidade atual, este campo deve ser definido como **Convencional Tipo de varredura na página 679**; caso contrário, ele se tornará inválido.

Quando o Sistema convencional referido selecionado no campo [Sistema ASTRO na página 452](#) for um Tipo de Sistema **DVRS**, esse campo deverá ser definido como Nenhum, caso contrário, ele se tornará inválido.

O RadioCentral considera esta seleção inválida quando esta personalidade está ativada para Banda larga LTE, e esta Lista de varredura selecionada tem Canais membro da Lista de varredura na seguinte condição:

- seu campo [Frequência de interferência de LTE presente na página 430](#) de Personalidade convencional definido como **Ativado**, ou
- seu campo Frequência de interferência LTE presente do sistema de entroncamento for **Verdadeiro**, ou
- seu campo Tipo de cobertura do Sistema de entroncamento definido como **Roaming Inter-WACN**.

OBSERVAÇÃO:

Um canal convencional está habilitado para LTE quando o Sistema convencional - ASTRO referenciado da Personalidade tem um Perfil de dados referenciado com um Tipo de perfil de dados igual a **Convencional e banda larga** ou **Apenas banda larga** e quando a Origem da banda larga desse Perfil de dados é **Modem LTE interno**.

O RadioCentral considera esta seleção inválida quando o campo Frequência de interferência de LTE presente da Personalidade convencional atual está **Ativado** e esta Seleção da lista de varredura faz referência a uma Lista de varredura com um canal habilitado para Banda larga LTE de um Membro de dados designado.

OBSERVAÇÃO:

Um canal convencional está habilitado para LTE quando o Sistema convencional - ASTRO referenciado da Personalidade tem um Perfil de dados referenciado com um Tipo de perfil de dados igual a **Convencional e banda larga** ou **Apenas banda larga** e quando o campo Habilitar LTE desse Perfil de dados está **Ativado**.

OBSERVAÇÃO:

A funcionalidade Lista de varredura e Membro da lista de verificações é definida na janela Lista de varredura.

Somente listas de varredura com a seleção **Convencional** ou **Grupo de conversação** no campo Tipo de varredura são seleções da lista de varredura válidas para a Personalidade convencional atual.

Listas de varredura com a seleção **Prioridade inteligente** no campo Tipo de varredura são seleções da Lista de varredura válidas para a Personalidade convencional atual sem sistema DVRS.

É possível iniciar a edição da Lista de varredura ativando/desativando a Programação de lista de varredura, selecionando o menu Lista de varredura ou fazendo um pressionamento longo do botão Varredura.

A Varredura de ponderação é uma seleção inválida em uma personalidade clonável.

Acessado apenas: Quando o campo Sistema de interface de site remoto do Sistema convencional referenciado está **Desativado**;

se **Ativado**, o campo [Tipo de voz/sinal de recepção na página 424](#) deve ser definido como **ASTRO** e esta Seleção da lista de varredura deve ser **Nenhum**; caso contrário, o campo se tornará inválido.

10.34.9.7

Varredura automática

Este campo faz com que o rádio entre automaticamente no modo de varredura quando você seleciona (com o seletor de canal) a Personalidade convencional atual.

A Verificação automática é chamada quando o rádio é ativado para a Personalidade atual.

Quando desativado, é possível chamar a operação no Modo de varredura pressionando o botão Varredura, ativando ou desativando a chave Varredura ou selecionando o menu Varredura ao operar na Personalidade convencional atual.

Acessado apenas: Quando o campo [Seleção da lista de varredura na página 470](#) não estiver definido como **Nenhum**.

10.34.9.8

Ativação de Varredura de Voto Misto

Este campo ativa a varredura de ponderação mista convencional para a personalidade convencional atual.

Quando esse campo está **Ativado**, todas as opções de frequência (registros/linhas) da personalidade atual são usadas para formar a lista Varredura de ponderação.

INFORMAÇÕES:

Além disso, quando esse campo é ativado, o número máximo de opções de frequência é limitado a 15.

OBSERVAÇÃO:

Os perfis de opções de frequência podem ser selecionados para uso na página Canais da Atribuição de zonas e canais; primeiro, a personalidade é selecionada no campo Personalidade e, depois, o perfil Opções de frequência é selecionado no campo Opções de frequência.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção e quando a personalidade não é criada automaticamente pelo recurso Clonagem de zona e

(quando o campo Sistema de interface de site remoto do sistema convencional mencionado está **Desativado**; se estiver **Ativado**, o campo [Tipo de voz/sinal de recepção na página 424](#) deverá ser definido como **ASTRO** e essa seleção Ativar varredura de ponderação mista deverá ser **Desativado**; caso contrário, esse campo se tornará inválido).

10.34.9.9

Direção de transmissão de varredura de ponderação mista

Este campo ativa os perfis de Opções de frequência da Personalidade convencional atual para variar quando essa Personalidade estiver habilitada para Varredura de ponderação mista convencional.

Consulte o campo [Ativação de Varredura de Voto Misto na página 472](#). Quando desativado, todas as opções de frequência de transmissão e opções de frequência de recepção específicas da Personalidade convencional atual devem ser as mesmas.

Acessado apenas: Quando o campo Ativação de varredura de ponderação mista estiver **Ativado**.

10.34.9.10

Tipo de Smart PTT

Este campo permite selecionar uma regra de bloqueio de canal que impede o rádio de transmitir enquanto a condição de transmissão **Inibição ativada** selecionada existir.

Esta seleção se aplica à operação na Personalidade convencional atual.

**INFORMAÇÕES:**

O campo [Substituição de chave rápida na página 474](#) é uma função de substituição que pertence a essas seleções de **Inibição ativada** da transmissão. Este recurso de substituição permite transmitir independentemente da regra **Inibição ativada** selecionada no momento.

**OBSERVAÇÃO:**

Se você tentar transmitir (pressionando o botão PTT) enquanto uma regra de transmissão **Inibição ativada** selecionada estiver impedindo a transmissão, o rádio apresentará um destes dois comportamentos:

- Se a condição de **Inibição Ativada** da transmissão selecionada for atendida, mas o rádio estiver mudo, um tom de alerta contínuo será emitido até que o botão PTT seja liberado. Isso incluiria, por exemplo, casos em que o repetidor estivesse ocupado com uma conversa criptografada, mas o rádio continuasse mudo devido à falta de suporte de segurança (**Inibir em símbolos de status**).
- Se o rádio estiver recebendo uma transmissão e a função mudo for desativada para uma transmissão de voz, pressionar o botão PTT causará a emissão de um breve tom de alerta. Isso acontece porque a função mudo do rádio é desativada para o áudio de voz de prioridade mais alta após um pequeno intervalo.

Acessado apenas: Quando o campo [Receber Somente Personalidade na página 423](#) estiver **Desativado** e quando o Sistema convencional referido não for um Tipo de sistema DVRS e (se o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **ASTRO**, então o campo Sistema de interface de site remoto no sistema convencional referido deverá estar **Desativado**).

O tipo de Smart PTT é compatível com as seguintes seleções:

Desabilitado

Permite a transmissão quando qualquer transmissão é detectada no canal atual.

Inibir em PL incorreto

Para ligações de voz analógicas (não ASTRO): Impede a transmissão quando o silenciador de portadora é detectado com um código de PL que não corresponde à personalidade/ao canal atual. Se o código de PL do canal ocupado corresponder à personalidade atual, as transmissões de rádio serão permitidas.

Para chamadas de voz digitais (ASTRO): Impede a transmissão quando o rádio não está no modo mudo ao receber um ID do grupo de conversação que não corresponde ao ID do grupo de conversação da personalidade/canal atual. Se o Grupo de conversação do canal ocupado corresponder ao ID do grupo de conversação do canal/personalidade atual, as transmissões de rádio serão permitidas.

**OBSERVAÇÃO:**

Os Grupos de conversação permitidos são determinados pela Lista de grupos de conversação do ASTRO referenciado da personalidade.

Inibir na portadora

Impede uma transmissão quando o silenciador de portadora é detectado no canal atual.

Inibir em NAC correto

Impede a transmissão enquanto o rádio estiver recebendo uma chamada de voz digital (ASTRO) com um NAC (Network Access Code, código de acesso à rede) para o canal atual (consulte [ID da rede de recepção na página 436](#)).

Inibir em símbolos de status

Impede a transmissão durante uma chamada de voz digital (ASTRO) e quando o bit do status de sinal gravado "recebido por último" for **entrada ocupada** ou **desconhecido**.

OBSERVAÇÃO:

Receber sinais analógicos só é possível quando o campo Tipo de voz/sinal de recepção está definido como **Não ASTRO** ou **Modo misto**, e um Tipo de sistema MDC ou QCII foi selecionado no campo Tipo de sinalização não ASTRO, e o Sistema não ASTRO correspondente foi selecionado para a Personalidade convencional atual.

Receber sinais digitais só é possível quando o campo Tipo de voz/sinal de recepção está definido como **Modo ASTRO** ou **Modo misto** e um Sistema convencional - ASTRO foi selecionado no campo [Sistema ASTRO na página 452](#).

10.34.9.11

Substituição de chave rápida

Este campo permite ignorar a regra **Inibição ativada** do campo Tipo de Smart PTT selecionado, possibilitando enviar uma transmissão em um canal ocupado de forma rude.

Isso pode ser feito com o chaveamento rápido do botão PTT. O chaveamento rápido ocorre quando o botão PTT é pressionado, solto e pressionado rapidamente mais uma vez dentro do tempo especificado no campo Temporizador da tecla rápida do Smart PTT. Essa função se aplica à Personalidade convencional atual.

Acessado apenas: Quando o campo [Receber Somente Personalidade na página 423](#) estiver **Desativado**, e quando o campo [Tipo de Smart PTT na página 473](#) não estiver **Desativado**, e quando o Sistema convencional referenciado não for um Tipo de sistema DVRS, e (se o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **ASTRO**, então o campo Sistema de interface de site remoto no Sistema convencional referenciado deverá estar **Desativado**).

10.34.9.12

Tipo de sinalização incidente

Esse campo seleciona o tipo de sinalização Responsabilidade de equipe ou TPS (Tactical Public Safety, segurança pública tática) para a Personalidade convencional atual.

OBSERVAÇÃO:

Nenhuma dessas seleções têm qualquer influência sobre o recurso [Ativação da IU de Segurança Pública Tática na página 476](#).

Acessado apenas: Quando a personalidade não é criada automaticamente pelo recurso Clonagem de zona e quando o modelo ou a opção do rádio for compatível.

As seleções a seguir são compatíveis:

Desabilitado

Nenhuma sinalização de Responsabilidade de equipe ou de TPS está disponível para o rádio.

Responsabilidade pela equipe

Ativa a Responsabilidade de equipe para a Personalidade convencional atual.

AVISO:

Esta seleção só é válida quando [Operação do telefone](#) está definido como **Nenhum**, quando [Tipo de voz/sinal de transmissão na página 427](#) está definido como **ASTRO**, quando o Sistema convencional de referência não for um Tipo de sistema DVRS e quando o Perfil de dados de referência desse Sistema convencional tiver a opção **Convencional e banda larga** ou **Somente banda larga**.

Responsabilidade de equipe com o MDC

Ativa a Responsabilidade de equipe com o MDC na Personalidade convencional atual

AVISO:

Esta seleção só é válida quando [Operação do telefone](#) está definido como **Nenhum**, quando [Tipo de voz/sinal de transmissão na página 427](#) está definido como **ASTRO**, quando o campo Tipo de sinal/voz de recepção estiver definido como **Modo misto**, quando o Tipo de voz de transmissão da Responsabilidade de equipe estiver definido como **Analogico**, quando o tipo de sinal Não ASTRO estiver definido como **MDC** , quando o Acesso ao Repetidor/RAC estiver desativado, quando o Sistema convencional de referência estiver definido como Tipo de sistema ASTRO e quando o Perfil de dados de referência desse Sistema convencional tiver a opção **Convencional e banda larga** ou **Somente banda larga**.

Segurança pública tática

Habilita a Sinalização de TPS para a Personalidade convencional atual.

AVISO:

Esta seleção só é válida quando [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **Modo misto**, quando o campo Tipo de sinal/voz de transmissão estiver definido como **ASTRO**, quando o campo Tipo de sinalização não ASTRO estiver definido como **Nenhum**, quando o campo [Grupo de conversação na página 467](#) estiver **Desativado** e quando o campo [Recepção/transmissão de chamada seletiva na página 462](#) estiver definido como **Desativado** ou **Decodificado**, quando o Sistema convencional de referência não for um Tipo de sistema DVRS e quando o Perfil de dados de referência desse Sistema convencional tiver a opção **Convencional e banda larga** ou **Somente banda larga** e quando o campo Operação segura estiver **Desativado** ou (quando Operação segura estiver definido como **Hardware** ou **Privacidade digital avançada**, e quando [Privacidade de voz/Remover ligação na página 480](#) estiver definido como **Apagar**.)

10.34.9.13

Registro de responsabilidade pela equipe

Este campo permite que o rádio faça o registro no ICT (Incident Command Terminal, terminal de comando de incidente) do PA (Personnel Accountability, responsabilidade pela equipe).

O registro é feito mediante a transmissão de pacotes de registro do PA para o ICT, do qual se espera receber uma

confirmação de que a transmissão do registro foi bem-sucedida. Se a transmissão do pacote de registro não for confirmada, o rádio continuará tentando fazer a transmissão do pacote pelo número de

vezes definido em Todo o entroncamento, no campo [Máximo de Tentativas de Transmissão na página 504](#). Essa função se aplica ao operar na Personalidade convencional atual.

**OBSERVAÇÃO:**

O campo Responder a chamadas em Todos os rádios determina a frequência (em minutos) em que a tentativa de registro ocorrerá novamente.

Acessado apenas: Quando o campo [Tipo de sinalização incidente na página 474](#) está definido como **Responsabilidade pela equipe** ou **Responsabilidade pela equipe com MDC**, quando o campo Registro de dados CAI do Sistema convencional referenciado da Personalidade convencional atual está **Desativado**, quando o Perfil de dados referenciado desse Sistema convencional tem o campo Modo ARS **Desativado** e o rádio está habilitado para o modelo/a opção.

10.34.9.14

Tipo de voz de transmissão

Este campo seleciona o modo Voz de transmissão (Tx) que é usado durante a operação de Responsabilidade pela equipe para a Personalidade convencional atual.

Acessado apenas: Quando o campo [Tipo de sinalização incidente na página 474](#) está definido como **Responsabilidade pela equipe** ou **Responsabilidade pela equipe com MDC** e o rádio está habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Digital

O modo digital ASTRO é usado para transmitir voz durante a operação Responsabilidade pela equipe. O modo digital ASTRO não é válido para Responsabilidade pela equipe com MDC.

Analógico

O modo analógico Não ASTRO é usado para transmitir voz durante a operação Responsabilidade pela equipe ou .

**AVISO:**

Essa seleção será válida de acordo com a Personalidade convencional quando o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **Modo misto**, e quando o campo [Grupo de conversação na página 467](#) estiver **Desativado**, e quando o campo [Recepção/transmissão de chamada seletiva na página 462](#) não estiver definido como **Codificação** ou **Codificação e decodificação**.

10.34.9.15

Ativação da IU de Segurança Pública Tática

Este campo permite vários recursos de TPS (Tactical Public Safety, segurança pública tática) que estão relacionados à operação no Modo de emergência para a Personalidade convencional.

Essas funções incluem Todos os Rádios, Segurança Pública Tática: Sinal de Emergência Audível, Roteamento do Indicador Sonoro de Emergência Audível, Campanha Lateral de Desligamento de Chamada de Emergência e Taxa de Tentativas do Alarme de Emergência.

**INFORMAÇÕES:**

Esta função se aplica à Personalidade Convencional, independentemente da seleção [Tipo de sinalização incidente na página 474](#) desta Personalidade.

Acessado apenas: Quando o rádio está ativado para o modelo/para a opção.

10.34.9.16

Personalidade do modo de zona de perigo

Esse campo permite ativar o Modo de zona de perigo (HZM) usando a chave concêntrica ao operar na Personalidade convencional do momento.

OBSERVAÇÃO:

Este campo se aplica apenas a rádios APX NEXT XN.

INFORMAÇÕES:

Quando o HZM estiver **Ativado**, as seguintes condições devem ser atendidas:
O campo Sistema ASTRO na Personalidade convencional está definido como um sistema ASTRO com as seguintes configurações:

- O campo Seleção de perfil de emergência está vinculado a um perfil de emergência convencional.
- O campo Seleção de perfil de emergência não está definido como **Transmissão de Emergência desativada**.
- O campo Indicador de recepção do alarme de emergência está **ativado**.

O campo Tipo de voz/sinal de Tx e Tipo de voz/sinal de Rx está definido como **ASTRO** ou o campo Tipo de sinalização de incidente não está definido como **Desativado**.

Quando o campo Personalidade de modo de zona de perigo estiver marcado, o campo Tipo de reversão de emergência está definido como **Canal selecionado** ou para outro canal vinculado a uma personalidade do Modo de zona de perigo.

Acessado apenas: Quando o rádio é o modelo mais recente para os padrões de serviço dos bombeiros.

10.34.9.17

Solicitação PTT de entrada DVRS cordial

Esse campo ativa o PTT cordial para o modo DVRS Convencional. As solicitações de acesso de voz cordial são enviadas usando a nova tentativa rápida em vez de paciência limitada.

Acessado apenas: Este campo se torna aplicável quando o sistema ASTRO faz referência a um sistema DVRS.

10.34.10

Phone

Essa seção permite visualizar ou definir a funcionalidade de discagem de telefone ou sistema telefônico para Personalidades convencionais individuais.

Essas configurações se aplicam durante a operação no modo Telefone.

OBSERVAÇÃO:

Após a definição exclusiva das funções das personalidades convencionais, cada personalidade poderá ser atribuída à posição desejada do seletor de canais do rádio. Isso é feito pela atribuição de zonas e canais, na página Canais.

É possível ativar o Modo telefone com uma Resposta da ligação, toque no botão Telefone ou seleção de menu Telefone.

Os campos a seguir são suportados:

10.34.10.1

Seleção de tempo de DTMF

Este campo seleciona um conjunto predefinido de parâmetros de tempo DTMF na página Tempo de DTMF de todos os telefones.

Cada conjunto define parâmetros nos três campos a seguir: Atraso inicial, Duração do dígito e Atraso interdígito. Essa seleção se aplica durante a operação no Modo telefone para a Personalidade convencional atual.

Acessado apenas: (Quando o rádio estiver habilitado para o modelo/a opção, e quando o campo [Receber Somente Personalidade na página 423](#) estiver **Desativado**, e quando o campo [Operação do telefone](#) estiver definido como **Somente listar** ou **Ilimitado**, e quando o Sistema convencional referenciado selecionado no campo Sistema ASTRO não for um Tipo de sistema DVRS), e (se o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **ASTRO**, então o campo Sistema de interface de site remoto no Sistema convencional referenciado deverá estar **Desativado**).

10.34.10.2

Seleção de código de acesso automático

Este campo seleciona um conjunto predefinido de códigos de DTMF de acesso e cancelamento de acesso a serem usados no modo telefone para comunicação com um sistema de telefone.

Os códigos de acesso e cancelamento de acesso do sistema de telefone são emparelhados em conjuntos que são nomeados no campo Nome dos códigos DTMF. Essa seleção se aplica durante a operação no Modo telefone para a Personalidade convencional atual.

Acessado apenas: (Quando o rádio estiver habilitado para o modelo/a opção, e quando o campo [Receber Somente Personalidade na página 423](#) estiver **Desativado**, e quando o campo [Operação do telefone](#) estiver definido como **Somente listar** ou **Ilimitado**, e quando o Sistema convencional referenciado selecionado no campo Sistema ASTRO não for um Tipo de sistema DVRS), e (se o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **ASTRO**, então o campo Sistema de interface de site remoto no Sistema convencional referenciado deverá estar **Desativado**).

10.34.11

Proteger

Esta seção permite visualizar ou definir funcionalidades de segurança para transmitir e receber comunicações de uma codificação segura.

Esta funcionalidade pode ser personalizada para uma Personalidade Convencional individual.

**OBSERVAÇÃO:**

Após a definição exclusiva das funções das personalidades convencionais, cada personalidade poderá ser atribuída à posição desejada do seletor de canais do rádio. Isso é feito pela atribuição de zonas e canais, na página Canais.

10.34.11.1

Tipo de Voz/Sinal Seguro

Esse campo seleciona o modo de sinalização de voz de criptografia segura para a Personalidade convencional atual.

**AVISO:**

Quando o campo [Tipo de voz/sinal de recepção na página 424](#) for **ASTRO** ou **Modo Misto**, o ASTRO se tornará o modo de Voz/Sinal Seguro válido.

Quando o campo Tipo de Voz/Sinal de Recepção for **Não ASTRO**, o SecureNet se tornará o modo de Voz/Sinal Seguro.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware**, ou (quando o campo [Operação segura na página 294](#) estiver definido como **Software**, e quando o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **ASTRO** ou **Modo misto**).

As seleções a seguir são compatíveis:

ASTRO

Quando o campo Tipo de Voz/Sinal de Recepção estiver definido como **ASTRO** ou **Modo Misto**.

SecureNet

Quando o campo Tipo de Voz/Sinal de Recepção estiver definido como **Não ASTRO**.

10.34.11.2

Transmissão XL

Esse campo ativa o DES-XL (Data Encryption Standard - Extended Range, padrão de criptografia de dados - intervalo estendido) analógico/SecureNet™ para a Personalidade convencional atual.

DES XL é um padrão de criptografia Tipo 3 (nível médio).

Quando desativado, o DES (Data Encryption Standard, padrão de criptografia de dados) analógico/SecureNet se aplica à Personalidade Convencional atual.

OBSERVAÇÃO:

As comunicações recebidas do chip XL seguro não precisam ser configuradas, pois descriptografam automaticamente fluxos de dados XL e não XL.

Acessado apenas: Quando o campo Operação Segura estiver definido como **Hardware**, e quando o campo [Tipo de voz/sinal de recepção na página 424](#) for **Não ASTRO**, e quando o campo [Privacidade de voz/Remover ligação na página 480](#) não for **Apagar**, e quando o campo [Tipo de Voz/Sinal Seguro na página 478](#) for **SecureNet** quando o rádio estiver habilitado para o modelo/a opção.

10.34.11.3

Transmissão DES-XL padrão

Este campo ativa o algoritmo DES-XL (Data Encryption Standard – Extended Range, padrão de criptografia de dados – faixa estendida) digital como padrão para todas as transmissões de dados e voz criptografadas durante a operação na Personalidade convencional atual.

Isso ocorre somente quando você não inicia a transmissão durante o ID de chave - Tempo de desconexão de recepção. DES XL é um padrão de criptografia Tipo 3 (nível médio).

Quando desabilitado, o DES-OFB (Data Encryption Standard – Output Feedback, padrão de criptografia de dados – feedback de saída) digital se aplica à Personalidade convencional atual.

INFORMAÇÕES:

Esse recurso só se aplica quando o rádio for equipado com um módulo de criptografia de algoritmo duplo DES-XL/DES-OFB.

Acessado apenas: Quando o rádio for compatível com o modelo/a opção, e quando o [Tipo de voz/sinal de recepção na página 424](#) for **ASTRO** ou **Modo misto**, e quando o campo [Operação segura na página 294](#) estiver definido como **Hardware**, e (quando o campo [Tipo de Voz/Sinal Seguro na página 478](#) for **ASTRO**, e quando o campo [ASTRO Grupo de conversação na página 467](#) estiver **Ativado**, ou quando o campo [Privacidade de voz/Remover ligação na página 480](#) for **Selecionar** ou **Proteger**, ou (quando um Tipo de sistema **ASTRO** mencionado no Sistema convencional com um Perfil de dados válido for selecionado, e quando o campo Dados de terminal nesse Perfil de dados for **Ativado**), e quando o campo [Proteger Dados do Pacote/Limpar Ligação na página 481](#) for **Selecionar** ou **Proteger**)).

10.34.11.4

Privacidade de voz/Remover ligação

Este campo seleciona o modo de transmissão de criptografia segura para a Personalidade convencional atual.

**AVISO:**

Quando o campo Áudio analógico plano estiver **Ativado**, este campo deve ser definido como **Remover**, caso contrário, se tornará inválido. Desse modo, as duas funções não podem ser ativadas na mesma personalidade.

(Quando a Banda de Frequência Principal for **900 MHz**), ou (quando Permitir Frequências Inválidas estiver **Ativada**, e quando 900 MHz Usados no Codeplug estiver **Ativado**), e (quando o campo Operação Segura estiver definido como **Hardware**, e quando o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **Não ASTRO**, e quando o [Espaçamento de canais/desvio de transmissão na página 435](#) para um dos perfis atuais de Opções de Frequência (registros/linhas) estiver definido como **2,5 khz / 12,5 khz**), então esse campo deverá ser definido como **Apagar**; caso contrário, ele se tornará inválido.

Acessado apenas: (Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**, e quando o campo [Grupo de conversaç o na página 467](#) estiver desativado, e quando a personalidade não for criada automaticamente pelo recurso de Clonagem de zonas, e (quando o campo [Tipo de voz/sinal de recepç o na página 424](#) for **Modo misto** ou **ASTRO** e quando o campo Sistema de interface de site remoto do Sistema convencional mencionado estiver desativado)),

Ou

(quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** e quando o campo [Tipo de voz/sinal de recepç o na página 424](#) for **Não ASTRO**).

As seleç es a seguir s o compat veis:

Selecionar

Permite ativar ou desativar as comunicaç es protegidas por criptografia.

Pressionar o bot o Seleç o de transmiss o segura, ativar e desativar a Seleç o de transmiss o segura ou selecionar o menu Proteger permite alternar entre comunicaç es Proteger ou Remover para esse canal.

Apagar

Liga ou confirma o canal para a operaç o Convencional normal (n o protegida).

Proteger

Liga ou confirma o canal para operaç o com criptografia segura.

10.34.11.5

Ligaç o de Chave de Voz

Este campo escolhe se voc  pode selecionar a chave de criptografia de voz ou n o enquanto opera na Personalidade convencional atual.

Acessado apenas: Quando o campo [Privacidade de voz/Remover ligaç o na página 480](#) for aplic vel e n o estiver definido como **Apagar** e quando o r dio estiver habilitado para o modelo/a opç o.

As seleç es a seguir s o compat veis:

Selecionar

Permite selecionar a chave de criptografia segura apropriada.

Vinculado

A chave selecionada no campo [Seleção de Chave de Voz na página 481](#) é vinculada permanentemente à Personalidade Convencional atual.

AVISO:

A seleção de menu da chave deve ser escolhida para poder selecionar chaves para a Personalidade convencional atual.

10.34.11.6

Seleção de Chave de Voz

Este campo seleciona a chave de criptografia de voz aplicada durante a operação na Personalidade convencional atual.

Essas chaves são programadas na Lista de chaves de criptografia segura.

INFORMAÇÕES:

Quando o campo [ASTRO OTAR na página 485](#) estiver **Ativado** para a Personalidade convencional atual, o valor desta Seleção de chave será escolhido na Lista de referências de chaves de criptografia segura de hardware do Perfil de KMF seguro selecionado no campo Índice de perfil de KMF para a Personalidade convencional atual.

AVISO:

Esteja ciente de que o aplicativo está, na verdade, indicando as Chaves da lista de chaves de criptografia para essa seleção. As chaves individuais da Lista de referências de chave de criptografia segura fazem referência às Chaves da lista de chaves de criptografia do campo Referência de chave de criptografia. Portanto, todas as chaves selecionadas quando o ASTRO OTAR estiver **Ativado** deverão ser definidas primeiramente na Lista de referências de chave de criptografia segura de hardware.

Quando o campo ASTRO OTAR estiver **Desativado** para a Personalidade convencional atual, esse valor de Seleção de chave será diretamente selecionado na Lista de chaves de criptografia da janela Segurança total.

Acessado apenas: Quando o campo [Privacidade de voz/Remover ligação na página 480](#) for aplicável e não estiver definido como **Apagar** e quando o rádio estiver habilitado para o modelo/a opção.

10.34.11.7

Ignorar voz clara de recepção

Este campo faz com que o rádio ignore todas as comunicações de voz "Claras" (criptografadas não seguras) quando opera na Personalidade convencional atual.

Acessado apenas: Quando o campo [Operação segura na página 294](#) está definido como **Hardware** ou **Software**, e

(Se o campo [Tipo de voz/sinal de recepção na página 424](#) está definido como **ASTRO**, então o campo Sistema de interface de site remoto no Sistema convencional referenciado deve estar desativado).

10.34.11.8

Proteger Dados do Pacote/Limpar Ligação

Este campo seleciona o modo de transmissão de Dados do pacote da APCO (Association of Public-Safety Communications Officials, associação de oficiais de comunicações em segurança pública) para a Personalidade convencional atual.

Acessado apenas: (Quando o rádio for compatível com o modelo/a opção, e quando o [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **Modo ASTRO** ou **Modo misto**, e quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**, e quando o Sistema convencional mencionado não for um Tipo de sistema DVRS, e quando a personalidade não for criada automaticamente pelo recurso de Clonagem de zonas),

e

(quando o campo Ativar (Inibição tática) estiver ativado, ou quando o Sistema convencional mencionado tiver uma referência válida [Perfis de Dados na página 369](#) selecionada e quando o campo [Dados de terminal na página 374](#) nesse Perfil de dados estiver ativado.)

As seleções a seguir são compatíveis:

Apagar

O rádio transmite os Dados do Pacote APCO em um modo não seguro.

Proteger

O rádio transmite os Dados do Pacote APCO em um modo de criptografia segura.

10.34.11.9

Seleção de Chave dos Dados do Pacote

Este campo seleciona a chave de criptografia a ser usada para transmissões de Dados do pacote da APCO (Association of Public-Safety Communications Officials, associação de oficiais de comunicações em segurança pública).

Esta seleção se aplica à Personalidade convencional atual.

INFORMAÇÕES:

Quando o campo [ASTRO OTAR na página 485](#) estiver **Ativado** para a Personalidade convencional atual, o valor desta Seleção de chave será escolhido na Lista de referências de chave de criptografia segura de hardware do Perfil de KMF seguro selecionado no campo [Índice de perfil ASTRO OTAR na página 485](#) para a Personalidade convencional atual.

AVISO:

Esteja ciente de que o aplicativo está, na verdade, indicando as Chaves da lista de chaves de criptografia para essa seleção. As chaves individuais da Lista de referências de chave de criptografia segura fazem referência às Chaves da lista de chaves de criptografia do campo Referência de chave de criptografia. Portanto, todas as chaves selecionadas quando o ASTRO OTAR estiver **Ativado** deverão ser definidas primeiramente na Lista de referências de chave de criptografia segura de hardware.

Quando o campo ASTRO OTAR estiver **Desativado** para a Personalidade convencional atual, esse valor de Seleção de chave será diretamente selecionado na Lista de chaves de criptografia da janela Segurança total.

Acessado apenas: (Quando o rádio for compatível com o modelo/a opção e quando o [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **Modo ASTRO** ou **Modo misto** e quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** e quando o Sistema convencional mencionado não for um Tipo de sistema DVRS) e ((quando o campo Ativação da inibição tática estiver **Ativado**) ou (quando o Sistema convencional mencionado tiver um Perfil de dados mencionado selecionado e quando o campo Dados de terminal nesse Perfil de dados estiver **Ativado**.)

10.34.11.10

Ignorar Recepção e Limpeza de Dados do Pacote

Este campo faz com que o rádio ignore todas as comunicações "Limpas" (sem criptografia segura) de dados do pacote ASTRO convencional em operação na Personalidade convencional atual.

OBSERVAÇÃO:

Para obter mais informações sobre os dados do pacote ASTRO Convencional, consulte a janela Perfil de Dados e o Sistema Convencional. ASTRO, campo Seleção de perfil de dados.

Acessado apenas: (Quando o [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **Modo ASTRO** ou **Modo misto**, e quando o campo [Operação segura na página 294](#) estiver definido

como **Hardware** ou **Software**, e quando o campo [Proteger Dados do Pacote/Limpar Ligação na página 481](#) for **Proteger** e quando o rádio for compatível com o modelo/a opção),

e

(quando o Sistema convencional mencionado não for um Tipo de sistema DVRS e

quando esse Sistema convencional referido tem um Perfil de dados referido selecionado, e

quando o campo [Dados de terminal na página 374](#) no Perfil de dados estiver ativado).

10.34.11.11

Detecção do código adequado

Este campo desativa a função mudo do alto-falante do rádio somente em dados do SecureNet™ quando os dados são criptografados com a chave de segurança correta.

A chave de segurança criptografada é embutida no rádio com um chip de criptografia interno ou um dispositivo carregador variável de chaves (KVL, Key-Variable Loader). Essa função se aplica à Personalidade convencional atual.

Acessado apenas: Quando o campo Operação Segura estiver definido como **Hardware** e quando o campo [Tipo de Voz/Sinal Seguro na página 478](#) for **Securenet** e o rádio estiver habilitado para o modelo/a opção.

10.34.11.12

Transmissão de OTAR

Este campo permite que o rádio transmita o ASTRO e MDC OTAR para a Personalidade convencional atual.

As transmissões OTAR incluem: Solicitações de alteração de chave, Confirmações atrasadas ou de energização.

AVISO:

Sua capacidade de iniciar Solicitações de alteração de chave deve ser programada.

OBSERVAÇÃO:

Solicitações de alteração de chave: Quando o campo [ASTRO OTAR na página 485](#) estiver ativado para o canal atual e os sistemas ASTRO e MDC estiverem disponíveis para o canal (consulte [Tipo de voz/sinal de recepção na página 424 Modo misto](#)), suas Solicitações de alteração de chave iniciadas sempre serão transmitidas com ASTRO OTAR. No entanto, quando o rádio está respondendo a uma transmissão OTAR, a transmissão sempre será feita com o mesmo tipo de OTAR que foi recebido.

Configurando o Modo misto do ASTRO e MDC: Quando o campo Tipo de voz/sinal de recepção estiver definido como **Modo misto**, um Sistema convencional do tipo ASTRO deverá ser selecionado no campo [Sistema ASTRO na página 452](#), e **MDC** deverá ser selecionado no campo Tipo de sinalização não ASTRO, permitindo que um Sistema convencional do tipo MDC seja selecionado no campo Sistema não ASTRO.

O Sistema convencional não é um Tipo de sistema DVRS

Acessado apenas: Quando o campo [Operação segura na página 294](#) for **Hardware** ou **Software** e o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) estiver ativado, e

quando o campo [Ativação do OTAR na página 296](#) estiver ativado, e

quando o campo [Receber Somente Personalidade na página 423](#) estiver desativado e o rádio for compatível com o modelo/a opção,

e

(quando o campo [Ativação do ASTRO OTAR na página 297](#) estiver ativado, e

quando o campo [Ativação do MDC OTAR na página 300](#) estiver ativado)

Ou

(quando o campo Ativação do ASTRO OTAR estiver ativado, e

quando o campo Ativação do MDC OTAR estiver desativado, e

quando o [Tipo de voz/sinal de recepção na página 424](#) for **ASTRO** ou **Modo misto**)

Ou

(quando o campo Ativação do ASTRO OTAR estiver desativado, e

quando o campo Ativação do MDC OTAR estiver ativado, e

quando o campo Tipo de voz/sinal de recepção for **Não ASTRO** ou **Modo misto**,

e quando o campo [Tipo de Sinalização Não ASTRO na página 454](#) for **MDC**).

Sistema convencional é um Tipo de sistema DVRS

Quando o campo [Operação segura na página 294](#) for **Hardware** ou **Software** e o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) estiver ativado, e

quando o campo [Ativação do OTAR na página 296](#) estiver ativado, e

quando o campo [Receber Somente Personalidade na página 423](#) estiver desativado e o rádio for compatível com o modelo/a opção,

e

(quando o campo [Ativação do ASTRO OTAR na página 297](#) estiver ativado, e

quando o campo [Ativação do MDC OTAR na página 300](#) estiver ativado), e

quando o [Tipo de voz/sinal de recepção na página 424](#) for **Modo misto**, e

quando o campo [Tipo de Sinalização Não ASTRO na página 454](#) for **MDC**)

Ou

(quando o campo Ativação do ASTRO OTAR estiver ativado, e

quando o [Tipo de voz/sinal de recepção na página 424](#) não estiver definido como **Não ASTRO**.

10.34.11.13

ASTRO OTAR

Este campo permite a capacidade do rádio de receber ASTRO OTAR (Over-The-Air-Rekeying) e/ou de receber MDC OTAR para a Personalidade convencional atual.

**OBSERVAÇÃO:**

Para que ASTRO OTAR e MDC OTAR recebam capacidade no mesmo canal, o campo [Tipo de voz/sinal de recepção na página 424](#) deve estar definido como **Modo misto**. Embora ASTRO OTAR tenha precedência sobre MDC OTAR, se um MDC OTAR for recebido, o rádio primeiro tentará responder com MDC OTAR.

**INFORMAÇÕES:**

Quando o campo [Ativação do ASTRO OTAR na página 297](#) estiver **Ativado** para a Personalidade convencional atual, os valores da Seleção de chave de hardware para essa personalidade usarão a [Lista de referências de chave de criptografia segura de hardware na página 315](#) do Perfil de KMF (Key Management Facility, local de gerenciamento de chaves) seguro no campo Índice de perfil de KMF para a Personalidade convencional atual.

**AVISO:**

Lembre-se que o RadioCentral está, na verdade, indicando as Chaves da [Lista de chaves de criptografia na página 310](#) para esta seleção. As Chaves individuais da Lista de referências de chave de criptografia segura de hardware fazem alusão às Chaves da Lista de chaves de criptografia do campo [Referência de Chaves de Criptografia na página 316](#). Portanto, todas as chaves selecionadas quando o ASTRO OTAR estiver ativado deverão ser definidas primeiramente na Lista de referências de chave de criptografia segura de hardware.

Quando o campo [Ativação do ASTRO OTAR na página 297](#) estiver **Desativado** para a Personalidade convencional atual, os valores de Seleção de chave de hardware serão diretamente selecionados na Lista de chaves de criptografia da janela Segurança total.

Acessado apenas: Quando o campo [Operação segura na página 294](#) for **Hardware** ou **Software**, e quando o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) estiver ativado, e quando o [Tipo de voz/sinal de recepção na página 424](#) for **Modo ASTRO** ou **Modo misto**, e quando o campo [Ativação do OTAR na página 296](#) estiver **Ativado**, e quando o campo [Ativação do ASTRO OTAR na página 297](#) estiver **Ativado**, e quando a personalidade não é criada automaticamente pelo recurso de Clonagem de zonas, e quando o rádio está habilitado para o modelo/a opção.

10.34.11.14

Índice de perfil ASTRO OTAR

Este campo seleciona o perfil de KMF seguro a ser usado durante a operação no modo ASTRO OTAR.

Esta seleção se aplica à operação na Personalidade convencional atual.

OBSERVAÇÃO:

Todos os parâmetros do ASTRO OTAR especificados no perfil de KMF selecionado se aplicam à Personalidade convencional atual.

AVISO:

Este campo é inválido quando essa personalidade faz referência a um Sistema convencional (que tenha um Tipo de sistema **ASTRO**), que faz referência a um Perfil de dados (tendo um Tipo de perfil de dados **Banda larga e convencional** ou **Apenas banda larga**) e quando o campo Endereço IP do KMF está definido como 0.0.0.0.

INFORMAÇÕES:

Quando o campo [ASTRO OTAR na página 485](#) estiver **Ativado** para a Personalidade convencional atual, os valores da Seleção de chave de hardware para essa Personalidade usarão a Lista de referências de chave de criptografia segura de hardware do Perfil de KMF seguro no campo Índice de perfil de KMF para a Personalidade convencional atual.

AVISO:

Esteja ciente de que o aplicativo está, na verdade, indicando as Chaves da lista de chaves de criptografia para essa seleção. As chaves individuais da Lista de referências de chave de criptografia segura fazem referência às Chaves da lista de chaves de criptografia do campo Referência de chave de criptografia. Portanto, todas as chaves selecionadas quando o ASTRO OTAR estiver **Ativado** deverão ser definidas primeiramente na Lista de referências de chave de criptografia segura de hardware.

Quando o campo ASTRO OTAR estiver **Desativado** para a Personalidade convencional atual, os valores de Seleção de chave de hardware serão escolhidos diretamente na Lista de chaves de criptografia da janela Segurança total.

Acessado apenas: Quando o campo [Operação segura na página 294](#) for **Hardware** ou **Software** e o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) estiver ativado e

quando o campo ASTRO OTAR estiver **Ativado** e aplicável e

quando o [Tipo de voz/sinal de recepção na página 424](#) for **ASTRO** ou **Modo misto** e

quando o campo [Ativação do ASTRO OTAR na página 297](#) estiver ativado, e

quando o campo [Ativação do OTAR na página 296](#) estiver ativado, e

quando o campo Ativação da alteração de chave tática estiver desativado e

quando o rádio está habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

- Desabilitado
- Perfis de KMF seguro disponíveis

10.34.11.15

Tempo de emudecimento de eco

Este campo seleciona por quanto tempo o alto-falante do rádio permanece mudo imediatamente após uma transmissão de criptografia segura.

Ou seja, para sistemas repetidores com uma grande quantidade de atraso na taxa de transferência de dados, a parte final de uma transmissão de voz criptografada pode ser novamente ouvida após uma desconexão. Esse tempo permite atrasos do sistema repetidor, emudecendo, assim, esse possível efeito de eco. Esse tempo é iniciado quando o botão PTT é liberado. Esta seleção se aplica à Personalidade convencional atual.

Acessado apenas: (Quando o campo ASTRO [Grupo de conversação na página 467](#) estiver **Ativado**, ou quando o campo Grupo de conversação ASTRO estiver **Desativado** e quando o campo [Privacidade de voz/Remover ligação na página 480](#) estiver definido como **Selecionar** ou **Proteger**), e (quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software** e quando o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **ASTRO** ou **Modo misto**).

Acima 217: Alcance

Mínimo	Máximo	Incrementos
0 ms	1500 ms	50 ms

10.34.11.16

Seleção da varredura

Este campo seleciona por quanto tempo o rádio aguarda durante o modo de verificação ativa para uma transmissão SecureNet™ codificada (Não ASTRO) a ser detectada.

Esse período de espera começa depois que o silenciador de portadora é detectado. Esse recurso se aplica à [Seleção da lista de varredura na página 470](#) selecionada da Personalidade Convencional atual e somente ao verificar um canal do membro da lista de varreduras codificadas pelo SecureNet.

Acessado apenas: Quando o campo Operação Segura estiver definido como **Hardware**, e quando o campo [Transmissão XL na página 479](#) estiver **Desativado**, e quando o campo [Tipo de Voz/Sinal Seguro na página 478](#) for **Securenet** e quando o rádio estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Não XL

Se um canal do membro da Lista de verificações estiver definido como SecureNet Não XL, o rádio aguardará o período de tempo especificado pelo campo Duração da desativação do silenciador de verificação não XL.

Não XL e XL

Se um canal do membro da Lista de verificações estiver definido como SecureNet Não XL e XL, ele aguardará o período de tempo especificado pelo campo Duração da desativação do silenciador de verificação XL.

OBSERVAÇÃO:

XL requer um período de espera maior.

10.34.11.17

Verificar e desativar ligação

Este campo seleciona a otimização do algoritmo de desativação do mudo da verificação relacionado às chamadas codificadas SecureNet™ (não ASTRO).

O algoritmo também se baseia na configuração [Tipo de desativação da função mudo na página 458](#) selecionada para a Personalidade convencional atual. Essa funcionalidade se aplica quando há uma tentativa de desativar a função mudo em canais do Membro da Lista de Verificações (convencional somente). Esta seleção se aplica à Personalidade convencional atual.

Acessado apenas: Quando o campo Operação Segura estiver definido como **Hardware** e quando o campo [Tipo de voz/sinal de recepção na página 424](#) for **Não ASTRO** e o rádio estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Ambos

Essa seleção é a menos eficiente levando-se em consideração todos os tipos de verificação possíveis.

Somente aberto

As configurações internas do rádio se aplicam para PL, DPL, CSQ (Carrier Squelch, silenciador de portadora) e Sinalização.

Somente segurança

Usa a duração da desativação do silenciador apropriada com base na seleção do campo [Seleção da varredura na página 487](#) XL ou não XL.

10.34.11.18

ID de chave

Este campo seleciona o método ID de chave ao operar na Personalidade convencional atual.

Acessado apenas: Quando a Operação segura estiver definida como **Hardware**, e quando o campo Tipo de sinalização não ASTRO for **MDC**, e quando o campo for **Securenet** e quando o rádio estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Somente transmissão

Transmitir a ID de chave no início de cada transmissão.

Somente recepção

Altere sua ID de chave para aquela especificada no início de cada mensagem recebida. Se a mensagem recebida não especificar uma ID de chave, o rádio usará sua ID de chave atual.

Transmissão e recepção

Seleciona as duas funções acima.

Nenhum

Não seleciona nenhuma das funções acima.

10.34.11.19

Atraso de XL após ID da chave

Este campo seleciona o tempo que o rádio espera após uma transmissão de opcode de ID de chave antes de transmitir áudio criptografado de XL (intervalo estendido).

Esta seleção se aplica à operação na Personalidade convencional atual.

Acessado apenas: Quando o campo Operação Segura estiver definido como **Hardware**, e quando o [Tipo de voz/sinal de recepção na página 424](#) for **Não ASTRO**, e quando o Tipo de Sinalização Não ASTRO for **MDC**, e quando o campo [Privacidade de voz/Remover ligação na página 480](#) não estiver definido como **Apagar**, e quando o campo [Transmissão XL na página 479](#) estiver **Ativado**, e quando o campo [Tipo de Voz/Sinal Seguro na página 478](#) for **Securenet**, e quando o campo [ID de chave na página 488](#) for **Somente Transmissão** ou **Transmissão e Recepção** e quando o rádio estiver habilitado para o modelo/a opção.

Acima 218: Alcance

Mínimo	Máximo
0	200

10.34.11.20

ASTRO OTAR de banda larga

Se esse campo estiver habilitado, você poderá usar OTAR (Over-the-Air-Rekeying, troca de chave de criptografia pelo ar) em banda larga em canais analógicos.

Acessado apenas: Quando as seguintes condições forem atendidas.

- O rádio está habilitado para modelo/opção.
- O campo Operação segura é definido como **Hardware** ou está definido para **Software** e Ativar padrão de criptografia avançada (AES) é ativado.
- O campo Ativar ASTRO OTAR está ativado.
- O campo Personalidade Convencional, Tipo de voz/sinal Rx é definido como **Não ASTRO**.
- Receber somente Personalidade está desativado.

10.34.12

Avançado

Esta seção permite visualizar ou definir funcionalidades diversas e, às vezes, complexas para Personalidades convencionais individuais.

OBSERVAÇÃO:

Após a definição exclusiva das funções das personalidades convencionais, cada personalidade poderá ser atribuída à posição desejada do seletor de canais do rádio. Isso é feito pela atribuição de zonas e canais, na página Canais.

10.34.12.1

AGC de RF avançado

Este campo seleciona o tipo de AGC (Automatic Gain Control, controle de ganho automático) de RF (Radio Frequency, radio frequência) que se aplica à personalidade convencional atual.

As seleções a seguir são compatíveis:

Desabilitado

Mesmo quando em **Desativado**, o rádio utiliza uma forma básica do AGC integrada ao receptor do rádio. Essa proteção integrada ajuda a evitar limitação de sinal e saturação do receptor, o que pode danificar os componentes do rádio.

Padrão

Permite uma forma avançada de AGC de RF, que tenta proteger contra interferência de intermodulação (IM) por meio da detecção e da remoção de qualquer interferência recebida em razão de fontes externas.

Aprimorado

Possibilita que o rádio utilize outros esquemas para reduzir a interferência de IM, limpando o sinal.

Inteligente

Permite que o rádio use um esquema exclusivo para melhorar a imunidade à interferência quando próximo às estações base de difusão simultânea linear e de fase 2 APCO. A opção SMART é mutuamente exclusiva da caixa de seleção proteção de banda larga.

INFORMAÇÕES:

O AGC de RF avançado **Padrão** e **Aprimorado** pode prejudicar o desempenho dos canais que não sofrem interferência de IM. Por isso, só ative essas seleções nos canais que sabidamente apresentam interferência de IM.

10.34.13

One Touch

Essa seção permite visualizar ou definir as seleções **Recurso** e **Índice** específicas do botão One Touch para até quatro pressionamentos de botão One Touch ou seleções de opções de menu no One Touch.

O One Touch permite criar menus de navegação e/ou botões de atalho. Esses atalhos podem diminuir muito o esforço envolvido na ativação de um recurso do rádio. Um pressionamento do botão ou a seleção de um item de menu no One Touch pode reduzir a ativação de um recurso do rádio ao pressionamento de um botão. Sem esse recurso, o processo pode exigir muitas etapas de navegação do menu. Essas seleções se aplicam à Personalidade convencional atual.

**OBSERVAÇÃO:**

Após a definição exclusiva das funções das personalidades convencionais, cada personalidade poderá ser atribuída à posição desejada do seletor de canais do rádio. Isso é feito pela atribuição de zonas e canais, na página Canais.

10.34.13.1

Botão

Exibe somente a visualização do nome atribuído para o pressionamento do botão Um toque ou seleção do menu Um toque.

**OBSERVAÇÃO:**

Os Sistemas de entroncamento individuais são referidos como Personalidade de entroncamento. Então, essas configurações de sistemas de entroncamento poderão se tornar funcionais para todos os tipos de canal dessa personalidade de entroncamento.

10.34.13.2

Função do botão de um toque

Este campo seleciona o recurso Um toque para o pressionamento do botão Um toque ou a seleção do menu Um toque.

Esta seleção se aplica ao registro/linha atual, que se aplica ao Sistema de entroncamento da atual.

**INFORMAÇÕES:**

O Botão 1 de Um toque convencional (em outras palavras, o primeiro registro/linha) corresponderia ao pressionamento do botão Um toque 1 e/ou à seleção do menu TCH1 ou SIG1, e assim por diante.

**OBSERVAÇÃO:**

Quando qualquer um dos tipos de Função do botão Um toque a seguir é selecionado, uma seleção de Índice/Membro da lista de [Índice do botão Um toque na página 491](#) também é necessária para a personalidade atual: Telefone, Chamada seletiva, Alerta de chamada, Status ou Mensagem.

As seleções disponíveis da Função do botão de um toque são dependentes do modelo/da opção.

Acessado apenas: Quando o rádio estiver habilitado para o modelo/a opção (se o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **ASTRO**, o campo [Sistema de interface de site remoto](#) no Sistema convencional referenciado deverá estar **Desativado**).

As seleções a seguir são compatíveis:

Desabilitado

A função Um toque não está disponível para a seleção de Botão atual.

Phone

O recurso [Operação do telefone na página 568](#) está ativado para a personalidade atual.

Selecionar chamada

O recurso [Recepção/transmissão de chamada seletiva na página 457](#) está definido como **Codificação e decodificação** ou **Codificação**.

INFORMAÇÕES:

Quando o Sistema convencional referenciado é um Tipo de sistema "DVRS", o recurso associa a funcionalidade de Chamada privada do entroncamento ao pressionamento do botão Um toque ou à seleção do menu [Um Toque \(SIG1-SIG4/DISP\)](#).

Alerta de Chamada.

O campo [Alerta de chamada/operação da página na página 566](#) é definido como **Somente lista** ou **Ilimitado** para a Personalidade de entroncamento mencionada.

Status

O recurso [Status na página 412](#) do Sistema convencional referenciado (para a personalidade atual) está **Ativado**.

Message

O recurso [Message](#) do Sistema convencional referenciado (para a personalidade atual) está **Ativado**.

RAB1 (botão de acesso do repetidor)

O recurso [Acesso Repetido](#) está ativado para a personalidade atual. Quando o campo [Tipo de acesso](#) estiver definido como **Automático**, esta seleção se tornará inválida. Quando o campo Tipo de acesso for **Manual**, a seleção Tipo de código 1 para RAB1 se aplicará ao pressionamento desse botão.

RAB2

O recurso Acesso do repetidor está ativada para a personalidade atual. Quando o campo Tipo de acesso estiver definido como **Automático** e/ou o Tipo de código 2 para RAB2 estiver definido como **Nenhum**, essa seleção se tornará inválida.

RTT (Solicitação para conversar)

O recurso Acesso do repetidor está ativado, e o recurso Tipo de acesso está definido como **Manual** para a personalidade atual.

10.34.13.3

Índice do botão Um toque

Este campo seleciona Índice do botão Um toque/Membro da lista de para você pressionar o botão Um toque ou selecionar o menu Um toque, pertencente à Função do botão Um toque selecionada.

Índice refere-se ao registro/linha real da lista determinado pela seleção da função do botão Um toque. Esta seleção se aplica à Personalidade convencional atual.

INFORMAÇÕES:

Botão 1 de Um toque convencional, o primeiro registro/linha corresponderá ao pressionamento do botão 1 Um toque e à seleção do menu TCH1 ou SIG1.

Acessado apenas: Quando o campo [Função do botão de um toque na página 490](#) não estiver **Desativado**, **RAB1**, **RAB2**, ou **RTT**,

e se o campo [Tipo de voz/sinal de recepção na página 424](#) estiver definido como **ASTRO**, o campo [Sistema de interface de site remoto](#) no Sistema convencional referenciado deverá estar desativado.

As seleções a seguir são compatíveis:

Selecionar chamada

Este número de "Índice" correlaciona-se com o número de linha da Lista de prioridades de chamada.

Disponível quando [Recepção/transmissão de chamada seletiva na página 457](#) está definido como **Decodificação e codificação** ou **Codificação** para a personalidade atual.

**INFORMAÇÕES:**

Os campos Seleção da lista de prioridades determinam qual lista de prioridades de chamada é usada para a Personalidade atual.

Alerta de Chamada.

Este número de "Índice" correlaciona-se com o número de linha da Lista de prioridades de chamada.

Disponível quando [Recepção/Transmissão de alerta de chamada na página 459](#) está definido como "Decodificação e codificação" ou "Codificação" para a personalidade atual.

**INFORMAÇÕES:**

Os campos Seleção da lista de prioridades determinam qual lista de prioridades de chamada é usada para a personalidade atual.

Phone

Este número de "Índice" está correlacionado ao número da linha da Lista de favoritos de chamada telefônica.

Disponível quando a função [Operação do telefone](#) está ativada para a personalidade atual.

Status

Este número de "Índice" está correlacionado ao número da linha da Lista de alias de status.

Disponível quando o recurso [Status na página 412](#) do [Sistema convencional na página 408](#) referenciado (para a personalidade atual) está ativado.

Message

Este número de "Índice" está correlacionado ao número da linha da Lista de alias de mensagem.

Disponível quando o recurso [Message](#) do [Sistema convencional na página 408](#) referenciado (para a personalidade atual) está ativado.

10.35**Todo o Entroncamento**

Essa seção permite visualizar ou definir a funcionalidade que pode ser aplicada a todos os Sistemas de entroncamento e, portanto, a todas as Personalidades de entroncamento.

10.35.1**Geral**

Esta seção permite visualizar ou definir a funcionalidade básica que pode ser aplicada a todos os sistemas de entroncamento e, portanto, a todas as personalidades de entroncamento.

10.35.1.1**Tempo máximo da campanha de destino de chamada individual**

Este campo seleciona o tempo máximo pelo qual a unidade do rádio (SU, Subscriber Unit) toca ao receber uma solicitação de chamada individual.

**INFORMAÇÕES:**

Uma chamada individual inclui ligações telefônicas e de unidade a unidade. Se você atender a chamada antes que o temporizador expire, o temporizador e o toque serão interrompidos. Essa seleção se aplica a todos os sistemas de entroncamento e, portanto, a todas as personalidades de entroncamento. O tempo é medido em segundos.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

Quando definido como **Infinito**, o tempo da campanha é ilimitado.

Acima 219: Alcance

Mínimo	Máximo	Incrementos
61 s	120 s	1 s

10.35.1.2

Campainha inicial máxima da chamada privada

Este campo seleciona o tempo que a unidade de rádio toca depois de iniciar uma solicitação de chamada de unidade para unidade.

INFORMAÇÕES:

As solicitações de chamada telefônica não são incluídas. Se o contador expirar antes que a ligação seja atendida pelo rádio pretendido, a tentativa de ligação será interrompida. O contador e a campanha serão interrompidos se a unidade de destino atender a ligação antes de o contador expirar. Essa seleção se aplica a todos os sistemas de entroncamento e, portanto, a todas as personalidades de entroncamento. O tempo é medido em segundos.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

Quando definido como **Infinito**, o tempo da campanha é ilimitado.

Acima 220: Alcance

Mínimo	Máximo	Incrementos
1 s	255 s	1 s

10.35.1.3

Interrupção Automática da Discagem

Este campo seleciona o tempo que o rádio aguardará depois que o acesso ao canal de voz digital tiver sido concedido ao sistema telefônico.

Depois que esse contador expirar, os números selecionados pela Lista de Prioridades de Ligação do Tipo II pré-digitados (discagem rápida) ou do [Teclado direto \(DTMF\) na página 571](#) serão transmitidos.

INFORMAÇÕES:

Esta seleção se aplica apenas ao telefone digital dos sistemas de entroncamento do tipo II e, portanto, a todas as personalidades de entroncamento do tipo II. Consulte também o campo Sistema de entroncamento, tipo de sistema. O tempo é medido em milissegundos.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 221: Alcance

Mínimo	Máximo	Incrementos
0 ms	6375 ms	25 ms

10.35.1.4

Emergência bloqueada em Failsoft

Esse campo faz com que o rádio ignore qualquer tentativa de entrar na função Modo emergência das Comunicações de entroncamento quando a rede está na condição Failsoft.

Essa seleção se aplica a todos os sistemas de entroncamento e, portanto, a todas as personalidades de entroncamento.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.35.1.5

Ativação do AFC

Esse campo faz com que o algoritmo de AFC (Automatic Frequency Control, controle de frequência automática) do rádio seja desativado.

**AVISO:**

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

O AFC corrige automaticamente o direcionamento do RO (Reference Oscillator, oscilador de referência) do rádio resolvendo a frequência do sinal recebido de RF e retornando um sinal de erro proporcional ao grau em que o RO estiver desajustado e que, por sua vez, diminuirá os erros de ajuste. Entretanto, pode ser benéfico desabilitar o AFC em ambientes ruidosos, onde o sinal de erro pode ser rastreado para uma frequência de interferência ao invés da frequência alocada.

**INFORMAÇÕES:**

Quando o AFC for **Desativado**, o Oscilador de Referência deverá estar precisamente ajustado. Essa seleção se aplica a todos os sistemas de entroncamento e, portanto, a todas as personalidades de entroncamento.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.35.1.6

Ignorar acesso ao canal de voz com tecla rápida

Ao ativar este campo, o recurso Tecla rápida é desativado (desabilitado) para chamadas de voz em grupo.

**AVISO:**

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

Portanto, ao receber uma concessão de acesso de canal de voz para uma solicitação de canal de voz do despacho e o botão PTT não estiver mais pressionado, o rádio finaliza a sequência de solicitação e volta para o estado inativo. Essa seleção se aplica a todos os sistemas de entroncamento e, portanto, a todas as personalidades de entroncamento.

Quando desativada, a função Tecla Rápida é habilitada durante chamadas de voz em grupo.

INFORMAÇÕES:

Uma vez que, especialmente em uma condição de ocupado, uma quantidade significativa de tempo pode passar entre a operação de pressionamento inicial do botão PTT que envia uma solicitação para voz do despacho ao sistema de entroncamento e recebe a concessão de acesso ao canal de voz que atribui um canal de voz para o rádio solicitante, você pode decidir desativar o rádio em vez de permitir que o [Contador de tempo limite na página 428](#) expire. Quando a concessão de acesso ao Canal de Voz é eventualmente recebida, o rádio reproduz um [Tom de permissão para falar na página 570](#) e o recurso de Tecla Rápida faz com que ele inicie a transmissão de áudio silencioso por três segundos, mesmo que o botão PTT não esteja mais pressionado. Se você pressionar o botão PTT antes que o contador da tecla rápida expire, o rádio continuará transmitindo, mas com um microfone ativo; caso contrário, o rádio interromperá a transmissão.

O recurso de Tecla rápida é sempre ativado para chamadas privadas e modo de telefone.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

Esta é uma configuração avançada disponível apenas no Expert View (consulte Visão do codeplug).

10.35.1.7

Deixar Limite de RSSI MS-LMR

Quando o rádio detecta que a força de sinal RSSI filtrada por sites LMR é menor do que o Deixar Limite de RSSI MS-LMR, ele alterna automaticamente da operação de LMR para operação de banda larga, se disponível.

Acima 222: Alcance

Padrão	Mínimo	Máximo	Incrementos
34 (Hex)	0	FF (Hex)	1

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.35.2

Constantes de filtro

Essa seção permite visualizar ou definir a funcionalidade SmartZone que pode ser aplicada a todos os Sistemas de entroncamento e, portanto, a todas as Personalidades de entroncamento.

As Constantes de Filtro do indicador de intensidade do sinal recebido, ou RSSI (Received Signal Strength Indication), SmartZone permite que o rádio interprete as comunicações recebidas do SmartZone com base nas configurações e regras operacionais do Sistema de Entroncamento do SmartZone. Em um sistema SmartZone, as constantes K1, K2 e K3 são desenvolvidas para reduzir a diminuição de intensidade do filtro enquanto o tempo entre o RSSI aumenta.

10.35.2.1

Constante de Filtro K1

Esse campo seleciona o valor da Constante de filtro K1, que é usado quando menos de oito segundos decorrem entre as amostras de RSSI.

O valor da Constante de Filtro K1 selecionada é usado pela [Constante de Limite de Filtro T1 na página 498](#). Esta seleção pode se aplicar a todos os Sistemas de entroncamento e, portanto, a todas as Personalidades de entroncamento.

AVISO:

As modificações das Constantes de Filtro devem ser realizadas apenas por um Representante Técnico de Campo da Motorola Solutions.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 223: Alcance

Mínimo	Máximo
0	9

OBSERVAÇÃO:

O filtro de RSSI apresenta as seguintes características de val. de filtro = $(\text{Val.} * K + \text{Leitura atual} * (10-K))/10$ em que o domínio de K é $\{K: K = K1, K2, K3\}$ e 0 (sem filtro) $\leq K3 \leq K2 \leq K1 \leq 9$ (filtro com intensidade bastante diminuída).

Em um sistema SmartZone, as constantes K1, K2 e K3 são desenvolvidas para reduzir a diminuição de intensidade do filtro à medida que o tempo entre as amostras aumenta.

- K1 é usada quando menos de 8 segundos decorrem entre as amostras de RSSI.
- [Constante de Filtro K2 na página 496](#) é usada quando decorrem 8 a 16 segundos entre as amostras de RSSI.
- [Constante de Filtro K3 na página 497](#) é usada quando mais de 16 segundos decorrem entre as amostras de RSSI.

10.35.2.2

Constante de Filtro K2

Esse campo seleciona o valor da Constante de filtro K2, que é usado quando entre 8 e 16 segundos decorrem entre as amostras do RSSI.

O valor da Constante de Filtro K2 selecionada é usado pela [Constante de Limite de Filtro T2 na página 498](#). Esta seleção pode se aplicar a todos os Sistemas de entroncamento e, portanto, a todas as Personalidades de entroncamento.

AVISO:

As modificações das Constantes de Filtro devem ser realizadas apenas por um Representante Técnico de Campo da Motorola Solutions.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 224: Alcance

Mínimo	Máximo
0	9

OBSERVAÇÃO:

O filtro de RSSI apresenta as seguintes características de val. de filtro = $(\text{Val.} * K + \text{Leitura atual} * (10-K))/10$ em que o domínio de K é $\{K: K = K1, K2, K3\}$ e 0 (sem filtro) $\leq K3 \leq K2 \leq K1 \leq 9$ (filtro com intensidade bastante diminuída).

Em um sistema SmartZone, as constantes K1, K2 e K3 são desenvolvidas para reduzir a diminuição de intensidade do filtro à medida que o tempo entre as amostras aumenta.

- A [Constante de Filtro K1 na página 495](#) é usada quando menos de 8 segundos decorrem entre as amostras de RSSI.
- K2 é usada quando decorrem 8 a 16 segundos entre as amostras de RSSI.
- [Constante de Filtro K3 na página 497](#) é usada quando mais de 16 segundos decorrem entre as amostras de RSSI.

10.35.2.3

Constante de Filtro K3

Esse campo seleciona o valor da Constante de filtro K3, que é usado quando mais de 16 segundos decorrem entre as amostras do RSSI.

O valor da Constante de Filtro K3 selecionada é usado pela [Constante de Limite de Filtro T3 na página 499](#). Esta seleção pode se aplicar a todos os Sistemas de entroncamento e, portanto, a todas as Personalidades de entroncamento.

AVISO:

As modificações das Constantes de Filtro devem ser realizadas apenas por um Representante Técnico de Campo da Motorola Solutions.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 225: Alcance

Mínimo	Máximo
0	9

OBSERVAÇÃO:

O filtro de RSSI apresenta as seguintes características de val. de filtro = $(\text{Val.} * K + \text{Leitura atual} * (10-K))/10$ em que o domínio de K é $\{K: K = K1, K2, K3\}$ e 0 (sem filtro) $\leq K3 \leq K2 \leq K1 \leq 9$ (filtro com intensidade bastante diminuída).

- A [Constante de Filtro K1 na página 495](#) é usada quando menos de 8 segundos decorrem entre as amostras de RSSI.
- [Constante de Filtro K2 na página 496](#) é usada quando decorrem 8 a 16 segundos entre as amostras de RSSI.
- K3 é usada quando mais de 16 segundos decorrem entre as amostras de RSSI

10.35.2.4

Constante de Limite de Filtro T1

Este campo seleciona um valor que cria uma janela de tempo programado na qual as amostras de intensidade do sinal recebido (RSS, Received Signal Strength) devem se enquadrar para serem consideradas válidas.

Essa janela está centralizada no valor [Constante de Filtro K1 na página 495](#) de RSSI (Received Signal Strength Indication, indicação de intensidade do sinal recebido). O tamanho da janela é duas vezes o valor da constante de limite. Esta constante de T1 é usada quando menos de oito segundos decorrem entre as amostras de RSSI. Esta seleção pode se aplicar a todos os Sistemas de entroncamento e, portanto, a todas as Personalidades de entroncamento.

**AVISO:**

As modificações das Constantes de Filtro devem ser realizadas apenas por um Representante Técnico de Campo da Motorola Solutions.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 226: Alcance

Mínimo	Máximo
0 (hex)	FF (hex)

**INFORMAÇÕES:**

As Constantes de Limite de Filtro (T1, T2, T3) são números hexadecimais que variam de 0 a FF e devem ser modificados apenas de acordo com a seguinte regra: (00 <= T1 <= T2 <= T3 <= FF)

**OBSERVAÇÃO:**

T1, T2 e T3 criam uma janela na qual as amostras de RSS devem se enquadrar para serem consideradas válidas. A janela está centralizada no valor Constante de Filtro de RSSI ([Constante de Filtro K1 na página 495](#), [Constante de Filtro K2 na página 496](#) ou [Constante de Filtro K3 na página 497](#)). O tamanho da janela é duas vezes o valor da constante de limite.

- T1 é usada quando menos de 8 segundos decorrem entre as amostras de RSSI.
- [Constante de Limite de Filtro T2 na página 498](#) é usada quando decorrem 8 a 16 segundos entre as amostras de RSSI.
- [Constante de Limite de Filtro T3 na página 499](#) é usada quando mais de 16 segundos decorrem entre as amostras de RSSI.

10.35.2.5

Constante de Limite de Filtro T2

Este campo seleciona um valor que cria uma janela de tempo programado na qual as amostras de intensidade do sinal recebido (RSS, Received Signal Strength) devem se enquadrar para serem consideradas válidas.

Essa janela está centralizada no valor [Constante de Filtro K2 na página 496](#) de RSSI (Received Signal Strength Indication, indicação de intensidade do sinal recebido). O tamanho da janela é duas vezes o valor da constante de limite. Este T2 é usado quando decorrem 8 e 16 segundos entre as amostras de RSSI. Esta seleção pode se aplicar a todos os Sistemas de entroncamento e, portanto, a todas as Personalidades de entroncamento.

**AVISO:**

As modificações das Constantes de Filtro devem ser realizadas apenas por um Representante Técnico de Campo da Motorola Solutions.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 227: Alcance

Mínimo	Máximo
0 (hex)	FF (hex)

INFORMAÇÕES:

As Constantes de Limite de Filtro (T1, T2, T3) são números hexadecimais que variam de 0 a FF e devem ser modificados apenas de acordo com a seguinte regra: (00 <= T1 <= T2 <= T3 <= FF)

OBSERVAÇÃO:

T1, T2 e T3 criam uma janela na qual as amostras de RSS devem se enquadrar para serem consideradas válidas. A janela está centralizada no valor Constante de Filtro de RSSI ([Constante de Filtro K1 na página 495](#), [Constante de Filtro K2 na página 496](#) ou [Constante de Filtro K3 na página 497](#)). O tamanho da janela é duas vezes o valor da constante de limite.

- [Constante de Limite de Filtro T1 na página 498](#) é usada quando menos de 8 segundos decorrem entre as amostras de RSSI.
- T2 é usada quando decorrem 8 a 16 segundos entre as amostras de RSSI.
- [Constante de Limite de Filtro T3 na página 499](#) é usada quando mais de 16 segundos decorrem entre as amostras de RSSI.

10.35.2.6

Constante de Limite de Filtro T3

Este campo seleciona um valor que cria uma janela de tempo programado na qual as amostras de intensidade do sinal recebido (RSS, Received Signal Strength) devem se enquadrar para serem consideradas válidas.

Essa janela está centralizada no valor [Constante de Filtro K3 na página 497](#) de RSSI (Received Signal Strength Indication, indicação de intensidade do sinal recebido). O tamanho da janela é duas vezes o valor da constante de limite. Esta constante de T3 é usada quando mais de 16 segundos decorrem entre as amostras de RSSI. Esta seleção pode se aplicar a todos os Sistemas de entroncamento e, portanto, a todas as Personalidades de entroncamento.

AVISO:

As modificações das Constantes de Filtro devem ser realizadas apenas por um Representante Técnico de Campo da Motorola Solutions.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 228: Alcance

Mínimo	Máximo
0 (hex)	FF (hex)

INFORMAÇÕES:

As Constantes de Limite de Filtro (T1, T2, T3) são números hexadecimais que variam de 0 a FF e devem ser modificados apenas de acordo com a seguinte regra: (00 <= T1 <= T2 <= T3 <= FF)

OBSERVAÇÃO:

T1, T2 e T3 criam uma janela na qual as amostras de RSSI devem se enquadrar para serem consideradas válidas. A janela está centralizada no valor Constante de Filtro de RSSI ([Constante de Filtro K1 na página 495](#), [Constante de Filtro K2 na página 496](#) ou [Constante de Filtro K3 na página 497](#)). O tamanho da janela é duas vezes o valor da constante de limite.

- [Constante de Limite de Filtro T1 na página 498](#) é usada quando menos de 8 segundos decorrem entre as amostras de RSSI.
- [Constante de Limite de Filtro T2 na página 498](#) é usada quando decorrem 8 a 16 segundos entre as amostras de RSSI.
- T3 é usada quando mais de 16 segundos decorrem entre as amostras de RSSI.

10.35.3

Limites de RSSI

Esta seção permite visualizar ou definir a funcionalidade do RSSI (Received Signal Strength Indication, indicador de intensidade do sinal recebido) que pode ser aplicada a todos os Sistemas de entroncamento e, portanto, a todas as Personalidades de entroncamento.

A funcionalidade Limite do RSSI permite que o rádio interprete as comunicações SmartZone de recepção com base nas configurações e regras operacionais do sistema de entroncamento do SmartZone.

10.35.3.1

Contador RSSI OSW

Esse campo seleciona o número de intervalos de OSW (Outbound Signal Word, palavra de sinal de saída) — (23ms) nos quais o rádio permanece inativo no Canal de controle, antes que um conjunto de amostras de RSSI seja aceito.

Assim que esses intervalos OSW forem concluídos, as amostras de RSSI medirão a intensidade do sinal atual recebido. Esta seleção pode se aplicar a todos os Sistemas de entroncamento e, portanto, a todas as Personalidades de entroncamento.

AVISO:

Não tente modificar essa configuração de RSSI, a menos que conheça muito bem o funcionamento do recurso. Configurações incorretas podem impedir que o rádio se comunique com o Equipamento de rede fixo (Fixed Network Equipment, FNE).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 229: Alcance

Mínimo	Máximo
60	255

10.35.3.2

Contador RSSI OSP

Esse campo seleciona o número de OSPs (Outbound Signaling Packets, pacotes de sinalização de saída) RSSI do ASTRO 25 para os quais o rádio deve permanecer inativo no Canal de controle antes que um conjunto de amostras de RSSI seja aceito.

Esse valor deve ser definido com a suposição de formato de canal TSBK (Trunking Signaling Block, bloco de sinalização de entroncamento) único (1 OSP = 37,5 ms). Se o canal estiver realmente no formato TSBK duplo ou triplo, o valor do codeplug será escalado para que o intervalo que o rádio usa para permanecer inativo seja igual a: Contador RSSI OSP * 37,5 ms. Esta seleção pode se aplicar a todos os Sistemas de entroncamento e, portanto, a todas as Personalidades de entroncamento.

AVISO:

Não tente modificar essa configuração de RSSI, a menos que conheça muito bem o funcionamento do recurso. Configurações incorretas podem impedir que o rádio se comunique com o Equipamento de rede fixo (Fixed Network Equipment, FNE).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 230: Alcance

Mínimo	Máximo
40	255

10.35.3.3

Contador de Desense

Esse campo seleciona o tempo que o rádio continua verificando o site atual depois que ele se torna "desensed".

O rádio será considerado como Desense se encontrar um sinal de RF que abafe o canal de controle. Tal condição poderá ocorrer se outro rádio de alta potência estiver transmitindo em proximidade física, não necessariamente na mesma frequência. O rádio sairá da condição de Desense se encontrar um canal de controle válido no local inicial ou encontrar failsoft. Se o contador expirar enquanto o rádio ainda estiver em Desense, ele procurará um canal de controle válido em um local adjacente, se houver. Esta seleção pode se aplicar a todos os Sistemas de entroncamento e, portanto, a todas as Personalidades de entroncamento. O tempo é medido em segundos.

AVISO:

Não tente modificar essa configuração de RSSI, a menos que conheça muito bem o funcionamento do recurso. Configurações incorretas podem impedir que o rádio se comunique com o Equipamento de rede fixo (Fixed Network Equipment, FNE).

INFORMAÇÕES:

O valor desse campo não será copiado quando um procedimento de arrastar e soltar entre bandas de frequência for realizado (por exemplo, 700/800 para UHF).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

Quando definido como **Desativado**, o contador será desativado (0 s).

Acima 231: Alcance

Mínimo	Máximo	Incrementos
1 s	30 s	1 s

10.35.3.4

Limite do RSSI Aceitável

Este campo seleciona uma intensidade de sinal que define um sinal SmartZone de recepção no limite baixo/aceitável.

O Sistema de Entroncamento do SmartZone usa essa informação ao determinar a prioridade de sinal. O indicador de intensidade do sinal recebido (RSSI, Received Signal Strength Indication) é uma medição da intensidade de sinal recebido. Esta seleção pode se aplicar a todos os Sistemas de entroncamento e, portanto, a todas as Personalidades de entroncamento.

AVISO:

Não tente modificar essa configuração de RSSI, a menos que você conheça muito bem o funcionamento deste recurso. Configurações incorretas podem impedir que o rádio se comunique com o Equipamento de rede fixo (Fixed Network Equipment, FNE).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 232: Alcance

Mínimo	Máximo
0 (hex)	FF (hex)

10.35.3.5

Limite Bom do RSSI

Esse campo seleciona uma intensidade de sinal que define um sinal SmartZone de recepção para estar no limite Aceitável/Bom.

O Sistema de Entroncamento do SmartZone usa essa informação ao determinar a prioridade de sinal. O indicador de intensidade do sinal recebido (RSSI, Received Signal Strength Indication) é uma medição da intensidade de sinal recebido. Esta seleção pode se aplicar a todos os Sistemas de entroncamento e, portanto, a todas as Personalidades de entroncamento.

AVISO:

Não tente modificar essa configuração de RSSI, a menos que conheça muito bem o funcionamento do recurso. Configurações incorretas podem impedir que o rádio se comunique com o Equipamento de rede fixo (Fixed Network Equipment, FNE).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 233: Alcance

Mínimo	Máximo
0 (hex)	FF (hex)

10.35.3.6

Limite Muito Bom do RSSI

Esse campo seleciona uma intensidade de sinal que define um sinal SmartZone de recepção para estar no limite Bom/Muito bom.

O Sistema de Entroncamento do SmartZone usa essa informação ao determinar a prioridade de sinal. O indicador de intensidade do sinal recebido (RSSI, Received Signal Strength Indication) é

uma medição da intensidade de sinal recebido. Esta seleção pode se aplicar a todos os Sistemas de entroncamento e, portanto, a todas as Personalidades de entroncamento.

**AVISO:**

Não tente modificar essa configuração de RSSI, a menos que conheça muito bem o funcionamento do recurso. Configurações incorretas podem impedir que o rádio se comunique com o Equipamento de rede fixo (Fixed Network Equipment, FNE).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 234: Alcance

Mínimo	Máximo
0 (hex)	FF (hex)

10.35.3.7

Limite Excelente do RSSI

Esse campo seleciona uma intensidade de sinal que define um sinal SmartZone de recepção para estar no limite Muito bom/Excelente.

O Sistema de Entroncamento do SmartZone usa essa informação ao determinar a prioridade de sinal. O indicador de intensidade do sinal recebido (RSSI, Received Signal Strength Indication) é uma medição da intensidade de sinal recebido. Esta seleção pode se aplicar a todos os Sistemas de entroncamento e, portanto, a todas as Personalidades de entroncamento.

**AVISO:**

Não tente modificar essa configuração de RSSI, a menos que conheça muito bem o funcionamento do recurso. Configurações incorretas podem impedir que o rádio se comunique com o Equipamento de rede fixo (Fixed Network Equipment, FNE).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 235: Alcance

Mínimo	Máximo
0 (hex)	FF (hex)

10.35.3.8

Roaming de Sinal Forte

Quando ativado, este campo ativa a Indicação de intensidade do sinal recebido (RSSI) adicional.

Os limites são derivados em intervalos regulares acima dos Limites Muito Bom/Excelente configurados atualmente. Isso permite a troca de local adicional entre os locais de sinal forte. Ainda que haja trocas de local adicional, quando esse campo estiver ativado, dois níveis de melhoria serão necessários para que uma troca de local ocorra, a fim de impedir a troca excessiva.

Quando desativado, a troca de local com base no RSSI é limitada à melhoria de sinais até o nível excelente configurado.

Essa seleção se aplica a todos os Sistemas de entroncamento e, portanto, a todas as Personalidades de entroncamento.

10.35.3.9

Retornar ao Limite de RSSI MS-LMR

O recurso Retornar ao Limite de RSSI MS-LMR é a intensidade do sinal usada pelo rádio para determinar que um site LMR se recuperou o suficiente para trocar da operação de banda larga para a operação LMR.

Acima 236: Alcance

Padrão	Mínimo	Máximo	Incrementos
41 (Hex)	0	FF (Hex)	1

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.35.4

Dados do CAI

A seção **Dados da interface aérea comum (CAI)** permite visualizar ou definir parâmetros que definem a funcionalidade ou as regras dos pacotes de dados transmitidos usando o protocolo CAI.

Essas seleções podem ser aplicadas a todos os Sistemas de entroncamento e, portanto, a todas as Personalidades de entroncamento.

10.35.4.1

Máximo de Tentativas de Transmissão

Este campo seleciona o número máximo de vezes que o rádio tenta enviar uma transmissão de pacote de dados de interface aérea comum (CAI).

O rádio prosseguirá com essas tentativas até receber uma confirmação do recebimento bem-sucedido da transmissão, ou até que esse número selecionado de Tentativas de Transmissão seja alcançado. Essa seleção se aplica na operação CAI para todos os Sistemas de entroncamento e todas as Personalidades de entroncamento.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 237: Alcance

Mínimo	Máximo
2	10

10.35.4.2

Temporizador de resposta

Esse campo seleciona o tempo mínimo que o rádio deverá aguardar pela confirmação de uma transmissão bem-sucedida de CAI, antes de reenviar outro pacote de dados de CAI.

Essa seleção se aplica na operação CAI para todos os Sistemas de entroncamento e todas as Personalidades de entroncamento. O tempo é medido em milissegundos.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 238: Alcance

Mínimo	Máximo	Incrementos
100 ms	5000 ms	100 ms

10.35.4.3

Tempo de Resposta

Esse campo seleciona o tempo mínimo que o rádio deverá aguardar pela confirmação do envio de uma CAI pelo canal.

Esse parâmetro deve ser ligeiramente maior do que o atraso da taxa de transferência de dados do controlador de rede para rádio (RNC, Radio Network Controller) (o controlador de dados). Essa seleção se aplica na operação CAI para todos os Sistemas de entroncamento e todas as Personalidades de entroncamento. O tempo é medido em milissegundos.

AVISO:

Não tente alterar essa configuração sem primeiro verificar a taxa de transferência específica do sistema.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 239: Alcance

Mínimo	Máximo	Incrementos
50 ms	2000 ms	50 ms

10.35.4.4

Período de Busca de Sinc. Quadro

Este campo seleciona a quantidade de tempo que o rádio escuta uma sequência de sincronização de quadros (FSS).

A presença de uma FSS em um canal indica que a voz ou os dados estão sendo transmitidos no momento. Se uma FSS não for detectada nesse período de busca, o rádio presumirá que o canal está ocioso e transmitirá o próximo pacote CAI (Common Air Interface, interface aérea comum) na fila para transmissão. Essa seleção se aplica na operação CAI para todos os Sistemas de entroncamento e todas as Personalidades de entroncamento. O tempo é medido em milissegundos.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 240: Alcance

Mínimo	Máximo	Incrementos
0 ms	5000 ms	50 ms

10.35.4.5

Alcance Aleatório Curto de Transmissão

Esse campo seleciona o tempo máximo que o rádio deverá aguardar para transmitir depois que a primeira FSS (Frame Sync Sequence, sequência de sincronização de quadros) for recebida indicando que o canal está livre.

O rádio verifica de forma aleatória o status de acesso ao canal com base no tempo de espera máximo. Essa seleção se aplica na operação CAI para todos os Sistemas de entroncamento e Personalidades de entroncamento. O tempo é medido em milissegundos.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 241: Alcance

Mínimo	Máximo	Incrementos
50 ms	500 ms	50 ms

10.35.4.6

Alcance Aleatório Longo de Transmissão

Esse campo seleciona o limite superior do alcance aleatório uniforme.

Quando o rádio capta um status de canal ocupado, ele usa um processo de seleção de tempo aleatório dentro desse alcance, conhecido como "retirada de atraso", para determinar quando tentar transmitir novamente a mensagem de dados CAI (Common Air Interface, interface aérea comum). Essa seleção se aplica na operação CAI para todos os Sistemas de entroncamento e todas as Personalidades de entroncamento. O tempo é medido em milissegundos.

INFORMAÇÕES:

O valor mínimo desse alcance é definido automaticamente como 50 ms e os valores uniformes desse alcance são definidos em acréscimos de 50 ms.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 242: Alcance

Mínimo	Máximo	Incrementos
50 ms	5000 ms	50 ms

10.35.4.7

Alcance Aleatório de Resp. de Transmissão

Esse campo seleciona o limite superior da faixa aleatória uniforme.

Quando o rádio capta um status de canal ocupado, ele usa um processo de seleção de tempo aleatório dentro desse alcance, conhecido como "retirada de atraso", para determinar quando tentar transmitir novamente a mensagem de dados CAI (Common Air Interface, interface aérea comum) de Resposta. A resposta geralmente é uma confirmação "Ack" para uma mensagem enviada do sistema. Essa seleção se aplica na operação CAI para todos os Sistemas de Entroncamento e todas as Personalidades de Entroncamento. O tempo é apresentado em milissegundos.

INFORMAÇÕES:

O valor mínimo desse alcance é definido automaticamente como 50 ms e os valores uniformes desse alcance são definidos em acréscimos de 50 ms.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 243: Alcance

Mínimo	Máximo	Incrementos
50 ms	1000 ms	50 ms

10.35.4.8

Paciência Limitada de Transmissão

Esse campo seleciona o tempo máximo que o rádio tentará transmitir um pacote de dados de CAI.

Quando esse tempo expira, o rádio interrompe as tentativas de transmissão. Essa seleção se aplica na operação CAI para todos os Sistemas de entroncamento e todas as Personalidades de entroncamento. O tempo é medido em segundos.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

Quando definido como **Infinito**, nenhum contador é utilizado, portanto, não há limite de tempo de transmissão.

Acima 244: Alcance

Mínimo	Máximo	Incrementos
1 s	255 s	1 s

10.35.5

Avançado

Essa seção permite visualizar ou definir a funcionalidade SmartZone que pode ser aplicada a todos os Sistemas de entroncamento e, portanto, a todas as Personalidades de entroncamento.

INFORMAÇÕES:

O SmartZone é selecionado por sistema de entroncamento no campo Tipo de cobertura.

10.35.5.1

Inatividade de Failsoft do SmartZone

Este campo seleciona a quantidade de tempo de inatividade do modo Failsoft que determina quando o rádio fará uma tentativa de procurar um canal de controle válido e ativo.

Esse contador inicia depois que todo o Failsoft recebe e transmite as comunicações que foram interrompidas, se o contador expirar antes que quaisquer comunicações de Failsoft ocorram, o rádio começa a procurar por um canal de controle disponível. Se as comunicações ocorrerem durante esse período de tempo, o contador é reinicializado. Essa seleção se aplica na operação do SmartZone para todos os Sistemas de entroncamento e Personalidades de entroncamento. O tempo é medido em segundos.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 245: Alcance

Mínimo	Máximo
0 s	255 s

10.35.5.2

Interrupção de Afiliação do SmartZone

Esse campo seleciona o tempo que o rádio aguarda antes de se conectar a um novo site de Entroncamento.

Esse contador inicia depois que o rádio deixa o local de Entroncamento atual devido a uma falha de conexão do canal de controle. O tempo selecionado é utilizado pelo rádio como uma média aleatória. Essa seleção se aplica apenas quando em operação de SmartZone para os Sistemas de entroncamento do "Tipo II" e, portanto, a todas as Personalidades de entroncamento "Tipo II".

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

- 1 s
- 3 s
- 7 s
- 15 s
- 31 s
- 63 s

- 127 s
- 255 s

10.35.5.3

Verificação do Canal de Controle do Espectro Total do SmartZone

Esse campo permite que o rádio execute automaticamente uma verificação do canal de controle do espectro total quando este estiver fora do alcance de todas as informações do controlador programado atualmente.

Esse recurso faz com que o rádio procure no codeplug inteiro todas as definições de canal, verificando também qualquer atividade válida de canal de controle em cada definição de canal encontrada. Essa seleção se aplica na operação do SmartZone para todos os Sistemas de entroncamento e Personalidades de entroncamento.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.35.5.4

Contador de Verificação do Canal de Controle do Espectro Total do SmartZone

Esse campo seleciona o tempo que o rádio é alocado para realizar uma Verificação de canal de controle de espectro total.

Uma vez que esse temporizador expirar, o rádio retorna para as operações normais do canal de controle. Essa seleção se aplica na operação do SmartZone para todos os Sistemas de entroncamento e Personalidades de entroncamento. O tempo é medido em segundos.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 246: Alcance

Mínimo	Máximo
5 s	31 s

10.35.5.5

Desativação do Rádio Interno do SmartZone

Esse campo seleciona a quantidade de IRHOT (Internal Radio Random Holdoff Time, tempo da desativação aleatória do rádio interno) que o rádio deve atrasar antes de se registrar em um novo site ao deixar um site que acabou de falhar ou ao retornar para um site que acabou de se recuperar de uma falha.

O rádio calcula um valor aleatório entre 0 e o valor IRHOT para o período de espera antes de se registrar após a falha ou recuperação de um local. O IRHOT será usado somente se o [Atraso da Desativação do SmartZone na página 509](#) expirar sem que o rádio tenha recebido um pacote OTA indicando o período de desativação. Essa seleção se aplica na operação SmartZone e somente para Sistemas de entroncamento e Personalidades de entroncamento APCO. O tempo é medido em minutos.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 247: Alcance

Mínimo	Máximo
0 min	60 min

10.35.5.6

Atraso da Desativação do SmartZone

Este campo seleciona o tempo que o rádio deve atrasar o início de um tempo de espera para registro ou afiliação.

Durante esse período, o rádio aguarda por um pacote OTA indicando o período de desativação. Se um valor OTA não for recebido ao fim do Atraso da Desativação, o tempo de [Desativação do Rádio Interno do SmartZone na página 508](#) será usado. Essa seleção se aplica na operação SmartZone e somente para Sistemas de entroncamento e Personalidades de entroncamento APCO. O tempo é medido em segundos.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 248: Alcance

Mínimo	Máximo
5 s	60 s

10.35.5.7

Ajuste da janela ISW

Esse campo seleciona, em formato decimal ou hexadecimal, um valor que ajuste a Janela ISW (Inbound Signal Word, palavra de sinalização de entrada) para aprimoramento do desempenho do Sistema de entroncamento.

A janela ISW é um período de tempo que é sincronizado entre o rádio e o Controlador Central. Esse período de tempo é alocado para fins de sincronização da transmissão ISW dentro da hora de chegada prevista da ISW do Controlador Central. Esta seleção se aplica apenas aos Sistemas de entroncamento tipo II e, portanto, a todas as Personalidades de entroncamento tipo II.

AVISO:

Não faça modificações, a menos que você seja um Representante técnico de campo da Motorola Solutions. O ajuste inadequado pode reduzir o desempenho do Sistema de Entroncamento.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 249: Alcance

Mínimo	Máximo
0 (Hex)	FFFF (Hex)

10.35.5.8

ViQi: Tempo de atividade da chamada do parceiro virtual (s)

Este campo permite que você selecione quanto tempo você pode permanecer ativo no canal do Parceiro virtual antes de reverter para o grupo de conversação selecionado.

OBSERVAÇÃO:

Este campo se aplica apenas aos rádios APX NEXT e APX N70.

Acima 250: Alcance

Valor padrão	Valor mínimo	Valor máximo	Incrementos
5 s	5 s	30 s	1 s

10.36

Sistema de entroncamento tipo II

O conjunto **Sistema de entroncamento tipo II** permite criar e apagar os Sistemas de entroncamento, bem como definir funcionalidades do Sistema de entroncamento individual. Os Sistemas de entroncamento são configurações virtuais que espelham as configurações e as funcionalidades reais do Sistema de entroncamento (no campo). A definição do sistema RadioCentral permite que o rádio se comunique com os sistemas reais.

**AVISO:**

Se um campo, Tipo do sistema do Sistema de entroncamento for modificado, qualquer Personalidade de entroncamento previamente atribuída a esse Sistema de entroncamento específico terá que ser atribuída novamente a outro sistema que tenha a seleção do Tipo de sistema apropriado. Caso contrário, um erro de codeplug ocorrerá ao gravar o codeplug no rádio. Os esquemas de endereçamento do Sistema de entroncamento podem ser do **Tipo II** ou **ASTRO 25**.

**OBSERVAÇÃO:**

Os Sistemas de entroncamento são referidos a uma Personalidade de entroncamento. Essas configurações de Sistema de entroncamento poderão se tornar funcionais para todos os tipos de entroncamento — canal.

10.36.1

Geral (Sistema de Entroncamento Tipo II)

A seção **Geral** do conjunto Sistema de Entroncamento do Tipo II permite ao usuário visualizar ou definir funcionalidades básicas para Sistemas de Entroncamento individuais.

**OBSERVAÇÃO:**

Os Sistemas de entroncamento individuais são referidos como Personalidade de entroncamento. Depois de referidos, essas configurações de Sistemas de Entroncamento poderão se tornar funcionais para todos os tipos de canal dessa Personalidade de Entroncamento.

10.36.1.1

Nome do Sistema de Entroncamento

Este campo permite definir um nome reconhecível para o sistema de entroncamento atual.

**OBSERVAÇÃO:**

Sistemas de entroncamento individuais são atribuídos a uma Personalidade de entroncamento por meio do campo Sistema, selecionando esse nome. Então, essas configurações de sistemas de entroncamento poderão se tornar funcionais para todos os tipos de canal dessa personalidade de entroncamento.

Quando o **Monitor de prioridade** é selecionado como o Tipo de verificação para canais de Membro da lista de verificação, o nome desse Sistema de Entroncamento deve ser selecionado para a Lista de verificação atual por meio do campo Registro do sistema de entroncamento.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

**OBSERVAÇÃO:**

Exemplos: EMT-001, #500, Electric1, # A5

É possível usar caracteres, números, espaços e caracteres especiais.

Os espaços iniciais em branco são substituídos por sublinhados no visor do rádio.

Os pontos iniciais não aparecem no visor do rádio.

10.36.1.2

Tipo de chave de sistema

Este campo exibe somente leitura do Tipo de chave de sistema selecionado para o Sistema de entroncamento atual, seja **Chave de sistema** ou **Chave WACN**.

Quando o [Tipo de cobertura na página 511](#) está configurado para **roaming intra-WACN**, o Tipo de chave de sistema será **Chave WACN**, caso contrário ele será **Chave de Sistema**.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.36.1.3

Chave do sistema presente

O aplicativo recupera e exibe somente leitura se um Arquivo de chaves do sistema de software ou Chave avançada (hardware) for carregado e corresponder ao ID selecionado no campo ID do sistema ou ID da WACN doméstica para o Sistema de entroncamento atual.

Consulte também [Tipo de chave de sistema na página 511](#).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.36.1.4

Permitir chave de software legada

"Permitir Chave do Software Legado" permite que o usuário ignore temporariamente a necessidade de usar ASKs (Advanced System Keys, chaves de sistema avançadas) ao programar um rádio.

Acessado apenas: Quando a opção H de aplicação de chaves de hardware ou ASKs está ativada e quando uma ASK de uso ilimitado correspondente ao ID do sistema doméstico/do proprietário do rádio está carregada.

10.36.1.5

Tipo de cobertura

Este campo seleciona o tipo de cobertura geográfica do rádio e, portanto, os métodos específicos para determinar comunicações entre rádios dentro de sistemas de entroncamento.

O Tipo de Cobertura se aplica ao Sistema de Entroncamento atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/a opção, quando um Arquivo de Teclas do Sistema de Software ou uma Chave de Sistema Avançada com acesso é selecionada no campo ID do Sistema ou uma Chave Avançada WACN com acesso é selecionada no campo ID da WACN doméstica.

OBSERVAÇÃO:

Essas seleções dependem do modelo/da opção do rádio.

As seleções a seguir são compatíveis:

Desativado = SmartNet

Quando o rádio estiver habilitado para o modelo/a opção de SmartZone e você desativar esse campo, o Sistema de Entroncamento usará a SmartNet.

OBSERVAÇÃO:

Valores de operação da SmartNet para SmartZone de um único site.

SmartZone

A operação da SmartZone permite que o rádio determine, através do indicador de intensidade do sinal recebido (RSSI), amostras de chamadas seletivas e o melhor Site de Entroncamento a ser usado para canais de entroncamento habilitados para SmartZone.

OBSERVAÇÃO:

Para sistemas ASTRO 25: A operação limita-se a locais dentro de uma única zona de um único Sistema de Entroncamento.

Para sistemas Tipo II: A operação limita-se a locais dentro de um único sistema de entroncamento.

SmartZone e OmniLink

conferem ao rádio habilitado para SmartZone a capacidade de fazer roaming de um sistema de SmartZone para outro dentro do mesmo sistema OmniLink. O OmniLink se aplica a canais de entroncamento habilitados para OmniLink.

OBSERVAÇÃO:

Para sistemas ASTRO 25: A operação limita-se a Sites e Zonas dentro de um único Sistema OmniLink.

Para sistemas Tipo II: A operação limita-se a locais dentro de um conjunto de sistemas de entroncamento interconectados.

Roaming intra-WACN

O Roaming Intra-WACN fornece a capacidade ao rádio habilitado para Projeto 25 de fazer roaming automaticamente entre todos os IDs da rede de comunicações de área ampla (WACN) sem nenhuma intervenção. Consulte também ID da WACN doméstica.

OBSERVAÇÃO:

Para sistemas ASTRO 25: A operação limita-se a sistemas de entroncamento dentro de uma única WACN.

AVISO:

O Roaming Intra-WACN será inválido se um dos cenários a seguir ocorrer:

Quando o Tipo de Sistema for Tipo II, ou

Quando o campo Ativação de Hardware DVRS estiver **Habilitado**, ou

Quando o campo Seleção de Rádio – Rádio Duplo estiver definido como **Rádio Secundário** e quando o campo Habilitar TX de Rádio Secundário estiver definido como **Desabilitado**.

Roaming inter-WACN

O Roaming Inter-WACN fornece a capacidade aos rádios habilitados para Projeto 25 dos grupos de conversação selecionados de fazer o roaming automaticamente entre WACNs (Wide Area Communications Network, rede de comunicações de área ampla) diferentes sem nenhuma intervenção.

AVISO:

O Roaming inter-WACN será inválido se um dos cenários a seguir ocorrer:

Quando o Tipo de Sistema for Tipo II, ou

Quando o campo Ativação de Hardware DVRS estiver **Habilitado**, ou

Quando o campo Seleção de Rádio - Rádio Duplo estiver definido como **Rádio Secundário** e quando o campo Habilitar TX de Rádio Secundário estiver definido como **Desabilitado**, ou

Quando esse sistema estiver **Habilitado** para banda larga LTE.

Um Sistema de entroncamento é habilitado para LTE quando um Perfil de dados referenciado com uma seleção de Tipo de Perfil de dados igual a **Entroncamento e banda larga** ou **Somente banda larga**, e quando a Origem da banda larga desse Perfil de Dados é **Modem LTE Interno**.

Sistemas capacitados para O SmartZone e Projeto 25 também são configurados a partir dos campos SmartZone de Todo o Entroncamento e a partir dos campos Constantes de Filtro de Todo o Entroncamento.

10.36.1.6

ID do sistema

Este campo permite visualizar o ID do sistema ASTRO 25 e o ID do sistema tipo II no campo para o Sistema de entroncamento atual selecionado.

O campo Nome do sistema seleciona o Sistema de entroncamento desejado para o registro/linha atual. Este valor se aplica ao conjunto de IDs de chamadas atual (registro/linha) do Contato atual da Lista de chamadas unificadas. Esse conjunto de IDs de chamada pode ser selecionado no campo [ID de chamada na página 661](#) (ASTRO 25) [ID de chamada na página 663](#) (Type II).

Acessado apenas: Quando o campo Nome do sistema não estiver definido como **Personalizado** e o rádio for compatível com o modelo/a opção.

10.36.1.7

Banda de frequência do tipo II

Este campo seleciona a banda de frequência operacional para o Sistema de entroncamento atual tipo II.

INFORMAÇÕES:

Os Sistemas de entroncamento tipo II podem operar apenas em uma banda de frequência única. Essa seleção se aplica ao Sistema de entroncamento atual.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **Tipo II** e o rádio for compatível com o modelo/a opção.

A seleção a seguir é suportada: VHF, UHF1, UHF2, 700/800 MHz, 900 MHz

10.36.1.8

Tom de conexão

Este campo seleciona a frequência do tom de conexão para o sistema de entroncamento Tipo II atual.

Esta seleção deve corresponder ao tom esperado no canal de tráfego pelo controlador central do Sistema de Entroncamento para verificar que uma transmissão de rádio esteja ocorrendo. A frequência está em Hz.

Acessado apenas: Quando um arquivo de chaves do sistema de software ou uma chave de sistema avançada com acesso é selecionado(a) no campo ID do sistema. Quando o campo Tipo de sistema estiver definido como **Tipo II** e o rádio for compatível com o modelo/a opção.

10.36.1.9

Tom de conexão de Failsoft

Este campo seleciona a frequência do tom de conexão do Modo Failsoft para o sistema de entroncamento atual.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **Tipo II** e o rádio for compatível com o modelo/a opção.

A seleção a seguir é suportada:

Padrão

Quando o Tipo de cobertura do sistema estiver definido como **SmartZone**, a seleção "Padrão" usa 105,88 Hz.

Quando o Tipo de Cobertura do Sistema estiver definido com **Desativado**, a seleção "Padrão" usará o [Tom de conexão na página 513](#) como o Tom de Conexão de Failsoft.

10.36.1.10

ID da rede

O aplicativo recupera e permite que você visualize (em formato decimal ou hexadecimal) a ID de rede tipo II para o Sistema de entroncamento atual.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **Tipo II** e o rádio for compatível com o modelo/a opção.

10.36.1.11

Pesquisa de sites não adjacentes

Este campo permite que o rádio pesquise a lista programada de Canais de controle de um site com sinal mais forte.

Isso permite que o rádio entre em roaming e use um site que não seja definido por equipamento de rede fixa (FNE) como adjacente ao local inicial atual do rádio, mas tenha um sinal "Aceitável" ou mais forte.

OBSERVAÇÃO:

Isso ocorre somente quando o site inicial atual e os sites adjacentes definidos por FNE estão todos registrados com um determinado valor de limite abaixo do nível do limite de RSSI aceitável. Esse recurso se aplica ao Sistema de Entroncamento atual.

INFORMAÇÕES:

Ao operar em uma área de baixa cobertura, esse recurso faz com que o rádio pesquise na lista programada de Canais de controle aproximadamente uma vez a cada dois minutos. Durante esse tempo de pesquisa, o rádio não monitora o canal de controle do site inicial e, portanto, pode perder o áudio. Com base no número de Canais de Controle contidos na lista de Canais de Controle apropriada para esse Sistema de Entroncamento, a pesquisa pode levar até quatro segundos.

Acessado apenas: Quando o campo [Tipo de cobertura na página 511](#) não está definido como **Desativado** e quando o rádio está habilitado para o modelo/para a opção.

10.36.2

Atribuição de Canais de OBТ

A seção **Atribuição de canais OBТ** (Other Band Trunking) permite visualizar ou definir parâmetros relacionados à frequência para comunicações OBТ do tipo II.

INFORMAÇÕES:

A seção Atribuição de canais OBТ ficará visível somente quando o rádio estiver operando em uma banda de frequência UHF/VHF.

OBSERVAÇÃO:

Esses parâmetros são usados para validar todas as frequências de canal de controle OBТ do tipo II e de Failsoft inseridas. Essas configurações se aplicam a sistemas de entroncamento individuais.

Depois que os parâmetros para essas atribuições de canais OBТ são definidos, as frequências do canal de controle do Sistema de entroncamento e as frequências de Failsoft da Personalidade de entroncamento podem ser definidas.

Os Sistemas de entroncamento são referidos a uma Personalidade de entroncamento. Essas configurações de Sistema de entroncamento poderão se tornar funcionais para todos os tipos de Entroncamento - canal.

Acessado apenas: Quando o tipo de sistema estiver definido como **Tipo II** e quando o campo Banda de frequência do tipo II estiver definido como uma banda de frequência VHF/UHF.

10.36.2.1

Ativação da recepção

Este campo ativa uma divisão da frequência para o intervalo de canal de recepção (Rx) OBT atual.

Esta seleção se aplica ao [Sistema de entroncamento tipo II na página 510](#) atual.

AVISO:

O primeiro registro/linha nessa seção de Atribuição de canal de OBT deve estar ativado para ser considerado válido.

Essa configuração deve ser exatamente a mesma configuração do Controlador central para que as comunicações do Sistema de entroncamento sejam possíveis.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **Tipo II**, e quando o campo [Banda de frequência do tipo II na página 513](#) estiver definido como banda de frequência de OBT **VHF**, **UHF1** ou **UHF2** e o rádio for compatível com o modelo/a opção.

10.36.2.2

Espaçamento de Rx

Este campo seleciona o espaçamento (em kHz) entre as frequências de recepção (Rx) para o intervalo de canais atual de OBT.

INFORMAÇÕES:

A [Frequência de início de Rx na página 515](#) e a [Frequência do final de Rx na página 516](#) definem a faixa de frequência de recepção atual. Essa seleção se aplica ao Sistema de entroncamento atual.

OBSERVAÇÃO:

O valor da faixa ([Frequência do final de Rx na página 516](#) - [Frequência de início de Rx na página 515](#)) deve ser divisível de forma exata pelo espaçamento do canal. Isso possibilita que a faixa seja dividida em um valor inteiro para atribuir adequadamente o número de Canal de controle.

AVISO:

Essa configuração deve ser exatamente a mesma configuração do Controlador central para que as comunicações do Sistema de entroncamento sejam possíveis.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **Tipo II**, e quando o campo [Banda de frequência do tipo II na página 513](#) estiver definido como banda de frequência de OBT **VHF**, **UHF1** ou **UHF2** e o rádio for compatível com o modelo/a opção.

10.36.2.3

Frequência de início de Rx

Este campo permite inserir o ponto de partida (em MHz) para a faixa de frequência de recepção (Rx) para o intervalo de canais atual de OBT.

INFORMAÇÕES:

A Frequência do Início da Tx deve ser menor ou igual a [Frequência do final de Rx na página 516](#). Essa seleção se aplica ao Sistema de entroncamento atual.

AVISO:

Essa configuração deve ser exatamente a mesma configuração do Controlador central para que as comunicações do Sistema de entroncamento sejam possíveis.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **Tipo II**, e quando o campo [Banda de frequência do tipo II na página 513](#) estiver definido como banda de frequência de OBT **VHF**, **UHF1** ou **UHF2** e o rádio for compatível com o modelo/a opção.

10.36.2.4

Frequência do final de Rx

Este campo permite inserir o ponto de extremidade (em MHz) para a faixa de frequência de recepção (Rx) para o intervalo de canais atual de OBT.

INFORMAÇÕES:

A Frequência do Final da Rx deve ser maior ou igual a [Espaçamento de Rx na página 515](#). Essa seleção se aplica ao Sistema de entroncamento atual.

AVISO:

Essa configuração deve ser exatamente a mesma configuração do Controlador central para que as comunicações do Sistema de entroncamento sejam possíveis.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **Tipo II**, e quando o campo [Banda de frequência do tipo II na página 513](#) estiver definido como banda de frequência de OBT **VHF**, **UHF1** ou **UHF2** e o rádio for compatível com o modelo/a opção.

10.36.2.5

Ativação da transmissão

Esse campo ativa uma divisão de frequência para a Faixa do canal de transmissão (Tx) de OBT.

Esta seleção se aplica ao [Sistema de entroncamento tipo II na página 510](#) atual.

AVISO:

O primeiro registro/linha nessa seção de Atribuição de canal de OBT deve estar ativado para ser considerado válido.

Essa configuração deve ser exatamente a mesma configuração do Controlador central para que as comunicações do Sistema de entroncamento sejam possíveis.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **Tipo II**, e quando o campo [Banda de frequência do tipo II na página 513](#) estiver definido como banda de frequência de OBT **VHF**, **UHF1** ou **UHF2** e o rádio for compatível com o modelo/a opção.

10.36.2.6

Espaçamento de Tx

Este campo seleciona o espaçamento (em kHz) entre as frequências de transmissão (Tx) para o intervalo de canais atual de OBT.

INFORMAÇÕES:

A [Frequência de início de Tx na página 517](#) e a [Frequência do final de Tx na página 517](#) definem a faixa de frequência de recepção atual. Essa seleção se aplica ao Sistema de entroncamento atual.

OBSERVAÇÃO:

O valor da faixa ([Frequência do final de Tx na página 517](#) - [Frequência de início de Tx na página 517](#)) deve ser divisível de forma exata pelo espaçamento do canal. Isso possibilita que a faixa seja dividida em um valor inteiro para atribuir adequadamente o número de Canal de controle.

AVISO:

Essa configuração deve ser exatamente a mesma configuração do Controlador central para que as comunicações do Sistema de entroncamento sejam possíveis.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **Tipo II**, e quando o campo [Banda de frequência do tipo II na página 513](#) estiver definido como banda de frequência de OBV **VHF**, **UHF1** ou **UHF2** e o rádio for compatível com o modelo/a opção.

10.36.2.7

Frequência de início de Tx

Este campo seleciona o espaçamento (em kHz) entre as frequências de transmissão (Tx) para o intervalo de canais atual de OBV.

INFORMAÇÕES:

A [Frequência de início de Tx na página 517](#) e a [Frequência do final de Tx na página 517](#) definem a faixa de frequência de recepção atual. Essa seleção se aplica ao Sistema de entroncamento atual.

OBSERVAÇÃO:

O valor da faixa ([Frequência do final de Tx na página 517](#) - [Frequência de início de Tx na página 517](#)) deve ser divisível de forma exata pelo espaçamento do canal. Isso possibilita que a faixa seja dividida em um valor inteiro para atribuir adequadamente o número de Canal de controle.

AVISO:

Essa configuração deve ser exatamente a mesma configuração do Controlador central para que as comunicações do Sistema de entroncamento sejam possíveis.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **Tipo II**, e quando o campo [Banda de frequência do tipo II na página 513](#) estiver definido como banda de frequência de OBV **VHF**, **UHF1** ou **UHF2** e o rádio for compatível com o modelo/a opção.

10.36.2.8

Frequência do final de Tx

Este campo permite inserir o ponto de extremidade (em MHz) para a faixa de frequência de recepção (Tx) para o intervalo de canais atual de OBV.

INFORMAÇÕES:

A Frequência do Final da Tx deve ser maior ou igual a [Espaçamento de Tx na página 516](#). Essa seleção se aplica ao Sistema de entroncamento atual.

AVISO:

Essa configuração deve ser exatamente a mesma configuração do Controlador central para que as comunicações do Sistema de entroncamento sejam possíveis.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **Tipo II**, e quando o campo [Banda de frequência do tipo II na página 513](#) estiver definido como banda de frequência de OBV **VHF**, **UHF1** ou **UHF2** e o rádio for compatível com o modelo/a opção.

10.36.3

Canais de Controle (Sistema de Entroncamento Tipo II)

A seção **Canais de Controle** do conjunto Sistema de Entroncamento Tipo II permite ao usuário visualizar ou definir as frequências de Recebimento e Transmissão para os Canais de Controle.

Até um máximo de 250 canais de controle podem ser criados para Sistemas de Entroncamento individuais, conforme necessário.

**OBSERVAÇÃO:**

Para modelos de rádio que contêm firmware anterior à Versão R12.01.00, o número máximo de canais de controle é 128.

**INFORMAÇÕES:**

Os Sistemas de entroncamento individuais são referidos como Personalidade de entroncamento. Depois de referidos, essas configurações de Sistemas de Entroncamento poderão se tornar funcionais para todos os tipos de canal dessa Personalidade de Entroncamento.

É útil classificar as frequências de canal de controle em ordem ascendente em um sistema de SmartZone. Em uma situação de Failsoft, o rádio utilizará o primeiro canal do Canal de controle como seu canal de Failsoft. Se os canais estiverem classificados (ou pelo menos classificados em uma ordem projetada para facilitar as operações de Failsoft), problemas potenciais, como ter vários rádios em canais de Failsoft diferentes, podem ser evitados.

10.36.3.1**Frequência de Rx**

Este campo permite digitar uma frequência de Rx (Receive, recepção) de canal de controle para o sistema de entroncamento atual.

**AVISO:**

As Restrições de frequência de entroncamento aplicáveis a essa seleção são determinadas pela banda de frequência deste Sistema.

Acessado apenas: (Quando um arquivo de Teclas do Sistema de Software ou uma Chave Avançada de Sistema com acesso for selecionado no campo ID do Sistema, ou uma Chave Avançada WACN com acesso for selecionada no campo ID da WACN Doméstica), e quando o rádio estiver habilitado para o modelo/a opção.

10.36.3.2**Frequência de transmissão**

Este campo permite digitar uma Frequência de Tx (Transmit, transmissão) de canal de controle para o sistema de entroncamento atual.

**AVISO:**

As Restrições de frequência de entroncamento aplicáveis a essa seleção são determinadas pelo Tipo de sistema e banda de frequência deste Sistema. Para Sistemas de entroncamento Tipo II, esse campo tem um status somente para visualização quando [Banda de frequência do tipo II na página 513](#) for 700/800 MHz ou 900 MHz.

Acessado apenas: Quando um arquivo de Teclas do sistema de software ou uma Chave de sistema avançada com acesso é selecionada no campo ID do sistema ou uma Chave avançada WACN com acesso é selecionada no campo ID da WACN doméstica, quando o campo Tipo de sistema estiver definido como **Tipo II** e o campo [Banda de frequência do tipo II na página 513](#) não estiver definido para **700/800** MHz ou **900** MHz e quando o rádio estiver habilitado para o modelo/a opção.

10.36.4

Funções (Sistema de Entroncamento Tipo II)

A seção **Funções** do conjunto Sistema de Entroncamento Tipo II permite ao usuário visualizar ou modificar as configurações de dados para sistemas de entroncamento individuais.

**OBSERVAÇÃO:**

Os Sistemas de entroncamento individuais são referidos como Personalidade de entroncamento. Então, essas configurações de sistemas de entroncamento poderão se tornar funcionais para todos os tipos de canal dessa personalidade de entroncamento.

10.36.4.1

Inibição de rádio

Este campo permite que o rádio receba e responda a um comando de inibição remota enquanto opera no sistema de entroncamento atual.

Esse comando de inibição é enviado pelo despachador. Ao receber esse comando com êxito, o rádio transmite uma confirmação de volta ao equipamento de transmissão e, em seguida, entra em um estado de inatividade. Durante a inibição, o receptor do rádio fica mudo e o caminho de áudio de transmissão é bloqueado; todos os seus controles ficam inoperantes; o modo de verificação é interrompido no canal operacional que recebeu o comando e todos os LEDs do rádio são desligados.

**AVISO:**

Quando o campo Tipo de sistema estiver definido como **ASTRO 25**, quando o campo de **Índice de Perfil ASTRO OTAR** estiver ativado (para o Sistema de entroncamento atual) e quando a Configuração segura **Inibição de rádio via ASTRO OTAR** estiver ativada, esse campo poderá ser desativado. Nesse caso, a Inibição de rádio é realizada "via ASTRO OTAR".

Quando o campo Tipo de sistema estiver definido como **ASTRO 25** e o campo de Índice de perfil ASTRO OTAR estiver desativado (para o sistema de entroncamento atual), esse campo deverá estar ativado. Isso garante que a Inibição de rádio seja possível via Entroncamento de **ASTRO 25**.

Quando o campo **Tipo de sistema** estiver definido como **Tipo II** e quando o valor do ID do sistema do Sistema de entroncamento corresponde ao campo ID da chave de um dos Arquivos de chave de sistema de software ou Chave de sistema avançada (veja o Relatório de chave de sistema) carregadas, esse campo poderá ser desativado. Nesse caso, os comandos de Inibição de Rádio recebidos neste Sistema de Entroncamento serão ignorados, e o rádio continuará a funcionar normalmente.

Quando a Configuração segura **Índice de Perfil de Inibição de Rádio via ASTRO OTAR** estiver ativada e quando o campo de **Índice de perfil ASTRO OTAR** estiver ativado (para o Sistema de entroncamento atual), esse campo poderá ser desativado. Nesse caso, a Inibição de rádio é realizada "via ASTRO OTAR".

Quando o campo de Índice de Perfil ASTRO OTAR está desativado (para o Sistema de Entroncamento atual), esse campo deve ser ativado. Isso garante que a Inibição de rádio seja possível via Entroncamento de **ASTRO 25**.

**INFORMAÇÕES:**

Para apagar esse estado de Inibição no rádio, um comando de desinibição deve ser enviado a ele.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.36.4.2

Tipo de alias do rádio OTA

Este campo configura a codificação (transmissão) e a decodificação (recepção) do recurso Alias do rádio OTA (Over The Air).

AVISO:

O rádio não poderá exibir o alias se estiver recebendo IDs duplicados até que a duplicação seja removida. Gravar o codeplug do aplicativo em um rádio fará com que a lista de chamadas retorne ao estado original, e todas as atualizações de alias OTA serão perdidas.

INFORMAÇÕES:

Se a atualização de alias OTA não aparecer no visor, você deverá atualizar a lista de chamadas do rádio ou o gerenciador de provisionamento.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Desabilitado

O rádio não transmite nem recebe os dados do alias do rádio.

Apenas decodificação

Os dados do alias do rádio recebem dados sem limitação.

10.36.4.3

Nível de potência de TX

Este campo seleciona o nível de potência do rádio para transmitir para o sistema de entroncamento atual.

O pressionamento do botão Baixa energia de transmissão, a alternância da chave Baixa energia de transmissão e a seleção do menu Energia têm prioridade sobre essa configuração quando selecionada por você.

OBSERVAÇÃO:

Durante o Modo de emergência, o rádio transmite automaticamente em alta potência.

A potência de transmissão pode ser reduzida em 1 watt para modelos 800 e em 2 watts para modelos VHF e UHF.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Baixa

Usado para comunicações próximas e para impedir que o rádio transmita para outros grupos geográficos operando na mesma frequência.

Alta

Utilizada quando um sinal mais forte é necessário para estender distâncias de transmissão.

10.36.4.4

HearClear

Este campo permite uma melhora da clareza do áudio aplicando o cancelamento de ruído e/ou um algoritmo de compressão ao sinal de rádio.

Esse recurso se aplica ao Sistema de Entroncamento atual.

INFORMAÇÕES:

Com a compressão, a faixa dinâmica do áudio de transmissão é compactada e, em seguida, expandida até seu nível original no áudio de recepção. Portanto, a função de compressão deve estar habilitada nos rádios de transmissão e de recepção para que não o áudio não fique distorcido. Como o algoritmo de compressão/expansão é ativado no áudio de transmissão e recepção, expandir o áudio descompactado ou compactar o áudio sem expandi-lo logo em seguida resultará em uma saída de áudio não natural. O caminho do áudio até o operador também deve ser compactado.

Acessado apenas: Quando o campo Tipo de sistema está definido como **Tipo II** e quando o campo Ativação de hardware DVRS está desativado.

As seleções a seguir são compatíveis:

Desabilitado

Nenhum cancelamento ou compressão de ruído é aplicada aos sinais de transmissão/recepção.

Somente compressor de áudio

O compressor de áudio é aplicado ao áudio de transmissão e recepção. Ver Nota importante.

Somente cancelamento de ruído

O cancelamento de ruído é aplicado ao áudio de recepção.

Compressor de áudio e cancelamento de ruído

O compressor de áudio é aplicado ao áudio de transmissão e recepção (ver Nota importante) e o cancelamento de ruído é aplicado ao áudio de recepção.

OBSERVAÇÃO:

As configurações **Somente cancelamento de ruído** e **Compressor de áudio e cancelamento de ruído** só podem ser aplicadas na personalidade atual se todas as frequências estiverem na frequência de 900 MHz.

10.36.4.5

Monitor remoto/ativação de rastreamento de rádio

Este campo permite que o rádio decodifique um comando de monitor remoto ou de rastreamento de rádio para o sistema de entroncamento atual.

AVISO:

O **Rastreamento de rádio** se aplica somente ao Tipo de sistema **Tipo II**. Além disso, somente para um sistema **Tipo II** e aplicável a **Monitor remoto** e **Rastreamento de rádio**, o rádio é ativado pelo tempo selecionado pelo Monitor remoto/Tempo base da transmissão de rastreamento de rádio.

OBSERVAÇÃO:

Para um Tipo de sistema **ASTRO 25**, o tempo de transmissão do rádio dentro do campo é definido por um transmissor e contido no comando de **Monitor remoto** transmitido.

Quando um comando de **Monitor remoto** for recebido, o rádio será ativado automaticamente e transmitirá o áudio ao seu redor por meio do microfone "avançado". Isso é especialmente útil em uma situação de emergência de um usuário com problemas.

O **Monitor remoto** é conhecido também como **Monitor de unidade de rádio**.

Quando um comando de **rastreamento de rádio** for recebido, o rádio será ativado automaticamente e enviará um sinal sem modulação à operadora. Assim, um rádio perdido ou roubado poderá ser recuperado. O **Rastreamento de rádio** se aplica somente ao Tipo de sistema **Tipo II**.

Aplica-se apenas:

Para APX 7000XE e APX 6000, esse recurso se aplica apenas quando a Opção de sistema H43 está disponível no rádio. Além disso, o rádio requer o firmware versão R05.xx.xx ou superior, e o APX deve ser R05.xx.xx ou superior.

Para o APX 6500, esse recurso se aplica apenas quando a Opção de sistema G170 está disponível no rádio. Além disso, o rádio requer o firmware versão R05.xx.xx ou superior, e o APX deve ser R05.xx.xx ou superior.

10.36.4.6

Monitor remoto/tempo base de transmissão de rastreamento de rádio

Essa campo seleciona o tempo pelo qual o rádio monitorado de forma remota fará a transmissão quando o comando de Monitor remoto ou de Rastreamento de rádio for recebido para o Sistema de entroncamento atual.

OBSERVAÇÃO:

Essa configuração de campo de aplicativo não é compatível com acessórios de terceiros. Qualquer alteração nas configurações deve ser feita por meio do desenvolvedor do acessório.

Aplica-se apenas:

Para APX 7000XE e APX 6000, esse recurso se aplica apenas quando a Opção de sistema H43 está disponível no rádio. Além disso, o rádio requer o firmware versão R05.xx.xx ou superior, e o APX deve ser R05.xx.xx ou superior.

Para o APX 6500, esse recurso se aplica apenas quando a Opção de sistema G170 está disponível no rádio. Além disso, o rádio requer o firmware versão R05.xx.xx ou superior, e o APX deve ser R05.xx.xx ou superior.

Acessado apenas: Quando o campo Tipo de sistema está definido como **Tipo II**, quando o campo Monitor remoto/Ativação de rastreamento de rádio está ativado e quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

- 15
- 30
- 45
- 60

10.36.4.7

Indicador de Rx do alarme de emergência

Este campo permite que o rádio acione um indicador de áudio ou visual, ou os dois, quando um alarme de emergência é detectado e recebido de outro rádio.

O tipo de Indicador de emergência é determinado pela configuração de Tipo de indicador de recepção de alarme de emergência. Esse recurso se aplica ao Sistema de Entroncamento atual.

INFORMAÇÕES:

O tempo do Indicador de recepção do alarme de emergência é de 10 segundos. Durante esses 10 segundos, é possível desativar o indicador pressionando qualquer um dos botões do rádio, exceto Volume e Luz/Inverter (Tela).

Assim que o indicador apaga ou é desativado, os alarmes de emergência repetidos com o mesmo ID individual do sistema de entroncamento são ignorados nos próximos 20 segundos.

Os alarmes de emergência não são detectados enquanto o rádio está no modo de varredura.

Os alarmes de emergência podem não ser detectados sempre que o rádio não estiver monitorando ou decodificando o canal de controle, por exemplo, atividade em um canal de dados ou voz, amostragem de RSSI etc.

Acessado apenas: Quando o campo Tipo de Indicador de Recepção do Alarme de Emergência não estiver definido como **Sem Indicação** e quando o rádio estiver habilitado para o modelo/a opção.

10.36.4.8

LED seguro

Este campo ativa o LED amarelo ocupado sempre que uma chamada de voz segura criptografada for recebida e continua a piscar enquanto a atividade de voz atual for segura.

O LED amarelo ocupado piscará nessas condições, independente de o rádio específico poder desativar a função de mudo do sinal de voz. O LED de segurança se aplica ao Sistema de Entroncamento atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.36.4.9

Ativação do reagrupamento dinâmico

Este campo ativa um grupo de conversação de reagrupamento dinâmico para uma personalidade de entroncamento/canal que faz referência ao sistema de entroncamento atual.

OBSERVAÇÃO:

Quando esse campo é habilitado, um [Zona de Reagrupamento dinâmico na página 524](#) e [Canal de reagrupamento dinâmico na página 524](#) devem ser selecionados para esse Sistema de Entroncamento.

AVISO:

Uma configuração de Reagrupamento dinâmico só é válida quando uma das Personalidades de entroncamento referentes a um canal tem seu campo Grupo de conversação de entroncamento definido como **DYN** (Reagrupamento dinâmico), e a zona e o canal selecionados dessa Personalidade correspondem às seleções de Zona de reagrupamento dinâmico e ao Canal de reagrupamento dinâmico no Sistema de Entroncamento referido nas Personalidades.

INFORMAÇÕES:

Portanto, apenas um canal dentro de determinado Sistema de entroncamento pode ser o de Reagrupamento dinâmico.

É possível solicitar uma nova atribuição de Reagrupamento dinâmico do despachador pressionando o botão Solicitação de reprogramação ou selecionando o menu Solicitação de reprogramação. Os recursos e as configurações reais do grupo de conversação de reagrupamento dinâmico são definidos e transmitidos novamente pelo transmissor.

Para que o grupo de conversação de Reagrupamento dinâmico possa transmitir em modo Seguro, é necessário pressionar o botão Seleção de transmissão segura, ativar/desativar Seleção de transmissão segura ou selecionar o menu Proteger. Caso contrário, as transmissões do grupo de conversação de Reagrupamento dinâmico ficam amarradas à transmissão no modo **Não criptografado**.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.36.4.10

Zona de Reagrupamento dinâmico

Este campo seleciona a zona da personalidade de entroncamento/canal que faz referência ao sistema de entroncamento atual.

**AVISO:**

As zonas de interface de site remoto (RSI) são inválidas e não podem ser selecionadas (zonas que têm o modo RSI ativado).

**OBSERVAÇÃO:**

É possível solicitar uma nova atribuição de Reagrupamento dinâmico do despachador pressionando o botão Solicitação de reprogramação ou selecionando o menu Solicitação de reprogramação. Os recursos e as configurações reais do grupo de conversação de reagrupamento dinâmico são definidos e transmitidos novamente pelo transmissor.

Para que o grupo de conversação de Reagrupamento dinâmico possa transmitir em modo Seguro, é necessário pressionar o botão Seleção de transmissão segura, ativar/desativar Seleção de transmissão segura ou selecionar o menu Proteger. Caso contrário, as transmissões do grupo de conversação de Reagrupamento dinâmico ficam amarradas à transmissão no modo **Não criptografado**.

Quando [Ativação do reagrupamento dinâmico na página 523](#) está **Habilitado**, uma Zona de reagrupamento dinâmico e um [Canal de reagrupamento dinâmico na página 524](#) devem ser selecionados para esse Sistema de Entroncamento.

**AVISO:**

As Zonas selecionadas nesse campo devem ter a opção Zona dinâmica ativada desabilitada; caso contrário, esse campo se tornará inválido.

Uma configuração de reagrupamento dinâmico só é válida quando uma das Personalidades de entroncamento referentes a um canal tem seu campo Grupo de conversação de entroncamento definido como **DYN** (Reagrupamento dinâmico), e a zona e o canal selecionados dessa Personalidade correspondem às seleções de Zona de reagrupamento dinâmico e ao Canal de reagrupamento dinâmico no Sistema de Entroncamento referido nas Personalidades.

**INFORMAÇÕES:**

Portanto, apenas um canal (dentro de determinado sistema de entroncamento) pode ser o de Reagrupamento dinâmico.

Acessado apenas: Quando o campo [Ativação do reagrupamento dinâmico na página 523](#) está definido como **Ativado** e quando o rádio está habilitado para o modelo/para a opção.

10.36.4.11

Canal de reagrupamento dinâmico

Este campo seleciona um canal/personalidade de entroncamento de reagrupamento dinâmico que faz referência ao sistema de entroncamento atual.

Consulte também [Zona de Reagrupamento dinâmico na página 524](#).

OBSERVAÇÃO:

É possível solicitar uma nova atribuição de Reagrupamento dinâmico do despachador pressionando o botão Solicitação de reprogramação ou selecionando o menu Solicitação de reprogramação. Os recursos e as configurações reais do grupo de conversação de reagrupamento dinâmico são definidos e transmitidos novamente pelo transmissor.

Para que o grupo de conversação de Reagrupamento dinâmico possa transmitir em modo Seguro, é necessário pressionar o botão Seleção de transmissão segura, ativar/desativar Seleção de transmissão segura ou selecionar o menu Proteger. Caso contrário, as transmissões do grupo de conversação de Reagrupamento dinâmico ficam amarradas à transmissão no modo **Não criptografado**.

Quando [Ativação do reagrupamento dinâmico na página 523](#) está **Habilitado**, uma Zona de reagrupamento dinâmico e um Canal de reagrupamento dinâmico devem ser selecionados para esse Sistema de Entroncamento.

AVISO:

Uma configuração de reagrupamento dinâmico só é válida quando uma das Personalidades de entroncamento referentes a um canal tem seu campo Grupo de conversação de entroncamento definido como **DYN** (Reagrupamento dinâmico), e a zona e o canal selecionados dessa Personalidade correspondem às seleções de Zona de reagrupamento dinâmico e ao Canal de reagrupamento dinâmico no Sistema de Entroncamento referido nas Personalidades.

INFORMAÇÕES:

Portanto, apenas um canal dentro de determinado Sistema de entroncamento pode ser o de Reagrupamento dinâmico.

AVISO:

Para codeplugs Portáteis APX™ 3000, somente os primeiros 48 canais na Zona de reagrupamento dinâmico são considerados seleções válidas.

Acessado apenas: Quando o campo [Ativação do reagrupamento dinâmico na página 523](#) estiver definido como **Habilitado**, quando o campo Zona de reagrupamento dinâmico não estiver definido como uma Zona dinâmica e quando o rádio estiver habilitado para o modelo/a opção.

10.36.4.12

Redefinição do ICUA

Este campo seleciona uma exceção de silenciamento, programada ou manual, para alertas de chamada/páginas de entroncamento quando o canal quando o canal Emudecer voz – Alerta do usuário de chamada recebida é ativado.

O tempo de exceção (programado ou manual) é conhecido como Estado de liberação do silenciador. Para as duas seleções programadas, o campo [Tempo de redefinição automática do ICUA na página 526](#) (para esse Sistema de entroncamento) determina parcialmente por quanto tempo o Estado de liberação do silenciador continuará. O Estado de liberação do silenciador começa quando o recurso Silenciar Alerta do usuário de chamada recebida estiver ativo e o rádio não estiver mudo. Essa seleção se aplica ao Sistema de entroncamento atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Manual

Quando a função Ativação do alerta do usuário de chamada recebida da função Emudecer voz estiver ativa, o botão Emudecer voz for pressionado ou a seleção de menu Emudecer voz desativar Emudecer voz e encerrar o Estado de liberação do silenciador. Pressionar o botão PTT encerrará o estado de liberação do silenciador.

Automático

Se o contador expirar, independentemente de o rádio estar com a função mudo ativada ou não, o Estado de liberação do silenciador será encerrado, e as regras de ativação do Alerta do usuário de chamada recebida da função Emudecer voz serão novamente necessárias para desativar a função mudo de futuras transmissões.

Automático com a operadora

Se a função Mudo do rádio estiver desativada quando o contador expirar devido à Silenciador da Operadora ser atendido, o rádio permanecerá com a função Mudo desativada até que a operadora seja liberada. Após liberar a operadora e o rádio ficar mudo, o contador será reinicializado e reiniciado, estendendo o Estado de Liberação do Silenciador novamente; se o rádio permanecer mudo por um período inteiro de tempo sem substituição da operadora, o Estado de Liberação do Silenciador será encerrado e as regras de Ativação de Alerta de Usuário de Ligação Recebida da função Emudecer Voz serão novamente necessárias para ativar a função mudo para qualquer transmissão.

10.36.4.13

Tempo de redefinição automática do ICUA

Este campo seleciona uma quantidade de tempo usada durante a exceção de silenciamento das páginas/alertas de chamada de entroncamento quando o canal Emudecer voz – Alerta do usuário de chamada recebida é ativado.

O tempo de exceção é conhecido como Estado de liberação do silenciador. Esse contador é relevante apenas para as duas seleções de tempo programado da Redefinição de ligação recebida. Essa seleção se aplica ao Sistema de entroncamento atual. O tempo é medido em segundos.

Acessado apenas: Quando o campo [Redefinição do ICUA na página 525](#) não está definido como **Manual** e quando o rádio está habilitado para o modelo/para a opção.

Acima 251: Alcance

Mínimo	Máximo	Incrementos
0 s	255 s	1 s

10.36.4.14

Serviço de mensagens de texto

Este campo seleciona o modo de Mensagens de texto para o sistema de entroncamento atual.

OBSERVAÇÃO:

A Mensagem de texto é acessada ao pressionar o botão Serviço de mensagens de texto ou ao selecionar o menu Serviço de mensagens de texto.

A Mensagem de texto rápida é acessada ao pressionar o botão Mensagem rápida TMS.

A Mensagem de consulta é acessada ao pressionar o botão Consulta TMS.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **ASTRO 25**, quando o sistema de Entroncamento atual tiver um Perfil de dados referenciado e quando a Seleção de perfil de dados não estiver definida como **Dados desativados**.

As seleções a seguir são compatíveis:

Nenhum

O recurso está desativado.

Somente lista

Permite selecionar apenas mensagens de texto na Lista de mensagens de texto rápidas.

Ilimitado

Permite selecionar Mensagens de texto rápidas e inserir sua própria mensagem de texto pelo teclado do rádio.

AVISO:

Essa seleção fica disponível somente em rádios que têm um teclado ou microfone do teclado.

OBSERVAÇÃO:

Esta seleção não se aplica ao APX N70.

10.36.5

Alias de mensagem

Esta seção permite visualizar ou definir a funcionalidade de mensagem para sistemas de entroncamento individuais.

Em seguida, você poderá selecionar e transmitir essas mensagens. As mensagens podem ser enviadas de uma unidade transmissora para uma unidade móvel ou portátil, ou de uma unidade portátil ou móvel para uma unidade transmissora. Entretanto, uma mensagem não pode ser enviada de uma unidade móvel ou portátil para outra unidade móvel ou portátil.

AVISO:

Esse recurso se aplica somente quando a [Personalidade de entroncamento tipo II na página 548](#) que faz referência a esse Sistema de entroncamento tem o campo Ativação de mensagem habilitado.

Cada Alias de mensagem deve ser configurado de forma idêntica (ou com o mesmo significado) para o transmissor e as unidades portáteis ou móveis. Ou seja, o alias de mensagem 1 da unidade de transmissão deve ser idêntico ao alias de mensagem 1 da unidade portátil ou móvel (ou ter o mesmo significado).

OBSERVAÇÃO:

Uma transmissão de mensagem faz uso mais eficiente de um canal em relação a uma transmissão de voz.

As mensagens são apenas aplicáveis a modelos com tela.

Acessado apenas: Quando o campo [Ativação do alias de mensagem na página 527](#) está ativado, quando o campo Tipo de sistema está definido como **Tipo II** e quando o rádio está habilitado para o modelo/para a opção.

10.36.5.1

Ativação do alias de mensagem

Este campo ativa a capacidade de definir as Mensagens para o Sistema de entroncamento atual.

AVISO:

Esse recurso se aplica somente quando a [Personalidade de entroncamento tipo II na página 548](#) que faz referência a esse Sistema de entroncamento tem o campo Ativação de mensagem habilitado.

Após ativá-lo, você deve configurar cada Alias de mensagem do rádio (Nome de alias da mensagem e Número do alias da mensagem do mesmo registro/linha) para que correspondam exatamente (ou tenham o mesmo significado) ao Alias de mensagem da unidade do despachador correspondente.

Depois de definido, é possível ativar o recurso Mensagem pressionando o botão [Message na página 184](#), o botão Mensagem direta ou com a seleção do menu [Message na página 214](#).

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **Tipo II** e o rádio for compatível com o modelo/a opção.

10.36.5.2

Número do alias de mensagem

Este campo seleciona um número que identifica a Mensagem atual.

Esta seleção se aplica à mensagem atual (registro/linha) que se aplica ao Sistema de entroncamento atual.

**AVISO:**

Esse recurso se aplica somente quando a Personalidade de entroncamento que faz referência a esse sistema de entroncamento tem o campo [Ativação da mensagem na página 570](#) habilitado.

Depois de definido, é possível acessar o recurso Mensagem ao pressionar o botão Mensagem, o botão Mensagem direta ou com a seleção do menu Mensagem.

Acessado apenas: Quando o campo [Ativação do alias de mensagem](#) está ativado, quando o campo Tipo de sistema está definido como **Tipo II** e quando o rádio está habilitado para o modelo/para a opção.

10.36.5.3

Texto do alias de mensagem

Este campo permite definir nomes reconhecíveis para a Mensagem atual (registro/linha).

Essa seleção se aplica ao Sistema de entroncamento atual.

**AVISO:**

Esse recurso se aplica somente quando a Personalidade de entroncamento que faz referência a esse sistema de entroncamento tem o campo [Ativação da mensagem na página 570](#) habilitado.

Depois de definido, é possível acessar o recurso Mensagem ao pressionar o botão Mensagem, o botão Mensagem direta ou com a seleção do menu Mensagem.

**OBSERVAÇÃO:**

O Alias de mensagem deve ser configurado de forma idêntica (ou com o mesmo significado) para o despachador e as unidades portáteis ou móveis. Ou seja, o alias de mensagem 1 da unidade de transmissão deve ser idêntico ao alias de mensagem 1 da unidade portátil ou móvel (ou ter o mesmo significado).

Acessado apenas: Quando o campo [Ativação do alias de mensagem](#) está ativado, quando o campo Tipo de sistema está definido como **Tipo II** e quando o rádio está habilitado para o modelo/para a opção.

**OBSERVAÇÃO:**

Exemplos: MESSAGE-01, Electric1, #510

É possível usar caracteres, números, espaços e caracteres especiais.

São permitidos no máximo 14 caracteres.

10.36.6

Configuração do canal de tipo II

Esta seção permite visualizar ou definir funções específicas do sistema de entroncamento do tipo II.

**INFORMAÇÕES:**

Os Sistemas de entroncamento individuais são referidos como Personalidade de entroncamento. Em seguida, essas configurações de Sistemas de entroncamento podem se tornar funcionais para todos os tipos de canal dessa [Personalidade de entroncamento tipo II na página 548](#).

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **Tipo II** e o rádio for compatível com o modelo/a opção.

10.36.6.1

Canal Splinter

Este campo permite a operação do canal Splinter para oferecer suporte à sistemas de entroncamento que operam como um "sistema Splinter" (somente 800 Mhz).

OBSERVAÇÃO:

Neste caso, as frequências de canal de controle e as frequências de Failsoft operam usando os "canais Splinter" que estão entre as frequências "normais" do plano de banda de 800 MHz e que são, conseqüentemente, diminuídas para 12,5 kHz. Então, o rádio interpreta os números de canal recebidos via OTA como canais splinter. Esse recurso se aplica ao Sistema de Entroncamento atual.

Acessado apenas: Quando o rádio estiver operando dentro da banda de frequências de 800 MHz e quando um arquivo de chave de sistema de software ou uma chave de sistema avançada com acesso tiver sido selecionado no campo ID do sistema e quando o campo Tipo de sistema estiver definido como **Tipo II** e quando o rádio estiver habilitado para modelo/opção.

10.36.6.2

Sistema de trânsito legado

Esse campo que habilita esse recurso restringe o uso do Sistema de entroncamento atual para o formato de frequência legado para compatibilidade com os sistemas de trânsito legados.

AVISO:

NÃO FAÇA MODIFICAÇÕES nesse recurso a menos que instruído explicitamente por um Representante técnico de campo da Motorola Solutions.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **Tipo II** e o rádio for compatível com o modelo/a opção.

10.36.6.3

Largura de banda de canal

Este campo seleciona a largura de banda do canal para o sistema de entroncamento atual.

Para a configuração do sistema de entroncamento doméstico de 800 MHz, este campo é a largura de banda de canal 806 designada, ou seja, esta seleção especifica a largura de banda de canal das frequências no intervalo de 806 MHz a 821 MHz.

INFORMAÇÕES:

A largura de banda das frequências no intervalo de 821 MHz a 824 MHz é definida no campo [Largura de banda de canal NPSPAC na página 530](#).

Quando **12,5 kHz** é selecionado e quando o tipo de voz e sinal de um grupo é definido como **Analógico**, o campo [Proteger/remover chamada de AG na página 561](#) e os campos Proteger/remover chamada do grupo de conversação são obrigatoriamente **Removidos**.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **Tipo II**, quando o rádio não estiver operando dentro da banda de frequência de 900 Mhz, quando uma chave de sistema avançada com acesso tiver sido selecionada no campo ID do sistema e quando o rádio estiver habilitado para modelo/opção.

As seleções a seguir são compatíveis:

25,0 kHz**20,0 kHz****AVISO:****20,0 kHz e 25,0 kHz são inválidos se o seguinte cenário for verdadeiro:**

Quando o Requisito de estreitamento de banda FCC de 12,5 kHz se aplicar a esse codepluge

quando o sistema de entroncamento [Banda de frequência do tipo II na página 513](#) é OBT (Other Band Trunking) e

quando qualquer um dos registros/linhas na página de atribuição de canal de OBT tem seu: (o campo [Ativação da transmissão na página 516](#) **Ativado**, e [Frequência de início de Tx na página 517](#) OU [Frequência do final de Tx na página 517](#) incidir em um dos intervalos de Requisitos de FCC).

12,5 kHz

Sempre disponível

10.36.6.4**Largura de banda de canal NPSPAC**

Esse campo seleciona a Largura de banda de canal NPSPAC (National Public Safety Planning Advisor Committee, Comitê Nacional de Planejamento de Segurança Pública) para o Sistema de entroncamento atual.

Essa seleção especifica a Largura de Banda das frequências no intervalo de 821 MHz a 824 MHz.

**OBSERVAÇÃO:**

A largura de banda das frequências no intervalo de 806 MHz a 821 MHz é definida no campo [Largura de banda de canal na página 529](#).

Quando **12,5 kHz** é selecionado e quando o tipo de voz e sinal de um grupo é definido como **Analógico**, o campo [Proteger/remover chamada de AG na página 561](#) e os campos Proteger/remover chamada do grupo de conversação são obrigatoriamente **Removidos**.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **Tipo II**, quando o rádio estiver em operação na banda de frequência de 800 MHz e quando o rádio for compatível com o modelo/a opção.

As seleções a seguir são compatíveis:

- 20,0 kHz
- 12,5 kHz

10.36.6.5**Tipo de atribuição de canal**

Este campo seleciona uma pequena variação na divisão da banda de frequência (em MHz) e ajusta a largura de banda no espaçamento do canal (em kHz).

Essa seleção se aplica ao Sistema de entroncamento atual.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **Tipo II**, quando o rádio estiver em operação na banda de frequência de 800 MHz e quando o rádio for compatível com o modelo/a opção.

As seleções a seguir são compatíveis:

Doméstico

Espaçamento de canais de 25 kHz usado nos Estados Unidos.

Internacional

Espaçamento de canais de 12,5 kHz usado fora dos Estados Unidos.

10.36.7

Alias de Status (Sistema de Entroncamento do Tipo II)

A seção **Alias de Status** do conjunto Sistema de Entroncamento Tipo II permite ao usuário visualizar ou definir Status para Sistemas de Entroncamento individuais. Os usuários poderão, então, selecionar e transmitir seu Status atual para um despachador (unidade base) pressionando o botão Status, o botão Status Direto ou selecionando o menu Status.

OBSERVAÇÃO:

As transmissões de Status fazem uso mais eficiente de um canal quando comparadas a uma transmissão de voz.

Para modelos sem teclado esse recurso pode ser usado somente com a Função do botão de um toque.

AVISO:

Esse recurso se aplica somente quando a Personalidade de entroncamento que faz referência a esse sistema de entroncamento tem o campo Ativação de status habilitado.

Cada Alias de status deve ser configurado de forma idêntica (ou com o mesmo significado) para o despachador e as unidades portáteis ou móveis. Ou seja, o Alias de status 1 da unidade de transmissão deve ser idêntico ao Alias de status 1 da unidade portátil ou móvel (ou ter o mesmo significado).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.36.7.1

Ativação do alias de status

Este campo ativa a habilidade de definir o Status para o sistema de entroncamento atual.

AVISO:

Esse recurso se aplica somente quando a Personalidade de entroncamento que faz referência a esse sistema de entroncamento tem o campo Ativação de status habilitado.

Após ativá-lo, você deve configurar cada Alias de status de rádio (Nome de alias de status e Número de alias de status do mesmo registro/linha) para que correspondam exatamente (ou tenham o mesmo significado) do Alias de status da unidade do despachador correspondente.

Depois de definido, você pode acessar o recurso Status ao pressionar o botão Status, o botão Status direto ou com a seleção do menu Status.

Para modelos sem teclado, o recurso Status pode ser usado somente com o recurso Botão de um toque.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.36.7.2

Número do alias de status

Este campo seleciona um número que identifica o Status atual.

Essa seleção se aplica ao Status atual (registro/linha) que se aplica ao sistema de entroncamento atual.

**AVISO:**

- Esse recurso se aplica somente quando a personalidade de entroncamento que faz referência a esse sistema de entroncamento tem o campo Ativação de status ativado.
- Depois de definido, você pode acessar o recurso Status ao pressionar o botão Status, o botão Status direto ou com a seleção do menu Status.

**INFORMAÇÕES:**

O alias de status deve ser configurado de forma idêntica (ou com o mesmo significado) para o transmissor e as unidades portáteis ou móveis. Ou seja, o Alias de status 1 da unidade de transmissão deve ser idêntico ao Alias de status 1 da unidade portátil ou móvel (ou ter o mesmo significado).

Acessado apenas: Quando o campo [Ativação do alias de status na página 531](#) estiver ativado e quando o rádio estiver habilitado para o modelo/a opção.

10.36.7.3

Texto do alias de status

Este campo permite definir nomes reconhecíveis para o Status atual (registro/linha).

Essa seleção se aplica ao sistema de entroncamento atual.

**OBSERVAÇÃO:**

- Esse recurso se aplica somente quando a Personalidade de entroncamento que faz referência a esse sistema de entroncamento tem o campo Ativação de status habilitado.
- Depois de definido, você pode acessar o recurso Status ao pressionar o botão Status, o botão Status direto ou com a seleção do menu Status.

**INFORMAÇÕES:**

O alias de status deve ser configurado de forma idêntica (ou com o mesmo significado) para o transmissor e as unidades portáteis ou móveis. Ou seja, o Alias de status 1 da unidade de transmissão deve ser idêntico ao Alias de status 1 da unidade portátil ou móvel (ou ter o mesmo significado).

Acessado apenas: Quando o campo [Ativação do alias de status na página 531](#) estiver ativado e quando o rádio estiver habilitado para o modelo/a opção.

**OBSERVAÇÃO:**

É possível usar caracteres, números, espaços e caracteres especiais.

São permitidos no máximo 14 caracteres.

Exemplos: STATUS-01, Electric1, #510

10.36.8

Alias do Site (Sistema de Entroncamento do Tipo II)

A seção **Alias do Site** do conjunto do Sistema de Entroncamento Tipo II permite ao usuário visualizar ou definir aliases de rádio simples para identificar Sistemas de Entroncamento ou sites individuais dentro desses Sistemas que um rádio pode encontrar enquanto faz o roaming entre sites, Sistemas de Entroncamento ou até mesmo WACNs (Wide Area Communications Networks, Redes de

Comunicações de Área Ampla). Os Alias também podem identificar chamadas (por meio das IDs de PTT) recebidas de rádios fora do Sistema de Entroncamento do rádio selecionado (doméstico).

INFORMAÇÕES:

Apenas os Aliases de site definidos no Sistema de entroncamento atualmente selecionados pelo usuário estarão disponíveis para o rádio.

OBSERVAÇÃO:

O Tipo de alias do site determina o que está sendo atribuído ao Texto de alias do site. Pode ser um Sistema de entroncamento ou um site dentro de um sistema.

INFORMAÇÕES:

Um Sistema de Entroncamento sempre é definido por seu Número de WACN RAS Doméstico e pelo Número de Sistema, enquanto que um site é definido por combinações específicas de seu Número de WACN RAS Doméstico, pelo Número de Sistema, Número de Alias RFSS e pela ID do Site, dependendo do Tipo de Abordagem e do Tipo de Sistema do Sistema de Entroncamento atual.

A visualização do Alias do site atual e seu RSSI (Received Signal Strength Indicator, indicador de potência do sinal recebido) ou alteração do site atual é ativada pelo usuário do rádio ao pressionar o botão Exibir/Procurar site. Um pressionamento de botão Bloquear/Desbloquear site ativado pelo usuário do rádio ou uma seleção de menu de site pode exibir ou alterar o status de bloqueio do site atual.

Os Sistemas de entroncamento individuais são referidos como Personalidade de entroncamento. Então, essas configurações de sistemas de entroncamento poderão se tornar funcionais para todos os tipos de canal dessa personalidade de entroncamento.

10.36.8.1

Ativação do alias do site

Esse campo ativa os campos Alias do site para o ID do site atual (registro/linha), que também se aplica ao sistema de entroncamento atual.

OBSERVAÇÃO:

A visualização do Alias do site atual e seu RSSI (Received Signal Strength Indicator, indicador de potência do sinal recebido) ou alteração do site atual é ativada pelo usuário do rádio ao pressionar o botão Exibir/Procurar site.

Um pressionamento do botão Bloquear/Desbloquear Site ou uma seleção de menu de Site pode exibir ou alterar o status de bloqueio do site atual.

OBSERVAÇÃO:

A AMSS (Automatic Multiple Site Select, seleção automática de vários locais não é suportada neste produto.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **Tipo II**, quando o campo [Tipo de cobertura na página 511](#) estiver definido como **SmartZone** e quando o rádio estiver habilitado para o modelo/a opção,

Ou quando o campo Tipo de sistema estiver definido como **ASTRO 25**, quando o campo Tipo de cobertura não estiver definido como **Desativado** e quando o rádio estiver habilitado para o modelo/a opção.

10.36.8.2

ID do site

Este campo permite inserir (em formato decimal ou hexadecimal) o número de ID que identifica o site para o atual (registro/linha).

Para suportar o roaming entre sites diferentes, cada ID de Site deve ser único dentro do RFSS. Essa seleção também se aplica ao sistema de entroncamento atual.

Acessado apenas: Quando o campo [Ativação do alias do site na página 533](#) estiver ativado, quando o campo Tipo de sistema estiver definido como **Tipo II**, quando o campo Tipo de cobertura estiver definido como **SmartZone** e quando o rádio estiver habilitado para o modelo/a opção,

Ou quando o campo [Ativação do alias do site na página 533](#) estiver ativado, e quando o campo [Tipo de alias do site na página 599](#) estiver definido como **Site**, e quando o campo Tipo de sistema estiver definido como **ASTRO 25** e quando o campo Tipo de cobertura não estiver definido como **Desativado**, e quando o rádio estiver habilitado para o modelo/a opção.

Acima 252: Alcance

Mínimo	Máximo
0 (Hex)	FE (Hex)

10.36.8.3

Texto do alias de local

Este campo permite definir nomes reconhecíveis para o Alias do site atual (registro/linha) que se aplica ao sistema de entroncamento atual.

Consulte também [Tipo de alias do site na página 599](#). Você pode ativar o Texto do alias do site pressionando o botão Exibir/Pesquisar do site, pressionando o botão Bloquear/Desbloquear do site e com os recursos de seleção do menu Site.

Acessado apenas: Quando o campo [Ativação do alias do site na página 533](#) estiver ativado, quando o campo Tipo de sistema estiver definido como **Tipo II**, quando o campo Tipo de cobertura estiver definido como **SmartZone** e quando o rádio estiver habilitado para o modelo/a opção,

Ou quando o campo [Ativação do alias do site na página 533](#) estiver ativado, e quando o campo Tipo de sistema estiver definido como **ASTRO 25**, e quando o campo Tipo de cobertura não estiver definido como **Desativado**, e quando o rádio estiver habilitado para o modelo/a opção.

OBSERVAÇÃO:

É possível usar caracteres, números, espaços e caracteres especiais.

São permitidos no máximo 14 caracteres.

Exemplos: EMT-001, #500, Electric1, alias de local 01

10.36.9

Um Toque (Sistema de Entroncamento do Tipo II)

A seção **Um Toque** do conjunto Sistema de Entroncamento Tipo II permite visualizar ou definir seleções específicas de [Função do botão de um toque na página 535](#) e [Índice do botão Um toque na página 536](#) Um Toque para até quatro (4) pressionamentos de botão Um Toque ou seleções de menu de Um Toque.

A função Um Toque permite criar atalhos de navegação de menu e/ou de botões para o usuário do rádio. Esses atalhos podem diminuir muito o esforço do usuário para ativar uma função do rádio. Um pressionamento do botão ou a seleção de um item de menu no One Touch pode reduzir a ativação de um recurso do rádio ao pressionamento de um botão. Sem esse recurso, o processo pode exigir muitas etapas de navegação do menu. Essas seleções se aplicam ao Sistema de Entroncamento atual.

OBSERVAÇÃO:

Os Sistemas de entroncamento individuais são referidos como Personalidade de entroncamento. Então, essas configurações de sistemas de entroncamento poderão se tornar funcionais para todos os tipos de canal dessa personalidade de entroncamento.

10.36.9.1

Botão

Exibe somente a visualização do nome atribuído para o pressionamento do botão Um toque ou seleção do menu Um toque.

OBSERVAÇÃO:

Os Sistemas de entroncamento individuais são referidos como Personalidade de entroncamento. Então, essas configurações de sistemas de entroncamento poderão se tornar funcionais para todos os tipos de canal dessa personalidade de entroncamento.

10.36.9.2

Função do botão de um toque

Este campo seleciona o recurso Um toque para o pressionamento do botão Um toque ou a seleção do menu Um toque.

Essa seleção se aplica ao registro/linha atual, que se aplica ao Sistema de entroncamento atual.

INFORMAÇÕES:

O Botão 1 de entroncamento de Um toque (em outras palavras, o primeiro registro/linha) corresponderia ao pressionamento do botão Um toque 1 e/ou à seleção do menu (TCH1 ou SIG1) e assim por diante.

OBSERVAÇÃO:

Em qualquer uma dessas seleções de Função, a seleção de Índice do Botão de um toque também deve ser definida.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Desabilitado

A função Um toque não está disponível para a seleção de Botão atual.

Phone

A função [Operação do telefone na página 568](#) é definida como **Somente lista** ou **Ilimitado** para a Personalidade de entroncamento mencionada.

Chamada privada

O [Tipo de chamada privada na página 565](#) não está **Desativado**, e o campo [Operação de chamada privada na página 565](#) é definido como **Somente lista** ou **Ilimitado** para a Personalidade de entroncamento mencionada.

Alerta de Chamada.

O campo [Alerta de chamada/operação da página na página 566](#) é definido como **Somente lista** ou **Ilimitado** para a Personalidade de entroncamento mencionada.

Status

A função [Ativação do alias de status na página 531](#) está habilitada para o Sistema de entroncamento atual.

Message

A função Mensagem está habilitada para o Sistema de entroncamento atual.

OBSERVAÇÃO:

As seleções disponíveis da Função do botão de um toque são dependentes do modelo/da opção.

10.36.9.3

Índice do botão Um toque

Este campo seleciona Índice do botão Um toque/Membro da lista de para você pressionar o botão Um toque ou selecionar o menu Um toque, pertencente à Função do botão Um toque selecionada.

Índice refere-se ao registro/linha real da lista determinado pela seleção da função do botão Um toque. Essa seleção se aplica ao Sistema de entroncamento atual.

**INFORMAÇÕES:**

O Botão 1 de entroncamento de Um toque – primeiro registro/linha – corresponderá ao pressionamento do botão 1 de Um toque e à seleção do menu TCH1 ou SIG1.

Acessado apenas: Quando o campo [Função do botão de um toque na página 535](#) do atual registro/linha não está definido como **Desativado**, e quando o rádio está habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Chamada privada

Este número de Índice correlaciona-se ao número da linha da Lista de prioridade de chamada Tipo II ou ASTRO 25.

**INFORMAÇÕES:**

A seleção [Lista de prioridades de chamada de entroncamento na página 566](#) determina qual Lista de prioridade de chamada será usada para a Personalidade de entroncamento mencionada.

Disponível para você quando [Tipo de chamada privada na página 565](#) não estiver **Desativado** e o campo [Operação de chamada privada na página 565](#) estiver definido como **Somente lista** ou **Ilimitado** para a Personalidade de entroncamento mencionada.

Alerta de Chamada.

Este número de Índice correlaciona-se ao número da linha da Lista de prioridade de chamada Tipo II ou ASTRO 25.

**INFORMAÇÕES:**

A Lista de prioridade de chamada de entroncamento especifica qual Lista de prioridade de chamada é usada para a Personalidade de entroncamento mencionada.

Disponível para você quando o campo [Alerta de chamada/operação da página na página 566](#) estiver definido como **Somente lista** ou **Ilimitado** para a Personalidade de entroncamento mencionada.

Phone

Este número de Índice correlaciona-se ao número da linha da Lista de prioridade de chamada telefônica.

Disponível para você quando o recurso [Operação do telefone na página 568](#) estiver definido como **Somente lista** ou **Ilimitado** para a Personalidade de entroncamento mencionada.

Status

Este número de Índice está correlacionado à posição/número da linha dos membros da Lista de alias de status.

Disponível para você quando o recurso [Ativação do alias de status na página 531](#) estiver **Ativado** para o Sistema de entroncamento atual.

Message

Este número de Índice está correlacionado à posição/número da linha dos membros da Lista de alias de mensagem.

Disponível para você quando o recurso de Mensagem estiver **Ativado** para o Sistema de entroncamento atual.

10.36.10

Digital (Sistema de Entroncamento ASTRO 25)

A seção **Digital** do conjunto Sistema de Entroncamento ASTRO 25 permite ao usuário visualizar ou definir funcionalidades de comunicação digital.

OBSERVAÇÃO:

Os Sistemas de entroncamento individuais são referidos como Personalidade de entroncamento. Então, essas configurações de sistemas de entroncamento poderão se tornar funcionais para todos os tipos de canal dessa personalidade de entroncamento.

10.36.10.1

Energia adaptável

Este campo permite que o rádio ajuste automaticamente o nível de energia do transmissor no canal de voz, não no canal de controle, com base na intensidade do sinal das informações de APA LC (Auto Power Adaptation Link Control, controle de link de adaptação de desligamento automático) recebidas via Over The Air.

Se a força do sinal for melhor que o limite aceitável, o rádio transmitirá em potência média em vez de potência total. Essa seleção se aplica ao Sistema de entroncamento atual.

OBSERVAÇÃO:

Se você pressionar o botão PTT uma segunda vez dentro de 30 segundos quando o APA estiver ativado para modo seguro F2 TDMA, o rádio transmite em potência média se o nível de potência atual estiver definido para alto. Se o tempo exceder 30 segundos, o nível de energia permanecerá alto.

Acessado apenas: Quando o campo Nível de Potência Tx [Nível de potência de TX na página 520](#) não estiver definido como **Baixo** e quando o rádio estiver habilitado para o modelo/a opção.

10.36.10.2

Duração do preâmbulo

Este campo seleciona um número que determina a quantidade de tempo que os pacotes de preâmbulo de sincronização de bits são enviados no início de todas as transmissões do canal de voz do ASTRO 25 para o sistema de entroncamento atual.

Esses pacotes permitem que os rádios transmissores e receptores se sincronizem entre si antes de uma transmissão do ASTRO 25.

OBSERVAÇÃO:

A duração do Preâmbulo é igual ao valor de Duração do preâmbulo multiplicado por 0,2083 ms.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

[Acima 253: Alcance](#)

Mínimo	Máximo
0	255

10.36.10.3

Tipo de modulador digital

Este campo seleciona o tipo de modulador digital para o sistema de entroncamento atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

C4FM (Padrão de fábrica para Entroncamento Tipo II)

Modulação de frequência do nível 4 contínua para operação que não é de difusão simultânea.

CQPSK (Padrão de fábrica para Entroncamento ASTRO 25)

Compatível com Modulação em Fase e em Quadratura para a operação de banda estreita de simulcast e operação não simulcast.

**INFORMAÇÕES:**

Essa seleção está disponível apenas para modelos de rádio equipados com Operação digital CAI (Common Air Interface, interface aérea comum).

TOTAL

Operação de difusão simultânea de banda larga.

**INFORMAÇÕES:**

Essa seleção não poderá ser escolhida se uma Largura de banda de 12,5 kHz for selecionada.

10.36.10.4

Limite BER de sincronização de quadros de TDMA

Este campo seleciona a BER (Bit Error Rate, taxa de erros de bits) de TDMA (Time Division Multiple Access, acesso múltiplo por divisão de tempo) tolerada por um rádio em um canal de voz TDMA X2 ou de Fase 2.

**OBSERVAÇÃO:**

A BER de TDMA é calculada durante a parte de sincronização de quadros de uma transmissão de voz por TDMA. Se uma BER maior do que esse valor máximo for detectada, o rádio tentará alternar para um site melhor, quando disponível. Essa seleção se aplica ao Sistema de entroncamento atual.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **ASTRO 25**, quando o campo [Capacitado para voz fase 2 na página 607](#) estiver **Ativado**, e quando o rádio estiver habilitado para o modelo/a opção.

Acima 254: Alcance

Mínimo	Máximo	Incrementos
Desabilitado	25,4%	0,1%

10.36.10.5

Limite BER NID/de sinc. de quadros de FDMA

Este campo seleciona a BER (Bit Error Rate, taxa de erro de bits) de sincronização de quadros/NID (Network ID, ID de rede) máxima permitida por FDMA (Frequency Division Multiple Access, acesso múltiplo por divisão de frequência) tolerada por um rádio em um site de entroncamento.

Esse valor máximo se aplica ao canal de controle e ao canal de voz. Se uma BER maior do que esse valor máximo for detectada, o rádio tentará alternar para um site melhor, quando disponível. Essa seleção se aplica ao Sistema de entroncamento atual.

Acessado apenas: Quando o campo [Tipo de cobertura na página 511](#) não está definido como **Desativado** e quando o rádio está habilitado para o modelo/para a opção.

Acima 255: Alcance

Mínimo	Máximo	Incrementos
Desabilitado	25,4%	0,1%

10.36.11

Proteger/Multitecla (Sistema de Entroncamento Tipo II)

A seção **Proteger/Multitecla** do conjunto Sistema de Entroncamento Tipo II permite ao usuário visualizar ou definir a funcionalidade de segurança e multitecla para comunicações de transmissão e recepção codificadas seguras. Esta funcionalidade pode ser personalizada todo o Sistema de Entroncamento .

**OBSERVAÇÃO:**

Os Sistemas de entroncamento individuais são referidos como Personalidade de entroncamento. Então, essas configurações de sistemas de entroncamento poderão se tornar funcionais para todos os tipos de canal dessa personalidade de entroncamento.

10.36.11.1

Padrão de Tx/Rx DES-XL

Este campo ativa apenas o DES-XL digital a ser usado para todas as chamadas de voz protegidas por criptografia.

DES-XL é um padrão de criptografia Tipo 3 (nível médio). Essa seleção se aplica ao Sistema de entroncamento atual.

Quando desabilitado, apenas o DES-OFB (Data Encryption Standard - Output Feedback) é usado para ligações de voz criptografadas seguras. DES-OFB é um padrão de criptografia Tipo 3 (nível médio).

**AVISO:**

Esse recurso só se aplica quando o rádio for equipado com um módulo de criptografia de algoritmo duplo DES-XL/DES-OFB.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** e o rádio for compatível com o modelo/a opção.

10.36.11.2

Seleção de chave de patch

Esse campo seleciona a chave de criptografia segura a ser usada durante comunicações de Grupo de conversação de patch enquanto opera no modo de criptografia segura.

Os Grupos de conversação de patch permitem que um despachador una vários grupos de conversação ou usuários para que todos possam se comunicar como um único grupo de conversação. Essa seleção se aplica ao Sistema de entroncamento atual.

**INFORMAÇÕES:**

Quando o campo [ASTRO OTAR na página 611](#) estiver **Ativado** para o Sistema de Entroncamento atual, o valor desta Seleção de Chave será escolhido na Lista de Referências de Chaves de criptografia Segura de Hardware do Perfil do KMF Seguro selecionado no campo [Índice de perfil ASTRO OTAR na página 612](#) para o Sistema de Entroncamento atual.

**AVISO:**

Esteja ciente de que ele está, na verdade, indicando as Chaves da Lista de chaves de criptografia para essa seleção. As Chaves individuais da Lista de referências de chave de criptografia segura de hardware fazem referência às chaves da Lista de chaves de criptografia do campo Referência de chaves de criptografia. Portanto, todas as chaves selecionadas quando o ASTRO OTAR estiver ativado deverão ser definidas primeiramente na Lista de referências de chave de criptografia segura de hardware.

Quando esse campo ASTRO OTAR estiver **Desativado** no atual Sistema de entroncamento, os valores de Seleção da chave de hardware do sistema de entroncamento será escolhido diretamente da Lista de chaves de criptografia da janela Segurança total.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** e o rádio for compatível com o modelo/a opção,

Ou quando o campo [Operação segura na página 294](#) estiver definido como **Software**, o campo Tipo de sistema estiver definido como **ASTRO 25** e o rádio for compatível com o modelo/a opção.

10.36.11.3

Proteger/remover ligação de failsoft

Este campo seleciona o tipo de ligação usada para Failsoft.

Quando o rádio está habilitado para o modelo/para a opção.

Selecionar

Permite ativar ou desativar as comunicações protegidas por criptografia.

OBSERVAÇÃO:

O pressionamento do botão Seleção de transmissão segura, a ativação/desativação da Seleção de transmissão segura ou a seleção do menu Proteger permite o acesso às comunicações por criptografia segura.

Apagar

Liga ou confirma o canal para a operação de comunicações Convencionais normais (não protegidas).

Proteger

Liga ou confirma o canal para operação com criptografia Segura.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**.

10.36.11.4

Seleção de chave de Failsoft

Esse campo seleciona a chave de criptografia segura a ser usada para o modo failsoft enquanto estiver operando no modo de criptografia segura.

Essa seleção se aplica ao Sistema de entroncamento atual.

INFORMAÇÕES:

Quando o campo [ASTRO OTAR na página 611](#) estiver **Ativado** para o Sistema de Entroncamento atual, o valor desta Seleção de Chave será escolhido na Lista de Referências de Chaves de criptografia Segura de Hardware do Perfil do KMF Seguro selecionado no campo [Índice de perfil ASTRO OTAR na página 612](#) para o Sistema de Entroncamento atual.

AVISO:

Esteja ciente de que ele está, na verdade, indicando as Chaves da lista de chaves de criptografia para essa seleção. As chaves individuais da lista de referências de chave de criptografia segura de hardware fazem referência às chaves da lista de Chaves de criptografia do campo Referência de chave de criptografia. Portanto, todas as chaves selecionadas quando o ASTRO OTAR estiver ativado deverão ser definidas primeiramente na Lista de referências de chave de criptografia segura de hardware.

Quando o campo ASTRO OTAR estiver **Desativado** no Sistema de entroncamento atual, o valor de Seleção desta chave será escolhido diretamente da Lista de chaves de criptografia da janela Segurança total.

Acessado apenas: Quando o rádio for compatível com o modelo/a opção e quando o campo [Operação segura na página 294](#) estiver definido como **Hardware**,

Quando o campo [Operação segura na página 294](#) estiver definido como **Software**, e quando o campo Tipo de sistema estiver definido como **ASTRO 25** e o campo Proteger/remover ligação de failsoft não estiver definido como **Limpar**

10.36.11.5

Proteger/remover ligação da chamada privada

Este campo seleciona o tipo de ligação usado para Chamada privada.

Quando o rádio está habilitado para o modelo/para a opção.

Selecionar

Permite ativar ou desativar as comunicações protegidas por criptografia.

OBSERVAÇÃO:

O pressionamento do botão Seleção de transmissão segura, a ativação/desativação da Seleção de transmissão segura ou a seleção do menu Proteger permite o acesso às comunicações por criptografia segura.

Apagar

Liga ou confirma o canal para a operação de comunicações Convencionais normais (não protegidas).

Proteger

Liga ou confirma o canal para operação com criptografia Segura.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**.

10.36.11.6

Seleção de chave de ligação privada

Este campo seleciona a chave de criptografia segura a ser usada para Chamada privada enquanto estiver operando no modo de criptografia segura.

Essa seleção se aplica ao Sistema de entroncamento atual. Quando o campo Índice de perfil ASTRO OTAR do Sistema de entroncamento atual estiver definido como **Ativado**, o valor para este campo será selecionado a partir da Lista de referências de chave de criptografia segura.

INFORMAÇÕES:

O aplicativo aponta para as Chaves da lista de chaves de criptografia desta seleção. As chaves individuais da Lista de referências de chave de criptografia segura referencia as chaves da Lista de chaves de criptografia do campo Referências de chave de criptografia. Portanto, as chaves devem ser definidas na Lista de referências de chave de criptografia segura antes que as chaves estejam disponíveis para seleção. Chaves retiradas do Perfil OTAR com campo de Lista de chaves independentes ativado estão disponíveis.

Quando o campo Índice de perfil ASTRO OTAR do Sistema de entroncamento atual estiver **Desativado**, o valor para esse campo será selecionado da Lista de chaves de criptografia na janela Segurança total.

Acessado apenas: Quando o rádio for compatível com o modelo/a opção e quando o campo [Operação segura na página 294](#) estiver definido como **Hardware**,

Ou quando o campo [Operação segura na página 294](#) estiver definido como **Software**, e quando o campo Tipo de sistema estiver definido como **ASTRO 25** e o campo Ligação privada Proteger/remover não estiver definido como **Hardware**

10.36.11.7

Proteger/remover ligação do Interconnect

Este campo seleciona o tipo de ligação usado para a Interconexão.

Quando o rádio está habilitado para o modelo/para a opção.

Selecionar

Permite ativar ou desativar as comunicações protegidas por criptografia.

**OBSERVAÇÃO:**

O pressionamento do botão Seleção de transmissão segura, a ativação/desativação da Seleção de transmissão segura ou a seleção do menu Proteger permite o acesso às comunicações por criptografia segura.

Apagar

Liga ou confirma o canal para a operação de comunicações Convencionais normais (não protegidas).

Proteger

Liga ou confirma o canal para operação com criptografia Segura.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**.

10.36.11.8

Seleção de chave de interconexão

Este campo seleciona a chave de criptografia segura a ser usada para uma chamada de interconexão (modo telefone) durante a operação no modo de criptografia segura.

Essa seleção se aplica ao Sistema de entroncamento atual.

**INFORMAÇÕES:**

Quando o campo Índice de perfil ASTRO OTAR estiver **Ativado** para o Sistema de entroncamento atual, esse valor de Seleção de chave será selecionado na Lista de referências de chave de criptografia segura do Perfil ASTRO OTAR selecionado no campo Índice de perfil ASTRO OTAR do Sistema de entroncamento atual.

**AVISO:**

Esteja ciente de que ele está, na verdade, indicando as Chaves da lista de chaves de criptografia para essa seleção. As chaves individuais da Lista de referências de chave de criptografia segura fazem referência às Chaves da lista de chaves de criptografia do campo Referência de chave de hardware. Portanto, todas as chaves selecionadas quando o Índice de Perfil ASTRO OTAR está ativado devem ser definidas primeiramente na Lista de Referências de Chaves de Criptografia Segura. Chaves retiradas do Perfil OTAR com campo de Lista de chaves independentes ativado estão disponíveis.

O aplicativo aponta para as Chaves da lista de chaves de criptografia desta seleção. As chaves individuais da Lista de referências de chave de criptografia segura referencia as chaves da Lista de chaves de criptografia do campo Referências de chave de criptografia. Portanto, as chaves devem ser definidas na Lista de referências de chave de criptografia segura antes que as chaves estejam disponíveis para seleção.

Quando o campo Índice de perfil ASTRO OTAR do Sistema de entroncamento atual estiver **Desativado**, o valor para esse campo será selecionado da Lista de chaves de criptografia na janela Segurança total.

Acessado apenas: Quando o rádio for compatível com o modelo/a opção e quando o campo [Operação segura na página 294](#) estiver definido como **Hardware**,

Quando o campo [Operação segura na página 294](#) estiver definido como **Software**, quando o campo Tipo de sistema estiver definido como **ASTRO 25**, e quando o campo Proteger/remover ligação de interconexão não estiver definido como **Hardware**

10.36.11.9

Proteger/Remover Ligação do Reagrupamento Dinâmico

Este campo seleciona o tipo de ligação usada para Reagrupamento dinâmico.

Quando o rádio está habilitado para o modelo/para a opção.

10.36.11.10

Seleção de chave de grupo de conversação dinâmico

Esse campo seleciona a chave de criptografia segura a ser usada para um Reagrupamento dinâmico (grupo de conversação dinâmico) durante a operação no modo de criptografia segura.

Essa seleção se aplica ao Sistema de entroncamento atual.

**INFORMAÇÕES:**

Quando o campo [ASTRO OTAR na página 611](#) estiver **Ativado** para o Sistema de Entroncamento atual, o valor desta Seleção de Chave será escolhido na Lista de Referências de Chaves de criptografia Segura de Hardware do Perfil do KMF Seguro selecionado no campo [Índice de perfil ASTRO OTAR na página 612](#) para o Sistema de Entroncamento atual.

**AVISO:**

Esteja ciente de que ele está, na verdade, indicando as Chaves da Lista de chaves de criptografia para essa seleção. As Chaves individuais da Lista de referências de chave de criptografia segura de hardware fazem referência às chaves da Lista de chaves de criptografia do campo Referência de chaves de criptografia. Portanto, todas as chaves selecionadas quando o ASTRO OTAR estiver ativado deverão ser definidas primeiramente na Lista de referências de chave de criptografia segura de hardware.

Quando o campo ASTRO OTAR estiver **Desativado** no Sistema de entroncamento atual, o valor de Seleção desta chave será escolhido diretamente da Lista de chaves de criptografia da janela Segurança total.

Acessado apenas: Quando o rádio for compatível com o modelo/a opção, quando o campo [Ativação do reagrupamento dinâmico na página 523](#) estiver **Ativado**, quando o campo de Operação segura estiver definido como **Hardware**,

Quando o [Operação segura na página 294](#) campo estiver definido como **Software**, quando o campo Tipo de sistema estiver definido como **ASTRO 25**, e quando o campo Proteger/Remover ligação do Reagrupamento dinâmico não estiver definido como **Hardware**

10.36.11.11

Seleção de Chave de AG Dinâmico

Este campo seleciona a chave de criptografia segura a ser usada para um Grupo de notificação dinâmico durante a operação no modo de criptografia segura.

Essa seleção se aplica ao Sistema de entroncamento atual.

**INFORMAÇÕES:**

Quando o **ASTRO OTAR na página 611** campo estiver **Ativado** para o sistema de entroncamento atual, este valor de seleção de chave é escolhido no [Lista de referências de chave de criptografia segura de hardware na página 315](#) Perfil de KMF seguro selecionado no campo [Índice de perfil ASTRO OTAR na página 612](#) para o sistema de entroncamento atual.

**AVISO:**

Esteja ciente de que ele está, na verdade, indicando as Chaves de [Lista de chaves de criptografia na página 310](#) nesta seleção. As Chaves individuais de [Lista de referências de chave de criptografia segura de hardware na página 315](#) referem-se às Chaves da lista de chaves de criptografia do campo [Referência de Chaves de Criptografia na página 316](#). Portanto, todas as chaves selecionadas quando o ASTRO OTAR estiver ativado deverão ser definidas primeiramente nas Referências de chaves de criptografia segura de hardware.

Quando o campo ASTRO OTAR estiver **Desativado** no Sistema de entroncamento atual, o valor de Seleção desta chave será escolhido diretamente da Lista de chaves de criptografia da janela Segurança total.

Acessado apenas: Quando o campo [Ativação do reagrupamento dinâmico na página 523](#) estiver ativado e o campo [Operação segura na página 294](#) estiver definido como **Hardware** e o campo Tipo de sistema estiver definido como **Tipo II** e o campo Proteger/remover ligação do Reagrupamento dinâmico estiver definido como **Tipo II** e o rádio for compatível com o modelo/a opção.

10.36.12

Grupo de Conversação (Sistema de Entroncamento Tipo II)

A seção **Grupo de Conversação** do conjunto Sistema de Entroncamento Tipo II permite ao usuário visualizar ou definir a funcionalidade de Grupo de Conversação individual para Sistemas de Entroncamento individuais. Um Grupo de conversação é um agrupamento de rádios definido pelo RadioCentral e criado com o objetivo de gerar comunicação frequente e eficiente entre rádios.

**OBSERVAÇÃO:**

As frequências do grupo de conversação são determinadas pelo Sistema de entroncamento em campo e não são configuradas no RadioCentral.

**OBSERVAÇÃO:**

As frequências de Failsoft de Personalidade de entroncamento devem ser configuradas no RadioCentral.

Após a definição, é possível atribuir um Grupo de conversação a um ou mais canais do Seletor de canais do rádio na [Atribuição de zonas e canais na página 666](#) e no campo Configurar grupo de conversação de entroncamento da Lista de canais.

O campo a seguir é suportado:

10.36.12.1

Talkgroup Name

Este campo permite definir nomes reconhecíveis para o grupo de conversação atual (registro/linha).

Essa seleção se aplica à personalidade de entroncamento atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

Exemplos: PerTG-001, #500, Electric1, # A5.

É possível usar caracteres, números, espaços e caracteres especiais.

Os espaços iniciais em branco são substituídos por sublinhados no visor do rádio.

Os pontos iniciais não aparecem no visor do rádio.

10.36.12.2

ID do grupo de conversação

Este campo permite inserir (em formato decimal ou hexadecimal) o número do grupo de conversação que identifica exclusivamente o grupo de conversação atual (registro/linha).

Essa seleção se aplica à personalidade de entroncamento atual.

Acessado apenas: Quando o Sistema de Entroncamento mencionado tiver ((um Arquivo de Teclas do Sistema de Software ou uma Chave Avançada de Sistema com acesso selecionado no campo ID do Sistema) ou, (uma Chave Avançada WACN com acesso selecionado no campo ID da WACN Doméstica)),

E quando o rádio for compatível com o modelo/a opção.

Acima 256: Alcance

Para o Tipo de protocolo	Desabilitado	Mínimo	Máximo
ASTRO 25	Nenhum	0001 hex	FFFE hex
Tipo II	Nenhum	001 hex	FFE hex

INFORMAÇÕES:

A faixa de seleção pode ser modificada de acordo com a chave avançada por meio do programa Administrador de chaves avançadas.

10.36.12.3

Tipo de voz/sinal de transmissão

Este campo seleciona o modo de sinalização de transmissão para o grupo de conversação atual (registro/linha).

Esta seleção se aplica à personalidade de entroncamento atual.

Acessado apenas: Digital é acessado somente quando o campo **Tipo de protocolo** está definido como **Tipo II** e quando o campo **Banda de frequência do tipo II na página 513** não está definido como **900 MHz**.

As seleções a seguir são compatíveis:

- Analógico
- Digital

10.36.12.4

Proteger/remover proteção

Este campo seleciona o modo de transmissão e recepção de criptografia segura para o grupo de conversação (registro/ linha) atual.

Essa seleção se aplica à Personalidade de entroncamento atual.

Acessado apenas: Quando o Sistema de Entroncamento referenciado tem ((um arquivo de Chaves do sistema de software ou uma Chave de sistema avançada com acesso selecionada no campo [ID do sistema na página 513](#)) ou (uma Chave WACN avançada com acesso selecionada no campo [ID da WACN doméstica na página 658](#))), quando o campo [Operação segura na página 294](#) está definido como **Hardware** ou **Software**, quando o campo [Tipo de protocolo](#) está definido como **ASTRO 25** e o rádio está habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Apagar

Liga ou confirma o canal como comunicações normais (não protegidas).

Selecionar

Permite ativar ou desativar o modo de criptografia segura. Você deve pressionar o botão Seleção de transmissão segura, ativar/desativar a chave [Seleção de Transmissão Segura na página 202](#) ou selecionar o menu Proteger para ativar ou desativar as comunicações protegidas por criptografia.

Proteger

Liga ou confirma o canal para comunicações de criptografia segura.

10.36.12.5

Seleção de chave

Esse campo seleciona a chave de criptografia segura a ser usada no modo de criptografia segura para o grupo de conversação atual (registro/linha).

Essa seleção se aplica ao grupo de conversação atual da Personalidade de entroncamento atual.

INFORMAÇÕES:

Quando o campo [Índice de perfil ASTRO OTAR na página 406](#) não está desabilitado para a Lista de grupos de conversação ASTRO atual, este valor de seleção de chave é escolhido a partir da [Lista de referências de chave de criptografia segura de hardware na página 315](#) do perfil KMF seguro selecionado no campo Índice de perfil KMF.

AVISO:

Esteja ciente que o RadioCentral está, na verdade, apontando para as chaves da [Lista de chaves de criptografia na página 310](#) para essa seleção. Chaves individuais da Lista de referências de chave de criptografia segura de hardware fazem referência às chaves da Lista de chaves de criptografia do campo [Referência de Chaves de Criptografia na página 316](#). Portanto, qualquer chave selecionada quando ASTRO OTAR estiver habilitado deve ser definida primeiro na Lista de referências de chave de criptografia segura de hardware.

Quando o campo Índice de perfil KMF estiver desabilitado ou não for aplicável (cinza) à Lista de grupos de conversação ASTRO, esse valor de seleção de chave será diretamente escolhido da Lista de chaves de criptografia segura.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software** e quando o campo [Privacidade de voz/Remover ligação na página 407](#) estiver definido como **Proteger** ou **Selecionar** e quando o modelo ou a opção do rádio for compatível.

10.36.12.6

Failsoft de grupo de conversação

Este campo ativa a operação de Failsoft para o grupo de conversação (registro/linha) atual.

Esta seleção se aplica ao [Personalidade de entroncamento](#) atual.

Acessado apenas: Quando o sistema de entroncamento mencionado tem um arquivo de chaves do sistema de software ou uma chave de sistema avançada com acesso selecionado no campo [ID do sistema na página 513](#) ou uma chave de WACN avançada com acesso selecionado no campo [ID da](#)

[WACN doméstica na página 658](#), quando o campo [Tipo de Failsoft na página 551](#) está definido como **Grupo de conversação** e quando o rádio está habilitado para o modelo/para a opção.

10.36.12.7

Frequência de recepção de Failsoft

Este campo permite inserir a frequência de recepção (Rx) de Failsoft para o grupo de conversação (registro/linha) atual.

Essa seleção se aplica à Personalidade de entroncamento atual.

AVISO:

As Limitações de frequência de entroncamento aplicadas a esta seleção são determinadas pela configuração desta Personalidade e pela banda de frequência do Sistema de Entroncamento mencionado.

Acessado apenas: Quando o Sistema de Entroncamento mencionado tem um Arquivo de chaves do sistema de software ou uma Chave de sistema avançada com acesso selecionada no campo [ID do sistema na página 513](#) ou uma Chave WACN avançada com acesso selecionada no campo [ID da WACN doméstica na página 658](#), quando o campo [Tipo de Failsoft na página 551](#) está definido como **Grupo de conversação**, quando o campo [Failsoft de grupo de conversação na página 546](#) está **Ativado** e o rádio está habilitado para o modelo/a opção.

10.36.12.8

Frequência de transmissão de Failsoft

Este campo permite inserir a frequência de transmissão (Tx) de Failsoft para o grupo de conversação (registro/linha) atual.

Esta seleção se aplica ao [Personalidade de entroncamento](#) atual.

AVISO:

As Limitações de frequência de entroncamento aplicadas a esta seleção são determinadas pela configuração desta Personalidade e pela banda de frequência do Sistema de Entroncamento mencionado.

Acessado apenas: Quando o Sistema de entroncamento mencionado tem um Arquivo de chaves do sistema de software ou uma Chave de sistema avançada com acesso selecionada no campo [ID do sistema na página 513](#) ou uma Chave WACN avançada com acesso selecionada no campo [ID da WACN doméstica](#), quando o campo [Tipo de Failsoft na página 551](#) está definido como **Grupo de conversação**, quando o campo [Failsoft de grupo de conversação na página 546](#) está **Ativado** e o rádio está habilitado para o modelo/a opção.

10.36.12.9

Failsoft secundário de grupo de conversação

Este campo ativa a operação de failsoft secundário para o grupo de conversação (registro/linha) atual.

Esta seleção se aplica à personalidade de entroncamento atual.

Acessado apenas: Quando o campo [Tipo de Failsoft na página 551](#) está definido como **Grupo de conversação**, quando o campo [Failsoft de grupo de conversação na página 546](#) está ativado e quando o rádio está habilitado para o modelo/para a opção.

10.36.12.10

Frequência de Rx de Failsoft secundário

Este campo permite inserir a frequência de recepção (Rx) de Failsoft secundária para o grupo de conversação (registro/linha) atual.

Esta seleção se aplica à personalidade de entroncamento atual.

**AVISO:**

As Limitações de frequência de entroncamento aplicadas a esta seleção são determinadas pela configuração [Tipo de protocolo](#) desta personalidade e pela banda de frequência do [Sistema de entroncamento](#) mencionado.

Acessado apenas: Quando o campo [Tipo de Failsoft na página 551](#) está definido como **Grupo de conversação**, quando o campo [Failsoft de grupo de conversação na página 546](#) está **Ativado**, quando o campo [Failsoft secundário de grupo de conversação na página 547](#) está **Ativado** e quando o rádio está habilitado para o modelo/para a opção.

10.36.12.11

Frequência de transmissão de Failsoft secundário

Este campo permite inserir a frequência de Tx (transmit, transmissão) do Failsoft secundário para o grupo de conversação (registro/linha) atual.

Esta seleção se aplica à personalidade de entroncamento atual.

**INFORMAÇÕES:**

As limitações de frequência de entroncamento aplicadas a essa seleção são determinadas pela configuração [Tipo de protocolo](#) desta personalidade e pela banda de frequência do [Sistema de entroncamento](#) mencionado.

Acessado apenas: Quando o campo [Tipo de Failsoft na página 551](#) está definido como **Grupo de conversação**, quando o campo [Failsoft de grupo de conversação na página 546](#) está **Ativado**, quando o campo [Failsoft secundário de grupo de conversação na página 547](#) está **Ativado** e quando o rádio está habilitado para o modelo/para a opção.

10.37

Personalidade de entroncamento tipo II

O conjunto **Personalidade de entroncamento tipo II** permite que o usuário crie e apague Personalidades de entroncamento, bem como defina Personalidades de entroncamento individuais. Entroncamento e Convencional são os dois modos de comunicação de rádio.

**OBSERVAÇÃO:**

Os Sistemas de entroncamento são referidos a Personalidades de entroncamento. As configurações do Sistema de entroncamento poderão se tornar funcionais para todos os tipos de Entroncamento — canais.

Quando os recursos de Personalidade de entroncamento tiverem sido exclusivamente definidos, cada Personalidade poderá ter sido atribuída à posição desejada do seletor de canais do rádio com o recurso [Atribuição de zonas e canais](#).

10.37.1

Geral (Personalidade de Entroncamento Tipo II)

A seção **Geral** do conjunto Personalidade de Entroncamento do Tipo II permite ao usuário visualizar ou definir funcionalidades básicas para Personalidades de Entroncamento individuais.

**OBSERVAÇÃO:**

Quando os recursos de personalidade de entroncamento tiverem sido exclusivamente definidos, cada personalidade poderá ser atribuída à posição desejada do seletor de canais do rádio com o uso do recurso [Atribuição de zonas e canais](#).

10.37.1.1

Nome da Personalidade de entroncamento

Este campo permite definir um nome reconhecível para a Personalidade de entroncamento atual.

**OBSERVAÇÃO:**

Quando os recursos de Personalidade de entroncamento tiverem sido exclusivamente definidos, cada Personalidade poderá ter sido atribuída à posição desejada do seletor de canais do rádio com o recurso Atribuição de zonas e canais. Esse nome é usado para selecionar a personalidade atual na página Canais dessa função.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

**OBSERVAÇÃO:**

Exemplos: Personality-01, #500, Electric1, # A5

É possível usar caracteres, números, espaços e caracteres especiais.

Os espaços iniciais em branco são substituídos por sublinhados no visor do rádio.

Os pontos iniciais não aparecem no visor do rádio.

10.37.1.2

Sistema

Este campo seleciona o Sistema de entroncamento programado para a Personalidade de entroncamento atual.

**INFORMAÇÕES:**

Só devem ser selecionados Sistemas de entroncamento que têm um tipo de sistema que corresponde ao tipo de protocolo das personalidades atuais.

Somente os sistemas de entroncamento com arquivos de chaves do sistema de software ou chaves (de hardware) avançadas que não tenham campo ou proteção de função (acesso ilimitado) podem ser selecionados; caso contrário, o campo será marcado como inválido.

Quando o valor do campo é marcado como inválido, os campos protegidos por chave de sistema na Personalidade de entroncamento atual são mostrados como somente leitura.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.37.1.3

Contador de tempo limite

Este campo seleciona o tempo durante o qual o rádio pode transmitir de maneira contínua para a Personalidade de entroncamento atual.

Quando o tempo estiver prestes a expirar, o rádio emitirá um tom de alerta e interromperá a transmissão automaticamente. O tempo é medido em segundos.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

**OBSERVAÇÃO:**

Quando definido como **Infinito**:

Nenhum contador usado para rádios APX Next e APX N70, portanto o tempo de conversação é infinito.

Acima 257: Alcance

Tipo de rádio	Mínimo	Máximo	Incrementos
Rádios não APX4000XH	15 s	465 s	15 s

Tipo de rádio	Mínimo	Máximo	Incrementos
Rádios APX4000XH	15 s	60 s	15 s

Acima 258: Alcance

Tipo de rádio	Mínimo	Máximo	Incrementos
APX NEXT	0 s	465 s	15 s

10.37.1.4

AGC de RF avançado

Este campo seleciona o tipo de AGC (Automatic Gain Control, controle de ganho automático) da RF (Receive Frequency, frequência de recebimento) para a Personalidade de entroncamento atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Desabilitado

Mesmo quando **Desativado**, o rádio utiliza uma forma básica de AGC embutida no receptor do rádio. Essa proteção integrada ajuda a evitar limitação de sinal e saturação do receptor, o que pode danificar os componentes do rádio.

Padrão

Permite uma forma avançada de AGC de RF, que tenta proteger contra interferência de intermodulação (IM) por meio da detecção e da remoção de qualquer interferência recebida em razão de fontes externas.

Aprimorado

Possibilita que o rádio utilize outros esquemas para reduzir a interferência de IM, limpando o sinal.

Inteligente

Permite que o rádio use um esquema exclusivo para melhorar a imunidade à interferência quando próximo às estações base de difusão simultânea linear e de fase 2 APCO. A opção SMART é mutuamente exclusiva da caixa de seleção proteção de banda larga.

INFORMAÇÕES:

O AGC de RF avançado **Padrão** e **Aprimorado** pode prejudicar o desempenho dos canais que não sofrem interferência de IM. Por isso, só ative essas seleções nos canais que sabidamente apresentam interferência de IM.

10.37.1.5

Proteção da banda larga

Este campo permite habilitar a Proteção da banda larga para a Personalidade de entroncamento atual.

A proteção da banda larga aprimora o AGC de RF avançado adicionando um filtro de banda larga de alta seletividade ao receber em frequências selecionadas dentro das bandas de 700 MHz e 800 MHz.

10.37.1.6

Tipo de conversação

Este campo seleciona o modo de comunicação para a Personalidade de entroncamento atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Message

O sistema atribui um canal de tráfego para a duração de uma única transmissão feita por um rádio. Quando o rádio é desativado, todos os rádios permanecem no canal de tráfego até o tempo de desconexão do canal de tráfego expirar. Quando o tempo de desconexão expirar, os rádios retornarão para o canal de controle. Qualquer rádio envolvido na chamada pode ser ativado enquanto está no canal de tráfego, sem retornar ao canal de controle. O entroncamento de mensagem está disponível nos sistemas de canal de controle de 3600 bauds.

**AVISO:**

O entroncamento de mensagem não é compatível com Sistemas ASTRO 25.

Transmissão

O sistema atribui um canal de tráfego para a duração de uma única transmissão feita por um rádio. Quando o rádio é desativado, o canal de tráfego é anulado, e todos os rádios envolvidos na chamada retornam ao canal de controle. Qualquer solicitação de canal de tráfego subsequente é enviada no canal de controle pelo rádio solicitante.

ID do PTT

O sistema atribui um canal de tráfego pelo tempo que durar uma conversa inteira como descrito a seguir. Depois que o rádio é desativado, o canal de voz permanece ativo (tempo de desconexão), e os rádios permanecem inativos no canal de voz. Qualquer rádio que responder durante esse tempo de desconexão primeiro irá ativar o canal de controle para enviar uma mensagem com o ID de PTT (ID de unidade) da unidade, indicando que o rádio quer enviar áudio para a chamada; em seguida, o sistema envia uma mensagem de concessão direcionando o rádio de volta para o mesmo canal de voz que atua como a nova origem.

10.37.1.7

Tipo de Failsoft

Este campo seleciona o tipo de Failsoft para a Personalidade de entroncamento atual.

**OBSERVAÇÃO:**

O Failsoft oferece a operação no modo convencional bidirecional durante a falha do Sistema de entroncamento. O rádio volta automaticamente para o modo Entroncado após a restauração do Sistema de entroncamento.

Acessado apenas: Quando o Sistema de entroncamento mencionado tem um Arquivo de chave do sistema de software ou uma Chave de sistema avançada com acesso é selecionada no campo ID do sistema ou uma Chave avançada WACN com acesso é selecionada no campo ID da WACN doméstica e quando o rádio for compatível com o modelo/a opção do rádio.

As seleções a seguir são compatíveis:

Seleções	Definições	Disponível quando	
		Tipo de protocolo é igual a	Tipo de cobertura é igual a
Desabilitado	Nenhum Failsoft usado.	Qualquer	Qualquer

10.37.1.8

Frequência de Failsoft de recepção por personalidade

Este campo seleciona a frequência de recepção (Rx) a ser usada durante a operação de Failsoft de SmartNet para a Personalidade de entroncamento atual.

Isso só é válido para a operação de SmartNet (consulte Tipo de cobertura).

**INFORMAÇÕES:**

Quando o tipo de cobertura é igual a **SmartZone**, as frequências de Failsoft de personalidade não são usadas. O Failsoft é realizado nos Canais de controle definidos na Lista de canais de controle do sistema de entroncamento referenciado.

Acessado apenas:

Quando o Sistema de entroncamento mencionado tem um Arquivo de chave do sistema de software ou uma Chave de sistema avançada com acesso selecionada no campo ID do sistema, e

Quando o campo Tipo de cobertura do Sistema de Entroncamento referenciado está definido como **Desativado**, quando o campo Tipo de protocolo está definido como **Tipo II**, quando o campo Tipo de Failsoft está definido como **Personalidade** e o rádio está habilitado para o modelo/a opção.

10.37.1.9

Frequência de Failsoft de transmissão por personalidade

Este campo seleciona a frequência de Tx (Transmit, transmissão) a ser usada durante a operação de Failsoft de SmartNet da Personalidade de entroncamento atual.

Isso só é válido para a operação de SmartNet (consulte Tipo de cobertura).

**INFORMAÇÕES:**

No Tipo de cobertura igual a **SmartZone**, as frequências de Failsoft de personalidade não são usadas. A tentativa de Failsoft é realizada em Canais de controle definidos na lista de Canais de controle do Sistema de entroncamento mencionado.

Acessado apenas:

Quando o Sistema de entroncamento mencionado tem um Arquivo de chave do sistema de software ou uma Chave de sistema avançada com acesso selecionada no campo ID do sistema, e

Quando o campo Tipo de cobertura do Sistema de Entroncamento referenciado está definido como **Desativado**, quando o campo Tipo de protocolo está definido como **Tipo II**, quando o campo Tipo de Failsoft está definido como **Personalidade** e o rádio está habilitado para o modelo/a opção.

10.37.1.10

Failsoft secundário por personalidade

Este campo ativa a seleção das frequências secundárias de Transmissão (Tx) e Recepção (Rx) a serem usadas durante a operação de Failsoft de SmartNet para a Personalidade de entroncamento atual.

Isso só é válido para a operação de SmartNet (consulte [Tipo de cobertura na página 511](#)).

INFORMAÇÕES:

Quando [Tipo de cobertura na página 511](#) é igual a SmartZone, as Frequências de Failsoft de personalidade não são usadas. O Failsoft é realizado nos Canais de controle definidos na Lista de [Canais de Controle](#) do [Sistema de entroncamento](#) referenciado.

Acessado apenas: quando o campo [Tipo de cobertura na página 511](#) do Sistema de entroncamento referenciado está definido como **Desativado**, quando o campo [Tipo de protocolo](#) está definido como **Tipo II**, quando o campo Tipo de Failsoft está definido como **Personalidade** e o rádio for compatível com o modelo/a opção.

10.37.1.11

Frequência de Failsoft de recepção secundária por personalidade

Este campo seleciona a frequência de recepção (Rx) secundária a ser usada durante a operação de Failsoft de SmartNet para a Personalidade de entroncamento atual.

Isso só é válido para a operação de SmartNet (consulte [Tipo de cobertura](#)).

INFORMAÇÕES:

Quando o tipo de cobertura é igual a SmartZone, as frequências de Failsoft de personalidade não são usadas. O Failsoft é realizado nos Canais de controle definidos na Lista de canais de controle do sistema de entroncamento referenciado.

Acessado apenas: Quando o campo Tipo de cobertura do Sistema de Entroncamento referenciado está definido como **Desativado**, quando o campo Tipo de protocolo está definido como **Tipo II**, quando o campo Tipo de Failsoft está definido como **Personalidade**, o campo Failsoft secundário está ativado e o rádio está habilitado para o modelo/a opção.

10.37.1.12

Frequência de Failsoft de transmissão secundária por personalidade

Este campo seleciona a frequência de transmissão (Tx) secundária a ser usada durante a operação de Failsoft de SmartNet para a Personalidade de entroncamento atual.

Isso só é válido para a operação de SmartNet (consulte [Tipo de cobertura na página 511](#)).

INFORMAÇÕES:

Quando o tipo de cobertura é igual a SmartZone, as frequências de Failsoft de personalidade não são usadas. O Failsoft é realizado nos Canais de controle definidos na Lista de canais de controle do sistema de entroncamento referenciado.

Acessado apenas: Quando o campo Tipo de cobertura do Sistema de Entroncamento referenciado está definido como **Desativado**, quando o campo Tipo de protocolo está definido como **Tipo II**, quando o campo Tipo de Failsoft está definido como **Personalidade**, o campo Failsoft secundário está ativado e o rádio está habilitado para o modelo/a opção.

10.37.1.13

Modo de transmissão

Este campo seleciona se a personalidade ou o canal terá a funcionalidade de transmissão completa ou se restringirá a transmitir comunicações de voz do Grupo de conversação (TG) e do Grupo de notificação (AG).

Essa seleção se aplica à Personalidade de entroncamento atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Irrestrito

Nenhum limite é colocado na funcionalidade de transmissão.

TG/AG desativados (somente escuta)

O rádio não consegue transmitir no TG ou AG selecionado. Consulte o campo Grupo de conversação de entroncamento. O rádio pode receber transmissões de voz no modo selecionado do canal.

AVISO:

O Reagrupamento dinâmico não é compatível com essa seleção.

Essa [Seleção de perfil de emergência na página 555](#) da Personalidade deve ser definida como **Transmissão de emergência desativada** ou o Perfil selecionado deve ter seu campo [Talkback de emergência na página 346](#) definido como **Reverter**; do contrário, a seleção do campo Perfil de emergência será considerada inválida.

Essa Lista de varredura mencionada da Personalidade não deve ter seu campo [Tipo de membro de transmissão de voz designado na página 686](#) definido como **Canal selecionado**, o que significa esse canal; do contrário, a [Seleção da lista de varredura na página 568](#) se tornará inválida.

O [Teclado direto \(DTMF\) na página 571](#) não é possível com essa seleção.

10.37.1.14

Seleção de perfil de emergência

Este campo seleciona o Perfil de emergência de entroncamento a ser usado com a Personalidade de entroncamento atual.

Você pode iniciar a funcionalidade do modo de Emergência ou iniciá-lo com um rádio programado

AVISO:

Quando o campo [Modo de transmissão na página 554](#) estiver definido como **TG/AG Desativados** (Modo somente escuta) para a Personalidade de entroncamento atual, essa seleção de Perfil deverá ser **Transmissão de emergência desativada** ou o Perfil selecionado deverá ter seu campo [Talkback de emergência na página 346](#) definido como **Reverter**; caso contrário, o RM considerará essa seleção inválida.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

- Transmissão de emergência desativada
- Perfis de Emergência de Entroncamento Disponíveis

10.37.1.15

Tipo de reversão de emergência

Este campo seleciona o tipo de reversão de emergência **Não tática** a ser usada durante a operação no modo de emergência na Personalidade de entroncamento atual.

Consulte também [Talkback de emergência na página 346](#).

AVISO:

Você pode iniciar a funcionalidade no Modo de emergência ou iniciá-la com um rádio programado.

Acessado apenas: Quando a função estendida **Reversão múltipla de emergência** for mostrada no campo Nome do recurso estendido, quando um Perfil de emergência de entroncamento mencionado for selecionado para a Personalidade de entroncamento atual, quando esse Perfil de emergência de entroncamento tiver um campo Resposta de emergência definido como **Reverter** e quando o rádio for compatível com o modelo/a opção.

As seleções a seguir são compatíveis:

Reversão do grupo de conversação

O rádio utiliza a ID do grupo de conversação de reversão de resposta de emergência definida para a Personalidade de entroncamento atual para transmitir Alarmes de emergência e/ou Chamadas de emergência.

Reversão do sistema

O rádio usa [Zona de reversão do sistema de emergência na página 558](#) e [Canal de reversão do sistema de emergência na página 559](#) para transmitir Alarme de emergência e/ou Chamada de emergência. As transmissões de Emergência também são enviadas para o console do emissor.

AVISO:

O Reagrupamento dinâmico não é compatível com essa seleção.

10.37.1.16

ID do grupo de conversação da reversão de talkback de emergência

Esse campo permite inserir em formato decimal ou hexadecimal o número do grupo de conversação que identifica exclusivamente o grupo de conversação atual (registro/linha).

Essa seleção se aplica à [Personalidade de entroncamento](#) atual.

Acessado apenas: Quando o Sistema de entroncamento mencionado tiver um Arquivo de chaves do sistema de software ou uma Chave de sistema avançada com acesso selecionado no campo [ID do sistema na página 513](#) ou uma Chave WACN avançada com acesso selecionada no campo [ID da WACN doméstica na página 658](#) e quando o rádio for compatível com o modelo/a opção.

Acima 259: Alcance

Para o tipo de protocolo:	Desabilitado	Mínimo	Máximo
ASTRO 25	Nenhuma	0001 (Hex)	FFFE (Hex)
Tipo II	Nenhuma	001 (Hex)	FFE (Hex)

INFORMAÇÕES:

A faixa de seleção pode ser modificada de acordo com a chave avançada por meio do programa Administrador de chaves avançadas.

10.37.1.17

Tipo de voz/sinal de reversão de talkback de emergência

Esse campo seleciona o modo de transmissão de sinalização ao operar no modo Emergência para o Grupo de conversação da reversão de resposta de emergência.

Essa seleção se aplica à Personalidade de entroncamento atual.

Acessado apenas: Digital só será acessado quando o campo Tipo de protocolo estiver definido como **Tipo II** e a banda de frequência do Tipo II não for **900 MHz**

As seleções a seguir são compatíveis:

Analógico

Não é possível para o Entroncamento ASTRO 25

Digital

10.37.1.18

Reversão de talkback de emergência Proteger/Limpar chamada

Esse campo seleciona o modo de transmissão ao operar no modo Emergência para o Grupo de conversação da reversão de resposta de emergência.

Essa seleção se aplica à Personalidade de entroncamento atual.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software** e quando o campo Tipo de protocolo estiver definido como **ASTRO 25**.

As seleções a seguir são compatíveis:

Apagar

Vincula ou aloca o grupo de conversação/canal à operação de entroncamento regular (não segura).

Selecionar

Permite que você ative ou desative a operação de criptografia segura para o grupo de conversação atual. Ao pressionar o botão Seleção de Tx segura, ativar/desativar a chave [Seleção de Transmissão Segura na página 202](#) ou selecionar o menu Proteger, você poderá ativar ou desativar as comunicações protegidas por criptografia.

Proteger

Liga ou confirma o grupo de conversação para a operação com criptografia segura.

10.37.1.19

Seleção de chave de reversão de talkback de emergência

Esse campo seleciona a chave de criptografia segura usada ao operar no modo de emergência para o Grupo de conversação da reversão de resposta de emergência.

Essa seleção se aplica à Personalidade de entroncamento atual.

INFORMAÇÕES:

Quando o campo [Índice de perfil ASTRO OTAR na página 612](#) estiver **Ativado** para o Sistema de entroncamento mencionado, o valor dessa Seleção de chave será escolhido na Lista de referências de chave de criptografia segura do Perfil ASTRO OTAR selecionado no campo Índice do perfil ASTRO OTAR do Sistema de entroncamento mencionado.

AVISO:

Esteja ciente de que ele está, na verdade, indicando as chaves da Lista de chaves de criptografia para essa seleção. As chaves individuais da Lista de referências de chave de criptografia segura fazem alusão às chaves da Lista de chaves de criptografia do campo Referência de chave de criptografia. Portanto, todas as chaves selecionadas quando o campo Índice de perfil ASTRO OTAR está ativado devem ser definidas primeiramente na Lista de referências de chaves de criptografia segura. Chaves retiradas do Perfil OTAR com campo de Lista de chaves independentes ativado estão disponíveis.

Quando o campo Índice do perfil ASTRO OTAR estiver **Desativado** no Sistema de entroncamento mencionado, o valor dessa Seleção de chave será escolhido diretamente na Lista de chaves de criptografia da janela Segurança total.

AVISO:

Quando existir uma correspondência entre o ID do grupo de conversação normal que está sendo utilizado por outros rádios e pelo ID do grupo de conversação de reversão de talkback de emergência do rádio, e...

quando não existe uma correspondência entre a Chave de grupo de conversação que está sendo utilizada por outros rádios e essa Chave de grupo de conversação de reversão de emergência...

As seguintes afirmações valem:

- Quando o rádio alternar para seu ID do grupo de conversação de reversão de talkback de emergência usando essa chave, a transmissão de emergência desse rádio não será ouvida pelos outros rádios.
- Entretanto, a transmissão de emergência pode ser captada pela varredura, mesmo quando não existe uma correspondência de chave.

Acessado apenas: Quando o campo [Reversão de talkback de emergência Proteger/Limpar chamada na página 557](#) de resposta de emergência estiver definido como **Proteger** ou **Selecionar** e

Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**, quando o campo Tipo de protocolo estiver definido como **ASTRO 25** e quando o rádio for compatível com o modelo/a opção.

10.37.1.20

Zona de reversão do sistema de emergência

Este campo seleciona uma zona a ser usada durante uma transmissão no modo de emergência.

Essa seleção se aplica à Personalidade de entroncamento atual.

OBSERVAÇÃO:

Apenas após a seleção desta zona é que o [Canal de reversão do sistema de emergência na página 559](#) pode ser selecionado.

As zonas e os canais devem ser previamente definidos na janela Atribuição de zonas e canais.

AVISO:

Só é possível selecionar Zonas não dinâmicas, ou seja, zonas com a opção Zona dinâmica ativada **Desativada**; caso contrário, esse campo se tornará inválido.

Acessado apenas: Quando o Recurso estendido **Reversão múltipla de emergência** é exibido no campo Nome do recurso estendido, quando um Perfil de emergência de entroncamento mencionado válido é selecionado para a Personalidade de entroncamento atual, quando esse Perfil de emergência de entroncamento com o campo [Talkback de emergência na página 346](#) definido como **Reverter**, quando o campo [Tipo de reversão de emergência na página 555](#) é definido como **Reversão do sistema** e quando o rádio for compatível com o modelo/a opção.

10.37.1.21

Canal de reversão do sistema de emergência

Este campo seleciona um canal de Entroncamento ou Convencional que é usado durante uma transmissão no modo de emergência.

Essa seleção se aplica à Personalidade de entroncamento atual.

OBSERVAÇÃO:

A [Zona de reversão do sistema de emergência na página 558](#) deve ser selecionada antes da seleção deste canal.

As zonas e os canais devem ser previamente definidos na janela Atribuição de zonas e canais.

AVISO:

Para codeplugs portáteis APX™ 3000, somente os primeiros 48 canais na [Zona de reversão do sistema de emergência na página 558](#) selecionada são considerados seleções válidas.

Essa seleção de Canal de reversão do sistema de emergência só é considerada válida: quando o campo [Grupo de conversação de entroncamento na página 670](#) da Personalidade de entroncamento/canal selecionado não está definido como **DYN** ou **ATG**, quando o campo [Receber Somente Personalidade na página 423](#) da Personalidade convencional/canal selecionado está **Desativado**, quando o campo ID do Grupo de conversação do ASTRO da Personalidade convencional/canal selecionado não está definido como **DYN** ou **ATG**, quando o campo [Modo de transmissão na página 554](#) para a Personalidade de entroncamento/canal selecionado não está definido como **TG/AG desativados (Modo somente escuta)** e quando o [Seleção de perfil de emergência na página 555](#) do canal selecionado não está como **Transmissão de emergência desativada**.

Acessado apenas: Quando o recurso estendido **Reversão múltipla de emergência** aparece no campo Nome do recurso estendido, quando um Perfil de emergência de entroncamento mencionado é selecionado para a Personalidade de entroncamento atual, quando esse Perfil de emergência de entroncamento tem um campo [Talkback de emergência na página 346](#) definido como **Reverter**, quando o campo [Tipo de reversão de emergência na página 555](#) está definido como **Reversão do sistema**, quando o campo [Zona de reversão do sistema de emergência na página 558](#) não está definido como Zona dinâmica e quando o rádio for compatível com o modelo/a opção.

10.37.2

Grupo de notificação (Personalidade de Entroncamento Tipo II)

A seção **Grupo de notificação** da Personalidade de Entroncamento Tipo II permite ao usuário visualizar e definir os parâmetros do Grupo de notificação das Personalidades de entroncamento individuais. Os Grupos de Notificação permitem que o usuário do rádio inicie e se comunique em

um grande canal de comunicação constituído de todos os Grupos de Conversação definidos para a Personalidade de Entroncamento atual.

OBSERVAÇÃO:

Um ATG (Announcement Group, grupo de notificação) deve ser selecionado para a Personalidade de entroncamento no campo [Atribuição de zonas e canais na página 666](#) e Grupo de conversação de entroncamento do conjunto de listas de canais. A seleção de ATG permite que um canal seja especificamente designado para os propósitos do Grupo de notificação.

Quando os recursos de personalidade de entroncamento tiverem sido exclusivamente definidos, cada personalidade poderá ser atribuída à posição desejada do seletor de canais do rádio com o uso do recurso Atribuição de zonas e canais.

10.37.2.1

Grupo de notificação

Esse campo permite inserir em formato decimal ou hexadecimal, o ID que definirá com exclusividade o grupo de notificação para a Personalidade de entroncamento.

OBSERVAÇÃO:

Os Grupos de notificação permitem que o usuário do rádio inicie e se comunique em um grande canal de comunicação composto por todos os grupos de conversação definidos para a Personalidade de entroncamento atual.

AVISO:

O ATG (Announcement Group, grupo de notificação) deve ser selecionado para a Personalidade de entroncamento no campo [Grupo de conversação de entroncamento na página 670](#) da página Canais de atribuição de zonas e canais. A seleção de ATG permite que um canal seja especificamente designado para os propósitos do Grupo de notificação.

A Personalidade é selecionada no campo [Personalidade na página 669](#) da página Canais de atribuição de zonas e canais.

Acessado apenas: Quando o Sistema de entroncamento mencionado tiver um Arquivo de chaves do sistema de software ou uma Chave de sistema avançada com acesso selecionado no campo [ID do sistema na página 513](#) ou uma Chave WACN avançada com acesso selecionada no campo [ID da WACN doméstica na página 658](#) e quando o rádio for compatível com o modelo/a opção.

Acima 260: Alcance

Para Tipo de protocolo	Desabilitado	Mínimo	Máximo
ASTRO 25	Nenhuma	0001 (Hex)	FFFE (Hex)
Tipo II	Nenhuma	001 (Hex)	FFE (Hex)

INFORMAÇÕES:

A faixa de seleção pode ser modificada de acordo com a chave avançada por meio do programa Administrador de chaves avançadas.

10.37.2.2

Tipo de voz/sinal de AG

Esse campo seleciona o modo de transmissão e recepção do Grupo de notificação da Personalidade de entroncamento atual.

Os Grupos de notificação permitem que o usuário do rádio inicie e se comunique em um grande canal de comunicação composto por todos os grupos de conversação definidos para a Personalidade de entroncamento atual.

Acessado apenas: Digital será acessado somente quando o campo Tipo de protocolo estiver definido como **Tipo II**, quando a banda de frequência do Tipo II não for **900 MHz** e quando o campo Grupo de notificação não estiver definido como **Nenhum**.

As seleções a seguir são compatíveis:

- Analógico
- Digital

10.37.2.3

Proteger/remover chamada de AG

Esse campo seleciona o modo de transmissão e de recepção do Grupo de notificação da Personalidade de entroncamento atual.

Acessado apenas: Quando o campo [Grupo de notificação na página 560](#) não estiver definido como **Nenhum** e quando o rádio for compatível com o modelo/a opção,

e

Quando o campo [Operação segura na página 294](#) precisar ser definido como **Hardware**, quando o campo [Tipo de voz/sinal de AG na página 560](#) estiver definido como **Digital** e quando a largura de banda de canal do Sistema de entroncamento mencionado não estiver definida como **12,5 kHz**,

Ou

Quando o campo Tipo de protocolo estiver definido como **ASTRO 25** e quando o campo [Operação segura na página 294](#) precisar ser definido como **Hardware** ou **Software**.

As seleções a seguir são compatíveis:

Apagar

Liga ou confirma o canal como Comunicações de entroncamento normal (não seguro).

Selecionar

Permite ativar ou desativar o modo de criptografia segura.

Você precisa pressionar o botão Seleção de Tx segura, ativar/desativar a chave [Seleção de Transmissão Segura na página 202](#) ou selecionar o menu Proteger para ativar ou desativar as comunicações protegidas por criptografia.

Proteger

Liga ou confirma o canal para o modo de criptografia segura.

10.37.2.4

Seleção de chave de AG

Esse campo seleciona a chave de criptografia segura que será usada no Grupo de notificação da Personalidade de entroncamento atual.

Essa seleção se aplica durante a operação no modo de criptografia segura.

INFORMAÇÕES:

Quando o campo [ASTRO OTAR na página 611](#) estiver **Ativado** para o Sistema de entroncamento mencionado, o valor dessa Seleção de chave será escolhido na Lista de referências de chave de criptografia segura do Perfil ASTRO OTAR selecionado no campo [Índice de perfil ASTRO OTAR na página 612](#) do Sistema de entroncamento mencionado.

AVISO:

Esteja ciente de que ele está, na verdade, indicando as chaves da Lista de chaves de criptografia para essa seleção. As chaves individuais da Lista de referências de chave de criptografia segura fazem alusão às chaves da Lista de chaves de criptografia do campo [Referência de Chaves de Criptografia na página 316](#). Portanto, todas as chaves selecionadas quando o ASTRO OTAR está ativado devem ser definidas primeiramente na Lista de referências de chaves de criptografia segura. Chaves retiradas do Perfil ASTRO OTAR com campo Lista de chaves independentes ativado estão disponíveis.

Quando o campo ASTRO OTAR estiver **Desativado** no Sistema de entroncamento mencionado, o valor dessa Seleção de chave será escolhido diretamente na Lista de chaves de criptografia da janela Segurança total.

Acessado apenas: Quando o campo [Proteger/remover chamada de AG na página 561](#) não estiver definido como **Limpo**, quando o campo [Grupo de notificação na página 560](#) não estiver definido como **Nenhum** e quando o rádio for compatível com o modelo/a opção,

e

Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** e quando o campo [Tipo de voz/sinal de AG na página 560](#) estiver definido como **Digital**,

Ou

Quando o campo Operação segura estiver definido como **Hardware**, quando o campo Tipo de voz/sinal de AG estiver definido como **Analógico** e quando a largura de banda de canal do Sistema de entroncamento mencionado não estiver definida como **12,5 kHz**,

Ou

quando o campo Tipo de protocolo estiver definido como **ASTRO 25** e quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**.

10.37.2.5

Failsoft de grupo de notificação

Esse campo habilita o Failsoft para o Grupo de notificação da Personalidade de entroncamento atual.

Acessado apenas: Quando o Sistema de entroncamento mencionado tiver um arquivo de Chaves do sistema de software ou uma Chave de sistema avançada com acesso selecionado no campo ID do sistema, ou uma Chave avançada WACN com acesso selecionado no campo ID da WACN doméstica, quando o campo [Tipo de Failsoft na página 551](#) estiver definido como **Grupo de conversação**, quando o campo [Grupo de notificação na página 560](#) não estiver definido como **Nenhum** e quando o rádio estiver habilitado para o modelo/a opção.

10.37.2.6

Frequência de recepção de Failsoft AG

Esse campo permite inserir a frequência de Rx (Receive, recepção) que será usada durante a operação de Failsoft para o Grupo de notificação da Personalidade de entroncamento atual.

AVISO:

As limitações de frequência de entroncamento aplicadas à essa seleção são determinadas pela definição do Tipo de protocolo dessa personalidade e a banda de frequência do Sistema de entroncamento mencionado.

Acessado apenas: Quando o Sistema de entroncamento mencionado tiver um Arquivo de chave do sistema de software ou uma Chave de sistema avançada com acesso selecionado no campo ID do sistema, ou uma Chave avançada WACN com acesso selecionado no campo ID da WACN doméstica, quando o campo [Tipo de Failsoft na página 551](#) estiver definido como **Grupo de conversação**, quando o campo [Grupo de notificação na página 560](#) não estiver definido como **Nenhum**, quando o campo [Failsoft de grupo de notificação na página 562](#) estiver **Habilitado** e quando o rádio estiver habilitado para o modelo/a opção.

10.37.2.7

Frequência de transmissão de Failsoft AG

Esse campo permite inserir a frequência de Tx (Transmit, transmissão) que será usada durante a operação de Failsoft para o Grupo de notificação da Personalidade de entroncamento atual.

AVISO:

As limitações de frequência de entroncamento aplicadas à essa seleção são determinadas pela definição do Tipo de protocolo dessa personalidade e a banda de frequência do Sistema de entroncamento mencionado.

Acessado apenas: Quando o Sistema de entroncamento mencionado tiver um Arquivo de chave do sistema de software ou uma Chave de sistema avançada com acesso selecionado no campo ID do sistema, ou uma Chave avançada WACN com acesso selecionado no campo ID da WACN doméstica, quando o campo [Tipo de Failsoft na página 551](#) estiver definido como **Grupo de conversação**, quando o campo [Grupo de notificação na página 560](#) não estiver definido como **Nenhum**, quando o campo [Failsoft de grupo de notificação na página 562](#) estiver **Habilitado** e quando o rádio estiver habilitado para o modelo/a opção.

10.37.2.8

Failsoft secundário de AG

Esse campo habilita o Failsoft secundário para o Grupo de notificação da Personalidade de entroncamento atual.

Acessado apenas: Quando o campo [Tipo de Failsoft na página 551](#) for definido como **Grupo de conversação**, quando o campo [Grupo de notificação na página 560](#) não estiver definido como **Nenhum**, quando o campo [Failsoft de grupo de notificação na página 562](#) estiver **Habilitado** e quando o rádio estiver habilitado para o modelo/a opção.

10.37.2.9

Frequência de recepção F/S secundária de AG

Esse campo permite inserir a frequência de Rx (Receive, recepção) secundária que será usada durante a operação de Failsoft para o Grupo de notificação da Personalidade de entroncamento atual.

AVISO:

As limitações de frequência de entroncamento aplicadas à essa seleção são determinadas pela definição do Tipo de protocolo dessa personalidade e a banda de frequência do Sistema de entroncamento mencionado.

Acessado apenas: Quando o campo [Tipo de Failsoft na página 551](#) for definido como **Grupo de conversação**, quando o campo [Grupo de notificação na página 560](#) não estiver definido como **Nenhum**, quando o campo [Failsoft de grupo de notificação na página 562](#) estiver **Habilitado**, quando o campo [Failsoft secundário de AG na página 563](#) estiver **Habilitado** e quando o rádio estiver habilitado para o modelo/a opção.

10.37.2.10

Frequência de transmissão F/S secundária de AG

Esse campo permite inserir a frequência de Tx (Transmit, transmissão) secundária que será usada durante a operação de Failsoft para o Grupo de notificação da Personalidade de entroncamento atual.

AVISO:

As limitações de frequência de entroncamento aplicadas à essa seleção são determinadas pela definição do Tipo de protocolo dessa personalidade e a banda de frequência do Sistema de entroncamento mencionado.

Acessado apenas: Quando o campo [Tipo de Failsoft na página 551](#) for definido como **Grupo de conversação**, quando o campo [Grupo de notificação na página 560](#) não estiver definido como **Nenhum**, quando o campo [Failsoft de grupo de notificação na página 562](#) estiver **Habilitado**, quando o campo [Failsoft secundário de AG na página 563](#) estiver **Habilitado** e quando o rádio estiver habilitado para o modelo/a opção.

10.37.3

Grupo de conversação (Personalidade de Entroncamento Tipo II)

A seção **Grupo de conversação** do conjunto Personalidade de entroncamento tipo II permite ao usuário visualizar ou definir a funcionalidade de Grupo de conversação individual para Personalidades de entroncamento individuais. Um Grupo de conversação é um agrupamento de rádios definido pelo RadioCentral e criado com o objetivo de gerar comunicação frequente e eficiente entre rádios.

OBSERVAÇÃO:

As frequências do grupo de conversação são determinadas pelo Sistema de entroncamento em campo e não são configuradas no RadioCentral.

OBSERVAÇÃO:

As frequências de Failsoft de Personalidade de entroncamento devem ser configuradas no RadioCentral.

Após a definição, é possível atribuir um Grupo de conversação a um ou mais canais do Seletor de canais do rádio a partir da [Atribuição de zonas e canais na página 666](#) e do campo Lista de canais definida para o grupo de conversação de entroncamento.

10.37.3.1

Grupo de conversação

Exibe o nome reconhecível pelo usuário do RadioCentral para o Grupo de conversação atual (registro/linha).

Essa seleção se aplica à Personalidade de entroncamento ou Personalidade de entroncamento do ASTRO 25 atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.37.4

Ligação/Página (Personalidade de Entroncamento Tipo II)

A seção **Ligação/Página** do conjunto Personalidade de Entroncamento Tipo II permite ao usuário visualizar ou definir as funcionalidades de Ligação Privada e Página para Personalidades de

entroncamento individuais. Esta funcionalidade pode ser aplicada à funcionalidade Lista de prioridades de chamada de entroncamento.

OBSERVAÇÃO:

Quando os recursos de personalidade de entroncamento tiverem sido exclusivamente definidos, cada personalidade poderá ser atribuída à posição desejada do seletor de canais do rádio com o uso do recurso Atribuição de zonas e canais.

10.37.4.1

Tipo de chamada privada

Esse campo seleciona o tipo de chamada privada para a Personalidade de entroncamento atual.

É possível iniciar uma chamada privada pressionando o botão Selecionar/Chamada privada ou selecionando o menu de chamada [Selecionar/Ligação privada na página 211](#). Por sua vez, um usuário responde a uma chamada privada pressionando o botão [Resposta da Ligação na página 180](#).

As seleções a seguir são compatíveis:

Desabilitado

A função Chamada privada é desabilitada.

Disponível quando o tipo de protocolo for Tipo II ou ASTRO 25

PC II

A Chamada privada II permite uma chamada entre dois rádios individuais, independentemente dos grupos de conversação, sem exigir que o rádio receptor reconheça a chamada recebida.

Disponível quando o tipo de protocolo for Tipo II ou ASTRO 25

Unidade para unidade aprimorada

A Chamada privada aprimorada ou Chamada privada unidade a unidade permite chamadas entre dois rádios individuais, independentemente do grupo de conversação. O rádio receptor tocará, e é necessário confirmar a chamada recebida.

Disponível quando o tipo de protocolo for Tipo II ou ASTRO 25

PC com CA

Chamada privada avançada ou Chamada privada unidade para unidade, seguida por um Alerta de chamada privada. Consulte [Alerta de chamada automática na página 568](#).

Disponível quando o tipo de protocolo for Tipo II ou ASTRO 25

OBSERVAÇÃO:

PC II é compatível na operação de entroncamento "Analogico". Consulte os campos [Tipo de voz/sinal de AG na página 560](#) e [Grupo de conversação na página 564](#) no [Personalidade de entroncamento tipo II na página 548](#).

Há um atraso de dois minutos no PC II e na Chamada privada aprimorada ao operar em um sistema de entroncamento 3600, e de seis segundos ao operar em um sistema de entroncamento 9600. Nenhuma indicação é exibida durante o atraso.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.37.4.2

Operação de chamada privada

Esse campo seleciona o modo de operação da função Chamada privada para a Personalidade de entroncamento atual.

Você pode iniciar uma Chamada privada pressionando o botão Selecionar/Chamada privada ou selecionando o menu [Selecionar/Ligação privada na página 211](#). Por sua vez, um usuário responde a uma chamada privada pressionando o botão [Resposta da Ligação na página 180](#).

Acessado apenas: Quando o campo [Tipo de chamada privada na página 565](#) não estiver definido como **Desabilitado** e quando o rádio estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Somente resposta (Somente resp.)

Permite que o rádio aceite somente Páginas.

Somente lista

Permite que o usuário envie páginas da Lista de prioridades de chamada. Para modelos sem teclado, essa opção pode ser usada somente com a Função do botão um toque. Essa funcionalidade depende do modelo/da opção.

Ilimitado

Permite que o usuário envie páginas da Lista de prioridades de chamada e do teclado do rádio. Essa funcionalidade depende do modelo/da opção.

AVISO:

Essa seleção não está disponível para rádios portáteis que tenham somente um visor superior.

10.37.4.3

Alerta de chamada/operação da página

Esse campo seleciona a funcionalidade Página/Alerta de chamada para a Personalidade de entroncamento atual.

Você pode ativar a Operação da página de alerta de chamada pressionando o botão [Alerta de Chamada. na página 180](#) ou selecionando o menu [Página na página 216](#).

Acessado apenas: Quando o rádio estiver habilitado para o modelo/a opção, quando o campo Ativação de hardware de DVRS estiver **Desabilitado**, ou quando o campo Ativação de hardware de DVRS estiver **Habilitado** e quando o Perfil de DVRS mencionado pela Personalidade de entroncamento atual tiver um campo de Ativação remota de DVRS definido como **Desabilitado**.

As seleções a seguir são compatíveis:

Desabilitado

Funcionalidade Alerta de chamada/página não disponível.

Somente resposta (Somente resp.)

Permite que o rádio aceite somente Páginas.

Somente lista

Permite que o usuário envie páginas da Lista de prioridades de chamada. Para modelos sem teclado, essa opção pode ser usada somente com a Função do botão um toque. Essa funcionalidade depende do modelo/da opção.

Ilimitado

Permite que o usuário envie páginas da Lista de prioridades de chamada e do teclado do rádio. Essa funcionalidade depende do modelo/da opção.

AVISO:

Essa seleção não está disponível para rádios portáteis que tenham somente um visor superior.

10.37.4.4

Lista de prioridades de chamada de entroncamento

Este campo seleciona a Lista de prioridades de chamada a ser usada pra a Personalidade de entroncamento atual.

A Lista de prioridades de chamada usada depende da seleção do campo Tipo de protocolo **Tipo II** ou **ASTRO 25** para a Personalidade de entroncamento atual. O usuário usa a Lista de prioridades de chamada para transmitir chamadas privadas e páginas.

Acessado apenas: Quando o campo [Operação de chamada privada na página 565](#) estiver definido como **Somente lista** ou **Ilimitado**, ou quando [Alerta de chamada/operação da página na página 566](#) campo estiver definido como **Somente lista** ou **Ilimitado** e quando o rádio estiver habilitado para o modelo/a opção.

10.37.4.5

Alerta do usuário de chamada recebida ativado

Essa função permite que o rádio permaneça silenciado para chamadas do grupo de conversação afiliado durante a operação na Personalidade de entroncamento.

As páginas individuais e de grupo desativam o modo silencioso do rádio para que o som do tom de alerta possa ser emitido. O rádio também desativa o áudio de chamadas individuais entre rádios, como chamadas privadas, chamadas de sinalização de tom e chamadas de interconexão (modo telefone). Essa função será muito útil quando você preferir não ouvir o tráfego do grupo de conversação afiliado, mas precisar permanecer em contato com o sinal do rádio. Ao pressionar o botão [Silenciar voz na página 192](#) ou selecionar o menu [Silenciar voz na página 220](#), você poderá ativar e desativar a função Silenciar voz de um canal habilitado para Alerta do usuário de chamada recebida.

AVISO:

Quando essa função estiver desativada, o usuário do rádio não poderá ativá-la para a personalidade de entroncamento atual.

INFORMAÇÕES:

Além disso, quando a funcionalidade Silenciar voz estiver ativa:

Uma página individual ou de grupo recebida pelo rádio desativa o modo silencioso do rádio. Assim que a página desativar a função mudo do rádio, uma chamada de voz que é recebida a seguir pode ser uma chamada em grupo que é ouvida no alto-falante do rádio.

Se os canais de rádio forem alterados e a função Silenciar voz for desativada pelo rádio, a função Silenciar voz deverá ser reativada, se desejado, ao voltar para o canal.

Se você pressionar o botão PTT, iniciar o modo Emergência ou desligar e ligar o rádio, a função Silenciar voz será desativada pelo rádio.

Os seguintes tipos de chamadas também podem ser recebidos:

- [Ativação do reagrupamento dinâmico na página 523](#)
- [Inibição de rádio na página 519](#)
- [Indicador Fora de alcance na página 228](#)
- Failsoft
- [indicador de entroncamento de local na página 229](#)
 - A função Varredura não está disponível.
 - Outras indicações do visor de chamada em grupo, como o LED de recepção e PTT-ID (se ativado), funcionam normalmente.

Acessado apenas: Quando o rádio for compatível com o modelo/a opção e quando o campo [Alerta de chamada/operação da página na página 566](#) não estiver definido como **Desativado**,

Ou quando o campo Tipo de protocolo estiver definido como **ASTRO 25** e quando o campo [Lista de sinalização de tom na página 642](#) da Personalidade de entroncamento atual estiver fazendo referência a uma Lista de sinalização de tom que tenha pelo menos um registro/linha, no qual o recurso de desativação do modo silencioso esteja **Ativado**.

10.37.4.6

Alerta de chamada automática

Esse campo permite que o rádio transmita automaticamente um alerta de chamada privada em um evento em que o destinatário de uma chamada privada aprimorada ou de unidade para unidade não responde à chamada dentro de um período de tempo específico.

Essa função se aplica à Personalidade de entroncamento atual e é aplicável aos Tipos de protocolo ASTRO 25 e Tipo II.

Acessado apenas: Quando o campo [Tipo de chamada privada na página 565](#) estiver definido como **PC com CA** e quando o rádio estiver habilitado para o modelo/a opção.

10.37.5

Funções (Personalidade de Entroncamento Tipo II)

A seção **Funções** do conjunto Personalidade de Entroncamento Tipo II permite que o usuário visualize ou modifique diversos recursos de Personalidades de entroncamento da Personalidade de entroncamento atual.

OBSERVAÇÃO:

Quando os recursos de personalidade de entroncamento tiverem sido exclusivamente definidos, cada personalidade poderá ser atribuída à posição desejada do seletor de canais do rádio com o uso do recurso Atribuição de zonas e canais.

10.37.5.1

Operação do telefone

Este campo seleciona a funcionalidade do telefone ao operar no modo de telefone para a Personalidade de entroncamento atual.

É possível iniciar o recurso Modo telefone pressionando o botão Telefone ou Resposta da chamada ou selecionando o menu Telefone.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Desabilitado

O modo telefone não está disponível.

Somente resposta

Permite que o rádio aceite somente chamadas.

Somente lista

Permite fazer chamadas somente da Lista de prioridades de chamada do rádio.

AVISO:

Se o campo [Número de telefone editável na página 652](#) da Lista de todas as chamadas estiver **Ativado**, você poderá modificar os Números de telefone da Lista de chamadas unificada do rádio.

Ilimitado

Permite fazer chamadas usando a lista de telefones ou um teclado.

10.37.5.2

Seleção da lista de varredura

Este campo seleciona qual Lista de varredura é utilizada pelo rádio ao operar no Modo de varredura para a Personalidade de entroncamento atual.

Em seguida, essa Lista de varredura determina os autores de chamadas que o rádio varrerá, procurará ativamente ou escutará e depois considera a desativação da função mudo para o canal de entroncamento atual.

OBSERVAÇÃO:

A funcionalidade Lista de varredura e Membro da lista de verificações é definida na janela Lista de varredura.

Somente as Listas de varredura que têm a seleção **Monitor de prioridade** ou **Grupo de conversação multissistema** no campo [Tipo de varredura na página 679](#) são seleções da Lista de varredura válidas para a Personalidade de entroncamento atual.

Listas de varredura com a seleção **Prioridade inteligente** no campo Tipo de varredura são seleções da Lista de varredura válidas para a Personalidade convencional atual sem sistema DVRS.

É possível iniciar a edição da Lista de varredura ativando/desativando a Programação de lista de varredura, selecionando o menu Lista de varredura ou fazendo um pressionamento longo do botão Varredura.

AVISO:

Quando o campo [Modo de transmissão na página 554](#) está definido no modo **TG/AG desativados (somente escuta)** para a Personalidade de entroncamento atual, a Lista de varredura mencionada dessa personalidade não deve ter o campo [Tipo de membro de transmissão de voz designado na página 686](#) definido como **Canal selecionado** (o que significa este canal); caso contrário, a seleção será considerada inválida.

Quando a [Seleção da Lista de Alertas de Site Seleccionáveis na página 589](#) do Sistema de entroncamento referenciado não está **Desativada**, a Lista de varredura referenciada dessa personalidade não deve ser um Tipo de varredura **Grupo de conversação multissistema**; caso contrário, a seleção será considerada inválida.

O aplicativo considera esta seleção inválida quando a personalidade está habilitada para Banda larga LTE e a Lista de varredura selecionada tem Canais de membro da Lista de varredura com as seguintes dependências:

- Seu campo [Frequência de interferência de LTE presente na página 430](#) de Personalidade convencional definido como **Ativado** ou
- Seu campo [Frequência de interferência de LTE presente na página 592](#) do Sistema de entroncamento é **Verdadeiro** ou
- Seu campo [Tipo de cobertura na página 511](#) do Sistema de entroncamento definido como **Roaming Inter-WACN**.

Um canal de entroncamento está habilitado para LTE quando o Sistema de entroncamento referenciado da personalidade tem um Perfil de dados referenciado com uma seleção de [Tipo de perfil de dados na página 370](#) igual a **Entroncamento e banda larga** ou **Apenas banda larga** e quando a Origem da banda larga desse Perfil de dados é **Modem LTE interno**.

Quando a Seleção da lista de responsabilidade pela equipe do Sistema de entroncamento referenciado não está **Desativada**, a Lista de varredura referenciada desta personalidade não deve ser do Tipo de varredura **Grupo de conversação multissistema**; caso contrário, a seleção será considerada inválida.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.37.5.3

Varredura automática

Este campo faz com que o rádio entre automaticamente no Modo de varredura quando você seleciona (com o Seletor de canal) a Personalidade de entroncamento atual.

A Verificação automática também é executada quando o rádio é ativado para o canal atual.

Quando desativado, é possível chamar a operação no Modo de varredura pressionando o botão Varredura, ativando ou desativando a chave Varredura ou selecionando o menu Varredura ao operar na Personalidade de entroncamento atual.

Acessado apenas: Quando o campo [Seleção da lista de varredura na página 568](#) não estiver definido como **Nenhum** e quando o rádio estiver habilitado para o modelo/a opção.

10.37.5.4

Ativação do alias

Este campo permite selecionar e transmitir um Status programado para a Personalidade de entroncamento atual.

Os status disponíveis dependem do Sistema de entroncamento referenciado da personalidade.

É possível iniciar a função Status pressionando o botão Status ou Status direto ou selecionando o menu Status.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.37.5.5

Ativação da mensagem

Este campo permite selecionar e transmitir uma mensagem programada para a Personalidade de entroncamento atual.

As mensagens disponíveis dependem do Sistema de entroncamento referenciado da personalidade.

É possível ativar o recurso Mensagem pressionando o botão [Message na página 184](#) ou o botão [Mensagem direta](#) ou ainda selecionando o menu [Message na página 214](#).

Acessado apenas: Quando o campo Tipo de protocolo está definido como **Tipo II** e o rádio está habilitado para o modelo/a opção.

10.37.5.6

Tom de permissão para falar

Este campo permite que o rádio emita um tom de alerta quando uma concessão de acesso ao Canal de controle é recebida de um repetidor.

O recurso se aplica à Personalidade de entroncamento atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.37.5.7

Detecção do código seguro adequado

Este campo permite que o rádio desative a função de silenciar para comunicações criptografadas SecureNet™.

Esse recurso se aplica à Personalidade de entroncamento atual.

Acessado apenas: Quando o campo Tipo de protocolo está definido como **Tipo II**, quando o campo [Operação segura na página 294](#) está definido como **Hardware** ou **Software** e o rádio for compatível com o modelo/a opção.

10.37.5.8

Ignorar voz clara de recepção

Este campo faz com que o rádio ignore todas as comunicações por voz **Claras** (criptografadas e não seguras) em operação na Personalidade de entroncamento atual.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**.

10.37.5.9

Finalizar transmissão por perda da voz

Este campo permite que, durante uma transmissão de voz de Entroncamento, o rádio seja automaticamente desativado quando o DSP (Digital Signal Processor, processador de sinal digital) detectar a falta de voz do microfone por um período que exceda o do Contador de ausência de voz.

Esta seleção se aplica à operação na Personalidade de entroncamento atual.

AVISO:

O recurso não funciona quando:

- Um rádio no campo estiver operando no Modo de emergência e a opção **Emergência de mic. direto** ou **Emergência via áudio silencioso** estiver ativa atualmente (consulte também Modo de transmissão automática de emergência), ou
- O rádio no campo estiver sendo monitorado remotamente no momento (consulte também Ativação de monitor remoto/rastreamento de rádio).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.37.5.10

Teclado direto (DTMF)

Esse campo permite transmitir tons DTMF usando o teclado do rádio, mesmo quando o rádio não estiver no modo Telefone.

Para iniciar o modo de Teclado direto, mantenha pressionado o botão PTT enquanto disca os números do teclado DTMF. Esse recurso se aplica à Personalidade de entroncamento atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

AVISO:

Esse recurso não funciona quando o campo [Modo de transmissão na página 554](#) é definido como modo **TG/AG desativados (somente escuta)**.

10.37.5.11

Microfone DTMF habilitado

Esse campo permite transmitir tons DTMF usando o teclado do rádio, mesmo quando o rádio não estiver no modo Telefone.

Para iniciar o microfone DTMF, mantenha pressionado o botão superior, o lateral ou Cabeça de controle enquanto o número do teclado DTMF necessário é enviado.

Microfone DTMF habilitado se aplica à Personalidade de entroncamento atual.

AVISO:

Esse recurso não funciona quando o campo [Modo de transmissão na página 554](#) é definido como modo **TG/AG desativados (somente escuta)**.

10.37.5.12

Timer de tempo limite do despacho de prioridade

Este campo seleciona o tempo necessário para você pressionar o botão Envio prioritário até o Envio prioritário sair. O tempo é medido em segundos.

Acima 261: Alcance

Mínimo	Máximo	Incrementos
1	255	1

Acessado apenas: Quando o campo Tipo de Sistema está definido como **ASTRO 25** e o campo Seleção de perfil DVRS está definido como **Desativado**.

10.37.6

Locais preferidos (Personalidade de Entroncamento Tipo II)

A seção **Sites preferidos** da Personalidade de Entroncamento Tipo II permite que o usuário visualize ou defina preferências de local para entroncamento de vários locais para Personalidades de Entroncamento individuais. Quando um rádio faz roaming em uma área de cobertura sobreposta de vários sites dentro de um Sistema de entroncamento ou de uma WACN (Wide Area Communications Network, rede de comunicações de área ampla), ele procurará por um site com preferência de operação ao avaliar todos os outros sites disponíveis com base na prioridade, de acordo com sua seleção correspondente de status preferencial. Este recurso fornece um gerenciamento e uma conservação mais inteligentes dos recursos de repetidor em áreas de cobertura sobreposta.

INFORMAÇÕES:

O campo Tipo de cobertura do Sistema de entroncamento mencionado determina a configuração de site único (SmartNet) ou de vários sites. Em uma configuração de vários sites, a operação SmartZone permite que o rádio determine, por meio de amostras de chamadas seletivas de RSSI, o melhor site a ser usado para as comunicações de Entroncamento.

Consulte também os campos Todo o entroncamento avançado e Constantes do Filtro do Sistema de Entroncamento.

Quando os recursos de Personalidade de entroncamento tiverem sido exclusivamente definidos, cada Personalidade poderá ter sido atribuída à posição desejada do seletor de canais do rádio com o recurso Atribuição de zonas e canais.

10.37.6.1

Ignorar preferência da função do local

Este campo permite que o rádio ignore informações de recursos do site recebidas em OSWs (Outbound Signal Words, palavras de sinal de saída) do canal de controle; por exemplo, se o site possuir repetidores não criptografados analógicos, seguros de 12 Kbits ou ASTRO.

O recurso se aplica à Personalidade de entroncamento atual e somente ao operar em SmartZone.

Se estiver **desativada**, o rádio selecionará locais com base nas informações de recursos do local. Por exemplo, se um rádio tiver selecionado um grupo de conversação ASTRO.

Acessado apenas: Quando o Sistema de entroncamento mencionado tiver o campo [Tipo de cobertura na página 511](#) não definido como **Desativado**, e quando o rádio estiver habilitado para o modelo/a opção.

10.37.6.2

Tipo de lista de sites

Este campo permite selecionar o tipo de Lista de sites para a Personalidade de entroncamento.

O Tipo de lista de sites define a forma como o rádio usará os sites identificados na Lista de sites a seguir. O acesso à Preferência de site e mobilidade (roaming) é definido pelo Tipo de lista de sites.

Acessado apenas: Quando o Sistema de entroncamento mencionado tiver o campo [Tipo de cobertura na página 511](#) não definido como **Desativado**, e quando o rádio estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Lista de preferidos

Esta é a seleção legada e padrão. Não há restrições de acesso ou preferência implícita para os sites que não estão listados.

Lista de permitidos

O rádio somente pode fazer roaming dos sites listados, e as preferências definidas serão aplicadas. O sistema ainda pode negar o acesso a um site na lista de permitidos depois que a "anexação" ao sistema for tentada no site. Se o rádio não estiver ao alcance de pelo menos um dos sites listados, o rádio permanecerá fora de alcance.

Lista de bloqueados

O rádio não tem permissão para fazer roaming para qualquer site listado. Todos os outros sites são tratados como sites permitidos sem preferência definida.

10.37.6.3

ID do site

Este campo permite inserir, em formato decimal ou hexadecimal, o número de ID que identifica o site SmartZone atual (registro/linha), que se aplica à personalidade de entroncamento atual.

AVISO:

Para suportar o roaming entre sites diferentes, cada ID de Site deve ser único dentro do RFSS.

Acessado apenas: Quando o Sistema de entroncamento mencionado tiver o campo [Tipo de cobertura na página 511](#) não definido como **Desativado**, e quando o rádio estiver habilitado para o modelo/a opção.

Acima 262: Alcance

Tipo de cobertura	Mínimo	Máximo
ASTRO 25	1	FE hex
Tipo II	1	40 hex

10.37.6.4

Status preferido

Este campo seleciona o status preferido para o site SmartZone quando determinado, por meio de amostras de sondagens de RSSI, o melhor site a ser usado para comunicações de entroncamento.

Essa seleção se aplica ao site atual (registro/linha), que se aplica à Personalidade de entroncamento atual.

Acessado apenas: Quando o Sistema de entroncamento mencionado tiver o campo [Tipo de cobertura na página 511](#) não definido como **Desativado**, e quando o rádio estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Nenhum

O local não recebe preferência.

INFORMAÇÕES:

Se um site não estiver listado aqui, o rádio não atribuirá a ele nenhuma preferência.

Menor preferência

O local será evitado, a menos que seja o único local utilizável para operação.

Preferido

O local será usado com prioridade sobre todos os locais não preferidos. Rádio deixar este site quando se entrar em Entroncamento de Site.

Sempre preferido

O site será usado como prioridade sobre todos os sites não preferidos, mesmo se o site tiver entrado em Entroncamento de Site.

10.37.6.5

ID RFSS

Este campo permite inserir, em formato decimal ou hexadecimal, o ID do RFSS (Radio Frequency Sub-System, subsistema de radiofrequência) do ASTRO 25 que corresponde ao ID do site atual (registro/linha), aplicável à personalidade de entroncamento atual.

**AVISO:**

Para oferecer suporte ao roaming entre RFSSs diferentes dentro de um sistema de entroncamento, cada RFSS deve ter um número único.

**OBSERVAÇÃO:**

Um RFSS é composto por um ou mais sites.

Acessado apenas: Quando o campo [Tipo de cobertura na página 511](#) do sistema de entroncamento mencionado está definido como **SmartZone e OmniLink**, **Roaming intra-WACN** ou **Roaming inter-WACN**, quando o campo Tipo de protocolo está definido como **Tipo II** e quando o rádio está habilitado para o modelo/para a opção.

Acima 263: Alcance

Mínimo	Máximo
1	FE hex

10.37.6.6

ID do sistema

Este campo permite inserir em formato decimal ou hexadecimal o ID do sistema Tipo II ou ASTRO 25 que corresponde ao ID do site no site (registro/linha) atual, o que se aplica à Personalidade de entroncamento atual.

**AVISO:**

Para suportar o roaming entre Sistemas de entroncamento diferentes que compõe as WACNs (Wide Area Communications Networks, redes de comunicações de área ampla), cada Sistema de entroncamento deve ter uma ID de sistema única.

**OBSERVAÇÃO:**

Um Sistema de entroncamento é composto por um ou mais RFSS (Radio Frequency Sub-Systems, subsistemas de radiofrequência).

Acessado apenas: Quando o campo Tipo de protocolo está definido como **Tipo II**, quando o Sistema de entroncamento referenciado tem seu campo [Tipo de cobertura na página 511](#) definido como **SmartZone e OmniLink** e o rádio está habilitado para o modelo/a opção,

Quando o campo Tipo de protocolo está definido como **ASTRO 25**, quando o Sistema de entroncamento referenciado tem o campo Tipo de cobertura definido como **Roaming intra-WACN** ou **Roaming inter-WACN** e o rádio está habilitado para o modelo/a opção.

Acima 264: Alcance

Tipo de cobertura	Mínimo	Máximo
ASTRO 25	0	0FFE hex
Tipo II	0	FFFE hex

10.37.6.7

ID do RAS WACN

Este campo permite inserir, em formato decimal ou hexadecimal, o ID da WACN (Wide Area Communications Network, rede de comunicações de área ampla) do RAS (Remote Access Server, servidor de acesso remoto) para o ID do site atual (registro/linha).

**AVISO:**

Para oferecer suporte ao roaming entre WACNs diferentes, cada WACN deve ter um número único.

**OBSERVAÇÃO:**

Uma WACN é composta por um ou mais sistemas de entroncamento. Essa seleção também se aplica à personalidade de entroncamento atual.

Acessado apenas: Quando o campo Tipo de protocolo está definido como **ASTRO 25**, quando o campo [Tipo de cobertura na página 511](#) do sistema de entroncamento mencionado está definido como **Roaming inter-WACN** e quando o rádio está habilitado para o modelo/para a opção.

Acima 265: Alcance

Mínimo	Máximo
0	FFFFE hex

10.37.6.8

Caractere curinga

Este campo define o tipo de entrada na Lista de sites. A seleção é um tipo de curinga que determinará qual site ou grupo de sites será **Preferido**, **Permitido** ou **Bloqueado**.

Acessado apenas: Quando o Sistema de entroncamento mencionado tiver o campo [Tipo de cobertura na página 511](#) não definido como **Desativado**, e quando o rádio estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Sem curinga

Esta é a seleção padrão.

Qualquer site

Todos os sites de um RFSS, Sistema e WACN aplicáveis com base na seleção do campo Tipo de cobertura

Qualquer RFSS

Todos os sites, RFSS em um Sistema e WACN aplicáveis com base na seleção do campo Tipo de cobertura

Qualquer sistema

Todos os sites, RFSS e Sistemas em uma WACN aplicáveis com base na seleção do campo Tipo de cobertura

10.37.6.9

Permitir emergência em site bloqueado

Se esse campo estiver ativado, o rádio tentará registrar o grupo de conversação selecionado em um site definido como bloqueado no RadioCentral quando o rádio estiver no modo de emergência. Quando a emergência é apagada, o rádio continua a bloquear o grupo de conversação selecionado.

Acessado apenas: Este campo pode ser acessado somente quando as seguintes condições forem atendidas:

- O campo **Tipo de lista de sites** está definido como **Bloqueado**.
- O campo **Tipo de cobertura** do sistema de Entroncamento mencionado **não** está definido como **Desativado**.

10.38

Sistema de entroncamento ASTRO 25

O conjunto **Sistema de entroncamento ASTRO 25** permite criar e apagar os Sistemas de entroncamento, bem como definir funcionalidades do Sistema de entroncamento individual. Os sistemas de entroncamento são configurações virtuais que espelham as configurações e as funcionalidades reais do sistema de entroncamento (no campo). A definição dos sistemas RadioCentral possibilita que o rádio se comunique com os sistemas reais.

**AVISO:**

Se um campo, Tipo do sistema, do Sistema de entroncamento for modificado, qualquer Personalidade de entroncamento previamente atribuída a esse Sistema de entroncamento específico terá que ser atribuída novamente a outro sistema que tenha a seleção do Tipo de sistema apropriado. Caso contrário, um erro de codeplug ocorrerá ao gravar o codeplug no rádio. Os esquemas de endereçamento do Sistema de entroncamento podem ser do Tipo II ou ASTRO 25.

**OBSERVAÇÃO:**

Os Sistemas de entroncamento são referidos a uma Personalidade de entroncamento. Essas configurações de Sistema de entroncamento poderão se tornar funcionais para todos os tipos de Entroncamento - canal.

10.38.1

Geral (Sistema de Entroncamento do ASTRO 25)

A seção **Geral** do conjunto Sistema de Entroncamento do ASTRO 25 permite ao usuário visualizar ou definir funcionalidades básicas para Sistemas de Entroncamento individuais.

**OBSERVAÇÃO:**

Os Sistemas de entroncamento individuais são referidos como Personalidade de entroncamento. Depois de referidos, essas configurações de Sistemas de Entroncamento poderão se tornar funcionais para todos os tipos de canal dessa Personalidade de Entroncamento.

10.38.1.1

Nome do Sistema de Entroncamento

Este campo permite definir um nome reconhecível para o sistema de entroncamento atual.

OBSERVAÇÃO:

Sistemas de entroncamento individuais são atribuídos a uma Personalidade de entroncamento por meio do campo Sistema, selecionando esse nome. Então, essas configurações de sistemas de entroncamento poderão se tornar funcionais para todos os tipos de canal dessa personalidade de entroncamento.

Quando o **Monitor de prioridade** é selecionado como o Tipo de verificação para canais de Membro da lista de verificação, o nome desse Sistema de Entroncamento deve ser selecionado para a Lista de verificação atual por meio do campo Registro do sistema de entroncamento.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

Exemplos: EMT-001, #500, Electric1, # A5

É possível usar caracteres, números, espaços e caracteres especiais.

Os espaços iniciais em branco são substituídos por sublinhados no visor do rádio.

Os pontos iniciais não aparecem no visor do rádio.

10.38.1.2

Tipo de chave de sistema

Este campo exibe somente leitura do Tipo de chave de sistema selecionado para o Sistema de entroncamento atual, seja **Chave de sistema** ou **Chave WACN**.

Quando o [Tipo de cobertura na página 511](#) está configurado para **roaming intra-WACN**, o Tipo de chave de sistema será **Chave WACN**, caso contrário ele será **Chave de Sistema**.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.38.1.3

Chave do sistema presente

O aplicativo recupera e exibe somente leitura se um Arquivo de chaves do sistema de software ou Chave avançada (hardware) for carregado e corresponder ao ID selecionado no campo ID do sistema ou ID da WACN doméstica para o Sistema de entroncamento atual.

Consulte também [Tipo de chave de sistema na página 511](#).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.38.1.4

Tipo de cobertura

Este campo seleciona o tipo de cobertura geográfica do rádio e, portanto, os métodos específicos para determinar comunicações entre rádios dentro de sistemas de entroncamento.

O Tipo de Cobertura se aplica ao Sistema de Entroncamento atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/a opção, quando um Arquivo de Teclas do Sistema de Software ou uma Chave de Sistema Avançada com acesso é selecionada no campo ID do Sistema ou uma Chave Avançada WACN com acesso é selecionada no campo ID da WACN doméstica.

OBSERVAÇÃO:

Essas seleções dependem do modelo/da opção do rádio.

As seleções a seguir são compatíveis:

Desativado = SmartNet

Quando o rádio estiver habilitado para o modelo/a opção de SmartZone e você desativar esse campo, o Sistema de Entroncamento usará a SmartNet.

OBSERVAÇÃO:

Valores de operação da SmartNet para SmartZone de um único site.

SmartZone

A operação da SmartZone permite que o rádio determine, através do indicador de intensidade do sinal recebido (RSSI), amostras de chamadas seletivas e o melhor Site de Entroncamento a ser usado para canais de entroncamento habilitados para SmartZone.

OBSERVAÇÃO:

Para sistemas ASTRO 25: A operação limita-se a locais dentro de uma única zona de um único Sistema de Entroncamento.

Para sistemas Tipo II: A operação limita-se a locais dentro de um único sistema de entroncamento.

SmartZone e OmniLink

conferem ao rádio habilitado para SmartZone a capacidade de fazer roaming de um sistema de SmartZone para outro dentro do mesmo sistema OmniLink. O OmniLink se aplica a canais de entroncamento habilitados para OmniLink.

OBSERVAÇÃO:

Para sistemas ASTRO 25: A operação limita-se a Sites e Zonas dentro de um único Sistema OmniLink.

Para sistemas Tipo II: A operação limita-se a locais dentro de um conjunto de sistemas de entroncamento interconectados.

Roaming intra-WACN

O Roaming Intra-WACN fornece a capacidade ao rádio habilitado para Projeto 25 de fazer roaming automaticamente entre todos os IDs da rede de comunicações de área ampla (WACN) sem nenhuma intervenção. Consulte também ID da WACN doméstica.

OBSERVAÇÃO:

Para sistemas ASTRO 25: A operação limita-se a sistemas de entroncamento dentro de uma única WACN.

AVISO:

O Roaming Intra-WACN será inválido se um dos cenários a seguir ocorrer:

Quando o Tipo de Sistema for Tipo II, ou

Quando o campo Ativação de Hardware DVRS estiver **Habilitado**, ou

Quando o campo Seleção de Rádio – Rádio Duplo estiver definido como **Rádio Secundário** e quando o campo Habilitar TX de Rádio Secundário estiver definido como **Desabilitado**.

Roaming inter-WACN

O Roaming Inter-WACN fornece a capacidade aos rádios habilitados para Projeto 25 dos grupos de conversação selecionados de fazer o roaming automaticamente entre WACNs (Wide Area

Communications Network, rede de comunicações de área ampla) diferentes sem nenhuma intervenção.

AVISO:

O Roaming inter-WACN será inválido se um dos cenários a seguir ocorrer:

Quando o Tipo de Sistema for Tipo II, ou

Quando o campo Ativação de Hardware DVRS estiver **Habilitado**, ou

Quando o campo Seleção de Rádio - Rádio Duplo estiver definido como **Rádio Secundário** e quando o campo Habilitar TX de Rádio Secundário estiver definido como **Desabilitado**, ou

Quando esse sistema estiver **Habilitado** para banda larga LTE.

Um Sistema de entroncamento é habilitado para LTE quando um Perfil de dados referenciado com uma seleção de Tipo de Perfil de dados igual a **Entroncamento e banda larga** ou **Somente banda larga**, e quando a Origem da banda larga desse Perfil de Dados é **Modem LTE Interno**.

Sistemas capacitados para O SmartZone e Projeto 25 também são configurados a partir dos campos SmartZone de Todo o Entroncamento e a partir dos campos Constantes de Filtro de Todo o Entroncamento.

10.38.1.5

ID RFSS

Este campo seleciona o número de identificação do Subsistema de radiofrequência (RFSS) de entroncamento do ASTRO 25 no formato decimal ou hexadecimal.

OBSERVAÇÃO:

Um RFSS é composto por um ou mais sites. Essa seleção se aplica ao Sistema de entroncamento atual.

Acessado apenas: Quando um Arquivo de chave de sistema de software ou uma Chave de sistema avançada com acesso é selecionada no campo ID do sistema ou uma Chave WACN avançada com acesso é selecionada no campo ID da WACN doméstica, e quando o campo Tipo de sistema estiver definido como **ASTRO 25**, e quando o campo [Tipo de cobertura na página 511](#) estiver definido como **SmartZone** ou **Desativado** e o rádio for compatível com o modelo/a opção.

AVISO:

A faixa de seleção pode ser modificada de acordo com a chave avançada por meio do programa Administrador de chaves avançadas.

[Acima 266: Alcance](#)

Mínimo	Máximo
01 (Hex)	FE (Hex)

10.38.1.6

ID do site

Seleciona (no formato decimal ou hexadecimal) o número de identificação do site com status preferencial para o Sistema de entroncamento atual do ASTRO 25.

Acessado apenas: Quando um arquivo de Chave de sistema de software ou uma Chave de sistema avançada com acesso é selecionada no campo ID do sistema ou uma Chave WACN avançada com acesso é selecionada no campo ID da WACN doméstica, e quando o campo Tipo de sistema estiver

definido como **ASTRO 25**, e quando o campo [Tipo de cobertura na página 511](#) estiver definido como **Desativado** e o rádio for compatível com o modelo/a opção.

AVISO:

O alcance da seleção pode ser modificado para cada Chave avançada pela ferramenta Administrador de chaves avançadas.

Acima 267: Alcance

Mínimo	Máximo
01 (Hex)	FE (Hex)

10.38.1.7

Tempo de resposta de RFSS

Este campo seleciona o tempo de resposta do RFSS.

Esse é o tempo de resposta base (quantidade mínima) que o rádio receptor (extremidade fixa) aguarda entre as tentativas de resposta do Equipamento de Rede Fixa (FNE) ao pacote de sinalização de entrada do rádio.

OBSERVAÇÃO:

É acrescentado um tempo aleatório adicional a esse tempo base para evitar que os rádios no sistema efetuem uma nova tentativa simultaneamente. Essa seleção se aplica ao Sistema de entroncamento atual. O tempo é medido em milissegundos.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 268: Alcance

Mínimo	Máximo	Incrementos
25 ms	6375 ms	25 ms

10.38.1.8

Temporizador do Estabilizador RFSS

Este campo seleciona o tempo mínimo que o temporizador do estabilizador RFSS (Radio Frequency Sub-System, subsistema de radiofrequência) do rádio aguardará o registro/afiliação ao alternar entre subsistemas de RF diferentes.

OBSERVAÇÃO:

Depois que um rádio se afilia a um RFSS, uma solicitação para alternar para outro RFSS não é enviada ao sistema até que o contador expire. Essa seleção se aplica ao Sistema de entroncamento atual.

Acessado apenas: Quando o campo for definido como [Tipo de cobertura na página 511](#) **SmartZone** e **OmniLink** ou **Roaming Intra-WACN** ou **Roaming Inter-WACN**, e quando o rádio está habilitado para o modelo/a opção.

Acima 269: Alcance

Mínimo	Máximo
1 s	10 s

10.38.1.9

Pesquisa de sites não adjacentes

Este campo permite que o rádio pesquise a lista programada de Canais de controle de um site com sinal mais forte.

Isso permite que o rádio entre em roaming e use um site que não seja definido por equipamento de rede fixa (FNE) como adjacente ao local inicial atual do rádio, mas tenha um sinal "Aceitável" ou mais forte.

OBSERVAÇÃO:

Isso ocorre somente quando o site inicial atual e os sites adjacentes definidos por FNE estão todos registrados com um determinado valor de limite abaixo do nível do limite de RSSI aceitável. Esse recurso se aplica ao Sistema de Entroncamento atual.

INFORMAÇÕES:

Ao operar em uma área de baixa cobertura, esse recurso faz com que o rádio pesquise na lista programada de Canais de controle aproximadamente uma vez a cada dois minutos. Durante esse tempo de pesquisa, o rádio não monitora o canal de controle do site inicial e, portanto, pode perder o áudio. Com base no número de Canais de Controle contidos na lista de Canais de Controle apropriada para esse Sistema de Entroncamento, a pesquisa pode levar até quatro segundos.

Acessado apenas: Quando o campo [Tipo de cobertura na página 511](#) não está definido como **Desativado** e quando o rádio está habilitado para o modelo/para a opção.

10.38.1.10

Seleção de Perfil de dados

Este campo seleciona o perfil de dados a ser usado com o sistema de entroncamento do ASTRO 25.

AVISO:

Quando o campo Seleção de Rádio - Rádio Duplo for definido como **Rádio Secundário** e o campo Habilitar TX de Rádio Secundário estiver **Desabilitado**, esse campo deverá ser definido como **Dados Desabilitados**, caso contrário, ele será considerado inválido.

Acessado apenas: Quando o campo Tipo de sistema está definido como **ASTRO 25** e quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Dados desativados

Sem recursos de dados.

Perfis de dados disponíveis

AVISO:

Um Perfil de dados habilitado para banda larga LTE não poderá ser selecionado quando o [Tipo de cobertura na página 511](#) do Sistema de Entroncamento atual estiver definido como **Roaming Inter-WACN**, ou quando o campo Frequência de Interferência de LTE Presente do Sistema de Entroncamento for **Verdadeiro**.

Um perfil de dados é habilitado para LTE para um sistema de entroncamento quando a Perfil de dados tem uma seleção de Tipo de Perfil de dados igual a **Entroncamento e banda larga** ou **Somente banda larga**.

10.38.2

Canais de Controle (Sistema de Entroncamento do ASTRO 25)

A seção **Canais de Controle** do conjunto Sistema de Entroncamento ASTRO 25 permite ao usuário visualizar ou definir as frequências de Recebimento e Transmissão para os Canais de Controle.

Até um máximo de 250 canais de controle podem ser criados para Sistemas de Entroncamento individuais, conforme necessário.

**OBSERVAÇÃO:**

Para modelos de rádio que contêm firmware anterior à Versão R12.01.00, o número máximo de canais de controle é 128.

**INFORMAÇÕES:**

Os Sistemas de entroncamento individuais são referidos como Personalidade de entroncamento. Depois de referidos, essas configurações de Sistemas de Entroncamento poderão se tornar funcionais para todos os tipos de canal dessa Personalidade de Entroncamento.

É útil classificar as frequências de canal de controle em ordem ascendente em um sistema de SmartZone. Em uma situação de Failsoft, o rádio utilizará o primeiro canal do Canal de controle como seu canal de Failsoft. Se os canais estiverem classificados (ou pelo menos classificados em uma ordem projetada para facilitar as operações de Failsoft), problemas potenciais, como ter vários rádios em canais de Failsoft diferentes, podem ser evitados.

Os campos a seguir são suportados:

10.38.2.1**Frequência de Rx**

Este campo permite digitar uma frequência de Rx (Receive, recepção) de canal de controle para o sistema de entroncamento atual.

**AVISO:**

As Restrições de frequência de entroncamento aplicáveis a essa seleção são determinadas pela banda de frequência deste Sistema.

Acessado apenas: (Quando um arquivo de Teclas do Sistema de Software ou uma Chave Avançada de Sistema com acesso for selecionado no campo ID do Sistema, ou uma Chave Avançada WACN com acesso for selecionada no campo ID da WACN Doméstica), e quando o rádio estiver habilitado para o modelo/a opção.

10.38.2.2**Frequência de transmissão**

Este campo permite digitar uma Frequência de Tx (Transmit, transmissão) de canal de controle para o sistema de entroncamento atual.

**AVISO:**

As Restrições de frequência de entroncamento aplicáveis a essa seleção são determinadas pelo Tipo de sistema e banda de frequência deste Sistema. Para Sistemas de entroncamento Tipo II, esse campo tem um status somente para visualização quando [Banda de frequência do tipo II na página 513](#) for 700/800 MHz ou 900 MHz.

Acessado apenas: Quando um arquivo de Teclas do sistema de software ou uma Chave de sistema avançada com acesso é selecionada no campo ID do sistema ou uma Chave avançada WACN com acesso é selecionada no campo ID da WACN doméstica, quando o campo Tipo de sistema estiver definido como **Tipo II** e o campo [Banda de frequência do tipo II na página 513](#) não estiver definido para **700/800** MHz ou **900** MHz e quando o rádio estiver habilitado para o modelo/a opção.

10.38.3

ID do Canal ASTRO 25

Esta seção permite visualizar ou definir parâmetros relacionados à frequência para comunicações do ASTRO 25.

**AVISO:**

Esses parâmetros são usados para validar todos os OBTs (Other Band Trunking, outros entroncamentos de bandas) ou canal de controle 700/800/900 MHz do ASTRO 25 e frequências de Failsoft inseridas. Essas configurações se aplicam a sistemas de entroncamento individuais.

**OBSERVAÇÃO:**

Depois que os parâmetros para esses IDs de Canal do ASTRO 25 são definidos, as frequências do canal de controle do Sistema de Entroncamento e as frequências de Failsoft da Personalidade de entroncamento podem ser definidas.

Os Sistemas de entroncamento individuais são referidos como Personalidade de entroncamento. Então, essas configurações de sistemas de entroncamento poderão se tornar funcionais para todos os tipos de canal dessa personalidade de entroncamento.

**AVISO:**

Cada registro de seleções de ID de canal contém parâmetros relacionados à frequência que são usados: regras de restrição de frequência de entroncamento para validar todas as frequências de canal de controle OBT do ASTRO ou 700/800/900 MHz e Failsoft inseridas.

Acessado apenas: Quando o campo Tipo de sistema está definido como **ASTRO 25**.

10.38.3.1

Identificador ativado

Este campo ativa as seleções de ID (Identifier, identificador) de canal para o mesmo ID de canal (registro/linha).

Essa seleção se aplica ao sistema de entroncamento atual do ASTRO 25.

**AVISO:**

Cada registro das seleções de ID de canal contém parâmetros relacionados à frequência: regras de restrição de frequência de entroncamento para validar todas as frequências de Canal de controle ASTRO 25 OBT ou 700/800/900 MHz e Failsoft inseridas.

**OBSERVAÇÃO:**

O primeiro registro/linha nessa página de ID do Canal ASTRO 25 deve estar ativado para ser considerado válido.

Depois que os registros/linhas dos parâmetros do ID do canal ASTRO 25 forem definidos, as frequências do Canal de controle do Sistema de entroncamento e as frequências de Failsoft da personalidade de entroncamento poderão ser definidas.

Acessado apenas: Quando o campo Tipo de sistema está definido como **ASTRO 25**, quando o arquivo de chaves do sistema de software ou uma chave de sistema avançada com acesso é selecionado(a) no campo ID do sistema ou uma chave de WACN avançada com acesso é selecionada no campo ID da WACN doméstica e quando o rádio está habilitado para o modelo/para a opção.

10.38.3.2

Tipo de canal

Este campo seleciona o tipo de protocolo de canal de tráfego a ser usado para o ID de canal do ASTRO 25 atual (registro/linha), FDMA (Frequency Division Multiple Access, acesso múltiplo por divisão de frequência) ou TMDA (Time Division Multiple Access, acesso múltiplo por divisão de tempo).

Acessado apenas: Quando o campo Tipo de sistema está definido como **ASTRO 25**, quando o campo [Identificador ativado na página 583](#) está habilitado para o ID de canal ASTRO 25 atual (registro/linha) e quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

FDMA

Seleciona a compatibilidade do Sistema de Entroncamento para FDMA (Frequency Division Multiple Access).

TDMA

Seleciona a compatibilidade do Sistema de Entroncamento para TDMA (Time Division Multiple Access).

OBSERVAÇÃO:

Isso se aplica ao canal de voz.

10.38.3.3

Sinal de desvio de transmissão

Este campo seleciona o sinal de desvio de transmissão (mais ou menos) para o ID do canal ASTRO 25 atual (registro/linha).

Essa seleção se aplica ao sistema de entroncamento atual do ASTRO 25.

AVISO:

Cada registro das seleções de ID de canal contém parâmetros relacionados à frequência: regras de restrição de frequência de entroncamento para validar todas as frequências de Canal de controle ASTRO 25 OBT ou 700/800/900 MHz e Failsoft inseridas.

Acessado apenas: ((Quando um arquivo de Teclas do sistema de software ou uma Chave de sistema avançada com acesso é selecionada no campo ID do Sistema) ou (uma Chave avançada WACN com acesso é selecionada no campo ID da WACN doméstica)), quando o campo Tipo de sistema estiver definido como **ASTRO 25**, quando o campo [Identificador ativado na página 583](#) estiver ativado para o ID do Canal ASTRO 25 atual (registro/linha) e quando o rádio estiver habilitado para o modelo/a opção.

10.38.3.4

Desvio de transmissão

Este campo permite inserir o valor de desvio de transmissão (em MHz) para o ID do canal ASTRO 25 atual (registro/linha).

Essa seleção se aplica ao sistema de entroncamento atual do ASTRO 25.

AVISO:

Cada registro das seleções de ID de canal contém parâmetros relacionados à frequência: regras de restrição de frequência de entroncamento para validar todas as frequências de Canal de controle ASTRO 25 OBT ou 700/800/900 MHz e Failsoft inseridas.

Acessado apenas: ((Quando um arquivo de Teclas do sistema de software ou uma Chave de sistema avançada com acesso for selecionada no campo ID do sistema) ou (uma Chave avançada WACN com acesso for selecionada no campo ID da WACN doméstica)), quando o campo Tipo de sistema estiver definido como **ASTRO 25** e quando o campo [Identificador ativado na página 583](#) estiver habilitado para o ID do canal ASTRO 25 atual (registro / linha) e quando o rádio estiver habilitado para o modelo/a opção.

10.38.3.5

Espaçamento de canais

Este campo permite inserir o valor de espaçamento de canais para o ID do canal ASTRO 25 atual (registro/linha).

Essa seleção se aplica ao sistema de entroncamento atual do ASTRO 25.

AVISO:

Cada registro das seleções de ID de canal contém parâmetros relacionados à frequência: regras de restrição de frequência de entroncamento para validar todas as frequências de Canal de controle ASTRO 25 OBT ou 700/800/900 MHz e Failsoft inseridas.

Acessado apenas: ((Quando um arquivo de Teclas do sistema de software ou uma Chave de sistema avançada com acesso for selecionada no campo ID do sistema) ou (uma Chave avançada WACN com acesso for selecionada no campo ID da WACN doméstica)), quando o campo Tipo de sistema estiver definido como **ASTRO 25** e quando o campo [Identificador ativado na página 583](#) estiver ativado para o ID do canal ASTRO 25 atual (registro / linha) e quando o rádio estiver ativado para o modelo/a opção.

10.38.3.6

Frequência base

Este campo permite inserir qualquer frequência dentro do intervalo das bandas de frequência do rádio com o valor de Frequência base para o ID do canal ASTRO 25 atual (registro/linha).

AVISO:

Cada registro das seleções de ID de canal contém parâmetros relacionados à frequência: regras de restrição de frequência de entroncamento para validar todas as frequências de Canal de controle ASTRO 25 OBT ou 700/800/900 MHz e Failsoft inseridas.

INFORMAÇÕES:

Depois que os registros/linhas dos parâmetros do ID do canal ASTRO 25 forem definidos, as frequências do Canal de controle do Sistema de entroncamento e as frequências de Failsoft da personalidade de entroncamento poderão ser definidas.

Para que o algoritmo interno seja válido, essa Frequência base deve ter valor igual ou inferior aos valores das frequências do Canal de controle e de Recebimento de Failsoft.

Acessado apenas: Quando o campo Tipo de sistema está definido como **ASTRO 25** e ((quando um arquivo de chaves do sistema de software ou uma chave de sistema avançada com acesso é selecionado(a) no campo ID do sistema) ou (uma chave de WACN avançada com acesso é selecionada no campo ID da WACN inicial)), quando o campo [Identificador ativado na página 583](#) está habilitado para o ID do canal ASTRO 25 atual (registro/linha) e quando o rádio está habilitado para o modelo/para a opção.

Qualquer frequência dentro do alcance da(s) banda(s) de frequência do rádio.

10.38.4

Funções (Sistema de Entroncamento ASTRO 25)

A seção **Funções** do conjunto Sistema de Entroncamento ASTRO 25 permite ao usuário visualizar ou modificar as configurações de dados para sistemas de entroncamento individuais.

OBSERVAÇÃO:

Os Sistemas de entroncamento individuais são referidos como Personalidade de entroncamento. Então, essas configurações de sistemas de entroncamento poderão se tornar funcionais para todos os tipos de canal dessa personalidade de entroncamento.

10.38.4.1

Inibição de rádio

Este campo permite que o rádio receba e responda a um comando de inibição remota enquanto opera no sistema de entroncamento atual.

Esse comando de inibição é enviado pelo despachador. Ao receber esse comando com êxito, o rádio transmite uma confirmação de volta ao equipamento de transmissão e, em seguida, entra em um estado de inatividade. Durante a inibição, o receptor do rádio fica mudo e o caminho de áudio de transmissão é bloqueado; todos os seus controles ficam inoperantes; o modo de verificação é interrompido no canal operacional que recebeu o comando e todos os LEDs do rádio são desligados.

**AVISO:**

Quando o campo Tipo de sistema estiver definido como **ASTRO 25**, quando o campo de **Índice de Perfil ASTRO OTAR** estiver ativado (para o Sistema de entroncamento atual) e quando a Configuração segura **Inibição de rádio via ASTRO OTAR** estiver ativada, esse campo poderá ser desativado. Nesse caso, a Inibição de rádio é realizada "via ASTRO OTAR".

Quando o campo Tipo de sistema estiver definido como **ASTRO 25** e o campo de Índice de perfil ASTRO OTAR estiver desativado (para o sistema de entroncamento atual), esse campo deverá estar ativado. Isso garante que a Inibição de rádio seja possível via Entroncamento de **ASTRO 25**.

Quando o campo **Tipo de sistema** estiver definido como **Tipo II** e quando o valor do ID do sistema do Sistema de entroncamento corresponde ao campo ID da chave de um dos Arquivos de chave de sistema de software ou Chave de sistema avançada (veja o Relatório de chave de sistema) carregadas, esse campo poderá ser desativado. Nesse caso, os comandos de Inibição de Rádio recebidos neste Sistema de Entroncamento serão ignorados, e o rádio continuará a funcionar normalmente.

Quando a Configuração segura **Índice de Perfil de Inibição de Rádio via ASTRO OTAR** estiver ativada e quando o campo de **Índice de perfil ASTRO OTAR** estiver ativado (para o Sistema de entroncamento atual), esse campo poderá ser desativado. Nesse caso, a Inibição de rádio é realizada "via ASTRO OTAR".

Quando o campo de Índice de Perfil ASTRO OTAR está desativado (para o Sistema de Entroncamento atual), esse campo deve ser ativado. Isso garante que a Inibição de rádio seja possível via Entroncamento de **ASTRO 25**.

**INFORMAÇÕES:**

Para apagar esse estado de Inibição no rádio, um comando de desinibição deve ser enviado a ele.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.38.4.2

Serviço de mensagens de texto

Este campo seleciona o modo de Mensagens de texto para o sistema de entroncamento atual.

**OBSERVAÇÃO:**

A Mensagem de texto é acessada ao pressionar o botão Serviço de mensagens de texto ou ao selecionar o menu Serviço de mensagens de texto.

A Mensagem de texto rápida é acessada ao pressionar o botão Mensagem rápida TMS.

A Mensagem de consulta é acessada ao pressionar o botão Consulta TMS.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **ASTRO 25**, quando o sistema de Entroncamento atual tiver um Perfil de dados referenciado e quando a Seleção de perfil de dados não estiver definida como **Dados desativados**.

As seleções a seguir são compatíveis:

Nenhum

O recurso está desativado.

Somente lista

Permite selecionar apenas mensagens de texto na Lista de mensagens de texto rápidas.

Ilimitado

Permite selecionar Mensagens de texto rápidas e inserir sua própria mensagem de texto pelo teclado do rádio.

AVISO:

Essa seleção fica disponível somente em rádios que têm um teclado ou microfone do teclado.

OBSERVAÇÃO:

Esta seleção não se aplica ao APX N70.

10.38.4.3

Nível de potência de TX

Este campo seleciona o nível de potência do rádio para transmitir para o sistema de entroncamento atual.

O pressionamento do botão Baixa energia de transmissão, a alternância da chave Baixa energia de transmissão e a seleção do menu Energia têm prioridade sobre essa configuração quando selecionada por você.

OBSERVAÇÃO:

Durante o Modo de emergência, o rádio transmite automaticamente em alta potência.

A potência de transmissão pode ser reduzida em 1 watt para modelos 800 e em 2 watts para modelos VHF e UHF.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Baixa

Usado para comunicações próximas e para impedir que o rádio transmita para outros grupos geográficos operando na mesma frequência.

Alta

Utilizada quando um sinal mais forte é necessário para estender distâncias de transmissão.

10.38.4.4

Monitor remoto/ativação de rastreamento de rádio

Este campo permite que o rádio decodifique um comando de monitor remoto ou de rastreamento de rádio para o sistema de entroncamento atual.

**AVISO:**

O **Rastreamento de rádio** se aplica somente ao Tipo de sistema **Tipo II**. Além disso, somente para um sistema **Tipo II** e aplicável a **Monitor remoto** e **Rastreamento de rádio**, o rádio é ativado pelo tempo selecionado pelo Monitor remoto/Tempo base da transmissão de rastreamento de rádio.

**OBSERVAÇÃO:**

Para um Tipo de sistema **ASTRO 25**, o tempo de transmissão do rádio dentro do campo é definido por um transmissor e contido no comando de **Monitor remoto** transmitido.

Quando um comando de **Monitor remoto** for recebido, o rádio será ativado automaticamente e transmitirá o áudio ao seu redor por meio do microfone "avançado". Isso é especialmente útil em uma situação de emergência de um usuário com problemas.

O **Monitor remoto** é conhecido também como **Monitor de unidade de rádio**.

Quando um comando de **rastreamento de rádio** for recebido, o rádio será ativado automaticamente e enviará um sinal sem modulação à operadora. Assim, um rádio perdido ou roubado poderá ser recuperado. O **Rastreamento de rádio** se aplica somente ao Tipo de sistema **Tipo II**.

Aplica-se apenas:

Para APX 7000XE e APX 6000, esse recurso se aplica apenas quando a Opção de sistema H43 está disponível no rádio. Além disso, o rádio requer o firmware versão R05.xx.xx ou superior, e o APX deve ser R05.xx.xx ou superior.

Para o APX 6500, esse recurso se aplica apenas quando a Opção de sistema G170 está disponível no rádio. Além disso, o rádio requer o firmware versão R05.xx.xx ou superior, e o APX deve ser R05.xx.xx ou superior.

10.38.4.5

Indicador de Rx do alarme de emergência

Este campo permite que o rádio acione um indicador de áudio ou visual, ou os dois, quando um alarme de emergência é detectado e recebido de outro rádio.

O tipo de Indicador de emergência é determinado pela configuração de Tipo de indicador de recepção de alarme de emergência. Esse recurso se aplica ao Sistema de Entroncamento atual.

**INFORMAÇÕES:**

O tempo do Indicador de recepção do alarme de emergência é de 10 segundos. Durante esses 10 segundos, é possível desativar o indicador pressionando qualquer um dos botões do rádio, exceto Volume e Luz/Inverter (Tela).

Assim que o indicador apaga ou é desativado, os alarmes de emergência repetidos com o mesmo ID individual do sistema de entroncamento são ignorados nos próximos 20 segundos.

Os alarmes de emergência não são detectados enquanto o rádio está no modo de varredura.

Os alarmes de emergência podem não ser detectados sempre que o rádio não estiver monitorando ou decodificando o canal de controle, por exemplo, atividade em um canal de dados ou voz, amostragem de RSSI etc.

Acessado apenas: Quando o campo Tipo de Indicador de Recepção do Alarme de Emergência não estiver definido como **Sem Indicação** e quando o rádio estiver habilitado para o modelo/a opção.

10.38.4.6

LED seguro

Este campo ativa o LED amarelo ocupado sempre que uma chamada de voz segura criptografada for recebida e continua a piscar enquanto a atividade de voz atual for segura.

O LED amarelo ocupado piscará nessas condições, independente de o rádio específico poder desativar a função de mudo do sinal de voz. O LED de segurança se aplica ao Sistema de Entroncamento atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.38.4.7

Seleção da Lista de Alertas de Site Seleccionáveis

Esse campo seleciona a Lista de alertas seleccionáveis de site que será usada com o Sistema de entroncamento ASTRO 25 atual.

OBSERVAÇÃO:

A funcionalidade Lista de Alertas de Site Seleccionáveis é definida na página Lista de Alertas de Site Seleccionáveis.

É possível ativar ou desativar os Alertas seleccionáveis de site selecionando o menu Alerta seleccionável de site. Tanto um único site como todos os disponíveis na Zona podem ser selecionados para ativar ou desativar um Alerta de Site Seleccionável.

Acessado apenas: Quando o campo Tipo de sistema está definido como **ASTRO 25** e quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

- Desabilitado
- Listas de Alertas de Site Seleccionáveis disponíveis

AVISO:

As seleções da lista só podem ser feitas quando o campo [Tipo de cobertura na página 511](#) estiver definido como **Desabilitado** ou quando o campo Tipo de cobertura não estiver definido como **Desabilitado** e quando o campo [Ativação do alias do site na página 533](#) estiver **Habilitado**. Caso contrário, a Lista de seleção será considerada inválida.

10.38.4.8

Ativação do reagrupamento dinâmico

Este campo ativa um grupo de conversação de reagrupamento dinâmico para uma personalidade de entroncamento/canal que faz referência ao sistema de entroncamento atual.

**OBSERVAÇÃO:**

Quando esse campo é habilitado, um [Zona de Reagrupamento dinâmico na página 524](#) e [Canal de reagrupamento dinâmico na página 524](#) devem ser selecionados para esse Sistema de Entroncamento.

**AVISO:**

Uma configuração de Reagrupamento dinâmico só é válida quando uma das Personalidades de entroncamento referentes a um canal tem seu campo Grupo de conversação de entroncamento definido como **DYN** (Reagrupamento dinâmico), e a zona e o canal selecionados dessa Personalidade correspondem às seleções de Zona de reagrupamento dinâmico e ao Canal de reagrupamento dinâmico no Sistema de Entroncamento referido nas Personalidades.

**INFORMAÇÕES:**

Portanto, apenas um canal dentro de determinado Sistema de entroncamento pode ser o de Reagrupamento dinâmico.

É possível solicitar uma nova atribuição de Reagrupamento dinâmico do despachador pressionando o botão Solicitação de reprogramação ou selecionando o menu Solicitação de reprogramação. Os recursos e as configurações reais do grupo de conversação de reagrupamento dinâmico são definidos e transmitidos novamente pelo transmissor.

Para que o grupo de conversação de Reagrupamento dinâmico possa transmitir em modo Seguro, é necessário pressionar o botão Seleção de transmissão segura, ativar/desativar Seleção de transmissão segura ou selecionar o menu Proteger. Caso contrário, as transmissões do grupo de conversação de Reagrupamento dinâmico ficam amarradas à transmissão no modo **Não criptografado**.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.38.4.9

Zona de Reagrupamento dinâmico

Este campo seleciona a zona da personalidade de entroncamento/canal que faz referência ao sistema de entroncamento atual.

**AVISO:**

As zonas de interface de site remoto (RSI) são inválidas e não podem ser selecionadas (zonas que têm o modo RSI ativado).

**OBSERVAÇÃO:**

É possível solicitar uma nova atribuição de Reagrupamento dinâmico do despachador pressionando o botão Solicitação de reprogramação ou selecionando o menu Solicitação de reprogramação. Os recursos e as configurações reais do grupo de conversação de reagrupamento dinâmico são definidos e transmitidos novamente pelo transmissor.

Para que o grupo de conversação de Reagrupamento dinâmico possa transmitir em modo Seguro, é necessário pressionar o botão Seleção de transmissão segura, ativar/desativar Seleção de transmissão segura ou selecionar o menu Proteger. Caso contrário, as transmissões do grupo de conversação de Reagrupamento dinâmico ficam amarradas à transmissão no modo **Não criptografado**.

Quando [Ativação do reagrupamento dinâmico na página 523](#) está **Habilitado**, uma Zona de reagrupamento dinâmico e um [Canal de reagrupamento dinâmico na página 524](#) devem ser selecionados para esse Sistema de Entroncamento.

**AVISO:**

As Zonas selecionadas nesse campo devem ter a opção Zona dinâmica ativada desabilitada; caso contrário, esse campo se tornará inválido.

Uma configuração de reagrupamento dinâmico só é válida quando uma das Personalidades de entroncamento referentes a um canal tem seu campo Grupo de conversação de entroncamento definido como **DYN** (Reagrupamento dinâmico), e a zona e o canal selecionados dessa Personalidade correspondem às seleções de Zona de reagrupamento dinâmico e ao Canal de reagrupamento dinâmico no Sistema de Entroncamento referido nas Personalidades.

**INFORMAÇÕES:**

Portanto, apenas um canal (dentro de determinado sistema de entroncamento) pode ser o de Reagrupamento dinâmico.

Acessado apenas: Quando o campo [Ativação do reagrupamento dinâmico na página 523](#) está definido como **Ativado** e quando o rádio está habilitado para o modelo/para a opção.

10.38.4.10

Canal de reagrupamento dinâmico

Este campo seleciona um canal/personalidade de entroncamento de reagrupamento dinâmico que faz referência ao sistema de entroncamento atual.

Consulte também [Zona de Reagrupamento dinâmico na página 524](#).

**OBSERVAÇÃO:**

É possível solicitar uma nova atribuição de Reagrupamento dinâmico do despachador pressionando o botão Solicitação de reprogramação ou selecionando o menu Solicitação de reprogramação. Os recursos e as configurações reais do grupo de conversação de reagrupamento dinâmico são definidos e transmitidos novamente pelo transmissor.

Para que o grupo de conversação de Reagrupamento dinâmico possa transmitir em modo Seguro, é necessário pressionar o botão Seleção de transmissão segura, ativar/desativar Seleção de transmissão segura ou selecionar o menu Proteger. Caso contrário, as transmissões do grupo de conversação de Reagrupamento dinâmico ficam amarradas à transmissão no modo **Não criptografado**.

Quando [Ativação do reagrupamento dinâmico na página 523](#) está **Habilitado**, uma Zona de reagrupamento dinâmico e um Canal de reagrupamento dinâmico devem ser selecionados para esse Sistema de Entroncamento.

**AVISO:**

Uma configuração de reagrupamento dinâmico só é válida quando uma das Personalidades de entroncamento referentes a um canal tem seu campo Grupo de conversação de entroncamento definido como **DYN** (Reagrupamento dinâmico), e a zona e o canal selecionados dessa Personalidade correspondem às seleções de Zona de reagrupamento dinâmico e ao Canal de reagrupamento dinâmico no Sistema de Entroncamento referido nas Personalidades.

**INFORMAÇÕES:**

Portanto, apenas um canal dentro de determinado Sistema de entroncamento pode ser o de Reagrupamento dinâmico.

**AVISO:**

Para codeplugs Portáteis APX™ 3000, somente os primeiros 48 canais na Zona de reagrupamento dinâmico são considerados seleções válidas.

Acessado apenas: Quando o campo [Ativação do reagrupamento dinâmico na página 523](#) estiver definido como **Habilitado**, quando o campo Zona de reagrupamento dinâmico não estiver definido como uma Zona dinâmica e quando o rádio estiver habilitado para o modelo/a opção.

10.38.4.11

Serviço de mensagem de texto em grupo

Este campo seleciona o modo Serviço de mensagens de texto em grupo para o sistema de entroncamento ASTRO25 atual.

Acessado apenas: Quando o campo Tipo de sistema está definido como **ASTRO 25** e quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Desabilitado

A Mensagem de texto em grupo não será recebida.

Decodificação completa

A Mensagem de texto em grupo será recebida.

10.38.4.12

Frequência de interferência de LTE presente

O aplicativo permite que você visualize (verdadeiro ou falso) quando a tabela de ID do canal ASTRO 25 contém uma Frequência de base de 700 MHz que possa causar interferência em um canal de Banda larga LTE.

Um Perfil de dados referenciado a um Sistema de entroncamento com um Tipo de perfil de dados de **Banda larga** e a Origem da banda larga é **Modem LTE interno** cria um Canal de entroncamento com Banda larga LTE ativada. Portanto, quando a capacidade de Banda larga LTE for o caso, e qualquer Frequência Base na tabela contiver uma frequência na banda de frequência de 700 MHz, esse campo avisará **Verdadeiro** com relação à possível interferência de frequência. Esse recurso se aplica ao Sistema de entroncamento atual do ASTRO 25.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

INFORMAÇÕES:

Essa função só está disponível na Visualização de Especialistas (consulte Visualização do Codeplug).

10.38.4.13

Seleção da lista responsabilidade de equipe

Este campo permite selecionar uma lista de responsabilidade pela equipe a ser usada durante a operação do sistema de entroncamento.

Acessado apenas: Quando o campo Tipo de sistema está definido como **ASTRO 25** e quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

- Desabilitado
- Responsabilidade pela equipe disponível

10.38.4.14

Localização no PTT

O sistema ASTRO 25 permite que os rádios APX transmitam a localização do GPS para a infraestrutura por meio dos quadros de voz, no canal de voz após a operação do PTT.

Isso permite a ativação da localização do rádio transmissor no aplicativo de mapeamento.

AVISO:

Modo ARS deve ser definido como **Servidor aprimorado** no registro do Perfil de dados para evitar Relatório de campos inválidos.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção, quando o campo Tipo de sistema está definido como **ASTRO 25**, quando o Modo ARS está definido como **Servidor aprimorado** em seu perfil de dados e quando o campo [Ativação de localização na página 118](#) está ativado.

10.38.4.15

Atualização de alias do rádio OTA ativada

Permite que o sistema atual atualize o alias de rádio.

Acessado apenas: Quando Ativação do alias de rádio estiver ativado, o Tipo de sistema for **ASTRO 25**, o campo Tipo de alias do rádio OTA não estiver **Desativado** e quando o rádio for compatível com o modelo/a opção.

10.38.4.16

Tipo de alias do rádio OTA

Configura a codificação (transmissão) e decodificação (recebimento) do recurso do Nome do Rádio OTA (Over the Air — Pelo Ar).

**AVISO:**

O rádio não poderá exibir o alias se estiver recebendo IDs duplicados até que a duplicação seja removida. Gravar no rádio fará com que a lista de chamadas retorne ao estado original e todas as atualizações de alias de OTA serão perdidas.

**INFORMAÇÕES:**

Se a atualização de alias de OTA não aparecer no visor, usuário do rádio deve atualizar a lista de chamadas do rádio no RadioCentral ou Gerenciador de provisionamento.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Desabilitado

O rádio não transmite nem recebe os dados do alias do rádio.

Apenas decodificação

Os dados do alias do rádio recebem dados sem limitação.

10.38.4.17

Redefinição do ICUA

Este campo seleciona uma exceção de silenciamento, programada ou manual, para alertas de chamada/páginas de entroncamento quando o canal quando o canal Emudecer voz – Alerta do usuário de chamada recebida é ativado.

O tempo de exceção (programado ou manual) é conhecido como Estado de liberação do silenciador. Para as duas seleções programadas, o campo [Tempo de redefinição automática do ICUA na página 526](#) (para esse Sistema de entroncamento) determina parcialmente por quanto tempo o Estado de liberação do silenciador continuará. O Estado de liberação do silenciador começa quando o recurso Silenciar Alerta do usuário de chamada recebida estiver ativo e o rádio não estiver mudo. Essa seleção se aplica ao Sistema de entroncamento atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Manual

Quando a função Ativação do alerta do usuário de chamada recebida da função Emudecer voz estiver ativa, o botão Emudecer voz for pressionado ou a seleção de menu Emudecer voz desativar Emudecer voz e encerrar o Estado de liberação do silenciador. Pressionar o botão PTT encerrará o estado de liberação do silenciador.

Automático

Se o contador expirar, independentemente de o rádio estar com a função mudo ativada ou não, o Estado de liberação do silenciador será encerrado, e as regras de ativação do Alerta do usuário de chamada recebida da função Emudecer voz serão novamente necessárias para desativar a função mudo de futuras transmissões.

Automático com a operadora

Se a função Mudo do rádio estiver desativada quando o contador expirar devido à Silenciador da Operadora ser atendido, o rádio permanecerá com a função Mudo desativada até que a operadora seja liberada. Após liberar a operadora e o rádio ficar mudo, o contador será reinicializado e reiniciado, estendendo o Estado de Liberação do Silenciador novamente; se o rádio permanecer mudo por um período inteiro de tempo sem substituição da operadora, o Estado de Liberação do Silenciador será encerrado e as regras de Ativação de Alerta de Usuário de Ligação Recebida

da função Emudecer Voz serão novamente necessárias para ativar a função mudo para qualquer transmissão.

10.38.4.18

Tempo de redefinição automática do ICUA

Este campo seleciona uma quantidade de tempo usada durante a exceção de silenciamento das páginas/alertas de chamada de entroncamento quando o canal Emudecer voz – Alerta do usuário de chamada recebida é ativado.

O tempo de exceção é conhecido como Estado de liberação do silenciador. Esse contador é relevante apenas para as duas seleções de tempo programado da Redefinição de ligação recebida. Essa seleção se aplica ao Sistema de entroncamento atual. O tempo é medido em segundos.

Acessado apenas: Quando o campo [Redefinição do ICUA na página 525](#) não está definido como **Manual** e quando o rádio está habilitado para o modelo/para a opção.

Acima 270: Alcance

Mínimo	Máximo	Incrementos
0 s	255 s	1 s

10.38.4.19

LED ocupado

Quando esse campo está ativado, o LED amarelo ocupado pisca sempre que uma chamada de voz é recebida.

OBSERVAÇÃO:

O LED amarelo ocupado continua a piscar enquanto a atividade de voz atual está em andamento.

10.38.5

Alias de Status (Sistema de Entroncamento ASTRO 25)

A seção **Alias de Status** do conjunto Sistema de Entroncamento ASTRO 25 permite ao usuário visualizar ou definir Status para Sistemas de Entroncamento individuais. Os usuários poderão, então, selecionar e transmitir seu Status atual para um despachador (unidade base) pressionando o botão Status, o botão Status Direto ou selecionando o menu Status.

OBSERVAÇÃO:

As transmissões de Status fazem uso mais eficiente de um canal quando comparadas a uma transmissão de voz.

Para modelos sem teclado esse recurso pode ser usado somente com a Função do botão de um toque.

AVISO:

Esse recurso se aplica somente quando a Personalidade de entroncamento que faz referência a esse sistema de entroncamento tem o campo Ativação de status habilitado.

Cada Alias de status deve ser configurado de forma idêntica (ou com o mesmo significado) para o despachador e as unidades portáteis ou móveis. Ou seja, o Alias de status 1 da unidade de transmissão deve ser idêntico ao Alias de status 1 da unidade portátil ou móvel (ou ter o mesmo significado).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.38.5.1

Ativação do alias de status

Este campo ativa a habilidade de definir o Status para o sistema de entroncamento atual.

AVISO:

Esse recurso se aplica somente quando a Personalidade de entroncamento que faz referência a esse sistema de entroncamento tem o campo Ativação de status habilitado.

Após ativá-lo, você deve configurar cada Alias de status de rádio (Nome de alias de status e Número de alias de status do mesmo registro/linha) para que correspondam exatamente (ou tenham o mesmo significado) do Alias de status da unidade do despachador correspondente.

Depois de definido, você pode acessar o recurso Status ao pressionar o botão Status, o botão Status direto ou com a seleção do menu Status.

Para modelos sem teclado, o recurso Status pode ser usado somente com o recurso Botão de um toque.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.38.5.2

Número do alias de status

Este campo seleciona um número que identifica o Status atual.

Essa seleção se aplica ao Status atual (registro/linha) que se aplica ao sistema de entroncamento atual.

AVISO:

- Esse recurso se aplica somente quando a personalidade de entroncamento que faz referência a esse sistema de entroncamento tem o campo Ativação de status ativado.
- Depois de definido, você pode acessar o recurso Status ao pressionar o botão Status, o botão Status direto ou com a seleção do menu Status.

INFORMAÇÕES:

O alias de status deve ser configurado de forma idêntica (ou com o mesmo significado) para o transmissor e as unidades portáteis ou móveis. Ou seja, o Alias de status 1 da unidade de transmissão deve ser idêntico ao Alias de status 1 da unidade portátil ou móvel (ou ter o mesmo significado).

Acessado apenas: Quando o campo [Ativação do alias de status na página 531](#) estiver ativado e quando o rádio estiver habilitado para o modelo/a opção.

10.38.5.3

Texto do alias de status

Este campo permite definir nomes reconhecíveis para o Status atual (registro/linha).

Essa seleção se aplica ao sistema de entroncamento atual.

OBSERVAÇÃO:

- Esse recurso se aplica somente quando a Personalidade de entroncamento que faz referência a esse sistema de entroncamento tem o campo Ativação de status habilitado.
- Depois de definido, você pode acessar o recurso Status ao pressionar o botão Status, o botão Status direto ou com a seleção do menu Status.

INFORMAÇÕES:

O alias de status deve ser configurado de forma idêntica (ou com o mesmo significado) para o transmissor e as unidades portáteis ou móveis. Ou seja, o Alias de status 1 da unidade de transmissão deve ser idêntico ao Alias de status 1 da unidade portátil ou móvel (ou ter o mesmo significado).

Acessado apenas: Quando o campo [Ativação do alias de status na página 531](#) estiver ativado e quando o rádio estiver habilitado para o modelo/a opção.

OBSERVAÇÃO:

É possível usar caracteres, números, espaços e caracteres especiais.

São permitidos no máximo 14 caracteres.

Exemplos: STATUS-01, Electric1, #510

10.38.6

Alias do Site (Sistema de Entroncamento do ASTRO 25)

A seção **Alias do Site** do conjunto do Sistema de Entroncamento ASTRO 25 permite ao usuário visualizar ou definir aliases de rádio simples para identificar Sistemas de Entroncamento ou sites individuais dentro desses Sistemas que um rádio pode encontrar enquanto faz o roaming entre sites, Sistemas de Entroncamento ou até mesmo WACNs (Wide Area Communications Networks, Redes de Comunicações de Área Ampla). Os Alias também podem identificar chamadas (por meio das IDs de PTT) recebidas de rádios fora do Sistema de Entroncamento do rádio selecionado (doméstico).

INFORMAÇÕES:

Apenas os Aliases de site definidos no Sistema de entroncamento atualmente selecionados pelo usuário estarão disponíveis para o rádio.

OBSERVAÇÃO:

O Tipo de alias do site determina o que está sendo atribuído ao Texto de alias do site. Pode ser um Sistema de entroncamento ou um site dentro de um sistema.

INFORMAÇÕES:

Um Sistema de Entroncamento sempre é definido por seu Número de WACN RAS Doméstico e pelo Número de Sistema, enquanto que um site é definido por combinações específicas de seu Número de WACN RAS Doméstico, pelo Número de Sistema, Número de Alias RFSS e pela ID do Site, dependendo do Tipo de Abordagem e do Tipo de Sistema do Sistema de Entroncamento atual.

A visualização do Alias do site atual e seu RSSI (Received Signal Strength Indicator, indicador de potência do sinal recebido) ou alteração do site atual é ativada pelo usuário do rádio ao pressionar o botão Exibir/Procurar site. Um pressionamento de botão Bloquear/Desbloquear site ativado pelo usuário ou uma seleção de menu de Site pode exibir ou alterar o status de bloqueio do site atual.

Os Sistemas de entroncamento individuais são referidos como Personalidade de entroncamento. Então, essas configurações de sistemas de entroncamento poderão se tornar funcionais para todos os tipos de canal dessa personalidade de entroncamento.

10.38.6.1

Ativação do alias do site

Esse campo ativa os campos Alias do site para o ID do site atual (registro/linha), que também se aplica ao sistema de entroncamento atual.

OBSERVAÇÃO:

A visualização do Alias do site atual e seu RSSI (Received Signal Strength Indicator, indicador de potência do sinal recebido) ou alteração do site atual é ativada pelo usuário do rádio ao pressionar o botão Exibir/Procurar site.

Um pressionamento do botão Bloquear/Desbloquear Site ou uma seleção de menu de Site pode exibir ou alterar o status de bloqueio do site atual.

OBSERVAÇÃO:

A AMSS (Automatic Multiple Site Select, seleção automática de vários locais não é suportada neste produto.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **Tipo II**, quando o campo [Tipo de cobertura na página 511](#) estiver definido como **SmartZone** e quando o rádio estiver habilitado para o modelo/a opção,

Ou quando o campo Tipo de sistema estiver definido como **ASTRO 25**, quando o campo Tipo de cobertura não estiver definido como **Desativado** e quando o rádio estiver habilitado para o modelo/a opção.

10.38.6.2

Número do alias de RFSS

Este campo permite inserir (em formato decimal) o número RFSS (Radio Frequency Sub-System, subsistema de radiofrequência) que corresponde ao ID do site atual (registro/linha).

Para oferecer suporte ao roaming entre RFSSs diferentes dentro de um sistema de entroncamento, cada RFSS deve ter um número único. Um RFSS é composto por um ou mais sites. Essa seleção também se aplica ao sistema de entroncamento atual.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **ASTRO 25**, quando o campo Tipo de cobertura estiver definido como **SmartZone e OmniLink** ou **Roaming Intra-WACN** ou **Roaming Inter-WACN**, quando o campo [Ativação do alias do site na página 533](#) estiver ativado, quando o campo [Tipo de alias do site na página 599](#) estiver definido como **Site** e quando o rádio estiver habilitado para o modelo/a opção.

Acima 271: Alcance

Mínimo	Máximo
1	254

10.38.6.3

ID do site

Este campo permite inserir (em formato decimal ou hexadecimal) o número de ID que identifica o site para o atual (registro/linha).

Para suportar o roaming entre sites diferentes, cada ID de Site deve ser único dentro do RFSS. Essa seleção também se aplica ao sistema de entroncamento atual.

Acessado apenas: Quando o campo [Ativação do alias do site na página 533](#) estiver ativado, quando o campo Tipo de sistema estiver definido como **Tipo II**, quando o campo Tipo de cobertura estiver definido como **SmartZone** e quando o rádio estiver habilitado para o modelo/a opção,

Ou quando o campo [Ativação do alias do site na página 533](#) estiver ativado, e quando o campo [Tipo de alias do site na página 599](#) estiver definido como **Site**, e quando o campo Tipo de sistema estiver definido como **ASTRO 25** e quando o campo Tipo de cobertura não estiver definido como **Desativado**, e quando o rádio estiver habilitado para o modelo/a opção.

Acima 272: Alcance

Mínimo	Máximo
0 (Hex)	FE (Hex)

10.38.6.4

Texto do alias de local

Este campo permite definir nomes reconhecíveis para o Alias do site atual (registro/linha) que se aplica ao sistema de entroncamento atual.

Consulte também [Tipo de alias do site na página 599](#). Você pode ativar o Texto do alias do site pressionando o botão Exibir/Pesquisar do site, pressionando o botão Bloquear/Desbloquear do site e com os recursos de seleção do menu Site.

Acessado apenas: Quando o campo [Ativação do alias do site na página 533](#) estiver ativado, quando o campo Tipo de sistema estiver definido como **Tipo II**, quando o campo Tipo de cobertura estiver definido como **SmartZone** e quando o rádio estiver habilitado para o modelo/a opção,

Ou quando o campo [Ativação do alias do site na página 533](#) estiver ativado, e quando o campo Tipo de sistema estiver definido como **ASTRO 25**, e quando o campo Tipo de cobertura não estiver definido como **Desativado**, e quando o rádio estiver habilitado para o modelo/a opção.

OBSERVAÇÃO:

É possível usar caracteres, números, espaços e caracteres especiais.

São permitidos no máximo 14 caracteres.

Exemplos: EMT-001, #500, Electric1, alias de local 01

10.38.6.5

Tipo de alias do site

Este campo seleciona a atribuição do Texto do alias do site para um sistema de entroncamento ou para um site dentro de um sistema.

Você pode visualizar o alias do site atual do rádio ou o alias do sistema pressionando o botão Exibir/Pesquisar do site. Essa seleção se aplica ao alias do site atual (registro/linha), que se aplica ao sistema de entroncamento atual.

Acessado apenas: Quando o Tipo de sistema estiver definido como **ASTRO 25**, quando o campo Tipo de cobertura não estiver definido como **Desativado**, quando o campo [Ativação do alias do site na página 533](#) estiver ativado e quando o rádio estiver habilitado para o modelo/a opção,

As seleções a seguir são compatíveis:

Site

O é usado como o "Alias do site" para o site atualmente registrado do rádio. A seleção de Tipo de cobertura do sistema de entroncamento determina o modo como um site deve ser definido para alias de site.

- Para **SmartZone**, somente o ID do site é necessário.
- Para **SmartZone e OmniLink**, o número do alias de RFSS e o ID do site são necessários.
- Para **Roaming Intra-WACN**, o número do sistema, número do alias de RFSS, e ID do Site são necessários.

- Para **Roaming Inter-WACN**, o número do sistema, número do alias de RFSS, ID do site e número da RAS WACN inicial são necessários.

Sistema

O [Texto do alias de local na página 534](#) é usado como um alias do site para o sistema de entroncamento estrangeiro registrado atualmente registrado do rádio. Os aliases de sistema são definidos por seu número de RAS WACN inicial e número do sistema. Somente o Tipo de cobertura do sistema de entroncamento de **Roaming Inter-WACN** é possível para o Tipo de alias sistema. Os aliases de sistema podem ser usados para criar um ID de PTT ou um alias de site:

- Quando o rádio recebe uma chamada de um rádio externo e um alias de site para o site no sistema de entroncamento especificado não for definido, o alias do sistema e o ID de unidade serão exibidos na tela do rádio receptor para identificar o rádio que fez a chamada. Se um alias de sistema não estiver definido, todo o ID de unidade de rádio (SUID) do rádio estranho aparece na tela do rádio de recepção; o SUID é uma combinação do ID WACN inicial, ID do sistema e ID da unidade.
- Se o rádio tiver em roaming para um sistema de entroncamento estrangeiro no qual nenhum alias de site está disponível para o site atual e, em seguida, esse alias de sistema, o ID do Site e seu respectivo nível do RSSI (Received Signal Strength Indicator, indicador de intensidade do sinal recebido) correspondente aparecer na tela do rádio quando o usuário do rádio pressionar o botão Exibir/Pesquisar do site. Se um alias de sistema não for definido para o sistema estrangeiro atualmente registrado, todo o ID do site (número da RAS WACN doméstico + número do sistema + ID do site + nível de RSSI) será exibida na tela do rádio.

10.38.6.6

Número do sistema

Este campo permite inserir (em formato decimal ou hexadecimal) o ID do sistema que corresponde ao ID do site atual (registro/linha).

Para oferecer suporte ao roaming entre diferentes sistemas de entroncamento que compõem WACNs. Cada sistema de entroncamento terá que possuir um ID do sistema único. Um sistema de entroncamento é composto de um ou mais RFSS. Essa seleção também se aplica ao sistema de entroncamento atual.

Acessado apenas: Quando o rádio estiver habilitado para o modelo/a opção, e quando o campo [Ativação do alias do site na página 533](#) estiver ativado, e quando o campo Tipo de sistema estiver definido como **ASTRO 25**,

E quando o campo Tipo de cobertura estiver definido como **Roaming intra-WACN** ou **Roaming inter-WACN**, e quando o campo [Tipo de alias do site na página 599](#) estiver definido como **Site**,

Ou quando o campo Tipo de cobertura não estiver definido como **Desativado**, e quando o campo [Tipo de alias do site na página 599](#) estiver definido como **Sistema**.

Acima 273: Alcance

Mínimo	Máximo
000 (Hex)	FFE (Hex)

INFORMAÇÕES:

Um valor "0" faz com que o rádio copie o valor do campo ID do sistema do sistema de entroncamento atual para esse campo.

10.38.6.7

Número da RAS WACN doméstica

Este campo permite inserir (em formato decimal ou hexadecimal) o ID da WACN (Wide Area Communications Network, rede de comunicações de área ampla) do RAS (Remote Access Server, servidor de acesso remoto) doméstico que corresponde ao ID do site atual (registro/linha).

Para suportar o roaming entre WACNs diferentes, (consulte também Roaming intra-WACN), cada WACN deve ter um número único. Uma WACN é composta por um ou mais sistemas de entroncamento. Essa seleção também se aplica ao sistema de entroncamento atual.

Acessado apenas: Quando o rádio estiver habilitado para o modelo/a opção, quando o campo [Ativação do alias do site na página 533](#) estiver ativado, quando o campo Tipo de sistema estiver definido como **ASTRO 25** e

Quando o campo Tipo de cobertura estiver definido como **Roaming inter-WACN**, e quando o campo [Tipo de alias do site na página 599](#) estiver definido como **Site**,

Ou quando o campo Tipo de cobertura não estiver definido como **Desativado**, e quando o campo [Tipo de alias do site na página 599](#) estiver definido como **Sistema**.

Acima 274: Alcance

Mínimo	Máximo
00000 (Hex)	FFFFE (Hex)

**INFORMAÇÕES:**

Padrão de fábrica = 1. Um valor "0" faz com que o rádio copie o valor do campo ID WACN doméstico para o sistema de entroncamento para esse campo.

10.38.7

One Touch

Essa seção permite visualizar ou definir as seleções **Recurso** e **Índice** específicas do botão One Touch para até quatro pressionamentos de botão One Touch ou seleções de opções de menu no One Touch.

O One Touch permite criar menus de navegação e atalhos de botão. Esses atalhos podem diminuir muito o esforço envolvido na ativação de um recurso do rádio.

Um pressionamento do botão ou a seleção de um item de menu no One Touch pode reduzir a ativação de um recurso do rádio ao pressionamento de um botão. Sem esse recurso, o processo pode exigir muitas etapas de navegação do menu. Essas seleções se aplicam ao Sistema de Entroncamento atual.

**OBSERVAÇÃO:**

Os Sistemas de entroncamento individuais são referidos como Personalidade de entroncamento. Então, essas configurações de sistemas de entroncamento poderão se tornar funcionais para todos os tipos de canal dessa personalidade de entroncamento.

10.38.7.1

Botão

Exibe somente a visualização do nome atribuído para o pressionamento do botão Um toque ou seleção do menu Um toque.

**OBSERVAÇÃO:**

Os Sistemas de entroncamento individuais são referidos como Personalidade de entroncamento. Então, essas configurações de sistemas de entroncamento poderão se tornar funcionais para todos os tipos de canal dessa personalidade de entroncamento.

10.38.7.2

Função do botão de um toque

Este campo seleciona o recurso Um toque para o pressionamento do botão Um toque ou a seleção do menu Um toque.

Essa seleção se aplica ao registro/linha atual, que se aplica ao Sistema de entroncamento atual.

**INFORMAÇÕES:**

O Botão 1 de entroncamento de Um toque (em outras palavras, o primeiro registro/linha) corresponderia ao pressionamento do botão Um toque 1 e/ou à seleção do menu (TCH1 ou SIG1) e assim por diante.

**OBSERVAÇÃO:**

Em qualquer uma dessas seleções de Função, a seleção de Índice do Botão de um toque também deve ser definida.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Desabilitado

A função Um toque não está disponível para a seleção de Botão atual.

Phone

A função [Operação do telefone na página 568](#) é definida como **Somente lista** ou **Ilimitado** para a Personalidade de entroncamento mencionada.

Chamada privada

O [Tipo de chamada privada na página 565](#) não está **Desativado**, e o campo [Operação de chamada privada na página 565](#) é definido como **Somente lista** ou **Ilimitado** para a Personalidade de entroncamento mencionada.

Alerta de Chamada.

O campo [Alerta de chamada/operação da página na página 566](#) é definido como **Somente lista** ou **Ilimitado** para a Personalidade de entroncamento mencionada.

Status

A função [Ativação do alias de status na página 531](#) está habilitada para o Sistema de entroncamento atual.

Message

A função Mensagem está habilitada para o Sistema de entroncamento atual.

**OBSERVAÇÃO:**

As seleções disponíveis da Função do botão de um toque são dependentes do modelo/da opção.

10.38.7.3

Índice do botão Um toque

Este campo seleciona Índice do botão Um toque/Membro da lista de para você pressionar o botão Um toque ou selecionar o menu Um toque, pertencente à Função do botão Um toque selecionada.

Índice refere-se ao registro/linha real da lista determinado pela seleção da função do botão Um toque. Essa seleção se aplica ao Sistema de entroncamento atual.

**INFORMAÇÕES:**

O Botão 1 de entroncamento de Um toque – primeiro registro/linha – corresponderá ao pressionamento do botão 1 de Um toque e à seleção do menu TCH1 ou SIG1.

Acessado apenas: Quando o campo [Função do botão de um toque na página 535](#) do atual registro/linha não está definido como **Desativado**, e quando o rádio está habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Chamada privada

Este número de Índice correlaciona-se ao número da linha da Lista de prioridade de chamada Tipo II ou ASTRO 25.

INFORMAÇÕES:

A seleção [Lista de prioridades de chamada de entroncamento na página 566](#) determina qual Lista de prioridade de chamada será usada para a Personalidade de entroncamento mencionada.

Disponível para você quando [Tipo de chamada privada na página 565](#) não estiver **Desativado** e o campo [Operação de chamada privada na página 565](#) estiver definido como **Somente lista** ou **Ilimitado** para a Personalidade de entroncamento mencionada.

Alerta de Chamada.

Este número de Índice correlaciona-se ao número da linha da Lista de prioridade de chamada Tipo II ou ASTRO 25.

INFORMAÇÕES:

A Lista de prioridade de chamada de entroncamento especifica qual Lista de prioridade de chamada é usada para a Personalidade de entroncamento mencionada.

Disponível para você quando o campo [Alerta de chamada/operação da página na página 566](#) estiver definido como **Somente lista** ou **Ilimitado** para a Personalidade de entroncamento mencionada.

Phone

Este número de Índice correlaciona-se ao número da linha da Lista de prioridade de chamada telefônica.

Disponível para você quando o recurso [Operação do telefone na página 568](#) estiver definido como **Somente lista** ou **Ilimitado** para a Personalidade de entroncamento mencionada.

Status

Este número de Índice está correlacionado à posição/número da linha dos membros da Lista de alias de status.

Disponível para você quando o recurso [Ativação do alias de status na página 531](#) estiver **Ativado** para o Sistema de entroncamento atual.

Message

Este número de Índice está correlacionado à posição/número da linha dos membros da Lista de alias de mensagem.

Disponível para você quando o recurso de Mensagem estiver **Ativado** para o Sistema de entroncamento atual.

10.38.8

ASTRO 25

Esta seção permite visualizar ou modificar a funcionalidade básica usada durante a operação no modo ASTRO 25.

Essas configurações se aplicam a sistemas de entroncamento individuais.

OBSERVAÇÃO:

Os Sistemas de entroncamento individuais são referidos como Personalidade de entroncamento. Então, essas configurações de sistemas de entroncamento poderão se tornar funcionais para todos os tipos de canal dessa personalidade de entroncamento.

10.38.8.1

Recursos proprietários da Motorola

Este campo permite que as transmissões de ISP (Inbound Signaling Packet, pacote de sinalização de entrada) proprietárias da Motorola sejam enviadas pelo rádio.

Esse recurso se aplica ao Sistema de Entroncamento atual.

Acessado apenas: Quando o campo Tipo de sistema está definido como **ASTRO 25** e quando o rádio está habilitado para o modelo/para a opção.

10.38.8.2

Comprimento da sequência ISP

Este campo seleciona o tempo máximo permitido por site para uma sequência de repetição de ISP (Inbound Signaling Packet, pacote de sinalização de entrada).

O rádio fará cinco novas tentativas ou continuará tentando até que esse tempo expire, o que ocorrer primeiro. Essa seleção se aplica ao Sistema de entroncamento atual. O tempo é medido em segundos.

Acessado apenas: Quando o campo Tipo de sistema está definido como **ASTRO 25** e quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

Quando definido como **Infinito**, o temporizador não expirará.

Acima 275: Alcance

Mínimo	Máximo	Incrementos
10 (segundo)	255 (segundos)	1 (segundo)

10.38.8.3

Tamanho máximo do slot

Este campo seleciona o tamanho máximo do slot ISP (Inbound Signaling Packet, pacote de sinalização de entrada) que o rádio pode usar.

INFORMAÇÕES:

Esse valor não pode ser maior do que o tamanho do slot permitido pelo sistema.

OBSERVAÇÃO:

Esse valor é usado para acelerar o processo de localização do slot do firmware do rádio. Essa seleção se aplica ao Sistema de entroncamento atual. O tempo é medido em milissegundos.

Acessado apenas: Quando o campo Tipo de sistema está definido como **ASTRO 25** e quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

Quando definido como **Ilimitado**, o tamanho do slot é ilimitado.

Acima 276: Alcance

Mínimo	Máximo	Incrementos
37,5 (milissegundos)	142,550 (milissegundos)	7,5 (milissegundos)

10.38.8.4

Forçar hora de desativação da função mudo

Este campo seleciona o tempo máximo que o rádio permanece silenciado para receber áudio antes do atraso da taxa de transferência do sistema.

O contador é iniciado assim que o rádio envia uma transmissão. Se o firmware do rádio confirmar por outros meios que o áudio de entrada não é o dele, esse tempo será desconsiderado. Essa seleção se aplica ao Sistema de entroncamento atual. O tempo é medido em milissegundos.

Acessado apenas: Quando o campo Tipo de sistema está definido como **ASTRO 25** e quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

Quando definido como **imediate**, que significa 0 (Tempo zero), não há tempo da função mudo após a transmissão.

Acima 277: Alcance

Mínimo	Máximo	Incrementos
250 (ms)	6375 (ms)	25 (ms)

10.38.8.5

Proteção contra falha rápida

Este campo seleciona a quantidade de tempo que o rádio permanece no canal de controle após a sincronização ser perdida e antes de tentar a sincronização novamente.

Isso permite que o tempo do rádio recupere o sinal sem uma nova sincronização total do canal. Essa seleção se aplica ao Sistema de entroncamento atual. O tempo é medido em milissegundos.

Acessado apenas: Quando o campo Tipo de sistema está definido como **ASTRO 25** e quando o rádio está habilitado para o modelo/para a opção.

Acima 278: Alcance

Mínimo	Máximo	Incrementos
200 ms	6375 ms	25 ms

10.38.8.6

Tempo do aviso de PTT

Este campo seleciona o tempo que o rádio aguarda antes de emitir um Tom de proibição de fala para avisar que uma solicitação PTT está sendo processada e você deve soltar o botão PTT.

Essa seleção se aplica ao Sistema de entroncamento atual. O tempo é medido em milissegundos.

Acessado apenas: Quando o campo Tipo de sistema está definido como **ASTRO 25** e quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

Quando definido como **Desativado**, nenhum aviso é emitido.

Acima 279: Alcance

Mínimo	Máximo	Incrementos
0 ms	6375 ms	25 ms

10.38.8.7

Tempo de atualização ocupada

Este campo seleciona o tempo que o rádio aguarda no estado ocupado por uma atualização de concessão, rejeição ou outra atualização ocupada do FNE (Fixed Network Equipment equipamento de rede fixo).

Se esse tempo expirar, o rádio não esperará mais uma resposta do FNE e tentará a transmissão novamente. Essa seleção se aplica ao Sistema de entroncamento atual. O tempo é medido em segundos.

Acessado apenas: Quando o campo Tipo de sistema está definido como **ASTRO 25** e quando o rádio está habilitado para o modelo/para a opção.

**OBSERVAÇÃO:**

Quando definido como **Infinito**, o rádio aguarda indefinidamente uma resposta.

Acima 280: Alcance

Mínimo	Máximo	Incrementos
150 (segundos)	945 (segundos)	15 (segundos)

10.38.8.8

Tempo de resposta pendente

Este campo seleciona o tempo que o rádio aguarda uma resposta a uma solicitação do FNE (Fixed Network Equipment, equipamento de rede fixo).

Essa situação ocorre quando o FNE envia uma indicação ao rádio informando que sua solicitação está sendo processada e que outras sinalizações estão a caminho. Se esse tempo expirar, o rádio não esperará mais uma resposta do FNE e voltará ao estado inativo. Essa seleção se aplica ao Sistema de entroncamento atual. O tempo é medido em segundos.

Acessado apenas: Quando o campo Tipo de sistema está definido como **ASTRO 25** e quando o rádio está habilitado para o modelo/para a opção.

**OBSERVAÇÃO:**

Quando definido como **Infinito**, o rádio aguarda indefinidamente uma resposta do FNE.

Acima 281: Alcance

Mínimo	Máximo	Incrementos
10 (segundo)	255 (segundos)	1 (segundo)

10.38.8.9

ID do RCM padrão

Este campo seleciona o endereço do RCM (Radio Control Manager, gerenciador de controle de rádio) usado como o endereço de destino das transmissões de ISP (Inbound Signaling Packet, pacote de sinalização de entrada) direcionadas para o FNE (Fixed Network Equipment, equipamento de rede fixo), por exemplo, transmissões de status e mensagens.

Essa seleção se aplica ao Sistema de entroncamento atual.

Acessado apenas: Quando o campo Tipo de sistema está definido como **ASTRO 25** e quando o rádio está habilitado para o modelo/para a opção.

Acima 282: Alcance

Mínimo	Máximo
000000 (Hex)	FFFFFF (Hex)

10.38.8.10

Capacitado para voz fase 2

Este campo permite que o rádio transmita em um sistema de entroncamento que oferece suporte a comunicações de voz compatíveis com TDMA (Time Division Multiple Access, acesso múltiplo por divisão de tempo) Fase 2 padrão do Projeto 25.

OBSERVAÇÃO:

O TDMA Fase 2 utiliza um protocolo TDMA de dois slots em um canal de 12,5 kHz, que permite a capacidade de voz em dobro comparada à implementação de FDMA (Frequency Division Multiple Access, acesso múltiplo de divisão de frequência) Fase 1. Essa seleção se aplica ao Sistema de entroncamento atual.

Acessado apenas: Quando o campo Tipo de sistema está definido como **ASTRO 25** e quando o rádio está habilitado para o modelo/para a opção.

10.38.8.11

Transmissão final de TDMA fase 2 fora do intervalo

Este campo permite que o rádio interrompa uma transmissão TDMA (Time Division Multiple Access, acesso múltiplo por divisão de tempo) de Fase 2 em andamento.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

Essa função também alerta que, durante a transmissão, o rádio fez roaming fora da faixa de cobertura do Equipamento de rede fixo (FNE). Um tom de alerta sonoro persiste enquanto o botão PTT estiver pressionado. Essa seleção se aplica ao Sistema de entroncamento atual.

Acessado apenas: Quando o campo Tipo de Sistema estiver definido como **ASTRO 25**, e quando o campo estiver [Capacitado para voz fase 2 na página 607](#) **Ativado**.

10.38.8.12

Validar NAC em Relação ao ID do Sistema

Este campo faz com que o rádio valide os 8 bits superiores do ID do sistema de 16 bits em relação aos 8 bits superiores do NAC (Network Access Code, código de acesso à rede) de 12 bits recebidos no Entroncamento – Canal de controle.

Se uma correspondência não for encontrada, o rádio não tentará registrar-se/afiliar-se ao local de Entroncamento. Portanto, a habilitação desse campo permite que o rádio faça a correspondência rápida de um código NAC com seu ID do sistema e rejeite rapidamente a interferência dos canais de controle do Sistema de Entroncamento. Essa seleção se aplica ao Sistema de entroncamento atual.

AVISO:

Se algum local no Sistema de Entroncamento não estiver configurado dessa forma, esse campo deverá ser desabilitado.

Quando desabilitado, o rádio não tenta fazer a correspondência dos 8 bits superiores do ID do sistema de 16 bits com os 8 bits superiores do código NAC de 12 bits. Isso permite que o rádio opere nos canais de controle que tenham um NAC que seja independente desse ID do Sistema de

entroncamento. O rádio pode levar mais tempo para rejeitar a interferência dos canais de controle do Sistema de Entroncamento. Essa seleção se aplica ao Sistema de entroncamento atual.

**AVISO:**

Quando o campo [Tipo de cobertura na página 511](#) estiver definido como **Roaming Inter-WACN**, essa seleção deve ser desativada; do contrário essa seleção é considerada inválida.

Quando o campo [Tipo de cobertura na página 511](#) estiver definido como **Roaming Intra-WACN**, o campo Ativação de hardware DVRS estiver habilitado, essa seleção deve ser desativada; do contrário essa seleção será considerada inválida.

Acessado apenas: Quando o campo Tipo de sistema está definido como **ASTRO 25** e quando o rádio está habilitado para o modelo/para a opção.

10.38.8.13

Suporte à validade WUID

Este campo faz com que o rádio revalide periodicamente seu WUID (Working Unit ID, ID de unidade de trabalho) com o FNE (Fixed Network Equipment, equipamento de rede fixo).

Um WUID é atribuído a um rádio durante sua atividade inicial de registro/afiliação; qualquer solicitação Pacote de sinalização de entrada (ISP) para o FNE que contiver o WUID do rádio o revalidará com seu Sistema de Entroncamento atual no campo.

**INFORMAÇÕES:**

Essa seleção é exigida apenas para um FNE que dependa do rádio para rastrear períodos de inatividade e revalidar seu WUID antes que expire. Essa seleção se aplica ao Sistema de entroncamento atual.

Quando desativado, o rádio não revalida automaticamente seu WUID porque ele está esperando o tipo de FNE que consulta o rádio após um período de inatividade antes de cancelar o registro e remover o WUID do Sistema de Entroncamento.

**AVISO:**

Quando o campo [Tipo de cobertura na página 511](#) estiver definido como **Roaming Inter-WACN**, essa seleção deve ser desativada; do contrário essa seleção é considerada inválida.

Acessado apenas: Quando o campo Tipo de sistema está definido como **ASTRO 25** e quando o rádio está habilitado para o modelo/para a opção.

10.38.9

Digital (Sistema de Entroncamento ASTRO 25)

A seção **Digital** do conjunto Sistema de Entroncamento ASTRO 25 permite ao usuário visualizar ou definir funcionalidades de comunicação digital.

**OBSERVAÇÃO:**

Os Sistemas de entroncamento individuais são referidos como Personalidade de entroncamento. Então, essas configurações de sistemas de entroncamento poderão se tornar funcionais para todos os tipos de canal dessa personalidade de entroncamento.

10.38.9.1

Energia adaptável

Este campo permite que o rádio ajuste automaticamente o nível de energia do transmissor no canal de voz, não no canal de controle, com base na intensidade do sinal das informações de APA LC (Auto Power Adaptation Link Control, controle de link de adaptação de desligamento automático) recebidas via Over The Air.

Se a força do sinal for melhor que o limite aceitável, o rádio transmitirá em potência média em vez de potência total. Essa seleção se aplica ao Sistema de entroncamento atual.

OBSERVAÇÃO:

Se você pressionar o botão PTT uma segunda vez dentro de 30 segundos quando o APA estiver ativado para modo seguro F2 TDMA, o rádio transmite em potência média se o nível de potência atual estiver definido para alto. Se o tempo exceder 30 segundos, o nível de energia permanecerá alto.

Acessado apenas: Quando o campo Nível de Potência Tx [Nível de potência de TX na página 520](#) não estiver definido como **Baixo** e quando o rádio estiver habilitado para o modelo/a opção.

10.38.9.2

Duração do preâmbulo

Este campo seleciona um número que determina a quantidade de tempo que os pacotes de preâmbulo de sincronização de bits são enviados no início de todas as transmissões do canal de voz do ASTRO 25 para o sistema de entroncamento atual.

Esses pacotes permitem que os rádios transmissores e receptores se sincronizem entre si antes de uma transmissão do ASTRO 25.

OBSERVAÇÃO:

A duração do Preâmbulo é igual ao valor de Duração do preâmbulo multiplicado por 0,2083 ms.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

[Acima 283: Alcance](#)

Mínimo	Máximo
0	255

10.38.9.3

Transmissão de desvio alto

Este campo permite que o rádio transmita voz e/ou dados do ASTRO com maior desvio.

Um desvio de transmissão elevado é necessário apenas se o rádio for usado em veículos ou aplicativos que sujeitem a unidade a uma velocidade acima de 257 km/h (aprox. 160 mph). Esse recurso se aplica ao Sistema de Entroncamento atual.

AVISO:

Não habilite esse campo a menos que o sistema do rádio físico tenha sido configurado de forma similar e o desvio de transmissão aumentado tenha sido definido como necessário. Habilitar esse parâmetro indiscriminadamente pode resultar em dano severo no desempenho do rádio.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **Tipo II** e o rádio for compatível com o modelo/a opção.

10.38.9.4

Tipo de modulador digital

Este campo seleciona o tipo de modulador digital para o sistema de entroncamento atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

C4FM (Padrão de fábrica para Entroncamento Tipo II)

Modulação de frequência do nível 4 contínua para operação que não é de difusão simultânea.

CQPSK (Padrão de fábrica para Entroncamento ASTRO 25)

Compatível com Modulação em Fase e em Quadratura para a operação de banda estreita de simulcast e operação não simulcast.

**INFORMAÇÕES:**

Essa seleção está disponível apenas para modelos de rádio equipados com Operação digital CAI (Common Air Interface, interface aérea comum).

TOTAL

Operação de difusão simultânea de banda larga.

**INFORMAÇÕES:**

Essa seleção não poderá ser escolhida se uma Largura de banda de 12,5 kHz for selecionada.

10.38.9.5

Limite BER de sincronização de quadros de TDMA

Este campo seleciona a BER (Bit Error Rate, taxa de erros de bits) de TDMA (Time Division Multiple Access, acesso múltiplo por divisão de tempo) tolerada por um rádio em um canal de voz TDMA X2 ou de Fase 2.

**OBSERVAÇÃO:**

A BER de TDMA é calculada durante a parte de sincronização de quadros de uma transmissão de voz por TDMA. Se uma BER maior do que esse valor máximo for detectada, o rádio tentará alternar para um site melhor, quando disponível. Essa seleção se aplica ao Sistema de entroncamento atual.

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **ASTRO 25**, quando o campo [Capacitado para voz fase 2 na página 607](#) estiver **Ativado**, e quando o rádio estiver habilitado para o modelo/a opção.

Acima 284: Alcance

Mínimo	Máximo	Incrementos
Desabilitado	25,4%	0,1%

10.38.9.6

Limite BER NID/de sinc. de quadros de FDMA

Este campo seleciona a BER (Bit Error Rate, taxa de erro de bits) de sincronização de quadros/NID (Network ID, ID de rede) máxima permitida por FDMA (Frequency Division Multiple Access, acesso múltiplo por divisão de frequência) tolerada por um rádio em um site de entroncamento.

Esse valor máximo se aplica ao canal de controle e ao canal de voz. Se uma BER maior do que esse valor máximo for detectada, o rádio tentará alternar para um site melhor, quando disponível. Essa seleção se aplica ao Sistema de entroncamento atual.

Acessado apenas: Quando o campo [Tipo de cobertura na página 511](#) não está definido como **Desativado** e quando o rádio está habilitado para o modelo/para a opção.

Acima 285: Alcance

Mínimo	Máximo	Incrementos
Desabilitado	25,4%	0,1%

10.38.10

Proteger/Multitecla (Sistema de Entroncamento ASTRO 25)

A seção **Proteger/Multitecla** do conjunto Sistema de Entroncamento ASTRO 25 permite ao usuário visualizar ou definir a funcionalidade de segurança e multitecla para comunicações de transmissão e recepção codificadas seguras. Esta funcionalidade pode ser personalizada todo o Sistema de Entroncamento .

OBSERVAÇÃO:

Os Sistemas de entroncamento individuais são referidos como Personalidade de entroncamento. Então, essas configurações de sistemas de entroncamento poderão se tornar funcionais para todos os tipos de canal dessa personalidade de entroncamento.

10.38.10.1

Padrão de Tx/Rx DES-XL

Este campo ativa apenas o DES-XL digital a ser usado para todas as chamadas de voz protegidas por criptografia.

DES-XL é um padrão de criptografia Tipo 3 (nível médio). Essa seleção se aplica ao Sistema de entroncamento atual.

Quando desabilitado, apenas o DES-OFB (Data Encryption Standard - Output Feedback) é usado para ligações de voz criptografadas seguras. DES-OFB é um padrão de criptografia Tipo 3 (nível médio).

AVISO:

Esse recurso só se aplica quando o rádio for equipado com um módulo de criptografia de algoritmo duplo DES-XL/DES-OFB.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** e o rádio for compatível com o modelo/a opção.

10.38.10.2

ASTRO OTAR

Ativa a capacidade do rádio de receber ASTRO 25 OTAR para o Sistema de entroncamento atual.

INFORMAÇÕES:

Quando esse campo ASTRO OTAR estiver **Ativado** para o Sistema de entroncamento atual, os valores de Seleção de chave de hardware são escolhidos na Lista de referências de chave de criptografia segura de hardware do Perfil de KMF seguro selecionado no campo [Índice de perfil ASTRO OTAR na página 612](#) para o Sistema de entroncamento atual.

AVISO:

Esteja ciente de que o RadioCentral está, na verdade, indicando as Chaves da Lista de chaves de criptografia para essa seleção. As Chaves individuais da Lista de referências de chave de criptografia segura de hardware fazem referência às Chaves da Lista de chaves de criptografia do campo Referência de chave de criptografia. Portanto, todas as chaves selecionadas quando o ASTRO OTAR estiver ativado deverão ser definidas primeiramente na Lista de referências de chave de criptografia segura de hardware.

Quando esse campo ASTRO OTAR estiver **Desativado** no atual Sistema de entroncamento, os valores de Seleção da chave de hardware do sistema de entroncamento será escolhido diretamente da Lista de chaves de criptografia da janela Segurança total.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**, e quando o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) estiver ativado e

quando o campo [Ativação do OTAR na página 296](#) estiver ativado, e

quando o campo [Ativação do ASTRO OTAR na página 297](#) estiver ativado, e
quando o campo ASTRO OTAR estiver habilitado e
quando o Sistema de entroncamento atual tiver um Perfil de dados referenciado, e
quando o rádio está habilitado para o modelo/a opção.

10.38.10.3

Transmissão de OTAR

Este campo permite que o rádio transmita informações sobre ASTRO Over-The-Air-Rekeying (OTAR) para o Sistema de entroncamento atual.

As transmissões OTAR incluem: Solicitações de rechaveamento e Confirmações de atraso.

AVISO:

Sua capacidade de iniciar Solicitações de alteração de chave deve ser programada.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**, e quando o campo [Padrão de criptografia avançada \(AES256\) na página 295](#) estiver ativado e

quando o campo Operação OTAR estiver definido como **Somente ASTRO** ou **ASTRO e MDC**, e

quando o campo Tipo de sistema estiver definido como **ASTRO 25**, e

quando o Índice de Perfil ASTRO OTAR está ativado e

quando o Sistema de entroncamento atual tiver um Perfil de dados referenciado, e

quando o rádio está habilitado para o modelo/a opção.

10.38.10.4

Índice de perfil ASTRO OTAR

Este campo seleciona o perfil de KMF seguro a ser usado durante a operação no modo ASTRO OTAR.

Essa seleção se aplica ao Sistema de entroncamento atual.

OBSERVAÇÃO:

Todos os parâmetros do ASTRO OTAR especificados no perfil de KMF selecionado se aplicam ao Sistema de entroncamento atual.

AVISO:

Este campo é inválido quando esse sistema faz referência a um Perfil de dados com Tipo de perfil de dados de **Entroncamento**, **Entroncamento e banda larga** ou **Apenas banda larga**, e quando o campo Endereço IP do KMF for definido como 0.0.0.0.

INFORMAÇÕES:

Quando o campo [ASTRO OTAR na página 611](#) estiver **Desativado** para o Sistema de entroncamento atual, os valores de Seleção da chave de hardware serão escolhidos diretamente da Lista de chaves de criptografia da janela Segurança total.

Quando o campo ASTRO OTAR estiver **Ativado** para o Sistema de entroncamento atual, os valores de Seleção de chaves de hardware para esse Sistema usarão a Lista de referências de chave de criptografia segura de hardware do Perfil de KMF seguro selecionado neste campo [Índice de perfil ASTRO OTAR na página 612](#) para o Sistema de entroncamento atual.

AVISO:

Esteja ciente de que ele está, na verdade, indicando as Chaves da lista de chaves de criptografia para essa seleção. As chaves individuais da lista de referências de chave de criptografia segura de hardware fazem referência às chaves da lista de Chaves de criptografia do campo Referência de chave de criptografia. Portanto, todas as chaves selecionadas quando o ASTRO OTAR estiver ativado deverão ser definidas primeiramente na Lista de referências de chave de criptografia segura de hardware.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software** e [Padrão de criptografia avançada \(AES256\) na página 295](#) estiver ativado e quando o campo Operação OTAR estiver definido como **Somente ASTRO** ou **ASTRO e MDC**, e quando o Tipo de sistema for **ASTRO 25**, e

quando o Sistema de entroncamento atual tiver um Perfil de dados mencionado e o rádio for compatível com o modelo/a opção

As seleções a seguir são compatíveis:

Desabilitado

Perfis ASTRO OTAR

10.38.10.5

Seleção de chave de patch

Esse campo seleciona a chave de criptografia segura a ser usada durante comunicações de Grupo de conversação de patch enquanto opera no modo de criptografia segura.

Os Grupos de conversação de patch permitem que um despachador una vários grupos de conversação ou usuários para que todos possam se comunicar como um único grupo de conversação. Essa seleção se aplica ao Sistema de entroncamento atual.

**INFORMAÇÕES:**

Quando o campo [ASTRO OTAR na página 611](#) estiver **Ativado** para o Sistema de Entroncamento atual, o valor desta Seleção de Chave será escolhido na Lista de Referências de Chaves de criptografia Segura de Hardware do Perfil do KMF Seguro selecionado no campo [Índice de perfil ASTRO OTAR na página 612](#) para o Sistema de Entroncamento atual.

**AVISO:**

Esteja ciente de que ele está, na verdade, indicando as Chaves da Lista de chaves de criptografia para essa seleção. As Chaves individuais da Lista de referências de chave de criptografia segura de hardware fazem referência às chaves da Lista de chaves de criptografia do campo Referência de chaves de criptografia. Portanto, todas as chaves selecionadas quando o ASTRO OTAR estiver ativado deverão ser definidas primeiramente na Lista de referências de chave de criptografia segura de hardware.

Quando esse campo ASTRO OTAR estiver **Desativado** no atual Sistema de entroncamento, os valores de Seleção da chave de hardware do sistema de entroncamento será escolhido diretamente da Lista de chaves de criptografia da janela Segurança total.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** e o rádio for compatível com o modelo/a opção,

Ou quando o campo [Operação segura na página 294](#) estiver definido como **Software**, o campo Tipo de sistema estiver definido como **ASTRO 25** e o rádio for compatível com o modelo/a opção.

10.38.10.6

Proteger/remover ligação de failsoft

Este campo seleciona o tipo de ligação usada para Failsoft.

Quando o rádio está habilitado para o modelo/para a opção.

Selecionar

Permite ativar ou desativar as comunicações protegidas por criptografia.

**OBSERVAÇÃO:**

O pressionamento do botão Seleção de transmissão segura, a ativação/desativação da Seleção de transmissão segura ou a seleção do menu Proteger permite o acesso às comunicações por criptografia segura.

Apagar

Liga ou confirma o canal para a operação de comunicações Convencionais normais (não protegidas).

Proteger

Liga ou confirma o canal para operação com criptografia Segura.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**.

10.38.10.7

Seleção de chave de Failsoft

Esse campo seleciona a chave de criptografia segura a ser usada para o modo failsoft enquanto estiver operando no modo de criptografia segura.

Essa seleção se aplica ao Sistema de entroncamento atual.

INFORMAÇÕES:

Quando o campo [ASTRO OTAR na página 611](#) estiver **Ativado** para o Sistema de Entroncamento atual, o valor desta Seleção de Chave será escolhido na Lista de Referências de Chaves de criptografia Segura de Hardware do Perfil do KMF Seguro selecionado no campo [Índice de perfil ASTRO OTAR na página 612](#) para o Sistema de Entroncamento atual.

AVISO:

Esteja ciente de que ele está, na verdade, indicando as Chaves da lista de chaves de criptografia para essa seleção. As chaves individuais da lista de referências de chave de criptografia segura de hardware fazem referência às chaves da lista de Chaves de criptografia do campo Referência de chave de criptografia. Portanto, todas as chaves selecionadas quando o ASTRO OTAR estiver ativado deverão ser definidas primeiramente na Lista de referências de chave de criptografia segura de hardware.

Quando o campo ASTRO OTAR estiver **Desativado** no Sistema de entroncamento atual, o valor de Seleção desta chave será escolhido diretamente da Lista de chaves de criptografia da janela Segurança total.

Acessado apenas: Quando o rádio for compatível com o modelo/a opção e quando o campo [Operação segura na página 294](#) estiver definido como **Hardware**,

Quando o campo [Operação segura na página 294](#) estiver definido como **Software**, e quando o campo Tipo de sistema estiver definido como **ASTRO 25** e o campo Proteger/remover ligação de failsoft não estiver definido como **Limpar**

10.38.10.8

Proteger/remover ligação da chamada privada

Este campo seleciona o tipo de ligação usado para Chamada privada.

Quando o rádio está habilitado para o modelo/para a opção.

Selecionar

Permite ativar ou desativar as comunicações protegidas por criptografia.

OBSERVAÇÃO:

O pressionamento do botão Seleção de transmissão segura, a ativação/desativação da Seleção de transmissão segura ou a seleção do menu Proteger permite o acesso às comunicações por criptografia segura.

Apagar

Liga ou confirma o canal para a operação de comunicações Convencionais normais (não protegidas).

Proteger

Liga ou confirma o canal para operação com criptografia Segura.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**.

10.38.10.9

Seleção de chave de ligação privada

Este campo seleciona a chave de criptografia segura a ser usada para Chamada privada enquanto estiver operando no modo de criptografia segura.

Essa seleção se aplica ao Sistema de entroncamento atual. Quando o campo Índice de perfil ASTRO OTAR do Sistema de entroncamento atual estiver definido como **Ativado**, o valor para este campo será selecionado a partir da Lista de referências de chave de criptografia segura.

**INFORMAÇÕES:**

O aplicativo aponta para as Chaves da lista de chaves de criptografia desta seleção. As chaves individuais da Lista de referências de chave de criptografia segura referencia as chaves da Lista de chaves de criptografia do campo Referências de chave de criptografia. Portanto, as chaves devem ser definidas na Lista de referências de chave de criptografia segura antes que as chaves estejam disponíveis para seleção. Chaves retiradas do Perfil OTAR com campo de Lista de chaves independentes ativado estão disponíveis.

Quando o campo Índice de perfil ASTRO OTAR do Sistema de entroncamento atual estiver **Desativado**, o valor para esse campo será selecionado da Lista de chaves de criptografia na janela Segurança total.

Acessado apenas: Quando o rádio for compatível com o modelo/a opção e quando o campo [Operação segura na página 294](#) estiver definido como **Hardware**,

Ou quando o campo [Operação segura na página 294](#) estiver definido como **Software**, e quando o campo Tipo de sistema estiver definido como **ASTRO 25** e o campo Ligação privada Proteger/remover não estiver definido como **Hardware**

10.38.10.10**Proteger/remover ligação do Interconnect**

Este campo seleciona o tipo de ligação usado para a Interconexão.

Quando o rádio está habilitado para o modelo/para a opção.

Selecionar

Permite ativar ou desativar as comunicações protegidas por criptografia.

**OBSERVAÇÃO:**

O pressionamento do botão Seleção de transmissão segura, a ativação/desativação da Seleção de transmissão segura ou a seleção do menu Proteger permite o acesso às comunicações por criptografia segura.

Apagar

Liga ou confirma o canal para a operação de comunicações Convencionais normais (não protegidas).

Proteger

Liga ou confirma o canal para operação com criptografia Segura.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**.

10.38.10.11**Seleção de chave de interconexão**

Este campo seleciona a chave de criptografia segura a ser usada para uma chamada de interconexão (modo telefone) durante a operação no modo de criptografia segura.

Essa seleção se aplica ao Sistema de entroncamento atual.

INFORMAÇÕES:

Quando o campo Índice de perfil ASTRO OTAR estiver **Ativado** para o Sistema de entroncamento atual, esse valor de Seleção de chave será selecionado na Lista de referências de chave de criptografia segura do Perfil ASTRO OTAR selecionado no campo Índice de perfil ASTRO OTAR do Sistema de entroncamento atual.

AVISO:

Esteja ciente de que ele está, na verdade, indicando as Chaves da lista de chaves de criptografia para essa seleção. As chaves individuais da Lista de referências de chave de criptografia segura fazem referência às Chaves da lista de chaves de criptografia do campo Referência de chave de hardware. Portanto, todas as chaves selecionadas quando o Índice de Perfil ASTRO OTAR está ativado devem ser definidas primeiramente na Lista de Referências de Chaves de Criptografia Segura. Chaves retiradas do Perfil OTAR com campo de Lista de chaves independentes ativado estão disponíveis.

O aplicativo aponta para as Chaves da lista de chaves de criptografia desta seleção. As chaves individuais da Lista de referências de chave de criptografia segura referencia as chaves da Lista de chaves de criptografia do campo Referências de chave de criptografia. Portanto, as chaves devem ser definidas na Lista de referências de chave de criptografia segura antes que as chaves estejam disponíveis para seleção.

Quando o campo Índice de perfil ASTRO OTAR do Sistema de entroncamento atual estiver **Desativado**, o valor para esse campo será selecionado da Lista de chaves de criptografia na janela Segurança total.

Acessado apenas: Quando o rádio for compatível com o modelo/a opção e quando o campo [Operação segura na página 294](#) estiver definido como **Hardware**,

Quando o campo [Operação segura na página 294](#) estiver definido como **Software**, quando o campo Tipo de sistema estiver definido como **ASTRO 25**, e quando o campo Proteger/remover ligação de interconexão não estiver definido como **Hardware**

10.38.10.12

Proteger/Remover Ligação do Reagrupamento Dinâmico

Este campo seleciona o tipo de ligação usada para Reagrupamento dinâmico.

Quando o rádio está habilitado para o modelo/para a opção.

10.38.10.13

Seleção de chave de grupo de conversação dinâmico

Esse campo seleciona a chave de criptografia segura a ser usada para um Reagrupamento dinâmico (grupo de conversação dinâmico) durante a operação no modo de criptografia segura.

Essa seleção se aplica ao Sistema de entroncamento atual.

INFORMAÇÕES:

Quando o campo [ASTRO OTAR na página 611](#) estiver **Ativado** para o Sistema de Entroncamento atual, o valor desta Seleção de Chave será escolhido na Lista de Referências de Chaves de criptografia Segura de Hardware do Perfil do KMF Seguro selecionado no campo [Índice de perfil ASTRO OTAR na página 612](#) para o Sistema de Entroncamento atual.

AVISO:

Esteja ciente de que ele está, na verdade, indicando as Chaves da Lista de chaves de criptografia para essa seleção. As Chaves individuais da Lista de referências de chave de criptografia segura de hardware fazem referência às chaves da Lista de chaves de criptografia do campo Referência de chaves de criptografia. Portanto, todas as chaves selecionadas quando o ASTRO OTAR estiver ativado deverão ser definidas primeiramente na Lista de referências de chave de criptografia segura de hardware.

Quando o campo ASTRO OTAR estiver **Desativado** no Sistema de entroncamento atual, o valor de Seleção desta chave será escolhido diretamente da Lista de chaves de criptografia da janela Segurança total.

Acessado apenas: Quando o rádio for compatível com o modelo/a opção, quando o campo [Ativação do reagrupamento dinâmico na página 523](#) estiver **Ativado**, quando o campo de Operação segura estiver definido como **Hardware**,

Quando o [Operação segura na página 294](#) campo estiver definido como **Software**, quando o campo Tipo de sistema estiver definido como **ASTRO 25**, e quando o campo Proteger/Remover ligação do Reagrupamento dinâmico não estiver definido como **Hardware**

10.38.10.14

ViQi: Proteger/Remover ligação de parceiro virtual

Este campo permite selecionar o tipo de ligação usado para o ViQi: Parceiro virtual.

Essa seleção se aplica à operação LMR.

Apagar

Liga ou confirma o canal para a operação de comunicações Convencionais normais (não protegidas). Essa é a configuração padrão.

Selecionar

Permite que o usuário do rádio ative ou desative as comunicações com criptografia segura.

OBSERVAÇÃO:

O pressionamento do botão Seleção de Tx segura, a ativação/desativação da Seleção de Tx segura ou o menu Proteger permite que o usuário do rádio acesse as comunicações protegidas por criptografia.

Proteger

Liga ou confirma o canal para operação com criptografia Segura.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software** e quando o rádio for compatível com o modelo/a opção.

10.38.10.15

ViQi: Seleção de chave do parceiro virtual

Este campo permite selecionar a chave de criptografia segura a ser usada para um ViQi: Parceiro virtual durante a operação em modo de criptografia segura.

Essa seleção se aplica ao Sistema de entroncamento atual.

INFORMAÇÕES:

Quando o campo [ASTRO OTAR na página 611](#) estiver **Ativado** para o Sistema de Entroncamento atual, o valor desta Seleção de Chave será escolhido na Lista de Referências de Chaves de criptografia Segura de Hardware do Perfil do KMF Seguro selecionado no campo [Índice de perfil ASTRO OTAR na página 612](#) para o Sistema de Entroncamento atual. Essa seleção se aplica à operação LMR.

AVISO:

Esteja ciente de que o programa está indicando as chaves da lista de chaves de criptografia para essa seleção. As chaves individuais da lista de referências de chave de criptografia segura de hardware fazem referência às chaves da lista de chaves de criptografia do campo Referência de chave de hardware. Todas as chaves selecionadas quando o ASTRO OTAR estiver ativado deverão ser definidas primeiramente na lista de referências de chave de criptografia de hardware segura.

Quando o campo ASTRO OTAR estiver **Desativado** no Sistema de entroncamento atual, o valor de Seleção desta chave será escolhido diretamente da Lista de chaves de criptografia da janela Segurança total.

Acessado apenas: Quando o rádio for compatível com o modelo/a opção e quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou quando o campo [Operação segura na página 294](#) estiver definido como **Software** para um [Sistema de entroncamento ASTRO 25 na página 576](#).

10.38.10.16

Recepção de ID de Chave Automática

Este campo permite que o rádio desative o mudo de uma KID (Key ID, ID de chave) e de uma ALGID (Algorithm ID, ID de algoritmo) recebidas OTA (Over-the-Air) e que ele responda usando a KID e a ALGID OTA durante o tempo de desconexão da ID de chave de transmissão ou recepção.

OBSERVAÇÃO:

Receber outra chamada com uma Chave de incompatibilidade diferente durante o [ID da chave - Tempo de desconexão de recepção na página 309](#) ou [ID do conjunto de chaves – Tempo de desconexão de transmissão na página 310](#) substituirá a Chave de incompatibilidade anterior pela nova Chave.

Acessado apenas: Quando o campo [Operação segura na página 294](#) não estiver **Desativado** e o campo Tipo de sistema estiver definido como "ASTRO 25" e o rádio for compatível com o modelo/a opção.

10.38.11

Grupo de Conversação (Sistema de Entroncamento do ASTRO 25)

A seção **Grupo de Conversação** do conjunto Sistema de Entroncamento ASTRO permite ao usuário visualizar ou definir a funcionalidade de Grupo de Conversação individual para Sistemas

de Entroncamento individuais. Um Grupo de conversação é um agrupamento de rádios definido pelo RadioCentral e criado com o objetivo de gerar comunicação frequente e eficiente entre rádios.

**OBSERVAÇÃO:**

As frequências do grupo de conversação são determinadas pelo Sistema de entroncamento em campo e não são configuradas no RadioCentral.

**OBSERVAÇÃO:**

As frequências de Failsoft de Personalidade de entroncamento devem ser configuradas no RadioCentral.

Após a definição, é possível atribuir um Grupo de conversação a um ou mais canais do Seletor de canais do rádio na [Atribuição de zonas e canais na página 666](#) e no campo Configurar grupo de conversação de entroncamento da Lista de canais.

10.38.11.1

Talkgroup Name

Este campo permite definir nomes reconhecíveis para o grupo de conversação atual (registro/linha).

Essa seleção se aplica à personalidade de entroncamento atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

**OBSERVAÇÃO:**

Exemplos: PerTG-001, #500, Electric1, # A5.

É possível usar caracteres, números, espaços e caracteres especiais.

Os espaços iniciais em branco são substituídos por sublinhados no visor do rádio.

Os pontos iniciais não aparecem no visor do rádio.

10.38.11.2

ID do grupo de conversação

Este campo permite inserir (em formato decimal ou hexadecimal) o número do grupo de conversação que identifica exclusivamente o grupo de conversação atual (registro/linha).

Essa seleção se aplica à personalidade de entroncamento atual.

Acessado apenas: Quando o Sistema de Entroncamento mencionado tiver ((um Arquivo de Teclas do Sistema de Software ou uma Chave Avançada de Sistema com acesso selecionado no campo ID do Sistema) ou, (uma Chave Avançada WACN com acesso selecionado no campo ID da WACN Doméstica)),

E quando o rádio for compatível com o modelo/a opção.

Acima 286: Alcance

Para o Tipo de protocolo	Desabilitado	Mínimo	Máximo
ASTRO 25	Nenhum	0001 hex	FFFE hex
Tipo II	Nenhum	001 hex	FFE hex

**INFORMAÇÕES:**

A faixa de seleção pode ser modificada de acordo com a chave avançada por meio do programa Administrador de chaves avançadas.

10.38.11.3

Grupo de conversação de prioridade

Este campo permite ligar para o despachador pressionando o botão Envio prioritário e, em seguida, o botão PTT.

Acessado apenas: Quando o campo Tipo de sistema está definido como **ASTRO 25** e quando o campo Perfil DVRS está definido como **Desativado**.

A seleção a seguir é suportada:

Nenhum

Valor padrão. Aplica-se a todos os grupos de conversação criados a partir do conjunto Personalidade atual.

10.38.11.4

Proteger/remover proteção

Este campo seleciona o modo de transmissão e recepção de criptografia segura para o grupo de conversação (registro/ linha) atual.

Essa seleção se aplica à Personalidade de entroncamento atual.

Acessado apenas: Quando o Sistema de Entroncamento referenciado tem ((um arquivo de Chaves do sistema de software ou uma Chave de sistema avançada com acesso selecionada no campo [ID do sistema na página 513](#)) ou (uma Chave WACN avançada com acesso selecionada no campo [ID da WACN doméstica na página 658](#))), quando o campo [Operação segura na página 294](#) está definido como **Hardware** ou **Software**, quando o campo [Tipo de protocolo](#) está definido como **ASTRO 25** e o rádio está habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Apagar

Liga ou confirma o canal como comunicações normais (não protegidas).

Selecionar

Permite ativar ou desativar o modo de criptografia segura. Você deve pressionar o botão Seleção de transmissão segura, ativar/desativar a chave [Seleção de Transmissão Segura na página 202](#) ou selecionar o menu Proteger para ativar ou desativar as comunicações protegidas por criptografia.

Proteger

Liga ou confirma o canal para comunicações de criptografia segura.

10.38.11.5

Seleção de chave

Esse campo seleciona a chave de criptografia segura a ser usada no modo de criptografia segura para o grupo de conversação atual (registro/linha).

Essa seleção se aplica ao grupo de conversação atual da Personalidade de entroncamento atual.

**INFORMAÇÕES:**

Quando o campo [Índice de perfil ASTRO OTAR na página 406](#) não está desabilitado para a Lista de grupos de conversação ASTRO atual, este valor de seleção de chave é escolhido a partir da [Lista de referências de chave de criptografia segura de hardware na página 315](#) do perfil KMF seguro selecionado no campo Índice de perfil KMF.

**AVISO:**

Esteja ciente que o RadioCentral está, na verdade, apontando para as chaves da [Lista de chaves de criptografia na página 310](#) para essa seleção. Chaves individuais da Lista de referências de chave de criptografia segura de hardware fazem referência às chaves da Lista de chaves de criptografia do campo [Referência de Chaves de Criptografia na página 316](#). Portanto, qualquer chave selecionada quando ASTRO OTAR estiver habilitado deve ser definida primeiro na Lista de referências de chave de criptografia segura de hardware.

Quando o campo Índice de perfil KMF estiver desabilitado ou não for aplicável (cinza) à Lista de grupos de conversação ASTRO, esse valor de seleção de chave será diretamente escolhido da Lista de chaves de criptografia segura.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software** e quando o campo [Privacidade de voz/Remover ligação na página 407](#) estiver definido como **Proteger** ou **Selecionar** e quando o modelo ou a opção do rádio for compatível.

10.38.11.6

Failsoft de grupo de conversação

Este campo ativa a operação de Failsoft para o grupo de conversação (registro/linha) atual.

Esta seleção se aplica ao [Personalidade de entroncamento](#) atual.

Acessado apenas: Quando o sistema de entroncamento mencionado tem um arquivo de chaves do sistema de software ou uma chave de sistema avançada com acesso selecionado no campo [ID do sistema na página 513](#) ou uma chave de WACN avançada com acesso selecionado no campo [ID da WACN doméstica na página 658](#), quando o campo [Tipo de Failsoft na página 551](#) está definido como **Grupo de conversação** e quando o rádio está habilitado para o modelo/para a opção.

10.38.11.7

Frequência de recepção de Failsoft

Este campo permite inserir a frequência de recepção (Rx) de Failsoft para o grupo de conversação (registro/linha) atual.

Essa seleção se aplica à Personalidade de entroncamento atual.

**AVISO:**

As Limitações de frequência de entroncamento aplicadas a esta seleção são determinadas pela configuração desta Personalidade e pela banda de frequência do Sistema de Entroncamento mencionado.

Acessado apenas: Quando o Sistema de Entroncamento mencionado tem um Arquivo de chaves do sistema de software ou uma Chave de sistema avançada com acesso selecionada no campo [ID do sistema na página 513](#) ou uma Chave WACN avançada com acesso selecionada no campo [ID da WACN doméstica na página 658](#), quando o campo [Tipo de Failsoft na página 551](#) está definido como **Grupo de conversação**, quando o campo [Failsoft de grupo de conversação na página 546](#) está **Ativado** e o rádio está habilitado para o modelo/a opção.

10.38.11.8

Frequência de transmissão de Failsoft

Este campo permite inserir a frequência de transmissão (Tx) de Failsoft para o grupo de conversação (registro/linha) atual.

Esta seleção se aplica ao [Personalidade de entroncamento](#) atual.

AVISO:

As Limitações de frequência de entroncamento aplicadas a esta seleção são determinadas pela configuração desta Personalidade e pela banda de frequência do Sistema de Entroncamento mencionado.

Acessado apenas: Quando o Sistema de entroncamento mencionado tem um Arquivo de chaves do sistema de software ou uma Chave de sistema avançada com acesso selecionada no campo [ID do sistema na página 513](#) ou uma Chave WACN avançada com acesso selecionada no campo ID da WACN doméstica, quando o campo [Tipo de Failsoft na página 551](#) está definido como **Grupo de conversação**, quando o campo [Failsoft de grupo de conversação na página 546](#) está **Ativado** e o rádio está habilitado para o modelo/a opção.

10.38.11.9

Failsoft secundário de grupo de conversação

Este campo ativa a operação de failsoft secundário para o grupo de conversação (registro/linha) atual.

Esta seleção se aplica à personalidade de entroncamento atual.

Acessado apenas: Quando o campo [Tipo de Failsoft na página 551](#) está definido como **Grupo de conversação**, quando o campo [Failsoft de grupo de conversação na página 546](#) está ativado e quando o rádio está habilitado para o modelo/para a opção.

10.38.11.10

Frequência de Rx de Failsoft secundário

Este campo permite inserir a frequência de recepção (Rx) de Failsoft secundária para o grupo de conversação (registro/linha) atual.

Esta seleção se aplica à personalidade de entroncamento atual.

AVISO:

As Limitações de frequência de entroncamento aplicadas a esta seleção são determinadas pela configuração [Tipo de protocolo](#) desta personalidade e pela banda de frequência do [Sistema de entroncamento](#) mencionado.

Acessado apenas: Quando o campo [Tipo de Failsoft na página 551](#) está definido como **Grupo de conversação**, quando o campo [Failsoft de grupo de conversação na página 546](#) está **Ativado**, quando o campo [Failsoft secundário de grupo de conversação na página 547](#) está **Ativado** e quando o rádio está habilitado para o modelo/para a opção.

10.38.11.11

Frequência de transmissão de Failsoft secundário

Este campo permite inserir a frequência de Tx (transmit, transmissão) do Failsoft secundário para o grupo de conversação (registro/linha) atual.

Esta seleção se aplica à personalidade de entroncamento atual.

INFORMAÇÕES:

As limitações de frequência de entroncamento aplicadas a essa seleção são determinadas pela configuração [Tipo de protocolo](#) desta personalidade e pela banda de frequência do [Sistema de entroncamento](#) mencionado.

Acessado apenas: Quando o campo [Tipo de Failsoft na página 551](#) está definido como **Grupo de conversação**, quando o campo [Failsoft de grupo de conversação na página 546](#) está **Ativado**, quando o campo [Failsoft secundário de grupo de conversação na página 547](#) está **Ativado** e quando o rádio está habilitado para o modelo/para a opção.

10.38.11.12

ID do sistema do grupo de conversação

Este campo permite inserir (em formato decimal ou hexadecimal) o ID de três dígitos do sistema do grupo de conversação (sistema de entroncamento) que é necessário quando o roaming intra-WACN ou o roaming inter-WACN são o [Tipo de cobertura na página 511](#) selecionado do sistema de entroncamento mencionado

Esta seleção se aplica ao grupo de conversação (registro/linha) atual, aplicável à [Personalidade de entroncamento](#) atual.

Acessado apenas: Quando o [Tipo de protocolo](#) está definido como **ASTRO 25**, quando o campo [Tipo de cobertura na página 511](#) do sistema de entroncamento mencionado está definido como **Roaming intra-WACN** ou **Roaming inter-WACN** e quando o rádio está habilitado para o modelo/para a opção.

Acima 287: Alcance

Mínimo	Máximo
000 (Hex)	FFE (Hex)

**INFORMAÇÕES:**

Padrão de fábrica = 1. Um valor "0" faz com que o rádio copie o valor do campo [ID do sistema na página 513](#) do [Sistema de entroncamento](#) mencionado nesse campo.

10.38.11.13

ID da WACN do grupo de conversação

Este campo permite inserir (em formato decimal ou hexadecimal) o ID de cinco dígitos **Grupo de conversação** da WACN (Wide Area Communications Network, rede de comunicações de área ampla) que é necessário quando Roaming inter-WACN é o [Tipo de cobertura na página 511](#) selecionado do sistema de entroncamento mencionado.

Esta seleção se aplica ao [Grupo de conversação](#) (registro/linha) atual, aplicável à [Personalidade de entroncamento](#) atual.

Acessado apenas: Quando o [Tipo de protocolo](#) está definido como **ASTRO 25**, quando o campo [Tipo de cobertura na página 511](#) do sistema de entroncamento mencionado está definido como **Roaming inter-WACN** e quando o rádio está habilitado para o modelo/para a opção.

Acima 288: Alcance

Mínimo	Máximo
00000 (Hex)	FFFFE (Hex)

**INFORMAÇÕES:**

Padrão de fábrica = 1. Um valor "0" faz com que o rádio copie o valor do campo [ID da WACN doméstica na página 658](#) do [Sistema de entroncamento](#) mencionado nesse campo.

10.39

Personalidade de entroncamento ASTRO 25

A **Personalidade de entroncamento ASTRO 25** permite que o usuário crie e apague personalidades de entroncamento e defina personalidades de entroncamento individuais. Entroncamento e Convencional são os dois modos de comunicação de rádio.

**OBSERVAÇÃO:**

Os Sistemas de entroncamento são referidos a Personalidades de entroncamento. As configurações do Sistema de entroncamento poderão se tornar funcionais para todos os tipos de Entroncamento - canais.

Quando os recursos de Personalidade de entroncamento tiverem sido exclusivamente definidos, cada Personalidade poderá ter sido atribuída à posição desejada do seletor de canais do rádio com o recurso Atribuição de zonas e canais.

10.39.1

Geral (Personalidade de Entroncamento do ASTRO 25)

A seção **Geral** do conjunto Personalidade de Entroncamento do ASTRO 25 permite ao usuário visualizar ou definir funcionalidades básicas para Personalidades de Entroncamento individuais.

**OBSERVAÇÃO:**

Quando os recursos de personalidade de entroncamento tiverem sido exclusivamente definidos, cada personalidade poderá ser atribuída à posição desejada do seletor de canais do rádio com o uso do recurso Atribuição de zonas e canais.

10.39.1.1

Nome da Personalidade de entroncamento

Este campo permite definir um nome reconhecível para a Personalidade de entroncamento atual.

**OBSERVAÇÃO:**

Quando os recursos de Personalidade de entroncamento tiverem sido exclusivamente definidos, cada Personalidade poderá ter sido atribuída à posição desejada do seletor de canais do rádio com o recurso Atribuição de zonas e canais. Esse nome é usado para selecionar a personalidade atual na página Canais dessa função.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

**OBSERVAÇÃO:**

Exemplos: Personality-01, #500, Electric1, # A5

É possível usar caracteres, números, espaços e caracteres especiais.

Os espaços iniciais em branco são substituídos por sublinhados no visor do rádio.

Os pontos iniciais não aparecem no visor do rádio.

10.39.1.2

Sistema

Este campo seleciona o Sistema de entroncamento programado para a Personalidade de entroncamento atual.

INFORMAÇÕES:

Só devem ser selecionados Sistemas de entroncamento que têm um tipo de sistema que corresponde ao tipo de protocolo das personalidades atuais.

Somente os sistemas de entroncamento com arquivos de chaves do sistema de software ou chaves (de hardware) avançadas que não tenham campo ou proteção de função (acesso ilimitado) podem ser selecionados; caso contrário, o campo será marcado como inválido.

Quando o valor do campo é marcado como inválido, os campos protegidos por chave de sistema na Personalidade de entroncamento atual são mostrados como somente leitura.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.39.1.3

Contador de tempo limite

Este campo seleciona o tempo durante o qual o rádio pode transmitir de maneira contínua para a Personalidade de entroncamento atual.

Quando o tempo estiver prestes a expirar, o rádio emitirá um tom de alerta e interromperá a transmissão automaticamente. O tempo é medido em segundos.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

Quando definido como **Infinito**:

Nenhum contador usado para rádios APX Next e APX N70, portanto o tempo de conversação é infinito.

Acima 289: Alcance

Tipo de rádio	Mínimo	Máximo	Incrementos
Rádios não APX4000XH	15 s	465 s	15 s
Rádios APX4000XH	15 s	60 s	15 s

Acima 290: Alcance

Tipo de rádio	Mínimo	Máximo	Incrementos
APX NEXT	0 s	465 s	15 s

10.39.1.4

AGC de RF avançado

Este campo seleciona o tipo de AGC (Automatic Gain Control, controle de ganho automático) da RF (Receive Frequency, frequência de recebimento) para a Personalidade de entroncamento atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Desabilitado

Mesmo quando **Desativado**, o rádio utiliza uma forma básica de AGC embutida no receptor do rádio. Essa proteção integrada ajuda a evitar limitação de sinal e saturação do receptor, o que pode danificar os componentes do rádio.

Padrão

Permite uma forma avançada de AGC de RF, que tenta proteger contra interferência de intermodulação (IM) por meio da detecção e da remoção de qualquer interferência recebida em razão de fontes externas.

Aprimorado

Possibilita que o rádio utilize outros esquemas para reduzir a interferência de IM, limpando o sinal.

Inteligente

Permite que o rádio use um esquema exclusivo para melhorar a imunidade à interferência quando próximo às estações base de difusão simultânea linear e de fase 2 APCO. A opção SMART é mutuamente exclusiva da caixa de seleção proteção de banda larga.

INFORMAÇÕES:

O AGC de RF avançado **Padrão** e **Aprimorado** pode prejudicar o desempenho dos canais que não sofrem interferência de IM. Por isso, só ative essas seleções nos canais que sabidamente apresentam interferência de IM.

10.39.1.5

Proteção da banda larga

Este campo permite habilitar a Proteção da banda larga para a Personalidade de entroncamento atual.

A proteção da banda larga aprimora o AGC de RF avançado adicionando um filtro de banda larga de alta seletividade ao receber em frequências selecionadas dentro das bandas de 700 MHz e 800 MHz.

10.39.1.6

Tipo de conversação

Este campo seleciona o modo de comunicação para a Personalidade de entroncamento atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Message

O sistema atribui um canal de tráfego para a duração de uma única transmissão feita por um rádio. Quando o rádio é desativado, todos os rádios permanecem no canal de tráfego até o tempo de desconexão do canal de tráfego expirar. Quando o tempo de desconexão expirar, os rádios retornarão para o canal de controle. Qualquer rádio envolvido na chamada pode ser ativado enquanto está no canal de tráfego, sem retornar ao canal de controle. O entroncamento de mensagem está disponível nos sistemas de canal de controle de 3600 bauds.

AVISO:

O entroncamento de mensagem não é compatível com Sistemas ASTRO 25.

Transmissão

O sistema atribui um canal de tráfego para a duração de uma única transmissão feita por um rádio. Quando o rádio é desativado, o canal de tráfego é anulado, e todos os rádios envolvidos na chamada retornam ao canal de controle. Qualquer solicitação de canal de tráfego subsequente é enviada no canal de controle pelo rádio solicitante.

ID do PTT

O sistema atribui um canal de tráfego pelo tempo que durar uma conversação inteira como descrito a seguir. Depois que o rádio é desativado, o canal de voz permanece ativo (tempo de desconexão), e os rádios permanecem inativos no canal de voz. Qualquer rádio que responder durante esse tempo de desconexão primeiro irá ativar o canal de controle para enviar uma

mensagem com o ID de PTT (ID de unidade) da unidade, indicando que o rádio quer enviar áudio para a chamada; em seguida, o sistema envia uma mensagem de concessão direcionando o rádio de volta para o mesmo canal de voz que atua como a nova origem.

10.39.1.7

Tipo de Failsoft

Este campo seleciona o tipo de Failsoft para a Personalidade de entroncamento atual.

OBSERVAÇÃO:

O Failsoft oferece a operação no modo convencional bidirecional durante a falha do Sistema de entroncamento. O rádio volta automaticamente para o modo Entroncado após a restauração do Sistema de entroncamento.

Acessado apenas: Quando o Sistema de entroncamento mencionado tem um Arquivo de chave do sistema de software ou uma Chave de sistema avançada com acesso é selecionada no campo ID do sistema ou uma Chave avançada WACN com acesso é selecionada no campo ID da WACN doméstica e quando o rádio for compatível com o modelo/a opção do rádio.

As seleções a seguir são compatíveis:

Seleções	Definições	Disponível quando	
		Tipo de protocolo é igual a	Tipo de cobertura é igual a
Desabilitado	Nenhum Failsoft usado.	Qualquer	Qualquer
Personalidade	Quando Tipo de cobertura na página 511 estiver Desabilitado , que é SmartNet, o Failsoft usará as frequências de Failsoft de personalidade para todos os Grupos de conversação dentro dessa Personalidade de entroncamento. Quando o tipo de cobertura é igual a SmartZone , as frequências de Failsoft de personalidade não são usadas: <ul style="list-style-type: none"> Quando o rádio tem o site bloqueado, o Failsoft utiliza o último canal controle ativo. Quando o rádio tem o local desbloqueado, o Failsoft utiliza o último canal de controle ativo. Se o Failsoft ainda não tiver sido encontrado, o rádio verificará a Lista de canais de controle para Failsoft. 	Tipo II	Qualquer
Grupo de conversação	Quando o Tipo de cobertura está Desativado , que é SmartNet: <ul style="list-style-type: none"> O Failsoft usa as Frequências de grupo de conversação do Failsoft, ou  AVISO: O campo Failsoft de grupo de conversação deve estar Ativado .	Qualquer	Qualquer

Seleções	Definições	Disponível quando	
		Tipo de protocolo é igual a	Tipo de cobertura é igual a
	<ul style="list-style-type: none"> O Failsoft poderá usar as Frequências de Failsoft do Grupo de notificação quando for chamado de um Grupo de notificação. <p> AVISO: O campo Failsoft de grupo de notificação na página 562 deve estar Ativado.</p> <ul style="list-style-type: none"> Se nenhum dos campos acima estiver Ativado, o rádio utilizará o último canal de controle ativo. <p>Quando o Tipo de cobertura é igual a SmartZone:</p> <ul style="list-style-type: none"> Quando o rádio tem o local bloqueado e quando o campo Failsoft de grupo de conversação está Ativado, o Failsoft utiliza as frequências de grupo de conversação de Failsoft; se o Failsoft ainda não tiver sido encontrado, ele utilizará o último canal de controle ativo. Se o campo Failsoft de grupo de conversação não estiver Ativado, o Failsoft utilizará o último canal de controle ativo. Quando o rádio tem o local desbloqueado e quando o campo Failsoft de grupo de conversação está Ativado, o Failsoft utiliza as frequências de grupo de conversação de Failsoft; se o Failsoft ainda não tiver sido encontrado, ele utilizará o último canal de controle ativo. Se o Failsoft ainda não tiver sido encontrado, o rádio verificará a Lista de canais de controle do Sistema de entroncamento mencionado para Failsoft. Se o campo Failsoft de grupo de conversação não estiver Ativado, ele utilizará o último canal de controle ativo e talvez precisará verificar a lista de canais de controle. 		

10.39.1.8

Modo de transmissão

Este campo seleciona se a personalidade ou o canal terá a funcionalidade de transmissão completa ou se restringirá a transmitir comunicações de voz do Grupo de conversação (TG) e do Grupo de notificação (AG).

Essa seleção se aplica à Personalidade de entroncamento atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Irrestrito

Nenhum limite é colocado na funcionalidade de transmissão.

TG/AG desativados (somente escuta)

O rádio não consegue transmitir no TG ou AG selecionado. Consulte o campo Grupo de conversação de entroncamento. O rádio pode receber transmissões de voz no modo selecionado do canal.

**AVISO:**

O Reagrupamento dinâmico não é compatível com essa seleção.

Essa [Seleção de perfil de emergência na página 555](#) da Personalidade deve ser definida como **Transmissão de emergência desativada** ou o Perfil selecionado deve ter seu campo [Talkback de emergência na página 346](#) definido como **Reverter**; do contrário, a seleção do campo Perfil de emergência será considerada inválida.

Essa Lista de varredura mencionada da Personalidade não deve ter seu campo [Tipo de membro de transmissão de voz designado na página 686](#) definido como **Canal selecionado**, o que significa esse canal; do contrário, a [Seleção da lista de varredura na página 568](#) se tornará inválida.

O [Teclado direto \(DTMF\) na página 571](#) não é possível com essa seleção.

10.39.1.9

Seleção de perfil de emergência

Este campo seleciona o Perfil de emergência de entroncamento a ser usado com a Personalidade de entroncamento atual.

Você pode iniciar a funcionalidade do modo de Emergência ou iniciá-lo com um rádio programado

**AVISO:**

Quando o campo [Modo de transmissão na página 554](#) estiver definido como **TG/AG Desativados** (Modo somente escuta) para a Personalidade de entroncamento atual, essa seleção de Perfil deverá ser **Transmissão de emergência desativada** ou o Perfil selecionado deverá ter seu campo [Talkback de emergência na página 346](#) definido como **Reverter**; caso contrário, o RM considerará essa seleção inválida.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

- Transmissão de emergência desativada
- Perfis de Emergência de Entroncamento Disponíveis

10.39.1.10

Tipo de reversão de emergência

Este campo seleciona o tipo de reversão de emergência **Não tática** a ser usada durante a operação no modo de emergência na Personalidade de entroncamento atual.

Consulte também [Talkback de emergência na página 346](#).

**AVISO:**

Você pode iniciar a funcionalidade no Modo de emergência ou iniciá-la com um rádio programado.

Acessado apenas: Quando a função estendida **Reversão múltipla de emergência** for mostrada no campo Nome do recurso estendido, quando um Perfil de emergência de entroncamento mencionado for selecionado para a Personalidade de entroncamento atual, quando esse Perfil de emergência de entroncamento tiver um campo Resposta de emergência definido como **Reverter** e quando o rádio for compatível com o modelo/a opção.

As seleções a seguir são compatíveis:

Reversão do grupo de conversação

O rádio utiliza a ID do grupo de conversação de reversão de resposta de emergência definida para a Personalidade de entroncamento atual para transmitir Alarmes de emergência e/ou Chamadas de emergência.

Reversão do sistema

O rádio usa [Zona de reversão do sistema de emergência na página 558](#) e [Canal de reversão do sistema de emergência na página 559](#) para transmitir Alarme de emergência e/ou Chamada de emergência. As transmissões de Emergência também são enviadas para o console do emissor.

**AVISO:**

O Reagrupamento dinâmico não é compatível com essa seleção.

10.39.1.11

ID do grupo de conversação da reversão de talkback de emergência

Esse campo permite inserir em formato decimal ou hexadecimal o número do grupo de conversação que identifica exclusivamente o grupo de conversação atual (registro/linha).

Essa seleção se aplica à [Personalidade de entroncamento](#) atual.

Acessado apenas: Quando o Sistema de entroncamento mencionado tiver um Arquivo de chaves do sistema de software ou uma Chave de sistema avançada com acesso selecionado no campo [ID do sistema na página 513](#) ou uma Chave WACN avançada com acesso selecionada no campo [ID da WACN doméstica na página 658](#) e quando o rádio for compatível com o modelo/a opção.

Acima 291: Alcance

Para o tipo de protocolo:	Desabilitado	Mínimo	Máximo
ASTRO 25	Nenhuma	0001 (Hex)	FFFE (Hex)
Tipo II	Nenhuma	001 (Hex)	FFE (Hex)

**INFORMAÇÕES:**

A faixa de seleção pode ser modificada de acordo com a chave avançada por meio do programa Administrador de chaves avançadas.

10.39.1.12

Reversão de talkback de emergência Proteger/Limpar chamada

Esse campo seleciona o modo de transmissão ao operar no modo Emergência para o Grupo de conversação da reversão de resposta de emergência.

Essa seleção se aplica à Personalidade de entroncamento atual.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software** e quando o campo Tipo de protocolo estiver definido como **ASTRO 25**.

As seleções a seguir são compatíveis:

Apagar

Vincula ou aloca o grupo de conversação/canal à operação de entroncamento regular (não segura).

Selecionar

Permite que você ative ou desative a operação de criptografia segura para o grupo de conversação atual. Ao pressionar o botão Seleção de Tx segura, ativar/desativar a chave [Seleção de Transmissão Segura na página 202](#) ou selecionar o menu Proteger, você poderá ativar ou desativar as comunicações protegidas por criptografia.

Proteger

Liga ou confirma o grupo de conversação para a operação com criptografia segura.

10.39.1.13

Seleção de chave de reversão de talkback de emergência

Esse campo seleciona a chave de criptografia segura usada ao operar no modo de emergência para o Grupo de conversação da reversão de resposta de emergência.

Essa seleção se aplica à Personalidade de entroncamento atual.

**INFORMAÇÕES:**

Quando o campo [Índice de perfil ASTRO OTAR na página 612](#) estiver **Ativado** para o Sistema de entroncamento mencionado, o valor dessa Seleção de chave será escolhido na Lista de referências de chave de criptografia segura do Perfil ASTRO OTAR selecionado no campo Índice do perfil ASTRO OTAR do Sistema de entroncamento mencionado.

**AVISO:**

Esteja ciente de que ele está, na verdade, indicando as chaves da Lista de chaves de criptografia para essa seleção. As chaves individuais da Lista de referências de chave de criptografia segura fazem alusão às chaves da Lista de chaves de criptografia do campo Referência de chave de criptografia. Portanto, todas as chaves selecionadas quando o campo Índice de perfil ASTRO OTAR está ativado devem ser definidas primeiramente na Lista de referências de chaves de criptografia segura. Chaves retiradas do Perfil OTAR com campo de Lista de chaves independentes ativado estão disponíveis.

Quando o campo Índice do perfil ASTRO OTAR estiver **Desativado** no Sistema de entroncamento mencionado, o valor dessa Seleção de chave será escolhido diretamente na Lista de chaves de criptografia da janela Segurança total.

**AVISO:**

Quando existir uma correspondência entre o ID do grupo de conversação normal que está sendo utilizado por outros rádios e pelo ID do grupo de conversação de reversão de talkback de emergência do rádio, e...

quando não existe uma correspondência entre a Chave de grupo de conversação que está sendo utilizada por outros rádios e essa Chave de grupo de conversação de reversão de emergência...

As seguintes afirmações valem:

- Quando o rádio alternar para seu ID do grupo de conversação de reversão de talkback de emergência usando essa chave, a transmissão de emergência desse rádio não será ouvida pelos outros rádios.
- Entretanto, a transmissão de emergência pode ser captada pela varredura, mesmo quando não existe uma correspondência de chave.

Acessado apenas: Quando o campo [Reversão de talkback de emergência Proteger/Limpar chamada na página 557](#) de resposta de emergência estiver definido como **Proteger** ou **Selecionar** e

Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**, quando o campo Tipo de protocolo estiver definido como **ASTRO 25** e quando o rádio for compatível com o modelo/a opção.

10.39.1.14

Zona de reversão do sistema de emergência

Este campo seleciona uma zona a ser usada durante uma transmissão no modo de emergência.

Essa seleção se aplica à Personalidade de entroncamento atual.

OBSERVAÇÃO:

Apenas após a seleção desta zona é que o [Canal de reversão do sistema de emergência na página 559](#) pode ser selecionado.

As zonas e os canais devem ser previamente definidos na janela Atribuição de zonas e canais.

AVISO:

Só é possível selecionar Zonas não dinâmicas, ou seja, zonas com a opção Zona dinâmica ativada **Desativada**; caso contrário, esse campo se tornará inválido.

Acessado apenas: Quando o Recurso estendido **Reversão múltipla de emergência** é exibido no campo Nome do recurso estendido, quando um Perfil de emergência de entroncamento mencionado válido é selecionado para a Personalidade de entroncamento atual, quando esse Perfil de emergência de entroncamento com o campo [Talkback de emergência na página 346](#) definido como **Reverter**, quando o campo [Tipo de reversão de emergência na página 555](#) é definido como **Reversão do sistema** e quando o rádio for compatível com o modelo/a opção.

10.39.1.15

Canal de reversão do sistema de emergência

Este campo seleciona um canal de Entroncamento ou Convencional que é usado durante uma transmissão no modo de emergência.

Essa seleção se aplica à Personalidade de entroncamento atual.

OBSERVAÇÃO:

A [Zona de reversão do sistema de emergência na página 558](#) deve ser selecionada antes da seleção deste canal.

As zonas e os canais devem ser previamente definidos na janela Atribuição de zonas e canais.

AVISO:

Para codeplugs portáteis APX™ 3000, somente os primeiros 48 canais na [Zona de reversão do sistema de emergência na página 558](#) selecionada são considerados seleções válidas.

Essa seleção de Canal de reversão do sistema de emergência só é considerada válida: quando o campo [Grupo de conversação de entroncamento na página 670](#) da Personalidade de entroncamento/canal selecionado não está definido como **DYN** ou **ATG**, quando o campo [Receber Somente Personalidade na página 423](#) da Personalidade convencional/canal selecionado está **Desativado**, quando o campo ID do Grupo de conversação do ASTRO da Personalidade convencional/canal selecionado não está definido como **DYN** ou **ATG**, quando o campo [Modo de transmissão na página 554](#) para a Personalidade de entroncamento/canal selecionado não está definido como **TG/AG desativados (Modo somente escuta)** e quando o [Seleção de perfil de emergência na página 555](#) do canal selecionado não está como **Transmissão de emergência desativada**.

Acessado apenas: Quando o recurso estendido **Reversão múltipla de emergência** aparece no campo Nome do recurso estendido, quando um Perfil de emergência de entroncamento mencionado é selecionado para a Personalidade de entroncamento atual, quando esse Perfil de emergência de entroncamento tem um campo [Talkback de emergência na página 346](#) definido como **Reverter**, quando o campo [Tipo de reversão de emergência na página 555](#) está definido como **Reversão do sistema**, quando o campo [Zona de reversão do sistema de emergência na página 558](#) não está definido como Zona dinâmica e quando o rádio for compatível com o modelo/a opção.

10.39.2

Grupo de notificação (Personalidade de Entroncamento ASTRO 25)

A seção **Grupo de notificação** da Personalidade de Entroncamento ASTRO 25 permite ao usuário visualizar e definir os parâmetros do Grupo de notificação das Personalidades de entroncamento

individuais. Os Grupos de Notificação permitem que o usuário do rádio inicie e se comunique em um grande canal de comunicação constituído de todos os Grupos de Conversação definidos para a Personalidade de Entroncamento atual.

OBSERVAÇÃO:

Um ATG (Announcement Group, grupo de notificação) deve ser selecionado para a Personalidade de entroncamento no campo [Atribuição de zonas e canais na página 666](#) e Grupo de conversação de entroncamento do conjunto de listas de canais. A seleção de ATG permite que um canal seja especificamente designado para os propósitos do Grupo de notificação.

Quando os recursos de personalidade de entroncamento tiverem sido exclusivamente definidos, cada personalidade poderá ser atribuída à posição desejada do seletor de canais do rádio com o uso do recurso Atribuição de zonas e canais.

10.39.2.1

Grupo de notificação

Esse campo permite inserir em formato decimal ou hexadecimal, o ID que definirá com exclusividade o grupo de notificação para a Personalidade de entroncamento.

OBSERVAÇÃO:

Os Grupos de notificação permitem que o usuário do rádio inicie e se comunique em um grande canal de comunicação composto por todos os grupos de conversação definidos para a Personalidade de entroncamento atual.

AVISO:

O ATG (Announcement Group, grupo de notificação) deve ser selecionado para a Personalidade de entroncamento no campo [Grupo de conversação de entroncamento na página 670](#) da página Canais de atribuição de zonas e canais. A seleção de ATG permite que um canal seja especificamente designado para os propósitos do Grupo de notificação.

A Personalidade é selecionada no campo [Personalidade na página 669](#) da página Canais de atribuição de zonas e canais.

Acessado apenas: Quando o Sistema de entroncamento mencionado tiver um Arquivo de chaves do sistema de software ou uma Chave de sistema avançada com acesso selecionado no campo [ID do sistema na página 513](#) ou uma Chave WACN avançada com acesso selecionada no campo [ID da WACN doméstica na página 658](#) e quando o rádio for compatível com o modelo/a opção.

Acima 292: Alcance

Para Tipo de protocolo	Desabilitado	Mínimo	Máximo
ASTRO 25	Nenhuma	0001 (Hex)	FFFE (Hex)
Tipo II	Nenhuma	001 (Hex)	FFE (Hex)

INFORMAÇÕES:

A faixa de seleção pode ser modificada de acordo com a chave avançada por meio do programa Administrador de chaves avançadas.

10.39.2.2

Proteger/remover chamada de AG

Esse campo seleciona o modo de transmissão e de recepção do Grupo de notificação da Personalidade de entroncamento atual.

Acessado apenas: Quando o campo [Grupo de notificação na página 560](#) não estiver definido como **Nenhum** e quando o rádio for compatível com o modelo/a opção,

e

Quando o campo [Operação segura na página 294](#) precisar ser definido como **Hardware**, quando o campo [Tipo de voz/sinal de AG na página 560](#) estiver definido como **Digital** e quando a largura de banda de canal do Sistema de entroncamento mencionado não estiver definida como **12,5 kHz**,

Ou

Quando o campo Tipo de protocolo estiver definido como **ASTRO 25** e quando o campo [Operação segura na página 294](#) precisar ser definido como **Hardware** ou **Software**.

As seleções a seguir são compatíveis:

Apagar

Liga ou confirma o canal como Comunicações de entroncamento normal (não seguro).

Selecionar

Permite ativar ou desativar o modo de criptografia segura.

Você precisa pressionar o botão Seleção de Tx segura, ativar/desativar a chave [Seleção de Transmissão Segura na página 202](#) ou selecionar o menu Proteger para ativar ou desativar as comunicações protegidas por criptografia.

Proteger

Liga ou confirma o canal para o modo de criptografia segura.

10.39.2.3

Seleção de chave de AG

Esse campo seleciona a chave de criptografia segura que será usada no Grupo de notificação da Personalidade de entroncamento atual.

Essa seleção se aplica durante a operação no modo de criptografia segura.

INFORMAÇÕES:

Quando o campo [ASTRO OTAR na página 611](#) estiver **Ativado** para o Sistema de entroncamento mencionado, o valor dessa Seleção de chave será escolhido na Lista de referências de chave de criptografia segura do Perfil ASTRO OTAR selecionado no campo [Índice de perfil ASTRO OTAR na página 612](#) do Sistema de entroncamento mencionado.

AVISO:

Esteja ciente de que ele está, na verdade, indicando as chaves da Lista de chaves de criptografia para essa seleção. As chaves individuais da Lista de referências de chave de criptografia segura fazem alusão às chaves da Lista de chaves de criptografia do campo [Referência de Chaves de Criptografia na página 316](#). Portanto, todas as chaves selecionadas quando o ASTRO OTAR está ativado devem ser definidas primeiramente na Lista de referências de chaves de criptografia segura. Chaves retiradas do Perfil ASTRO OTAR com campo Lista de chaves independentes ativado estão disponíveis.

Quando o campo ASTRO OTAR estiver **Desativado** no Sistema de entroncamento mencionado, o valor dessa Seleção de chave será escolhido diretamente na Lista de chaves de criptografia da janela Segurança total.

Acessado apenas: Quando o campo [Proteger/remover chamada de AG na página 561](#) não estiver definido como **Limpo**, quando o campo [Grupo de notificação na página 560](#) não estiver definido como **Nenhum** e quando o rádio for compatível com o modelo/a opção,

e

Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** e quando o campo [Tipo de voz/sinal de AG na página 560](#) estiver definido como **Digital**,

Ou

Quando o campo Operação segura estiver definido como **Hardware**, quando o campo Tipo de voz/ sinal de AG estiver definido como **Analógico** e quando a largura de banda de canal do Sistema de entroncamento mencionado não estiver definida como **12,5 kHz**,

Ou

quando o campo Tipo de protocolo estiver definido como **ASTRO 25** e quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**.

10.39.2.4

Failsoft de grupo de notificação

Esse campo habilita o Failsoft para o Grupo de notificação da Personalidade de entroncamento atual.

Acessado apenas: Quando o Sistema de entroncamento mencionado tiver um arquivo de Chaves do sistema de software ou uma Chave de sistema avançada com acesso selecionado no campo ID do sistema, ou uma Chave avançada WACN com acesso selecionado no campo ID da WACN doméstica, quando o campo [Tipo de Failsoft na página 551](#) estiver definido como **Grupo de conversação**, quando o campo [Grupo de notificação na página 560](#) não estiver definido como **Nenhum** e quando o rádio estiver habilitado para o modelo/a opção.

10.39.2.5

Frequência de recepção de Failsoft AG

Esse campo permite inserir a frequência de Rx (Receive, recepção) que será usada durante a operação de Failsoft para o Grupo de notificação da Personalidade de entroncamento atual.

AVISO:

As limitações de frequência de entroncamento aplicadas à essa seleção são determinadas pela definição do Tipo de protocolo dessa personalidade e a banda de frequência do Sistema de entroncamento mencionado.

Acessado apenas: Quando o Sistema de entroncamento mencionado tiver um Arquivo de chave do sistema de software ou uma Chave de sistema avançada com acesso selecionado no campo ID do sistema, ou uma Chave avançada WACN com acesso selecionado no campo ID da WACN doméstica, quando o campo [Tipo de Failsoft na página 551](#) estiver definido como **Grupo de conversação**, quando o campo [Grupo de notificação na página 560](#) não estiver definido como **Nenhum**, quando o campo [Failsoft de grupo de notificação na página 562](#) estiver **Habilitado** e quando o rádio estiver habilitado para o modelo/a opção.

10.39.2.6

Frequência de transmissão de Failsoft AG

Esse campo permite inserir a frequência de Tx (Transmit, transmissão) que será usada durante a operação de Failsoft para o Grupo de notificação da Personalidade de entroncamento atual.

AVISO:

As limitações de frequência de entroncamento aplicadas à essa seleção são determinadas pela definição do Tipo de protocolo dessa personalidade e a banda de frequência do Sistema de entroncamento mencionado.

Acessado apenas: Quando o Sistema de entroncamento mencionado tiver um Arquivo de chave do sistema de software ou uma Chave de sistema avançada com acesso selecionado no campo ID do sistema, ou uma Chave avançada WACN com acesso selecionado no campo ID da WACN doméstica, quando o campo [Tipo de Failsoft na página 551](#) estiver definido como **Grupo de conversação**, quando o campo [Grupo de notificação na página 560](#) não estiver definido como **Nenhum**, quando o campo [Failsoft de grupo de notificação na página 562](#) estiver **Habilitado** e quando o rádio estiver habilitado para o modelo/a opção.

10.39.2.7

Failsoft secundário de AG

Esse campo habilita o Failsoft secundário para o Grupo de notificação da Personalidade de entroncamento atual.

Acessado apenas: Quando o campo [Tipo de Failsoft na página 551](#) for definido como **Grupo de conversação**, quando o campo [Grupo de notificação na página 560](#) não estiver definido como **Nenhum**, quando o campo [Failsoft de grupo de notificação na página 562](#) estiver **Habilitado** e quando o rádio estiver habilitado para o modelo/a opção.

10.39.2.8

Frequência de recepção F/S secundária de AG

Esse campo permite inserir a frequência de Rx (Receive, recepção) secundária que será usada durante a operação de Failsoft para o Grupo de notificação da Personalidade de entroncamento atual.

**AVISO:**

As limitações de frequência de entroncamento aplicadas à essa seleção são determinadas pela definição do Tipo de protocolo dessa personalidade e a banda de frequência do Sistema de entroncamento mencionado.

Acessado apenas: Quando o campo [Tipo de Failsoft na página 551](#) for definido como **Grupo de conversação**, quando o campo [Grupo de notificação na página 560](#) não estiver definido como **Nenhum**, quando o campo [Failsoft de grupo de notificação na página 562](#) estiver **Habilitado**, quando o campo [Failsoft secundário de AG na página 563](#) estiver **Habilitado** e quando o rádio estiver habilitado para o modelo/a opção.

10.39.2.9

Frequência de transmissão F/S secundária de AG

Esse campo permite inserir a frequência de Tx (Transmit, transmissão) secundária que será usada durante a operação de Failsoft para o Grupo de notificação da Personalidade de entroncamento atual.

**AVISO:**

As limitações de frequência de entroncamento aplicadas à essa seleção são determinadas pela definição do Tipo de protocolo dessa personalidade e a banda de frequência do Sistema de entroncamento mencionado.

Acessado apenas: Quando o campo [Tipo de Failsoft na página 551](#) for definido como **Grupo de conversação**, quando o campo [Grupo de notificação na página 560](#) não estiver definido como **Nenhum**, quando o campo [Failsoft de grupo de notificação na página 562](#) estiver **Habilitado**, quando o campo [Failsoft secundário de AG na página 563](#) estiver **Habilitado** e quando o rádio estiver habilitado para o modelo/a opção.

10.39.2.10

ID do sistema de AG

Esse campo permite inserir, em formato decimal ou hexadecimal, o ID de três dígitos do Sistema (de entroncamento) do Grupo de notificação que será necessário quando Roaming inter-WACN for o tipo de cobertura selecionado do Sistema de entroncamento mencionado.

Essa seleção se aplica à personalidade de entroncamento atual.

Acessado apenas: Quando o campo Tipo de sistema do Sistema de entroncamento mencionado estiver definido como **ASTRO 25**, quando o campo [Tipo de cobertura na página 511](#) estiver definido como **Roaming inter-WACN** e quando o rádio for compatível com o modelo/a opção.

Acima 293: Alcance

Mínimo	Máximo
000 hex	FFE hex

10.39.2.11

ID do AG WACN

Esse campo permite inserir (em formato decimal ou hexadecimal) o ID de cinco dígitos da WACN (Wide Area Communications Network, rede de comunicações de área ampla) do Grupo de notificação que será necessário quando Roaming inter-WACN for o tipo de cobertura selecionado do Sistema de entroncamento mencionado.

O ID do AG WACN se aplica à personalidade de entroncamento atual.

Acessado apenas: Quando o campo Tipo de sistema do Sistema de entroncamento mencionado estiver definido como **ASTRO 25**, quando seu campo [Tipo de cobertura na página 511](#) estiver definido como **Roaming inter-WACN** e quando o rádio for compatível com o modelo/a opção.

Acima 294: Alcance

Mínimo	Máximo
00000 (Hex)	FFFFE (Hex)

10.39.3

Grupo de Conversação (Personalidade de entroncamento ASTRO 25)

A seção **Grupo de conversação** do conjunto Personalidade de entroncamento ASTRO 25 permite ao usuário visualizar ou definir a funcionalidade de grupo de conversação individual para Personalidades de entroncamento individuais. Um Grupo de conversação é um agrupamento de rádios definido pelo RadioCentral e criado com o objetivo de gerar comunicação frequente e eficiente entre rádios.

OBSERVAÇÃO:

As frequências do grupo de conversação são determinadas pelo Sistema de entroncamento em campo e não são configuradas no RadioCentral.

OBSERVAÇÃO:

As frequências de Failsoft de Personalidade de entroncamento devem ser configuradas no RadioCentral.

Após a definição, é possível atribuir um Grupo de conversação a um ou mais canais do Seletor de canais do rádio na [Atribuição de zonas e canais na página 666](#) e no campo Configurar grupo de conversação de entroncamento da Lista de canais.

10.39.3.1

Grupo de conversação

Exibe o nome reconhecível pelo usuário do RadioCentral para o Grupo de conversação atual (registro/linha).

Essa seleção se aplica à Personalidade de entroncamento ou Personalidade de entroncamento do ASTRO 25 atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.39.3.2

Seleção de chave

Este campo seleciona a chave de criptografia segura a ser usada para o grupo de conversação atual (registro/linha).

Essa seleção se aplica à Personalidade de entroncamento atual.

INFORMAÇÕES:

Quando o campo [ASTRO OTAR na página 611](#) estiver **Ativado** para o [Sistema de entroncamento](#) mencionado, o valor dessa seleção de chave será escolhido na Lista de referências de chaves de criptografia segura do Perfil ASTRO OTAR selecionado no campo [Índice de perfil ASTRO OTAR na página 612](#) do sistema de entroncamento mencionado.

AVISO:

Esteja ciente de que ele está, na verdade, indicando as chaves de [Lista de chaves de criptografia na página 310](#) nessa seleção. As chaves individuais da Lista de referências de chaves de criptografia segura referem-se às chaves da Lista de chaves de criptografia do campo [Referência de Chaves de Criptografia na página 316](#). Portanto, todas as chaves selecionadas quando o Índice de Perfil ASTRO OTAR estiver ativado deverão ser definidas primeiramente na Lista de referências de chaves de criptografia segura. Chaves retiradas do Perfil OTAR com campo de Lista de chaves independentes ativado estão disponíveis.

Acessado apenas: Quando o sistema de entroncamento mencionado tem (um arquivo de teclas do sistema de software ou uma chave de sistema avançada com acesso selecionado no campo ID do sistema) ou (uma chave avançada de WACN com acesso selecionado no campo ID da WACN doméstica) e

quando o campo [Proteger/remover proteção na página 545](#) da linha/do grupo de conversação atual (desta tabela) não está definido como **Remover**.

e

quando o campo [Operação segura na página 294](#) está definido como **Hardware** ou **Software**, quando o campo Tipo de protocolo está definido como **ASTRO 25** e quando o rádio está habilitado para o modelo/para a opção.

10.39.3.3

Grupo de conversação de prioridade

Este campo permite ligar para o despachador pressionando o botão Envio prioritário e, em seguida, o botão PTT.

Acessado apenas: Quando o campo Tipo de sistema está definido como **ASTRO 25** e quando o campo Perfil DVRS está definido como **Desativado**.

A seleção a seguir é suportada:

Nenhum

Valor padrão. Aplica-se a todos os grupos de conversação criados a partir do conjunto Personalidade atual.

10.39.4

Ligação/Página (Personalidade de Entroncamento ASTRO 25)

A seção **Ligação/Página** do conjunto Personalidade de Entroncamento ASTRO 25 permite ao usuário visualizar ou definir as funcionalidades de Ligação Privada e Página para Personalidades

de entroncamento individuais. Esta funcionalidade pode ser aplicada à funcionalidade Lista de prioridades de chamada de entroncamento.

**OBSERVAÇÃO:**

Quando os recursos de personalidade de entroncamento tiverem sido exclusivamente definidos, cada personalidade poderá ser atribuída à posição desejada do seletor de canais do rádio com o uso do recurso Atribuição de zonas e canais.

10.39.4.1**Tipo de chamada privada**

Esse campo seleciona o tipo de chamada privada para a Personalidade de entroncamento atual.

É possível iniciar uma chamada privada pressionando o botão Selecionar/Chamada privada ou selecionando o menu de chamada [Selecionar/Ligação privada na página 211](#). Por sua vez, um usuário responde a uma chamada privada pressionando o botão [Resposta da Ligação na página 180](#).

As seleções a seguir são compatíveis:

Desabilitado

A função Chamada privada é desabilitada.

Disponível quando o tipo de protocolo for Tipo II ou ASTRO 25

PC II

A Chamada privada II permite uma chamada entre dois rádios individuais, independentemente dos grupos de conversação, sem exigir que o rádio receptor reconheça a chamada recebida.

Disponível quando o tipo de protocolo for Tipo II ou ASTRO 25

Unidade para unidade aprimorada

A Chamada privada aprimorada ou Chamada privada unidade a unidade permite chamadas entre dois rádios individuais, independentemente do grupo de conversação. O rádio receptor tocará, e é necessário confirmar a chamada recebida.

Disponível quando o tipo de protocolo for Tipo II ou ASTRO 25

PC com CA

Chamada privada avançada ou Chamada privada unidade para unidade, seguida por um Alerta de chamada privada. Consulte [Alerta de chamada automática na página 568](#).

Disponível quando o tipo de protocolo for Tipo II ou ASTRO 25

**OBSERVAÇÃO:**

PC II é compatível na operação de entroncamento "Analogico". Consulte os campos [Tipo de voz/sinal de AG na página 560](#) e [Grupo de conversação na página 564](#) no [Personalidade de entroncamento tipo II na página 548](#).

Há um atraso de dois minutos no PC II e na Chamada privada aprimorada ao operar em um sistema de entroncamento 3600, e de seis segundos ao operar em um sistema de entroncamento 9600. Nenhuma indicação é exibida durante o atraso.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.39.4.2**Operação de chamada privada**

Esse campo seleciona o modo de operação da função Chamada privada para a Personalidade de entroncamento atual.

Você pode iniciar uma Chamada privada pressionando o botão Selecionar/Chamada privada ou selecionando o menu [Selecionar/Ligação privada na página 211](#). Por sua vez, um usuário responde a uma chamada privada pressionando o botão [Resposta da Ligação na página 180](#).

Acessado apenas: Quando o campo [Tipo de chamada privada na página 565](#) não estiver definido como **Desabilitado** e quando o rádio estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Somente resposta (Somente resp.)

Permite que o rádio aceite somente Páginas.

Somente lista

Permite que o usuário envie páginas da Lista de prioridades de chamada. Para modelos sem teclado, essa opção pode ser usada somente com a Função do botão um toque. Essa funcionalidade depende do modelo/da opção.

Ilimitado

Permite que o usuário envie páginas da Lista de prioridades de chamada e do teclado do rádio. Essa funcionalidade depende do modelo/da opção.

AVISO:

Essa seleção não está disponível para rádios portáteis que tenham somente um visor superior.

10.39.4.3

Alerta de chamada/operação da página

Esse campo seleciona a funcionalidade Página/Alerta de chamada para a Personalidade de entroncamento atual.

Você pode ativar a Operação da página de alerta de chamada pressionando o botão [Alerta de Chamada. na página 180](#) ou selecionando o menu [Página na página 216](#).

Acessado apenas: Quando o rádio estiver habilitado para o modelo/a opção, quando o campo Ativação de hardware de DVRS estiver **Desabilitado**, ou quando o campo Ativação de hardware de DVRS estiver **Habilitado** e quando o Perfil de DVRS mencionado pela Personalidade de entroncamento atual tiver um campo de Ativação remota de DVRS definido como **Desabilitado**.

As seleções a seguir são compatíveis:

Desabilitado

Funcionalidade Alerta de chamada/página não disponível.

Somente resposta (Somente resp.)

Permite que o rádio aceite somente Páginas.

Somente lista

Permite que o usuário envie páginas da Lista de prioridades de chamada. Para modelos sem teclado, essa opção pode ser usada somente com a Função do botão um toque. Essa funcionalidade depende do modelo/da opção.

Ilimitado

Permite que o usuário envie páginas da Lista de prioridades de chamada e do teclado do rádio. Essa funcionalidade depende do modelo/da opção.

AVISO:

Essa seleção não está disponível para rádios portáteis que tenham somente um visor superior.

10.39.4.4

Lista de prioridades de chamada de entroncamento

Este campo seleciona a Lista de prioridades de chamada a ser usada pra a Personalidade de entroncamento atual.

A Lista de prioridades de chamada usada depende da seleção do campo Tipo de protocolo **Tipo II** ou **ASTRO 25** para a Personalidade de entroncamento atual. O usuário usa a Lista de prioridades de chamada para transmitir chamadas privadas e páginas.

Acessado apenas: Quando o campo [Operação de chamada privada na página 565](#) estiver definido como **Somente lista** ou **Ilimitado**, ou quando [Alerta de chamada/operação da página na página 566](#) campo estiver definido como **Somente lista** ou **Ilimitado** e quando o rádio estiver habilitado para o modelo/a opção.

10.39.4.5

Alerta de chamada automática

Esse campo permite que o rádio transmita automaticamente um alerta de chamada privada em um evento em que o destinatário de uma chamada privada aprimorada ou de unidade para unidade não responde à chamada dentro de um período de tempo específico.

Essa função se aplica à Personalidade de entroncamento atual e é aplicável aos Tipos de protocolo ASTRO 25 e Tipo II.

Acessado apenas: Quando o campo [Tipo de chamada privada na página 565](#) estiver definido como **PC com CA** e quando o rádio estiver habilitado para o modelo/a opção.

10.39.4.6

Lista de sinalização de tom

Este campo seleciona a Lista de sinalização de tom a ser usada durante a operação no modo ASTRO 25 e na Personalidade de entroncamento atual.

OBSERVAÇÃO:

A funcionalidade Lista de sinalização de tom é definida na página Lista de sinalização de tom.

Acessado apenas: Quando o campo Tipo de protocolo estiver definido como **ASTRO 25** e quando o rádio estiver habilitado para o modelo/a opção.

AVISO:

O Tipo de lista de tom na Lista de sinalização de tom deve ser **Quik Call II**.

As seleções a seguir são compatíveis:

- Sinalização de tom desativada
- Lista de sinalização de tom disponível

10.39.4.7

Alerta do usuário de chamada recebida ativado

Essa função permite que o rádio permaneça silenciado para chamadas do grupo de conversação afiliado durante a operação na Personalidade de entroncamento.

As páginas individuais e de grupo desativam o modo silencioso do rádio para que o som do tom de alerta possa ser emitido. O rádio também desativa o áudio de chamadas individuais entre rádios, como chamadas privadas, chamadas de sinalização de tom e chamadas de interconexão (modo telefone). Essa função será muito útil quando você preferir não ouvir o tráfego do grupo de conversação afiliado, mas precisar permanecer em contato com o sinal do rádio. Ao pressionar o botão [Silenciar voz na página 192](#) ou selecionar o menu [Silenciar voz na página 220](#), você poderá

ativar e desativar a função Silenciar voz de um canal habilitado para Alerta do usuário de chamada recebida.

AVISO:

Quando essa função estiver desativada, o usuário do rádio não poderá ativá-la para a personalidade de entroncamento atual.

INFORMAÇÕES:

Além disso, quando a funcionalidade Silenciar voz estiver ativa:

Uma página individual ou de grupo recebida pelo rádio desativa o modo silencioso do rádio. Assim que a página desativar a função mudo do rádio, uma chamada de voz que é recebida a seguir pode ser uma chamada em grupo que é ouvida no alto-falante do rádio.

Se os canais de rádio forem alterados e a função Silenciar voz for desativada pelo rádio, a função Silenciar voz deverá ser reativada, se desejado, ao voltar para o canal.

Se você pressionar o botão PTT, iniciar o modo Emergência ou desligar e ligar o rádio, a função Silenciar voz será desativada pelo rádio.

Os seguintes tipos de chamadas também podem ser recebidos:

- [Ativação do reagrupamento dinâmico na página 523](#)
- [Inibição de rádio na página 519](#)
- [Indicador Fora de alcance na página 228](#)
- Failsoft
- [indicador de entroncamento de local na página 229](#)
 - A função Varredura não está disponível.
 - Outras indicações do visor de chamada em grupo, como o LED de recepção e PTT-ID (se ativado), funcionam normalmente.

Acessado apenas: Quando o rádio for compatível com o modelo/a opção e quando o campo [Alerta de chamada/operação da página na página 566](#) não estiver definido como **Desativado**,

Ou quando o campo Tipo de protocolo estiver definido como **ASTRO 25** e quando o campo [Lista de sinalização de tom na página 642](#) da Personalidade de entroncamento atual estiver fazendo referência a uma Lista de sinalização de tom que tenha pelo menos um registro/linha, no qual o recurso de desativação do modo silencioso esteja **Ativado**.

10.39.5

Funções (Personalidade de Entroncamento ASTRO 25)

A seção **Funções** do conjunto Personalidade de Entroncamento ASTRO 25 permite que o usuário visualize ou modifique diversos recursos de Personalidades de entroncamento da Personalidade de entroncamento atual.

OBSERVAÇÃO:

Quando os recursos de personalidade de entroncamento tiverem sido exclusivamente definidos, cada personalidade poderá ser atribuída à posição desejada do seletor de canais do rádio com o uso do recurso Atribuição de zonas e canais.

10.39.5.1

Seleção da lista de varredura

Este campo seleciona qual Lista de varredura é utilizada pelo rádio ao operar no Modo de varredura para a Personalidade de entroncamento atual.

Em seguida, essa Lista de varredura determina os autores de chamadas que o rádio varrerá, procurará ativamente ou escutará e depois considera a desativação da função mudo para o canal de entroncamento atual.

**OBSERVAÇÃO:**

A funcionalidade Lista de varredura e Membro da lista de verificações é definida na janela Lista de varredura.

Somente as Listas de varredura que têm a seleção **Monitor de prioridade** ou **Grupo de conversação multissistema** no campo [Tipo de varredura na página 679](#) são seleções da Lista de varredura válidas para a Personalidade de entroncamento atual.

Listas de varredura com a seleção **Prioridade inteligente** no campo Tipo de varredura são seleções da Lista de varredura válidas para a Personalidade convencional atual sem sistema DVRS.

É possível iniciar a edição da Lista de varredura ativando/desativando a Programação de lista de varredura, selecionando o menu Lista de varredura ou fazendo um pressionamento longo do botão Varredura.

**AVISO:**

Quando o campo [Modo de transmissão na página 554](#) está definido no modo **TG/AG desativados (somente escuta)** para a Personalidade de entroncamento atual, a Lista de varredura mencionada dessa personalidade não deve ter o campo [Tipo de membro de transmissão de voz designado na página 686](#) definido como **Canal selecionado** (o que significa este canal); caso contrário, a seleção será considerada inválida.

Quando a [Seleção da Lista de Alertas de Site Seleccionáveis na página 589](#) do Sistema de entroncamento referenciado não está **Desativada**, a Lista de varredura referenciada dessa personalidade não deve ser um Tipo de varredura **Grupo de conversação multissistema**; caso contrário, a seleção será considerada inválida.

O aplicativo considera esta seleção inválida quando a personalidade está habilitada para Banda larga LTE e a Lista de varredura selecionada tem Canais de membro da Lista de varredura com as seguintes dependências:

- Seu campo [Frequência de interferência de LTE presente na página 430](#) de Personalidade convencional definido como **Ativado** ou
- Seu campo [Frequência de interferência de LTE presente na página 592](#) do Sistema de entroncamento é **Verdadeiro** ou
- Seu campo [Tipo de cobertura na página 511](#) do Sistema de entroncamento definido como **Roaming Inter-WACN**.

Um canal de entroncamento está habilitado para LTE quando o Sistema de entroncamento referenciado da personalidade tem um Perfil de dados referenciado com uma seleção de [Tipo de perfil de dados na página 370](#) igual a **Entroncamento e banda larga** ou **Apenas banda larga** e quando a Origem da banda larga desse Perfil de dados é **Modem LTE interno**.

Quando a Seleção da lista de responsabilidade pela equipe do Sistema de entroncamento referenciado não está **Desativada**, a Lista de varredura referenciada desta personalidade não deve ser do Tipo de varredura **Grupo de conversação multissistema**; caso contrário, a seleção será considerada inválida.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.39.5.2

Varredura automática

Este campo faz com que o rádio entre automaticamente no Modo de varredura quando você seleciona (com o Seletor de canal) a Personalidade de entroncamento atual.

A Verificação automática também é executada quando o rádio é ativado para o canal atual.

Quando desativado, é possível chamar a operação no Modo de varredura pressionando o botão Varredura, ativando ou desativando a chave Varredura ou selecionando o menu Varredura ao operar na Personalidade de entroncamento atual.

Acessado apenas: Quando o campo [Seleção da lista de varredura na página 568](#) não estiver definido como **Nenhum** e quando o rádio estiver habilitado para o modelo/a opção.

10.39.5.3

Ativação do alias

Este campo permite selecionar e transmitir um Status programado para a Personalidade de entroncamento atual.

Os status disponíveis dependem do Sistema de entroncamento referenciado da personalidade.

É possível iniciar a função Status pressionando o botão Status ou Status direto ou selecionando o menu Status.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.39.5.4

Tom de permissão para falar

Este campo permite que o rádio emita um tom de alerta quando uma concessão de acesso ao Canal de controle é recebida de um repetidor.

O recurso se aplica à Personalidade de entroncamento atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.39.5.5

Ignorar voz clara de recepção

Este campo faz com que o rádio ignore todas as comunicações por voz **Claras** (criptografadas e não seguras) em operação na Personalidade de entroncamento atual.

Acessado apenas: Quando o campo [Operação segura na página 294](#) estiver definido como **Hardware** ou **Software**.

10.39.5.6

Finalizar transmissão por perda da voz

Este campo permite que, durante uma transmissão de voz de Entroncamento, o rádio seja automaticamente desativado quando o DSP (Digital Signal Processor, processador de sinal digital) detectar a falta de voz do microfone por um período que exceda o do Contador de ausência de voz.

Esta seleção se aplica à operação na Personalidade de entroncamento atual.

AVISO:

O recurso não funciona quando:

- Um rádio no campo estiver operando no Modo de emergência e a opção **Emergência de mic. direto** ou **Emergência via áudio silencioso** estiver ativa atualmente (consulte também Modo de transmissão automática de emergência), ou
- O rádio no campo estiver sendo monitorado remotamente no momento (consulte também Ativação de monitor remoto/rastreamento de rádio).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.39.5.7

Timer de tempo limite do despacho de prioridade

Este campo seleciona o tempo necessário para você pressionar o botão Envio prioritário até o Envio prioritário sair. O tempo é medido em segundos.

Acima 295: Alcance

Mínimo	Máximo	Incrementos
1	255	1

Acessado apenas: Quando o campo Tipo de Sistema está definido como **ASTRO 25** e o campo Seleção de perfil DVRS está definido como **Desativado**.

10.39.5.8

Personalidade do modo de zona de perigo

Esse campo permite ativar o HZM (Hazard Zone Mode, Modo de zona de perigo) usando a chave concêntrica ao operar na Personalidade de entroncamento do momento.

OBSERVAÇÃO:

Este campo se aplica apenas a rádios APX NEXT XN.

INFORMAÇÕES:

Quando o HZM estiver **Ativado**, as seguintes condições devem ser atendidas:

O sistema selecionado para a personalidade de entroncamento do momento é definido como um sistema ASTRO25 e o campo Indicador de recepção de alarme de emergência é ativado no sistema selecionado.

O campo Seleção de perfil de emergência de entroncamento fica conectado a um perfil de emergência de entroncamento e não está definido como **Transmissão de emergência desativada**.

Se o campo Tipo de reversão de emergência for definido como **Reverter sistema**, o canal de reversão deve ser definido para corresponder à personalidade HZM quando o campo Personalidade HZM estiver marcado.

Acessado apenas: Quando o rádio é o modelo mais recente para os padrões de serviço dos bombeiros.

10.39.5.9

Operação do SmartConnect

Ativa a função SmartConnect para a Personalidade de Entroncamento atual.

O Tipo de protocolo para a personalidade deve ser definido como "ASTRO 25".

As seleções a seguir são compatíveis:

LMR

Os grupos de conversação contidos na personalidade atual operam somente como LMR.

LMR Preferido

Os grupos de conversação na personalidade atual alternarão automaticamente entre LMR e banda larga com base na configuração de [Deixar Limite de RSSI MS-LMR na página 495](#). Os grupos de conversação na personalidade atual alternarão automaticamente de banda larga de volta para LMR com base na configuração de [Retornar ao Limite de RSSI MS-LMR na página 504](#).

As seleções de LMR preferido e Apenas banda larga são válidas quando a Personalidade de entroncamento atual faz referência um sistema de entroncamento ASTRO 25. A Seleção do perfil

de dados deve fazer referência a um perfil de dados válido no qual o Nome de host do gateway do SmartConnect e o Número da porta TLS do gateway SmartConnect estejam configurados.

Apenas banda larga

Os grupos de conversação na personalidade atual operarão apenas em banda larga.

Acessado apenas: Quando o Tipo de protocolo estiver definido como "ASTRO 25" e o rádio for compatível com o modelo/opção.

10.39.5.10

Ativação da IU de Segurança Pública Tática

Este campo permite vários recursos de TPS (Tactical Public Safety, segurança pública tática) que estão relacionados à operação no Modo de emergência para a Personalidade de entroncamento ASTRO 25.

Essas funções incluem Todos os Rádios, Segurança Pública Tática: Sinal de emergência audível, Roteamento do indicador sonoro de emergência audível e Campanha lateral de desligamento de chamada de emergência.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.39.6

Locais preferidos (Personalidade de Entroncamento ASTRO 25)

A seção **Sites preferidos** da Personalidade de Entroncamento ASTRO 25 permite que o usuário visualize ou defina preferências de local para entroncamento de vários locais para Personalidades de Entroncamento individuais. Quando um rádio faz roaming em uma área de cobertura sobreposta de vários sites dentro de um Sistema de entroncamento ou de uma WACN (Wide Area Communications Network, rede de comunicações de área ampla), ele procurará por um site com preferência de operação ao avaliar todos os outros sites disponíveis com base na prioridade, de acordo com sua seleção correspondente de status preferencial. Este recurso fornece um gerenciamento e uma conservação mais inteligentes dos recursos de repetidor em áreas de cobertura sobreposta.

INFORMAÇÕES:

O campo Tipo de cobertura do Sistema de entroncamento mencionado determina a configuração de site único (SmartNet) ou de vários sites. Em uma configuração de vários sites, a operação SmartZone permite que o rádio determine, por meio de amostras de chamadas seletivas de RSSI, o melhor site a ser usado para as comunicações de Entroncamento.

Consulte também os campos Todo o entroncamento avançado e Constantes do Filtro do Sistema de Entroncamento.

Quando os recursos de Personalidade de entroncamento tiverem sido exclusivamente definidos, cada Personalidade poderá ter sido atribuída à posição desejada do seletor de canais do rádio com o recurso Atribuição de zonas e canais.

10.39.6.1

Ignorar preferência da função do local

Este campo permite que o rádio ignore informações de recursos do site recebidas em OSWs (Outbound Signal Words, palavras de sinal de saída) do canal de controle; por exemplo, se o site possuir repetidores não criptografados analógicos, seguros de 12 Kbits ou ASTRO.

O recurso se aplica à Personalidade de entroncamento atual e somente ao operar em SmartZone.

Se estiver **desativada**, o rádio selecionará locais com base nas informações de recursos do local. Por exemplo, se um rádio tiver selecionado um grupo de conversação ASTRO.

Acessado apenas: Quando o Sistema de entroncamento mencionado tiver o campo [Tipo de cobertura na página 511](#) não definido como **Desativado**, e quando o rádio estiver habilitado para o modelo/a opção.

10.39.6.2

Tipo de lista de sites

Este campo permite selecionar o tipo de Lista de sites para a Personalidade de entroncamento.

O Tipo de lista de sites define a forma como o rádio usará os sites identificados na Lista de sites a seguir. O acesso à Preferência de site e mobilidade (roaming) é definido pelo Tipo de lista de sites.

Acessado apenas: Quando o Sistema de entroncamento mencionado tiver o campo [Tipo de cobertura na página 511](#) não definido como **Desativado**, e quando o rádio estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Lista de preferidos

Esta é a seleção legada e padrão. Não há restrições de acesso ou preferência implícita para os sites que não estão listados.

Lista de permitidos

O rádio somente pode fazer roaming dos sites listados, e as preferências definidas serão aplicadas. O sistema ainda pode negar o acesso a um site na lista de permitidos depois que a "anexação" ao sistema for tentada no site. Se o rádio não estiver ao alcance de pelo menos um dos sites listados, o rádio permanecerá fora de alcance.

Lista de bloqueados

O rádio não tem permissão para fazer roaming para qualquer site listado. Todos os outros sites são tratados como sites permitidos sem preferência definida.

10.39.6.3

ID do site

Este campo permite inserir, em formato decimal ou hexadecimal, o número de ID que identifica o site SmartZone atual (registro/linha), que se aplica à personalidade de entroncamento atual.

AVISO:

Para suportar o roaming entre sites diferentes, cada ID de Site deve ser único dentro do RFSS.

Acessado apenas: Quando o Sistema de entroncamento mencionado tiver o campo [Tipo de cobertura na página 511](#) não definido como **Desativado**, e quando o rádio estiver habilitado para o modelo/a opção.

Acima 296: Alcance

Tipo de cobertura	Mínimo	Máximo
ASTRO 25	1	FE hex
Tipo II	1	40 hex

10.39.6.4

Status preferido

Este campo seleciona o status preferido para o site SmartZone quando determinado, por meio de amostras de sondagens de RSSI, o melhor site a ser usado para comunicações de entroncamento.

Essa seleção se aplica ao site atual (registro/linha), que se aplica à Personalidade de entroncamento atual.

Acessado apenas: Quando o Sistema de entroncamento mencionado tiver o campo [Tipo de cobertura na página 511](#) não definido como **Desativado**, e quando o rádio estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Nenhum

O local não recebe preferência.

INFORMAÇÕES:

Se um site não estiver listado aqui, o rádio não atribuirá a ele nenhuma preferência.

Menor preferência

O local será evitado, a menos que seja o único local utilizável para operação.

Preferido

O local será usado com prioridade sobre todos os locais não preferidos. Rádio deixar este site quando se entrar em Entroncamento de Site.

Sempre preferido

O site será usado como prioridade sobre todos os sites não preferidos, mesmo se o site tiver entrado em Entroncamento de Site.

10.39.6.5

ID RFSS

Este campo permite inserir, em formato decimal ou hexadecimal, o ID do RFSS (Radio Frequency Sub-System, subsistema de radiofrequência) do ASTRO 25 que corresponde ao ID do site atual (registro/linha), aplicável à personalidade de entroncamento atual.

AVISO:

Para oferecer suporte ao roaming entre RFSSs diferentes dentro de um sistema de entroncamento, cada RFSS deve ter um número único.

OBSERVAÇÃO:

Um RFSS é composto por um ou mais sites.

Acessado apenas: Quando o campo [Tipo de cobertura na página 511](#) do sistema de entroncamento mencionado está definido como **SmartZone e OmniLink**, **Roaming intra-WACN** ou **Roaming inter-WACN**, quando o campo Tipo de protocolo está definido como **Tipo II** e quando o rádio está habilitado para o modelo/para a opção.

Acima 297: Alcance

Mínimo	Máximo
1	FE hex

10.39.6.6

ID do sistema

Este campo permite inserir em formato decimal ou hexadecimal o ID do sistema Tipo II ou ASTRO 25 que corresponde ao ID do site no site (registro/linha) atual, o que se aplica à Personalidade de entroncamento atual.

AVISO:

Para suportar o roaming entre Sistemas de entroncamento diferentes que compõe as WACNs (Wide Area Communications Networks, redes de comunicações de área ampla), cada Sistema de entroncamento deve ter uma ID de sistema única.

OBSERVAÇÃO:

Um Sistema de entroncamento é composto por um ou mais RFSS (Radio Frequency Sub-Systems, subsistemas de radiofrequência).

Acessado apenas: Quando o campo Tipo de protocolo está definido como **Tipo II**, quando o Sistema de entroncamento referenciado tem seu campo [Tipo de cobertura na página 511](#) definido como **SmartZone e OmniLink** e o rádio está habilitado para o modelo/a opção,

Quando o campo Tipo de protocolo está definido como **ASTRO 25**, quando o Sistema de entroncamento referenciado tem o campo Tipo de cobertura definido como **Roaming intra-WACN** ou **Roaming inter-WACN** e o rádio está habilitado para o modelo/a opção.

Acima 298: Alcance

Tipo de cobertura	Mínimo	Máximo
ASTRO 25	0	0FFE hex
Tipo II	0	FFFE hex

10.39.6.7

ID do RAS WACN

Este campo permite inserir, em formato decimal ou hexadecimal, o ID da WACN (Wide Area Communications Network, rede de comunicações de área ampla) do RAS (Remote Access Server, servidor de acesso remoto) para o ID do site atual (registro/linha).

AVISO:

Para oferecer suporte ao roaming entre WACNs diferentes, cada WACN deve ter um número único.

OBSERVAÇÃO:

Uma WACN é composta por um ou mais sistemas de entroncamento. Essa seleção também se aplica à personalidade de entroncamento atual.

Acessado apenas: Quando o campo Tipo de protocolo está definido como **ASTRO 25**, quando o campo [Tipo de cobertura na página 511](#) do sistema de entroncamento mencionado está definido como **Roaming inter-WACN** e quando o rádio está habilitado para o modelo/para a opção.

Acima 299: Alcance

Mínimo	Máximo
0	FFFFE hex

10.39.6.8

Caractere curinga

Este campo define o tipo de entrada na Lista de sites. A seleção é um tipo de curinga que determinará qual site ou grupo de sites será **Preferido**, **Permitido** ou **Bloqueado**.

Acessado apenas: Quando o Sistema de entroncamento mencionado tiver o campo [Tipo de cobertura na página 511](#) não definido como **Desativado**, e quando o rádio estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Sem curinga

Esta é a seleção padrão.

Qualquer site

Todos os sites de um RFSS, Sistema e WACN aplicáveis com base na seleção do campo Tipo de cobertura

Qualquer RFSS

Todos os sites, RFSS em um Sistema e WACN aplicáveis com base na seleção do campo Tipo de cobertura

Qualquer sistema

Todos os sites, RFSS e Sistemas em uma WACN aplicáveis com base na seleção do campo Tipo de cobertura

10.39.6.9

Permitir emergência em site bloqueado

Se esse campo estiver ativado, o rádio tentará registrar o grupo de conversação selecionado em um site definido como bloqueado no RadioCentral quando o rádio estiver no modo de emergência. Quando a emergência é apagada, o rádio continua a bloquear o grupo de conversação selecionado.

Acessado apenas: Este campo pode ser acessado somente quando as seguintes condições forem atendidas:

- O campo **Tipo de lista de sites** está definido como **Bloqueado**.
- O campo **Tipo de cobertura** do sistema de Entroncamento mencionado **não** está definido como **Desativado**.

10.40

Lista de todas as ligações

A seção **Lista de todas as chamadas** permite ativar seletivamente alterações em campo para as informações de Contato.

10.40.1

UCL editável

Esse campo permite criar contatos na UCL (Unified Call List, lista de chamadas unificadas) do rádio.

OBSERVAÇÃO:

Toda a UCL é salva no rádio com todos os recursos programados do codeplug.

Você pode criar contatos pressionando o botão Contatos ou selecionando o menu Contatos.

INFORMAÇÕES:

A ativação deste campo também ativa o campo [Lista de prioridades editável na página 652](#); no entanto, a desativação desse campo não desativa o campo editável, Lista de prioridades.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.40.2

Lista de prioridades editável

Esse campo permite criar, excluir ou modificar os membros das listas de prioridades de chamadas individuais do rádio.

**OBSERVAÇÃO:**

A lista de prioridades individuais é programada por canal, exceto pela [Lista de prioridades do telefone](#), que se aplica a todos os rádios.

O acesso do usuário ao modo de edição da Lista de prioridades é iniciado ao pressionar o botão Contatos ou selecionar o menu Contatos.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.40.3

Número de telefone editável

Esse campo permite editar números de telefone na UCL do rádio.

**OBSERVAÇÃO:**

Toda a UCL é salva no rádio com todos os recursos programados do codeplug.

O acesso do usuário aos Números de telefone é iniciado ao pressionar o botão Contatos ou selecionar o menu Contatos.

Acessado apenas: Quando o modelo/a opção do rádio for compatível e quando o campo [UCL editável na página 651](#) estiver **Ativado**.

10.40.4

ID de rádio editável

Esse campo permite editar os IDs de chamada nas listas de prioridades de chamadas programadas no rádio.

O acesso do ID de ligação do usuário à Lista de prioridades é iniciado ao pressionar o botão Contatos ou selecionar o menu Contatos.

Acessado apenas: Quando o modelo/a opção do rádio for compatível e quando o campo [UCL editável na página 651](#) estiver **Ativado**.

10.40.5

Indicador de ordem de dados de contatos

Esse campo permite especificar a ordem na qual os IDs de chamadas da UCL (Unified Call List, Lista de ligações unificadas) para entradas de contato individuais aparecerão no visor do rádio.

Para alterar a ordem atual, selecione um item com o cursor do mouse e arraste-o para uma nova posição na lista.

Você pode iniciar a visualização ou edição de entradas de contatos pressionando o botão Contatos ou selecionando o menu Contatos. Essa seleção se aplica a todos os rádios.

**OBSERVAÇÃO:**

Toda a UCL é salva no rádio com todos os recursos programados do codeplug.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.41

Lista de chamadas unificada

A seção **Lista de chamadas unificada** permite visualizar ou modificar contatos da Lista de chamadas individuais.

Cada contato pode conter informações relativas a diferentes tipos de sinalização convencional, tipos de cobertura de entroncamento ou parâmetros de conectividade de telefone.

OBSERVAÇÃO:

Depois de definidos, os contatos e IDs de chamada poderão ser selecionados nas listas de prioridades individuais. Essas seleções de ID de contato e de chamada permitem criar as listas de prioridades individuais.

Se o rádio receber IDs duplicados, não conseguirá exibir um alias até que a duplicação seja removida.

Gravar o codeplug em um rádio fará com que a lista de chamadas retorne ao estado original e com que todas as atualizações de alias de OTA sejam perdidas.

10.41.1

Contato

O Contato permite que o usuário defina nomes de sistema e o ID do ID de entroncamento do ASTRO 25, ID de entroncamento do tipo II, ID do ASTRO convencional, ID do MDC convencional e do Número do telefone.

10.41.1.1

Nome do contato

Esse campo permite definir nomes reconhecíveis para o contato atual da lista de contatos unificados.

Vários IDs de chamada de comunicações convencionais e de entroncamento ou números de telefone podem então ser definidos para esse contato. Depois de definidos, os contatos e IDs de chamada poderão ser selecionados nas listas de prioridades individuais.

OBSERVAÇÃO:

Exemplos: EMT 001, 500, Electric1.

Podem ser usados caracteres, números e espaços.

No máximo 14 caracteres no total.

10.41.1.2

ID de entroncamento do tipo II

O ID de entroncamento Tipo II da seção Contato permite que você visualize ou modifique os IDs de chamada de entroncamento Tipo II para contatos individuais.

10.41.1.2.1

Nome do sistema

Esse campo seleciona o sistema de entroncamento do tipo II ou permite criar um conjunto de IDs personalizados.

Selecionar um sistema de entroncamento seleciona automaticamente o valor **ID do sistema na página 513**. Esta seleção se aplica ao conjunto de IDs de chamada (registro/linha) do **contato** atual dentro da **Lista de chamadas unificada na página 653**. Esse conjunto de IDs de chamada pode então ser selecionado no campo **ID de chamada na página 663**.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Não atribuído

Nenhuma seleção.

Personalizado

Permite inserir um [ID do sistema personalizado na página 654](#) ao registro/linha atual. Esses IDs se aplicam a um sistema de entroncamento do tipo II não definido no codeplug atual. Esse conjunto de IDs de chamada pode então ser selecionado no campo [ID de chamada na página 663](#).

Pesquisar

Selecionar um conjunto do [Sistema de entroncamento tipo II na página 510](#) disponível.

10.41.1.2.2

ID do sistema

Este campo permite visualizar o ID do sistema ASTRO 25 e o ID do sistema tipo II no campo para o Sistema de entroncamento atual selecionado.

O campo Nome do sistema seleciona o Sistema de entroncamento desejado para o registro/linha atual. Este valor se aplica ao conjunto de IDs de chamadas atual (registro/linha) do Contato atual da Lista de chamadas unificadas. Esse conjunto de IDs de chamada pode ser selecionado no campo [ID de chamada na página 661](#) (ASTRO 25) [ID de chamada na página 663](#) (Type II).

Acessado apenas: Quando o campo Nome do sistema não estiver definido como **Personalizado** e o rádio for compatível com o modelo/a opção.

10.41.1.2.3

ID do sistema personalizado

Esse campo permite definir um ID do sistema — tipo II em um sistema de entroncamento não definido no codeplug atual.

Esta seleção apenas se aplica quando o campo [Nome do sistema na página 653](#) de Entroncamento está definido como **Personalizado** no registro/linha atual. Portanto, essa seleção corresponde a um [Sistema de entroncamento](#) no campo. Esta seleção se aplica ao conjunto de IDs de chamada atual (registro/linha) do [contato](#) atual dentro da [Lista de chamadas unificada na página 653](#). Esse conjunto de IDs de chamada pode então ser selecionado no campo [ID de chamada na página 663](#).

Acessado apenas: Quando o campo [Nome do sistema na página 653](#) estiver definido como **Personalizado** e o rádio for compatível com o modelo/opção.

OBSERVAÇÃO:

As seleções estão baseadas nos arquivos de chave de sistema de software ou chaves de sistema avançadas disponíveis no aplicativo. O relatório de chave de sistema permite visualizar as chaves disponíveis no momento.

Acima 300: Alcance

Mínimo	Máximo	Incremento
1	65535	1

10.41.1.2.4

ID de unidade

Esse campo seleciona o ID de unidade tipo II do rádio de destino operando no modo de comunicações de entroncamento do tipo II.

Esse ID corresponde ao [ID de unidade](#) do mesmo [Sistema de entroncamento](#) que foi definido no rádio de destino. Esta seleção se aplica ao conjunto de IDs de chamada (registro/linha) do [contato](#) atual dentro da [Lista de chamadas unificada na página 653](#). Esse conjunto de IDs de chamada pode então ser selecionado no campo [ID de chamada na página 663](#).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

AVISO:

A faixa de seleção pode ser modificada de acordo com a Chave avançada (Hardware) pelo programa Administrador de chaves avançadas.

Acima 301: Alcance

Mínimo	Máximo
000001	16777215

10.41.1.3

ID convencional do MDC

ID convencional do MDC da seção Contato permite que o usuário visualize ou modifique conjuntos de IDs convencionais do MDC de contatos individuais.

10.41.1.3.1

Nome do sistema

Esse campo seleciona o sistema convencional do MDC ou permite criar um conjunto de IDs personalizado.

Selecionar um sistema convencional do MDC seleciona automaticamente o valor [Número do grupo do sistema](#). Esta seleção se aplica ao conjunto de IDs de chamada (registro/linha) do [contato](#) atual dentro da [Lista de chamadas unificada na página 653](#). Esse conjunto de IDs de chamada pode então ser selecionado no campo [ID de chamada na página 665](#).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Não atribuído

Nenhuma seleção.

Personalizado

Permite inserir um [Número do grupo personalizado na página 656](#) ao registro/linha atual. Esses IDs se aplicam a um [Sistema convencional na página 408](#) MDC não definido no codeplug atual. Esse conjunto de IDs de chamada pode então ser selecionado no campo [ID de chamada na página 665](#).

Sistemas convencionais possíveis

Seleciona um sistema Convencional programado dentro do codeplug atual.

10.41.1.3.2

Número do grupo do sistema

Permite visualizar apenas o Número do grupo de sistema para o sistema convencional do MDC atualmente selecionado. O campo Nome do sistema seleciona o Sistema de ASTRO desejado para o registro/linha atual.

Este valor se aplica ao conjunto de IDs de chamadas atual (registro/linha) do Contato atual da Lista de chamadas unificadas. Esse conjunto de IDs de chamada pode então ser selecionado no campo [ID de chamada na página 665](#).

Acessado apenas: quando o campo Tipo de sistema estiver definido como **Personalizado** ou o rádio for compatível com o modelo/opção.

10.41.1.3.3

Número do grupo personalizado

Esse campo permite definir um número do grupo do sistema em um sistema convencional do MDC não definido no codeplug atual.

Esta seleção se aplica somente quando o campo [Nome do sistema na página 655](#) está definido como **Personalizado** no registro/linha atual. Portanto, essa seleção corresponde a um Sistema Convencional do MDC no campo. Esta seleção se aplica ao conjunto de IDs de chamada atual do [contato](#) atual dentro da [Lista de chamadas unificada na página 653](#). Esse conjunto de IDs de chamada pode então ser selecionado no campo [ID de chamada na página 665](#).

Acessado apenas: Quando o campo [Nome do sistema na página 656](#) estiver definido como **Personalizado** e o rádio for compatível com o modelo/opção.

10.41.1.3.4

ID principal

Esse campo seleciona o ID principal do rádio alvo que opera no modo Convencional do MDC.

Esse ID corresponde ao [ID principal do MDC](#) do mesmo sistema convencional que foi definido no rádio alvo. Esta seleção se aplica ao conjunto de IDs de chamada (registro/linha) do [contato](#) atual dentro da [Lista de chamadas unificada na página 653](#). Esse conjunto de IDs de chamada pode então ser selecionado no campo [ID de chamada na página 665](#).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

[Acima 302: Alcance](#)

Mínimo	Máximo	Incremento
0 (Hex)	FFFFFFFF (Hex)	1

10.41.1.4

ID do ASTRO convencional

O ID ASTRO convencional da seção Contato permite que você visualize ou modifique os IDs de chamada de entroncamento ASTRO 25 para contatos individuais.

10.41.1.4.1

Nome do sistema

Esse campo seleciona o sistema convencional ASTRO desejado ou permite criar um conjunto de IDs personalizados.

Selecionar um sistema convencional seleciona automaticamente o valor [Número do grupo do sistema](#). Esta seleção se aplica ao conjunto de IDs de chamada (registro/linha) do [contato](#) atual dentro da [Lista de chamadas unificada na página 653](#). Esse conjunto de IDs de chamada pode então ser selecionado no campo [ID de chamada na página 664](#).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Não atribuído

Nenhuma seleção.

Personalizado

Permite inserir um [Número do grupo personalizado](#) ao registro/linha atual. Esses IDs se aplicam a um ASTRO [Sistema convencional na página 408](#) não definido no codeplug atual. Esse conjunto de IDs de chamada pode então ser selecionado no campo [ID de chamada na página 664](#).

Sistemas convencionais possíveis

Seleciona um sistema Convencional programado dentro do codeplug atual.

10.41.1.4.2

Número do grupo do sistema

Permite visualizar apenas o Número do grupo de sistema — ASTRO para o sistema convencional atualmente selecionado. O campo Nome do sistema seleciona o Sistema de ASTRO desejado para o registro/linha atual.

Este valor se aplica ao conjunto de IDs de chamadas atual (registro/linha) do Contato atual da Lista de chamadas unificadas. Esse conjunto de IDs de chamada pode então ser selecionado no campo [ID de chamada na página 664](#).

Acessado apenas: quando o campo Tipo de sistema estiver definido como **Personalizado** ou o rádio for compatível com o modelo/opção.

10.41.1.4.3

Número do grupo do sistema

Esse campo permite definir um Número de grupo do sistema para um Sistema convencional ASTRO não definido no codeplug atual.

O número de grupo do sistema fornece um caminho para agrupar de forma lógica vários Sistemas convencionais no codeplug que é o mesmo sistema OTA.

**INFORMAÇÕES:**

Esta seleção apenas se aplica quando o campo Nome do sistema está definido como **Personalizado** no registro/linha atual. Portanto, essa seleção corresponde a um Sistema convencional do ASTRO no campo. Esta seleção se aplica ao conjunto de IDs de chamada atual (registro/linha) do Contato atual da Lista de ligações unificadas. Esse conjunto de IDs de chamada pode então ser selecionado no campo [ID de chamada na página 664](#).

Acessado apenas: Quando o campo Tipo de sistema estiver definido como **Personalizado** ou o rádio for compatível com o modelo/opção.

10.41.1.4.4

ID individual

Esse campo seleciona o ID individual do rádio alvo que opera no modo ASTRO — convencional.

Esse ID corresponde ao ID individual do rádio alvo. O ID individual também deve ser correspondente ao sistema convencional ([Número do grupo do sistema](#)) selecionado no campo [Nome do sistema na página 656](#) para o mesmo registro/linha. Esta seleção se aplica ao conjunto de IDs de chamada (registro/linha) do [contato](#) atual dentro da [Lista de chamadas unificada na página 653](#). Esse conjunto de IDs de chamada pode então ser selecionado no campo [ID de chamada na página 664](#).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

[Acima 303: Alcance](#)

Mínimo	Máximo	Incremento
1	16777215	1

10.41.1.4.5

Tipo de chamada

Esse campo seleciona o tipo de chamada do rádio alvo operando no modo ASTRO — convencional.

Esta seleção se aplica ao conjunto de IDs de chamada (registro/linha) do [contato](#) atual dentro da [Lista de chamadas unificada na página 653](#). Esse conjunto de IDs de chamada pode então ser selecionado no campo [ID de chamada na página 664](#).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Individual

Quando o conjunto ID da ligação atual for destinado a uma ligação individual.

Grupo

Quando o conjunto ID da ligação atual for destinado a uma ligação em grupo.

10.41.1.5

ID de entroncamento do ASTRO 25

O ID de entroncamento ASTRO 25 da seção Contato permite que você visualize ou modifique os IDs de chamada de entroncamento ASTRO 25 para contatos individuais.

10.41.1.5.1

Nome do sistema

Esse campo seleciona o sistema de entroncamento desejado ou permite criar um conjunto de IDs personalizado.

Selecionar um sistema de entroncamento seleciona automaticamente o [ID da RAS/WACN local](#) e os valores [ID do sistema na página 513](#). Esta seleção se aplica ao conjunto de IDs da ligação (registro/linha) do Contato atual da Lista de ligações unificadas. Esse conjunto de IDs de chamada pode então ser selecionado no campo [ID de chamada na página 661](#).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Não atribuído

Nenhuma seleção.

Personalizado

Permite inserir um ID de WACN personalizado, ID do sistema personalizado e ID individual no registro/linha atual. Esses IDs se aplicam a um sistema de entroncamento não definido no codeplug atual. Esse conjunto de IDs de chamada pode então ser selecionado no campo.

Pesquisar

Selecionar um conjunto do [Sistema de entroncamento ASTRO 25 na página 576](#) disponível.

10.41.1.5.2

ID da WACN doméstica

Este campo permite visualizar o ID da WACN do ASTRO 25 - RAS (doméstica) para o sistema de entroncamento selecionado atualmente.

O campo [Nome do sistema na página 658](#) seleciona o Sistema de Entroncamento desejado para o registro/a linha atual. Este valor se aplica ao conjunto de IDs de chamadas atual (registro/linha) do Contato atual da Lista de chamadas unificadas. O conjunto de IDs da chamada pode ser selecionado no campo [ID de chamada na página 661](#).

Acessado apenas: Quando o campo [Nome do sistema na página 658](#) não está definido como **Personalizado** e quando o rádio está habilitado para o modelo/para a opção.

10.41.1.5.3

ID do sistema

Este campo permite visualizar o ID do sistema ASTRO 25 e o ID do sistema tipo II no campo para o Sistema de entroncamento atual selecionado.

O campo Nome do sistema seleciona o Sistema de entroncamento desejado para o registro/linha atual. Este valor se aplica ao conjunto de IDs de chamadas atual (registro/linha) do Contato atual da Lista de chamadas unificadas. Esse conjunto de IDs de chamada pode ser selecionado no campo [ID de chamada na página 661](#) (ASTRO 25) [ID de chamada na página 663](#) (Type II).

Acessado apenas: Quando o campo Nome do sistema não estiver definido como **Personalizado** e o rádio for compatível com o modelo/a opção.

10.41.1.5.4

ID de unidade

Esse campo seleciona o ID de unidade do ASTRO 25 do rádio alvo que opera no modo de comunicações de entroncamento do ASTRO 25.

Esse ID corresponde ao ID de unidade do rádio alvo. O ID de unidade também deve corresponder ao sistema de entroncamento ([ID do sistema na página 513](#) e [ID da WACN doméstica na página 658](#)) estar selecionado no campo [Nome do sistema na página 658](#) para o mesmo registro/linha. Esta seleção se aplica ao conjunto de IDs de chamada (registro/linha) do [contato](#) atual dentro da [Lista de chamadas unificada na página 653](#). Esse conjunto de IDs de chamada pode então ser selecionado no campo [ID de chamada na página 661](#).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

**AVISO:**

A faixa de seleção pode ser modificada de acordo com a Chave avançada (Hardware) pelo programa Administrador de chaves avançadas.

Acima 304: Alcance

Mínimo	Máximo
000001	16777215

10.41.1.5.5

ID do sistema personalizado

Esse campo permite definir um ID do sistema — ASTRO 25 (em formato decimal ou hexadecimal) em um sistema de entroncamento não definido no codeplug atual.

Esta seleção se aplica apenas quando o campo [Nome do sistema na página 658](#) de entroncamento estiver definido como **Personalizado** para o registro/linha atual, e corresponder a um [Sistema de entroncamento](#) no campo. Esta seleção se aplica ao conjunto de IDs de chamada atual (registro/linha) do [contato](#) atual dentro da [Lista de chamadas unificada na página 653](#). Esse conjunto de IDs de chamada pode então ser selecionado no campo [ID de chamada na página 661](#).

Acessado apenas: Quando o campo [Nome do sistema na página 658](#) estiver definido como **Personalizado** e o rádio for compatível com o modelo/opção.

**OBSERVAÇÃO:**

As seleções são baseadas nos arquivos de chave de sistema de software ou chaves avançadas (hardware) disponíveis no aplicativo. O relatório de chaves de sistema permite visualizar todas as chaves de sistema disponíveis no momento.

Há dois valores separados que definem a faixa.

Acima 305: Primeiro valor

Mínimo	Máximo	Incremento
1	65535	1

Acima 306: Segundo valor

Mínimo	Máximo	Incremento
1	FFFF	1

10.41.1.5.6

ID da WACN personalizada

Esse campo permite definir um ID da WACN — ASTRO 25 (em formato decimal ou hexadecimal) em um sistema de entroncamento não definido no codeplug atual.

Esta seleção apenas se aplica quando o campo [Nome do sistema na página 658](#) de Entroncamento está definido como **Personalizado** no registro/linha atual. Portanto, esta seleção corresponde a um Sistema de entroncamento no campo. Esta seleção se aplica ao conjunto de IDs de chamada atual (registro/linha) do [contato](#) atual dentro da [Lista de chamadas unificada na página 653](#). Esse conjunto de IDs de chamada pode então ser selecionado no campo [ID de chamada na página 661](#).

Acessado apenas: Quando o campo [Nome do sistema na página 658](#) estiver definido como **Personalizado** e o rádio for compatível com o modelo/opção.

Há dois valores separados que definem a faixa.

Acima 307: Primeiro valor

Mínimo	Máximo	Incremento
1	1048574	1

Acima 308: Segundo valor

Mínimo	Máximo	Incremento
1	FFFFE	1

10.42

Lista de prioridades de entroncamento ASTRO 25

Ela permite visualizar ou definir as listas de prioridades de chamadas individuais para as comunicações de entroncamento ASTRO 25.

Você pode selecionar membros da lista de chamadas individuais ao operar no modo de entroncamento. Os membros da lista de chamadas permitem tipos de chamadas como chamadas privadas e páginas para rádios individuais ou para grupos de rádios.

A Lista de prioridades de chamada de entroncamento também possibilita um "ID de chamada".

OBSERVAÇÃO:

Contatos precisam ser primeiramente definidos na [UCL \(Unified Call List, lista de chamadas unificada\)](#) antes de serem selecionados para uma lista de prioridades de chamadas de entroncamento ASTRO 25.

Conjuntos de IDs de chamadas também precisam ser definidos na [página IDs de entroncamento de chamadas ASTRO 25](#) da UCL antes de serem selecionados para uma lista de prioridades de chamadas de entroncamento ASTRO 25.

As listas de prioridades individuais podem ser, então, selecionadas de acordo com [Personalidade de entroncamento](#) a partir do campo [Lista de prioridades de chamada de entroncamento na página 566](#).

Você pode iniciar o modo de edição da lista de prioridades pressionando o botão [Contacts na página 181](#) ou selecionando o menu [Contacts na página 212](#).

10.42.1

Alias da lista de favoritos

Este campo permite definir um nome reconhecível para a Lista de favoritos de entroncamento atual do ASTRO 25.

Depois de definidas, as listas de prioridades individuais do ASTRO 25 são selecionáveis por [Personalidade de entroncamento](#) a partir do campo [Lista de prioridades de chamada de entroncamento na página 566](#).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

Exemplos: EMT-001, #500, Electric1, # A5.

É possível usar caracteres, números, espaços e caracteres especiais. Para caracteres unicode não identificados, como emojis, o visor superior do rádio mostra "quadrados" para esses caracteres.

São permitidos no máximo 14 caracteres.

10.42.2

Contato

Este campo seleciona o Contato para o registro ou linha atual da Lista de prioridades de entroncamento do ASTRO 25 atual.

É necessário definir o [Contato](#) primeiro na [Lista de chamadas unificadas \(UCL\)](#). Após a seleção do contato, será possível selecionar o conjunto de IDs de chamada (definido na [Página ID de entroncamento do ASTRO](#)) no campo [ID de chamada na página 661](#) do mesmo registro ou da mesma linha.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.42.3

ID de chamada

Este campo seleciona o conjunto de IDs de chamada para o registro ou a linha atual da Lista de prioridades de entroncamento do ASTRO 25.

Esse conjunto de IDs de chamada é definido em [Lista de ligações unificadas](#), na [Página ID de entroncamento do ASTRO 25](#). O [Contato na página 661](#) do atual registro/linha deve ser selecionado antes que esta seleção seja feita.

Acessado apenas: quando o campo [Contato na página 661](#) do atual registro/linha não estiver definido como **Não atribuído** e o rádio for compatível com o modelo/opção.

10.43

Lista de prioridades de entroncamento do tipo II

Essa seção permite visualizar ou definir as Listas de prioridades de chamada individuais para as comunicações de entroncamento do tipo II.

Você pode selecionar membros da lista de chamadas individuais ao operar no modo de entroncamento. Os membros da lista de chamadas permitem tipos de chamadas como chamadas privadas e páginas para rádios individuais ou para grupos de rádios.

A Lista de prioridades de chamada de entroncamento também possibilita um "ID de chamada".

OBSERVAÇÃO:

Para selecionar os contatos na Lista de prioridades de chamada de entroncamento do tipo II, primeiramente, é necessário definir [Contatos](#) na [Lista de chamadas unificadas \(UCL\)](#).

Para selecionar os conjuntos de IDs de chamadas para uma Lista de prioridades de chamada de entroncamento do tipo II, também é necessário defini-los na [Página IDs de entroncamento do tipo II](#) antes.

As listas de prioridades individuais podem ser, então, selecionadas de acordo com [Personalidade de entroncamento](#) a partir do campo [Lista de prioridades de chamada de entroncamento na página 566](#).

Você pode iniciar o modo de edição da lista de prioridades pressionando o botão [Contacts na página 181](#) ou selecionando o menu [Contacts na página 212](#).

10.43.1

Alias da lista de favoritos

Esse campo permite definir nomes reconhecíveis para a lista de prioridades de entroncamento do tipo II atual.

Depois de definidos, as listas de prioridades de chamadas individuais do tipo II são selecionáveis para cada [Personalidade de entroncamento](#) do campo [Lista de prioridades de chamada de entroncamento na página 566](#).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

Exemplos: EMT-001, #500, Electric1, # A5.

É possível usar caracteres, números, espaços e caracteres especiais. Para caracteres unicode não identificados, como emojis, o visor superior do rádio mostra "quadrados" para esses caracteres.

São permitidos no máximo 14 caracteres.

10.43.2

Contato

Esse campo seleciona o Contato no registro/linha atual da lista de prioridades de entroncamento do tipo II atual.

O contato deve ser definido primeiro no campo [Contato](#) da [Lista de chamadas unificada na página 653](#). Uma vez que esse contato foi selecionado, o conjunto de IDs (definido na [página ID de entroncamento do tipo II](#) da UCL) deve ser selecionado no campo [ID de chamada na página 663](#) desse mesmo registro/linha.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.43.3

ID de chamada

Esse campo seleciona o conjunto de IDs de chamada no registro/linha atual da lista de prioridades de entroncamento do tipo II atual.

O contato do registro/linha atual deve ser selecionado antes que esta seleção seja feita.

Acessado apenas: quando o campo [Contato na página 662](#) do atual registro/linha não estiver definido como **Não atribuído** e o rádio for compatível com o modelo/opção.

10.44

Lista de prioridades ASTRO convencional

Esta seção permite visualizar ou definir as listas de prioridades de chamadas individuais para comunicações convencionais.

Você pode selecionar membros da lista de chamadas individuais ao operar no modo de comunicações convencionais. Os membros da lista de chamadas permitem tipos de chamadas como chamadas seletivas e alertas de chamada para rádios individuais ou para grupos de rádios.

A Lista de prioridades de chamada do ASTRO também possibilita um "ID de chamada".

**OBSERVAÇÃO:**

[Contatos](#) precisam ser primeiramente definidos na [UCL \(Unified Call List, lista de chamadas unificada\)](#) antes de serem selecionados para uma lista de prioridades de chamadas do ASTRO.

Conjuntos de IDs de chamadas também precisam ser definidos na [ID do ASTRO convencional](#) da UCL antes de serem selecionados para uma lista de prioridade de chamadas do ASTRO.

As listas de prioridades individuais podem ser, então, selecionadas de acordo com [Personalidade convencional na página 422](#) a partir do campo [Lista de Prioridades de Ligação ASTRO na página 465](#).

Você pode iniciar o modo de edição da lista de prioridades pressionando o botão [Contacts na página 181](#) ou selecionando o menu [Contacts na página 212](#).

10.44.1

Alias da lista de favoritos

Esse campo permite definir um nome reconhecível para a lista de prioridades convencionais do ASTRO atual.

Depois de definidas, as listas de prioridades individuais do ASTRO são selecionáveis para cada [Personalidade convencional na página 422](#) do campo [Lista de Prioridades de Ligação ASTRO na página 465](#).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

**OBSERVAÇÃO:**

Exemplos: EMT-001, #500, Electric1, #A5.

É possível usar caracteres, números, espaços e caracteres especiais. Para caracteres unicode não identificados, como emojis, o visor superior do rádio mostra "quadrados" para esses caracteres.

São permitidos no máximo 14 caracteres.

10.44.2

Contato

Esse campo seleciona o contato no registro/linha atual da lista de prioridades convencionais ASTRO atual.

O contato deve ser definido primeiro no campo [Contatos](#) da [UCL](#). Após a seleção do contato, o conjunto de IDs de chamada (definido na [página ID convencional do ASTRO](#) da UCL) pode ser selecionado no campo [ID de chamada na página 664](#) desse mesmo registro/linha.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.44.3

ID de chamada

Esse campo seleciona o conjunto de IDs de chamada para o registro/linha atual da lista de prioridades convencionais do ASTRO atual.

Este conjunto de IDs da ligação é definido na página Lista de ligações unificadas - ID convencional do ASTRO. O contato do registro/linha atual deve ser selecionado antes que esta seleção seja feita.

Acessado apenas: quando o campo [Contato na página 664](#) do atual registro/linha não estiver definido como **Não atribuído** e o rádio for compatível com o modelo/opção.

10.45

Lista de prioridades convencionais do MDC

Esta seção permite visualizar ou definir listas de acesso de chamadas individuais para comunicações convencionais do MDC.

Você pode selecionar membros individuais da lista de chamadas ao operar no modo convencional. Os membros da lista de chamadas permitem tipos de chamadas como chamadas seletivas e alertas de chamada para rádios individuais ou para grupos de rádios.

A Lista de favoritos de ligações do MDC também permite ID de chamadas.

**OBSERVAÇÃO:**

Os [contatos](#) devem ser definidos primeiro na [Lista de chamadas unificada \(UCL\)](#) antes de selecioná-los para uma lista de prioridades de chamadas do MDC.

Os conjuntos de IDs de chamadas também devem ser definidos na [página ID convencional do MDC](#) da UCL antes de selecioná-los na lista de prioridades de chamadas do MDC.

As listas de prioridades individuais podem ser, então, selecionadas de acordo com [Personalidade convencional na página 422](#) a partir do campo [Lista de prioridades de chamada não ASTRO na página 461](#).

Você pode inicializar o modo de edição da lista de prioridades pressionando o botão [Contacts na página 181](#) ou selecionando o menu [Contacts na página 212](#).

10.45.1

Alias da lista de favoritos

Esse campo permite definir nomes reconhecíveis para a lista de prioridades convencionais do MDC atual.

Depois de definidas, as listas de prioridades individuais do MDC são selecionáveis para cada [Personalidade convencional na página 422](#) do campo [Lista de prioridades de chamada não ASTRO na página 461](#).

OBSERVAÇÃO:

Exemplos: EMT-001, #500, Electric1, #A5.

É possível usar caracteres, números, espaços e caracteres especiais. Para caracteres unicode não identificados, como emojis, o visor superior do rádio mostra "quadrados" para esses caracteres.

São permitidos no máximo 14 caracteres.

10.45.2

Contato

Esse campo seleciona o contato desejado para o registro/linha atual da lista de prioridades convencionais do MDC atual.

O contato deve ser definido primeiro no campo [Contato](#) da [Lista de chamadas unificada na página 653](#). Após a seleção do contato, o conjunto de IDs de chamada (definido na seção ID convencional do MDC da UCL [contato]) pode ser selecionado no campo [ID de chamada na página 665](#) desse mesmo registro/linha.

Acessado apenas: Quando o campo do registro/linha atual não estiver definido como **Não atribuído** e o rádio for compatível com o modelo/opção.

10.45.3

ID de chamada

Esse campo seleciona o conjunto de IDs de chamada para o registro/linha atual da lista de prioridades convencionais do MDC atual.

Esse conjunto de IDs de chamada está definido na [página ID convencional do MDC da Lista de chamadas unificadas](#). O [Contato na página 665](#) do registro/linha atual deve ser selecionado antes que esta seleção seja feita.

Acessado apenas: Quando o [Contato na página 664](#) deste campo para o registro/linha atual não estiver definido como **Não atribuído** e o rádio for compatível com o modelo/opção.

10.45.4

ID principal

Esse campo seleciona o ID principal do rádio alvo que opera no modo Convencional do MDC.

Esse ID corresponde ao [ID principal do MDC](#) do mesmo sistema convencional que foi definido no rádio alvo. Esta seleção se aplica ao conjunto de IDs de chamada (registro/linha) do [contato](#) atual dentro da [Lista de chamadas unificada na página 653](#). Esse conjunto de IDs de chamada pode então ser selecionado no campo [ID de chamada na página 665](#).

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

[Acima 309: Alcance](#)

Mínimo	Máximo	Incremento
0 (Hex)	FFFFFFFF (Hex)	1

10.46

Atribuição de zonas e canais

A **Atribuição de zonas e canais** permite desenvolver e criar configurações de zona e canal.

A seleção de Personalidades convencionais para canais Convencionais e Grupos de entroncamento para canais de Entroncamento criam, basicamente, as posições desejadas do seletor de canais de rádio para cada zona.

**OBSERVAÇÃO:**

É possível selecionar Zonas ativando/desativando Seleção de zonas ou selecionando o menu Seleção de zonas.

10.46.1

Zona

Esta seção permite visualizar ou modificar nomes que possam ser reconhecidos para cada zona.

**OBSERVAÇÃO:**

As posições de zona no rádio são determinadas pela ordem em que são definidas no aplicativo.

**OBSERVAÇÃO:**

A seleção de Personalidades convencionais para canais Convencionais e Grupos de entroncamento para canais de Entroncamento criam, basicamente, as posições desejadas do seletor de canais de rádio para cada zona.

É possível selecionar Zonas ativando/desativando Seleção de zonas ou selecionando o menu Seleção de zonas.

10.46.1.1

Nomes da zona

Este campo permite definir nomes reconhecíveis para a zona atual.

**INFORMAÇÕES:**

Para rádios portáteis, esse nome aparece no visor principal do rádio, e não no visor superior.

Acessado apenas: Quando o campo [Tamanho do texto da zona na página 226](#) é maior que **0**.

**OBSERVAÇÃO:**

Exemplos: EMT-001, #500, Electric1, #A5.

É possível usar caracteres, números, espaços e caracteres especiais. Para caracteres unicode não identificados, como emojis, o visor superior do rádio mostra "quadrados" para esses caracteres.

O número real de caracteres do Nome da zona que aparecem no visor principal do rádio é determinado pelo campo **Tamanho do texto da zona**. Entradas maiores do que esse valor são consideradas inválidas.

O Nome da zona aparece acima do Nome do canal no visor principal do rádio.

10.46.1.2

Nome da zona de visualização superior

Este campo permite definir nomes de visualização superior reconhecíveis para a zona atual.

Esse nome aparece somente na Visor superior do rádio ou também aparece na visualização do DRSM (Display Remote Speaker Microphone, microfone de alto-falante remoto do visor) opcional.

Essa seleção se aplica à zona atual.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

Exemplos: EMT-001, #500, Electric1, #A5.

É possível usar caracteres, números, espaços e caracteres especiais.

O número real de caracteres do Nome da zona exibidos no visor do rádio é determinado pelo campo [Tamanho do texto da zona superior](#). Entradas maiores do que esse valor são consideradas inválidas.

Quando o número total de caracteres dos campos [Tamanho do texto da zona superior](#) e [Tamanho do texto do canal superior](#) é menor que 8, este Nome [Nome da zona de visualização superior na página 666](#) e o Nome [Nome do canal de visualização superior na página 669](#) podem ser exibidos ao mesmo tempo no visor superior do rádio. O nome da zona aparece à esquerda do nome do canal.

Quando o número total de caracteres dos campos [Tamanho do texto da zona superior](#) e [Tamanho do texto do canal superior](#) é maior que 8, este Nome [Nome da zona de visualização superior na página 666](#) e o Nome [Nome do canal de visualização superior na página 669](#) se alternam no visor superior do rádio.

10.46.1.3

Notificação de zona

Este campo seleciona o arquivo de anúncio de voz da Motorola (.MVA) a ser usado para anúncio de voz na zona atual.

Quando você muda o rádio para essa zona, uma instrução por voz é reproduzida. A instrução por voz de [notificação de canal](#) também poderá ser reproduzida, se aplicável. Se o TTS (Text-to-Speech, texto para fala) for selecionado, o texto no campo Comando de voz correspondente será convertido em fala e reproduzido como áudio. Consulte o campo [Prioridade de anúncio de voz na página 272](#).

OBSERVAÇÃO:

A página [Lista de anúncios de voz na página 291](#) permite carregar arquivos de anúncios de voz da Motorola (.MVA) no codeplug atual.

As seleções a seguir são compatíveis:

Nenhum

Nenhuma instrução por voz necessária para a zona atual.

TTS

Quando o recurso Controle por voz está ativado, o texto no campo Comando de voz para Notificação de zona é reproduzido como áudio.

Arquivo de anúncio de voz da Motorola (.MVA)

Lista todos os arquivos de voz possíveis definidos na página [Lista de anúncios de voz na página 291](#).

10.46.1.4

Nome do controle de voz da zona/Anúncio do TTS

Uma palavra falada comum para fazer referência a essa zona para anúncios de Controle de voz e texto para fala (TTS).

Ao clicar no "botão de reprodução" , o RadioCentral converte o texto no campo de comando de voz em fala e o reproduz pelo alto-falante.

**INFORMAÇÕES:**

Isso deve ser definido para alterar a zona usando o controle de voz. Certifique-se de que as palavras sejam exclusivas e que não haja dois controles de voz de zona foneticamente semelhantes escolhidos, pois eles serão sinalizados como inválidos.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

**OBSERVAÇÃO:**

Configurado por zona.

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.46.2

Canais

Esta seção permite visualizar ou modificar configurações específicas de canal na zona desejada.

**OBSERVAÇÃO:**

A seleção de [Personalidades convencionais](#) para canais Convencionais e Grupos de entroncamento para canais de Entroncamento criam, basicamente, as posições desejadas do seletor de canais de rádio para cada zona.

Você pode selecionar Canais pressionando o botão [Seleção de canais](#), ativando/desativando [Seleção de canais na página 200](#) ou selecionando o menu [Seleção de canais na página 211](#).

Acessado apenas: Quando o campo [Ativação da zona dinâmica](#) estiver **Desativado**.

10.46.2.1

Nome do canal

Esse campo permite definir nomes reconhecíveis para o canal atual (registro/linha).

**INFORMAÇÕES:**

Para rádios portáteis, esse nome aparece na tela principal do rádio, e não no [visor superior](#) do rádio.

Essa seleção se aplica à zona atual.

Acessado apenas: Quando o campo [Ativação da zona dinâmica](#) está desativado.

**OBSERVAÇÃO:**

Exemplos: EMT-001, #500, Electric1, #A5.

É possível usar caracteres, números, espaços e caracteres especiais. Para caracteres unicode não identificados, como emojis, o visor superior do rádio mostra "quadrados" para esses caracteres.

O número real de caracteres do nome do canal que aparecem na tela principal do rádio é determinado pelo campo **Tamanho do texto do canal**. Entradas maiores do que esse valor são consideradas inválidas.

O Nome da zona aparece acima do Nome do canal no visor principal do rádio.

10.46.2.2

Nome do canal de visualização superior

Este campo permite definir o nome da visualização superior reconhecível para o canal (registro/linha) atual.

Esse nome aparece somente na Visualização superior do rádio e/ou também aparece na visualização do DRSM (Display Remote Speaker Microphone, display do microfone de alto-falante remoto) opcional. Essa seleção se aplica à zona atual.

Acessado apenas: Quando o campo [Ativação da zona dinâmica](#) estiver desativado e quando o rádio estiver habilitado para o modelo/a opção.

**OBSERVAÇÃO:**

Exemplos: EMT-001, #500, Electric1, #A5.

É possível usar caracteres, números, espaços e caracteres especiais.

O número real de caracteres do Nome do canal que aparecem no visor do rádio é determinado pelo campo [Tamanho do texto do canal superior](#). Entradas maiores do que esse valor são consideradas inválidas.

Quando o número total de caracteres do campo [Tamanho do texto da zona superior](#) e do campo [Tamanho do texto do canal superior](#) é menor que 8, o nome da [Nome da zona de visualização superior na página 666](#) e este Nome do canal de visualização superior podem ser exibidos ao mesmo tempo no visor superior do rádio. O nome da zona aparece à esquerda do nome do canal.

Quando o número total de caracteres do campo [Tamanho do texto da zona superior](#) e do campo [Tamanho do texto do canal superior](#) é maior que 8, o [Nome da zona de visualização superior na página 666](#) e este Nome do canal de visualização superior se alternam no visor superior do rádio.

10.46.2.3

Tipo de canal

Esse campo seleciona o tipo de comunicação de rádio, Convencional ou Entroncamento, do canal (registro/linha) atual.

Essa seleção se aplica à zona atual.

**OBSERVAÇÃO:**

Depois de se fazer essa seleção, a seleção do campo [Personalidade na página 669](#) poderá ser feita.

Acessado apenas: Quando o rádio for compatível com o modelo/a opção, quando o campo [Ativação da zona dinâmica](#) estiver desativado e quando o campo [Clone ativado](#) estiver desativado.

As seleções a seguir são compatíveis:

Entrc

Entroncamento

Cnv

Convencional

10.46.2.4

Personalidade

Este campo seleciona a personalidade convencional ou a personalidade de entroncamento desejada para o canal (registro/linha) atual.

Essa seleção se aplica à zona atual.

**INFORMAÇÕES:**

O campo [Tipo de canal na página 669](#) determina o tipo de comunicação da Personalidade que está disponível para seleção a partir deste campo.

As personalidades devem ser criadas e definidas para que possam ser selecionadas nesse campo.

Acessado apenas: Quando o campo [Ativação da zona dinâmica](#) e o campo [Clone ativado](#) estão desativados.

10.46.2.5

Grupo de conversação de entroncamento

Este campo seleciona o Grupo de conversação ou o tipo de Grupo de conversação a ser usado para o canal atual (registro/linha).

Essa seleção se aplica à zona atual.

Acessado apenas: Quando o campo [Ativação da zona dinâmica](#) estiver **Desativado**, quando o campo [Tipo de canal na página 669](#) estiver definido como **Entronc.** e quando o rádio estiver habilitado para o modelo/a opção.

As seleções a seguir são compatíveis:

Seleções de grupo de conversação

Os grupos de conversação exibidos para seleção são baseados na [Personalidade de entroncamento](#) selecionada no campo [Personalidade na página 669](#) deste canal.

Um Grupo de conversação é um agrupamento programado de rádios criado com o objetivo de gerar comunicação frequente e eficiente entre eles.

**OBSERVAÇÃO:**

Os grupos de conversação são definidos na página [Grupo de conversação](#) da Personalidade.

DYN (Dynamic Regrouping, reagrupamento dinâmico)**AVISO:**

Esta seleção só é válida quando o campo [Modo de transmissão na página 554](#) da Personalidade de entroncamento selecionada no campo [Personalidade na página 669](#) deste canal não está definido como **TG/AG desativados** (somente escuta).

Uma configuração de Reagrupamento dinâmico só é válida quando uma Personalidade de entroncamento referenciada para um canal tem este campo definido como **DYN** e a zona e o canal selecionados dessa personalidade correspondem às seleções de [Zona de Reagrupamento dinâmico na página 524](#) e de [Canal de reagrupamento dinâmico na página 524](#) no Sistema de entroncamento referenciado.

**INFORMAÇÕES:**

Somente um canal de Reagrupamento dinâmico pode ser definido por Sistema de entroncamento referido.

É possível solicitar uma nova atribuição de Reagrupamento dinâmico do despachador pressionando o botão [Solicitação de reprogramação na página 188](#) ou selecionando o menu [Solicitação de reprogramação](#). Os recursos e configurações disponíveis do grupo de conversação de Reagrupamento dinâmico são definidos e transmitidos novamente pelo despachador.

Para que o grupo de conversação de Reagrupamento dinâmico possa transmitir em modo Seguro, é necessário pressionar o botão [Seleção de Transmissão Segura](#), ativar/desativar [Seleção de Transmissão Segura na página 202](#) ou selecionar o menu [Proteger](#); caso contrário, as transmissões do grupo de conversação de Reagrupamento dinâmico ficam amarradas à transmissão no modo **Não criptografado**.

ATG (grupo de notificação)

Esta seleção só é válida quando o campo [Grupo de notificação na página 560](#) da Personalidade de entroncamento selecionada no campo [Personalidade na página 669](#) deste canal não está definido como **Nenhum**.

Os Grupos de notificação permitem iniciar e se comunicar em um grande canal de comunicação formado por todos os [Grupos de conversação](#) definidos para a Personalidade de entroncamento atual.

10.46.2.6

Opção de frequência convencional

Esse campo seleciona o perfil Opções de frequência convencional para o canal (registro/linha) atual.

Essa seleção se aplica à zona atual.

**OBSERVAÇÃO:**

A Personalidade convencional deve ser selecionada primeiro no campo [Personalidade na página 669](#).

Os perfis Opção de frequência devem ser criados e definidos para poderem ser selecionados nesse campo.

Acessado apenas: Quando o campo [Ativação da zona dinâmica](#) estiver desativado e quando o campo [Tipo de canal na página 669](#) estiver definido como **Cnv** (Convencional).

10.46.2.7

Seleção de perfil de rádio

Este campo seleciona o perfil de rádio para o canal (registro/linha) atual.

Os perfis de rádio permitem que agrupamentos de configurações de áudio projetados sejam criados para canais de rádio e/ou cenários de utilização em campo específicos.

É possível selecionar perfis de rádio (por canal) com o pressionamento do botão [Perfis de rádio na página 187](#) ou a seleção do menu [Perfis de rádio na página 217](#).

Essa seleção se aplica à zona atual.

Acessado apenas: Quando o campo [Ativação da zona dinâmica](#) está desativado.

As seleções a seguir são compatíveis:

Selecionado por último

O primeiro registro/linha em [Perfis de rádio na página 693](#) (independentemente do nome do perfil) é usado até que você mude para outro perfil. Depois disso, ele bloqueia sua seleção de perfil atual para o canal até que a seleção de perfil seja alterada novamente.

Outros nomes de perfil

Três registros de perfil pré-nomeados são fornecidos para sua comodidade: **Padrão**, **Vigilância** e **Áudio alto**. Esses perfis podem ser renomeados e deverão ser definidos de acordo com suas necessidades se mais perfis puderem ser criados.

10.46.2.8

Anúncio de canal

Este campo seleciona o arquivo de anúncio de voz da Motorola (.MVA) que será usado para anúncio de voz no canal/modo atual.

Quando você altera o rádio para esse canal, uma instrução por voz é reproduzida. Pressionar o botão [Anúncio de canal na página 180](#) permite ouvir a gravação de voz do canal atual do rádio sempre que necessário. Consulte também o campo Prioridade de anúncios de voz. Se o TTS (Text-to-Speech,

texto para fala) for selecionado, o texto no campo Comando de voz correspondente será convertido em fala e reproduzido como áudio.

Essa seleção se aplica à zona atual.

OBSERVAÇÃO:

A página [Lista de anúncios de voz na página 291](#) permite carregar arquivos de anúncios de voz da Motorola (.MVA) no codeplug atual.

Acessado apenas:

- O campo [Ativação da zona dinâmica](#) está desativado.
- O campo [Modo RSI](#) está desativado para a zona atual.

As seleções a seguir são compatíveis:

Nenhum

Nenhuma instrução por voz é necessária para o canal atual.

TTS

Quando o recurso Controle por voz é ativado, o texto no campo Comando de voz para Anúncio de canal é reproduzido como áudio.

Arquivo *.MVA (Motorola Voice Announcement, anúncio de voz da Motorola)

Lista todos os arquivos de voz possíveis definidos na Página [Lista de anúncios de voz na página 291](#).

10.46.2.9

Anúncio do TTS/Nome do controle de voz do canal

Uma palavra comumente falada para fazer referência a esse canal para Controle por voz. Ela também poderá ser usada para definir o anúncio de canal para esse texto, se o anúncio de canal estiver definido como Texto para fala (TTS).

Ao clicar no "botão de reprodução" , o RadioCentral converte o texto no campo de comando de voz em fala e o reproduz pelo alto-falante.

INFORMAÇÕES:

Isso deve ser definido para alterar o canal usando o controle por voz. Certifique-se de que as palavras sejam exclusivas e que não haja dois controles por voz de canal foneticamente semelhantes escolhidos dentro de uma zona, pois eles serão sinalizados como inválidos.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

OBSERVAÇÃO:

Configurado por canal.

O valor padrão é em branco.

Caracteres Unicode.

Somente caracteres alfanuméricos (no máximo, 35).

10.46.2.10

ID do setor de responsabilidade pela equipe

Este campo seleciona o número de ID que identifica a localização atual do Setor de responsabilidade pela equipe para o canal atual.

Essa seleção se aplica à zona atual.

INFORMAÇÕES:

Quando você ou um rádio passa para um novo setor, é possível alterar o canal do rádio para o canal apropriado designado para a localização desse novo setor.

Acessado apenas: Quando o rádio está habilitado para o modelo/a opção, quando o campo [Tipo de canal na página 669](#) está definido como **Cnv** (Convencional) e quando a [Personalidade convencional na página 422](#) referenciada para o canal Convencional atual tem o campo [Tipo de sinalização incidente na página 474](#) definido como **Responsabilidade pela equipe** ou **Responsabilidade pela equipe com MDC**.

Acima 310: Alcance

Mínimo	Máximo	Incrementos
0 (hex)	FF (hex)	1

OBSERVAÇÃO:

Cada valor deve ser exclusivo para cada canal. Em outras palavras, cada valor só pode ser usado uma vez por rádio.

O valor padrão de fábrica **0** é usado para designar canais que não são de Responsabilidade pela equipe e, por isso, pode ser reutilizado conforme necessário.

10.46.2.11

Zona de Fallback

Esse campo descreve a zona para a qual o rádio deve ser alternado quando ocorrer Fallback de canal.

Se o campo Canal Fallback estiver desativado, o Fallback de canal não poderá ser ativado no canal selecionado.

Acessado apenas: Quando o campo Fallback de canal silencioso estiver ativado.

10.46.2.12

Canal de Fallback

Esse campo seleciona o canal na Zona de Fallback selecionada para a qual o rádio deve alternar quando ocorrer Fallback de canal. Se esse campo estiver desabilitado, o Fallback de canal não poderá ser ativado no canal selecionado.

Acessado apenas: Quando o campo **Habilitar Fallback de canal** estiver habilitado.

10.46.2.13

Seleção da cor da luz de fundo do canal

Este campo permite selecionar a cor da luz de fundo para o canal (registro/linha) atual.

OBSERVAÇÃO:

Essa seleção se aplica somente à zona atual.

Acessado apenas: Quando a [Cor da Luz de Fundo do Canal](#) está **Ativada** e a Seleção de perfil de rádio não está definida para um perfil com a opção [Ativar Visualização com Lentes Noturnas](#) ou [Desativar luzes na página 694](#) ativada.

As seleções a seguir são compatíveis:

- Branco
- Vermelho
- Verde
- Laranja

10.47

Varredura total

A seção **Varredura total** permite visualizar ou definir a funcionalidade de varredura relacionada aos modos de comunicação Convencional e de Entroncamento.

Os recursos de Varredura total podem ser aplicados em todos os rádios para todas as [Lista de varredura na página 678](#).

Uma lista de varredura permite muitos canais de recepção durante a operação no Modo de varredura.

OBSERVAÇÃO:

As Listas de varredura individuais podem ser atribuídas a Personalidades [Convencionais](#) e de [Entroncamento](#) com seu respectivo campo Seleção da lista de varredura.

10.47.1

Geral

A seção **Geral** permite visualizar ou definir a funcionalidade de varredura relacionada aos modos de comunicação Convencional e Entroncamento.

A função Varredura total pode ser aplicada a todas as listas de varredura de todos os rádios. Uma lista de varredura permite muitos canais de recepção durante a operação no Modo de varredura.

OBSERVAÇÃO:

As listas de varredura individual podem ser atribuídas a [Personalidade convencional na página 422](#) e [Personalidade de entroncamento ASTRO 25 na página 625](#) com seu respectivo campo Seleção da lista de varredura.

10.47.1.1

Alerta de varredura de prioridade

Este campo permite que o rádio emita um alerta audível.

Essa função é ativada quando um canal [Membro de prioridade 1 na página 684](#) ou [Membro de prioridade 2 na página 685](#) – [Membro da lista de varredura](#) é selecionado durante a varredura.

Um bipe é gerado para os dois canais: Prioridade 1 e Prioridade 2. Essa função se aplica a todos os [Tipos de varredura](#).

Acessado apenas: Quando o campo Tons de alerta está **Ativado** e quando o rádio está habilitado para o modelo/para a opção.

10.47.1.2

Tempo de Espera de Recepção e Transmissão de Voz

Este campo seleciona o tempo que o rádio permanecerá em um canal do Modo de varredura selecionado – Membro da lista de varredura antes de retomar o Modo de varredura ativa.

Esse temporizador é iniciado após o término de todas comunicações de transmissão e recepção de voz. Essa função se aplica a todos os [Tipos de varredura](#). durante a operação no Modo de varredura. O tempo é medido em segundos.

Acima 311: Alcance

Mínimo	Máximo
0 (segundo)	255 (segundos)

10.47.1.3

Tempo de espera de recepção e transmissão de dados

Este campo seleciona o tempo que o rádio permanecerá em um canal do Modo de varredura selecionado – Membro da lista de varredura antes de retomar o Modo de varredura ativa.

Esse temporizador é iniciado após o término de todas comunicações de transmissão e recepção de dados. Essa função se aplica somente a uma [Lista de varredura na página 678](#) que tenha o campo [Tipo de varredura na página 679](#) definido como **Convencional** e durante a operação no Modo de varredura. O tempo é medido em segundos.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 312: Alcance

Mínimo	Máximo
0 s	255 s

10.47.2

Convencional

Essa seção permite visualizar ou definir a funcionalidade sempre que **Convencional** ou **Grupo de conversação multissistema** foram selecionados.

OBSERVAÇÃO:

As listas de varredura individual podem ser atribuídas a [Personalidade convencional na página 422](#) e [Personalidade de entroncamento ASTRO 25 na página 625](#) com seu respectivo campo Seleção da lista de varredura.

10.47.2.1

Detecção de operadora necessária

Este campo permite que o rádio selecione o silenciador de portadora, mas somente desative o modo silencioso em Prioridade – Membros da lista de varredura ou em uma detecção de código de PL (Private Line, linha privada) adequada.

Isso é aplicável ao fazer uma varredura ativa de um canal do Membro da lista de varredura convencional no modo de varredura.

10.47.2.2

Marca de canal de prioridade

Este campo melhora o desempenho da Varredura do canal de prioridade fazendo com que as transmissões não qualificadas do Membro da lista de varredura de prioridade sejam "Marcadas" e temporariamente removidas da lista de varredura.

Isso é particularmente eficaz no Modo de varredura do canal selecionado em um Membro da lista de varredura sem prioridade e quando o rádio entra brevemente no modo silencioso em [intervalos de tempo](#) específicos para verificar a atividade do Membro [Membro de prioridade 1 na página 684](#) ou [Membro de prioridade 2 na página 685](#).

Essa remoção temporária do Membro da lista de verificações permite que o período na função mudo e a interrupção da chamada atual sejam menores. Esse recurso se aplica somente aos canais do Membro da lista de varredura convencional.

INFORMAÇÕES:

Um Canal de prioridade analógico é "marcado" quando ele é verificado sem êxito devido à inexistência de um código TPL/DPL (PL) onde um código PL era esperado ou quando o código PL está incorreto.

Um Canal de prioridade digital (Sistema ASTRO) é "marcado" quando ele é verificado sem êxito devido à inexistência de um código de acesso à rede (NAC) quando um código NAC era esperado ou quando um código NAC está incorreto.

Depois que o botão PTT é pressionado ou quando uma verificação detecta que a operadora caiu em um canal de Prioridade "marcado" ou o PL/NAC apropriado é detectado no canal "marcado", o status "Marcado" é removido para aquele canal de Prioridade, e a varredura da prioridade normal é retomada.

OBSERVAÇÃO:

O analógico e o digital são determinados pela configuração do campo [Tipo de voz/sinal de recepção na página 424](#) com base no canal.

10.47.2.3

Tempo de espera do monitor

Este campo seleciona a quantidade de tempo que o rádio permanecerá no canal do Membro da lista de varredura atual aguardando a atividade do canal.

Esse temporizador começa quando você pressiona e solta o botão [Monitoramento na página 184](#). Esta seleção se aplica somente aos canais do Membro da lista de varredura convencional. O tempo é medido em segundos.

OBSERVAÇÃO:

Às vezes, pressionar o botão Monitor é usado como método para suspender a verificação. Assim que o temporizador expirar, o rádio continua a operação normal no Modo de varredura.

Acima 313: Alcance

Mínimo	Máximo
0 (segundo)	255 (segundos)

10.47.2.4

Tempo entre as amostras de prioridade

Este campo seleciona o tempo que o rádio aguarda entre a coleta de amostras.

Amostras são tiradas para verificar [Membro de prioridade 1 na página 684](#) de entrada ou atividade do canal [Membro de prioridade 2 na página 685](#).

Essa amostragem é necessária quando o rádio está no Modo de varredura do Canal selecionado em um membro de lista de verificações sem prioridade, ou quando o rádio se encontra em um canal do membro da Lista de varredura de Prioridade 2 e está verificando a existência de uma transmissão de Prioridade 1. Quando a amostragem ocorre, o rádio entra brevemente na função mudo podendo causar breves interrupções na recepção de áudio do aparelho. Esta seleção se aplica somente aos canais do Membro da lista de varredura convencional. O tempo é medido em milissegundos.

OBSERVAÇÃO:

Consulte também [Marca de canal de prioridade na página 675](#).

Acima 314: Alcance

Mínimo	Máximo	Incrementos
250 ms	6375 ms	25 ms

10.47.2.5

Limite de RSSI ponderação

Este campo seleciona um nível de sinal forte do RSSI (Received Signal Strength Indication, indicador de intensidade do sinal recebido), que é solicitado pelo canal do Membro da lista de varredura para que o modo silencioso do rádio seja desativado.

Essa função se aplica somente quando o rádio é capaz de verificar a ponderação convencional. Quando no sistema de comunicação de Varredura de ponderação onvencional, vários repetidores reenviam a mesma transmissão simultaneamente em diferentes frequências; em seguida, o rádio seleciona o sinal mais limpo/mais forte. Portanto, essa configuração de limite define quando o melhor sinal é forte o suficiente para desativar a função mudo do rádio. Caso a Verificação de ponderação – Membro da Lista de varredura não exceda o limite, o canal com o maior valor de RSSI é selecionado para desativar a função mudo. Esta seleção se aplica somente aos canais do Membro da lista de varredura convencional.

AVISO:

Esse recurso funciona somente: Quando uma [Lista de varredura na página 678](#) tem seu campo [Tipo de varredura na página 679](#) definido como **Varredura de ponderação**, quando nenhum dos canais do [Membro da lista de varredura](#) nessa lista tem [Varredura automática na página 472](#) **Ativado** e quando todos os canais do Membro da lista de varredura usam repetidores em uma rede de longa distância de Varredura de ponderação convencional.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 315: Alcance

Mínimo	Máximo
00 (Hex)	FF (Hex)

10.47.3

Entroncamento

Esta seção permite visualizar ou definir a funcionalidade de todas as Listas que têm o **Grupo de Conversação de vários sistemas** selecionado para o Tipo de verificação.

OBSERVAÇÃO:

As listas de varredura individual podem ser atribuídas a [Personalidade convencional na página 422](#) e [Personalidade de entroncamento ASTRO 25 na página 625](#) com seu respectivo campo Seleção da lista de varredura.

10.47.3.1

Tempo de Espera de Failsoft

Este campo seleciona quanto tempo o rádio permanece com a função de silenciamento desativada em um canal (somente de entroncamento) de Varredura selecionada – Membro da lista de varredura na ocorrência do Failsoft.

Durante esse período, a função de silenciamento do rádio permanece desativada no canal de Failsoft, com uma transmissão de voz ou de operadora de Failsoft silenciosa. Após a expiração do temporizador, a operação Modo de varredura ativa é retomada. Essa seleção se aplica somente para

Listas de Varredura em que o **Grupo de conversação de vários sistemas** é o [Tipo de varredura na página 679](#) selecionado.

OBSERVAÇÃO:

Apenas uma lista de varredura do tipo **Grupo de conversação de multisistema** permite canais de entroncamento com vários [sistemas de entroncamento](#). Portanto, quando o Failsoft ocorrer em um canal, e o Contador de Espera expirar, outros canais em operação poderão ser verificados.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

Acima 316: Alcance

Mínimo	Máximo
0 (segundo)	255 (segundos)

10.47.3.2

Tempo de pesquisa do sistema

Este campo seleciona o tempo durante o qual o rádio permanecerá silenciado em um canal de controle Varredura do canal selecionado ao fazer a varredura de Membros da lista de varredura.

Durante esse período de tempo, o rádio estará decodificando as concessões do canal do Sistema de entroncamento, procurando concessões para os seus membros da Lista de verificações de entroncamento. Quando esse contador expira sem que o rádio receba uma concessão de canal, o aparelho começa a verificar ativamente o próximo membro da Lista de varredura convencional ou volta para o canal que está selecionado.

AVISO:

Este recurso funciona somente para [Listas de varredura](#) em que o **Grupo de conversação multissistema** é o [Tipo de varredura na página 679](#) selecionado.

INFORMAÇÕES:

Durante a varredura de um Sistema entroncado em um canal convencional, o rádio não escuta o canal convencional que está selecionado. Consequentemente, quanto maior o tempo de execução desse contador, mais tempo é gasto fora do canal atualmente selecionado. Portanto, essa seleção deve ser definida como um valor maior somente na varredura de um canal de controle em um sistema ocupado e pode ser definida como um valor menor na varredura de um sistema menos ocupado.

Apenas uma [Lista de varredura na página 678](#) com um **Grupo de conversação multissistema** [Tipo de varredura na página 679](#) permite canais de Entroncamento com vários [Sistemas de entroncamento](#). Portanto, esse contador de pesquisa permite que outros Sistemas sejam verificados de forma alternativa.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.48

Lista de varredura

Esta seção permite criar e excluir as Listas de varredura, bem como definir a funcionalidade Lista de varredura individual.

Uma Lista de varredura contém agrupamentos de canais Convencionais e/ou de Entroncamento, selecionados para cada lista na seção Membro da lista de varredura.

Os canais selecionados podem, então, ser verificados quanto à atividade de transmissão, um de cada vez, quando o rádio está no Modo de varredura. Portanto, permitindo vários canais de recepção possíveis. O rádio verifica apenas sua Lista de varredura atribuída do atual canal em operação.

OBSERVAÇÃO:

As Listas de varredura individuais podem ser atribuídas a Personalidades Convencionais e de Entroncamento com seu respectivo campo Seleção da lista de varredura.

É possível iniciar o modo de varredura automaticamente por meio da Varredura automática ou pressionando o botão Varredura, ativando/desativando a Varredura, ou selecionando o menu Varredura.

10.48.1

Geral

Esta seção permite visualizar ou definir a funcionalidade que se aplica a listas de varreduras individuais.

OBSERVAÇÃO:

Tipos de listas de varredura permitem que canais do membro da lista de varredura de entroncamento dependam de um ou mais [Sistema de entroncamento ASTRO 25 na página 576](#). Assim sendo, o sistema de entroncamento deve ser definido antes da configuração das funções da lista de varredura.

As listas de varredura individual podem ser atribuídas a [Personalidade convencional na página 422](#) e [Personalidade de entroncamento ASTRO 25 na página 625](#) com seu respectivo campo Seleção da lista de varredura.

10.48.1.1

Alias da Lista de varredura

Este campo permite definir nomes reconhecíveis para a Lista de varredura atual.

OBSERVAÇÃO:

Exemplos: Scan List 05, Electric1, #510.

É possível usar caracteres, números, espaços e caracteres especiais.

São permitidos no máximo 14 caracteres.

10.48.1.2

Tipo de varredura

Este campo seleciona o tipo dos canais do Membro da lista de varredura que podem ser selecionados para a Lista de varredura atual.

Esses canais do [Membro da lista de varredura](#) convencional ou de entroncamento (ou ambos) passam por varredura para identificar atividade de transmissão qualificada quando o rádio está operando no Modo de varredura.

INFORMAÇÕES:

Os Tipos de varredura que permitem canais/Personalidades do Membro da lista de varredura de entroncamento podem requerer certos [Sistemas de entroncamento](#) selecionados. Portanto, o sistema de entroncamento deve ser definido para essas Personalidades de entroncamento selecionadas antes de configurar certos recursos da Lista de varredura relacionados ao entroncamento. Os Sistemas de entroncamento são mencionados para uma Personalidade de entroncamento com o campo [Sistema na página 549](#) de personalidade de entroncamento.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

As seleções a seguir são compatíveis:

Convencional

Apenas canais Convencionais podem ser selecionados para este tipo de Lista de varredura; incluindo Personalidades Convencionais configuradas para Varredura de voto misto Convencional designada por ter seu campo [Ativação de Varredura de Voto Misto na página 472](#) **Ativado**

Até 30 [Canal na página 691](#) por lista de varredura é possível com as condições abaixo:

- Quando uma Personalidade convencional está com seu campo Ativação de varredura de ponderação mista **Ativado**, cada Opção de frequência (registro/linha) dessa personalidade é contada em referência ao máximo de 30 Membros da lista de varredura.
- É possível ter no máximo três Personalidades convencionais ativadas para Varredura de ponderação mista como canais do Membro da lista de varredura por Lista de varredura.

Validade das Personalidades de varredura de voto misto:

AVISO:

Quando o campo [Direção de transmissão de varredura de ponderação mista na página 472](#) está **Desativado** para essa Lista de varredura, qualquer canal do Membro da Lista de varredura (selecionado para a Lista de varredura atual) deverá ter seus parâmetros de transmissão de Opções de frequência definidos conforme as regras a seguir:

A Frequência de transmissão [Frequência de transmissão na página 432](#) deve ser correspondente para todos os canais na Lista de varredura.

A [Espaçamento de canais/desvio de transmissão na página 435](#) deve ser correspondente para todos os canais na Lista de varredura.

A [ID da rede de transmissão na página 437](#) deve ser correspondente para todos os canais na Lista de varredura.

ou

A Frequência de Tx deve ser correspondente para todos os canais na Lista de varredura.

O Espaçamento de canais/desvio de transmissão deve ser correspondente para todos os canais na Lista de varredura.

O campo PL selecionável pelo usuário (MPL) deve estar **Desativado** para todos os canais na Lista de varredura.

A [Tipo de silenciador de Tx na página 446](#) deve ser correspondente para todos os canais na Lista de varredura. Se o Tipo de silenciador de transmissão estiver definido como **PL**, então o [Código PL de transmissão na página 448](#) deverá corresponder a todos os canais na Lista de varredura, ou, se o Tipo de silenciador de transmissão estiver definido como **DPL**, então o [Código DPL de transmissão na página 450](#) e o [Inversão de DPL de transmissão na página 451](#) deverão corresponder a todos os canais na Lista de varredura.

Monitor de prioridade

Disponível em rádios habilitados para o modelo/a opção.

Somente canais de Entroncamento podem ser selecionados para esse tipo de Lista de varredura.

A Lista de varredura do monitor de prioridade permite até 50 canais do Membro da lista de varredura por Lista de varredura.

O campo Grupo de conversação de entroncamento de qualquer um dos canais do Membro da lista de varredura de entroncamento selecionados para a atual Lista de varredura não pode estar definido como **DYN** ou **ATG**.

A seleção de "Sistema" do campo Registro do sistema de entroncamento (para a Lista de varredura atual) deve corresponder ao campo referenciado sistema de entroncamento de todos os canais do Membro da lista de varredura de entroncamento selecionados para a atual Lista de varredura.

Se o campo [Tipo de cobertura na página 511](#) da seleção do sistema de entroncamento do campo Registro do sistema de entroncamento (para a Lista de varredura atual) for definido como **Roaming Inter-WACN**, então o ID da WACN doméstica e o ID do sistema nesse sistema de entroncamento devem corresponder ao ID da WACN TG e ao ID do sistema TG do Grupo de conversação de entroncamento de qualquer um dos canais do Membro da lista de varredura selecionados para a Lista de varredura atual.

Grupo de conversação de multissistema

Disponível em rádios habilitados para o modelo/a opção.

Ambos os canais convencionais e de entroncamento podem ser selecionados para esse tipo de Lista de varredura.

A Varredura do grupo de conversação de vários sistemas por Lista de varredura é limitada a cinco sistemas de entroncamento, com até 50 canais do Membro da lista de varredura por sistema de entroncamento e podem incluir até 10 canais do Membro da lista de varredura convencional. No entanto, o máximo por Lista de varredura é 250 canais do Membro da Lista de varredura.

No máximo, 50 dos canais do Membro da lista de varredura podem fazer referência ao mesmo sistema de entroncamento.

O campo Grupo de conversação de entroncamento de qualquer um dos canais do Membro da lista de varredura de entroncamento selecionados para a atual Lista de varredura não pode estar definido como **DYN** ou **ATG**.

O campo Ativação de varredura de ponderação mista da personalidade convencional deve estar **Desativado** para todos os canais do Membro da lista de varredura selecionados para esse tipo de Lista de varredura.

AVISO:

As operações de dados CAI não oferecem suporte a esse Tipo de varredura. Isso é verdadeiro devido à natureza conflitante da operação de dados CAI (que exige que o rádio receba transmissões em rajadas curtas) e Varredura de vários sistemas (que exige que o rádio gaste longos períodos monitorando membros de verificação secundários).

Varredura de ponderação

Disponível em rádios habilitados para o modelo/a opção.

Somente canais Convencionais podem ser selecionados para esse tipo de Lista de varredura.

A Varredura de ponderação permite somente até 10 canais do Membro da Lista de varredura.

AVISO:

Um sistema de Varredura de ponderação funciona somente quando todos os canais do Membro da Lista de varredura (selecionados para a Lista de varredura atual) usam repetidores dentro de uma rede de longa distância de Varredura de ponderação convencional.

OBSERVAÇÃO:

Durante a operação em um sistema de Varredura de ponderação, vários repetidores reenviam a mesma transmissão simultaneamente em diferentes frequências; assim, o rádio pode selecionar o sinal mais limpo/mais forte. A configuração do Limite de ponderação RSSI define quando o melhor sinal é forte o suficiente para que a função mudo do rádio seja desativada. Se nenhum canal excede o limite, o canal com o mais alto valor de RSSI é selecionado para desativação da função mudo.

Validade do canal da Lista de varredura:

O campo Ativação da varredura de ponderação mista da personalidade convencional deve estar **Desativado** para todos os canais do Membro da lista de varredura selecionados para a Lista de varredura atual.

O campo [Varredura automática na página 472](#) deve ser **Desativado** para todos os canais do Membro selecionados da Lista de varredura atual.

O status **Ativado** ou **Desativado** do campo Direção de transmissão para essa Lista de varredura, não é uma preocupação para nenhum canal do Membro da lista de varredura (selecionado para a Lista de varredura atual) que tenha o seu campo [Receber Somente Personalidade na página 423](#) **Ativado**.

**AVISO:**

No entanto, quando o campo Direção de transmissão está **Desativado** para essa Lista de varredura, qualquer canal do Membro da lista de varredura (selecionado para a Lista de varredura atual) que tenha o seu campo Receber somente personalidade **Desativado** também deve ter parâmetros de Transmissão (Tx) definidos de acordo com as regras a seguir.

Quando todos os canais do Membro da Lista de varredura atual têm o [Tipo de voz/sinal de transmissão na página 427](#) definido como **ASTRO**, o seguinte deve ser verdadeiro:

A Frequência de Tx deve ser correspondente para todos os canais na Lista de varredura.

O Espaçamento de canais/desvio de transmissão deve ser correspondente para todos os canais na Lista de varredura.

A ID da rede de transmissão deve ser correspondente para todos os canais na Lista de varredura.

ou

A Frequência de Tx deve ser correspondente para todos os canais na Lista de varredura.

O Espaçamento de canais/desvio de transmissão deve ser correspondente para todos os canais na Lista de varredura.

O campo PL selecionável pelo usuário (MPL) deve estar **Desativado** para todos os canais na Lista de varredura.

O Tipo do silenciador de transmissão deve ser correspondente para todos os canais na Lista de varredura. Se o Tipo de silenciador de transmissão estiver definido como **PL**, então o Código de PL de transmissão deverá corresponder a todos os canais na Lista de varredura, ou, se o Tipo de silenciador de transmissão estiver definido como **DPL**, então o Código DPL de transmissão e a Inversão de DPL de transmissão deverão corresponder a todos os canais na Lista de varredura.

**AVISO:**

Lembre-se também: Uma Lista de varredura do tipo de Varredura de ponderação não pode combinar canais do Membro da lista de varredura dos quais alguns sejam do Tipo de voz/sinal de transmissão **Não ASTRO** e alguns sejam do Tipo de voz/sinal de transmissão **ASTRO**. Portanto, todos os canais do Membro da lista de varredura de **Varredura de ponderação** devem ser do mesmo Tipo de voz/sinal de transmissão.

Prioridade inteligente

Ambos os canais convencionais e de entroncamento podem ser selecionados para esse tipo de Lista de varredura.

Esse tipo de varredura é baseado na Varredura do grupo de conversação de multissistema, suportando os limites desse tipo de varredura. Esse tipo de varredura fornece a capacidade de configurar um membro de varredura de Prioridade 1 e Prioridade 2.

**OBSERVAÇÃO:**

A atividade de varredura de Prioridade será recebida quando o rádio estiver verificando o mesmo sistema que o membro da varredura de Prioridade. A atividade de varredura de Prioridade não será recebida enquanto o rádio estiver ativado para um membro da varredura Não-prioritário, incluindo o canal selecionado de um sistema diferente, convencional ou entroncamento.

10.48.1.3

Registro de sistema de entroncamento

Este campo seleciona um sistema de entroncamento por seu nome programado.

Esse sistema de entroncamento é então usado para comunicações durante o Modo de varredura para a [Lista de varredura na página 678](#) atual.

INFORMAÇÕES:

Quando o campo [Tipo de varredura na página 679](#) está definido como **Monitor de prioridade**, esse sistema de entroncamento selecionado deve ser o mesmo (uma correspondência) para todos os canais do Membro da lista de varredura atual.

Quando canais/[Personalidades de entroncamento](#) estão selecionados para uma Lista de varredura, esses Sistemas de entroncamento "correspondentes" são mencionados para uma Personalidade de entroncamento com o campo [Sistema na página 549](#) de personalidades de entroncamento.

Acessado apenas: Quando o campo [Tipo de varredura na página 679](#) estiver definido como **Monitor** e quando o rádio estiver habilitado para o modelo/a opção.

10.48.1.4

Prioridade dinâmica

Este campo permite definir o último canal que o Modo de varredura do rádio selecionou e pelo qual transmitiu para ser o novo canal do Membro de prioridade 2.

Esse canal permanece o canal de Prioridade 2 até que um novo canal seja usado para transmissão ou até que o Modo de varredura seja desabilitado. Essa função se aplica à Lista de verificações atual.

INFORMAÇÕES:

Ative a Prioridade dinâmica pressionando o botão [Prioridade dinâmica na página 181](#) ou selecionando o menu [Prioridade dinâmica na página 212](#).

O canal [Membro de prioridade 1 na página 684](#) não é afetado.

Acessado apenas: Quando o campo [Tipo de varredura na página 679](#) estiver definido como **Convencional**.

10.48.1.5

Prioridade 1 - tipo

Este campo seleciona o tipo de varredura do Membro de prioridade 1 usado para a Lista de varredura atual.

Consulte também [Canal de prioridade PTT na página 186](#).

Acessado apenas: Quando o campo [Tipo de varredura na página 679](#) estiver definido como **Convencional**, **Monitor de prioridade** ou **Prioridade inteligente**.

As seleções a seguir são compatíveis:

Desabilitado

O canal [Membro de prioridade 1 na página 684](#) está desativado.

Fixo

O canal Prioridade 1 é selecionado no campo [Membro de prioridade 1 na página 684](#) e não pode ser alterado.

Canal selecionado

O rádio usa o canal selecionado do Seletor de canal atual como o Membro de prioridade 1.

Seleção de operador

Usa o [Membro de prioridade 1 na página 684](#) selecionado. No entanto, você pode modificar essa opção por meio da seleção do menu [Lista de varredura na página 218](#).

OBSERVAÇÃO:

Tanto Prioridade 1 - Tipo quanto [Prioridade 2 - tipo na página 684](#) não podem ser definidos como **Canal selecionado**; um deve ser diferente.

10.48.1.6

Membro de prioridade 1

Este campo seleciona um canal/modo do Membro da lista de varredura de prioridade 1 para a Lista de varredura atual.

Esse canal do Membro da lista de varredura é selecionado pelo seu respectivo número de registro programado na Lista de varredura atual. Quando o rádio está verificando ativamente uma Lista de varredura, 50% das varreduras são direcionadas para o canal do Membro de prioridade 1. Consulte também [Canal de prioridade PTT na página 186](#).

Exemplo: Se o Membro de prioridade 1 for P1, e os Membros da lista de varredura sem prioridade forem Nn, a sequência de varredura será: P1 N1, P1 N2, P1 N3, P1 N4, P1 N5 etc.

INFORMAÇÕES:

Quando o alto-falante do rádio não está mudo para uma chamada sem prioridade (Modo de varredura do canal selecionado) ou não está mudo no [Membro de prioridade 2 na página 685](#) (se houver), o rádio continua a verificar a existência de atividades de transmissão no canal do Membro de Prioridade 1. Se o rádio detecta uma transmissão válida de Prioridade 1, ele cancela a transmissão atual e desativa a função mudo para a chamada de Prioridade 1. Consulte também [Marca de canal de prioridade na página 675](#) e [Tempo entre as amostras de prioridade na página 676](#).

Quando o rádio está no Modo de varredura do canal selecionado para uma chamada do Membro de prioridade 1, não é necessário realizar a verificação do membro de prioridade.

Acessado apenas: Quando o campo [Tipo de varredura na página 679](#) estiver definido como **Convencional**, **Monitor de prioridade** ou **Prioridade inteligente** e quando [Prioridade 1 - tipo na página 683](#) não estiver definido como **Canal selecionado** ou **Desativado**.

10.48.1.7

Prioridade 2 - tipo

Este campo seleciona o tipo de varredura do Membro de prioridade 2 usado para a Lista de varredura atual.

Acessado apenas: Quando o campo [Tipo de varredura na página 679](#) estiver definido como **Monitor de prioridade** ou **Prioridade inteligente** ou (quando o campo [Tipo de varredura na página 679](#) estiver definido como **Convencional** e quando o campo [Prioridade dinâmica na página 683](#) estiver **Desativado**).

As seleções a seguir são compatíveis:

Desabilitado

O canal [Membro de prioridade 1 na página 684](#) está desativado.

Fixo

O canal Prioridade 2 é selecionado no campo [Membro de prioridade 2 na página 685](#) e não pode ser alterado.

Canal selecionado

O rádio usa o canal selecionado do Seletor de canal atual como o Membro de prioridade 2.

Seleção de operador

Usa o [Membro de prioridade 2 na página 685](#) selecionado. No entanto, você pode modificar essa opção por meio da seleção do menu [Lista de varredura na página 218](#).

OBSERVAÇÃO:

Tanto [Prioridade 1 - tipo na página 683](#) quanto Prioridade 2 - Tipo não podem ser definidos como **Canal selecionado**; um deve ser diferente.

10.48.1.8

Membro de prioridade 2

Este campo seleciona um canal/modo do Membro da lista de varredura de prioridade 2 para a Lista de varredura atual.

Este canal do Membro da lista de varredura é selecionado pelo seu respectivo número de registro programado. Quando o rádio está verificando ativamente uma Lista de varredura, 33,33% das varreduras são direcionadas para o canal do Membro de prioridade 2. Quando há um Membro de prioridade 2, as verificações de varredura do [Membro de prioridade 1 na página 684](#) são reduzidas de 50% para 33,33%.

Exemplo: Se o Membro de prioridade 1 for P1, o Membro de prioridade 2 for P2 e os Membros da Lista de varredura sem prioridade forem Nn, a sequência de verificação será: N1 P1 P2, N2 P1 P2, N3 P1 P2 etc.

INFORMAÇÕES:

Quando o alto-falante do rádio não está mudo para uma chamada sem prioridade (Modo de varredura do canal selecionado), o rádio continua a varredura da atividade de transmissão no canal do Membro de prioridade 2. Se o rádio detecta uma transmissão válida de Prioridade 2, ele cancela a transmissão atual e desativa a função mudo para a chamada de Prioridade 2. Consulte também [Marca de canal de prioridade na página 675](#) e [Tempo entre as amostras de prioridade na página 676](#).

Se o rádio está no Modo de varredura do Canal selecionado em uma chamada de Prioridade 2 e detecta uma transmissão válida de Prioridade 1, ele cancela a chamada de Prioridade 2 e desativa a função mudo para a chamada de Prioridade 1.

Quando o campo [Prioridade 2 - tipo na página 684](#) estiver definido como **Seleção do operador** ou **Fixo** e (quando o campo [Tipo de varredura na página 679](#) estiver definido como **Monitor de prioridade** ou **Prioridade inteligente**, ou quando o campo [Tipo de varredura na página 679](#) estiver definido como **Convencional** e o campo [Prioridade dinâmica na página 683](#) estiver **Desativado**).

10.48.1.9

Membros sem prioridade

Este campo seleciona se o status de um canal do Membro da lista de varredura de prioridade pode ser alterado para um status de Sem prioridade.

Essa função se aplica à Lista de verificações atual.

Acessado apenas: Quando o campo [Tipo de varredura na página 679](#) não estiver definido como **Varredura de ponderação**.

As seleções a seguir são compatíveis:

Fixo

Os Membros da lista de varredura que são programados para ter o status [Membro de prioridade 1 na página 684](#) ou [Membro de prioridade 2 na página 685](#) do Membro da lista de varredura não podem ser alterados.

Selecionável pelo operador

Os Membros da lista de varredura que são programados para ter o status Membro de prioridade 1 ou Membro de prioridade 2 do Membro da lista de varredura podem ser alterados para um status Sem prioridade, por meio da seleção do menu [Lista de varredura na página 218](#).

10.48.1.10

Tipo de membro de transmissão de voz designado

Este campo seleciona o tipo (fixo ou variável) desejado do canal da transmissão de voz da varredura do canal selecionado para a Lista de varredura atual.

Essa seleção se aplica durante a operação no Modo de varredura e assim que o canal do Membro da lista de varredura é selecionado.

INFORMAÇÕES:

Esse campo não está disponível quando o campo [Tipo de varredura na página 679](#) está definido como **Verificação de ponderação** e o campo [Direção da transmissão](#) está **Ativado**, pois o rádio deve usar o Grupo de conversação para a direção de transmissão.

Acessado apenas: Quando o campo [Tipo de varredura na página 679](#) não estiver definido como **Varredura de ponderação** ou quando o campo [Direção da transmissão](#) estiver **Desativado**.

As seleções a seguir são compatíveis:

Fixo

Permite selecionar o canal da transmissão de voz designado/fixo da Lista de varredura atual.

A seleção do canal deve ser feita pelo campo [Membro de transmissão de voz designado na página 686](#).

AVISO:

Os membros da transmissão de voz fixos funcionam somente quando o campo [Tipo de varredura na página 679](#) está definido como **Convencional** ou **Varredura de ponderação**; e não funcionam quando definido como varredura de **Monitor de prioridade** ou **Grupo de conversação de vários sistemas**.

Os Membros de transmissão de voz fixa não funcionam se um canal Convencional tiver seu campo [Receber Somente Personalidade na página 423](#) **Ativado**.

Canal selecionado

Faz com que o rádio transmita voz no canal/modo selecionado (comunicações Convencionais ou de Entroncamento).

AVISO:

Não funciona se o campo [Receber Somente Personalidade na página 423](#) do canal Convencional atual do rádio estiver **Ativado**.

Não funciona se o canal de Entroncamento atual do rádio tiver seu campo [Modo de transmissão na página 554](#) definido para **TG / AG Desativados (Somente Escuta)**.

Opção de resposta

Faz com que o rádio transmita voz no canal/modo do selecionado - [Membro da lista de varredura](#) (comunicações Convencionais ou de Entroncamento).

10.48.1.11

Membro de transmissão de voz designado

Este campo seleciona o canal de transmissão de voz da varredura do canal selecionado.

OBSERVAÇÃO:

Os Membros da lista de verificações são selecionados na Lista de verificações atual. Essa seleção se aplica durante a operação no Modo de varredura da Lista de varredura atual e assim que o canal do [Membro da lista de varredura](#) é selecionado.

Acessado apenas: Quando o campo [Tipo de membro de transmissão de voz designado na página 686](#) estiver definido como **Fixo** e (quando o campo [Tipo de varredura na página 679](#) não estiver definido como **Varredura de ponderação** ou quando o campo [Direção da transmissão](#) estiver **Desativado**).

**AVISO:**

Esse campo não está disponível quando o campo [Tipo de varredura na página 679](#) está definido como **Verificação de ponderação** e o campo [Direção da transmissão](#) está **Ativado**, pois o rádio deve usar o Grupo de conversação para a direção de transmissão.

**AVISO:**

Os membros da transmissão de voz fixos funcionam somente quando o campo [Tipo de varredura na página 679](#) está definido como **Convencional** ou **Varredura de ponderação**; e não funcionam quando definido como varredura de **Monitor de prioridade** ou **Grupo de conversação de vários sistemas**.

Os Membros de transmissão de voz fixa não funcionam se um canal Convencional tiver seu campo [Receber Somente Personalidade na página 423](#) **Ativado**.

Os Membros de transmissão de voz fixa não funcionam se a zona e o canal selecionados forem um Canal dinâmico.

10.48.1.12

Tipo de transmissão/recepção de dados designados

Este campo seleciona o tipo (fixo ou variável) do canal de dados da transmissão da CAI (Common Air Interface, interface aérea comum) da varredura do canal selecionado.

**OBSERVAÇÃO:**

[Membros da lista de varredura na página 690](#) são selecionados na Lista de varredura atual. Essa seleção se aplica durante a operação no Modo de varredura e assim que o canal do Membro da lista de varredura é selecionado.

Acessado apenas: Quando o campo [Tipo de varredura na página 679](#) estiver definido como **Convencional**.

As seleções a seguir são compatíveis:

Nenhum

A verificação de dados é desabilitada.

Fixo

Permite selecionar o canal de dados da transmissão designado/fixo na Lista de varredura atual.

A seleção do canal de dados deve ser feita pelo campo [Membro de dados designado na página 688](#).

**AVISO:**

Os Membros da transmissão de dados fixos funcionam somente quando o campo [Tipo de varredura na página 679](#) é definido como **Convencional**.

Os Membros de transmissão de dados fixo não funcionam se uma Personalidade convencional que referencie uma Lista de varredura **Fixa** tenha seu campo [Receber Somente Personalidade na página 423](#) **Ativado**.

Canal selecionado

Faz com que o rádio transmita dados no canal/modo selecionado (comunicações Convencionais ou Entroncamento).

**AVISO:**

Caso as funções de [dados](#) não estejam disponíveis no canal, a verificação de dados ficará inoperante.

10.48.1.13

Membro de dados designado

Este campo determina o canal de dados de transmissão da CAI (Common Air Interface, interface aérea comum) da varredura do canal selecionado.

OBSERVAÇÃO:

Esse Membro da lista de varredura é selecionado na Lista de varredura atual. Essa seleção se aplica durante a operação no Modo de varredura e quando o canal do Membro da lista de varredura é selecionado.

AVISO:

Aplica-se somente quando essa Lista de varredura é mencionada em uma Personalidade convencional que tem as condições a seguir: O campo [Tipo de voz/sinal de recepção na página 424](#) definido como **Modo misto** ou **ASTRO**, com um Sistema convencional referenciado com um Perfil de dados referenciado que, por sua vez, tem seu campo Dados do terminal **Ativado** e quando o campo do Índice de perfil do ASTRO OTAR está **Ativado** e não está esmaecido.

Acessado apenas: Quando o campo [Tipo de varredura na página 679](#) estiver definido como **Convencional**, e quando o campo [Tipo de transmissão/recepção de dados designados na página 687](#) estiver definido como **Fixo**, e quando não for uma Zona e Canal dinâmico e quando o rádio estiver habilitado para o modelo ou a opção.

10.48.2

Avançado

Essa seção permite visualizar ou definir uma variedade de recursos ou parâmetros que se aplicam por lista de verificação.

OBSERVAÇÃO:

As listas de varredura individual podem ser atribuídas a [Personalidade convencional na página 422](#) e [Personalidade de entroncamento ASTRO 25 na página 625](#) com seu respectivo campo Seleção da lista de varredura.

10.48.2.1

Contador de paciência limitada de transmissão de dados

Este campo define a duração de espera do rádio para transmitir dados enquanto estiver no Modo de varredura.

Quando o contador expira, os dados são descartados. Essa seleção se aplica à Lista de varredura atual. O valor deste campo é em segundos.

OBSERVAÇÃO:

Acessado apenas: Quando o campo [Tipo de varredura na página 679](#) estiver definido como **Convencional**, e quando o campo [Tipo de transmissão/recepção de dados designados na página 687](#) não estiver definido como **Nenhum**, e quando o rádio for dependente de o modelo ou a opção.

Quando definido como **Infinito**, o tempo de espera de transferência de dados do rádio é ilimitado.

Acima 318: Alcance

Mínimo	Máximo	Incrementos
1 s	255 s	1 s

10.48.2.2

Temporizador de atraso de varredura de ponderação

Este campo define a duração de espera do rádio antes de votar ou selecionar durante a varredura ativa na **Varredura de ponderação** ou **Varredura de ponderação mista convencional**.

Consulte o campo [Ativação de Varredura de Voto Misto na página 472](#).

Consulte também as seleções **Convencional** e **Varredura de ponderação** no campo [Tipo de varredura na página 679](#).

Para Varredura de ponderação ou Varredura de ponderação mista convencional, vários repetidores retransmitem a mesma transmissão simultaneamente em frequências diferentes. O rádio pode então selecionar o sinal mais forte ou mais claro. Essa seleção se aplica à Lista de varredura atual.

**OBSERVAÇÃO:**

Acessado apenas: Quando o campo [Tipo de varredura na página 679](#) estiver definido como **Convencional** ou **Varredura de ponderação** e quando o rádio depender de o modelo ou a opção.

Acima 319: Alcance

Mínimo	Máximo	Incrementos
0 ms	255 ms	5 ms

10.48.2.3

Canal votado de visualização mais forte

Este campo permite que o canal de Varredura de ponderação da varredura do canal selecionado apareça no visor do rádio.

Quando se está em um sistema de Varredura de ponderação, vários repetidores retransmitem a mesma transmissão simultaneamente em frequências diferentes. O rádio poderá então selecionar o sinal mais forte ou mais claro quando estiver no modo de leitura. O canal de Varredura de ponderação selecionado é baseado no RSSI (Received Signal Strength Indication, indicador de intensidade do sinal recebido). Consulte também as seleções **Convencional** e **Varredura de ponderação** nos campos [Limite de RSSI ponderação na página 677](#) e [Tipo de varredura na página 679](#). Essa função se aplica à Lista de verificações atual.

**OBSERVAÇÃO:**

Acessado apenas: Quando o campo [Tipo de varredura na página 679](#) estiver definido como **Convencional** ou **Varredura de ponderação** e quando o rádio depender de o modelo ou a opção.

10.48.2.4

Timer de inatividade da varredura de voto convencional misto

Este campo define a duração de espera do rádio, durante a varredura ativa na Varredura de ponderação mista convencional, antes de iniciar a varredura de outras frequências ou canais e quando nenhuma atividade qualificada é encontrada nas duas frequências mais fortes da atual lista de Varredura.

O valor deste campo é em minutos.

**OBSERVAÇÃO:**

Acessado apenas: Quando o campo [Tipo de varredura na página 679](#) estiver definido como **Convencional**.

Acima 320: Alcance

Mínimo	Máximo	Incrementos
1 m	255 m	1 m

10.48.3

Membros da lista de varredura

Esta seção permite selecionar os canais de comunicação convencionais e/ou de entroncamento necessários de zonas específicas para a lista de varredura atual.

Embora o rádio esteja operando em Modo de varredura, esses canais selecionados podem ter a atividade de transmissão verificada (uma por vez), permitindo assim o máximo possível de canais de recepção. A varredura de Membro de prioridade da lista de varredura deve ser programada.

OBSERVAÇÃO:

O rádio verifica apenas sua Lista de varredura atribuída do atual canal em operação.

Os canais de comunicação de entroncamento e/ou convencional do Membro da lista de varredura devem ser definidos na janela [Atribuição de zonas e canais na página 666](#) antes de se criar a Lista de varredura.

Listas de varredura individuais podem ser atribuídas a [Personalidade convencional na página 422](#) e [Personalidade de entroncamento ASTRO 25 na página 625](#) com seu respectivo campo de seleção da lista de varredura.

É possível iniciar o modo de varredura automaticamente por meio da Varredura automática ou pressionando o botão [Varredura na página 189](#), ativando/desativando [Varredura na página 202](#) ou selecionando o menu [Varredura na página 218](#).

AVISO:

Quando uma Lista de varredura contém 250 ou mais Membros da lista de varredura (registro/linhas) e 5 ou mais [Sistema de entroncamento ASTRO 25 na página 576](#) (dentro desses canais), o desempenho do rádio no Modo de varredura pode ser reduzido consideravelmente.

Para conhecer as condições que determinam as seleções válidas de canais do Membro da lista de varredura para os Tipos de lista de varredura disponíveis, consulte as seleções do [Tipo de varredura na página 679](#).

10.48.3.1

Posição

Este campo somente leitura é atribuído pelo RadioCentral e identifica a ordem do item em uma lista.

OBSERVAÇÃO:

Acessado apenas: Quando o rádio depende do modelo ou da opção.

10.48.3.2

Zona

Este campo seleciona uma zona para o atual Membro da lista de Varredura (registro ou linha) na lista de Varredura atual.

Quando você selecionar essa zona, um canal da zona deve ser selecionado para o mesmo registro ou linha. Consulte também a janela [Atribuição de zonas e canais na página 666](#).

AVISO:

Se o recurso estendido **Capacidade de varredura de zona dinâmica** não estiver disponível, as Zonas dinâmicas serão inválidas e não poderão ser selecionadas (zonas cuja [Ativação da zona dinâmica](#) foi ativada). Caso contrário, as Zonas dinâmicas poderão ser selecionadas.

As zonas de RSI(Remote Site Interface, interface de local remoto) são inválidas e não podem ser selecionadas (zonas que têm o [Modo RSI](#) ativado).

10.48.3.3

Canal

Este campo seleciona um canal para o atual Membro da lista de varredura (registro/linha) na Lista de varredura atual.

O campo Zona do Membro da Lista de varredura deve ser selecionado para o mesmo registro/linha para que a seleção desse canal seja possível.

**AVISO:**

Para conhecer as condições que determinam a seleção de canal válida para os diferentes Tipos de Lista de varredura, consulte as seleções do [Tipo de varredura na página 679](#).

Quando o campo [Tipo de cobertura na página 511](#) do sistema de entroncamento mencionado estiver definido como **Roaming inter-WACN** e o Tipo de varredura for **Grupo de conversação de multissistema**, o [ID da WACN do grupo de conversação na página 624](#) e o [ID do sistema do grupo de conversação na página 624](#) do [Grupo de conversação de entroncamento na página 670](#) atribuído a essa seleção de canal deverão corresponder ao ID da WACN doméstica e ao ID do sistema do sistema de entroncamento. Caso contrário, o aplicativo considera essa seleção de canal inválida.

O aplicativo considera essa seleção de canal inválida quando o campo [Membro de dados designado na página 688](#) faz referência a um canal convencional ativado para banda larga LTE e outro canal do membro da lista de varredura (da mesma lista de varredura) faz referência a um canal convencional cujo campo [Frequência de interferência de LTE presente na página 430](#) definido como **Ativado** ou a um canal de entroncamento cujo campo [Frequência de interferência de LTE presente na página 592](#) é definido como **Verdadeiro**. Um canal convencional é ativado para LTE quando o sistema convencional ASTRO referido da personalidade tem um perfil de dados referenciado com um [Tipo de perfil de dados na página 370](#) igual a **Convencional e banda larga** ou **Apenas banda larga**, e quando a [Fonte de banda larga](#) desse perfil de dados é **Modem LTE interno**.

Quando o recurso estendido "Capacidade de varredura da Zona dinâmica" está disponível e o canal é um Canal dinâmico:

- Se o [Tipo de varredura na página 679](#) estiver definido como **Varredura de ponderação**, o canal dinâmico não será válido.
- Se o [Tipo de varredura na página 679](#) estiver definido como **Convencional, Monitor de prioridade** ou **Grupo de conversação de multissistema**, o canal dinâmico sem atribuição será válido.
- Se o [Tipo de varredura na página 679](#) for **Convencional, Monitor de prioridade, Grupo de conversação de multissistema** ou **Prioridade inteligente**, o canal dinâmico com atribuição será considerado como outros canais normais.

**OBSERVAÇÃO:****Acessado apenas:**

- O campo [Zona na página 690](#) não está definido como **Não atribuído** e a zona não é uma zona dinâmica.
- O campo [Zona na página 690](#) não está definido como **Não atribuído**.
- A zona é uma zona dinâmica com a disponibilidade do **recurso Varredura de zona dinâmica**.

10.49

Perfis de rádio

A seção **Perfis de rádio** permite visualizar ou definir Perfis de rádio individuais. Os perfis de rádio permitem que agrupamentos de configurações de áudio e de indicador sejam montados para canais de rádio específicos e/ou cenários específicos de uso em campo.

OBSERVAÇÃO:

Os perfis de rádio são selecionados para uso em canais pelo campo Perfil do rádio da Atribuição de canais da zona.

Pressionar o botão Perfis de rádio ou selecionar o menu Perfis de rádio permite modificar a atribuição de Perfil de rádio de um canal.

10.49.1

Geral

Esta seção permite visualizar ou modificar as configurações de perfis de rádio individuais.

OBSERVAÇÃO:

Os perfis de rádio são selecionados para uso em canais pelo campo Perfil do rádio da Atribuição de canais da zona.

Pressionar o botão Perfis de rádio ou selecionar o menu Perfis de rádio permite modificar a atribuição de Perfil de rádio de um canal.

10.49.1.1

Nome do perfil do rádio

Este campo permite visualizar ou definir nomes reconhecíveis para o perfil do rádio atual.

Os perfis de rádio são selecionados para uso em canais pelo campo Perfil do rádio da Atribuição de canais da zona.

OBSERVAÇÃO:

Três registros de perfil de rádio pré-nomeados são fornecidos para sua conveniência: **Padrão**, **Vigilância** e **Áudio alto**. Você pode renomear todos os nomes sugeridos. Esses perfis devem ser definidos de acordo com suas necessidades. Você pode criar mais perfis.

OBSERVAÇÃO:

Exemplos: PROFILE-001, #500, Elétrico1, # A5.

É possível usar caracteres, números, espaços e caracteres especiais.

No máximo 14 caracteres no total.

O Nome do perfil de rádio aparece no display frontal.

10.49.1.2

Luz de fundo do display frontal permanente

Esse campo faz com que a luz de fundo da tela dianteira do rádio permaneça acesa.

Esta seleção se aplica ao Perfil do rádio atual.

INFORMAÇÕES:

Quando este campo é ativado, ocorre uma fuga de aproximadamente 20 minutos na duração da bateria padrão de um ciclo normal.

Quando o campo Desabilitar luzes estiver habilitado, esse recurso não será aplicado.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.49.1.3

Luz de fundo do visor superior permanente

Se ativado, esse campo faz com que a luz de fundo do visor superior do rádio permaneça acesa.

Esta seleção se aplica ao Perfil do rádio atual.

INFORMAÇÕES:

Quando este campo é ativado, ocorre uma fuga de aproximadamente 20 minutos na duração da bateria padrão de um ciclo normal.

Quando o campo Desativar luzes estiver ativado, esse recurso não será aplicado.

Acessado apenas: Quando o rádio está ativado para o modelo/para a opção.

10.49.1.4

Controle de volume com detecção de ruído

Se este campo estiver habilitado, o rádio ajustará automaticamente o volume do alto-falante para um nível apropriado para o ambiente de escuta.

Este recurso não é suportado em alto-falantes sem fio ou Microfones com alto-falante do rádio (RSM) com fio.

Acessado apenas: quando o rádio for compatível com o modelo ou opção.

10.49.1.5

Direcionamento de áudio do alto-falante

Este campo seleciona o roteamento de áudio para os alto-falantes internos do rádio.

Esta seleção se aplica ao Perfil do rádio atual.

INFORMAÇÕES:

O visor duplo portátil é equipado com dois alto-falantes internos, dos dois lados do rádio. Para este modelo você pode rotear o áudio em um dos (ou ambos) alto-falantes de forma independente.

O visor superior portátil é equipado com um único alto-falante. Para este modelo você pode ativar ou desativar o áudio neste alto-falante.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.49.1.6

Desativar luzes

Este campo faz com que todos os LEDs e as luzes de fundo de um rádio e de seus acessórios, como um DRSM, sejam desativados para o Perfil de rádio atual.

Este recurso é útil para operações ocultas/de vigilância.

INFORMAÇÕES:

Quando desativado, os rádios equipados com a criptografia do tipo 1 não operam. A criptografia do tipo 1 requer que você possa distinguir (das cores do LED) uma chamada de criptografia de entrada ou de saída do tipo 1.

Na cabeça de controle móvel O9, a seleção do modo de reserva Desativar luzes/LEDs substitui essa seleção sempre que o botão do modo de reserva integrado for LIGADO. Assim que o modo de reserva é DESLIGADO, o rádio volta para as configurações do perfil do rádio atual.

10.49.1.7

Desativar tons

Este campo faz com que todos os tons de alerta do rádio, toques laterais e tons do teclado sejam desabilitados para o perfil do rádio atual.

Esta seleção é útil durante operações secretas/de vigilância.

OBSERVAÇÃO:

Na cabeça de controle O9 móvel, a seleção do Modo de reserva desativar tons substitui essa seleção sempre que o botão Modo de reserva dedicado é alternado para LIGADO. Assim que o modo de reserva é DESLIGADO, o rádio volta para as configurações do perfil do rádio atual.

10.49.1.8

Desativar notificação de emergência

Este campo faz as luzes inteligentes, que indicam o modo de emergência, ficarem desativadas.

Esta seleção se aplica ao Perfil do rádio atual.

OBSERVAÇÃO:

Quando o campo Desativar luzes for ativado, a luz de fundo colorida não acenderá.

10.49.1.9

Desativar notificação crítica

Esse campo faz com que a iluminação Inteligente para autodiagnóstico e detecção de falha sejam desativadas. Isso é aplicável quando o rádio é o modelo mais recente de padrões de serviço de incêndio e no canal compatível no modo Sem perigo.

Esta seleção se aplica ao Perfil do rádio atual.

OBSERVAÇÃO:

Quando o campo Desativar luzes está ativado, a luz de fundo colorida é desativada.

10.49.1.10

Desativar notificação de ligação

Este campo faz com que as luzes inteligente para chamadas recebidas seja desativada.

Esta seleção se aplica ao Perfil do rádio atual.

INFORMAÇÕES:

Quando o campo [Desativar luzes na página 694](#) for ativado, a luz de fundo colorida não acenderá.

10.49.2

Configurações de Áudio - Não APX3000 (Perfis de Rádio)

A seção **Configurações de Áudio - Não APX3000** do conjunto de Perfis de Rádio permite que o usuário visualize ou modifique diversas configurações de microfone e áudio, configurações de volume de tom de alerta e configurações personalizadas de microfone e áudio que se aplicam a perfis de rádios não APX3000.

OBSERVAÇÃO:

Os perfis de rádio são selecionados para uso em canais pelo campo Perfil do rádio da Atribuição de canais da zona.

O pressionamento do botão Perfis de rádio ou a seleção do menu Perfis de rádio permitem que o usuário do rádio modifique a atribuição do perfil de rádio de um canal.

10.49.2.1

Configurações do grupo de redução de ruído

Este campo predefine um conjunto de valores para os campos Seção de redução de ruído em Grupo de configurações de microfone/TX.

Quando o valor **Personalizado** da Configuração de grupo for alterado, os valores dos campos dessa seção serão alterados de acordo. Quando o valor da configuração de grupo não for definido como **Personalizado**, todos os campos serão somente para visualização.

A lista a seguir mostra as seleções e definições para as Configurações de grupo de redução de ruído (rádio).

Desativado

O valor dos campos a seguir é definido como: A Redução de ruído personalizada é **Desabilitada**, o Nível de redução do ruído de fundo é **Desligado**, o Nível de redução de ruído do vento é **Desligado**, Alarme PASSE é **Desabilitado**, a Seleção do perfil de redução de ruído é **Rádio NR 1**, o Modo de redução do ruído de fundo é **Ligado/Aplicado**, o Modo de redução de ruído do vento é **Ligado/Ativo**, o Modo de fonte é **Totalmente automático** e o Modo de diretividade é **Ligado/Adaptando**.

Normal

O valor dos campos a seguir é definido como: A Redução de ruído personalizada é **Desabilitada**, o Nível de redução do ruído de fundo é **Normal**, o Nível de redução de ruído do vento é **Normal**, o Alarme PASSE é **Desabilitado**, a Seleção do perfil de redução de ruído é **Rádio NR 1**, o Modo de redução do ruído de fundo é **Ligado/Aplicado**, o Modo de redução de ruído do vento é **Ligado/Ativo**, o Modo de fonte é **Totalmente automático** e o Modo de diretividade é **Ligado/Adaptando**.

Agressiva

O valor dos campos a seguir é definido como: A Redução de ruído personalizada é **Desabilitada**, o Nível de redução do ruído de fundo é **Agressivo**, o Nível de redução de ruído do vento é **Normal**, o Alarme PASSE é **Desabilitado**, a Seleção do perfil de redução de ruído é **Rádio NR 1**, o Modo de redução do ruído de fundo é **Ligado/Aplicado**, o Modo de redução de ruído do vento é **Ligado/Ativo**, o Modo de fonte é **Totalmente automático** e o Modo de diretividade é **Ligado/Adaptando**.

Extremo

O valor dos campos a seguir é definido como: A Redução de ruído personalizada é **Desabilitada**, o Nível de redução do ruído de fundo é **Extremo_1-sided**, o Nível de redução de ruído do vento é **Normal**, o Alarme PASSE é **Habilitado**, a Seleção do perfil de redução de ruído é **Rádio NR 1**, o Modo de redução do ruído de fundo é **Ligado/Aplicado**, o Modo de redução de ruído do vento é **Ligado/Ativo**, o Modo de fonte é **Totalmente automático** e o Modo de diretividade é **Ligado/Adaptando**.

Automático

O valor dos campos a seguir é definido como: A Redução de ruído personalizada é **Desabilitada**, o Nível de redução do ruído de fundo é **Automático**, o Nível de redução de ruído do vento é **Normal** e o Alarme PASSE é **Habilitado**. Ativa o perfil de agressividade automática da redução de ruído. Esta seleção se aplica somente quando o modelo/opção do rádio for compatível.

A lista a seguir mostra as seleções e definições para as Configurações do grupo de redução de ruído (acessório).

Desativado

O valor dos campos a seguir é definido como: A Redução de ruído personalizada é **Desabilitada**, o Nível de redução do ruído de fundo está **Desligado**, o Nível de redução de ruído do vento está **Desligado**, o Alarme PASSE é **Desabilitado**, a Seleção do perfil de redução de ruído é **Acc NR 1**, Modo de redução do ruído de fundo é **Ligado/Aplicado**, o Modo de redução de ruído do vento está **Ligado/Ativo**, o Modo de fonte é **Mic 1** e o Modo de diretividade é **Ligado/Adaptando**.

Normal

O valor dos campos a seguir é definido como: A Redução de ruído personalizada é **Desabilitada**, o Nível de redução do ruído de fundo é **Normal**, o Nível de redução de ruído do vento é **Normal**, o Alarme PASSE é **Desabilitado**, a Seleção do perfil de redução de ruído é **Acc NR 1**, o Modo de redução do ruído de fundo é **Ligado/Aplicado**, o Modo de redução de ruído do vento é **Ligado/Ativo**, o Modo de fonte é **Mic 1** e o Modo de diretividade é **Ligado/Adaptando**.

Agressiva

O valor dos campos a seguir é definido como: A Redução de ruído personalizada é **Desabilitada**, o Nível de redução do ruído de fundo é **Agressivo**, o Nível de redução de ruído do vento é **Normal**, o Alarme PASSE é **Desabilitado**, a Seleção do perfil de redução de ruído é **Acc NR 1**, o Modo de redução do ruído de fundo é **Ligado/Aplicado**, o Modo de redução de ruído do vento é **Ligado/Ativo**, o Modo de fonte é **Mic 1** e o Modo de diretividade é **Ligado/Adaptando**.

Extremo

O valor dos campos a seguir é definido como: A Redução de ruído personalizada é **Desabilitada**, o Nível de redução do ruído de fundo é **Extreme_1-sided**, o Nível de redução de ruído do Vento é **Normal**, o Alarme PASSE é **Habilitado**, o Seleção do perfil de redução de ruído é **Acc NR 1**, o Modo de redução do ruído de fundo é **Ligado/Aplicado**, o Modo de redução de ruído do vento é **Ligado/Ativo**, o Modo de fonte é **Mic 1** e o Modo de diretividade é **Ligado/Adaptando**.

Automático

O valor dos campos a seguir é definido como: A Redução de ruído personalizada é **Desabilitada**, o Nível de redução do ruído de fundo é **Automático**, o Nível de redução de ruído do vento é **Normal** e o Alarme PASSE é **Habilitado**. Ativa o perfil de agressividade automática da redução de ruído. Esta seleção se aplica somente quando o modelo/opção do rádio for compatível.

Acessado apenas: Esta é uma configuração avançada disponível apenas na Visualização integral (veja Visualização do codeplug).

10.49.2.2

Configuração do grupo (acessório)

O objetivo das Configurações de grupo de redução de ruído é predefinir um conjunto de valores para os campos da seção Redução de ruído em Grupo de configurações de microfone/TX.

Quando o valor **Personalizado** da Configuração de grupo for alterado, os valores dos campos dessa seção serão alterados de acordo. Quando o valor da configuração de grupo não for definido como **Personalizado**, todos os campos serão somente para visualização.

OBSERVAÇÃO:

Na configuração **Personalizada**, é altamente recomendável ter conhecimento especializado sobre as diferentes configurações de Redução de ruído antes de fazer ajustes individuais.

A lista a seguir mostra as seleções e definições para as Configurações do grupo de redução de ruído (acessório).

Desativado

O valor dos campos a seguir é definido como: Redução de Ruído Personalizada está **Desativada**, Nível de Redução do Ruído de Fundo está **Desligado**, Nível de Redução de Ruído do Vento está **Desligado**, Alarme PASSE está **Desativado**, Seleção do Perfil de Redução de Ruído é **Acc NR 1**, Modo de Redução do Ruído de Fundo está **Ligado/Aplicado**, Modo de Redução de Ruído do Vento está **Ligado/Ativo**, Modo de Fonte é **Mic 1** e Modo de Diretividade está **Ligado/Adaptando**.

Normal

O valor dos campos a seguir é definido como: A Redução de ruído personalizada é **Desabilitada**, o Nível de redução do ruído de fundo é **Normal**, o Nível de redução de ruído do vento é **Normal**, o Alarme PASSE é **Desabilitado**, a Seleção do perfil de redução de ruído é **Acc NR 1**, o Modo de redução do ruído de fundo é **Ligado/Aplicado**, o Modo de redução de ruído do vento é **Ligado/Ativo**, o Modo de fonte é **Mic 1** e o Modo de diretividade é **Ligado/Adaptando**.

Agressiva

O valor dos campos a seguir é definido como: A Redução de ruído personalizada é **Desativada**, o Nível de redução de ruídos de fundo é **Agressivo**, o Nível de redução de ruídos do vento é **Normal**, o Alarme PASS é **Desativado**, a Seleção de perfil de redução de ruído é **Acc NR 1**, o Modo de redução do ruído de fundo é **Ligado/Aplicado**, o Modo de redução de ruídos do vento é **Ligado/Ativo**, o Modo de fonte é **Mic 1** e o Modo de diretividade é **Ligado/Adaptando**.

Extremo

O valor dos campos a seguir é definido como: Redução de Ruído Personalizada está **Desativada**, Nível de Redução do Ruído de Fundo está **Extreme_1-sided**, Nível de Redução de Ruído do Vento está **Normal**, Alarme PASSE está **Ativado**, Seleção do Perfil de Redução de Ruído é **Acc NR 1**, Modo de Redução do Ruído de Fundo está **Ligado/Aplicado**, Modo de Redução de Ruído do Vento está **Ligado/Ativo**, Modo de Fonte é **Mic 1** e Modo de Diretividade está **Ligado/Adaptando**.

Automático

O valor dos campos a seguir é definido como: A Redução de ruído personalizada é **Desabilitada**, o Nível de redução do ruído de fundo é **Automático**, o Nível de redução de ruído do vento é **Normal** e o Alarme PASSE é **Habilitado**. Ativa o perfil de agressividade automática da redução de ruído. Esta seleção se aplica somente quando o modelo/opção do rádio for compatível.

Personalizada

Use a opção Personalizado para definir individualmente configurações exclusivas de ganho de equalização de áudio do alto-falante do rádio que não são compatíveis com outras opções do menu Configuração de grupo. É altamente recomendável evitar configurações máximas para as mesmas bandas de frequência entre as equalizações de microfone e alto-falante.

10.49.2.3

Redução de ruído personalizada

Este campo ativa os microfones do Rádio ou do Acessório para usar um Perfil de redução de ruído do rádio personalizado ou Perfil de redução de ruído do acessório que vise condições específicas de ruído.

AVISO:

As configurações personalizadas de Redução de ruído do microfone devem ser modificadas somente quando necessário por Equipe de serviço qualificada. Falha ao configurar as definições corretamente pode degradar seriamente a supressão de ruídos do microfone e consequentemente a inteligibilidade da fala transmitida.

As Configurações de Redução de Ruído do Rádio e Configurações de Redução de Ruído de Acessório são recomendadas para a maioria dos ambientes ruidosos.

OBSERVAÇÃO:

A redução de ruído melhora a clareza da voz reduzindo o ruído de fundo. A redução de ruído ocorre no rádio transmissor antes da transmissão no modo analógico e antes da codificação de voz no modo digital. Não só a redução do ruído de fundo melhora a clareza de voz para um modo de transmissão analógico, no modo digital de um sinal mais nítido de voz no codificador de voz (vocoder) resulta em voz mais nítida a ser recebida e decodificada no receptor.

10.49.2.4

Redução de Ruído Personalizada (Acessório)

Ativa os microfones do Rádio/Acessório para usar um Perfil de redução de ruído do rádio personalizado ou Perfil de redução de ruído do acessório que vise condições específicas de ruído.

**AVISO:**

As configurações personalizadas de Redução de ruído do microfone devem ser modificadas somente quando necessário por Equipe de serviço qualificada. Falha ao configurar as definições corretamente pode degradar seriamente a supressão de ruídos do microfone e consequentemente a inteligibilidade da fala transmitida.

As Configurações de Redução de Ruído do Rádio e Configurações de Redução de Ruído de Acessório são recomendadas para a maioria dos ambientes ruidosos.

**OBSERVAÇÃO:**

A redução de ruído melhora a clareza da voz reduzindo o ruído de fundo. A redução de ruído ocorre no rádio transmissor antes da transmissão no modo analógico e antes da codificação de voz no modo digital. Não só a redução do ruído de fundo melhora a clareza de voz para um modo de transmissão analógico, no modo digital de um sinal mais nítido de voz no codificador de voz (vocoder) resulta em voz mais nítida a ser recebida e decodificada no receptor.

10.49.2.5

Nível de Redução do Ruído de Fundo (Rádio)

Seleciona o nível de redução de ruído de fundo aplicado aos microfones duplos internos e ao microfone externo.

**AVISO:**

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

Esta seleção se aplica ao Perfil do rádio atual.

**OBSERVAÇÃO:**

A redução de ruído melhora a clareza da voz reduzindo o ruído de fundo. A redução de ruído ocorre no rádio transmissor antes da transmissão no modo analógico e antes da codificação de voz no modo digital. Não só a redução do ruído de fundo melhora a clareza de voz para um modo de transmissão analógico, no modo digital de um sinal mais nítido de voz no codificador de voz (vocoder) resulta em voz mais nítida a ser recebida e decodificada no receptor.

Acessado apenas: Quando o campo Redução de ruído personalizada for desativado.

A lista a seguir mostra as seleções e definições para o nível de redução do ruído de fundo (rádio).

Desativado

Desativa a redução de ruído de fundo do microfone duplo. Ambos os microfones continuam ativos, e o usuário do rádio pode falar em qualquer um dos lados do rádio, mas nenhuma redução de ruído de fundo é aplicada.

Normal

Ambos os microfones estão ativos e adaptam continuamente o sinal de voz para obter a nitidez ideal em uma ampla extensão de ruído de fundo. Configuração recomendada para a maioria dos ambientes.

Agressiva

Um aumento do nível de redução de ruído de fundo é ativado. Recomendado para ambientes com ruído MUITO ALTO .

Xtreme 1_Sided

O nível máximo de redução de ruído de fundo é ativado. Recomendado para ambientes de ruídos EXTREMAMENTE ALTOS, por exemplo: Alarme PASSE (Personal Alert Safety System, sistema

de segurança de alerta pessoal) de incêndio, alertas aéreos baixos, caminhão de bombeamento, ventilação para gás, serra.

**OBSERVAÇÃO:**

Esta configuração exige que o usuário do rádio fale na lateral do rádio que tem o maior alto-falante. Esta seleção se aplica somente quando o modelo/opção do rádio for compatível.

Automático

Ativa o perfil de agressividade automática da redução de ruído.

**OBSERVAÇÃO:**

Esta seleção se aplica somente quando o modelo/opção do rádio for compatível.

A lista a seguir mostra as seleções e definições para o nível de redução do ruído de fundo (acessório).

Desativado

Desativa a redução do ruído de fundo. O microfone externo permanece ativo, mas nenhuma redução de ruído é aplicada.

Normal

O microfone externo adapta continuamente o sinal de voz para nitidez ideal sobre uma ampla extensão de ruído de fundo. Configuração recomendada para a maioria dos ambientes.

Xtreme 1_Sided

O nível máximo de redução de ruído de fundo é ativado. Recomendado para ambientes de ruídos EXTREMAMENTE ALTOS, por exemplo: Alarme PASSE de incêndio, alertas aéreos baixos, caminhão de bombeamento, ventilação para gás, serra.

**OBSERVAÇÃO:**

Esta configuração exige que o usuário do rádio fale na lateral do rádio que tem o maior alto-falante. Esta seleção se aplica somente quando o modelo/opção do rádio for compatível.

Automático

Ativa o perfil de agressividade automática da redução de ruído.

**OBSERVAÇÃO:**

Esta seleção se aplica somente quando o modelo/opção do rádio for compatível.

10.49.2.6**Nível de Redução do Ruído de Fundo (Acessório)**

Seleciona o nível de redução de ruído de fundo aplicado aos microfones duplos internos e ao microfone externo.

**AVISO:**

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

Esta seleção se aplica ao Perfil do rádio atual.

**OBSERVAÇÃO:**

A redução de ruído melhora a clareza da voz reduzindo o ruído de fundo. A redução de ruído ocorre no rádio transmissor antes da transmissão no modo analógico e antes da codificação de voz no modo digital. Não só a redução do ruído de fundo melhora a clareza de voz para um modo de transmissão analógico, no modo digital de um sinal mais nítido de voz no codificador de voz (vocoder) resulta em voz mais nítida a ser recebida e decodificada no receptor.

Acessado apenas: Quando o campo Redução de ruído personalizada for desativado.

A lista a seguir mostra as seleções e definições para o nível de redução do ruído de fundo (rádio).

Desativado

Desativa a redução de ruído de fundo do microfone duplo. Ambos os microfones continuam ativos, e o usuário do rádio pode falar em qualquer um dos lados do rádio, mas nenhuma redução de ruído de fundo é aplicada.

Normal

Ambos os microfones estão ativos e adaptam continuamente o sinal de voz para obter a nitidez ideal em uma ampla extensão de ruído de fundo. Configuração recomendada para a maioria dos ambientes.

Agressiva

Um aumento do nível de redução de ruído de fundo é ativado. Recomendado para ambientes com ruído MUITO ALTO .

Xtreme 1_Sided

O nível máximo de redução de ruído de fundo é ativado. Recomendado para ambientes de ruídos EXTREMAMENTE ALTOS, por exemplo: Alarme PASSE (Personal Alert Safety System, sistema de segurança de alerta pessoal) de incêndio, alertas aéreos baixos, caminhão de bombeamento, ventilação para gás, serra.

OBSERVAÇÃO:

Esta configuração exige que o usuário do rádio fale na lateral do rádio que tem o maior alto-falante. Esta seleção se aplica somente quando o modelo/opção do rádio for compatível.

Automático

Ativa o perfil de agressividade automática da redução de ruído.

OBSERVAÇÃO:

Esta seleção se aplica somente quando o modelo/opção do rádio for compatível.

A lista a seguir mostra as seleções e definições para o nível de redução do ruído de fundo (acessório).

Desativado

Desativa a redução do ruído de fundo. O microfone externo permanece ativo, mas nenhuma redução de ruído é aplicada.

Normal

O microfone externo adapta continuamente o sinal de voz para nitidez ideal sobre uma ampla extensão de ruído de fundo. Configuração recomendada para a maioria dos ambientes.

Agressiva

Um aumento do nível de redução de ruído de fundo é ativado. Recomendado para ambientes com ruído MUITO ALTO .

Xtreme 1_Sided

O nível máximo de redução de ruído de fundo é ativado. Recomendado para ambientes de ruídos EXTREMAMENTE ALTOS, por exemplo: Alarme PASSE de incêndio, alertas aéreos baixos, caminhão de bombeamento, ventilação para gás, serra.

OBSERVAÇÃO:

Esta configuração exige que o usuário do rádio fale na lateral do rádio que tem o maior alto-falante. Esta seleção se aplica somente quando o modelo/opção do rádio for compatível.

Automático

Ativa o perfil de agressividade automática da redução de ruído.

OBSERVAÇÃO:

Esta seleção se aplica somente quando o modelo/opção do rádio for compatível.

10.49.2.7

Nível de Redução de Ruído do Vento (Rádio)

Selecione o nível de redução de ruído do vento aplicado aos microfones duplos internos e ao microfone externo.

**AVISO:**

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

Esta seleção se aplica ao Perfil do rádio atual.

**OBSERVAÇÃO:**

A redução de ruído melhora a clareza da voz reduzindo o ruído de fundo. A redução de ruído ocorre no rádio transmissor antes da transmissão no modo analógico e antes da codificação de voz no modo digital. Não só a redução do ruído de fundo melhora a clareza de voz para um modo de transmissão analógico, no modo digital de um sinal mais nítido de voz no codificador de voz (vocoder) resulta em voz mais nítida a ser recebida e decodificada no receptor.

Acessado apenas: Quando o campo Redução de ruído personalizada for desativado.

A lista a seguir mostra as seleções e definições para as configurações de Redução de ruído do vento (rádio).

Desativado

Desativa a redução de ruído de vento do microfone duplo. Ambos os microfones continuam ativos, e o usuário do rádio pode falar em qualquer um dos lados do rádio, mas nenhuma redução de ruído de vento é aplicada.

Normal

Ambos os microfones estão ativos e adaptam continuamente o sinal de voz para obter a nitidez ideal em uma ampla extensão de ruído.

**OBSERVAÇÃO:**

Configuração recomendada para a maioria dos ambientes.

Agressiva

Um aumento do nível de redução de ruído do vento é ativado.

**OBSERVAÇÃO:**

Recomendado para ambientes com ruído muito alto.

10.49.2.8

Nível de Redução de Ruído do Vento (Acessório)

A tabela a seguir relaciona a seleção e a definição para o Nível de redução de ruído do vento (Acessório).

**OBSERVAÇÃO:**

Este é um campo não configurável e a configuração padrão é definida como **Desativado**.

Desativado

Desativa a redução de ruído do vento. O microfone externo permanece ativo, mas nenhuma redução de ruído do vento é aplicada.

10.49.2.9

Filtro do Alarme PASS (Rádio)

O Filtro do alarme PASS (Personal Alert Safety System, sistema de segurança de alerta pessoal) (Rádio) permite a redução do ruído de fundo para o microfone interno do rádio sempre que o rádio estiver transmitindo na presença de um alarme PASS ativo.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

O Filtro do alarme PASS (Acessório) permite a redução do ruído de fundo para o microfone externo do rádio sempre que o rádio estiver transmitindo na presença de um alarme PASS ativo. Esta seleção se aplica ao Perfil do rádio atual.

As seleções compatíveis são **Desativado** e **Ativado**.

OBSERVAÇÃO:

A redução de ruído melhora a clareza da voz reduzindo o ruído de fundo. A redução de ruído ocorre no rádio transmissor antes da transmissão no modo analógico e antes da codificação de voz no modo digital. Não só a redução do ruído de fundo melhora a clareza de voz para um modo de transmissão analógico, no modo digital de um sinal mais nítido de voz no codificador de voz (vocoder) resulta em voz mais nítida a ser recebida e decodificada no receptor.

Acessado apenas:

Quando o campo Ativar redução de ruído personalizada for desativado, e (Quando o campo Nível de Redução do Ruído de Fundo não estiver definido como **Desligado** e quando o campo Nível de Redução de Ruído do Vento não estiver definido como **Desligado**).

10.49.2.10

Filtro do Alarme PASS (Acessório)

O Filtro do Alarme PASS (Personal Alert Safety System, sistema de segurança de alerta pessoal) permite a redução do ruído de fundo para o microfone interno do rádio sempre que o rádio estiver transmitindo na presença de um alarme PASS ativo.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

O Filtro do alarme PASS (Acessório) permite a redução do ruído de fundo para o microfone externo do rádio sempre que o rádio estiver transmitindo na presença de um alarme PASS ativo. Esta seleção se aplica ao Perfil do rádio atual.

As seleções compatíveis são **Ativado** e **Desativado**.

OBSERVAÇÃO:

A redução de ruído melhora a clareza da voz reduzindo o ruído de fundo. A redução de ruído ocorre no rádio transmissor antes da transmissão no modo analógico e antes da codificação de voz no modo digital. Não só a redução do ruído de fundo melhora a clareza de voz para um modo de transmissão analógico, no modo digital de um sinal mais nítido de voz no codificador de voz (vocoder) resulta em voz mais nítida a ser recebida e decodificada no receptor.

Acessado apenas:

Quando o campo Ativar redução de ruído personalizada for desativado, e (Quando o campo Nível de Redução do Ruído de Fundo não estiver definido como **Desligado** e quando o campo Nível de Redução de Ruído do Vento não estiver definido como **Desligado**).

10.49.2.11

Seleção do Perfil de Redução de Ruído

Estas configurações personalizadas são aplicadas apenas quando o campo Redução de ruído personalizada é selecionado no Perfil de rádio referenciado.

**AVISO:**

Não modifique as configurações de Redução de ruído personalizadas a menos que você faça parte da Equipe de serviço qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

Os Perfis de Rádio são referenciados a um canal específico com a Atribuição de Zonas e Canais, no campo **Seleção de Perfil de Rádio** da Página do Canal.

10.49.2.12

Seleção do Perfil de Redução de Ruído (Acessório)

Ativa os microfones do Rádio/Acessório para usar um Perfil de redução de ruído do rádio personalizado ou Perfil de redução de ruído do acessório que vise condições específicas de ruído.

**AVISO:**

As configurações personalizadas de Redução de ruído do microfone devem ser modificadas somente quando necessário por Equipe de serviço qualificada. Falha ao configurar as definições corretamente pode degradar seriamente a supressão de ruídos do microfone e conseqüentemente a inteligibilidade da fala transmitida.

As Configurações de Redução de Ruído do Rádio e Configurações de Redução de Ruído de Acessório são recomendadas para a maioria dos ambientes ruidosos.

**OBSERVAÇÃO:**

A redução de ruído melhora a clareza da voz reduzindo o ruído de fundo. A redução de ruído ocorre no rádio transmissor antes da transmissão no modo analógico e antes da codificação de voz no modo digital. Não só a redução do ruído de fundo melhora a clareza de voz para um modo de transmissão analógico, no modo digital de um sinal mais nítido de voz no codificador de voz (vocoder) resulta em voz mais nítida a ser recebida e decodificada no receptor.

10.49.2.13

Modo de redução de ruído de fundo (Rádio)

Estas configurações personalizadas são aplicadas apenas quando o campo Redução de ruído personalizada é selecionado no Perfil de rádio referenciado.

**AVISO:**

O usuário não deve modificar as configurações de Redução de Ruído Personalizada, a menos que faça parte da Equipe de Serviço Qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

Os Perfis de Rádio são referenciados a um canal específico com a Atribuição de Zonas e Canais, no campo **Seleção de Perfil de Rádio** da Página do Canal.

10.49.2.14

Modo de redução de ruído de fundo (Acessório)

Estas configurações personalizadas são aplicadas apenas quando o campo Redução de ruído personalizada é selecionado no Perfil de rádio referenciado.

**AVISO:**

O usuário não deve modificar as configurações de Redução de Ruído Personalizada, a menos que faça parte da Equipe de Serviço Qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

Os Perfis de Rádio são referenciados a um canal específico com a Atribuição de Zonas e Canais, no campo **Seleção de Perfil de Rádio** da Página do Canal.

10.49.2.15

Modo de Redução de Ruído do Vento (Rádio)

Estas configurações personalizadas são aplicadas apenas quando o campo Redução de ruído personalizada é selecionado no Perfil de rádio referenciado.

AVISO:

O usuário não deve modificar as configurações de Redução de Ruído Personalizada, a menos que faça parte da Equipe de Serviço Qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

Os Perfis de Rádio são referenciados a um canal específico com a Atribuição de Zonas e Canais, no campo **Seleção de Perfil de Rádio** da Página do Canal.

10.49.2.16

Modo de Redução de Ruído do Vento (Acessório)

Estas configurações personalizadas são aplicadas apenas quando o campo Redução de ruído personalizada é selecionado no Perfil de rádio referenciado.

AVISO:

O usuário não deve modificar as configurações de Redução de Ruído Personalizada, a menos que faça parte da Equipe de Serviço Qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

Os Perfis de Rádio são referenciados a um canal específico com a Atribuição de Zonas e Canais, no campo **Seleção de Perfil de Rádio** da Página do Canal.

10.49.2.17

Modo de Fonte (Rádio)

Estas configurações personalizadas são aplicadas apenas quando o campo Redução de ruído personalizada é selecionado no Perfil de rádio referenciado.

AVISO:

O usuário não deve modificar as configurações de Redução de Ruído Personalizada, a menos que faça parte da Equipe de Serviço Qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

Os Perfis de Rádio são referenciados a um canal específico com a Atribuição de Zonas e Canais, no campo Seleção de Perfil de Rádio da Página do Canal.

As seleções a seguir são compatíveis:

- Emissão 1
- Emissão 2
- Totalmente automático
- Mic 1
- Mic 1 e Mic 2
- Mic 2
- Mic 3
- Desativado
- Mic 1 de proximidade

- Mic 2 de proximidade

10.49.2.18

Modo de Fonte (Acessório)

Estas configurações personalizadas são aplicadas apenas quando o campo Redução de ruído personalizada é selecionado no Perfil de rádio referenciado.

AVISO:

O usuário não deve modificar as configurações de Redução de Ruído Personalizada, a menos que faça parte da Equipe de Serviço Qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

10.49.2.19

Modo de Diretividade (Rádio)

Estas configurações personalizadas são aplicadas apenas quando o campo Redução de ruído personalizada é selecionado no Perfil de rádio referenciado.

AVISO:

O usuário não deve modificar as configurações de Redução de Ruído Personalizada, a menos que faça parte da Equipe de Serviço Qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

Os Perfis de Rádio são referenciados a um canal específico com a Atribuição de Zonas e Canais, no campo **Seleção de Perfil de Rádio** da Página do Canal.

10.49.2.20

Modo de Diretividade (Acessório)

Estas configurações personalizadas são aplicadas apenas quando o campo Redução de ruído personalizada é selecionado no Perfil de rádio referenciado.

AVISO:

O usuário não deve modificar as configurações de Redução de Ruído Personalizada, a menos que faça parte da Equipe de Serviço Qualificada. Configurações inadequadas podem resultar na transmissão de altos níveis de ruído com a voz, o que pode causar falha na comunicação.

10.49.2.21

Modo SAM

SAM (Speaker-As-Microphone — Alto-falante como microfone) é uma fonte de áudio alternativa.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

O desempenho de áudio melhora em condições com ruído do vento quando você utiliza o Modo SAM.

As seleções disponíveis são **Desligado**, **Ligado** e **Wind_On**.

Quando você define este recurso como **Wind_On**, a entrada de áudio SAM funciona somente em condições de vento.

Acessado apenas: Quando o rádio estiver habilitado para o modelo/a opção e quando [Redução de ruído personalizada na página 698](#) estiver **Ativado**.

10.49.2.22

Modo automático do Mic. do rádio

O Modo Automático do Mic. do Rádio se refere à configuração automática de agressividade da supressão de Ruído para o rádio.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

As seleções disponíveis são **Desligado** e **Ligado**.

Acessado apenas: Quando o rádio estiver habilitado para o modelo/a opção e quando [Redução de ruído personalizada na página 698](#) estiver **Ativado**.

10.49.2.23

Modo automático do Mic. do acessório

O Modo Automático do Mic. do Acessório se refere à configuração automática do nível de agressividade da supressão de Ruído para o acessório.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

As seleções disponíveis são **Desligado** e **Ligado**.

Acessado apenas: Quando o rádio estiver habilitado para o modelo/a opção e quando [Redução de Ruído Personalizada \(Acessório\) na página 699](#) estiver **Ativado**.

10.49.2.24

Comp Sobrecarga (Rádio)

Este campo permite que a compensação Automática para a sobrecarga do mic. melhore o desempenho da redução de ruído em condições com ruídos muito altos.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

As seleções são **Desligado** e **Ligado**.

Acessado apenas: Quando o rádio estiver habilitado para o modelo/a opção e quando [Redução de ruído personalizada na página 698](#) estiver **Ativado**.

10.49.2.25

Configuração de grupo (rádio)

Este campo predefine um conjunto de valores para os campos Seção de sensibilidade de ganho no grupo de Microfone/Configurações TX.

Quando o valor da Configuração de Grupo alterado for diferente de **Personalizado**, o valor dos campos nessa seção será alterado de acordo. Quando o valor da configuração de grupo não for definido como **Personalizado**, todos os campos serão somente para visualização.

Abaixo há uma lista de seleções e definições tanto para Configuração de grupo de sensibilidade/ganho (rádio) quanto para Configuração de grupo de sensibilidade/ganho (acessório).

Normal

O valor dos campos a seguir é definido como: O AGC Analógico está **Ativado**, o AGC Digital está **Ativado**, o AGC Securenet está **Ativado**, o Ganho Fixo Analógico é **0**, o Ganho Fixo Digital é **0**, o Ganho Fixo Securenet é **0**, a Saída do Controle de Ganho é **0**, o Total do Controle de Ganho é **6** e o Balanço Digital / Analógico está **Desativado**.

Otimização de ruído

O valor dos campos a seguir é definido como: O AGC analógico está **Desativado**, o AGC digital está **Desativado**, o AGC SecureNet está **Desativado**, o Ganho fixo analógico é **-6**, o Ganho fixo digital é **-6**, o Ganho fixo SecureNet é **-6**, a Saída do controle de ganho é **0**, o Total do controle de ganho é **6** e o Balanço digital/analógico está **Ativado**.

Saída alta

O valor dos campos a seguir é definido como: O AGC analógico está **Ativado**, o AGC digital está **Ativado**, o AGC SecureNet está **Ativado**, o Ganho fixo analógico é **0**, o Ganho fixo digital é **0**, o Ganho fixo SecureNet é **0**, a Saída do controle de ganho é **6**, o Total do controle de ganho é **9** e o Balanço digital/analógico está **Desativado**.

Reduzir retorno

O valor dos campos a seguir é definido como: O AGC analógico está **Desativado**, o AGC digital está **Desativado**, o AGC SecureNet está **Desativado**, o Ganho fixo analógico é **-9**, o Ganho fixo digital é **-9**, o Ganho fixo SecureNet é **-9**, a Saída do controle de ganho é **0**, o Total do controle de ganho é **6** e o Balanço digital/analógico está **Ativado**.

10.49.2.26

Configuração do grupo (acessório)

O objetivo deste campo é predefinir um conjunto de valores para os campos Seção de sensibilidade de ganho em Grupo de configurações de microfone/TX.

Quando o valor da Configuração de Grupo alterado for diferente de **Personalizado**, o valor dos campos nessa seção será alterado de acordo. Quando o valor da configuração de grupo não for definido como **Personalizado**, todos os campos serão somente para visualização.

Abaixo há uma lista de seleções e definições tanto para Configuração de grupo de sensibilidade/ganho (rádio) quanto para Configuração de grupo de sensibilidade/ganho (acessório).

Normal

O valor dos campos a seguir é definido como: O AGC analógico está **Ativado**, o AGC digital está **Ativado**, o AGC SecureNet está **Ativado**, o Ganho fixo analógico é **0**, o Ganho fixo digital é **0**, o Ganho fixo SecureNet é **0**, a Saída do controle de ganho é **0**, o Total do controle de ganho é **6** e o Balanço digital/analógico está **Desativado**.

Otimização de ruído

O valor dos campos a seguir é definido como: O AGC analógico está **Desativado**, o AGC digital está **Desativado**, o AGC SecureNet está **Desativado**, o Ganho fixo analógico é **-6**, o Ganho fixo digital é **-6**, o Ganho fixo SecureNet é **-6**, a Saída do controle de ganho é **0**, o Total do controle de ganho é **6** e o Balanço digital/analógico está **Ativado**.

Saída alta

O valor dos campos a seguir é definido como: O AGC analógico está **Ativado**, o AGC digital está **Ativado**, o AGC SecureNet está **Ativado**, o Ganho fixo analógico é **0**, o Ganho fixo digital é **0**, o Ganho fixo SecureNet é **0**, a Saída do controle de ganho é **6**, o Total do controle de ganho é **9** e o Balanço digital/analógico está **Desativado**.

Reduzir retorno

O valor dos campos a seguir é definido como: O AGC analógico está **Desativado**, o AGC digital está **Desativado**, o AGC SecureNet está **Desativado**, o Ganho fixo analógico é **-9**, o Ganho fixo digital é **-9**, o Ganho fixo SecureNet é **-9**, a Saída do controle de ganho é **0**, o Total do controle de ganho é **6** e o Balanço digital/analógico está **Ativado**.

Personalizada

Use a opção Personalizado para definir individualmente configurações exclusivas de ganho de equalização de áudio do alto-falante do rádio que não são compatíveis com outras opções do menu Configuração de grupo. É altamente recomendável evitar configurações máximas para as mesmas bandas de frequência entre as equalizações de microfone e alto-falante.

10.49.2.27

AGC analógico

Este campo ativa o AGC (Automatic Gain Control, controle de ganho automático) para ser usado no microfone interno ou externo do rádio.

Essa seleção se aplica somente enquanto o rádio transmite no modo analógico. O AGC compensa diferenças de voz e estilo operacional. Como resultado da AGC, o áudio é transmitido e recebido no mesmo nível de áudio/decibéis. Esta seleção se aplica ao Perfil do rádio atual.

AVISO:

(Se você definir o Nível de configuração de áudio como **Básico**.) Quando habilitado, o campo Equilíbrio analógico/digital de transmissão de Todos os rádios deve ser definido como **Todos os rádios**, e o Equilíbrio analógico/digital de transmissão no mesmo registro/linha do Perfil de rádio deve ser **Desabilitado**. Caso contrário, essa seleção será considerada inválida.

(Se você definir o Nível de configuração de áudio como **Aprimorado**.) Quando habilitado, o campo Equilíbrio analógico/digital de transmissão de Todos os rádios deve ser definido como **Todos os rádios**, e o Equilíbrio analógico/digital de transmissão no mesmo registro/linha do Perfil de rádio deve ser **Desabilitado**, caso contrário, essa seleção será considerada inválida.

INFORMAÇÕES:

O nível Controle de ganho total Tx (também conhecido como ganho puro) é aplicado antes de o AGC ter ocorrido. Para entrada do microfone abaixo do nível nominal: actual microphone output = microphone input + Tx Gain Control Total.

O nível de Saída de controle de ganho Tx é aplicado depois de o AGC ter ocorrido. A saída de controle de ganho TX implementa um infinito: razão de 1 dB quando a entrada do microfone estiver acima do nível nominal. Ou seja, para qualquer entrada acima do valor nominal, a saída nunca irá acima do nível estabelecido por este parâmetro.

10.49.2.28

AGC Analógico (Acessório)

Ativa o controle automático de ganho (AGC) para ser usado para microfone interno ou externo do rádio. Essa seleção se aplica somente enquanto o rádio transmite no modo analógico.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

O AGC compensa diferenças de voz e estilo operacional. Como resultado da AGC, o áudio é transmitido e recebido no mesmo nível de áudio/decibéis. Esta seleção se aplica ao Perfil do rádio atual.

**AVISO:**

(Se o usuário definir o Nível de configuração de áudio como **Básico**). Quando ativado, o campo Todos os rádios, Equilíbrio analógico/digital de transmissão deve ser definido como **Todos os rádios**, e o Equilíbrio analógico/digital de transmissão no mesmo registro/linha do Perfil de rádio deve ser **Desativado**. Caso contrário, essa seleção será considerada inválida.

(Se você definir o Nível de configuração de áudio como **Aprimorado**). Quando ativado, o campo Todos os rádios, Equilíbrio analógico/digital de transmissão deve ser definido como **Todos os rádios** e o Equilíbrio analógico/digital de transmissão no mesmo registro/linha do Perfil de rádio deve ser **Desativado**. Caso contrário, essa seleção será considerada inválida.

**INFORMAÇÕES:**

O nível Controle de ganho total Tx (também conhecido como ganho puro) é aplicado antes de o AGC ter ocorrido. Para entrada do microfone abaixo do nível nominal: actual microphone output = microphone input + Tx Gain Control Total.

O nível de Saída de controle de ganho Tx é aplicado depois de o AGC ter ocorrido. A saída de controle de ganho TX implementa um infinito: razão de 1 dB quando a entrada do microfone estiver acima do nível nominal. Ou seja, para qualquer entrada acima do valor nominal, a saída nunca será acima do nível estabelecido por este parâmetro.

10.49.2.29

AGC digital

Este campo ativa o AGC (Automatic Gain Control, controle de ganho automático) para ser usado no microfone interno ou externo do rádio.

Essa seleção se aplica somente enquanto o rádio transmite no modo digital. O AGC compensa diferenças de voz e estilo operacional. Como resultado da AGC, o áudio é transmitido e recebido no mesmo nível de áudio/decibéis. Esta seleção se aplica ao Perfil do rádio atual.

**OBSERVAÇÃO:**

(Se o usuário definir o Nível de configuração de áudio como **Básico**). Quando ativado, o campo Todos os rádios, Equilíbrio analógico/digital de transmissão deve ser definido como **Todos os rádios**, e o Equilíbrio analógico/digital de transmissão no mesmo registro/linha do Perfil de rádio deve ser **Desativado**. Caso contrário, essa seleção será considerada inválida.

(Se você definir o Nível de configuração de áudio como **Aprimorado**). Quando ativado, o campo Todos os rádios, Equilíbrio analógico/digital de transmissão deve ser definido como **Todos os rádios** e o Equilíbrio analógico/digital de transmissão no mesmo registro/linha do Perfil de rádio deve ser **Desativado**. Caso contrário, essa seleção será considerada inválida.

**OBSERVAÇÃO:**

O nível Controle de ganho total Tx (também conhecido como ganho puro) é aplicado antes de o AGC ter ocorrido. Para entrada do microfone abaixo do nível nominal: actual microphone output = microphone input + Tx Gain Control Total.

O nível de Saída de controle de ganho Tx é aplicado depois de o AGC ter ocorrido. A saída de controle de ganho TX implementa um infinito: razão de 1 dB quando a entrada do microfone estiver acima do nível nominal. Ou seja, para qualquer entrada acima do valor nominal, a saída nunca irá acima do nível estabelecido por este parâmetro.

10.49.2.30

AGC Digital (Acessório)

Ativa o controle automático de ganho (AGC) para ser usado para microfone interno ou externo do rádio.

**AVISO:**

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

Essa seleção se aplica somente enquanto o rádio transmite no modo digital. O AGC compensa diferenças de voz e estilo operacional. Como resultado da AGC, o áudio é transmitido e recebido no mesmo nível de áudio/decibéis. Esta seleção se aplica ao Perfil do rádio atual.

**AVISO:**

(Se o usuário definir o Nível de configuração de áudio como **Básico**). Quando ativado, o campo Todos os rádios, Equilíbrio analógico/digital de transmissão deve ser definido como **Todos os rádios**, e o Equilíbrio analógico/digital de transmissão no mesmo registro/linha do Perfil de rádio deve ser **Desativado**. Caso contrário, essa seleção será considerada inválida.

(Se você definir o Nível de configuração de áudio como **Aprimorado**). Quando ativado, o campo Todos os rádios, Equilíbrio analógico/digital de transmissão deve ser definido como **Todos os rádios** e o Equilíbrio analógico/digital de transmissão no mesmo registro/linha do Perfil de rádio deve ser **Desativado**. Caso contrário, essa seleção será considerada inválida.

**OBSERVAÇÃO:**

O nível Controle de ganho total Tx (também conhecido como ganho puro) é aplicado antes de o AGC ter ocorrido. Para entrada do microfone abaixo do nível nominal: actual microphone output = microphone input + Tx Gain Control Total.

O nível de Saída de controle de ganho Tx é aplicado depois de o AGC ter ocorrido. A saída de controle de ganho TX implementa um infinito: razão de 1 dB quando a entrada do microfone estiver acima do nível nominal. Ou seja, para qualquer entrada acima do valor nominal, a saída nunca irá acima do nível estabelecido por este parâmetro.

10.49.2.31

AGC Securenet

Este campo permite ativar o AGC (Automatic Gain Control, controle de ganho automático) para ser usado no microfone interno ou externo do rádio.

**AVISO:**

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

Essa seleção se aplica somente enquanto o rádio transmite no modo Securenet. O AGC compensa diferenças de voz e estilo operacional. Como resultado da AGC, o áudio é transmitido e recebido no mesmo nível de áudio/decibéis. Esta seleção se aplica ao Perfil do rádio atual.

**INFORMAÇÕES:**

O nível Controle de ganho total Tx (também conhecido como ganho puro) é aplicado antes de o AGC ter ocorrido. Para entrada do microfone abaixo do nível nominal: actual microphone output = microphone input + Tx Gain Control Total.

O nível de Saída de controle de ganho Tx é aplicado depois de o AGC ter ocorrido. A saída de controle de ganho TX implementa um infinito: razão de 1 dB quando a entrada do microfone estiver acima do nível nominal. Ou seja, para qualquer entrada acima do valor nominal, a saída nunca irá acima do nível estabelecido por este parâmetro.

Acessado apenas: Quando o rádio está habilitado para o modelo/para a opção.

10.49.2.32

AGC Securenet (Acessório)

Ativa o controle automático de ganho (AGC) para ser usado para microfone interno ou externo do rádio.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

Essa seleção se aplica somente enquanto o rádio transmite no modo Securenet. O AGC compensa diferenças de voz e estilo operacional. Como resultado da AGC, o áudio é transmitido e recebido no mesmo nível de áudio/decibéis. Esta seleção se aplica ao Perfil do rádio atual.

OBSERVAÇÃO:

O nível Controle de ganho total Tx (também conhecido como ganho puro) é aplicado antes de o AGC ter ocorrido. Para entrada do microfone abaixo do nível nominal: actual microphone output = microphone input + Tx Gain Control Total.

O nível de Saída de controle de ganho Tx é aplicado depois de o AGC ter ocorrido. A saída de controle de ganho TX implementa um infinito: razão de 1 dB quando a entrada do microfone estiver acima do nível nominal. Ou seja, para qualquer entrada acima do valor nominal, a saída nunca irá acima do nível estabelecido por este parâmetro.

Acessado apenas: Quando o rádio é compatível com o modelo/opção.

10.49.2.33

Saída de Controle de Ganho AGC (Rádio)

Seleciona ganho para microfones do rádio para aumento (valores positivos), diminuição (valores negativos), ou permanecer no mesmo (0).

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

O nível de Saída de controle de ganho AGC é aplicado depois da ocorrência do AGC (Automatic Gain Control, controle de ganho automático). A Saída de controle de ganho AGC implementa um infinito: razão de 1 dB quando a entrada do microfone estiver acima do nível nominal. Ou seja, para qualquer entrada acima do valor nominal, a saída nunca irá acima do nível estabelecido por este parâmetro. Esta seleção se aplica ao Perfil do rádio atual.

OBSERVAÇÃO:

Se o usuário configurar o Nível de Configuração do Áudio como **Básico**, então o campo de Saída de Controle de Ganho AGC (Acessório) será somente leitura (exceto apenas para rádios APX3000).

Para rádios que não são APX3000, o valor do Controle de ganho total AGC (Acessório) é sincronizado na Saída de controle de ganho AGC (Rádio).

Para rádios APX3000, o valor do Controle de ganho total AGC (Acessório) é sincronizado para a Saída de controle de ganho AGC (Rádio).

A Saída de controle de ganho AGC é aplicada a qualquer um dos campos AGC ativados pelo RadioCentral.

Acessado apenas:

(Se o usuário definir o Nível de Configuração do Áudio como **Básico**). Quando um dos campos de ativação do AGC estiver ativado, esse campo ficará ativado; ou

(Se o usuário configurar o Nível de Configuração do Áudio como **Aperfeiçoado**). Quando um dos campos de ativação de AGC (Rádio) estiver ativado, o campo de Saída de Controle de Ganho AGC

(Rádio) será ativado. Quando qualquer um dos campos AGC (Acessório) estiver ativado, o campo de Saída de controle de ganho AGC (Acessório) será ativado.

Acima 321: Alcance

Mínimo	Máximo	Incrementos
-12 decibéis	12 decibéis	3 decibéis

10.49.2.34

Saída de Controle de Ganho AGC (Acessório)

Seleciona ganho para microfones do rádio para aumento (valores positivos), diminuição (valores negativos), ou permanecer no mesmo ("0").

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

O nível de Saída de controle de ganho AGC é aplicado depois da ocorrência do AGC (Automatic Gain Control, controle de ganho automático). A Saída de controle de ganho AGC implementa um infinito: razão de 1 dB quando a entrada do microfone estiver acima do nível nominal. Ou seja, para qualquer entrada acima do valor nominal, a saída nunca irá acima do nível estabelecido por este parâmetro. Esta seleção se aplica ao Perfil do rádio atual.

OBSERVAÇÃO:

Se o usuário configurar o Nível de Configuração do Áudio como **Básico**, então o campo de Saída de Controle de Ganho AGC (Acessório) será somente leitura (exceto apenas para rádios APX3000).

Para rádios que não são APX3000, o valor do Controle de ganho total AGC (Acessório) é sincronizado na Saída de controle de ganho AGC (Rádio).

Para rádios APX3000, o valor do Controle de ganho total AGC (Acessório) é sincronizado para a Saída de controle de ganho AGC (Rádio).

A Saída de controle de ganho AGC é aplicada a qualquer um dos campos AGC ativados pelo RadioCentral.

Acessado apenas:

(Se o usuário configurar o Nível de Configuração do Áudio como **Básico**). Quando um dos campos AGC estiver ativado, esse campo fica ativado; ou

(Se o usuário configurar o Nível de Configuração do Áudio como **Aperfeiçoado**). Quando um dos campos de ativação de AGC (Rádio) estiver ativado, o campo de Saída de Controle de Ganho AGC (Rádio) será ativado. Quando qualquer um dos campos AGC (Acessório) estiver ativado, o campo de Saída de controle de ganho AGC (Acessório) será ativado.

Acima 322: Alcance

Mínimo	Máximo	Incrementos
-12 decibéis	12 decibéis	3 decibéis

10.49.2.35

Controle de Ganho Total AGC (Rádio)

Seleciona ganho para microfones do rádio para aumento (valores positivos), diminuição (valores negativos), ou permanecer o mesmo (0) para o Perfil de rádio atual.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

O nível de Controle de ganho total AGC (também conhecido como ganho puro) é aplicado antes da ocorrência do AGC (Controle de ganho automático). Para entrada do microfone abaixo do nível nominal: saída real do microfone = entrada do microfone + Controle de ganho total AGC.

OBSERVAÇÃO:

Se o usuário definir o Nível de Configuração do Áudio como **Básico**, então o campo de Controle de Ganho Total AGC (Acessório) será somente leitura (exceto apenas para rádios APX3000).

Para rádios que não são APX3000, o valor do Controle de ganho total AGC (Acessório) é sincronizado no Controle de ganho total AGC (Rádio).

Para rádios APX3000, o valor do Controle de ganho total AGC (Acessório) é sincronizado para o Controle de ganho total AGC (Rádio).

Existem valores de Controle de ganho total AGC separados para cada um dos campos ativados pelo RadioCentral.

Acessado apenas:

(Se o usuário definir o Nível de Configuração do Áudio como **Básico**). Quando um dos campos de ativação do AGC estiver ativado, esse campo ficará ativado; ou

(Se o usuário definir o Nível de Configuração do Áudio como **Aperfeiçoado**). Quando um dos campos de ativação de AGC (Rádio) estiver ativado, o campo de Controle de Ganho Total AGC (Rádio) será ativado. Quando qualquer um dos campos AGC (Acessório) estiver ativado, o campo de Controle de ganho total AGC (Acessório) será ativado.

A tabela a seguir lista os valores mínimos e máximos para a Saída de Controle de Ganho AGC, bem como cliques de áudio de amostra quando você inserir valores específicos.

Acima 323: Alcance

Mínimo	Máximo	Incrementos
-12 decibéis	12 decibéis	3 decibéis

10.49.2.36

Controle de Ganho Total AGC (Acessório)

Seleciona ganho para microfones do rádio para aumento (valores positivos), diminuição (valores negativos), ou permanecer o mesmo (0) para o Perfil de rádio atual.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

O nível de Controle de ganho total AGC (também conhecido como ganho puro) é aplicado antes da ocorrência do AGC (Controle de ganho automático). Para entrada do microfone abaixo do nível nominal: saída real do microfone = entrada do microfone + Controle de ganho total AGC.

OBSERVAÇÃO:

Se o usuário definir o Nível de Configuração do Áudio como **Básico**, então o campo de Controle de Ganho Total AGC (Acessório) será somente leitura (exceto apenas para rádios APX3000).

Para rádios que não são APX3000, o valor do Controle de ganho total AGC (Acessório) é sincronizado no Controle de ganho total AGC (Rádio).

Para rádios APX3000, o valor do Controle de ganho total AGC (Acessório) é sincronizado para o Controle de ganho total AGC (Rádio).

Existem valores de Controle de ganho total AGC separados para cada um dos campos ativados pelo RadioCentral.

Acessado apenas:

(Se o usuário definir o Nível de Configuração do Áudio como **Básico**). Quando um dos campos de ativação do AGC estiver ativado, esse campo ficará ativado; ou

(Se o usuário definir o Nível de Configuração do Áudio como **Aperfeiçoado**). Quando um dos campos de ativação de AGC (Rádio) estiver ativado, o campo de Controle de Ganho Total AGC (Rádio) será ativado. Quando qualquer um dos campos AGC (Acessório) estiver ativado, o campo de Controle de ganho total AGC (Acessório) será ativado.

10.49.2.43

Balanco digital/analógico

Este campo permite que o nível da transmissão de áudio seja equalizado ou equilibrado quando houver a alternância entre analógico e digital e vice-versa, com base no perfil de rádio.

A tabela a seguir relaciona as seleções e o clipe de áudio de amostra para o balanço analógico/digital.

A seleção está **desativada** ou **ativada**.

AVISO:

(Se você definir o Nível de configuração do áudio como **Básico**). Quando este campo estiver habilitado, o AGC digital (tanto rádio como acessório) e o AGC analógico (tanto rádio como acessório) no mesmo registro/linha do perfil de rádio deverão estar todos em **Desativados**; caso contrário, essa seleção será considerada inválida.

(Se você definir o Nível de configuração do áudio como **Aprimorado**). Quando o campo Balanço digital/analógico (rádio) estiver habilitado, o AGC digital (rádio) e o AGC analógico (rádio) no mesmo registro/linha do perfil de rádio deverão estar todos em **Desativados**; caso contrário, essa seleção será considerada inválida.

(Se você definir o Nível de configuração de áudio como **Aprimorado**). Quando o campo Balanço digital/analógico (acessório) estiver habilitado, o AGC digital (acessório) e o AGC analógico (acessório) no mesmo registro/linha do perfil de rádio deverão estar todos em **Desativados**; caso contrário, essa seleção será considerada inválida.

OBSERVAÇÃO:

Se você definir o Nível de configuração do áudio como **Básico**). Quando o campo Balanço digital/analógico (acessório) será somente leitura (exceto para rádios APX3000).

Nos rádios que não são APX3000, o valor do balanço digital/analógico (acessório) é sincronizado com o balanço digital/analógico (rádio).

Nos rádios APX3000, o valor do balanço digital/analógico (acessório) é sincronizado com o balanço digital/analógico (rádio).

O Total do controle de ganho AGC é aplicado a qualquer um dos campos AGC ativados pelo RadioCentral.

Acessado apenas:

(Se o campo Nível de configuração do áudio estiver definido como **Básico**). Quando qualquer um dos campos de ativação de AGC estiver habilitado, os campos Balanço digital/analógico serão habilitados; ou

(Se o campo Nível de configuração do áudio estiver definido como **Aprimorado**). Quando um dos campos de ativação de AGC (rádio) estiver habilitado, os campos Balanço digital/analógico serão habilitados. Quando qualquer um dos campos AGC (acessório) estiver habilitado, o campo Balanço digital/analógico (acessório) será habilitado; ou

Quando o campo Todos os rádios, Balanço digital/analógico estiver definido como **Por perfil**.

10.49.2.44

Equilíbrio digital/analógico (Acessório)

Permite que o nível da transmissão de áudio seja equalizado ou equilibrado ao alternar entre analógico e digital e vice-versa, com base no perfil de rádio.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

A seleção está **desativada** ou **ativada**.

AVISO:

(Se o usuário configurar o Nível de Configuração do Áudio como **Básico**). Quando esse campo estiver ativado, o AGC Digital (tanto Rádio como Acessório) e o AGC Analógico (tanto Rádio como Acessório) no mesmo registro/linha do Perfil do Rádio devem estar **Desativados**, caso contrário, essa seleção será considerada inválida.

(Se o usuário configurar o Nível de Configuração do Áudio como **Aperfeiçoado**). Quando o campo Balanço Digital/Analógico (Rádio) estiver ativado, o AGC Digital (Rádio) e o AGC Analógico (Rádio) no mesmo registro/linha do Perfil do Rádio devem estar **Desativados**, caso contrário, essa seleção será considerada inválida.

(Se o usuário configurar o Nível de Configuração do Áudio como **Aperfeiçoado**). Quando o campo Balanço Analógico / Digital (Acessório) estiver ativado, o AGC Digital (Acessório) e o AGC Analógico (Acessório) no mesmo registro/linha do Perfil do Rádio devem estar **Desativados**, caso contrário, essa seleção será considerada inválida.

OBSERVAÇÃO:

Se o usuário configurar o Nível de Configuração do Áudio como **Básico**, então o campo Balanço Analógico / Digital (Acessório) será somente leitura (exceto apenas para rádios APX3000).

Para os rádios que não são APX3000, o valor do Balanço Analógico / Digital (Acessório) é sincronizado a partir do Balanço Digital/Analógico (Rádio).

Para os rádios APX3000, o valor do Balanço Digital/Analógico (Acessório) é sincronizado para o Balanço Digital/Analógico (Rádio).

O Total do controle de ganho AGC é aplicado a qualquer um dos campos AGC ativados pelo RadioCentral.

Acessado apenas:

(Se o Nível de Configuração do Áudio estiver definido como **Básico**). Quando qualquer um dos campos de habilitação de AGC estiver ativado, os campos de Balanço Digital / Analógico são ativados; ou

(Se o Nível de Configuração do Áudio estiver configurado como **Aperfeiçoado**). Quando um dos campos de habilitação de AGC (Rádio) estiver ativado, os campos de Balanço Digital/Analógico são ativados. Quando qualquer um dos campos AGC (Acessório) estiver ativado, o campo Balanço Digital/ Analógico (Acessório) será ativado; ou

Quando o campo Todos os rádios, Balanço digital/analógico estiver definido como **Por perfil**.

10.49.2.45

Configurações de grupo (rádio)

O objetivo deste campo é predefinir um conjunto de valor para os campos da Seção Equalização de Áudio no Grupo de Microfone / Configurações TX.

Quando o valor **Personalizado** da Configuração de grupo for alterado, os valores dos campos dessa seção serão alterados de acordo. Todos os campos devem se tornar Não editáveis quando a configuração de grupo não estiver definida como **Personalizada**.

OBSERVAÇÃO:

Quanto à configuração **Personalizado** é altamente recomendável evitar configurações máximas para as mesmas bandas de frequência entre as equalizações de microfone e alto-falante.

A seguir estão as seleções e definições para as Configurações de Grupo de Equalização de Áudio (rádio) e Configurações de Grupo de Equalização de Áudio (Acessório) no Grupo de Microfone / Configurações TX.

Normal

A Banda de baixa frequência é **0**, a Banda de média frequência é **0** e a Banda de alta frequência é **0**.

Reforço de agudos

A Banda de baixa frequência é **0**, a Banda de média frequência é **0** e a Banda de alta frequência é **6**.

Low Cut

A Banda de baixa frequência é **-9**, a Banda de média frequência é **0** e a Banda de alta frequência é **0**.

XTS

A Banda de baixa frequência é **-3**, a Banda de média frequência é **0** e a Banda de alta frequência é **6**.

Personalizada

Use a opção Personalizado para definir individualmente configurações exclusivas de ganho de equalização de áudio do alto-falante do rádio que não são compatíveis com outras opções do menu Configuração de grupo. É altamente recomendável evitar configurações máximas para as mesmas bandas de frequência entre as equalizações de microfone e alto-falante.

10.49.2.46

Configuração do grupo (acessório)

O objetivo deste campo é predefinir um conjunto de valor para os campos da Seção Equalização de Áudio no Grupo de Microfone / Configurações TX.

Quando o valor **Personalizado** da Configuração de grupo for alterado, os valores dos campos dessa seção serão alterados de acordo. Todos os campos devem se tornar Não editáveis quando a configuração de grupo não estiver definida como **Personalizada**.

**OBSERVAÇÃO:**

Quanto à configuração **Personalizado** é altamente recomendável evitar configurações máximas para as mesmas bandas de frequência entre as equalizações de microfone e alto-falante.

A seguir estão as seleções e definições para as Configurações de Grupo de Equalização de Áudio (rádio) e Configurações de Grupo de Equalização de Áudio (Acessório) no Grupo de Microfone / Configurações TX.

Normal

A Banda de Baixa Frequência é **0**, a Banda de Média Frequência é **0** e a Banda de Alta Frequência é **0**.

Reforço de agudos

A Banda de baixa frequência é **0**, a Banda de média frequência é **0** e a Banda de alta frequência é **6**.

Low Cut

A Banda de baixa frequência é **-9**, a Banda de média frequência é **0** e a Banda de alta frequência é **0**.

XTS

A Banda de baixa frequência é **-3**, a Banda de média frequência é **0** e a Banda de alta frequência é **6**.

Personalizada

Use a opção Personalizado para definir individualmente configurações exclusivas de ganho de equalização de áudio do alto-falante do rádio que não são compatíveis com outras opções do menu Configuração de grupo. É altamente recomendável evitar configurações máximas para as mesmas bandas de frequência entre as equalizações de microfone e alto-falante.

Acima 335: Alcance

Mínimo	Máximo
-12	12

10.49.2.52

Banda de Alta Frequência (Acessório)

Seleciona o nível de som das chamadas transmitidas em um ambiente Analógico/Digital/Securenet.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

Esta seleção se aplica ao Perfil do rádio atual.

As seleções a seguir são compatíveis:

Acima 336: Alcance

Mínimo	Máximo
-12	12

10.49.2.53

Controle de volume: Volume de áudio máximo

Seleciona o maior nível possível do volume da recepção de voz do rádio.

O nível de volume da recepção de voz do rádio nunca ultrapassará o nível selecionado.

OBSERVAÇÃO:

Veja também a definição do campo Compensação de tom no ajuste de volume. Esta seleção se aplica ao Perfil do rádio atual.

AVISO:

Esta configuração deve ser maior que a configuração Volume mínimo do áudio ou ambos os campos se tornarão inválidos.

INFORMAÇÃO IMPORTANTE PARA AS CONFIGURAÇÕES DE FONE DE OUVIDO DE CAPACETE DE MOTOCICLETA: ATENÇÃO: Se o rádio do usuário estiver sendo usado com o fone de ouvido de capacete de motocicleta, não defina o rádio no nível mais alto possível do volume de recepção de voz. Para evitar possíveis danos à audição do usuário, será necessário reduzir o valor do nível de volume de recepção de voz para um máximo de 130.

INFORMAÇÃO IMPORTANTE AO USAR KITS DE ÁUDIO DE VIGILÂNCIA IMPRES: RLN5882, RLN5883, RLN5886, RLN6483, RLN6484, PMLN5111, PMLN5112, PMLN6123, PMLN6124, PMLN6129, PMLN6130 e o KIT DE BAIXO RUÍDO RLN5886: ATENÇÃO: Se o rádio APX do usuário estiver sendo usado com os acessórios de áudio citados acima, não defina o nível mais alto possível do volume de recepção de voz. Para evitar possíveis danos à audição do usuário, será necessário reduzir o valor do nível de volume de recepção de voz para um máximo de 160.

INFORMAÇÕES:

Para ter o Volume Máximo do rádio em um nível constante, mais alto ou mais baixo do que o volume máximo de recepção de voz do rádio (definido nesse campo), você deve usar o recurso Diferença de Volume (dB).

Quando o recurso Diferença de volume (dB) é definido como "0" (zero), o rádio sempre usa a configuração Volume máximo do áudio para esse Volume máximo, independentemente da configuração do campo Volume do tom de alerta máximo.

As seleções a seguir são compatíveis:

Acima 337: Alcance

Mínimo	Máximo
1	255

OBSERVAÇÃO:

5 = 1 decibel (dB)

10.49.2.54

Controle de volume: Volume de áudio mínimo

Seleciona o nível de áudio mínimo Rx (recepção) do rádio.

O nível de volume do rádio nunca cai abaixo desse nível, mesmo quando o usuário do rádio define o controle de volume do rádio como **0** (Zero). Veja também a definição do campo Compensação de tom no ajuste de volume. Esta seleção se aplica ao Perfil do rádio atual.

**AVISO:**

Esta configuração deve ser mais baixa que a configuração Volume máximo de áudio ou ambos os campos serão inválidos.

**INFORMAÇÕES:**

Para ter o Volume Mínimo do rádio em um nível constante, mais alto ou mais baixo do que o volume mínimo de recepção de voz do rádio (definido nesse campo), o usuário deve usar o recurso Diferença de Volume (dB).

Quando o recurso Diferença de Volume (dB) está definido como **0** (zero), o rádio sempre usa a configuração Volume mínimo do áudio para o Volume mínimo, independentemente da configuração do campo Volume mínimo.

10.49.2.55**Desvio do volume do tom de alerta (dB)**

Seleciona o valor em decibéis (dB) que aumenta ou diminui o volume de um tom de alerta em comparação volume do áudio de recepção selecionado pelo usuário do rádio.

Veja também a definição do campo Compensação de tom no ajuste de volume. Esta seleção se aplica ao Perfil do rádio atual.

Quando um volume de tons de alerta mais alto ou mais baixo é desejado: Defina o campo Volume máximo e o campo Volume máximo de áudio com o mesmo valor, e defina o campo Volume mínimo e o campo Volume mínimo de áudio com o mesmo valor, depois use esta configuração de Desvio do volume do tom de alerta para ficar com os tons de alerta do rádio a um nível constante maior ou menor do que o volume da voz de recepção do rádio.

**INFORMAÇÕES:**

Quando esse campo Desvio do volume do tom de alerta é definido como **0** (zero):
O rádio sempre usa a configuração Volume máximo de áudio para Volume máximo, independentemente da configuração do campo Volume máximo do tom de alerta.

O rádio sempre usa a configuração Volume mínimo de áudio para Volume mínimo, independentemente da configuração do campo Volume mínimo do tom de alerta.

Acessado apenas: Quando o campo Tons de alerta estiver definido como **Ativado**.

As seleções a seguir são compatíveis:

Acima 338: Alcance

Mínimo	Máximo	Incrementos
-26 decibéis	25 decibéis	1 decibéis

10.49.2.56**Volume do tom de alerta mínimo**

Seleciona o nível mínimo de recepção de tom de alerta, independentemente do quanto o usuário do rádio pode ajustar o volume baixo.

Veja também a definição do campo Compensação de tom no ajuste de volume. Esta seleção se aplica ao Perfil do rádio atual.

**AVISO:**

Esta configuração deve ser mais baixa que a configuração Volume máximo ou ambos os campos serão inválidos.

**INFORMAÇÕES:**

Para ter o Volume Mínimo do rádio (definido nesse campo) a um nível constante, mais alto ou mais baixo que o volume mínimo de voz de recepção do rádio (definido no campo Volume Mínimo do Áudio), o usuário deve usar o recurso Diferença de Volume (dB).

Quando o recurso Diferença de Volume (dB) é definido como "0" (zero), o rádio sempre usa a configuração Volume Mínimo do Áudio para esse Volume Mínimo, independentemente da configuração do campo Volume Mínimo.

Acessado apenas: Quando o campo Tons de alerta estiver definido como **Ativado**.

As seleções a seguir são compatíveis:

Acima 339: Alcance

Mínimo	Máximo
0	200

10.49.2.57

Volume do tom de alerta máximo

Seleciona o nível mais alto possível do volume de tom de alerta do rádio. A configuração do campo Diferença de volume (dB) pode substituir esta configuração.

Veja também a definição do campo Compensação de tom no ajuste de volume. Esta seleção se aplica ao Perfil do rádio atual.

**AVISO:**

Esta configuração deve ser maior que a configuração de Volume mínimo ou ambos os campos serão inválidos.

**OBSERVAÇÃO:**

Para ter o Volume Máximo do rádio (definido nesse campo) a um nível constante, mais alto ou mais baixo que o volume de voz de recepção do rádio (definido no campo Volume Máximo do Áudio), o usuário deve usar o recurso Diferença de Volume (dB).

Quando o recurso Diferença de volume (dB) é definido como **0** (zero), o rádio sempre usa a configuração de Volume máximo do áudio para esse Volume máximo, independentemente da configuração do campo Volume máximo.

As seleções a seguir são compatíveis:

Acima 340: Alcance

Mínimo	Máximo
0	255

**OBSERVAÇÃO:**

5 = 1 decibel (dB)

10.49.2.58

Configurações de grupo (rádio)

O objetivo deste campo é predefinir um conjunto de valor para os campos da Seção Equalização de Áudio no Grupo de Alto-falante / Configurações RX.

Quando o valor **Personalizado** da Configuração de grupo for alterado, os valores dos campos dessa seção serão alterados de acordo. Quando o valor da configuração de grupo não for definido como **Personalizado**, todos os campos serão somente para visualização.

As seleções a seguir listam as seleções e definições para as Configurações de Grupo de Equalização de Áudio (rádio) e Configuração de Grupo de Equalização de Áudio (Acessório) no Grupo de Alto-falante / Configurações RX.

Normal

O valor dos campos a seguir é definido como: [Banda de Baixa Frequência Analógica \(Acessório\) na página 728](#) é **0**, [Banda de Média Frequência Analógica \(Acessório\) na página 728](#) é **0**, [Banda de Alta Frequência Analógica \(Acessório\) na página 729](#) é **0**, a Banda de Baixa Frequência Digital é **0**, a Banda de Média Frequência Digital é **0**, a Banda de Alta Frequência Digital é **0**, a Banda de Baixa Frequência Securenet é **0**, a Banda de Média Frequência Securenet é **0** e a Banda de Alta Frequência Securenet é **0**.

Reforço de agudos

O valor dos campos a seguir é definido como: [Banda de Baixa Frequência Analógica \(Acessório\) na página 728](#) é **0**, [Banda de Média Frequência Analógica \(Acessório\) na página 728](#) é **0**, [Banda de Alta Frequência Analógica \(Acessório\) na página 729](#) é **6**, a Banda de Baixa Frequência Digital é **0**, a Banda de Média Frequência Digital é **0**, a Banda de Alta Frequência Digital é **6**, a Banda de Baixa Frequência Securenet é **0**, a Banda de Média Frequência Securenet é **0** e a Banda de Alta Frequência SecureNet é **6**.

Low Cut

O valor dos campos a seguir é definido como: [Banda de Baixa Frequência Analógica \(Acessório\) na página 728](#) é **-9**, [Banda de Média Frequência Analógica \(Acessório\) na página 728](#) é **0**, [Banda de Alta Frequência Analógica \(Acessório\) na página 729](#) é **0**, a Banda de Baixa Frequência Digital é **-9**, a Banda de Média Frequência Digital é **0**, a Banda de Alta Frequência Digital é **0**, a Banda de Baixa Frequência Securenet **-9**, a Banda de Média Frequência Securenet **0** e a Banda de Alta Frequência Securenet é **0**.

Reduzir retorno

O valor dos campos a seguir é definido como: [Banda de Baixa Frequência Analógica \(Acessório\) na página 728](#) é **-6**, [Banda de Média Frequência Analógica \(Acessório\) na página 728](#) é **0**, [Banda de Alta Frequência Analógica \(Acessório\) na página 729](#) é **-6**, a Banda de Baixa Frequência Digital é **-6**, a Banda de Média Frequência Digital é **0**, a Banda de Alta Frequência Digital é **-6**, a Banda de Baixa Frequência Securenet é **-6**, a Banda de Média Frequência Securenet é **0** e a Banda de Alta Frequência Securenet é **-6**.

Personalizada

Use a opção Personalizado para definir individualmente configurações exclusivas de ganho de equalização de áudio do alto-falante do rádio que não são compatíveis com outras opções do menu Configuração de grupo. É altamente recomendável evitar configurações máximas para as mesmas bandas de frequência entre as equalizações de microfone e alto-falante.

10.49.2.59

Configuração do grupo (acessório)

O objetivo deste campo é predefinir um conjunto de valor para os campos da Seção Equalização de Áudio no Grupo de Alto-falante / Configurações RX.

Quando o valor **Personalizado** da Configuração de grupo for alterado, os valores dos campos dessa seção serão alterados de acordo. Quando o valor da configuração de grupo não for definido como **Personalizado**, todos os campos serão somente para visualização.

As seleções a seguir listam as seleções e definições para as Configurações de Grupo de Equalização de Áudio (rádio) e Configuração de Grupo de Equalização de Áudio (Acessório) no Grupo de Alto-falante / Configurações RX.

Normal

O valor dos campos a seguir é definido como: [Banda de Baixa Frequência Analógica \(Acessório\) na página 728](#) é **0**, [Banda de Média Frequência Analógica \(Acessório\) na página 728](#) é **0**, [Banda de Alta Frequência Analógica \(Acessório\) na página 729](#) é **0**, [Banda de Baixa Frequência Digital \(Acessório\) na página 730](#) é **0**, [Banda de Média Frequência Digital \(Acessório\) na página 731](#) é **0**, [Banda de Alta Frequência Digital \(Acessório\) na página 731](#) é **0**, a Banda de Baixa Frequência Securenet é **0**, a Banda de Média Frequência Securenet é **0** e [Banda de Alta Frequência Securenet \(Rádio\) na página 733](#) é **0**.

Reforço de agudos

10.49.2.64

Banda de alta frequência analógica

Esse campo seleciona o nível de som das chamadas recebidas em um ambiente analógico.

Esta seleção se aplica ao Perfil do rádio atual.

OBSERVAÇÃO:

Se você configurar o Nível de configuração de áudio como **Básico**, então o campo da Banda de alta frequência analógica (acessório) será somente leitura (exceto para rádios APX3000).

Para os rádios que não são APX3000, o valor da Banda de alta frequência analógica (acessório) é sincronizado a partir da Banda de alta frequência analógica (rádio).

Para os rádios APX3000, o valor da Banda de alta frequência analógica (acessório) é sincronizado de acordo com a Banda de alta frequência analógica (rádio).

Acessado apenas:

(Se você definir o Nível de configuração do áudio como **Básico**). Quando um dos campos AGC estiver habilitado, este campo será habilitado; ou

(Se você configurar o Nível de configuração de Áudio como **Aperfeiçoado**). Quando um dos campos AGC (rádio) estiver ativado, o campo da Banda de alta frequência analógica (rádio) será ativado. Quando qualquer um dos campos AGC (Acessório) estiver habilitado, o campo da Banda de alta frequência digital (Acessório) será habilitado.

As seleções a seguir são compatíveis:

10.49.2.80

Saída de Controle de Ganho AGC (Rádio)

Seleciona ganho para microfones do rádio para aumento (valores positivos), diminuição (valores negativos), ou permanecer no mesmo (0).

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

O nível de Saída de controle de ganho AGC é aplicado depois da ocorrência do AGC (Automatic Gain Control, controle de ganho automático). A Saída de controle de ganho AGC implementa um infinito: razão de 1 dB quando a entrada do microfone estiver acima do nível nominal. Ou seja, para qualquer entrada acima do valor nominal, a saída nunca irá acima do nível estabelecido por este parâmetro. Esta seleção se aplica ao Perfil do rádio atual.

OBSERVAÇÃO:

Se o usuário configurar o Nível de Configuração do Áudio como **Básico**, então o campo de Saída de Controle de Ganho AGC (Acessório) será somente leitura (exceto apenas para rádios APX3000).

Para rádios que não são APX3000, o valor do Controle de ganho total AGC (Acessório) é sincronizado na Saída de controle de ganho AGC (Rádio).

Para rádios APX3000, o valor do Controle de ganho total AGC (Acessório) é sincronizado para a Saída de controle de ganho AGC (Rádio).

A Saída de controle de ganho AGC é aplicada a qualquer um dos campos AGC ativados pelo RadioCentral.

Acessado apenas:

(Se o usuário definir o Nível de Configuração do Áudio como **Básico**). Quando um dos campos de ativação do AGC estiver ativado, esse campo ficará ativado; ou

(Se o usuário configurar o Nível de Configuração do Áudio como **Aperfeiçoado**). Quando um dos campos de ativação de AGC (Rádio) estiver ativado, o campo de Saída de Controle de Ganho AGC (Rádio) será ativado. Quando qualquer um dos campos AGC (Acessório) estiver ativado, o campo de Saída de controle de ganho AGC (Acessório) será ativado.

10.49.2.81

Saída de Controle de Ganho AGC (Acessório)

Seleciona ganho para microfones do rádio para aumento (valores positivos), diminuição (valores negativos), ou permanecer no mesmo ("0").

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

O nível de Saída de controle de ganho AGC é aplicado depois da ocorrência do AGC (Automatic Gain Control, controle de ganho automático). A Saída de controle de ganho AGC implementa um infinito: razão de 1 dB quando a entrada do microfone estiver acima do nível nominal. Ou seja, para qualquer entrada acima do valor nominal, a saída nunca irá acima do nível estabelecido por este parâmetro. Esta seleção se aplica ao Perfil do rádio atual.

10.49.2.82

Controle de Ganho Total AGC (Rádio)

Seleciona ganho para microfones do rádio para aumento (valores positivos), diminuição (valores negativos), ou permanecer o mesmo (0) para o Perfil de rádio atual.

AVISO:

O valor neste campo deve ser modificado somente por uma equipe de serviço qualificada. Configurações inadequadas podem causar resultados imprevisíveis no rádio.

O nível de Controle de ganho total AGC (também conhecido como ganho puro) é aplicado antes da ocorrência do AGC (Controle de ganho automático). Para entrada do microfone abaixo do nível nominal: saída real do microfone = entrada do microfone + Controle de ganho total AGC.

OBSERVAÇÃO:

Se o usuário definir o Nível de Configuração do Áudio como **Básico**, então o campo de Controle de Ganho Total AGC (Acessório) será somente leitura (exceto apenas para rádios APX3000).

Para rádios que não são APX3000, o valor do Controle de ganho total AGC (Acessório) é sincronizado no Controle de ganho total AGC (Rádio).

Para rádios APX3000, o valor do Controle de ganho total AGC (Acessório) é sincronizado para o Controle de ganho total AGC (Rádio).

Existem valores de Controle de ganho total AGC separados para cada um dos campos ativados pelo RadioCentral.

Acessado apenas:

(Se o usuário definir o Nível de Configuração do Áudio como **Básico**). Quando um dos campos de ativação do AGC estiver ativado, esse campo ficará ativado; ou

(Se o usuário definir o Nível de Configuração do Áudio como **Aperfeiçoado**). Quando um dos campos de ativação de AGC (Rádio) estiver ativado, o campo de Controle de Ganho Total AGC (Rádio) será ativado. Quando qualquer um dos campos AGC (Acessório) estiver ativado, o campo de Controle de ganho total AGC (Acessório) será ativado.

A tabela a seguir lista os valores mínimos e máximos para a Saída de Controle de Ganho AGC, bem como cliques de áudio de amostra quando você inserir valores específicos.

Acima 361: Alcance

10.49.2.84

Supressão de retorno acústico

Quando ativada, a supressão de retorno acústico suprime o retorno ou o ruído que resulta de rádios estarem em uma chamada enquanto próximos uns dos outros.

Esse recurso é compatível com os seguintes modelos de acessórios para os seguintes rádios:

Acima 363: Modelos de acessórios compatíveis com supressão de retorno acústico

Rádios	Modelos de acessórios
APX NEXT	XV, XVP850, XVP830, XVE500, XVN500
APX N30	XVP730, XVP750, RM760, RM780
APX N50	
APX N70	

A supressão de retorno acústico não é compatível com o modo de sinalização Securenet, acessórios de áudio sem fio ou ambos.

Para obter o desempenho ideal da supressão de retorno acústico, é recomendável selecionar **Normal** como a configuração de Grupo para equalização de áudio do microfone e do alto-falante. Aplique a configuração normal de Grupo recomendada para as configurações de rádio e acessório. Não

selecione a **configuração personalizada de Grupo** para o controle de ganho nas configurações de alto-falante para a configuração de acessório.
