Intellectual Property and Regulatory Notices

Copyrights

The Motorola Solutions products described in this document may include copyrighted Motorola Solutions computer programs. Laws in the United States and other countries preserve for Motorola Solutions certain exclusive rights for copyrighted computer programs. Accordingly, any copyrighted Motorola Solutions computer programs contained in the Motorola Solutions products described in this document may not be copied or reproduced in any manner without the express written permission of Motorola Solutions.

No part of this document may be reproduced, transmitted, stored in a retrieval system, or translated into any language or computer language, in any form or by any means, without the prior written permission of Motorola Solutions, Inc.

Trademarks

MOTOROLA, MOTO, MOTOROLA SOLUTIONS, and the Stylized M Logo are trademarks or registered trademarks of Motorola Trademark Holdings, LLC and are used under license. All other trademarks are the property of their respective owners.

License Rights

The purchase of Motorola Solutions products shall not be deemed to grant either directly or by implication, estoppel or otherwise, any license under the copyrights, patents or patent applications of Motorola Solutions, except for the normal non-exclusive, royalty-free license to use that arises by operation of law in the sale of a product.

Open Source Content

This product may contain Open Source software used under license. Refer to the product installation media for full Open Source Legal Notices and Attribution content.

European Union (EU) and United Kingdom (UK) Waste of Electrical and Electronic Equipment (WEEE) Directive

The European Union's WEEE directive and the UK's WEEE regulation require that products sold into EU countries and the UK must have the crossed-out wheeled bin label on the product (or the package in some cases). As defined by the WEEE directive, this crossed-out wheeled bin label means that customers and end-users in EU and UK countries should not dispose of electronic and electrical equipment or accessories in household waste.

Customers or end-users in EU and UK countries should contact their local equipment supplier representative or service centre for information about the waste collection system in their country.

Disclaimer

Please note that certain features, facilities, and capabilities described in this document may not be applicable to or licensed for use on a specific system, or may be dependent upon the characteristics of a specific mobile subscriber unit or configuration of certain parameters. Please refer to your Motorola Solutions contact for further information.

Contact Us

The Centralized Managed Support Operations (CMSO) is the primary contact for technical support included in your organization's service agreement with Motorola Solutions.

Service agreement customers should be sure to call the CMSO in all situations listed under Customer Responsibilities in their agreement, such as:

- To confirm troubleshooting results and analysis before taking action

Your organization received support phone numbers and other contact information appropriate for your geographic region and service agreement. Use that contact information for the most efficient response. However, if needed, you can also find general support contact information on the Motorola Solutions website, by following these steps:

- 1 Enter motorolasolutions.com in your browser.
- 2 Ensure that your organization's country or region is displayed on the page. Clicking or tapping the name of the region provides a way to change it.
- 3 Select "Support" on the motorolasolutions.com page.

Comments

Send questions and comments regarding user documentation to documentation@motorolasolutions.com.

Provide the following information when reporting a documentation error:

- The document title and part number
- The page number or title of the section with the error
- A description of the error

Motorola Solutions offers various courses designed to assist in learning about the system. For information, go to <https://learning.motorolasolutions.com> to view the current course offerings and technology paths.

Contact Us.....	3
Chapter 1: Introduction to RadioCentral.....	43
Chapter 2: User Interface Overview.....	44
2.1 Menu Icons and View Selector.....	44
2.2 Navigation Pane in RadioCentral Configuration Client.....	44
2.3 Programming Pane in RadioCentral Configuration Client.....	45
2.3.1 Operational Buttons in RadioCentral.....	45
2.3.2 Row Selection in RadioCentral.....	45
2.3.3 Arrange and Hide Columns in RadioCentral.....	46
2.4 Information Windows in RadioCentral Configuration Client.....	46
2.4.1 Analyze Results Window.....	46
2.4.2 Analyzing the Radio Configuration.....	47
2.4.3 Tasks Window.....	47
2.4.4 Compare Configurations.....	48
2.4.4.1 Compare Results Window.....	48
2.4.5 Validation Results Window.....	49
2.4.6 Warning Messages Window.....	49
2.4.7 Search Results Window.....	49
2.4.8 User Roles.....	50
2.4.9 Help Window.....	50
Chapter 3: Actions Menu.....	51
3.1 Import Selections.....	51
3.1.1 Importing File to Grid.....	51
3.1.2 Importing Configurations.....	51
3.1.3 Importing Voice Announcements.....	52
3.1.4 Importing CA Certificates Manually.....	52
3.2 Export Window.....	53
3.2.1 Exporting Configuration.....	53
3.2.2 Exporting Grid to File.....	53
3.3 Manage Configurations.....	54
3.4 Manage Data Mining.....	55
3.4.1 Data Mining Query Window.....	56
3.4.2 Adding a Query for Data Mining.....	57
3.4.2.1 Grouping Query Clauses.....	58

3.4.2.2 Deleting a Query Clause.....	59
3.4.3 Deleting a Query from Data Mining.....	59
3.4.4 Grouping Queries in Data Mining.....	60
3.5 Manage License.....	60
3.5.1 Manage Radio Licenses View.....	60
3.5.1.1 Restoring Registered Licenses to Radio.....	62
3.5.1.2 Recovering Radio Licenses.....	62
3.5.1.3 Sorting the Grid in the Radio Licenses View.....	63
3.5.1.4 Filtering Available Radios by Groups.....	63
3.5.2 Register Radio Licenses Window.....	63
3.5.2.1 Running an EID Query.....	64
3.5.2.2 Selecting Multiple Line Items in the EID Table.....	64
3.5.2.3 Submitting Software License Assignment.....	64
3.6 Manage Firmware.....	65
3.7 Manage Voice Announcements.....	65
3.8 Manage CA Certificates.....	66
3.9 Manage System Keys.....	67
3.10 Codeplug Migration.....	68
3.11 Settings Window.....	68
3.11.1 Licenses Settings.....	68

5.1 Radio Groups.....	76
5.1.1 Creating and Managing Radio Groups.....	76
5.2 Radio View Table.....	78
5.3 Radio Details.....	83
Chapter 6: Radio Systems View.....	85
Chapter 7: Data Profile View.....	86
Chapter 8: Job View	88
Chapter 9: RadioCentral Common Tasks.....	90
9.1 Configuring SmartConnect.....	90
9.2 Configuring Radios.....	90
9.3 Converting APX Codeplugs.....	91
9.4 Scheduling Jobs in RadioCentral.....	91
Chapter 10: RadioCentral Sets for Radio.....	93
10.1 Radio Information.....	93

10.1.1	General.....	93
10.1.1.1	Model Number.....	93
10.1.1.2	Maximum Channels.....	93
10.1.1.3	Serial Number.....	93
10.1.1.4	VHF Enable.....	94
10.1.1.5	UHF1 Enable.....	94
10.1.1.6	UHF2 Enable.....	94
10.1.1.7	700 MHz Enable.....	94
10.1.1.8	800 MHz Enable.....	94
10.1.1.9	Regional Governance.....	94
10.1.1.10	Codeplug Version.....	95
10.1.1.11	Firmware Version.....	95
10.1.1.12	Secure Version.....	95
10.1.1.13	Secure Hardware Type.....	95
10.1.1.14	Secure Hardware Version.....	95
10.1.1.15	MAC Address.....	95
10.1.2	Tracking.....	95
10.1.2.1	Last Programmed Time and Date.....	96
10.1.2.2	Last Programmed Source.....	96
10.1.2.3	Original Programmed Time and Date.....	96
10.1.2.4	Original Programmed Codeplug Version.....	96
10.1.2.5	Original Programmed Source.....	96
10.1.3	FLASHport.....	97
10.1.3.1	FLASHcode.....	97
10.1.3.2	Number of Times Flashed.....	97
10.1.3.3	I-Button.....	97
10.1.3.4	Last Upgrade Source.....	97
10.1.3.5	Last FLASHed Time and Date.....	97
10.1.4	Advanced System Key Info.....	98
10.1.4.1	Last Programmed Time and Date.....	98
10.1.4.2	Serial Number.....	98
10.2	Radio Wide.....	98
10.2.1	Set Name.....	99
10.2.2	Last Modified Date.....	99
10.2.3	Comments.....	99
10.2.4	General.....	99
10.2.4.1	Codeplug Alias.....	99
10.2.4.2	Log Dispatch Calls Enable.....	99
10.2.4.3	Ultra Narrow Intermediate Freq Filter.....	99

10.2.4.4	Wi-Fi Regulatory Region.....	100
10.2.4.5	Connection Path.....	100
10.2.5	Alert Tones.....	100
10.2.5.1	Alert Tones.....	100
10.2.5.2	Volume Adjust Tone Offset.....	100
10.2.5.3	Power-Up Self Test Alert Tone.....	100
10.2.5.4	Scan Alert Tone Enable.....	101
10.2.5.5	Call Alert Tone Auto Reset.....	101
10.2.5.6	Enhanced Mute Tones Operation.....	101
10.2.5.7	Out of Range Tone.....	101
10.2.5.8	Talk Prohibit Tone.....	102
10.2.5.9	Low Battery LED.....	102
10.2.5.10	Tx Chirp.....	102
10.2.5.11	Standby Chirp (sec).....	102
10.2.5.12	Smart-Low Battery Alert.....	103
10.2.5.13	PTT Warning Tone.....	103
10.2.5.14	RSM Volume Set Tones.....	103
10.2.6	User Information and Passwords.....	104
10.2.6.1	Radio Alias Enable.....	104
10.2.6.2	Read/Write Password.....	104
10.2.6.3	Radio Write Password Enable.....	104
10.2.6.4	Radio Read Password Enable.....	104
10.2.6.5	Archive Read Password Enable.....	105
10.2.7	Features.....	105
10.2.7.1	Block Pending CA/PC.....	105
10.2.7.2	Rotary Switch (Scan Program).....	105
10.2.7.3	Disable Plug and Play.....	105
10.2.7.4	Cyclic Keying.....	106
10.2.7.5	Voice Absence Timer.....	106
10.2.7.6	External RF Routing.....	106
10.2.7.7	Radio Certification Type.....	106
10.2.7.8	ViQi: Voice Control Priority.....	107
10.2.7.9	Power Down Standby Mode (hours).....	107
10.2.7.10	ViQi: Virtual Partner Mode.....	107
10.2.7.11	ViQi: Virtual Partner Audio Priority.....	108
10.2.7.12	ViQi: Virtual Partner Inactivity Timer (sec).....	108
10.2.7.13	SmartMessaging Mode.....	108
10.2.7.14	Record Playback Audio Buffer Size.....	109
10.2.7.15	Evacuation Tone.....	109

10.2.7.16 Ignition Auto Power Off.....	109
10.2.7.17 Disable Ignition Auto Power Off Alert.....	110
10.2.7.18 Custom Power Up Image Enable.....	110
10.2.7.19 Channel Fallback Enable.....	110
10.2.8 Location.....	111
10.2.8.1 Location Enable.....	111
10.2.8.2 SmartLocate Reporting.....	111
10.2.8.3 User Selectable Location Enable.....	112
10.2.8.4 Location Display Format.....	112
10.2.8.5 Distance Unit.....	112
10.2.8.6 P25 Location Reporting.....	112
10.2.8.7 System Managed Geofence.....	113
10.2.8.8 Mapping Mode.....	113
10.2.8.9 Server Assisted Location.....	113
10.2.8.10 Geocoded Location Format.....	114
10.2.9 Audio Options.....	114
10.2.9.1 Concurrent Rx Enable.....	114
10.2.9.2 Tx Digital/Analog Balance.....	114
10.2.9.3 Audio Configuration Level.....	115
10.2.10 Transmit Power Levels.....	116
10.2.10.1 Band Plan Selection.....	116
10.2.10.2 Frequency Band.....	117
10.2.10.3 Frequency Range Start (MHz).....	117
10.2.10.4 Frequency Range End (MHz).....	117
10.2.10.5 Tx Power Level Minimum (W).....	117
10.2.10.6 Tx Power Level Low (W).....	118
10.2.10.7 Tx Power Level High (W).....	118
10.2.10.8 Tx Power Level Maximum (W).....	118
10.2.11 Frequency Ranges.....	119
10.2.11.1 VHF Used in Codeplug.....	119
10.2.11.2 UHF1 Used in Codeplug.....	119
10.2.11.3 UHF2 Used in Codeplug.....	120
10.2.11.4 700 MHz Used in Codeplug.....	120
10.2.11.5 800 MHz Used in Codeplug.....	120
10.2.11.6 Extended 700 MHz Range.....	121
10.2.12 Tactical Public Safety.....	121
10.2.12.1 Voice Tx End Tone.....	121
10.2.12.2 Audible Emergency Beacon.....	121
10.2.12.3 Audible Emergency Beacon Routing.....	122

10.2.12.4	Emergency Alarm Retry Rate.....	122
10.2.12.5	Emergency Call De-key Sidetone.....	123
10.2.12.6	TPS PTT Transmission.....	123
10.2.12.7	TPS Emergency PTT Transmission.....	123
10.2.13	Personnel Accountability.....	124
10.2.13.1	Periodic Update Timer.....	124
10.2.13.2	Respond To Polls.....	124
10.2.13.3	Evacuation Acknowledgment.....	125
10.2.13.4	Personnel Accountability PTT Transmission.....	125
10.2.13.5	Personnel Accountability Emergency PTT Transmission.....	125
10.2.13.6	Acknowledge Alerts on PTT.....	126
10.2.14	Bluetooth.....	126
10.2.14.1	Bluetooth Enable.....	126
10.2.14.2	Bluetooth Tones.....	126
10.2.14.3	Bluetooth Friendly Name Editable.....	127
10.2.14.4	Remote Speaker Microphone Bluetooth LED.....	127
10.2.14.5	Legacy Bluetooth PIN Pairing.....	127
10.2.15	Sensor.....	127
10.2.15.1	Sensor Event Disable Time.....	127
10.2.15.2	Sensor Event Notification Enable.....	127
10.2.16	Rx Frequency Split.....	128
10.2.17	Tx Frequency Split.....	128
10.3	Factory Overrides.....	128
10.3.1	General.....	128
10.3.1.1	Factory Overrides Enable.....	128
10.3.2	Tx SSI Clock Rate List.....	128
10.3.2.1	Tx Frequency.....	129
10.3.2.2	Tx SSI Clock Rate.....	129
10.3.3	Rx SSI Clock Rate List.....	130
10.3.3.1	Rx Frequency.....	130
10.3.3.2	Rx SSI Clock Rate.....	130
10.3.4	Rx SSI Clock Rate List : Tx Mode.....	131
10.3.4.1	Tx Frequency.....	131
10.3.4.2	Rx SSI Clock Rate.....	131
10.3.5	Second LO Injection Frequency List.....	132
10.3.5.1	Second LO Injection Frequency.....	132
10.3.6	Out of Band Rejection List	132
10.3.6.1	Rx Frequency (MHz).....	133
10.4	Radio Ergonomics Wide.....	133

10.4.1 Home Mode.....	133
10.4.1.1 Home Mode Selection.....	133
10.4.1.2 Home Mode Zone.....	134
10.4.1.3 Home Mode Channel.....	134
10.4.2 Advanced.....	134
10.4.2.1 Short Keypress Duration.....	135
10.4.2.2 Short Keypress Duration for Emergency.....	135
10.4.2.3 Long Keypress Duration.....	135
10.4.2.4 Long Keypress Duration for Emergency.....	136
10.4.2.5 Soft Power Off.....	136
10.4.2.6 Last Selected Channel Per Zone Enable.....	136
10.4.2.7 Power Up On Last Selected Zone and Channel.....	137
10.4.2.8 Volume Control Lockout with RSM.....	137
10.4.2.9 Channel Control Lockout with Accessory.....	137
10.4.2.10 Active Mic for Radio PTT.....	138
10.4.2.11 Active Mic for RSM PTT.....	138
10.4.2.12 Touch Screen Lock Enable.....	139
10.4.2.13 Side and Speaker Grille Buttons Lock Enable.....	139
10.4.3 Control Head.....	139
10.4.3.1 Control Head Power-up Brightness.....	139
10.5 Personnel Accountability.....	139
10.5.1 AC List Selection.....	140
10.5.2 Personnel Accountability List Name.....	140
10.6 Action Consolidation.....	140
10.6.1 General (Action Consolidation).....	141
10.6.1.1 Action Type.....	141
10.6.1.2 Action Allowed on Response Selector.....	141
10.6.1.3 Backlight Color.....	141
10.6.1.4 Consolidated Action Name.....	141
10.6.2 Consolidation Actions List (Action Consolidation).....	142
10.6.2.1 Action ID.....	142
10.6.2.2 Index.....	143
10.6.2.3 Zone.....	144
10.6.2.4 Channel.....	144
10.6.2.5 Alert Audio File.....	145
10.6.2.6 Alert Interval.....	145
10.6.2.7 Text Message.....	145
10.6.2.8 Transmit Power Level.....	145
10.6.2.9 Mute Site Selectable Alert.....	146

10.6.2.10 Error Strategy.....	146
10.7 Mission Critical Geofence.....	146

Chapter 1

Introduction to RadioCentral

RadioCentral provides the software capabilities for APX NEXT™ and APX N70 users to manage the following functions on the device:

- Provisioning all associated fields
- Managing software firmware updates
- Enabling new licenses on purchased feature

The RadioCentral agency database resides on a Microsoft Azure Cloud. The RadioCentral Public Safety Client provides the ability for the users to securely connect, login, and access the select agency database.

RadioCentral solution provides users with a secured login option from any network connection. The user can use RadioCentral to review and edit the radio ID settings in a user-friendly table without having to open or edit an archive. The user can apply the configuration changes or individual settings through scheduled updates through Wi-Fi and LTE.

Chapter 2

User Interface Overview

This section describes the different areas of the RadioCentral user interface.

The following windows and features are supported under the User Interface Overview:

[Menu Icons and View Selector on page 44](#)

[Navigation Pane in RadioCentral Configuration Client on page 44](#)

[Programming Pane in RadioCentral Configuration Client on page 45](#)

[Information Windows in RadioCentral Configuration Client on page 46](#)

2.1

Menu Icons and View Selector

The user can access the main menu functions and client views across the top.

Table 1: Menu Icons and View Selector

Icon	Functionality
	The Actions menu contains all the functions and operations that RadioCentral supports in a convenient drop-down list.
	The Scheduler menu is enabled when one or more radios in the main window are selected. The Scheduler allows for read, write, or switchover jobs to be scheduled for immediate execution or to occur within some specified window of time.
	The View Selector toggles the set of information shown in the programming windows.

2.2

Navigation Pane in RadioCentral Configuration Client

The navigation pane in the RadioCentral Configuration Client allows the user to switch between different items within the following views:

- Configuration View
- Data Mining View
- Radio License View
- Resource View

The different views are displayed by selecting **Actions**→**Manage**.

Auto Hide the Navigation

To increase the Programming area to the right of the navigation pane, the user can select the **Auto**

Hide pin icon  in the header section. When selected, the navigation pane becomes unpinned and collapses to the left. The name of the current view is then displayed vertically. Selecting the vertical

view name, expands the navigation pane. To pin the navigation pane to the application, select the horizontal **Auto Hide** pin icon.

2.3

Programming Pane in RadioCentral Configuration Client

The programming pane in the RadioCentral Configuration Client is the primary area in the application where users select and configure radio features and properties. The information is structured in a table format with column headings and rows for each item.

2.3.1

Operational Buttons in RadioCentral

The operational buttons allows the user to manage the radio data in the RadioCentral Server database. These buttons appear in main views, such as Radio View, on main Set windows and also above List Item tables within a Set.

NOTE: If a button is not enabled for the selected row, then the requested operation is not supported. Some areas in the programming pane may only allow for a single operation, such as export.

Table 2: Operational Buttons

Button	Description
	The Edit button is used to modify the properties for the selected row.
	The Add button is used to add items to the table.
	The Delete button is used to remove the selected item from the table.
	The Grid to File button is used to export the data for the selected rows to a comma-delimited CVS file.
	The File to Grid button is used to import the data from a comma-delimited CVS file to the RadioCentral Server.

2.3.2

Row Selection in RadioCentral

The selection of items is performed by hovering the pointer to the left of the relevant row and clicking the left mouse button.

Hovering the pointer over the first column in a row changes the pointer from a standard pointer to a hand pointer. The SHIFT and CTRL keys are used to select a range of rows or selective rows. Selected rows are highlighted.

Figure 1: Example of Selected Row

Serial Number	Radio Alias	Configuration	Group	Modified	Job Status	Job Name	Model Number
682IQU0069	Hormel Teldio	SL_Casino	None ▾				H81QCN9NA2AN
871TNF0772	Sherman2	871TNF0772	None ▾				H56JDN9KA1AN
682TPD1915	RM1915	682TPD1915(3)	None ▾				H81QCN9NA2AN

2.3.3

Arrange and Hide Columns in RadioCentral

Columns in the programming pane can be arranged by dragging any column by the header section to a new location.

Once a column is selected and dragged, arrows appear above and below the header section to indicate the new location.

The columns displayed in the programming pane can be hidden to show only those columns of data that are relevant. To hide columns, right-click over any column header to open the **Field Chooser** window and select only the relevant fields to display.

2.4

Information Windows in RadioCentral Configuration Client

The RadioCentral Configuration Client provides information windows along the bottom of the application. By default, these information windows are hidden, where only the names are visible in tabs.

These information windows provide the user with important and helpful details about operations performed in the application.

NOTE: The tabs that appear are dependent on the current view of the application.

The following windows are supported:

2.4.1

Analyze Results Window

The **Analyze Results** window displays any errors or warnings that are a result from a scheduled read or write job. When a read or write job is scheduled, the codeplug is compiled and all validations and dependencies are checked. If an error occurs, the job fails. Corrections to the configuration must be performed. The user can check for errors before scheduling a job by analyzing the radio. See [Analyzing the Radio Configuration on page 47](#).

The following columns are available from the Analyze Results table:

Serial Number

The Serial Number of the radio that was selected as part of the job.

Configuration

Name of the Configuration that is assigned to the radio that is being analyzed.

Item Path

Path within the Configuration to the field containing the error. Double-click the error message and RadioCentral automatically navigate to the field either in the Configuration or in the Set.

Description

Description of the errors (if any).

Actions

Actions taken on the errors (if any).

To reset radios in one batch, click the **Reset All in One Radio** button.

NOTE:

All the text in Analyze Results tab supports multiple languages based on the RadioCentral setting.

The Analyze result does not auto-refresh; even when the user has fixed the errors or warnings. Perform the spell check operation again to confirm whether or not the changes made is reflected.

If there is an ongoing operation, RadioCentral does not allow the user to perform another spell check operation. A spell check operation can have multiple items.

Starting a new operation will clear the results from the previous operation.

If the referred set is not added to the configuration, the item path is identified with a special flag. Motorola Solutions recommends to add the referred set to the configuration.

2.4.2

Analyzing the Radio Configuration

Radio configurations can be analyzed before a job is scheduled.

Procedure:

- 1 From **Radio View**, select the relevant radio or radios.
- 2 Right-click over the selected radio and select **Analyze**.

NOTE: The **Analyze** selection can also be opened by selecting the **Analyze** shortcut above the search field.

- 3 Expand the **Analyze Results** window by clicking on the **Analyze Results** tab along the bottom.

Radios without errors display a green check icon.

NOTE: Any errors or warning are displayed under the **All** radio button. To view only errors, select the **Errors** radio button. To view only warnings, select the **Warnings** radio button.

The user can launch Help for error related items by selecting the row with the error and pressing the F1 key.

2.4.3

Tasks Window

The **Tasks** window displays any background process that is performed in RadioCentral. Whenever a background process such as importing radios or a batch deletion is performed in RadioCentral, a task is created within the RadioCentral Server and information related to the task appears in the Tasks table.

The **Clear** button is used to delete all tasks listed in the Tasks table.

NOTE: When the user double-clicks any row, additional details are displayed in the **Job View** window.

The contents of the **Tasks** window is cleared when the RadioCentral Configuration Client is closed.

The following columns are available from the Tasks table:

Job Name

All jobs are given a default name. For example, the action to convert a radio from template to configuration mode creates a `Convert Template Mode Radio`. The customer can specify the name of some jobs, such as programming jobs.

Created Time

The date and time when the job started.

Summary

This column displays a progress bar while a Job is being processed. It also contains information regarding the number of items within the job.

Actions

While the job is processing, the **Actions** column contains a **Cancel** icon. Clicking the **Cancel** icon cancels the job.

2.4.4

Compare Configurations

The Compare Configurations feature allows the user to compare the codeplug values within two configurations.

The Compare Configuration feature can be performed in **Radio View** and in **Configuration View**.

Radio View

In **Radio View**, the following operations are supported:

Assigned Configuration

Compares the codeplug values from the currently assigned configurations.

Last Programmed

Compares the codeplug values from the configurations last programmed to the radio.

NOTE: Comparison is not applicable for the following scenarios:

- When one of the radios is unread under **Radio View**→**Compare**→**Last Programmed...**
- When one of the radios is not assigned to a configuration under **Radio View**→**Compare**→**Assigned Configuration...**
- When there are failed jobs under **Radio Detail View**→**Job History**→**Compare** for the selected radio.

2.4.4.1

Compare Results Window

The **Compare Results** window displays the differences between radio configurations, generated by the Compare Configuration feature.

NOTE: The Compare Configuration feature can be performed from **Radio View** or **Configuration View**.

The comparison table displays the following columns:

Navigation Path

Displays the navigation path to the field.

Field Name

Displays the field name.

Source Value

Displays the value in the source configuration.

Target Value

Displays the value in the target configuration.

NOTE: Selecting any linked value in the Source or Target columns redirects the user to the Set containing the field and places the focus on the field. For values that are not links, use the Navigation Path to manually locate the field within the configuration.

The **View by** radio buttons allow the user to display the following:

Radio Button	Description
All	Displays all fields with differences, missing values, and MVO field changes.
Different	Displays fields that contain different values.
Missing	Displays fields that exist in one configuration but not in the other.
MVO	Displays radio MVO (Model, Version, Option) fields that have changed from the MVO default value.

2.4.5

Validation Results Window

The **Validation Results** window displays error conditions within the configuration.

NOTE: The **Validation Results** window only appears when a Configuration is being edited.

The following columns are available from the Validation Results table:

Path

Path within the Configuration to the field containing the error.

Error Code

An internal error code that identifies the error within the system.

Description

A description that provides details to the user as to the cause of the error.

Actions

When a curly icon (Reset Value) is displayed in the **Actions** column, the validation error can be automatically resolved by clicking the icon. The user is taken to the Set associated with the error. The field with the error is highlighted in red.

The **Reset All (For Selected Top Set)** button allows the user to reset all validation errors that found in the currently selected Top Set.

2.4.6

Warning Messages Window

The **Warning Messages** window will display warnings that occur in configurations.

NOTE: The **Warning Messages** window only appears when a Configuration is being edited.

2.4.7

Search Results Window

The **Search Results** window allows the user to search for fields and/or field values when editing Configurations. This search feature allows the user to quickly locate fields within a Configuration without having to know the Set.

When editing a configuration, the user enters a word, phrase, or value in the **Search** field. The **x** to the right of the **Search** field is used to clear the search entry and the search results. The search icon (🔍) is used to start the search. The drop-down arrow to the right of the **Search** field allows the user to select from the previous 10 searches.

The following options are used to refine the search:

Name

When selected, the text entered in the **Search** field is searched against the name of all fields.

Value

When selected, the number or text entered in the **Search** field is searched against the value of all fields.

Name and Value

When selected, both the field name and value are searched against the entry in the **Search** field.

Match whole word

When checked, the exact word, phrase, or value entered in the **Search** field is used to narrow the search results.

The following columns provide details of the search:

Path

The path to the field within the Configuration in Set Name\Field Name format.

Value

The current value for the field.

NOTE: Double-clicking any row in the search results opens the relevant Set and places the focus on the field.

2.4.8

User Roles

The role of the users appear in the status bar according to the option selected in the **Select Agency** dialog box.

Role	Access
Admin	All privileges.
Technician	All privileges except registering licenses.
Reader	Can only view the radio fields and configurations. Cannot add, modify, or import any items into the Client.

2.4.9

Help Window

The **Help** window is used to display context-sensitive help for fields used within Configurations and Sets.

NOTE: The **Help** widow only appears when a Configuration is being edited.

When a user is editing a Configuration, help content is displayed in the **Help** window when a field is selected within the Set. Pressing the F1 key opens the full help system with the current selected field in focus.

Chapter 3

Actions Menu

The **Actions** menu allows the user to quickly access the most common functions used to configure an RadioCentral system.

The selections available under the **Actions** menu are dependent on the current view.

The following windows and features are supported under the **Actions** menu:

3.1

Import Selections

The selections under the **Import** menu allow the user to import archived data to assist in the configuration of the RadioCentral system.

3.1.1

Importing File to Grid

This feature allows the user to import radio codeplug data from a comma-delimited ***.csv** file or a spread sheet ***.xlsx** file.

Codeplug data that is exported from RadioCentral (see [Export Window on page 53](#)) can be modified in a spread sheet program and saved as a **.csv** file (using the **Save As** command).

NOTE: Comma-delimited ***.csv** files or spread sheet ***.xlsx** files can only be imported in **Radio View**.

Procedure:

- 1 From **Radio View**, select **Actions**→**Import**→**File to Grid**.

NOTE: The **Import File to Grid** window can also be opened by pressing CTRL+H.

- 2 From the **Import File to Grid** window, browse to the storage location that contains the codeplug archive files and perform one of the following:
 - For CSV (comma-delimited) files, select **CSV (comma-delimited) (*.csv)** from the file type drop-down list.

NOTE: By default, the **CSV (comma-delimited) (*.csv)** is the selected file type.

- 3 Select the relevant file or files.

NOTE: Use the CTRL key (selective) or the SHIFT key (range) to select multiple files.

- 4 Click **Open**.

3.1.2

Importing Configurations

This feature allows the user to import configuration files from the **Configuration View**.

Procedure:

- 1 From the **Actions** menu, select **Manage**→**Configurations** to open the **Configuration View** window.
- 2 Select **Actions**→**Import**→**Configurations**.
 **NOTE:** The **Import Configurations** window can also be launched by clicking on the **Import** button.
- 3 From the **Import Configurations** window, select the relevant **.dbn** files.
- 4 Click **Open**. The **Import Configuration** dialog box appears.
- 5 Type in a relevant name in the **Suffix for Sets** field.
- 6 Click **OK**.

3.1.3

Importing Voice Announcements

This feature allows the user to import voice announcement files from the **Resource View for Voice Announcements**.

Procedure:

- 1 From the **Actions** menu, select **Manage**→**Voice Announcements** to open the **Resource View for Voice Announcements** window.
- 2 Select **Actions**→**Import**→**Voice Announcements**.
 **NOTE:** The **Import Voice Announcements** window can also be launched by clicking on the **Import** button.
- 3 From the **Import Voice Announcements** window, select the relevant **.mva** or **.wav** files.
- 4 Click **Open**.

3.1.4

Importing CA Certificates Manually

Import CA Certificates Files allows the user to import new versions of CA Certificates files to the RadioCentral Server.

When and where to use: Use this procedure to import CA Certificates files.

Procedure:

- 1 From the **Actions** menu, select **Manage**→**CA Certificates** to open the **Resource View CA Certificates** window.
- 2 Click the **Import** button.
- 3 From the **Import CA Certificates** window, select the relevant **.*** file.
The size of the CA certificate must not exceed 10K and must be Privacy Enhanced Mail (PEM) formatted. CA Certificates cannot be automatically or manually imported when a file name match exists in the RadioCentral server.
- 4 Click **Open**.

3.2

Export Window

The selections under the **Export** menu allows the user to export radio data to various file types.

3.2.1

Exporting Configuration

This feature allows the user to export one or more configurations from the **Configuration View**.

Procedure:

- 1 From the **Actions** menu, select **Manage**→**Configurations**.
- 2 To export a single configuration, perform the following actions:
 - a Select the relevant row.
 - b Right-click the selected row and select **Export Configuration**.
 - c From the **Export Configuration** window, browse and select a folder.
 - d Enter a name for the configuration file.
 - e Click **Save**.
- 3 To export multiple configurations, perform the following actions:
 - a Select the first row.
 - b Press and hold the **CTRL** key.
 **NOTE:** To select consecutive rows, press and hold the **SHIFT** key.
 - c Select one or more additional rows.
 - d Right-click the selected rows and select **Export Configuration**.
 - e Browse and select a folder location.
 **NOTE:** Since the selected configuration files will be saved to the selected folder location, it is recommended to create a new folder to help organize the exported files.
- f Click **OK**.

3.2.2

Exporting Grid to File

The **Grid to File** selection allows the user to export all selected radios from **Radio View** into a comma delimited (*.csv) file that can view by a spread sheet application. The exported CSV file contains the same data that is represented in **Radio View**.

Procedure:

- 1 Select one or more radios from the table.
- 2 From the **Radio View**, select **Actions**→**Export**→**Grid to File** to open the **Export Grid to File** window.
Alternatively, enter `Ctrl+Shift+S`.
- 3 From the **Export Grid to File** window, browse and select a file location.
- 4 Enter a name for the **.csv** file.

- 5 Click **Save**. The **Export Grid to File** dialog box appears.
The **.csv** file is exported successfully.
- 6 Click **OK**

3.3

Manage Configurations

The management of configurations allows the user to define the configurations that will be created and stored in the RadioCentral Server.

Configuration View is launched from the **Actions** menu by selecting **Manage**→**Configurations**.

NOTE: Configurations that are assigned to a device cannot be deleted from the RadioCentral Server. The user must first select a different Configuration for the device in Radio View before it can be deleted from the RadioCentral Server.

From **Configuration View**, the user can perform the following basic operations:

-  **Edit**
-  **Add**
-  **Delete**
-  **NOTE:** The **Delete** icon removes configurations from the RadioCentral Server database that are not assigned to a device.
-  **Import**
-  **Export**

Configuration Management

Table 3: Configuration View Table Columns

Column	Description
Name	Allows the user to view and modify the name for the configuration. A configuration must have a unique name. A modified configuration name appears in all tables where used.
Last Modified Date	Displays the actual Date and Time that when the configuration was last modified.
Radios	Displays the number of radios assigned to the configuration.
Comments	Allows the user to add comment for the configuration.

Right-click Menu Option

The following right-click menu selections are available when a configuration is selected and the user right-clicks on the selected configuration:

Table 4: Configuration View Right-click Selections

Column	Description
Edit	This selection allows the user to edit all Sets that are assigned to the Configuration.
Delete	This selection is only available when the selected Configuration is not assigned to a radio.
Copy Configuration	This selection opens the Copy Configuration window and allows the user to duplicate the selected Configuration. From the Copy Configuration window, the user can rename the Configuration and add a suffix that is appended to each Set in the Configuration.
Show Related Radios	This selection opens the Related Radios window and displays all radios stored in the RadioCentral Server that are currently using the selected Configuration.  NOTE: Related Radios window displays only radios having View permission assigned. For users with the RM Administrator role, there are no restrictions.
Export Configurations	This selection allows the user to export the Configuration to a local drive or network drive as a binary data (*.dbn) file.

3.4

Manage Data Mining

The Data Mining feature in RadioCentral allows the user to locate specific fields with values used within Configurations and Radios.

The user can create simple or advanced queries that help identify where certain fields are being used. Data mining is launched from the **Actions** menu by selecting **Manage**→**Data Mining**.

From the main data mining view, the user can **Add** , **Edit** , **Delete** , or **Export**  queries. Queries are exported to a comma delimited CSV file.

Table 5: Data Mining Table

Column	Description
Query Name	Displays the names of queries created for data mining.
Search For	Displays the object that is the focus of the query search. The available objects are Configuration, Radio, and Set.
Group Query	A collection of unique queries. Useful for sorting queries.
Last Modified Data	Displays the date and time that the query was last modified.
Comments	Allows the user to enter a comment to help identify the purpose of the query.

 **NOTE:** Data Mining functionality is only available for users with the RM Administrator role.

3.4.1 Data Mining Query Window

The **Query** window allows users to build simple and advanced queries that can be ran and shared within an RM system. The user adds new queries to the Data Mining window by clicking the **Add** button.

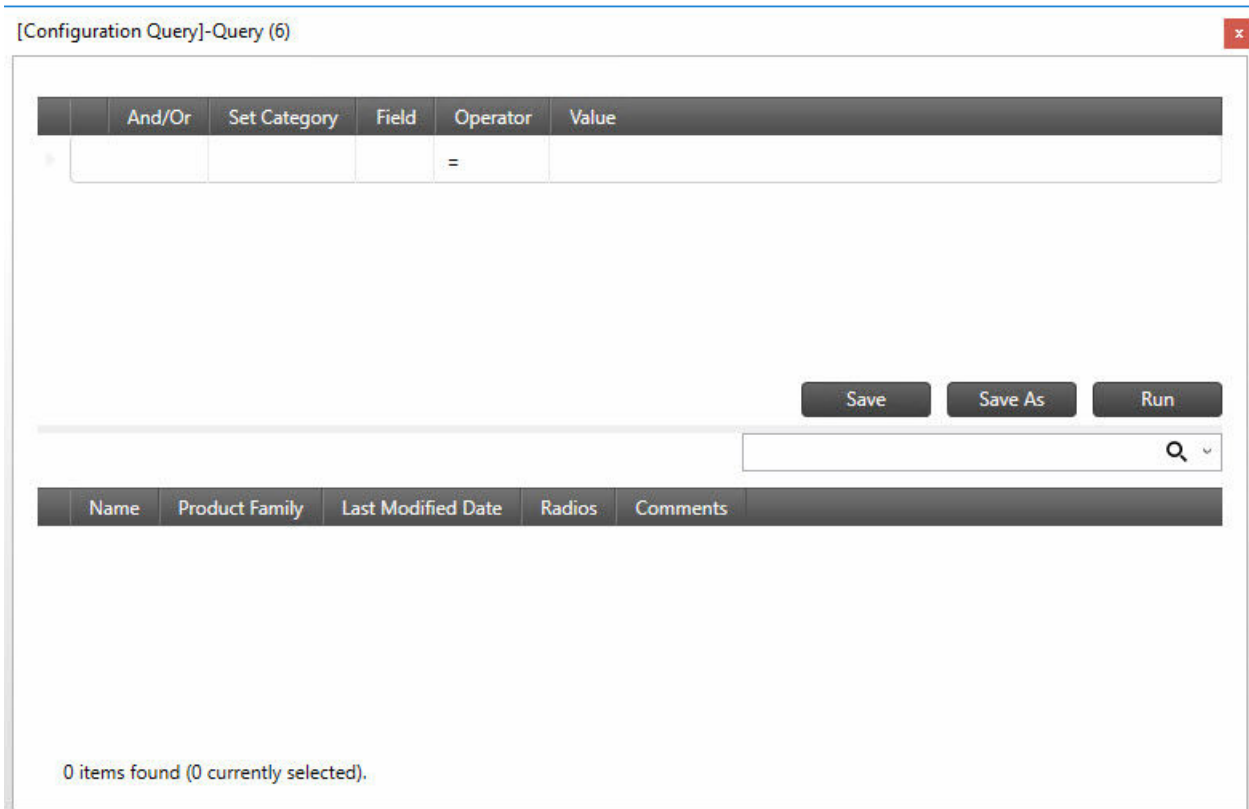

Figure 2: New Query Window

The **New Query** window allows the user to search for fields (fields) used in a **Configuration, Radio, or Set**.

Once the **Search For** query type is selected, the main **Query** window opens. The heading of the main query window displays the selected query type.

Figure 3: Main Query Window

The columns in the upper half of the window are used to build the clauses for the query.

Table 6: Query Clause Columns

Column	Function
And/Or	The And/Or operators are used to filter the results from one or more clauses. The And operator displays a result when the conditions for all clauses are true. The Or operator displays a result when at least one of the clauses is true. These operators are only valid for queries using more than one clause.
Set Category	This drop-down list is used to select a Set Category. Set Categories are a grouping of fields.
Field	This drop-down list is used to select a field contained within the selected Set Category.
Operator	This drop-down list is used to select a search query operator. The supported operators are as follows: <ul style="list-style-type: none"> • Contains • <= • < • >= • > • Does not contain • < > <p>The list of available operators is dependent on the selected field.</p>
Value	This field defines the value used in the query expression for the selected Field. The value can be true/false, numeric, or drop-down selection.

The columns in the lower half of the window are used to display the results for the executed query. The columns that are displayed are dependent on the query type selected. The results can be sorted by clicking on a column heading.

Table 7: Query Results Columns

Query Type	Columns Displayed
Configuration	Name / Product family / Last Modified Date / Radios / Comments
Radio	Serial Number / Radio Alias / Model Number / Comments
Set	Set Name / Last Modified Date / Comments

3.4.2

Adding a Query for Data Mining

Queries allow the user to identify where a parameter, containing a specific value, is used. Queries are created by adding one or more clause expressions. Simple queries can be created to locate a single parameter. More advanced queries can be created to locate multiple parameters.

When and where to use:

Use this procedure to build queries to locate parameters within Configurations, Sets, or Radios.

Once queries are created, the user can perform the following operations:

- [Grouping Query Clauses on page 58](#)

- [Deleting a Query Clause on page 59](#)

Procedure:

- 1 Click the **Actions** menu and select **Manage**→**Data Mining**.
- 2 From the **Data Mining** view, click the **Add** button.
- 3 From the **New Query** window, select **Configuration**, **Radio**, or **Set** from the Search For drop-down list.
- 4 Click **OK**.
- 5 From the **Query** window, create a query as follows:

If...	Then...
If creating a query for a single clause,	perform the following actions: <ol style="list-style-type: none"> a Click under the Set Category column and select the relevant Set. b Click under the Field column and select a parameter for the selected Set Category. c Select an Operator. See Table 6: Query Clause Columns on page 57 for a listing of operators. d Enter or select a Value for the selected Field.
If creating a query for multiple clauses,	perform the following actions: <ol style="list-style-type: none"> a After creating the first clause, right-click anywhere in the top-half and select Add new Clause. By default, the new clause is And to the previous clause. b From the And/Or drop-down list, select the relevant operator. c Select a Set Category. d Select a Field for the selected Set Category. e Select an Operator. f Enter or select a Value for the selected Field.

- 6 Click **Save** or **Save As** to assign a name for the query.
- 7 Click **Run** to initiate the query search.

If the query produces no results, Data mining completed, but no matching data appears to the right of the **Save** button. Otherwise, the resulting matches appear in the lower half of the window.

3.4.2.1

Grouping Query Clauses

The grouping of clauses allows the user to combine multiple clauses into a single expression. Clause expressions can be grouped when the query is first created or by editing an existing query.

When and where to use: Use this procedure to group clause expressions in a query.

NOTE: Queries and clause expressions are selected by hovering the cursor to the left of the relevant row and clicking the left mouse button.

Procedure:

- 1 Select a query from the **Data Mining** view and click the **Edit** button.

- 2 Select the first clause in the query to group.
The clause row is highlighted when selected.
- 3 Hold the CTRL key and select the second clause.
- 4 Right-click over the selected clauses and select **Group Clauses**.
A vertical bracket appears to the left of the grouped clause.

NOTE: To delete a grouping, select all the clause in the group, right-click, and select **UnGroup Clauses**.

3.4.2.2

Deleting a Query Clause

The deletion of a clause expression within a data mining query can be perform while building the query or when modifying existing queries.

When and where to use: Use this procedure to delete a clause expression in a query.

NOTE: Queries and clause expressions are selected by hovering the cursor to the left of the relevant row and clicking the left mouse button.

Procedure:

- 1 Click the **Actions** menu and select **Manage**→**Data Mining**.
- 2 Select the relevant query and click the **Edit** button.
The user can also right-click over the selected query and select **Edit Query**.
- 3 Select the clause expression, then right-click and select **Delete Clauses**.
- 4 From the **Data Mining** view, click the **Add** button.
- 5 If applicable, modify the query further, save it, or run the query.

3.4.3

Deleting a Query from Data Mining

The deletion of a queries from data mining allows the user to maintain current and update queries used for data mining.

When and where to use: Use this procedure to delete queries from data mining.

NOTE: Queries are selected by hovering the cursor to the left of the relevant row and clicking the left mouse button. Hovering over the initial column in the table changes the cursor from a standard pointer to a hand pointer.

Procedure:

- 1 Click the **Actions** menu and select **Manage**→**Data Mining**.
- 2 From the **Data Mining** view, select one or more queries from the table.
 **NOTE:** The **Edit** and **Delete** buttons are grayed out until a query is selected.
- 3 Click the **Delete** button.
- 4 Click **Yes** to delete the query or **No** to cancel the operation.

NOTE: Once the deletion operation is performed it cannot be undone.

3.4.4

Grouping Queries in Data Mining

The grouping of queries allows the user to organize queries in unique collections. Query groups must first be created before they can be assigned to queries.

When and where to use: Use this procedure to group one or more queries into a unique collection.

NOTE: Queries are selected by hovering the cursor to the left of the relevant row and clicking the left mouse button. Hovering over the initial column in the table changes the cursor from a standard pointer to a hand pointer.

Procedure:

- 1 Click the **Actions** menu and select **Manage**→**Data Mining**.
- 2 From the **Data Mining** view, right-click in the navigation pane and select **New Query Groups**.
- 3 Rename the new query group. Perform the following actions:
 - a Select the query group.
 - b Right-click and select **Rename**.
 - c Enter a new name for the query group and press ENTER.

NOTE: Query groups can also be renamed by double-clicking the query group and entering a new name.

- 4 Click **All Query Groups** to see all the existing queries to the right of the navigation pane.
- 5 Under the **Query Group** column, select the drop-down list and choose a query group for the query.
- 6 Repeat step 5 until all queries are added to the group.

NOTE: Selecting the group query in the navigation pane displays only those queries that were added to the group. Selecting **All Query Groups** at anytime displays all queries in the system.

3.5

Manage License

The Manage License feature allows a user to add additional radios to the RM System.

User can purchase the RM feature through the Motorola Solutions Online (MOL) website. If the purchase is successful, an Entitlement ID (EID) is provided. With this feature, the user specifies the number of radios they want to manage. The radio count associated with each EID is divided across multiple instances of the RM Server.

Manage License is launched from the **Actions** menu by selecting **Manage**→**Licenses**.

From each Licenses view, the user can **Add** , **Edit** , or **Delete**  radios.

The following license types can be managed in Radio Management:

3.5.1

Manage Radio Licenses View

Manage Licenses allows the user to add more radios to the RadioCentral System. The user can purchase the RadioCentral feature through the Motorola Online (MOL) website. If the purchase is successful, an Entitlement ID (EID) is provided. With this feature, the user can specify the number of radios that the user wants to manage. The radio count associated with each EID is divided across

multiple instances of RadioCentral Server. Radio License view is launched from the **Actions** menu by selecting **Manage**→**Licenses**→**Radio Licenses**.

Table 8: Radio Licenses

Column	Description
Serial Number	Allows the user to view-only the Serial Number of the radio for all licensed features. Serial Numbers are read from codeplugs.
Radio Alias	Allows the user to view-only the radio-user recognizable name of the radio for all licensed features. This field is only modifiable from the Radio View .
Model Number	Allows the user to view-only the Model Number of the radio for all licensed features. Model Numbers are read from codeplugs.
Region	Allows the user to view-only the region of the radio for all licensed features.
Feature Name	Allows the user to view-only the Feature's name. In this case the Feature Name is read from the actual license.
Status	Allows the user to view-only the status of all radio licenses.
Comments	The user can add any short description about this radio license row.

Table 9: Radio Licenses

Column	Descriptions
Serial Number	Allows the user to view-only the Serial Number of the radio for all licensed features. Serial Numbers are read from codeplugs.
Radio Alias	Allows the user to view-only the radio-user recognizable name of the radio for all licensed features. This field is only modifiable from the Radio View .
Model Number	Allows the user to view-only the model number.
FLASHcode Number	Allows user to view-only the purchased FLASHcode in the currently attached radio.
Feature Name	Allows the user to view-only the feature name.
Status	Allows the user to view-only the status of all radio licenses.

Table 10: Columns in the Radio Licenses View

Possible Statuses	Status Explanation
Registered	The feature is registered for the radio and changes triggered by registering the feature is discarded. The user can use the right-click menu to restore it to Ready for Activation .
Available for Registration	The feature is not registered for the device, the user can register the feature to the radio.

Column	Descriptions	
	Possible Statuses	Status Explanation
	Ready for Activation	The feature is registered for the device, and is pending activation for the radio.
	Activated - Purchased	This feature is purchased and activated for the radio.
Comments	The user can add any short description about this radio license row.	

NOTE:

In all views listing radios (Features, Radios, Feature Details), the user can only see radios with View permission assigned. The Radio Count column only reflects radios with View permissions assigned for the current RM user.

Registering features is only possible for devices with View and Modify permissions. For users with the RM Administrator role, there are no restrictions.

3.5.1.1

Restoring Registered Licenses to Radio

This section covers the ability to find licenses in the Device Capability table which are associated with a given radio, but are not shown in the Radio Licenses view. Licenses can end up in this state when changes to the device are dismissed with licenses in the registered state (before being activated in the device through a write operation).

Procedure:

- 1 Open **Radio Licenses View**.
- 2 Load one (or more) radio device into the RadioCentral database.
- 3 Select one or more rows in the Radio Licenses view.
- 4 Right-click and select **Restore Licenses** or click CTR+O.

The RadioCentral Client communicates with the RadioCentral Server to determine if there are any licenses associated with the device by registered ID. Restored licenses are displayed in the Radio Licenses View as in *Ready for Activation* state.

3.5.1.2

Recovering Radio Licenses

This feature helps user to recover lost licensing information due to reimaging RadioCentral server machine. Contact customer support if the machine hardware is changed. The user must call back to the Licensing Server to recover licenses (in the form of Capability Responses) for all radios in RadioCentral .

Procedure:

- 1 Click  and then click **Settings**.
- 2 Select **Licenses** tab.
- 3 In the **Recover Licenses** window, click **Radio Licenses–Recover** button.

4 Click **OK**.

The existing Licenses from the Motorola Licensing server is restored.

3.5.1.3

Sorting the Grid in the Radio Licenses View

The data in the table is sorted in ascending order according to Radio Serial Number.

Procedure:

- Click one of the column headers in the grid.
- Sort the data in ascending or descending order based on the selected column.

3.5.1.4

Filtering Available Radios by Groups

Procedure:

- The user can sort radio data by any columns by clicking the column header.
- The user can filter Available Radios by Group.

3.5.2

Register Radio Licenses Window

This window allows the user to submit software license assignment. The Device Licensing window presents the following user interface:

- Text field—A field box for user to enter Entitlement ID (EID).
- List of Available Radios—A list that displays all devices that meet the EID license criteria.
- List of Selected Radios—A list for viewing all the devices that the user wants to associate with the license.

To access the Radio Licensing window, click the  button in the **Radio License View**.

The following table lists the descriptions for the columns in the Query EID table.

Table 11: Radio Licenses

Columns and Buttons	Description
Entitlement ID text box	For the user to type in the EID to be queried. See Running an EID Query on page 64 .
Query	Clicking this button displays the EID information in the table.
Clear All	Clicking this button deletes previously queried EIDs.
Entitlement ID	Allows the user to view-only the Entitlement ID row for each unique license. See Selecting Multiple Line Items in the EID Table on page 64 .
Feature Name	Allows the user to view-only the name of each new feature.
Available	Allows the user to view-only the remaining number of feature licenses that are still available to be registered to a radio.
Purchased	Allows the user to view-only the original purchased number of feature licenses.

Columns and Buttons	Description
Serial Number	Allows the user to view-only the serial number of the device.
Radio Alias	Allows the user to view-only the radio-user recognizable name of the radio for all licensed features. This field is only modifiable from the Radio View .
Add All	Clicking this button adds all the selected device from the Available Radios table to the Selected Radios table.
Add	Clicking this button adds the selected device from the Available Radios table to the Selected Radios table.
Remove	Clicking this button removes the selected device from the Selected Radios table and back to the Available Radios table.
Remove All	Clicking this button removes all devices from the Selected Radios table to the Available Radios table.
Register	Click this button to register the features selected in the Query ID table to the devices in the Selected Radios table. See Submitting Software License Assignment on page 64 .

3.5.2.1

Running an EID Query

Procedure:

- 1 Type in the "Entitlement ID" into the Entitlement ID text box.
- 2 Click the **Query** button.
To cancel, click **Clear All** button.

3.5.2.2

Selecting Multiple Line Items in the EID Table

Procedure:

- 1 Click on the check box in the first column of the desired row.
- 2 To check all or clear all, click the check box in the column header of the EID table.
The RadioCentral Client updates the EID table and applies filtering of the Available Radios and Selected Radios tables.
- 3 Click **OK** to remove any radios from the Selected Radios table and manually add the radios from the Available Radios table.
User can skip this step if there are no radios to be removed. To cancel, click **Clear All** button.
- 4 Click **OK**. The radios are filtered out from the Selected Radios table.

3.5.2.3

Submitting Software License Assignment

After selecting the radios to assign the licenses, click the **Register** button to commit these associations.

Prerequisites:

- Open **Radio Licensing** window.

- The EID table must contain at least one fully populated row, and at least one row in the EID table is checked.
- The Selected Radio table is populated with at least one fully populated row.
- The number of radios in the Selected Radios table must not exceed the number of licenses available in any of the checked rows in the EID table.
- RadioCentral Client has valid internet connection.

Procedure:

- 1 Click **Register** after selecting the radios to assign licenses to.
- 2 Click **OK**.

3.6

Manage Firmware

The **Manage Firmware** feature allows the user to view automatically-imported versions of firmware stored in the RadioCentral Server.

Each time a radio is added to RadioCentral, its firmware version is automatically added if its not currently stored in the RadioCentral. The newly added radios are then available to other managed radios.

Manage Firmware is launched from the **Actions** menu by selecting **Manage→Firmware**.

Table 12: Firmware

Column and Buttons	Description
Name	Allows the user to only view the name of all available firmware versions.
Version	Allows the user to only view the version number of all available firmware versions.
Size (KB)	Allows the user to only view the file size of all firmware versions.
Imported Date	Allows the user to only view the actual Date and Time that all firmware versions were imported.
Codeplug	Allows the user to only view the name of the codeplug version.
In-Use Radios	Allows the user to only view the number of radios using each firmware file.
In-Use Radios (Template Mode)	Displays the number of templates using each firmware file in Template Mode.
In-Use Radios (Configuration Mode)	Displays the number of radios using each firmware file in Configuration Mode.
Comments	Allows the user to add comments on a per firmware file basis.

3.7

Manage Voice Announcements

The **Manage Voice Announcements** feature allows the user to view automatically imported Voice Announcement files stored in the RM Server, and to manually import new Voice Announcement files to the RM Server.

Manage Voice Announcement is launched from the **Actions** menu by selecting **Manage→Voice Announcements**.

The user can **Add** , **Edit** , or **Delete**  language packs.

NOTE: Voice Announcement files cannot be automatically or manually imported when a file name match exists in the RM server. This importing is true even if the duration and content of the file are different.

NOTE: The audio length of the .mva file must not exceed 20 seconds.

There are two methods of storing Voice Announcement files to the RM Server:

Automatic Import

Each time a radio is added to the RM Server, its Voice Announcement files are automatically added if not currently stored in the RM Server. The Voice Announcement files are then available to other managed radios. See [Adding Radios to Radio Management](#).

Manual Import

Using the Import Voice files option. See [Importing Voice Announcement Files Manually](#).

Table 13: Manage Voice Announcements

Column and Buttons	Description
Name	Allows the user to only view the name of each Voice Announcement file.
Size (KB)	Allows the user to only view the file size of each Voice Announcement file.
Imported Date	Allows the user to only view the actual Date and Time that all Voice Announcement files were imported.
In-Use template and Radios	Allows the user to only view the number of templates and radios using each Voice Announcement file.
In-Use Templates (Template Mode)	Allows the user to only view the number of templates using each Voice Announcement file in Template Mode.
In-Use Radios (Configuration Mode)	Allows the user to only view the number of radios using each Voice Announcement file.
Comments	Allows the user to add comments on a per Voice Announcement file basis.

3.8

Manage CA Certificates

The **Manage CA Certificates** feature allows the user to view automatically imported CA Certificates stored in the RadioCentral Server, and to manually import new CA Certificates to the RadioCentral Server.

Manage CA Certificates is launched from the **Actions** menu by selecting **Manage**→**CA Certificates**.

The user can **Import** , or **Delete**  certificates.

NOTE:

- CA Certificates cannot be automatically or manually imported when a file name match exists in the RadioCentral server.
- Only CA Certificate files that are Privacy Enhanced Mail (PEM) formatted, and 10K or less in size can be imported into the RadioCentral Server.

There are two methods of storing CA Certificates files to the RadioCentral Server:

Automatic Import

Each time a radio is added to the RadioCentral Server, the CA Certificates files are automatically added if not currently stored in the RadioCentral Server. The CA Certificates files are then available to other managed radios.

Manual Import

Using the Import CA Certificates files option. See [Importing CA Certificates Manually on page 52](#).

Table 14: Certificates

Included Columns and Button	Definition
Name	Allows the user to view-only the name of all available certificates.
Size	Allows the user to view-only the file size of all certificates.
Imported Date	Allows the user to view-only the actual Date and Time that all certificates were imported.
In-Use (Radios)	Allows the user to view-only the number of radios using each certificates file.
Comments	Allows the user to add comments on a per certificates file basis.

3.9

Manage System Keys

The **Manage System Keys** feature allows the user to view the system keys stored in the RadioCentral Server.

System Keys is launched from the **Actions** menu by selecting **Manage**→**Manage System Keys**.

The user can **Add** , **Edit** , or **Delete**  system keys.

Table 15: Manage System Keys

Column	Description
System ID Hex	Trunking system ID assigned to the system key.
Type	Display the system key type as either Advanced System Key or Software Key.
iButton Serial Number	Serial Number of the iButton Key Devices(s) containing the Advanced (Hardware) Key(s) used for past programming operations that required an Advanced Key.
Access Level	<p>Unlimited Access</p> <p>This access type enables all the protected fields for all trunking features within the Trunking System and Trunking Personality categories. The system key allows read and write access to all protected trunking features in the codeplug.</p> <p>Unlimited Access Without Write Protection</p> <p>This access type enables all the protected fields for all trunking features within the Trunking System and Trunking Personality categories. This selection does not allow for the radio to be write protected.</p>

Column	Description
	<p>Limited This access type allows the administrator to selectively enable protected fields for all trunking features within the Trunking System and Trunking Personality categories. The administrator can also limit the range of values for fields that support ranges. The system key allows access to the field but limits the value to the specified range.</p>
Write Protect Enabled	Protects against unauthorized programming of certain ASTRO Trunking System and Trunking Personality key protected fields.

3.10

Codeplug Migration

Codeplug migration feature is a feature that allows the user to convert APX portable codeplugs from Customer Programming Software, .mc format to your radio configuration, .dbn format.

3.11

Settings Window

The **Settings** window allows the user to view or modify communications between the RadioCentral Client and the RadioCentral Server's database, and allows the user to "Recover" Application Licenses and Radio Licenses.

Select **Actions** → **Settings** to launch the **Settings** window.

3.11.1

Licenses Settings

The **Licenses Settings** window allows the user to recover Application and Radio Licenses to the RadioCentral Server.

Licenses Settings is launched from the **Actions** menu by selecting **Settings** → **Licenses**.

Table 16: Licenses Settings

Column	Description
Recover Application Licenses	<p>Only with the "From EID" (Entitlement ID) Method. When the user needs to re-image or reformat the RadioCentral Server's hard drive, the Recover Application Licenses allows the user to recover all radio Application Licenses to the RadioCentral Server:</p> <ol style="list-style-type: none"> 1 Verify that the user have an Internet connection. 2 "Enter the Entitlement ID" in the entry field. 3 Select the Recover Application Licenses button. 4 Verify in the Actions → Manage → Licenses → Application License View → Available column to transfer to server field that the proper amount of licenses have been retrieved from Motorola Solutions.
Recover Radio Licenses	When the user needs to re-image or reformat the RadioCentral Server's hard drive, the Recover Radio Licenses allows the user to recover all Radio Licenses to the RadioCentral Server :

Column	Description
	<ol style="list-style-type: none"> 1 Once the radio is brought back into RadioCentral , this Recover Radio Licenses can be run. 2 Once this Recover process is complete, the user must also run the Recover Licenses to change the Radio Licenses from a Status of Registered to Ready for Activation. <p> NOTE:</p> <p>To run the Recover Radio Licenses, go to Actions→Manage→Licenses→Radio License View, right click at the desired radio, and select Restore Licenses.</p>

3.11.2

Language

The **Language Settings** window allows you to select the language used in the application.

The application supports the following languages:

- English
- French (Canada)
- Spanish
- Portuguese (Brazil)

NOTE:

When a new language is selected, the RadioCentral must be restarted before the new language takes effect.

The input language depends on the keyboard selection configured for the operating system of the computer, and not this language selection; however, numbers entered into text field are always shown in the form 0-9, regardless of the language selection.

3.12

View Tasks

The **Tasks** informational window allows the user to view operational jobs.

The Task window contains a summary of all operational jobs. An operational job is an operation that is performed on one or more RadioCentral objects that does not involve a programming operation (read, write). For example, if the user selects a hundred radios and select **Delete**, the user is performing an operational job.

A job appears in the **Tasks** window whenever the user performs an operation on an RadioCentral entity, with the most recent job at the top. The Task window only shows jobs that have occurred during the current RadioCentral Client session.

The **Tasks** informational window is launched from the **Actions** menu by selecting **View Tasks**.

Table 17: View Tasks Table

Column	Description
Job Name	The name of the operational job that was performed in the RadioCentral.
Created Time	The time of the operational job that was created in the RadioCentral.

Column	Description
Summary	A summary of the job performed in the RadioCentral.
Actions	The type of operational jobs performed by the RadioCentral Server. A job can be canceled before it is completed by clicking the X.

Chapter 4

Scheduler

The **Scheduler** menu opens the **Schedule Job** window. The **Schedule Job** window allows the user to schedule one or more radios for a Read, Write or Factory Reset. Jobs can be scheduled to occur immediately or within a specific window of time. See [Scheduling Jobs in RadioCentral on page 91](#).

NOTE: The **Scheduler** menu is enabled in **Radio View** when one or more radios are selected from the programming pane, have valid radio data and Configuration, and are not waiting for a Job process.

The **Job Schedule** window contains fields that allow the user to configure the following settings:

Table 18: Job Schedule Settings

Setting	Function
Job Type	<p>The following job types are supported:</p> <p>Write The configuration data for all selected radios are written to the radios. The Force immediate update check box is available to enable the immediate installation of an update. This will result in the target device restarting immediately after download without user confirmation and is only permitted on one radio at a time.</p> <p> NOTE: This capability is available for jobs on a single provisioned device only. If an immediate update is required and this text is greyed out, the user will need to return to the Radio View to select only one desired radio to update.</p> <p>Write Protected Confirmation Enables the POP25 (Programming Over Project 25) Batch Programmer to Write Protect the radio. When enabling this field, an Owner ID - Advanced Key match (loaded and attached) must exist for each target radio.</p> <p>Read The selected radios are read and the configuration information is updated in the Server. The Generate Configuration check box is available for a Read job and generates a configuration from the data on the radio. If the Apply to radio option is checked, the configuration is assigned to the radio in RadioCentral.</p> <p>Factory Reset The selected radio configuration is deleted. The radio is restored to its original settings.</p>
Job Name	Selects a name for the current job. It is recommended that a meaningful name is entered, such as "Wired write for Fire station #3" so that the job can be more easily identified in Job View .
Time Zone	Selects the time zone in which the current job event executes in a RadioCentral Device Programmer. This selection applies for the current radio or radios selected for this job in the Schedule Job window.

Setting	Function
Start after	Selects the date (in day-month-year format) and time (in a 24-hour format) for the start of the job interval. This field is optional, and if not specified, the job executes as soon as possible.
End before	Selects the date (in day-month-year format) and time (in a 24-hour format) for the end of the active job interval. If a scheduled job has not started by this time, the job expires and cannot be executed. This field is optional and if nothing is entered, the job does not expire.

NOTE: When **Read** is the selected Job Type, the RadioCentral Device Programmer retrieves the codeplug of each radio associated with the job. Once the codeplug is uploaded to the RadioCentral server, the previous configuration association for the selected radio is overwritten.

Chapter 5

Radio View

The **Radio View** provides information on the devices that are in the system.

The serial number is autopopulated. The agency is created by Motorola Solutions. The autopopulated radio have customized default codeplug and purchased features.

The **Radio View** supports the following operations:

- Edit and Select Configurations
- Schedule and Cancel Jobs
- Group Radios
- Analyze a Radio Configuration

When a radio is selected from the list, the programming pane displays shortcuts to **Show Details**, **Edit Configuration**, **Analyze**, and **Schedule Job**. For more information, see [Programming Pane in RadioCentral Configuration Client on page 45](#).

Radio View Table

The radio fields are customizable. By default, the more common fields are displayed. Fields such as **Serial Number**, **Radio Alias**, **Configuration**, **Group**, **Modified**, **Job Status**, and so on. See [Radio View Table on page 78](#).

Table 19: Operational Buttons in Radios View

Button	Description
	The Edit button is not supported. Radio properties are unique to each radio and are not editable.
	The Grid to File (export) button is enabled when a radio is selected and used to export the radio data for the selected rows to a comma-delimited CVS file.
	The File to Grid (import) button is used to import radio data from a comma-delimited CVS file.

Right-click Operations for Radios

The following operations can be performed on a selected radio:

Table 20: Right-click Operations for Radios

Operation	Description
Show Details	Displays Radio Information, Job History, and Feature Sets for the selected radio. This operation is also available as a shortcut located above the search field.
Delete	Deletes the selected radio from the RM Server database.
Select Group	Allows the user to assign the selected radio to a group or sub-group.

Operation	Description
Edit Configuration	Launches Configuration View and displays device information along with all Sets assigned to the configuration. From this view, the user can modify fields within all relevant Sets.
Select Configuration	Launches the Select Configuration window that allows the user to assign a configuration to the selected radio.
Compare	<p>Allows the user to compare differences in codeplug values within two configurations, assigned to radios, using the compare configuration feature.</p> <p>The following operations are supported:</p> <p>Assigned Configuration Compares the codeplug values from the currently assigned configurations.</p> <p>Last Programmed Compares the codeplug values from the configurations last programmed to the radio.</p> <p> NOTE: These selections are accessible when two radios are selected.</p>
Discard Changes	<p>Discards any recent changes made to the selected radio. This is true for all changes to data. However a Group change is not restored (see Radio Groups on page 76).</p> <p> WARNING: Any pending features added via FLASHport will be permanently lost. The FLASHkey has already been decremented and cannot be reversed. Pending features added via Radio Licensing can be recovered via Settings.</p> <p>When a feature is added to a radio via Radio Licensing (see Manage Radio Licenses View on page 60), instead of via FLASHport, and then "Discard Changes" is selected prior to these FLASHcode changes being written to the radio, the "Restore" selection can be used (see Manage Radio Licenses) in order to change the Manage Radio License window's "Status" from "Registered" to "Ready for Activation".</p>
Schedule Job	Launches the Schedule Job window that allows the user to create a read or write programming job for the selected radio or radios.
Cancel Job	Allows the user to cancel a job for the currently selected radio.
Complete Job	Allows the user to manually move the state of the selected radio from the transferred state to the completed state. This action is only available when the radio is in the transferred state, which indicates that new firmware has been transferred to the radio over the air and is awaiting installation to the radio by the end user. Only use this action when certain that the end user has applied the changes or the user intend to perform a radio read, as manually moving this radio to completed otherwise could result in Radio Management getting out of sync with this radio.
Select MVO	Allows the user to assign a model, version, and option (MVO) to a new radio. See Model, Version, and Options .

Operation	Description
Update Radio Data	Launches the Query / Update Radio Data window, which allows the user to modify a radio's Owner Advanced Key Type and / or Owner ID, AND / OR enable or disable a radio's Write Protection.
Analyze	Allows the user to analyze a configuration for errors or warnings before creating a job. See Analyzing the Radio Configuration on page 47 .
Reports	Launches report pages for Channel Summary and Customer Handout . These reports can be printed or saved to a local or network file location.
Upgrade Firmware	<p>Allows the user to upgrade existing radio firmware to newer firmware version.</p> <p>Codeplug version is increased automatically, based on the chosen Firmware Version. New features will be available based on newer codeplug version.</p> <p>User can check existing firmwares in the RadioCentral through Manage Firmware feature. See Manage Firmware on page 65.</p> <p>Firmware Upgrade is launched from the Actions menu by selecting Upgrade→Upgrade Firmware.</p>
Upgrade Language Pack	<p>Compares the language pack versions currently read from the radio to those stored on the RM Server. If a newer language pack version is detected, the language pack is updated and the Language Packs Modified flag is set.</p> <p>A wired or wireless Write job must be scheduled to update the language packs on the radio and clear the Language Packs Modified flag.</p> <p> NOTE: The Language Packs Modified flag is only set when a newer language pack version is detected on the RM server.</p> <p>In addition, write jobs for codeplug modifications can be scheduled Over the Air even if the Language Packs Modified flag is set. Language packs can only be written to the radio over a wired or wireless connection.</p>
Upgrade Codeplug Version	Allows the user to upgrade codeplug version. The user is able to maintain its language selection after version upgrade.
Export Radio	Allows the user to export the selected radio or radios to a codeplug byte array file (*.xpba) format. See Exporting Radio
Export DVRS	Allows the user to exports the currently highlighted radio record / row to a (.XML) file format. See Exporting DVRS Data
Export Grid to File	Allows the user to export the selected radio or radios to a comma delimited file (*.csv) format. See Exporting Grid to File on page 53
Modify Radio Password	Launches the Modify Radio Password widow that allows the user to override the current codeplug password for the configuration for the radio.

Operation	Description
Copy Identity	Allows the user to copy identity data (such as IDs, Aliases, IPs, and so forth) from one radio to another.
Paste Identity	Allows the user to paste the copied identity data (such as IDs, Aliases, IPs, and so forth) from one radio to another.
	 NOTE: This feature is enabled when a radio is selected and its identity data is copied.

5.1

Radio Groups

Grouping radios within the RadioCentral Configuration Client allows you to organize and manage your radio for the RadioCentral system within a tree view structure. Groups are used with shared sets and configurations to more efficiently manage your radio system.

From **Radio View**, the navigation pane for **Groups** allows the user to create groups and subgroups using right-click mouse operations.

The following operations can be performed on groups or subgroups:

- Create a group or subgroup
- Delete a group or subgroup
- Rename a group or subgroup
- Drag and drop a group or subgroup to a new location
- Expand or collapse group nodes within the tree view

Selecting **All** displays all radios in the RadioCentral system regardless of the group assignment. The assignment of radios to a group or subgroup is performed under the **Group** column in the table. One or more radios can be selected from the table and assigned to a group or subgroup. See [Creating and Managing Radio Groups](#).

Table 21: Right-Click Operations for Radio Groups

Selection	Description
New Group	Allows the user to create a group or subgroup.
Delete	<p>Allows the user to delete a group or subgroup.</p> <p>When a group containing radios or subgroups is deleted, a confirmation window opens and warns the user that the selected group and all subgroups will be deleted. Any radios assigned to the group or subgroup will no longer be assigned to a group.</p> <p>The Group column in the table for all radios removed from a group or subgroup display <i>None</i>.</p>
Rename	Allows the user to rename a group or subgroup.

5.1.1

Creating and Managing Radio Groups

Radio groups and subgroups are created and managed within the **Group** navigation pane. Once radio groups and subgroups are created, they can be renamed, deleted, or moved within the tree view structure.

Procedure:

- 1 Click the **Radio View** icon to display the Radio view table.
- 2 Create, manage, or move a group or subgroup. Perform one of the following actions:

If...	Then...
If creating a group,	perform the following actions: <ol style="list-style-type: none"> a Right-click in the navigation pane and select New Group. b Enter a <code>name</code> for the new group.
If creating a subgroup,	perform the following actions: <ol style="list-style-type: none"> a Right-click the relevant group or subgroup and select New Group. b Enter a <code>name</code> for the new subgroup.
If deleting a group or subgroup,	perform the following actions: <ol style="list-style-type: none"> a Select the relevant group or subgroup. b Right-click and select Delete. <p> NOTE: A confirmation window opens and warns the user that the selected group and all subgroups will be deleted. Any radios assigned to the group or subgroup will no longer be assigned to a group.</p>
If renaming a group or subgroup,	perform the following actions: <ol style="list-style-type: none"> a Select the relevant group or subgroup. b Right-click and select Rename. c Enter a new <code>name</code> for the group or subgroup.
If moving a group or subgroup,	perform the following actions: <ol style="list-style-type: none"> a Select the relevant group or subgroup. b Using standard drag and drop functionality, move the group or subgroup to its new location. <p> NOTE: Groups or subgroups can be moved and placed over an existing group or between groups.</p> <p>Any radios assigned to the group or subgroup move with the group or subgroup to the new location.</p>

- 3 Assign radios to a group or subgroup. Perform one of the following actions:

If...	Then...
If assigning a single radio,	perform the following actions: <ol style="list-style-type: none"> a From the navigation pane, select All to display all radios in the RadioCentral system.

If...	Then...
	<p>b From the table, select the Group column drop-down list for a radio, expand the nodes if necessary, and select the relevant group or subgroup.</p> <p>c Repeat the previous step until all radios for the group or subgroup are assigned.</p>
If assigning multiple radios,	<p>perform the following actions:</p> <p>a From the navigation pane, select All to display all radios in the RadioCentral system.</p> <p>b Select all the relevant radios in the table using standard SHIFT and CTRL key functionality.</p> <p>c Right-click any highlighted row and select Select Group.</p> <p>d From the Select Group window, expand the nodes if necessary, and select the relevant group or subgroup.</p> <p>e Click OK.</p>

NOTE:

A radio can only be assigned to one group or subgroup.

If **None** is the only value in the **Group** drop-down list, then no radio groups exist in the navigation pane.

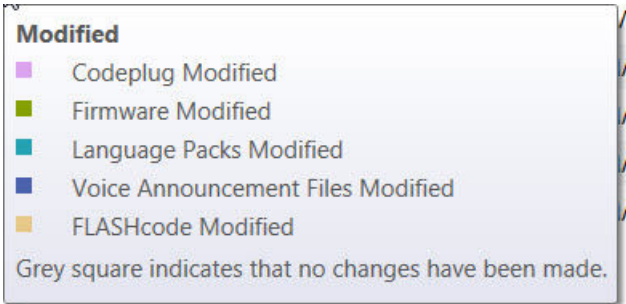

5.2

Radio View Table

The following table defines all the column fields that are supported in **Radio View**.

Table 22:

Column	Description	Notes
Serial Number	Displays the serial number of the radio stored in the Radio-Central Server.	Read-only
Radio Alias	Displays and allows the direct editing of the Radio Name.	This field can be edited.
Configuration	A unique file that resides on the RadioCentral Server and contains all the assigned Sets for the radio.	
Group	See Radio Groups on page 76 .	
Modified	Displays the color-based indicators alerting the user of a certain modified status for the radio. The user can hover on the word "Modified" in the column header to retrieve the col-	

Column	Description	Notes
	<p>or legend:</p> 	
Job Status	Displays the non-editable status of the radio and any current job that may be associated with the radio.	
Job Name	Displays the non-editable name given to the Job when the job was created. The value is not editable once a Job has been created.	
Model Number	Displays the non-editable model number of the radio.	
FLASHcode	The FLASHcode number reflects the entire list of Features/System Options that a codeplug is capable of using. Hovering on a radio's FLASHcode reveals the entire Feature Set for that radio, which can also be seen from the Manage Radio Licenses View on page 60 window.	
Configure Password Per Device	Displays whether or not a password was set for the radio. The password is required to edit the configuration of a radio.	
Check for Password	Displays the configured access (Read or ReadWrite) for radios supporting the Modify Radio Password feature. If no password is assigned to the radio, then None is displayed.	Read-only
OTAR ID	Displays the OTAR (Over-The-Air-Rekeying) ID needed for radio communication with the KMF (Key Management Facility).	
OTAR Fixed IP	Displays the OTA (Over The Air) Fixed IP Address (FIP)	

Column	Description	Notes
	<p>for all codeplug (record / rows) within Radio View. When a radio's IP Address is known it can be used for direct Device Programmer - POP25 / OTAP to radio communications, eliminating the need for ARS, which is also known as FIP Mode.</p>	
Subscriber IP	<p>Displays the Serial Link 1 Subscriber IP Address of all radio-codeplug (record / rows) within Radio View. This IP Address is assigned to the Subscriber Unit (SU) end of the serial link1.</p>	
Peer IP	<p>Displays the Serial Link 1 Peer IP Address of all radio-codeplug (record / rows) within Radio View. This IP Address is assigned to the Mobile Computer (MC) end of the serial link1.</p>	
Bluetooth DUN Subscriber IP	<p>Displays the Bluetooth Dial Up Network (DUN) Subscriber IP Address of all radio-codeplug (record / rows) within Radio View. This IP Address is assigned to the Subscriber Unit (SU = radio) end of the Bluetooth (BT) link.</p>	
Bluetooth DUN Peer IP	<p>Displays the Bluetooth DUN Peer IP Address of all radio-codeplug (record / rows) within Radio View. This IP Address is assigned to the MC (Mobile Computer) end of the Bluetooth (BT) link and is also used to address the MC via over-the-air packet data.</p>	
Bluetooth Friendly Name	<p>Displays the radio-user recognizable Bluetooth name of all radio-codeplug (record / rows) within Radio View. This name identifies the radio to a paired and connected Bluetooth device.</p>	
Username	<p>Allows the user to enter a Automatic Registration Service or User Authentication default</p>	

Column	Description	Notes
	<p>login User name for all radio-codeplug (record / rows) within Radio View. This User name can apply for all ARS "Server" enabled Data Profiles. When the Soft ID feature is enabled, this User name is also used for all Conventional dispatch ASTRO-enabled channels.</p>	
User PIN	<p>Allows the user to enter a default Automatic Registration Service login Personal Identification Number (PIN) or a User Authentication PIN / Password for all radio-codeplug (record / rows) within Radio View. This PIN / Password can apply for all ARS "Server" enabled Data Profiles (see ARS Mode). Asterisks are displayed when entering a user pin.</p>	
User Login Unit ID	<p>Displays a User Authentication default login Unit ID for all radio-codeplug (record / rows) within Radio View. This ID can be used to designate all radio-uses within a specific vehicle or squad. This ID applies for all ARS "Server" enabled Data Profiles.</p>	
Group Data Talk Group	<p>Displays the talk group that is used for the Group Data session to transmit the firmware (and optionally language pack) over the air through the Group Data Gateway. This value is not editable and gets updated once the radio has started downloading the firmware.</p>	
ASK Required	<p>Displays the Owner System Key Type, Owner System ID, Write Protect, and Advanced System Key (ASK) Required status of all codeplug (record / rows) within this Radio View.</p> <p>Enabling this feature ensures that only Advanced (Hardware) Keys can be loaded into RC and assigned for use to Trunking Systems; Software</p>	

Column	Description	Notes
	<p>System Key Files are not able to be assigned.</p> <p>When disabled, both Software Keys and Hardware Keys loaded into RC may be assigned for use in a Trunking System's System ID field. Additionally, disabling this features gives the user the ability to disable a radio's Write-Protected status.</p>	
Owner System Key Type	Displays the Owner System Key Type of all codeplug (record / rows) within Radio View.	The Owner Advanced "Key Type" and its corresponding "Owner System ID" or "Owner WACN ID" are initially determined for the radio and it's codeplugs at the time of the radio's original purchase.
Owner System ID (Hex)	Displays the Owner System ID of all codeplug (record / rows) within Radio View.	The Owner Advanced "Key Type" and its corresponding "Owner System ID" or "Owner WACN ID" are initially determined for the radio and it's codeplugs at the time of the radio's original purchase.
Write Protect	<p>Displays the Write Protect of all codeplug (record / rows) within Radio View.</p> <p>When enabled, is used to Write Protect the radio.</p> <p>When disabled, is used to disable Write Protect for the radio.</p>	Disabling ASK Required will disable the Write-Protected status in the radio.
Firmware Version	Displays the non-editable firmware version of the radio.	Firmware versions generally control which features are available on a radio. Typically a newer firmware version will support new or improved features than an older version.
Language Pack	Displays any language packs currently assigned to the radio.	
Voice Announcements	Displays the number of currently assigned voice announcements for the radio.	
Codeplug Version	Displays the non-editable codeplug version of the radio.	Codeplug versions describe the format of the configuration information that is programmed into a radio and are gen-

Column	Description	Notes
		erally tied to specific firmware versions.
Comments	An editable parameter where the user can put in any notes or comments about a radio. For example, the user could use this field to enter a customer's name. Since the information entered is searchable, it would provide a quick way to look for all the radios for a specific customer.	
Provisioned	Displays the non-editable provisioning status of the radio.	
Last Contact Time	Displays the non-editable time and date of the last contact.	

5.3

Radio Details

The following table defines all the column fields that are supported in **Radio Details**.

Concept definition.

Operation	Description	Notes
Serial Number	Displays the unique alphanumeric number that identifies the device.	
Product Identifier	Displays the device type being added to the RM Server.	
Model Number	Displays the model number for the selected device type.	
MCIF Profile Name	Displays the name of the Mission Critical Interaction Framework (MCIF) profile used by the device.	User must manually import the MCIF package. The MCIF package contains the <code>mcifconfig.xml</code> , <code>interactions.csv</code> , and <code>manifest.xml</code> files.
MCIF Profile Version	Displays the version of the Mission Critical Interaction Framework (MCIF) profile used by the device.	
Last Programmed Date	Displays the date of the last programmed jobs.	
Comments	An editable parameter where the user can put in any notes or comments about a radio. For example, the user could use this field to enter a customer's name. Since the information entered is searchable, it would provide	

Operation	Description	Notes
	a quick way to look for all the radios for a specific customer.	
Job Count	Displays the amount of job count.	

Chapter 6

Radio Systems View

The **Radio Systems View** displays radio specific conventional or trunking radio IDs for all radios within the RadioCentral Server database.

The **Radio Systems View** shows information about the status of your radio infrastructure. Each row in the table represents a conventional or trunking system.

The information that is displayed in the table can be filtered viewed by selecting **All**, **Radios**, or **Systems**.

The following radio system information is displayed:

- Serial Number
- Radio ID
- Configuration
- Radio Alias
- Communication Type
- Sub-system Type
- System ID
- System Name

Chapter 7

Data Profile View

The **Data Profile View** shows information about radio Configuration.

The radio grouping strategy designed in Radio View determines the data access in this view. See [Radio Groups on page 76](#). Each row in this **Data Profile View** represents one RadioCentral created Data Profile. When more than one data profile exists for a codeplug, multiple rows represent the same codeplug.

The **View by** selection allows the user to filter all data profiles by **Radios** or **Data Profiles**. The **All** selection is the default view.

The following fields are supported in the Data Profile View table:

Column	Description
Serial Number	Displays the serial number of the radio stored in the RadioCentral Server.
Configuration	A unique file that resides on the RadioCentral Server and contains all the assigned Sets for the radio.
Radio Alias	Displays and allows the direct editing of the Radio Name.
Communication Type	Displays Trunking or Conventional.
Auto Generate IPs	True when the Auto Generate IP Address field in the Data Profiles on page 340 is enabled.
Subscriber IP	Displays the IP address of the Subscriber Unit (SU) end of the serial link 1.
Peer IP	Displays the Serial Link 1 Peer IP Address of all Conventional - Data Profile (record / rows) within this Data Profile View. This IP Address is assigned to the Mobile Computer (MC) end of the serial link1, and is also used to address the MC via over-the-air packet data.
Bluetooth DUN Subscriber IP	Displays the Bluetooth Dial Up Network (DUN) Subscriber IP Address of all radio-codeplug (record / rows) within Radio View. This IP Address is assigned to the Subscriber Unit (SU = radio) end of the Bluetooth (BT) link.
Bluetooth DUN Peer IP	Displays the Bluetooth DUN Peer IP Address of all radio-codeplug (record / rows) within Radio View. This IP Address is assigned to the MC end of the BT link and is also used to address the MC via over-the-air packet data.
Subscriber Air Interface IP	Displays the Subscriber Air Interface IP Address of all Conventional - Data Profile (record / rows) within this Data Profile View. This IP Ad-

Column	Description
Data Profile Name	dress is needed for over the-air-packet data communication with the radio. Displays the name of the Data Profile set selected for the Data Profile.

Chapter 8

Job View

The **Job View** displays historical information related to all jobs processed and stored in the RadioCentral Server.

The initial view displays all jobs performed in the system. The **View by** selection allows the user to filter all jobs by **Programming Jobs** or **Operational Jobs**.

Programming Jobs

This selection displays jobs that were processed as either Read, or Write jobs in **Schedule Job** Window.

Operational Jobs

This selection displays jobs that are operations performed in the RadioCentral such as importing and exporting radios, scheduling jobs, selecting and deleting configuration, as well as many others.

The Job View table supports the following fields:

Column	Description
Job Name	The name assigned to the job when scheduled in the Schedule Job window.
Type	The job type configured in the Schedule Job window.
Created Time	The date and time that the job was created in the Schedule Job window.
Start Time	The date and time that the job is scheduled to start as entered in the Start after field in the Schedule Job window.
End Time	The date and time that the job is scheduled to end as entered in the End before field in the Schedule Job window.
Total	Displays the number of radios scheduled for the job.
Completed	Displays the number of radios complete in the scheduled job.

Job Name Selection

The **Job Name** column displays all jobs as selectable links.

The Job Name link provides the following information:

Column	Description
Item	The name of the file that was selected as part of the job.
Status	The following statuses are supported: Pending A scheduled job has not started, due to a radio not being detected on a Device Programmer or the Job Processor is busy processing another job. Running The job has started and is in progress. Canceled The job was canceled by the user.

Column	Description
	Completed The job was successful.
	Failed The job has failed. The reason for the failure is described in the Reason column.
	Expired The End date has passed and the job was not performed and/or executed.
Executed Date	This is the actual date and time that the scheduled job was executed.
Reason	This field is left blank when radio jobs are completed successfully. If a job fails, a description as to the cause of the failure appears.

Chapter 9

RadioCentral Common Tasks

RadioCentral supports a wide range of tasks that can be performed by users and administrators of an RadioCentral System. Common tasks allows users to quickly obtain the information that is required to perform the task.

9.1

Configuring SmartConnect

Procedure:

- 1 From the Set categories, select **Data Configuration**→**Data Profiles**.
- 2 Under **General**, set the **Data Profile Type** field to **Trunking**.
- 3 From the **Broadband** tab, set the following:
 - a Set the **SmartConnect Gateway Hostname** according to the correct Fully Qualified Domain Name (FQDN)/Hostname of the cloud-based Gateway. See [SmartConnect Gateway Hostname on page 352](#).
 - b Set the **SmartConnect Gateway TLS Port Number** to the default value. See [SmartConnect Gateway TLS Port Number on page 353](#).
- 4 From **Broadband**, leave the **SmartConnect Gateway Port Number** field empty.
- 5 Select **Trunking Configuration**→**Common Trunking Wide**.
- 6 Set the **RSSI SmartConnect Fallback Threshold** to **52**.

The [Leave LMR RSSI Threshold on page 451](#) and [Return To LMR RSSI Threshold on page 459](#) default value may not be the same for each user. The value depends on duration preference.
- 7 Select **Trunking Configuration**→**ASTRO 25 Trunking System**.
- 8 Select the system that is used with SmartConnect, right-click and select **Edit**.
- 9 In the **Data Profile Selection**, select the Data Profile name that was created in step 1.
- 10 Select **Trunking Configuration**→**ASTRO 25 Trunking Personality**.
- 11 Select the system that was created in step 1, right-click and select **Edit**.
- 12 Set **SmartConnect Operation** to either **LMR Only** (default) or **LMR Preferred**.
- 13 In the [Zones Channel Assignment on page 605](#), select an existing zone or create a zone to assign the trunking personality that was created in step 1 and talkgroups.

9.2

Configuring Radios

Procedure:

- 1 Launch RadioCentral Client and log on to the database.

Factory default codeplugs for all radios are available to the user in a secure cloud application. If the user wants use an existing APX codeplug, see [Converting APX Codeplugs on page 91](#).
- 2 From **Radio View**, configure the RadioCentral Sets. Perform the following actions:
 - a From the **Radio View** table, select the relevant radio.

- b Click  **Edit**.

A **Configuration View** window appears.

- 3 Configure the features for RadioCentral Sets.
See [RadioCentral Release 2.22.135](#) for more information.
- 4 To save the configuration, select **Radio View** icon.
- 5 In the **Leave Configuration** dialog box, click **Save this Configuration** and **OK** to save the configuration.
If the user choose to not save the current changes, click **Discard changes to this Configuration** and **OK** .
- 6 In the **Save as new configuration** dialog box, enter the configuration name in the **Name** field.
- 7 If the user wants to delete the previous configuration, enable the **Delete previous configuration if no radio use it** check box and click **OK**.
This configuration is by default.
- 8 If the user wants to keep the previous configuration, disable the **Delete previous configuration if no radio use it** check box and click **OK**.
If the configuration has been applied to any radios, the affected radios appears below the **Serial Number** section.
- 9 Schedule a write job for the device for the configuration to take effect.
See [Scheduling Jobs in RadioCentral on page 91](#).

9.3

Converting APX Codeplugs

Procedure:

- 1 From the **Actions** menu, select **Codeplug migration**.
- 2 From the **Codeplug migration** dialog box, click **Browse** and select the relevant **.mc** file.
- 3 Select the target radio from the **Select target device** section and click **OK**.
The conversion process starts. To monitor the progress of the conversion, go to **Job View**→**Operational Jobs**. The **Status** columns will change from **Running** to **Performed**.

9.4

Scheduling Jobs in RadioCentral

The scheduling of jobs is performed within the **Schedule Job** window of **Radio View**. Jobs can be scheduled to occur immediately or within a specific window of time.

CAUTION:

When upgrading the radio firmware and modifying the configuration, using the **Wireless (LAN)** connection method, it is highly recommended to perform two separate write jobs. Performing these tasks in a single write job causes the radio to reset twice.

First, upgrade the radio firmware by scheduling a write job. When the firmware write job is complete, register the new feature, configure the radio settings for the new feature, and then schedule a second write job. ss

Procedure:

- 1 From **Radio View**, select the relevant radio or radios.

- 2 Select the **Scheduler** menu.

NOTE: The **Schedule Job** window can also be opened by right-clicking on the selected radios and selecting **Schedule Job** from the pop-up menu or by selecting the **Schedule job** shortcut above the search field.

- 3 From the **Job Type** section, perform one of the following actions:
 - Select **Write** to schedule a write job for one or more radios.
 - 1 Select **Force immediate update** if necessary (only one provisioned radio is selected for programming).
 - 2 Review immediate update warning and confirm if you wish to proceed.
 - Select **Read** to schedule a read job.
 - Select **Factory Reset** to restore radio to its original settings.
- 4 In the **Job Name** field, enter a relevant name for the job.
- 5 In the **Time Zone** field, select the relevant time zone from the drop-down list.
- 6 **Optional:** In the **Start after** fields, select the start date (in day-month-year format) and start time (in a 24-hour format).
 **NOTE:** Clicking in the date field, enables a drop-down arrow that allows the user to select the date from a calendar. The time can be manually entered or selected, in one minute increments, using the up and down arrows.
- 7 In the **End after** fields, select the end date (in day-month-year format) and end time (in a 24-hour format).
- 8 Click **OK**.

Chapter 10

RadioCentral Sets for Radio

RadioCentral facilitates the creation of an extremely efficient radio programming configuration. RadioCentral allows the user to manage and program multiple radios at a time. Radio codeplugs are stored on a central database server allowing for remote configuration of data and remote programming of radios. A single codeplug can be used as a configuration, which can then be shared across multiple radios. Configuration edits may then be easily applied to all affected radios. Changes to a configuration or to an individual radio's parameters can be scheduled as a programming job. Programming Jobs may be scheduled through LTE.

10.1

Radio Information

This section allows you to view radio identity information used when programming or troubleshooting a radio.

NOTE: The Radio Information is only visible when editing a radio Configuration.

10.1.1

General

This section displays read-only model, serial number and version information for the attached radio.

10.1.1.1

Model Number

The application retrieves and displays the read-only attached radio's model number.

The model number identifies the type of radio. This information is stored in the radio's codeplug.

10.1.1.2

Maximum Channels

The application retrieves and displays the read-only maximum number of Conventional and Trunking communications channels possible for the currently attached radio.

This maximum channel number applies when defining zones and channels in the Zone Channel Assignment window.

IMPORTANT: This maximum number of channels are determined by the radio model and is only changeable through a FLASHport Upgrade.

Accessed Only: When the radio is model / option capable.

10.1.1.3

Serial Number

The application retrieves and displays the read-only Serial Number of the Key Device(s) containing the Advanced (Hardware) Key(s) used for past programming operations that required an Advanced Key.

Only one Key Device Serial Number is stored per operation. The specific Serial Number stored is of the Key Device containing the Owner System ID or the Owner WACN ID Advanced Key. Codeplug retains up to 25 of the latest Key Device Serial Numbers.

NOTE:

Programming operations that require an Advanced Key include: write protecting a radio, writing to a write-protected radio, and enabling/disabling the ASK Required field in a radio.

Whenever an operation that requires an Advanced Key is performed on a radio, the new Key Device Serial Number is added to the radio's programming history, and may be reviewed by reading the radio codeplug once the write or cloning operation is completed.

10.1.1.4

VHF Enable

This field specifies whether the VHF Band is enabled on the radio.

Accessed Only: When the radio is model/option capable.

10.1.1.5

UHF1 Enable

This field specifies whether the UHF1 Band is enabled on the radio.

Accessed Only: When the radio is model/option capable.

10.1.1.6

UHF2 Enable

This field specifies whether the UHF2 Band is enabled on the radio.

Accessed Only: When the radio is model/option capable.

10.1.1.7

700 MHz Enable

This field specifies whether the 700 MHz frequency band is enabled on the radio.

Accessed Only: When the radio is model/option capable.

10.1.1.8

800 MHz Enable

This field specifies whether the 800 MHz frequency band is enabled on the radio.

Accessed Only: When the radio is model/option capable.

10.1.1.9

Regional Governance

The application retrieves and displays the read-only whether the radio is compliant with the regulations and standards.

The regulations and standards the radio may comply are of the Federal Communications Commission (FCC) / Telecommunications Industry Association (TIA), the Radio and Telecommunications Terminal Equipment Directive (RTTE) / European Telecommunications Standards Institute (ETSI), or the Australian Communications and Media Authority (ACMA).

NOTE: When this field is set to **ACMA**, the radio/codeplug supports the "Extended UHF Range 1 Capable" Extended Feature, and the Used in Codeplug field is set to **Permanently Enabled**. In this case, the end value of UHF Range 1 extends to 472 MHz.

10.1.1.10

Codeplug Version

The application retrieves and displays the attached radio's current codeplug version number in the the read-only mode.

This is stored in the radio's internal codeplug.

10.1.1.11

Firmware Version

The application retrieves and displays the read-only firmware version of the currently attached radio.

Firmware is a software that controls the internal hardware components of the radio. Firmware can only be modified by a FLASHport Upgrade.

When the the application reads this information from a codeplug file (not from a radio), this field displays **Unknown**.

10.1.1.12

Secure Version

The application retrieves and displays the attached radio's current secure hardware version number in the read-only mode.

10.1.1.13

Secure Hardware Type

The application retrieves and displays the attached radio's current secure hardware type in the read-only mode.

10.1.1.14

Secure Hardware Version

The application retrieves and displays the attached radio's current secure hardware version number in the read-only mode.

10.1.1.15

MAC Address

The application retrieves and displays the unique 6-byte Ethernet Media Access Control (MAC) Address. This information is read-only.

This information is stored in the radio codeplug, that identifies the mobile radio to the network.

NOTE: If the Ethernet MAC address field is not assigned, the Wi-Fi MAC address is applied. The Ethernet and Wi-Fi connection cannot be used on the same network simultaneously.

Applies Only: When the radio is a mobile radio.

10.1.2

Tracking

This section displays Date and Time-stamped information and codeplug version useful when programming and troubleshooting the radio Configuration.

10.1.2.1

Last Programmed Time and Date

The application retrieves and allows you to view the most recent time and date (in day-month-year format) at which the currently attached radio was programmed.

This information is sometimes useful in preparation for the cloning process. This information is stored in the radio's codeplug.

10.1.2.2

Last Programmed Source

The application retrieves and allows you to view the most recent source used to program the currently attached radio.

This information is stored in the radio's codeplug.

The following source are displayed:

CPS

Programmed by a standard CPS.

Factory

Programmed in the factory.

Lab

Programmed using special development version.

FTR Key

Programmed using an FTR System Key.

10.1.2.3

Original Programmed Time and Date

The application retrieves and allows you to view the original time and date (in day-month-year format) on which the currently attached radio was programmed for the first time.

This information is sometimes useful in preparation for the Cloning process. This information is stored in the radio's codeplug.

10.1.2.4

Original Programmed Codeplug Version

The application retrieves and displays the read-only current codeplug version number of the attached radio's.

This is stored in the radio internal codeplug.

10.1.2.5

Original Programmed Source

The application retrieves and allows you to view the original source used to program the currently attached radio.

This information is stored in the radio's codeplug.

The following source are displayed:

CPS

Programmed by a standard CPS.

Factory

Programmed in the factory.

Lab

Programmed using special development version.

FTR Key

Programmed using an FTR System Key.

Hosted

Programmed using Hosted Depot Software.

10.1.3

FLASHport

This section displays read-only information about the most recent FLASHport Upgrade process.

The FLASHport process (also known as FLASHing) allows the programmer to upgrade the currently attached radio's System Package, System Options, Firmware and Secure Encryption capability.

10.1.3.1

FLASHcode

The application retrieves and displays the read-only number that identifies the Feature Set for the purchased FLASHcode in the currently attached radio.

This information is stored in the radio's codeplug.

IMPORTANT: Within the Motorola Solutions APX™ family of radios, certain features/options that are purchasable in Entry- and Mid-tier models are included in High-tier models. Only features that have been purchased appear in the FLASHcode.

10.1.3.2

Number of Times Flashed

The application retrieves and displays the total number of times the attached radio was upgraded in the read-only mode.

This information is stored in the radio's codeplug.

10.1.3.3

I-Button

The application retrieves and displays the read-only serial number of the Key Device - FLASHkey or Depot Key that last flashed in the currently attached radio.

This information is stored in the radio's codeplug and is only applicable when the radio has been upgraded. Before upgrade, this serial number contains all zeros.

10.1.3.4

Last Upgrade Source

The application retrieves and displays the most current upgrade source in read-only mode for the currently attached radio.

This information is stored in the radio's codeplug.

10.1.3.5

Last FLASHed Time and Date

The application retrieves and displays the read-only most recent time and date (in day-month-year format) at which the currently attached radio was upgraded (also known as FLASHing).

This information is stored in the radio's codeplug.

10.1.4

Advanced System Key Info

This section displays read-only radio programming history for operations that require an Advanced Key.

The programming history data includes: the date of programming and the Serial Number of the Key device (of the Advanced Key) that allowed the operation to be performed. Up to 25 programming dates are possible.

IMPORTANT:

Programming operations that require an Advanced Key include: write protecting a radio, writing to a write-protected radio, and enabling/disabling the ASK Required field in a radio.

Programming operations that do not require an Advanced Key do not record any data.

This feature is useful when looking at the program history of a radio that may have been stolen and then recovered. This is true as long as the serial number and the Advanced Key information of the Key Device used to program the radio was recorded for tracking purposes.

10.1.4.1

Last Programmed Time and Date

The application displays the read-only programming times/dates (in day-month-year format) of the current codeplug for operations that required an Advanced Key.

Up to 25 of the latest programming times and dates are retained by the codeplug.

IMPORTANT:

- Programming operations that require an Advanced Key include: write protecting a radio, writing to a write-protected radio, and enabling/disabling the ASK Required field in a radio.
- Whenever an operation that requires an Advanced Key is performed on a radio, the new time and date is added to the radio's programming history, and may be reviewed by reading the radio codeplug once the write or cloning operation is completed.

10.1.4.2

Serial Number

The application retrieves and displays the read-only Serial Number of the Key Device(s) containing the Advanced (Hardware) Key(s) used for past programming operations that required an Advanced Key.

Only one Key Device Serial Number is stored per operation; the specific Serial Number stored is of the Key Device containing the Owner System ID or the Owner WACN ID Advanced Key.

Up to 25 of the latest Key Device Serial Numbers are retained in the codeplug.

IMPORTANT:

- Programming operations that require an Advanced Key include: write protecting a radio, writing to a write-protected radio, and enabling/disabling the ASK Required field in a radio.
- Whenever an operation that requires an Advanced Key is performed on a radio, the new Key Device Serial Number is added to the radio's programming history, and may be reviewed by reading the radio codeplug once the write or cloning operation is completed.

10.2

Radio Wide

This section allows you to view or define radio-wide functionality that applies to both conventional and trunking communication modes.

All features are not common to both communication modes.

10.2.1

Set Name

The **Set Name** field allows you to enter a name that uniquely identifies the set within a list of similar sets. An error message is displayed when trying to save an already in use user-specified Set Name.

10.2.2

Last Modified Date

This read-only field displays the date and time for when the Set was last saved.

10.2.3

Comments

This field allows you to enter a comment for the Set that is currently being configured. The comment appears in the initial list of Sets for a given Set Category.

10.2.4

General

This section allows you to view or define basic radio-wide functionality.

10.2.4.1

Codeplug Alias

This field allows you to define recognizable names for the codeplug.

In addition, the serial number for the radio appears at the top of the Tree View.

This alias stays with a codeplug even when the codeplug is cloned to another radio.

NOTE:

Characters, numbers, spaces, and special characters can be used. For unidentified unicode characters, such as emojis, the radio top display shows "squares" for these characters.

31 characters in total are possible.

10.2.4.2

Log Dispatch Calls Enable

When this field is enabled, IDs received during Dispatch or Scan are logged in the Recent Calls list. When disabled, only IDs received through a Private Call or Call Alert are logged.

This feature applies on a radio-wide basis.

Accessed Only: When the radio is model/option capable.

10.2.4.3

Ultra Narrow Intermediate Freq Filter

This field selects the appropriate Ultra Narrow Intermediate Frequency Filter Bandwidth value to be used on a radio-wide basis.

The following selections are supported:

7.8 kHz

Designed for radios operating on channels with narrow bandwidths in environments where adjacent channel interference is not a major problem.

5.76 kHz

Designed to provide greater levels of adjacent channel interference protection for radios operating on channels with narrow bandwidths.

10.2.4.4

Wi-Fi Regulatory Region

This field specifies the Wi-Fi Regulatory Region used by the Wi-Fi controller in the radio.

The following channels will be used in the 2 GHz Spectrum:

- Federal Communications Commission (FCC) = Channels 1 - 11
- European Telecommunications Standards Institute (ETSI) = Channels 1 - 13

10.2.4.5

Connection Path

This field shows that your radio can be programmed by RadioCentral and CPS, or CPS only.

NOTE: This field is only applicable for APX NEXT and APX N70 radios.

10.2.5

Alert Tones

This section allows you to view or define alert tone functionality that applies on a radio-wide basis.

10.2.5.1

Alert Tones

This field enables the radio Alert Tone capabilities.

This feature applies on a radio-wide basis.

10.2.5.2

Volume Adjust Tone Offset

This field enables the sampling of the volume level for radio alert tones.

When enabled, the Volume Set Tone button-press allows you to sample the volume level of the radio's alert tones. The alert tone volume can vary from the current volume setting for incoming transmissions based on the Volume Offset (dB) setting. Therefore, when the Volume Set Tone button is pressed, a tone sounds at the current volume level for incoming transmissions plus or minus the Alert Tone Volume Offset amount.

NOTE: The Volume Set Tone follows the Volume Offset (dB) amount only as long as the tone does not go below the Minimum Volume setting.

When disabled, the Volume Set Tone button-press allows you to sample the radio's current volume level for incoming transmissions that unmute to the radio's speaker.

Accessed Only: When the [Alert Tones on page 100](#) field is **Enabled**.

10.2.5.3

Power-Up Self Test Alert Tone

This field enables the radio Self-Test Alert Tone to chirp when the self-test is completed and the radio is ready to transmit or receive.

This feature applies on a radio-wide basis.

Accessed Only: When the [Alert Tones on page 100](#) field is **Enabled**, and when the radio is model/option capable.

10.2.5.4

Scan Alert Tone Enable

This field causes the radio to emit an alert tone each time scan mode is entered or exited with a Scan button-press or Scan switch-toggle.

This alert tone is not applicable for a Scan menu-selection. This feature applies on a radio-wide basis.

Accessed Only: When the [Alert Tones on page 100](#) field is **Enabled**.

10.2.5.5

Call Alert Tone Auto Reset

This field causes the radio to generate just one sequence of the Call Alert tone.

Normally, the Call Alert Tone is a repeating tone. This feature applies on a radio-wide basis.

10.2.5.6

Enhanced Mute Tones Operation

This field selects the types of alert tones, such as keypad tones, that you can disabled (muted).

This Mute feature is available to you with the Mute switch-toggle or Mute menu-selection. This feature applies on a radio-wide basis.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Disabled

The Mute feature is disabled.

Keypad Tones

The Mute feature only mutes keypad and other non-signaling tones.

VA Tones

The Mute feature only mutes Voice Announcements.

All Tones

The Mute feature mutes all signaling and non-signaling tones, including keypad tones, Voice Announcements, talk permit tones, and other tones.

10.2.5.7

Out of Range Tone

This field selects the alert tone that sounds, immediately upon pressing the PTT button, whenever the radio is outside of the coverage range of the Trunking System and cannot sync with a Control Channel.

The alert tone continues to sound for as long as the PTT button is still pressed. See also Out of Range Indicator. This feature applies on a radio-wide basis for Trunking and DVRS-enabled P25 Conventional communications.

IMPORTANT: You can avoid confusion by selecting a desirable tone that is different from the Talk Prohibit Tone.

Accessed Only: When the radio is model or option capable.

The following selections are supported:

OOR Tone 1

The radio's rotary control has no alert tones.

OOR Tone 2

Repeating 800 Hz alert tone.

10.2.5.8

Talk Prohibit Tone

This field selects the alert tone that sounds whenever radio transmissions are not allowed, either immediately upon pressing the PTT button, or when the preset Time Out Timer has expired and the radio ends the current transmission.

The alert tone continues to sound for as long as the PTT button is still pressed. This feature applies on a radio-wide basis.

Accessed Only: When the radio is model or option capable.

IMPORTANT: You can avoid confusion by selecting a desirable tone that is different from the Out of Range Tone.

The following selections are supported:

TP Tone 1

Legacy continuous 300 Hz alert tone.

TP Tone 2

Repeating 600 Hz alert tone.

10.2.5.9

Low Battery LED

This field enables the radio to visually notify you when the radio's battery is running low.

That is, the Transmit LED flashes red when a low battery condition is detected and only while the radio is transmitting. The feature applies on a radio-wide basis.

Accessed Only: When the radio is model/option capable.

10.2.5.10

Tx Chirp

This field enables the radio to sound a beep immediately after the PTT button is released, but only when a low battery condition is detected during the transmission.

See also [Standby Chirp \(sec\) on page 102](#).

IMPORTANT: For Mobile radios, see the DEK VIP Input or Radio VIPs Input "Low Battery Alert" selection.

Accessed Only: When the radio is model/option capable.

10.2.5.11

Standby Chirp (sec)

This field selects how often the radio sounds the Standby low battery alert chirp (a short, high-pitched tone).

Your valid direct entries are also allowed.

IMPORTANT: For Mobile radios, see the DEK VIP Input or Radio VIPs Input **Low Battery Alert** selection.

Accessed Only: When the radio is model/option capable.

Table 23: Range

Minimum	Maximum	Increments
0 seconds	930 seconds	30 seconds

10.2.5.12

Smart-Low Battery Alert

This field selects the point at which the radio's battery power level causes a low battery chirp to be heard.

This feature applies on a radio-wide basis.

Accessed Only: When the radio is model or option capable.

The following selections are supported:

Standard

10% battery power left.

Early Warning

15% battery power left.

10.2.5.13

PTT Warning Tone

This field selects the alert tone that sounds whenever the following conditions are met:

- The Push-to-Talk (PTT) Warning Timer expires.
- The PTT is depressed while the radio is performing the Inbound Signal Data (ISD) sequence or the Response Pending Timer is active.

The alert tone starts sounding anytime after the conditions are met. The alert tone stops when one of the following situations occurs:

- You release PTT after the PTT Warning Timer expires.
- The radio receives the appropriate grant.
- The radio is busy after the PTT Warning Timer expires.

The following selections are supported:

PTT Warning Tone 1

The radio plays the legacy talk prohibit tone.

PTT Warning Tone 2

The radio plays a repeating 500 Hz alert tone with 100 ms (on) and 700 ms (off).

10.2.5.14

RSM Volume Set Tones

This field allows you to select the alert tone when pressing the button or rocker for volume adjust on a portable radio Remote Speaker Microphone (RSM).

This feature applies on a radio-wide basis.

Table 24: Types of Tones Selection

Tone Selection Types	Description
Volume Set Tone 1	Supports the 911 Hz feedback alert tone.

Tone Selection Types	Description
Volume Set Tone 2	Legacy behavior. Supports the 410 Hz feedback alert tone. Same as the mobile volume set tone.

NOTE: You can select Volume Set Tone 2 to differentiate from the MDC PTT-ID sidetone. Some RSMs are not affected by this field and always play Volume Set Tone 2.

10.2.6

User Information and Passwords

This section allows you to view or define functionality related to **User Information**, **Zone Protection**, **Radio Lock**, **Tactical Inhibit**, and **Password Required**.

10.2.6.1

Radio Alias Enable

This field enables the Radio Alias field.

This feature applies on a radio-wide basis.

Accessed Only: When the radio is model/option capable.

10.2.6.2

Read/Write Password

Allows the user to enter the codeplug Password, thus granting access to the current codeplug's password-protected permissions.

Protected permissions may include any one or all three of the following features:

- reading from the radio
- writing to the radio
- reading a codeplug file

This feature applies on a radio-wide basis.

Accessed Only: When the radio is model/option capable.

10.2.6.3

Radio Write Password Enable

When enabled, the user must enter the Read/Write Password set for the radio before any data can be written to the radio.

This feature applies on a radio-wide basis.

Accessed Only: When the radio is model/option capable.

10.2.6.4

Radio Read Password Enable

When enabled, the user must enter the Read/Write Password set for the radio before any data can be read from the radio.

This feature applies on a radio-wide basis.

Accessed Only: When the radio is model/option capable.

10.2.6.5

Archive Read Password Enable

When enabled, the Read/Write Password set for the radio can be archived.

This feature applies on a radio-wide basis.

Accessed Only: When the radio is model/option capable.

10.2.7

Features

This section allows you to view or define basic radio-wide functionality.

10.2.7.1

Block Pending CA/PC

This field enables your call blocking for Call Alert or Private Call.

The first Call Alert or Private Call data received by the unattended radio is held by the radio. Successive Call Alert or Private Call data is ignored unless the source information of the call is identical to the original source data received. This feature applies on a radio-wide basis.

When disabled, the last Call Alert or Private Call data received is the call data that is stored. Therefore, previously stored call information is overwritten in the radio's memory.

10.2.7.2

Rotary Switch (Scan Program)

This field selects which mode element (**Zones** or **Channels**) the Rotary switch on the radio and/or optional Display Remote Speaker Microphone (DRSM) selects while you are operating the radio in the Scan List Programming or Edit mode.

You can access the Scan List Programming or Edit mode with a Long Keypress of the Scan button-press, with a Scan List Programming switch-toggle, or with a Scan List menu-selection. This feature applies on a radio-wide basis.

IMPORTANT: For radios that have a Multi-Function Knob (MFK), this feature is only applicable to the Rotary switch on the optional DRSM accessory.

Accessed Only: When the radio is model or option capable.

The following selections are supported:

- Channel
- Zone

10.2.7.3

Disable Plug and Play

This field disables all the bias voltage from GCAI pins if no GCAI accessory is attached to the radio within 1 minute of power up.

IMPORTANT: If enabled and APX Vehicular Adapter is not connected to the radio after being powered up, the GCAI functionality is disabled. The radio will not be able to detect the present of an APX Vehicular Adapter.

Accessed Only: When the radio is model or option capable.

10.2.7.4

Cyclic Keying

This field enables power ramp up and ramp down of transmit power in order to meet both the ETS-300 and FTZ Cyclic Keying requirements.

This selection applies on a radio-wide basis.

NOTE: Cyclic Keying should be enabled only for radios used in Europe.

10.2.7.5

Voice Absence Timer

This field selects the amount of time, during a radio transmission, that the Digital Signal Processor (DSP) waits while detecting a lack of voice from the microphone before declaring a No Voice event.

This may be used to trigger End Tx on Voice Absence. This selection applies on a radio-wide basis for all Conventional and Trunking communications channels.

Accessed Only: When the radio is model/option capable.

Table 25: Range

Minimum	Maximum	Increments
5 seconds (default)	60 seconds	1 second

10.2.7.6

External RF Routing

This field is used to determine the RF band that will be routed to the external antenna when the radio is attached to the Vehicular Adapter (VA) or Public Safety Microphone with Antenna (PSM).

This selection applies to Portable radios that support multiple bands. This feature is only editable for multiple bands and uneditable for single band.

The following selections are supported:

7/800

It is valid only if 7/800 MHz is a purchased band.

UHF

It is valid only if either UHF1 or UHF2 is a purchased band.

VHF

It is valid only if VHF is a purchased band. VHF will only be routed externally when a Vehicular Adapter is attached.

ALL_BANDS

Routes all purchased bands externally. Only valid for multiband radios that support the Vehicular Adapter.

10.2.7.7

Radio Certification Type

This feature allows you to configure the Radio Certification Type.

Radio Certification Type is set to None by default. If a mismatched battery is attached, a wrong battery alert is triggered.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

None

Radio supports any kind of batteries.

UL Div 2

Radio only support UL Div 2 certified batteries only.

10.2.7.8

ViQi: Voice Control Priority

The following selections are supported:

Low

LMR audio has priority. LMR receive audio will cancel or block the voice control feature when the radio is actively receiving.

High

Voice Control has priority. While the voice control button is held down (voice control is active), LMR receive audio will be muted.

Disabled

Voice Control feature is disabled.

10.2.7.9

Power Down Standby Mode (hours)

This feature allows the Land Mobile Radio (LMR) modem to be powered off while the applications processor is in a low-power mode to allow for a quicker device power-up. This feature also allows you to set the time for power down standby mode.

Table 26: Range

Minimum	Maximum	Increments
1 (hour)	8 (hours)	1 (hour)

NOTE: If the radio stays in this mode for the selected duration, the radio is turned off automatically. If the value is set to 0, the radio is powered down immediately. If set to a value other than 0, the radio is kept in a low-power mode for the selected duration. If the radio knob is turned on while the radio is in standby, the radio fully functions within a few seconds.

The radio requires a cold-start power-up in the following shutdown scenarios:

- The battery is disconnected.
- Battery is drained.
- Power Down Standby Mode feature is disabled in the codeplug.
- Radio has been in standby mode for longer than the configured range for Power Down Standby Mode feature.

10.2.7.10

ViQi: Virtual Partner Mode

NOTE: This field is only applicable for APX NEXT and APX N70 radios.

The following selections are supported:

Disabled

Disables the Virtual Partner feature from operating.

Broadband

All Virtual Partner requests and responses will only use LTE or Wi-Fi connections.

LMR

All Virtual Partner requests and responses will only use APCO 25 Infrastructure voice channels.

10.2.7.11

ViQi: Virtual Partner Audio Priority

Configures how the Virtual Partner feedback audio is prioritized against LMR audio.

NOTE: This field is only applicable for APX NEXT and APX N70 radios.

The following selections are supported:

ViQi Only

Plays ViQi at 100% and mutes any LMR RX audio.

ViQi Priority

Plays LMR Rx audio and ViQi audio concurrently. The LMR Rx audio level will be attenuated below the ViQi audio level.

ViQi Equal

Plays LMR Rx audio and ViQi audio concurrently at equal audio levels.

LMR Priority

Plays LMR Rx audio and ViQi audio concurrently. The ViQi audio level will be attenuated below the LMR Rx audio level.

10.2.7.12

ViQi: Virtual Partner Inactivity Timer (sec)

Selects the amount of time that the user will remain inactive in the Virtual Partner feature before exiting and begin listening to the selected dispatch channel.

NOTE: This field is only applicable for APX NEXT and APX N70 radios.

Accessed Only: When **Broadband** or **LMR** is selected in [ViQi: Virtual Partner Mode on page 107](#) field and when the radio is model/option capable.

When the radio receives Virtual Partner audio and LMR audio, the radio plays the Virtual Partner audio. If the radio did not receive the Virtual Partner audio, the user hears the LMR audio.

Table 27: Range

Minimum	Maximum	Increments
5 seconds (default)	255 seconds	1 second

NOTE: While the user is using the Virtual Partner feature, all normal dispatch voice traffic will be missed.

10.2.7.13

SmartMessaging Mode

Allows the user to select the type of the message transmission routing.

LMR

Messages transmits according to the settings of the Conventional or Trunking channel.

NOTE: LMR is a narrowband network that has limited capability for data intensive applications.

SmartMessaging

Messages transmits through the default broadband messaging application.

NOTE: LTE is a broadband network that can handle data intensive applications.

10.2.7.14

Record Playback Audio Buffer Size

This field specifies the last number of seconds of the current incoming call to be recorded by the Instant Recall feature.

This feature applies on a radio-wide basis. The Instant Recall feature is enabled when this field is set to any value other than **Disabled** default.

WARNING: All calls are recorded for the duration of configured time until next power up cycle or until overwritten by more recent receive audio.

Accessed Only: When the radio is model or option capable.

Table 28: Range

Minimum	Maximum	Increments
10 sec	60 sec	1 sec

10.2.7.15

Evacuation Tone

This field enables the Evacuation Tone to be heard on the transmitting radio and on any radio that is able to receive the tone instruction.

The tone begins and is transmitted when the PTT button and the "Orange Button" are simultaneously pressed. Once the tone begins to sound, if the orange button is released the tone continues to alarm on all radios within the talkgroup, until the PTT button is released.

NOTE:

This evacuation tone instruction is transmitted to the radio's entire talkgroup (for the current channel); the type of talkgroup is dependent on the radio's current communications mode. It applies to both analog voice and digital voice channels, in trunking and conventional systems, and both FDMA and TDMA APCO systems.

WARNING: This feature only functions when the current channel is operating in "Clear" mode (not Secure Encryption).

10.2.7.16

Ignition Auto Power Off

This field allows you to select the amount of time that the radio waits before automatically powering off once the voltage at Ignition Sense is removed.

This timer begins once the voltage at Ignition Sense is removed, and a lack of interaction is determined by the radio thereafter. While the timer is active any button release on the radio resets the timer. During the last two minutes of this timer countdown, the radio generates audible and visual warnings

until the timer expires or is reset. This selection applies on a radio-wide basis for all Conventional and Trunking communications channels.

IMPORTANT:

Timer functionality is based on the Ignition Switch state of your vehicle.

In a Dual Radio configuration, this functionality is only configurable on the **Primary Radio**.

Accessed Only: When the **Ignition Switch** field is set to **Ignition Only Power-Up, Required**, or **Soft Power Off**, and when the radio is model/option capable.

NOTE: Inactivity Auto Power Off is disabled when set to **0 -Disabled** (default).

Table 29: Range

Minimum	Maximum	Increments
3 minutes	840 minutes	1 minute

10.2.7.17

Disable Ignition Auto Power Off Alert

When this field is checked, it disables the auto power off audio and visual warnings in the final 2 minutes of the radio powering off due to removal of voltage at Ignition Sense.

This field can be modified when **Ignition Auto Power Off** is accessible and not set to **Disabled**.

10.2.7.18

Custom Power Up Image Enable

If this field is enabled, you can upload an image to appear at the end of the power-up sequence.

10.2.7.19

Channel Fallback Enable

This field enables the Auto Channel Fallback feature. This feature allows you to associate a system-based channel with a Fallback Channel. The radio can switch to a Fallback Channel when it is unable to communicate with the Land Mobile Radio (LMR) network.

WARNING: You are **not** recommended to configure a Fallback Channel as a channel on the same system. If the radio automatically cannot communicate with the system on a talkgroup, then the radio is also not able to communicate on a different talkgroup.

IMPORTANT:

The Auto Channel Fallback feature is turned off for all channels by default. After enabling this field, you must choose a Fallback Zone and Fallback Channel for a given channel in the Zone Channel Assignment.

The radio can perform nested fallbacks. If the selected Fallback Channel is unable to communicate with the LMR network, the radio can perform a Channel Fallback if a Fallback Channel is assigned to it.

After the radio performs a Channel Fallback, the radio waits a short duration before attempting another Channel Fallback to avoid switching too frequently.

On a Fallback-enabled channel, the feature can be activated by pressing the **Automatic Channel Fallback Enable/Disable** button. Pressing and holding this button deactivates the feature and reverts the radio back to the last user-selected channel.

Pressing the **Channel Fallback Manual/Revert** button causes the radio to manually switch to the assigned Fallback Channel regardless of current network conditions and activation state. Pressing and holding this button reverts the radio back to the last user-selected channel.

On the following system-based channels, the radio is unable to communicate with the LMR network and switches to the Fallback Channel automatically. On any other channel type, only Manual Channel Fallback is available.

- P25 Trunking
- Type II Trunking
- DVRS-Enabled PSU

10.2.8

Location

This section allows you to view or modify settings related to any radio-based (or radio accessory-based) location-determining technology.

For example, Global Positioning System (GPS) is a location-determining technology.

10.2.8.1

Location Enable

This field enables the GPS receiver in the radio for all Location-related features including Location Request Response Protocol (LRRP) requests from the Fixed Network Equipment (FNE) and the Location menu.

The Location menu is available to you with the Location button-press or Location menu-item selection.

NOTE: LRRP is a Motorola Solutions Proprietary protocol used to exchange location information (longitude and latitude) between the radio and a data device such as a Mobile Computer in the Customer Enterprise Network (CEN). This feature applies on a radio-wide basis.

Accessed Only: When the radio is model/option capable.

10.2.8.2

SmartLocate Reporting

This field allows you to select the operation of SmartLocate Reporting.

The following selections are supported:

LMR Only

When [Location Enable on page 111](#) is enabled, the radio is configured to report device location using Motorola Solutions proprietary Location Request Response Protocol (LRRP) over ASTRO system to Command Central Aware.

Broadband Only

When this selection is enabled, the radio is configured to report device location as device-to-cloud telemetry messages using Broadband (WiFi or Cellular LTE) service to Command Central Aware.

Broadband Preferred

When [Location Enable on page 111](#) is enabled and Broadband service is available, the radio is configured to report device location as device-to-cloud telemetry messages using Broadband service to Command Central Aware. If Broadband service is not available, the radio is configured to report device location using Motorola Solutions proprietary Location Request Response Protocol (LRRP) over ASTRO system to Command Central Aware.

Accessed Only: When the [Location Enable on page 111](#) field is enabled, and when the radio is model/option capable.

10.2.8.3

User Selectable Location Enable

This field enables you to turn the radio's location functionality ON or OFF on a radio-wide basis.

Location may be used in conjunction with a location-determining technology such as Global Positioning System (GPS).

WARNING: The Location menu is available to you with the Location button-press or Location menu-selection. One of these controls must be programmed, otherwise, this field will be invalid. This feature applies on a radio-wide basis.

Accessed Only: When the [Location Enable on page 111](#) field is enabled, and when the radio is model/option capable.

10.2.8.4

Location Display Format

This field selects the format for viewing and editing the coordinates in the location menu and to display location formats.

WARNING: The Location menu is available to you with the Location button-press or Location menu-item selection. This feature applies on a radio-wide basis.

Accessed Only: When the radio is model/option capable, and when the [Location Enable on page 111](#) field or the [Display Peer Location](#) field is enabled.

The following selections are supported:

- Latitude/Longitude (DMD)
- Latitude/Longitude (DMS)
- Latitude/Longitude (DD)
- UTM
- MGRS (Military Grid Reference System)

10.2.8.5

Distance Unit

This field selects the unit of measurement to be used when displaying the distance between waypoints in the radio's Location menu.

The Location menu is available to you with the Location button-press or Location menu-item selection. This feature applies on a radio-wide basis.

Accessed Only: When the [Location Enable on page 111](#) field is enabled, and when the radio is model/option capable.

The following selections are supported:

- Kilometers
- Miles

10.2.8.6

P25 Location Reporting

This field enables the radio to process Location Request or Response Protocol (LRRP) messages using the Project 25 (P25) Location Reporting data format, in addition to the legacy Motorola Location Reporting data format.

This is required when the radio exchanges LRRP location information with a Location Server within a Conventional or Trunking communications infrastructure that is only compliant with P25 Tier 2 Location

Services Specifications (as published by the Telecommunications Industry Association). This feature applies on a radio-wide basis.

When disabled, the radio only supports LRRP messages using the legacy Motorola Location Reporting data format.

NOTE:

When the Location Server communicates with the radio at the port specified in the P25 Location Reporting UDP Port field, then the radio interprets the data as being P25 Location Reporting data (the default P25-specified port number for this port is 49198).

When the Location Server communicates with the radio at static port 4001, then the radio interprets the data as “Motorola legacy Location Reporting” data.

When the Location Server makes a request for location information from a radio at the port specified in the P25 Location Reporting UDP Port field, then the radio interprets the data as being P25 Location Reporting data (the default P25-specified port number for this port is 49198), and the radio encodes or decodes the LRRP messages between the radio and the Location Server using the “P25 Location Reporting” data format.

Direct Location Registration feature allows the radios to send the Presence notification to the Location Server when the ARS application is not present, by using the “Protocol Version Messaging” LRRP message which is encoded using “P25 Location Reporting” method.

Accessed Only: When the [Location Enable on page 111](#) field is enabled, and when the radio is model/option capable.

10.2.8.7

System Managed Geofence

This field enables the radio to support the Geofence from UNS.

When SU performs the ARS User Login with the presence server, the information to indicate whether SU is capable of supporting the System Managed Geofence transmits with the ARS.

WARNING: When enabling System Managed Geofence, [ARS Mode on page 346](#) must be set as **Enhanced Server** in at least one of the Data Profile record to prevent invalid Fields Report.

Accessed Only: When the radio is model/option capable, and when the ARS Mode is Enhanced Server in at least one of the Data Profiles, and when the [Location Enable on page 111](#) field is enabled.

10.2.8.8

Mapping Mode

Mapping Mode allows the user to view their location or location of others on the map.

Accessed Only: When the [Location Enable on page 111](#) field is enabled.

The following selections are supported:

- None
- SmartMapping

10.2.8.9

Server Assisted Location

When enabled, the radio uses a broadband internet connection to provide the location of the radio.

When GNSS is unavailable, telemetry data is sent to the location server to approximate the position of the radio. Locations are sent to the location server for reverse geocoding.

Accessed Only: When the [Location Enable on page 111](#) field is enabled.

10.2.8.10

Geocoded Location Format

Geocoded Location Format allows user to select format for reverse geocoding.

Accessed Only: When the [Location Enable on page 111](#) field is enabled.

The following selections are supported:

- Disabled
- Street Address
- Intersection

10.2.9

Audio Options

This section allows you to view or define receive and transmit audio control parameters that apply on a radio wide basis.

10.2.9.1

Concurrent Rx Enable

This field enables the radio to remain unmuted even when multiple transmissions occur at the same time and on the same channel.

This is only true when operating on analog Direct/Talkaround channels. These simultaneous transmissions are only heard when their received signal strengths are relatively strong and equal. This feature applies on a radio-wide basis.

IMPORTANT:

Enabling this feature will cause some weak signals that are normally received by the radio to remain muted; therefore, it is only recommended to enable this feature if the ability to receive concurrent transmissions has been identified as necessary.

For radio models containing firmware prior to version R12.00.00, this feature is applicable only to 25 kHz channels (see also the Tx Deviation/Channel Spacing field). For radio models with R12.00.00 firmware or later, this field applies to both 12.5 kHz and 25 kHz channels.

NOTE: The audio from these concurrent transmissions is mostly unintelligible. Receiving simultaneous transmissions is sometimes needed when managing on-scene incidents where it may be very important to receive all communications. For example, having this feature enabled may be crucial to incident management where analog-only communications are used, chaotic conditions are expected, and any received transmission is better than no transmission at all.

10.2.9.2

Tx Digital/Analog Balance

This field enables the audio transmission level to equalize or balance when switching between analog and digital.

This feature may be applied on a radio-wide basis or a per Radio Profile basis.

WARNING: When **Radio Wide** is selected, Digital AGC (Radio), Analog AGC (Radio), Digital AGC (Accessory), and Analog AGC (Accessory) must be "Disabled" for each record of Radio Profiles; otherwise, this selection is considered invalid.

The following selections are supported:

Off

The feature is disabled.

Radio Wide

Balancing of the audio transmission level occurs on a radio-wide basis.

Per Profile

With this selection, the Digital/Analog Balance field may then be enabled or disabled on any of the existing Radio Profile records.

10.2.9.3

Audio Configuration Level

This field allows you to configure the radio's audio level.

Accessed Only: This is a setting which is only available in Full View (see Codeplug View).

The following selections are supported:

Enhanced

Enables the audio enhancement feature.

If you make the selection from **Enhanced** to **Basic**, then Gain Sensitivity Group Settings values and Audio Equalization Group Settings (Speaker) values are synchronized from the Radio column to the Accessory column.

Basic

Choosing **Basic** disables the audio enhancement feature, and the following fields are non-applicable:

The following fields are non-applicable:

- **Digital Low Frequency Band for both Radio and Accessory**
- **Digital Mid Frequency Band for both Radio and Accessory**
- **Low Frequency Band for Radio and Accessory**
- **Digital High Frequency Band for Accessory**
- **Mid Frequency Band for Radio and Accessory**
- **Securenet Low Frequency Band for both Radio and Accessory**
- **High Frequency Band for both Radio and Accessory**
- **Securenet Mid Frequency Band for both Radio and Accessory**
- **Audio Equalization Group Settings (Mic)**
- **Analog Low Frequency Band for both Radio and Accessory**
- **Audio Equalization Group Settings (Speaker)**
- **Analog Mid Frequency Band for both Radio and Accessory**

The following fields are non-editable:

- **AGC Gain Control Output for Accessory**
- **AGC Gain Control Total for Accessory**
- **Digital / Analog Balance for Accessory**
- **Analog High Frequency Band for Accessory**
- **Securenet High Frequency Band for Accessory**
- **Digital High Frequency Band for Accessory**

10.2.10

Transmit Power Levels

This section allows you to view or define transmit (Tx) low and transmit high power settings, within pre-defined limits.

IMPORTANT:

There are unique Transmit Power Level configurations (records/rows) for each of the possible frequency ranges within a given frequency band. However, only those Transmit Power Level configurations for the frequency band (or bands) supported by the current codeplug apply and, in some cases, can be modified. See also Primary Frequency Band and Secondary Frequency Band for the frequency bands supported by the radio.

NOTE:

To fully comply with regulatory output power level requirements, Part 80 Marine users operating between 154 – 162.025 MHz (VHF Band) and 454 – 470 MHz (UHF Band) must program the transmit power from the defaults to a level not exceeding the values given in the table below.

Note that this reduced power restriction applies only to certain models of the radio and strictly for Part 80 Marine frequencies. Also, check your license for any additional restrictions on output power.

Product Family Description	FCC/IC	Frequency Range/Output Power
APX Next	AZ489FT7147/109U-89FT7 147	156 – 162.025 MHz/5 W 454 – 470 MHz/2 W

10.2.10.1

Band Plan Selection

This field selects the appropriate 7/800 MHz frequency band - band plan that the radio is licensed to operate under, which then determines which of two Transmit Power Level configuration tables is available to the radio's codeplug.

This value applies on a radio-wide basis.

WARNING: In 2007, the Federal Communications Commission's (FCC) 700 MHz band plan rebanded the 7/800 MHz frequency band, in part to allocate the 700 MHz "D-Block" Broadband frequencies for public safety use; however, certain agencies in the U.S. and Canada may have licences / waivers that allow them to use the original 700 MHz band plan.

IMPORTANT: There are unique Transmit Power Level configurations (records / rows) for each of the possible frequency ranges within a given frequency band; however, only those Transmit Power Level configurations for the frequency band (or bands) supported by the current codeplug will apply and, in some cases, can be modified. See also Primary Frequency Band and Secondary Frequency Band for the frequency band(s) supported by the radio.

The following selections are supported:

Old

The original 7/800 MHz band plan (see the Warning), and therefore the original Transmit Power Level Transmit Power Level configurations, are applicable to the radio's codeplug.

New

The latest 7/800 MHz band plan (see the Warning), and therefore the Tx Power Level (New Band Plan) configurations, are applicable to the radio's codeplug.

Accessed Only:

- When the Primary Frequency Band or the Secondary Frequency Band is "7/800 MHz".

- When **Allow Invalid Frequencies** is enabled, and when 7/800 MHz Used in Codeplug is enabled.
- When **700 MHz Enable or 800 MHz Enable** is enabled).
- When **Allow Invalid Frequencies** is enabled.
- When **700 MHz Used in Codeplug or 800 MHzUsed in Codeplug** is enabled.
- When the radio is model/option capable.

10.2.10.2

Frequency Band

The application retrieves and displays the read-only frequency band, where each range has a unique Transmit Power Level configuration (record/row).

The current frequency range is defined by [Frequency Range Start \(MHz\) on page 117](#) and [Frequency Range End \(MHz\) on page 117](#). Dual-band radios have support for more than one frequency band (see also Primary Frequency Band and Secondary Frequency Band for the frequency band(s) supported by the radio). This value applies on a radio-wide basis.

IMPORTANT: There are unique Transmit Power Level configurations (records/rows) for each of the possible frequency ranges within a given frequency band. However, only those Transmit Power Level configurations for the frequency band (or bands) supported by the current codeplug applies and, in some cases, can be modified.

10.2.10.3

Frequency Range Start (MHz)

The application retrieves and displays the read-only Frequency Range Start value for the frequency band of the current record/row.

These values are fixed for this radio model. This value applies on a radio-wide basis.

IMPORTANT: There are unique Transmit Power Level configurations (records/rows) for each of the possible frequency ranges within a given frequency band. However, only those Transmit Power Level configurations for the frequency band (or bands) supported by the current codeplug applies and, in some cases, can be modified. See also Primary Frequency Band and Secondary Frequency Band for the frequency band(s) supported by the radio.

10.2.10.4

Frequency Range End (MHz)

The application retrieves and displays the read-only Frequency Range End value for the frequency band of the current record/row.

These values are fixed for this radio model. This value applies on a radio-wide basis.

IMPORTANT: There are unique Transmit Power Level configurations (records/rows) for each of the possible frequency ranges within a given frequency band. However, only those Transmit Power Level configurations for the frequency band (or bands) supported by the current codeplug applies and, in some cases, can be modified. See also Primary Frequency Band and Secondary Frequency Band for the frequency band(s) supported by the radio.

10.2.10.5

Tx Power Level Minimum (W)

The application retrieves and displays the read-only Tx Power Level Minimum value.

This value is fixed for this radio model, and applies only to channels in the frequency band of the current record/row.

IMPORTANT: There are unique Transmit Power Level configurations (records/rows) for each of the possible frequency ranges within a given frequency band. However, only those Transmit Power Level configurations for the frequency band (or bands) supported by the current codeplug applies and, in some cases, can be modified. See also Primary Frequency Band and Secondary Frequency Band for the frequency band(s) supported by the radio.

10.2.10.6

Tx Power Level Low (W)

This field allows you to enter the transmit (Tx) low power level.

This value applies only to channels in the frequency band of the current record/row.

WARNING: To be considered valid, Tx Power Level Low must be greater than or equal to [Tx Power Level Minimum \(W\) on page 117](#), and less than or equal to [Tx Power Level High \(W\) on page 118](#) and [Tx Power Level Maximum \(W\) on page 118](#).

IMPORTANT: There are unique Transmit Power Level configurations (records/rows) for each of the possible frequency ranges within a given frequency band. However, only those Transmit Power Level configurations for the frequency band (or bands) supported by the current codeplug applies and, in some cases, can be modified. See also Primary Frequency Band and Secondary Frequency Band for the frequency band(s) supported by the radio.

10.2.10.7

Tx Power Level High (W)

This field allows you to enter the transmit (Tx) high power level.

This value applies only to channels in the frequency band of the current record/row.

IMPORTANT: There are unique Transmit Power Level configurations (records/rows) for each of the possible frequency ranges within a given frequency band. However, only those Transmit Power Level configurations for the frequency band (or bands) supported by the current codeplug applies and, in some cases, can be modified. See also Primary Frequency Band and Secondary Frequency Band for the frequency band(s) supported by the radio.

If the Tx high power setting is increased, current limits must be re-tuned using the Tuner application so that the desired power level can be achieved.

If the Tx high power setting is decreased, current limits may be re-tuned to increase current-limiting protection.

10.2.10.8

Tx Power Level Maximum (W)

The application retrieves and displays the read-only Tx Power Level Maximum value.

This value is fixed for this radio model, and applies only to channels in the frequency band of the current record/row.

NOTE: There are unique Transmit Power Level configurations (records/rows) for each of the possible frequency ranges within a given frequency band. However, only those Transmit Power Level configurations for the frequency band (or bands) supported by the current codeplug applies and, in some cases, can be modified. See also Primary Frequency Band and Secondary Frequency Band for the frequency band(s) supported by the radio.

10.2.11

Frequency Ranges

This section allows you to set up frequencies within the codeplug that are outside the frequency band capabilities of a particular radio.

NOTE: This is useful where a Trunking or Conventional system supports dual frequency bands but specific radios in that system are single band. In this case, you are still able to read and write codeplugs, and clone between radios, even when some frequency bands in the codeplug are invalid.

WARNING: When the Allow Invalid Frequencies field is enabled, there is no warning when you attempt to write to the codeplug (write, clone, or FLASHport) and there are channels programmed that will not function in the radio.

10.2.11.1

VHF Used in Codeplug

This check box enables you to enter frequencies from the VHF frequency band into the codeplug, regardless of the radio's capabilities.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

IMPORTANT: Enabling this field and programming VHF frequencies into the radio will not allow a radio to operate within the VHF frequency range. The radio must have the necessary hardware and supporting FLASHcode to support this band.

NOTE: If the frequency band has already been purchased for the radio as represented in the FLASHcode, then this field will be enabled and will not be editable.

Accessed Only: When the Allow Invalid Frequencies field is **Enabled** and when the radio is model/option capable.

10.2.11.2

UHF1 Used in Codeplug

This check box enables you to enter frequencies from the UHF1 frequency band into the codeplug, regardless of the radio's capabilities.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

IMPORTANT: Enabling this field and programming UHF1 frequencies into the radio will not allow a radio to operate within the UHF1 frequency range. The radio must have the necessary hardware and supporting FLASHcode to support this band.

NOTE: If the frequency band has already been purchased for the radio as represented in the FLASHcode, then this field will be enabled and will not be editable.

Accessed Only: When the Allow Invalid Frequencies field is **Enabled** and when the radio is model/option capable.

10.2.11.3

UHF2 Used in Codeplug

This check box enables you to enter frequencies from the UHF2 frequency band into the codeplug, regardless of the radio's capabilities.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

IMPORTANT: Enabling this field and programming UHF2 frequencies into the radio will not allow a radio to operate within the UHF2 frequency range. The radio must have the necessary hardware and supporting FLASHcode to support this band.

NOTE: If the frequency band has already been purchased for the radio as represented in the FLASHcode, then this field will be enabled and will not be editable.

Accessed Only: When the Allow Invalid Frequencies field is **Enabled** and when the radio is model/option capable.

10.2.11.4

700 MHz Used in Codeplug

This check box enables you to enter frequencies from the 700 MHz frequency band into the codeplug, regardless of the radio's capabilities.

IMPORTANT: Enabling this field and programming 700 MHz frequencies into the radio will not allow a radio to operate within the 700 MHz frequency range. The radio must have the necessary hardware and supporting FLASHcode to support this band.

NOTE: Currently, there is only one available H-Option QA00569 for 7/800 MHz. Therefore, you should enable or disable both 700 MHz Used in Codeplug and 800 MHz Used in Codeplug at the same time.

If the frequency band has already been purchased for the radio as represented in the FLASHcode, then this field will be enabled and will not be editable.

Accessed Only: When the Allow Invalid Frequencies field is **Enabled** and when the radio is model/option capable.

10.2.11.5

800 MHz Used in Codeplug

This check box enables you to enter frequencies from the 800 MHz frequency band into the codeplug, regardless of the radio's capabilities.

IMPORTANT: Enabling this field and programming 800 MHz frequencies into the radio will not allow a radio to operate within the 800 MHz frequency range. The radio must have the necessary hardware and supporting FLASHcode to support this band.

NOTE: Currently, there is only one available H-Option QA00569 for 7/800 MHz. Therefore, you should enable or disable both 700 MHz Used in Codeplug and 800 MHz Used in Codeplug at the same time.

If the frequency band has already been purchased for the radio as represented in the FLASHcode, then this field will be enabled and will not be editable.

Accessed Only: When the Allow Invalid Frequencies field is **Enabled** and when the radio is model/option capable.

10.2.11.6

Extended 700 MHz Range

This check box enables you to enter frequencies from the 762 – 763 MHz and 792 – 793 MHz frequency band into the codeplug, regardless of the radio's capabilities.

NOTE:

Currently, there is one available PCI-Option QA07468 for Extended 700 MHz Range.

If the frequency band has already been purchased for the radio as represented in the FLASHcode, then this field will be enabled and will not be editable.

10.2.12

Tactical Public Safety

This section allows you to view or modify Tactical Public Safety (TPS) parameters.

NOTE: TPS settings are then defined on an individual Conventional Personality basis. See the Conventional Personality, Incident Signaling Type and Tactical Public Safety UI Enable fields.

Accessed Only: When the radio is model/option capable.

10.2.12.1

Voice Tx End Tone

This field enables the radio to sound an alert tone at the end of a voice transmission.

This tone sounds once the PTT button is released for both Conventional analog and digital mode (see the Tx Voice/Signal Type field), independent of any Incident Signaling Type selection, including "Disabled". This feature applies on a radio-wide basis.

Accessed Only: When the radio is model/option capable.

10.2.12.2

Audible Emergency Beacon

This field enables you ability to generate emergency alert tones during an Emergency Mode transmission; and allows you to select the amount of time between these unique repeating tones.

These alert tones play from the radio's speaker to provide an audible search-and-rescue mechanism that continues until you cancel the emergency: see also Audible Emergency Beacon Routing. This selection applies on a radio-wide basis. Time is in seconds.

IMPORTANT:

For Mobile radios, the Emergency Beacon sounds at the radio's current volume level.

For Portable radios, the Emergency Beacon sounds at the radio's maximum volume level setting.

Applies only:

- When the radio is operating in Emergency Mode and only when operating on a Conventional Personality where the Tactical Public Safety UI Enable field is enabled.
- (For Mobile radios only) When the "Audible Emergency Beacon" Extended Feature appears in the Extended Feature Name field.

Accessed Only: When the radio is model/option capable.

NOTE: Audible Emergency Beacon is disabled when set to **0 -Disabled** (default).

Table 30: Range

Minimum	Maximum	Increments
1 (seconds)	255 (seconds)	1 second

10.2.12.3

Audible Emergency Beacon Routing

This field selects the routing of "Audible Emergency Beacon" alert tones and incoming audio to a specific speaker when an Emergency Mode transmission is active.

This selection applies on a radio-wide basis.

Applies only: When the radio is operating in Emergency Mode and only when operating on a Conventional Personality where the Tactical Public Safety UI Enable field is enabled.

Accessed Only:

- When the "Audible Emergency Beacon Routing" Extended Feature appears in the Extended Feature Name field.
- When the [Audible Emergency Beacon on page 121](#) field is not set to **Disabled**.
- When the radio is model/option capable.

The following selections are supported:

External Speaker

Emergency Beacon alert tones are routed to an External Speaker (if attached, otherwise the Internal Speaker is used)

Internal Speaker Only

Emergency Beacon alert tones sound on the Internal Speaker only (regardless of External Speaker availability).

10.2.12.4

Emergency Alarm Retry Rate

This field selects the amount of time that the radio waits between Emergency Alarm Retry transmissions. This selection applies on a radio-wide basis.

NOTE:

Once Emergency Mode is entered on a Conventional Personality, this wait time applies to both the Polite and Impolite Emergency retries defined in the referenced Conventional Emergency Profile of the Personality's referenced Conventional System.

Emergency Alarm Retries then continue until an acknowledgment (Ack) of a successful emergency transmission is received back to the radio or until the number of Polite and Impolite Emergency retries has been exhausted.

Applies only: When the radio is operating in Emergency Mode and only when operating on a Conventional Personality where the Tactical Public Safety UI Enable field is enabled.

Accessed Only: When the radio is model/option capable.

NOTE: Emergency Alarm Retry Rate is disabled when set to **4 -Disabled** (default).

Table 31: Range

Minimum	Maximum	Increments
5 (seconds)	64 (seconds)	1 second

10.2.12.5

Emergency Call De-key Sidetone

This field enables the radio to sound a unique alert tone reminding you that Emergency Mode is still active.

This alert tone sounds when you release the PTT button from an Emergency Call transmission.

IMPORTANT:

For Mobile radios, this Emergency Sidetone sounds at the radio's current volume level.

For Portable radios, this Emergency Sidetone sounds at the radio's Maximum Volume setting (see also Volume Offset (dB)).

Applies only: When the radio is operating in Emergency Mode and only when operating on a Conventional Personality where the Tactical Public Safety UI Enable field is enabled.

Accessed Only: When the radio is model/option capable.

10.2.12.6

TPS PTT Transmission

This field selects when a Tactical Public Safety (TPS) packet is transmitted in relation to a non-emergency voice transmission.

This feature applies on a radio-wide basis to TPS-enabled channels.

Applies only: When the radio is operating on a Conventional Personality where the Incident Signaling Type field is set to **Tactical Public Safety**.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

None

No TPS packet is transmitted.

Leading Edge

The TPS packet is transmitted once the PTT button is pressed and just prior to any voice transmission.

Trailing Edge

The TPS packet is transmitted just after the PTT button is released.

Both

The TPS packet is transmitted once the PTT button is pressed and just prior to any voice transmission and again just after the PTT button is released.

10.2.12.7

TPS Emergency PTT Transmission

This field selects when a Tactical Public Safety (TPS) packet is transmitted in relation to an Emergency "Call" (voice) transmission (see also Emergency Type).

This feature applies on a radio-wide basis to Emergency "Call" (voice) transmissions on TPS-enabled channels.

Applies only: When the radio is operating in Emergency Mode and only when operating on a Conventional Personality where the Incident Signaling Type field is set to **Tactical Public Safety**.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

None

No TPS packet is transmitted.

Leading Edge

The TPS packet is transmitted once the PTT button is pressed and just prior to any Emergency Call (voice) transmission.

Trailing Edge

The TPS packet is transmitted just after the PTT button is released in any Emergency Call (voice) transmission.

Both

The TPS packet is transmitted once the PTT button is pressed and just prior to any Emergency Call (voice) transmission and again just after the PTT button is released.

10.2.13

Personnel Accountability

The **Personnel Accountability** section of the **Radio Wide** allows the user to view or modify Personnel Accountability parameters.

NOTE: When operating in talkaround/direct mode and in close proximity of other radios, it is recommended to configure additional preamble of 160 to the ASTRO system configured with Personnel Accountability enabled channels.

10.2.13.1

Periodic Update Timer

This field selects the amount of time that determines how often (in minutes) the radio sends out an unsolicited and no-confirmation-required Personnel Accountability (PA) packet to the Incident Command Terminal (ICT).

This is only true once a successful PA Registration has already occurred. If the PA Registration attempt has failed, this timer is then used to determine how often (in minutes) that the radio will retry PA Registration. This feature applies on a radio-wide basis to Personnel Accountability-enabled channels.

Applies only: When the radio is operating on a Conventional Personality where both the Incident Signaling Type field is set to **Personnel Accountability** and the Personnel Accountability Registration field is enabled.

Accessed Only: When the radio is model/option capable.

NOTE: Periodic Update Timer is disabled when set to **0 -Disabled** (default). The radio does not send out unsolicited or no-confirmation-required Personnel Accountability (PA) packets; nor does it retry PA Registration.

Table 32: Range

Minimum	Maximum	Increments
1 minute	20 minutes	1 minute

10.2.13.2

Respond To Polls

This field enables the radio to send back a response immediately after receiving a Personnel Accountability poll.

Personnel Accountability polling is initiated by the Incident Commander (IC) and is used to query radios confirming their ability to communicate. This feature applies on a radio-wide basis to Personnel Accountability-enabled channels.

Applies only: When the radio is operating on a Conventional Personality where the Incident Signaling Type field is set to **Personnel Accountability**.

Accessed Only: When the radio is model/option capable.

10.2.13.3

Evacuation Acknowledgment

This field selects ways the radio responds to Personnel Accountability Evacuation messages.

Personnel Accountability Evacuation messages are sent by the Incident Commander (IC). This feature applies on a radio-wide basis to Personnel Accountability-enabled channels.

Applies only: When the radio is operating on a Conventional Personality where the Incident Signaling Type field is set to **Personnel Accountability**.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Disabled

The radio does not respond to an Evacuation message.

Manual

The radio responds to an Evacuation message upon your intervention through a PTT button press.

10.2.13.4

Personnel Accountability PTT Transmission

This field selects when an unconfirmed (no acknowledgment expected) Personnel Accountability (PA) packet is transmitted in relation to a non-emergency voice transmission.

This feature applies on a radio-wide basis to Personnel Accountability-enabled channels.

Applies only: When the radio is operating on a Conventional Personality where the Incident Signaling Type field is set to **Personnel Accountability**.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

None

No PA packet is transmitted.

Leading Edge

The PA packet is transmitted once the PTT button is pressed and just prior to any non-emergency voice transmission.

Trailing Edge

The PA packet is transmitted just after the PTT button is released.

Both

The PA packet is transmitted once the PTT button is pressed and just prior to any non-emergency voice transmission and again just after the PTT button is released.

10.2.13.5

Personnel Accountability Emergency PTT Transmission

This field selects when an unconfirmed (no acknowledgment expected) Personnel Accountability (PA) packet is transmitted in relation to an Emergency.

This feature applies on a radio-wide basis for Emergency Call transmissions on Personnel Accountability-enabled channels.

Applies only: When the radio is operating in Emergency Mode and only when operating on a Conventional Personality where the Incident Signaling Type field is set to **Personnel Accountability**.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

None

No PA packet is transmitted.

Leading Edge

The PA packet is transmitted once the PTT button is pressed and just prior to any Emergency Call transmission.

Trailing Edge

The PA packet is transmitted just after the PTT button is released.

Both

The PA packet is transmitted once the PTT button is pressed and just prior to any Emergency Call transmission and again just after the PTT button is released.

10.2.13.6

Acknowledge Alerts on PTT

This field allows you to configure the PTT button to acknowledge the fireground alerts.

When enabled, the PTT, Side Top (Purple) button on portable radio or accessories, and the 1-Dot Programmable Button on RSM can be used to acknowledge these alerts.

There are 16 programmable alerts that can be sent from the client and received by the radios. The alerts include tone, backlight, vibrating, voice announcement, text, LED, etc.

Accessed Only: When the radio is model/option capable.

10.2.14

Bluetooth

This section allows you to view or modify settings related to Bluetooth technology.

IMPORTANT: Refer to the radio User Guide for list of COTS approved devices and new supported profiles.

Accessed Only: When the radio is model/option capable.

10.2.14.1

Bluetooth Enable

This field allows you to enable the Bluetooth feature in the radio.

Bluetooth Enable allows the radio to pair and communicate with a Bluetooth-enabled accessory, such as an earpiece. This feature applies on a radio-wide basis.

Accessed Only: When the radio is model/option capable.

10.2.14.2

Bluetooth Tones

This field allows you to enable the Bluetooth tones.

This feature applies on a radio-wide basis.

Accessed Only: When the [Bluetooth Enable on page 126](#) field is **Enabled**, and when the radio is model/option capable.

10.2.14.3

Bluetooth Friendly Name Editable

This field allows you to edit the contents of the Bluetooth Friendly Name field through the radio menu or keypad.

This feature applies on a radio-wide basis.

Accessed Only: When the [Bluetooth Enable on page 126](#) field is **Enabled**, and when the radio is model/option capable.

10.2.14.4

Remote Speaker Microphone Bluetooth LED

The Remote Speaker Microphone (RSM) Bluetooth LED illuminates when there is radio Bluetooth connectivity.

10.2.14.5

Legacy Bluetooth PIN Pairing

This field allows you to enable the Legacy Bluetooth PIN pairing.

You can pair the radio with Bluetooth enabled accessory that uses Bluetooth Core Specification 2.0 and earlier.

This feature applies on a radio-wide basis.

10.2.15

Sensor

This section allows you to view or define Sensor functionality.

10.2.15.1

Sensor Event Disable Time

This field allows you to specify the amount of time you have to wait for an event to occur while in temporary disable mode.

If an event does not occur, the temporary disable is canceled. The default value is 30.

Accessed Only: When the radio is model/option capable.

Table 33: Range

Minimum	Maximum	Increments
5 seconds	300 seconds	5 seconds

10.2.15.2

Sensor Event Notification Enable

This field allows you to enable the local notification if there are any context event from the connected sensor devices.

Accessed Only: When the radio is model/option capable.

10.2.16

Rx Frequency Split

This field displays the starting and ending frequency of the Receive Frequency Split. Each row is applicable to the specified frequency band.

These values are fixed for the radio model on a radio-wide basis.

10.2.17

Tx Frequency Split

This field displays the starting and ending frequency of the Transmit Frequency Split. Each row is applicable to the specified frequency band.

These values are fixed for the radio model on a radio-wide basis.

10.3

Factory Overrides

The **Factory Overrides** is used to enter factory override information for certain radio signal algorithms on a radio-wide basis.

WARNING: Factory overrides should not be entered unless deemed necessary. Procedures to enter factory override information should only be attempted by Qualified Service Personnel. Failure to perform procedures properly may seriously degrade the radio and/or system performance.

10.3.1

General

This section enables you to enter factory override information.

10.3.1.1

Factory Overrides Enable

This field enables you to enter factory override information in the Factory Overrides lists.

This selection applies on a radio-wide basis. When disabled, all Factory Override settings are disregarded.

WARNING: This field should not be enabled unless deemed necessary. Procedures to enter factory override information in the Factory Overrides menu should only be attempted by Qualified Service Personnel. Failure to perform procedures properly may seriously degrade the radio and/or system performance.

Accessed Only: This is an advanced setting which is only available in Expert View.

10.3.2

Tx SSI Clock Rate List

This section allows you to enter transmit frequencies, and their respective reference divider values, for frequencies at which a crosstalk phenomenon occurs.

Crosstalk occurs when a signal transmitted on one channel creates an undesired effect on another channel. These fields apply on a radio-wide basis.

WARNING: Factory overrides should not be entered unless deemed necessary. Procedures to enter factory override information should only be attempted by Qualified Service Personnel. Failure to perform procedures properly may seriously degrade the radio and/or system performance.

10.3.2.1

Tx Frequency

This field allows you to enter a Transmit (Tx) frequency (in MHz) at which a crosstalk phenomenon occurs, for the respective Tx SSI Clock Rate frequency value.

This selection applies for the current record/row which applies on a radio-wide basis.

WARNING:

This field should not be enabled unless deemed necessary. Procedures to enter factory override information in the Factory Overrides menu should only be attempted by Qualified Service Personnel. Failure to perform procedures properly may seriously degrade the radio and/or system performance.

6.25 kHz step size for the 800 MHz frequency band:

Starting with Release R09.01.00, the application allows a 6.25 kHz step size for Conventional frequencies in the 800 MHz frequency band, to meet regulatory compliance in certain (non-FCC) countries; however, be aware that two radios operating on adjacent channels separated by 6.25 kHz only may experience an undesirable crosstalk phenomena.

IMPORTANT:

Duplicate frequencies are not allowed. Therefore, when selecting a frequency, if a frequency has already been entered into the list, then that frequency will no longer be a valid choice for the current field.

Refer to the Motorola Solutions Catalog Sheets/Price Pages or Manual for valid Frequencies for the current model.

For optimal performance, the frequencies should be entered in ascending order.

Accessed Only: When the [Factory Overrides Enable on page 128](#) field is **Enabled** and when the radio is model/option capable. This is an advanced setting which is only available in Expert View (see Codeplug View).

10.3.2.2

Tx SSI Clock Rate

This field selects the Transmit (Tx) synthesizer SSI Clock Rate frequency (in MHz) for the respective Tx Frequency at which the crosstalk phenomenon occurs.

This selection applies for the current record/row which applies on a radio-wide basis.

WARNING: This field should not be enabled unless deemed necessary. Procedures to enter factory override information in the Factory Overrides menu should only be attempted by Qualified Service Personnel. Failure to perform procedures properly may seriously degrade the radio and/or system performance.

Accessed Only: When the [Factory Overrides Enable on page 128](#) field is **Enabled** and when the radio is model/option capable. This is an advanced setting which is only available in Expert View (see Codeplug View).

The following selections are supported:

- 2.40 MHz
- 3.36 MHz
- 8.40 MHz
- 1.92 MHz

10.3.3

Rx SSI Clock Rate List

This section allows you to enter transmit frequencies, and their respective reference divider values, for frequencies at which a crosstalk phenomenon occurs.

Crosstalk occurs when a signal transmitted on one channel creates an undesired effect on another channel. These fields apply on a radio-wide basis.

WARNING: Factory overrides should not be entered unless deemed necessary. Procedures to enter factory override information should only be attempted by Qualified Service Personnel. Failure to perform procedures properly may seriously degrade the radio and/or system performance.

10.3.3.1

Rx Frequency

This field allows you to enter an Receive (Rx) frequency (in MHz) at which a crosstalk phenomenon occurs for the respective Rx SSI Clock Rate frequency value.

This selection applies for the current record / row which applies on a radio-wide basis.

WARNING: This field should not be enabled unless deemed necessary. Procedures to enter factory override information in the Factory Overrides menu should only be attempted by Qualified Service Personnel. Failure to perform procedures properly may seriously degrade the radio and/or system performance.

From R09.01.00, 6.25 kHz step size for Conventional frequencies in the 800 MHz frequency band is allowed to meet the regulatory compliance in certain (non-FCC) countries. Two radios operating on adjacent channels separated by 6.25 kHz only may experience an undesirable crosstalk phenomena.

IMPORTANT:

Duplicate frequencies are not allowed. Therefore, when selecting a frequency, if a frequency has already been entered into the list, then that frequency will no longer be a valid choice for the current field.

Refer to the Motorola Solutions Catalog Sheets/Price Pages or Manual for valid Frequencies for the current model.

For optimal performance, the frequencies should be entered in ascending order.

Accessed Only When the [Factory Overrides Enable on page 128](#) field is **Enabled** and when the radio is model / option capable.

10.3.3.2

Rx SSI Clock Rate

This field selects the Receive (Rx) synthesizer SSI Clock Rate frequency (in MHz) for the respective Rx Frequency at which the crosstalk phenomenon occurs.

This selection applies for the current record/row which applies on a radio-wide basis.

WARNING: This field should not be enabled unless deemed necessary. Procedures to enter factory override information in the Factory Overrides menu should only be attempted by Qualified Service Personnel. Failure to perform procedures properly may seriously degrade the radio and/or system performance.

Access Only: When the [Factory Overrides Enable on page 128](#) field is enabled and when the radio is model/option capable.

The following selections are supported:

- 1.2 MHz
- 1.5 MHz
- 1.8 MHz
- 6.4 MHz
- 9.6 MHz

10.3.4

Rx SSI Clock Rate List : Tx Mode

This section allows you to enter transmit frequencies, and their respective reference divider values, for frequencies at which a crosstalk phenomenon occurs.

Crosstalk occurs when a signal transmitted on one channel creates an undesired effect on another channel. These fields apply on a radio-wide basis.

WARNING: Factory overrides should not be entered unless deemed necessary. Procedures to enter factory override information should only be attempted by Qualified Service Personnel. Failure to perform procedures properly may seriously degrade the radio and/or system performance.

10.3.4.1

Tx Frequency

This field allows you to enter a Transmit (Tx) frequency (in MHz) at which a crosstalk phenomenon occurs, for the respective Tx SSI Clock Rate frequency value.

This selection applies for the current record/row which applies on a radio-wide basis.

WARNING: This field should not be enabled unless deemed necessary. Procedures to enter factory override information in the Factory Overrides menu should only be attempted by Qualified Service Personnel. Failure to perform procedures properly may seriously degrade the radio and/or system performance.

From R09.01.00, 6.25 kHz step size for Conventional frequencies in the 800 MHz frequency band is allowed to meet the regulatory compliance in certain (non-FCC) countries. Two radios operating on adjacent channels separated by 6.25 kHz only may experience an undesirable crosstalk phenomena.

IMPORTANT: Duplicate frequencies are not allowed. Therefore, when selecting a frequency, if a frequency has already been entered into the list, then that frequency will no longer be a valid choice for the current field.

Refer to the Motorola Solutions Catalog Sheets/Price Pages or Manual for valid Frequencies for the current model.

For optimal performance, the frequencies should be entered in ascending order.

Accessed Only: When the [Factory Overrides Enable on page 128](#) field is **Enabled** and when the radio is model/option capable. This is an advanced setting which is only available in Expert View (see Codeplug View).

10.3.4.2

Rx SSI Clock Rate

This field selects the Receive (Rx) synthesizer SSI Clock Rate frequency (in MHz) for the respective Rx Frequency at which the crosstalk phenomenon occurs.

This selection applies for the current record/row which applies on a radio-wide basis.

WARNING: This field should not be enabled unless deemed necessary. Procedures to enter factory override information in the Factory Overrides menu should only be attempted by Qualified Service Personnel. Failure to perform procedures properly may seriously degrade the radio and/or system performance.

Accessed Only: When the [Factory Overrides Enable on page 128](#) field is **Enabled**, and when the radio is model/option capable and when the radio is model/option capable.

The following selections are supported:

- 6.4 MHz
- 9.6 MHz

10.3.5

Second LO Injection Frequency List

This section allows you to view or modify individual Rx (Receive) frequencies for which the opposite second LO injection frequency will be used instead of the default.

This feature applies on a radio-wide basis.

WARNING: Factory overrides should not be entered unless deemed necessary. Procedures to enter factory override information should only be attempted by Qualified Service Personnel. Failure to perform procedures properly may seriously degrade the radio and/or system performance.

10.3.5.1

Second LO Injection Frequency

This field allows you to enter an individual receive (Rx) frequency (in MHz) for which the opposite second LO injection frequency will be used instead of the default.

This selection applies for the current record/row which applies on a radio-wide basis.

WARNING: This field should not be enabled unless deemed necessary. Procedures to enter factory override information in the Factory Overrides menu should only be attempted by Qualified Service Personnel. Failure to perform procedures properly may seriously degrade the radio and/or system performance.

From R09.01.00, 6.25 kHz step size for Conventional frequencies in the 800 MHz frequency band is allowed to meet the regulatory compliance in certain (non-FCC) countries. Two radios operating on adjacent channels separated by 6.25 kHz only may experience an undesirable crosstalk phenomena.

Accessed Only: When the [Factory Overrides Enable on page 128](#) field is **Enabled**, and when the radio is model/option capable.

10.3.6

Out of Band Rejection List

Out-of-band rejection specifies a rejection value centered around dB. It is defined in relation to a filter's peak efficiency.

10.3.6.1

Rx Frequency (MHz)

Allows the user to enter an Rx (Receive) frequency (in MHz) at which a crosstalk phenomenon occurs for the respective Out of Band Rejection List frequency value.

This selection applies for the current record / row which applies on a radio-wide basis.

WARNING:

This field should not be enabled unless deemed necessary. Procedures to enter factory override information in the Factory Overrides menu should only be attempted by Qualified Service Personnel. Failure to perform procedures properly may seriously degrade the radio and/or system performance.

6.25 kHz step size for the 800 MHz frequency band:

Starting with Release R09.01.00, RadioCentral allows a 6.25 kHz step size for Conventional frequencies in the 800 MHz frequency band, to meet regulatory compliance in certain (non-FCC) countries; however, be aware that two radios operating on adjacent channels separated by 6.25 kHz only may experience an undesirable crosstalk phenomena.

IMPORTANT:

Duplicate frequencies are not allowed. Therefore, when selecting a frequency, if a frequency has already been entered into the list, then that frequency will no longer be a valid choice for the current field.

Refer to the Motorola Solutions Catalog Sheets/Price Pages or Manual for valid Frequencies for the current model.

For optimal performance, the frequencies should be entered in ascending order.

Accessed Only When the [Factory Overrides Enable on page 128](#) field is **Enabled** and when the radio is model / option capable.

10.4

Radio Ergonomics Wide

This section allows you to view or define radio-wide functionality that applies to both conventional and trunking communications modes.

10.4.1

Home Mode

This section allows you to select a specific zone and channel that are then considered the radio's Home Mode.

Mode is another name for a certain zone and channel. Zones and Channels must first be defined in the Zone Channel Assignment Window. This feature then applies on a radio-wide basis.

NOTE: You can access this programmed Home Mode with a long keypress of the radio's Home button. A short keypress of the radio's Home button may also verify a current radio selection when using features such as changing channels, changing zones, or selecting Priority Members/channels for a Scan List.

10.4.1.1

Home Mode Selection

This field enables the Home Mode feature allowing the radio to easily jump to the programmed Home Mode Zone and Home Mode Channel.

Mode is another name for a certain zone and channel. This selection applies on a radio-wide basis.

NOTE: You are then easily able to access this programmed Home Mode with a long keypress of the radio Home button. A short keypress of the radio Home button may also verify a current radio selection when using features such as changing channels, changing zones, or selecting Priority Members/channels for a Scan List.

If the radio is the latest Fire Service Standards models, the Home Mode is checked and grayed out by default. The Home Mode's **Zone and Channel** must be set to a channel that is tied to a Hazard Zone Mode personality (Hazard Zone Mode Personality field is checked).

The latest Fire Service Standards radio model powers up to the Hazard Zone Mode channel. Home **Zone and Channel** is selected if the previous channel is not a Hazard Zone Mode channel.

Accessed Only: When radio is model or option capable.

10.4.1.2

Home Mode Zone

This field allows you to select a Home Mode Zone for the radio.

Once the Zone is selected, the Home Mode Channel may then be selected. Mode is another name for a certain zone and channel. This selection applies on a radio-wide basis.

NOTE: You are then easily able to access this programmed Home Mode with a long keypress of the radio's Home button. A short keypress of the radio's Home button may also verify a current radio selection when using features such as changing channels, changing zones, or selecting Priority Members/channels for a Scan List.

WARNING: Dynamic Zones are invalid and cannot be selected (zones that have Dynamic Zone Enable enabled).

Remote Site Interface (RSI) zones are invalid and cannot be selected (zones that have RSI Mode enabled).

Accessed Only: When the Home Mode Selection field is enabled, and when radio is model/option capable.

10.4.1.3

Home Mode Channel

This field selects a Home Mode Channel for the radio.

The Home Mode Zone must be selected first. Mode is another name for a certain zone and channel. This selection applies on a radio-wide basis.

NOTE: You are then easily able to access this programmed Home Mode with a long keypress of the radio's Home button. A short keypress of the radio's Home button may also verify a current radio selection when using features such as changing channels, changing zones, or selecting Priority Members/channels for a Scan List.

Accessed Only: When the [Home Mode Selection on page 133](#) field is **enabled**, and when the [Home Mode Zone on page 134](#) field is not set to a **Dynamic Zone**, and when radio is model/option capable.

10.4.2

Advanced

This section allows you to view or define diverse functionality that applies on a radio-wide basis.

Accessed Only: When the radio is model/option capable.

10.4.2.1

Short Keypress Duration

This field selects the amount of time that defines how long you must press and hold a radio-button in order for the action to be recognized as a short keypress by the radio.

Time is in milliseconds (ms). This selection applies on a radio-wide basis.

IMPORTANT: This short keypress duration must always be a shorter period of time than the Long Keypress Duration field setting.

The following selections are supported:

Table 34: Range

Minimum	Maximum	Increments
0 (ms)	6200 (ms)	50 (ms)

10.4.2.2

Short Keypress Duration for Emergency

This field selects the amount of time that defines how long you must press and hold the Emergency button before the radio activates the emergency mode operation.

A long keypress of the same Emergency button de-activates the radio's emergency mode. Time is in milliseconds (ms). This feature applies on a radio-wide basis.

NOTE: Either this short keypress duration must be a shorter period of time than the Long Keypress Duration for Emergency field setting, or the Long Keypress Duration for Emergency must be disabled (set to 0).

The following selections are supported:

Table 35: Range

Minimum	Maximum	Increments
50 (ms)	6200 (ms)	50 (ms)

10.4.2.3

Long Keypress Duration

This field selects the amount of time that defines how long you must press and hold a programmable button before the radio recognizes a valid long press.

The radio's preprogrammed Home button is an example of a button that takes advantage of Long Keypress functionality. Time is in milliseconds (ms). This feature applies on a radio-wide basis.

IMPORTANT: This long keypress duration must always be a longer period of time than the [Short Keypress Duration on page 135](#) field setting.

The following selections are supported:

Table 36: Range

Minimum	Maximum	Increments
250 (ms)	6350 (ms)	250 (ms)

10.4.2.4

Long Keypress Duration for Emergency

This field selects the amount of time that defines how long you must press and hold an Emergency button before the radio deactivates the radio's emergency mode operation.

A short keypress of the Emergency button activates the radio's emergency mode operation. This feature applies on a radio-wide basis. Time is in milliseconds (ms).

IMPORTANT:

When not set to **0**, this long keypress duration must be a longer period of time than the Short Keypress Duration for Emergency field setting.

Selecting **0** causes emergency mode exit with a long keypress to be disabled. Emergency exit may still be accomplished by powering off the radio.

The following selections are supported:

Table 37: Range

Minimum	Maximum	Increments
0 (ms)	63750 (ms)	250 (ms)

10.4.2.5

Soft Power Off

This field selects a specific radio button that you must pressed (after the Power knob is placed in the "Off" position) in order to power down the radio.

This selection applies on a radio-wide basis.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Disabled

Positioning the Power knob at the "Off" position shuts the radio off.

Side Button 1

To turn the radio off, the Side Top Button must be pressed after the Power knob is placed in the "Off" position. The User Guide refers to this as Top Side (Select) Button.

Side Button 2

To turn the radio off, the Side Middle Button must be pressed after the Power knob is placed in the "Off" position. The User Guide refers to this as Side Button 1.

Side Button 3

To turn the radio off, the Side Bottom Button must be pressed after the Power knob is placed in the "Off" position. The User Guide refers to this as Side Button 2.

10.4.2.6

Last Selected Channel Per Zone Enable

This field enables your most recent selected channel for each zone to automatically appear in the radio's display.

When scrolling through the radio's zones, the last-selected channel for each zone is remembered by the radio and is immediately available to you. You may then select any other desired channel within a zone. This feature applies on a your basis.

When disabled, the radio remains on the currently selected channel # when changing to a new zone. For example, the radio is on channel 14 in zone 3; if the zone is changed to zone 15, the channel is now on channel 14 in zone 15. Note that: if zone 15 does not have a channel 14, then

UNPROGRAMMED appears in the radio's display; you must then change to a channel that is available in the new zone.

NOTE: When this feature is enabled, the [Power Up On Last Selected Zone and Channel on page 137](#) and [Home Mode Channel on page 134](#) field also becomes enabled and view-only/not modifiable.

10.4.2.7

Power Up On Last Selected Zone and Channel

When this field is enabled, it causes the radio's current Zone and Channel switch positions to be ignored during power up.

This field also causes the radio to power up on the radio's last-selected Zone and Channel switch positions just prior to the radio being powered down. When disabled, the radio powers up on the radio's currently-selected Zone and Channel switch positions. This feature applies on a radio-wide basis.

WARNING: The Zone Select and Channel Select Rotary/switch-toggle selections must be programmed.

Accessed Only: When Last Selected Channel Per Zone Enable is **Disabled** and when the radio is model/option capable.

NOTE: When Last Selected Channel Per Zone Enable is **Enabled**, this field also becomes Enabled and view-only/not modifiable.

10.4.2.8

Volume Control Lockout with RSM

This field selects which volume control(s) can set the radio's volume level when an accessory is connected to the radio.

This feature applies on a radio-wide basis.

Accessed Only:When the microphone is model / option capable.

The following selections are supported:

None

Both the radio's and an accessory's volume controls can select the radio volume.

Lock Radio Only

When an accessory with volume control is attached, the radio's volume control becomes inoperable and the accessory's volume control selects the radio volume.

10.4.2.9

Channel Control Lockout with Accessory

This field enables a radio accessory's "channel control" to override and lock out the radio's channel control.

This feature applies on a radio-wide basis.

NOTE: This field should not be enabled if the RMN5067 microphone is in use, since this microphone has no channel control knob.

Accessed Only:When the microphone is model/option capable.

The following selections are supported:

None

Both the radio's and an accessory's channel controls can select the radio channels.

Lock Radio Only

When an accessory with channel control is attached, the radio's channel control becomes inoperable and the accessory's channel control selects the radio channels.

10.4.2.10

Active Mic for Radio PTT

This field selects which microphone is active when you press the PTT button.

This feature applies on a radio-wide basis.

IMPORTANT: This field setting is not supported for third party accessories. Any changes in the settings must be done through your accessory developer.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Radio Mic

The radio's internal microphone will be active.

RSM Mic

The Remote Speaker Microphone (RSM) will be active.

The radio's internal microphone provides contingency operation if an RSM is unavailable when you press the PTT button.

When the radio is plugged into a Vehicular Adapter (VA) that has a microphone attached to its Mobile Microphone Port (MMP), that microphone will be active.

Wireless Mic

The wireless microphone will be active.

The radio's internal microphone provides contingency operation if a wireless microphone is unavailable when you press the PTT button.

10.4.2.11

Active Mic for RSM PTT

This field selects which microphone is active when you press the PTT button on the Remote Speaker Microphone (RSM).

This feature applies on a radio-wide basis.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Radio Mic

The radio's internal microphone will be active.

RSM Mic

The RSM will be active.

The radio's internal microphone provides contingency operation if an RSM is unavailable when you press the PTT button.

When the radio is plugged into a Vehicular Adapter (VA) that has a microphone attached to its MMP (Mobile Microphone Port), that microphone will be active.

Wireless Mic

The wireless microphone will be active.

The radio's internal microphone provides contingency operation if a wireless microphone is unavailable when you press the PTT button.

10.4.2.12

Touch Screen Lock Enable

This field allows you to enable the unlock and lock option of the touch screen.

10.4.2.13

Side and Speaker Grille Buttons Lock Enable

This field enables the lock feature for the radio Side Top, Side Middle, Side Bottom, and Speaker Grille buttons.

NOTE: The buttons that are programmed with ViQi Voice Control and ViQi Virtual Partner features remain unlocked.

You can initiate this feature by toggling on and off with the Keypad/Controls Lock button-press or Keypad/Controls Lock switch-toggle. This feature applies on a radio-wide basis.

Accessed Only: When the radio is model/option capable.

10.4.3

Control Head

This section allows you to view or modify settings related to a multi-control-head to one transceiver configuration.

Accessed Only: When the radio is model or option capable.

10.4.3.1

Control Head Power-up Brightness

This feature allows each control head to power up with the previously selected brightness or minimum brightness.

If the previous user selected minimum brightness or higher, then the control head powers up with the same brightness.

Each control head at least powers up with the minimum brightness. If any control head's previous user selected brightness is equal to minimum, then that control head shall power up with the minimum brightness. If any control head's previous user selected brightness is above Minimum, then that control head shall power up with last user selected brightness.

NOTE: This field is not available if **Secondary Radio** is selected under the **Dual Radio - Radio Selection** field.

Last Mode (Default)

Control head powers up and maintain the last selected brightness.

Minimum

Control head powers up with the minimum brightness if it was in **Dark mode** or maintain the level that it was in before.

10.5

Personnel Accountability

The **Personnel Accountability** allows the user to view or define functionality relating to the personnel accountability feature. These settings apply on a radio-wide basis to Personnel Accountability-enabled channels.

When subscriber receives Evacuation (EVAC) or Personnel Accountability Report (PAR) command on voice channel or data channel, it will provide the visible display and audible tone to first responder.

When the first responder press PTT, the radio will transmit an acknowledgement response ("Ack") to inform incident commander that the command is received.

NOTE: Personnel Accountability settings must be defined on an individual Conventional Personality basis. See the Conventional Personality, Incident Signaling Type, Personnel Accountability Registration, and Tx Voice Type fields.

Accessed Only: When the radio is model/option capable.

10.5.1

AC List Selection

This field allows you to select 0-16 Action Consolidation for Personnel Accountability List.

Accessed Only: When the radio is model/option capable.

WARNING: This field must reference an Action Consolidation where **Action Type** is set to **Personnel Accountability**.

10.5.2

Personnel Accountability List Name

This field allows you to create a recognizable name for the current personnel accountability list.

Personnel accountability alert list is selected from the Conventional or Trunking System's Personnel Accountability List Selection field.

Accessed Only: When the radio is model/option capable.

10.6

Action Consolidation

The **Action Consolidation** is used to view and define specific sequences of radio actions; known as Consolidated Actions. Within a Consolidated Action, these individual actions may be designed to execute (in the radio) one-by-one in a specific order. Multiple Consolidation Actions may be created. A Consolidated Action's sequence of radio actions may then be easily executed with minimal effort by the radio-user.

IMPORTANT:

When the radio is powered up, any Consolidated Action assigned to the Response Selector's current position is executed.

No matter if a Consolidated Action is completed or canceled, if there are any required channel/mode changes in the action, the radio always returns to its original channel/mode.

Once initiated, a Consolidated Action may be canceled, however the individual actions typically happen so quickly, that the likelihood of terminating any part of the Action is nearly impossible.

- A Consolidated Action can be terminated by a Home button-press, a menu EXIT, a PTT button-press (provided the Public Address mode is not active), or the engagement of Emergency Mode.
- The Relay Pattern, Siren Type, or GPS Report actions are the first to launch and are therefore nearly immediate.

NOTE:

The radio-user may execute a Consolidated Action with the Action Consolidation selection defined on the Response Selector or on a button-press.

It is recommended that the Response Selector's "0" position be assigned a Consolidated Action that turns all Relay Patterns, Siren tones, GPS Reports, Mode changes, and Direct Status to an "Unassigned" or ALL OFF state. It may also be desirable to assign this Action to a button-press.

10.6.1

General (Action Consolidation)

The **General** section of the **Action Consolidation** contains the following fields:

10.6.1.1

Action Type

This field determines the type of the current Action Consolidation that will be used.

The following selections are available:

General

The Action Consolidation is applied to Enter Action on Mission Critical Geofence.

Exit Geofence

The Action Consolidation is applied to Exit Action or Enter Action on Mission Critical Geofence.

Personnel Accountability

The Action Consolidation is applied to as AC List Selection on Personnel Accountability or Enter Action on Mission Critical Geofence.

Virtual Partner

The Action Consolidation is applied when the radio receives a Virtual Partner Alert from the system.

ViQi: Virtual Partner

The Action Consolidation is applied when the radio receives a Virtual Partner Alert from the system.

10.6.1.2

Action Allowed on Response Selector

The application retrieves and allows you to view the availability of the current Consolidated Action for assignment to the Response Selector.

If any Action ID (record/row) is set to **Mode** for the current Consolidated Action, then this field is unchecked, indicating that the Response Selector is not available for the current Consolidated Action. When this field is checked, it indicates that the Response Selector is available for the current Consolidated Action.

Accessed Only: When the radio is model/option capable and the [Action Type on page 141](#) field is set to **Control**.

10.6.1.3

Backlight Color

This field allows you to select a backlight when the consolidated action is triggered.

The following options are supported:

- Disabled
- Red
- Amber
- Green

10.6.1.4

Consolidated Action Name

This field allows you to define recognizable names for the current Consolidated Action.

This field is also used as Personnel Accountability alert alias to highlight text in the display when the Action Consolidation is a Personnel Accountability action type.

Accessed Only: When the radio is model/option capable.

NOTE:

Characters, numbers, spaces, and special characters can be used.

Up to 14 characters are possible.

Examples: Traffic Stop, In Pursuit, #510

10.6.2

Consolidation Actions List (Action Consolidation)

The **Consolidation Actions List** section.

10.6.2.1

Action ID

This field selects the Action type for the current Action ID (record/row) of the current Consolidated Action.

Multiple Action IDs (Direct Status and Mode changes) may be defined within a single Consolidated Action. Multiple Action IDs allow the radio to automatically send a Direct Status on the appropriate radio mode. When defining multiple Action IDs, each action is executed in a top-down order. You may execute a Consolidated Action with the Action Consolidation selection defined on the Response Selector or on a button-press.

Example: This example shows an Action Consolidation containing multiple Action IDs. In this case the radio has three channels (Trunking 800 MHz, Trunking VHF, and Conventional ASTRO) and the goal is to automatically broadcast the **At Scene** status to all three channels from the same Consolidated Action.

Table 38: Examples

Action ID Setting:	Further Action ID Setting:	Radio Action
Row 1 = "Mode"	Mode to desired Trunking 800 MHz channel	Radio changes to desired mode
Row 2 = "Direct Status"	Direct Status to "At Scene"	Radio transmits Status on de-sired mode
Row 3 = "Mode"	Mode to desired Trunking VHF channel	Radio changes to desired mode
Row 4 = "Direct Status"	Direct Status to "At Scene"	Radio transmits Status on de-sired mode
Row 5 = "Mode"	Mode to desired Conventional ASTRO channel	Radio changes to desired mode
Row 6 = "Direct Status"	Direct Status to "At Scene"	Radio transmits Status on de-sired mode
Row 7 = "Mode"	Mode to desired Trunking 800 MHz channel	Radio changes to desired mode

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Direct Status

Transmits a Status for the current Consolidated Action. The Index selection for the current Consolidated Action (record/row) determines which Direct Status is transmitted.

- When operating in Conventional Mode, the Index number selection correlates with the same Status Number within the Conventional Status Alias List. There is only one Status Alias List for Conventional communications; therefore, the Status Alias List's Status Numbers apply for all Conventional Personalities.
- When operating in Trunking Mode, the Index number selection correlates with the same Status Number within the Trunking Mode's Status Alias List. Trunking allows for one Status Alias List per Trunking System; therefore, Status Text may vary with the same Status Number on a per Trunking System basis.

Mode

Causes the radio to change channel/mode as part of the current Consolidated Action. The Zone and Channel selections determine the actual modes available to you. Once the Consolidated Action is exited, the radio returns to the Mode (Zone/Channel) that the radio was operating on just prior to the Consolidated Action being launched.

NOTE: Once the Consolidated Action is exited, the radio returns to the Mode (Zone/Channel) that the radio was operating on just prior to the Consolidated Action being launched.

Direct Message

Causes the radio to transmit the message defined in Conventional or Trunking Message Alias List as a part of the current Consolidated Action.

Voice Announcement

Causes the radio to play a designed voice announcement as a part of the current Consolidated Action.

Text Message

Allows you to define a text message, which is displayed when the current Consolidated Action is triggered.

Transmit Power Level

Causes the radio to change Transmit Power Level as part of the current Consolidated Action.

Mute Site Selectable Alert

Causes the radio to mute site selectable alert as part of the current Consolidated Action.

10.6.2.2

Index

This field selects the Status or Message to be automatically transmitted for the current Action ID (record/row) of the current Consolidated Action.

You may execute a Consolidated Action with the Action Consolidation selection defined on the Response Selector or on a button-press, on the trigger of Subscriber Unit (SU) entry/exit the Mission Critical Geofence, or on the Personnel Accountability EVAC/PAR command.

IMPORTANT:

- When operating in Conventional Mode, this Index number selection correlates with the same Status Number within the Conventional Status Alias List. There is only one Status Alias List for Conventional communications; therefore, the Status Alias List's Status Numbers apply for all Conventional Personalities.
- When operating in Trunking Mode, this Index number selection correlates with the same Status Number within the Trunking Mode's Status Alias List. Trunking allows for one Status Alias List per Trunking System; therefore, Status Text may vary with same Status Number on a per Trunking System basis.

Example: This example shows an Action Consolidation containing multiple Action IDs. In this case the radio has three channels (Trunking 800 MHz, Trunking VHF, and Conventional ASTRO) and the goal

is to automatically broadcast the **At Scene** status to all three channels from the same Consolidated Action.

Table 39: Examples

Action ID Setting:	Further Action ID Setting:	Radio Action
Row 1 = "Mode"	Mode to desired Trunking 800 Mhz channel	Radio changes to desired mode
Row 2 = "Direct Status"	Direct Status to "At Scene"	Radio transmits Status on de-sired mode
Row 3 = "Mode"	Mode to desired Trunking VHF channel	Radio changes to desired mode
Row 4 = "Direct Status"	Direct Status to "At Scene"	Radio transmits Status on de-sired mode
Row 5 = "Mode"	Mode to desired Conventional ASTRO channel	Radio changes to desired mode
Row 6 = "Direct Status"	Direct Status to "At Scene"	Radio transmits Status on de-sired mode
Row 7 = "Mode"	Mode to desired Trunking 800 Mhz channel	Radio changes to desired mode

NOTE: Once the Consolidated Action is exited, the radio returns to the Mode (Zone/Channel) that the radio was operating on just prior to the Consolidated Action being launched.

Accessed Only: When the Action ID field for the current record/row is set to **Direct Status**, and when the Action Type field is set to **General**, and when the Action ID field for the current record/row is set to **Direct Status**, or **Direct Message**, and when the Action Type field is set to **General**, and when the radio is model/option capable.

10.6.2.3 Zone

This field selects the Zone change for the current Action ID (record/row) of the current Consolidated Action.

Once the Zone is selected, the Channel must be for current record/row. You may execute a Consolidated Action with the Action Consolidation selection defined on the Response Selector or on a button-press or on the trigger of the Subscriber Unit entry for the Mission Critical Geofence.

WARNING: Remote Site Interface (RSI) zones are invalid and cannot be selected (zones that have RSI Mode enabled).

Accessed Only: When the [Action ID on page 142](#) field for the current record/row is set to **Mode**, and the [Action Type on page 141](#) field is select to **General** or **Control**, and when the radio is model/option capable.

10.6.2.4 Channel

This field selects the Channel change for the current Action ID (record/row) of the current Consolidated Action.

The Zone selection for the current record/row must be chosen prior to defining this channel.

Accessed Only: When the Action ID field for the current record/row is set to **Mode**, and when the Zone field for the current record/row is not unassigned, and when the Action Type field is select to **General** or **Control**, and when the radio is model/option capable.

10.6.2.5 Alert Audio File

This field allows you to select which Motorola Voice Announcement (*.MVA) file as the current personnel accountability alert (record/row) of the personnel accountability list.

The alert prompt plays when the radio receives Evacuation (EVAC) or Personnel Accountability Report (PAR) command from incident commander.

Accessed Only: When [Action Type on page 141](#) is **General**, **Exit Geofence**, or **Personnel Accountability**, and the [Action ID on page 142](#) field for the current record/row is set to **Voice Announcement** and the radio is model/option capable.

10.6.2.6 Alert Interval

This field allows you to select the amount of time between the repeating personnel accountability alerts.

Accessed Only: When [Action Type on page 141](#) is **General**, **Exit Geofence**, or **Personnel Accountability**, and when the [Action ID on page 142](#) field for the current record/row is set to **Voice Announcement** and when the radio is model/option capable.

WARNING: In the current Action Consolidation, only 1 action is allowed which consists of the range from 1 to 254 or "Continuous".

The following selections are supported:

- 255**
Momentary
- 0**
Continuous

Table 40: Range

Minimum	Maximum	Increments
1 second	254 seconds	1 second

10.6.2.7 Text Message

This field allows you to view or define Text Message for the current Action ID (record/row) of the current Consolidated Action.

10.6.2.8 Transmit Power Level

If a Transmit Power Level is selected when entering Geofence, the power level switches to the specified power level (high or low).

When exiting Geofence, if the Transmit Power Level of the subscriber unit was changed on entry, it returns to the last user-selected transmit power level.

Accessed Only: When the [Action ID on page 142](#) field for the current record/row is set to **Transmit Power Level**, the [Action Type on page 141](#) is set to **General**, and the radio is model/option capable.

The following selections are supported:

Switch to Low

Switch the Transmit Power Level to low.

Switch to High

Switch the Transmit Power Level to high.

10.6.2.9

Mute Site Selectable Alert

If the Mute Site Selectable Alert is selected in the Action ID field when entering Geofence, the subscriber unit (SU) mutes the current site selectable alert.

When exiting Geofence, if the SU has previously muted a site selectable alert due to the entry actions, the SU shall unmute the site selectable alert.

Accessed Only: When the [Action ID on page 142](#) field for the current record/row is set to **Mute Site Selectable Alert**, and the [Action Type on page 141](#) is set to **General**, and the radio is model/option capable.

10.6.2.10

Error Strategy

This field selects the desired Error Strategy for the current Action ID (record/row) of the current Consolidated Action.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Exit Upon Error

Upon an Error, the radio immediately exits the current Consolidated Action without executing the remainder of the actions.

Continue Upon Error

Upon an Error, the radio does not exit the current Consolidated Action; therefore the remainder of the actions are executed.

10.7

Mission Critical Geofence

The **Mission Critical Geofence** allows you to view and define Mission Critical Geofence Profiles, including Geofence Alias Name, Priority, Radius (Meters), Entry Action, Exit Action, Longitude and Latitude.

The Mission Critical Geofence feature defines a virtual perimeter for a real-world geographical area.

Geofence coordinates (latitude/longitude) and associated entry or exit actions are programmed directly into the radio.

Once configured, the radio internally performs Geofence checks and actions every time it receives a new GPS location, which is every second.

Mission Critical Geofence has two shapes in geographic area: **Circle** and **Polygon**. If there is only one coordinate in Coordinate table, then it is regarded as center of Circle Geofence, and you can manually enter the radius.

If there are only two coordinates in Coordinate table, then the 1st coordinate is regarded as the center of Circle Geofence, and the distance between the 1st and 2nd coordinate is calculated automatically and regarded as the radius.

If there are 3–100 coordinates in Coordinate table, then it is regarded as the Polygon Geofence and Polygon Geofence is connected by the coordinates from one by one.

NOTE:

You can edit the Mission Critical Geofence Profiles manually.

You can click **Import Map File**  to import the Google Earth File with Keyhole Markup Language (KML) or Keyhole Markup language Zipped (KMZ) format from local disk into Mission Critical Geofence.

You can click **Export Map File**  to export current Mission Critical Geofence Profile to local disk with KML format.

Accessed Only: When the radio is model/option capable, and when the Location Enable field is Enabled.

See [Mission Critical GeoFence Feature](#)

10.7.1

Geofence Alias Name

This field allows you to view or define recognizable names for the current Mission Critical Geofence.

Accessed Only: When the radio is model/option capable and when the Location Enable field is enabled.

10.7.2

Priority

This field allows you to determine the Geofence that is executed when there are more than one overlapping geofence areas.

IMPORTANT:

- The Priority for each Geofence profile must be mutually exclusive.

Table 41: Range

Minimum	Maximum	Increments
1 (Lowest Priority)	100 (Highest Priority)	1

Accessed Only: When the radio is model/option capable and when the Location Enable field is enabled.

10.7.3

Radius (Meters)

This field allows you to determine the radius for the Circle Geofence.

IMPORTANT:

- **Circle Geofence:** Only one or two coordinates are listed in the Coordinates table.
Circle Geofence with only one coordinate - The coordinate is regarded as the center of Circle Geofence, and you can manually enter the radius.

Circle Geofence with only two coordinates - The first coordinate is regarded as the center of this Circle Geofence, and the distance between the first and second coordinates is calculated automatically and regarded as the radius for this Circle Geofence.
- **Polygon Geofence:** Three or more coordinates are listed in the Coordinates table.
The Radius sets as **Disabled** automatically when the Geofence is polygon shape.

Table 42: Range

Range	Increments	Disabled
10-500000 (meters)	1 (meters)	No radius used for Circle Geofence

Accessed Only: When the radio is model/option capable and when the Location Enable field is enabled.

10.7.4

Entry Action

This field selects the Action Consolidation to be used with current Mission Critical Geofence for the triggered event when SU is entering one Geofence.

The following selections are supported:

Unassigned

No Entry Action will be triggered.

Available Action Consolidations

All action consolidation whose Action Type is NOT **Control**.

Accessed Only: When the radio is model/option capable, and when the Location Enable field is enabled.

10.7.5

Exit Action

This field selects the Action Consolidation to be used with current Mission Critical Geofence for the triggered event when SU is exiting one Geofence.

The following selections are supported:

Unassigned

No Exit Action will be triggered.

Available Action Consolidations

All action consolidation whose Action Type is **Exit Geofence**.

Accessed Only: When the radio is model/option capable and when the Location Enable field is enabled.

10.7.6

Longitude

This field allows you to enter one longitude value for one coordinate.

The following selections are supported:

Minimum

-180.0000000.

Maximum

180.0000000.

Accessed Only: When the radio is model/option capable, and when the Location Enable field is enabled.

10.7.7

Latitude

This field allows you to enter one latitude value for one coordinate.

The following selections are supported:

Minimum

-90.0000000.

Maximum

90.0000000.

Accessed Only: When the radio is model/option capable, and when the Location Enable field is enabled.

10.8

Portable Control

The **Buttons**, **Switched**, **Menu Items**, **Keypad**, **Smart Key Fob Buttons**, or **Accessory Buttons** sections are used to view or select radio-wide programmable button functionality for both conventional and trunking communications modes.

IMPORTANT: For the **Buttons**, **Smart Key Fob Buttons**, and **Accessory Buttons** sections, button functionality is selected and operates separately for each of the two radio communications modes. That is, when the radio is operating on a conventional channel, only the selected conventional features are available to the radio-user. Likewise, when the radio is operating on a trunking channel, only the selected trunking features are available to the radio-user. For the **Keypad**, button functionality is selected once and operates for both of the two radio communications modes.

NOTE: Some selections are model/option dependent on a per radio basis.

10.8.1

Buttons (Portable Control)

The **Buttons** section allows the user to view or select radio-wide programmable button functionality for both Conventional and Trunking communications modes. Button functionality is selected and operates separately for each of the two radio communications modes. That is, when the radio is operating on a Conventional channel, only the selected Conventional features are available to the user. Likewise,

when the radio is operating on a Trunking channel, only the selected Trunking features are available to the user.

NOTE: Some selections are model/option dependent on a per radio basis.

The following fields are supported:

10.8.1.1

Top Button (Conventional)

Selects the function for the Top Button.

These selections apply while operating in Conventional or Trunking communications mode, as noted in the table below.

WARNING: User should not duplicate a function on multiple controls, for example, on more than one button, on more than one switch or on a button and a switch. This may cause incorrect radio operation.

See [Button Selections \(Top and Side\) on page 152](#) for a list of supported selections:

10.8.1.2

Top Button (Trunking)

Selects the function for the Top Button.

See [Top Button \(Conventional\) on page 150](#) for notes and warnings.

See [Button Selections \(Top and Side\) on page 152](#) for a list of supported selections:

10.8.1.3

Side Top Button (Conventional)

Selects the function for the Side Top Button.

See [Top Button \(Conventional\) on page 150](#) for notes and warnings.

See [Button Selections \(Top and Side\) on page 152](#) for a list of supported selections:

10.8.1.4

Side Top Button (Trunking)

Selects the function for the Side Top Button.

See [Top Button \(Conventional\) on page 150](#) for notes and warnings.

See [Button Selections \(Top and Side\) on page 152](#) for a list of supported selections:

10.8.1.5

Side Middle Button (Conventional)

Selects the function for the Side Middle Button.

See [Top Button \(Conventional\) on page 150](#) for notes and warnings.

See [Button Selections \(Top and Side\) on page 152](#) for a list of supported selections:

10.8.1.6

Side Middle Button (Trunking)

Selects the function for the Side Middle Button.

See [Top Button \(Conventional\) on page 150](#) for notes and warnings.

See [Button Selections \(Top and Side\) on page 152](#) for a list of supported selections:

10.8.1.7

Side Bottom Button (Conventional)

Selects the function for the Side Bottom Button.

See [Top Button \(Conventional\) on page 150](#) for notes and warnings.

See [Button Selections \(Top and Side\) on page 152](#) for a list of supported selections:

10.8.1.8

Side Bottom Button (Trunking)

Selects the function for the Side Bottom Button.

See [Top Button \(Conventional\) on page 150](#) for notes and warnings.

See [Button Selections \(Top and Side\) on page 152](#) for a list of supported selections:

10.8.1.9

Speaker Grille Button (Conventional)

Selects the function for the Speaker Grille Button.

See [Top Button \(Conventional\) on page 150](#) for notes and warnings.

See [Button Selections \(Top and Side\) on page 152](#) for a list of supported selections:

10.8.1.10

Speaker Grille Button (Trunking)

Selects the function for the Speaker Grille Button.

See [Top Button \(Trunking\) on page 150](#) for notes and warnings.

See [Button Selections \(Top and Side\) on page 152](#) for a list of supported selections:

10.8.1.11

Button Name

This field indicates the name of the programmable button.

10.8.1.12

Buttons (Conventional)

This field determines the feature selected for the corresponding programmable button in Conventional Mode.

See [Button Selections](#) for a list of supported selections.

10.8.1.13

Buttons (Trunking)

This field determines the feature selected for the corresponding programmable button in Trunking Mode.

See [Button Selections](#) for a list of supported selections.

10.8.1.14

Button Selections (Top and Side)

The Portable Control section allows the user to select the function for the Top and Side Portable radio buttons.

Table 43: Top and Side Portable Radio Functions

Button Selections:	This selection is only valid in RadioCentral, and/or available to the user:	Selections are Available in RadioCentral Based on Availability to Current Hardware:
Audio Playback on page 166	When selected, always available to the user, and therefore not dependent on any RadioCentral feature or selection.	<ul style="list-style-type: none"> • Keypad/Dual Display • Top Display • Front Display and Menu/Navigation Buttons • Front Display and Menu Buttons • Accessory • Smart Key Fob Buttons

10.8.1.14.1

Automatic Channel Fallback Enable/Disable

On a Channel Fallback-enabled channel, pressing this button activates Automatic Channel Fallback. Pressing and holding this button deactivates the feature and reverts the radio back to the last user-selected channel.

10.8.1.14.2

Audio Playback

Audio Playback plays the audio selected.

This feature is available for Conventional or Trunking communications mode.

10.8.1.14.3

Beacon

This button-press allows you to check the details of any recently received Emergency Beacons.

This feature is available for Conventional or Trunking communications mode.

10.8.1.14.4

Blank

Select this feature for a radio button that is not in use.

You will hear a chirp tone when pressing this button. This feature is available for Conventional or Trunking communications mode.

10.8.1.14.5

Bluetooth Audio Reroute

This button-press allows you to cycle active speaker audio between a portable radio's internal speaker or external (RSM/DRSM) speaker, and a Bluetooth accessory's wireless speakers.

This feature is available while operating in Conventional or Trunking communications mode.

10.8.1.14.6

Bluetooth Configuration

This button-press provides you with a list of Bluetooth status/information and Bluetooth options.

This feature is available while operating in Conventional or Trunking communications mode.

The following features are included:

Bluetooth Status

Allows you to turn on and off Bluetooth radio to Bluetooth device functionality.

Device Active

Allows you to view a list of all currently active (paired) Bluetooth devices.

Bluetooth Speaker

Allows you to turn on and off a Bluetooth device's speaker.

10.8.1.14.7

Bluetooth Headset PTT

This button-press serves as the primary, or as an additional, PTT button for a Bluetooth wireless headset; therefore this button-press allows you to key up the radio while using the Bluetooth headset's microphone as the audio source.

This feature is available while operating in Conventional or Trunking communications mode.

10.8.1.14.8

Bluetooth On/Off

This button-press activates and deactivates the radio's Bluetooth capabilities.

This feature is available while operating in Conventional or Trunking communications mode.

10.8.1.14.9

Call Alert

This button-press allows you to transmit a Call Alert for Conventional modes, or a Call Alert/Page for Trunking modes.

NOTE:

Call Alert/Pages allow a dispatcher or radio caller to notify you (or group of users) of a missed call.

Receiving radios are targeted based on radio and system information managed by the Contacts and Call IDs in the radio's Call Hot Lists. You can directly enter or select Call IDs from the channel's Hot List.

The receiving radio responds with both alert tones and visual alerts to you. The visual alert (flashing LED) persists until reset by your interaction with the radio.

10.8.1.14.10

Call Response

This button-press allows you to respond to (and hang up from) a received Phone Call (Conventional or Trunking) or Private Call. (Trunking only).

10.8.1.14.11

Channel Announcement

This button-press allows you to hear the Voice Announcement audio file that is assigned to the radio's current channel/mode.

IMPORTANT: Voice files are assigned to channels from the Zone Channel Assignment, [Channel Announcement on page 610](#) Channel Announcement field.

10.8.1.14.12

Channel Down

This button-press on the APX™ 3000 Portable allows you to scroll downward through the channels in the radio.

Faster scrolling is possible with a [Long Keypress Duration on page 135](#) of the button. Upon reaching the last channel in the list, continued scrolling causes the list to wrap around to the first channel. Channels are defined in the Zone Channel Assignment Window's Channels Page.

10.8.1.14.13

Channel Fallback Manual/Revert

On a Channel Fallback-enabled channel, pressing this button causes the radio to switch to the assigned Fallback Channel regardless of current network conditions and activation state. Pressing and holding this button reverts the radio back to the last user-selected channel.

10.8.1.14.14

Channel Up

This button-press on the APX™ 3000 Portable allows you to scroll upward through the channels in the radio.

Faster scrolling is possible with a [Long Keypress Duration on page 135](#) of the button. Upon reaching the last channel in the list, continued scrolling causes the list to wrap around to the first channel. Channels are defined in the Zone Channel Assignment Window's Channels Page.

10.8.1.14.15

Contacts

This button press allows you to view or edit the Contacts of the radio's current channel.

Contacts must be programmed in the Unified Call List. Contacts make up the members of Call Hot Lists. Hot List members/Contacts are selectable by you, allowing for call types such as Phone Calls, Selective Calls, Call Alerts, Private Calls and Pages to individual radios or to groups of radios.

IMPORTANT: This feature is not available for Portable radios having only a top display.

10.8.1.14.16

DTMF Tone

This button-press allows you to send out DTMF code of the assigned DTMF value.

There are 12 DTMF tones; namely DTMF Tone 0 to 9, DTMF Tone *, and DTMF Tone #. This feature is available while operating in Conventional or Trunking communications mode.

10.8.1.14.17

Dynamic ID

This button-press allows for entry into the Dynamic ID edit mode, which allows you to view and/or edit the radio's Individual ID and/or MDC Primary ID for the current ASTRO and/or MDC system.

This feature is available while operating in Conventional communications mode.

10.8.1.14.18

Dynamic Priority

This button-press allows you to select the Dynamic Priority scan assignment.

This feature is available while operating in Conventional communications mode.

10.8.1.14.19

Emergency Supervisor Clear

This button-press is selected for Side Middle Button or Accy 1-dot. Emergency Exit Control is set to "Supervisor".

This feature is available while operating in Trunking communications mode.

10.8.1.14.20

Emergency

This button-press allows you to enter and also exit emergency mode operation.

See also the [Short Keypress Duration for Emergency on page 135](#) and the [Long Keypress Duration for Emergency on page 136](#) features. This feature is available while operating in Conventional or Trunking communications mode.

WARNING:

When the Dual Radio-Radio Selection field is set to **Primary Radio** or **Secondary Radio**, this selection is invalid for the Side Top (Purple) button on a .

10.8.1.14.21

Information

This button-press allows you to retrieve and view basic radio information such as IP-related information and buttons/switches control mapping, as well as view or modify the Soft ID.

This feature applies only when operating on ASTRO - Conventional Systems. This is a Portable radio only feature.

IMPORTANT:

Modifying the Soft ID changes the radio's Username for Automatic Registration Service server or a User Authentication Unified Network Services (UNS) server logon. When editing the Username this way, the PIN/Password and Unit ID are blanked. Therefore, this can only be used when the server is expecting a blank PIN/Password and you do not want to use Unit ID.

This feature is not available for Portable radios having only a top display.

10.8.1.14.22

Internet Protocol Address (IP)

This button-press allows you to retrieve and view (in the radio's display) the radio's current IP Address, device name and status.

This feature is available while operating in Conventional or Trunking communications mode.

10.8.1.14.23

Keypad/Controls Lock

This button-press allows you to lock (or unlock) the radio's keypad (when available).

Additional control-locking functionality is possible (for all models) when the [Rotary Switch Lock Enable](#) field and/or [Side and Speaker Grille Buttons Lock Enable on page 139](#) field is **Enabled**.

This feature is available while operating in Conventional or Trunking communications mode.

IMPORTANT:

When Rotary Switch Lock Enable is **Enabled** on radios with a rotary switch, this feature also locks the radio's currently-operating [Rotary Selections on page 180](#) (zone or channel) even when the rotary switch is moved to another position.

When Side Button Lock Enable is **Enabled**, this feature also locks the radio's Side Top, Side Middle, and Side Bottom buttons.

10.8.1.14.24

Light/Flip (Display)

This button's Short Keypress Duration Light feature allows you to toggle on and off the lights that illuminate the radio's Rotary switch, display, top display and keypad.

This button's [Long Keypress Duration on page 135](#) Flip (Display) feature allows you to toggle back and forth the viewing perspective of the radio's top display by 180 degrees. This is particularly useful for viewing the top display while the radio is still in the carry holder.

This feature is available while operating in Conventional or Trunking communications mode.

IMPORTANT:

The [Display Light Time on page 213](#) determines the amount of time that the lights remain illuminated, when set to **Infinite** pressing this button again turns off the lights.

For all portable radio models, the Light and Flip (Display) features also apply to a portable Accessory that has a display, such as the Display Remote Speaker Microphone (DRSM).

10.8.1.14.25

Location

This button-press allows you to determine their current location (latitude, longitude, time and date) and also the distance and bearing to another location.

This feature is available while operating in Conventional or Trunking communications mode.

IMPORTANT: If the Radio Wide, [User Selectable Location Enable on page 112](#) field is **Enabled**, you are also allowed to turn the outdoor location/Global Positioning System (GPS) functionality on or off for all location/GPS enabled Conventional or Trunking communications channels.

10.8.1.14.26

LTE

This button-press activates and deactivates the radio's LTE Broadband data capabilities.

This feature is available while operating in Conventional or Trunking communications mode.

IMPORTANT:

This button-selection is only operational when a channel that is configured for LTE Broadband operation is selected. When a non-LTE channel is selected, the menu is hidden from you.

A channel is LTE capable when its Data Profile's [Data Profile Type on page 341](#) field is set to **Conventional & Broadband**, or **Trunking & Broadband**, or **Broadband-Only**.

10.8.1.14.27

Man Down Clear

This button-press allows you to clear (deactivate) the Man Down Emergency mode alarm.

This feature is available while operating in Conventional or Trunking communications mode.

10.8.1.14.28

Message

This button-press allows you to select from the Message Alias List of the current channel/mode.

IMPORTANT:

While operating in Conventional communications mode with MDC/ASTRO/DVRS Signaling, the Conventional Message Alias List is used.

While operating in Trunking communications mode, the Trunking System-Message Alias List selected for the current Trunking Personality is used.

10.8.1.14.29

Monitor

This button-press allows you to hear most or even all carrier activity on the radio's current channel.

The [Monitor Type on page 364](#) field selection determines if only the channel-receive requirement of a Private Line (PL) encoded match is temporarily ignored, or if the requirement of PL and carrier squelch is temporarily ignored. This feature is available while operating in Conventional communications mode.

IMPORTANT: When holding the Monitor button for the [Latch Enable Time on page 365](#) duration, the radio becomes latched in continuous monitor mode. The radio remains latched in monitor mode until released with a Monitor button short-press. Initiating Emergency, Phone, Scan, or a Call Alert or Selective Call also cancels continuous monitor mode. See also the [Latch Enable Tone on page 364](#) field.

10.8.1.14.30

MS01–MS13

These button assignments allows you to program these buttons with frequently used or any desired zone and channel combination.

The programming and use of these buttons is very similar to the programming and use of a car radio's preset buttons. That is, a long-press programs a button with the radio's current zone and channels; then once programmed, the short-press of that button jumps the radio to the programmed zone and channel. This feature is available while operating in Conventional or Trunking communications mode.

IMPORTANT:

The [Short Keypress Duration on page 135](#) and [Long Keypress Duration on page 135](#) are both programmed.

The APX™ 3000 Portable only supports MS01 and MS02.

10.8.1.14.31

Multiple Private Line (MPL)

This button-press allows for your access to a listing of the available MPL Lists.

IMPORTANT: Each list is represented by a recognizable name . You are then able to select the desired Alias/PL settings. This feature is available while operating in Conventional communications mode.

10.8.1.14.32

Nuisance Delete

This button-press allows you to temporarily remove the channel from the current Active Scan when it continually generates unwanted carrier noise.

This is accomplished by pressing this Nuisance Delete button while in Landed Scan Mode on the Scan List Member to be removed. This feature applies for the current Scan List while operating in Conventional or Trunking communications mode.

IMPORTANT:

Switching to another channel on the radio's channel selector, turning scan mode off and then back on, or turning the radio off and then back on effectively brings that temporarily removed Scan List Member channel back to an actively scanned status.

Nuisance Delete is not possible:

- For a Priority #1, or Priority #2 Scan List Member channel.
- When the [Designated Voice Tx Member Type on page 622](#) field is set to **Selected Channel** and the Landed Scan channel's Tx Frequency is the same as the Tx Frequency of the radio's currently-selected channel.
- If the current Scan List does not contain at least two members before a Nuisance Delete occurs.

10.8.1.14.33

One Touch 1–4

These four separately programmed button-presses allow you to launch a specific feature with one single button-press.

These button-presses allow you to enter One Touch features such as Status, Message, Selective/Private Call, Call Alert/Page, Phone, Repeater Access (RAC), and MDC RTT Button Access with the touch of one button. One to four buttons can be programmed for each Conventional Personality, and one to four buttons can be programmed for each Trunking System.

IMPORTANT: Pressing a One Touch button while the radio is already in the selected feature causes the radio to abort the feature.

10.8.1.14.34

Phone

This button-press allows you to initiate Phone Mode while operating in Conventional or Trunking communications mode.

10.8.1.14.35

Priority Channel PTT

If the radio is currently operating in Scan Mode, and there is Priority Member 1 Scan List Member in the current channel's Scan List, then pressing this button causes the radio to key up on the Priority 1 Scan List Member channel, therefore allowing transmission of voice communications; otherwise, the radio blocks the transmission and sounds the Talk Prohibit Tone.

This feature is available while operating in Conventional communications mode.

IMPORTANT:

Priority Channel PTT operation is mutually exclusive with the Intercomand Public Address (PA) functions.

For all APX radios, Priority Channel PTT operation will not perform sending/calling operation when any of the following functions are active in the radio:

- Emergency
- Call Alert
- Selective Call
- Recent Call
- Phone
- Stun/Kill
- TMS
- Status/Message
- Siren
- Public Address (PA)
- Unified Call List
- Rekey Request
- Evacuation Tone

For the O3 mobile control head, Priority Channel PTT will not perform Hot Keypad sending operation. This is because the O3 mobile control head does not support multi-button press between the side button, the menu softkey, the arrow key, or the keypad. This limitation also impacts other features that need two or more button press at the same time.

The radio handles the first PTT press and release, and ignores the second PTT press and release when the two PTT actions are a different type; in other words:

- whenever the radio is already transmitting due to a primary PTT button-press, the Priority Channel PTT button-press is ignored by the radio.
- conversely, whenever the radio is already transmitting on the Priority 1 Scan List Member channel, due to a Priority Channel PTT button-press, a primary PTT button-press is ignored by the radio.

Priority Channel PTT button must not be used in DVRS channel.

10.8.1.14.36

Radio Profiles

This button-press allows you to select one of the programmed Radio Profiles.

This feature is available while operating in Conventional or Trunking communications mode.

10.8.1.14.37

Recent Calls

This button-press allows you to access the recent incoming and outgoing call information for the following call types: Call Alert, Selective Calls, Private Calls, and (outgoing only) Phone calls.

This feature is available while operating in Conventional or Trunking communications mode.

10.8.1.14.38

Rekey Request

This button-press allows you to transmit an Over-The-Air-Rekeying (OTAR) rekey request to the dispatcher's (KMF or KMC) console while operating in Conventional or Trunking communications mode.

IMPORTANT:

For MDC OTAR (Conventional communications) the request protocol is determined by the [Rekey Request Mode on page 278](#) field.

For ASTRO OTAR (Conventional or Trunking communications) the [User Selectable Rekey Request on page 295](#) field must be **Enabled**, and the request protocol is determined by the [OTAR Tx Security Level on page 293](#) field.

10.8.1.14.39

Remote Emergency

This button-press activates the Remote Emergency Activation feature so an authorized user to encode this command can cause a target radio to initiate the Emergency feature without target user intervention.

NOTE: Remote Emergency is only supported on ASTRO Conventional and ASTRO 25 Trunking channels.

10.8.1.14.40

Repeater Access Button 1 (RAB1)

This button-press allows you to manually send a repeater access codeword.

This feature is available while operating in Conventional communications mode.

10.8.1.14.41

Repeater Access Button 2 (RAB2)

This button-press allows you to manually send a repeater access codeword.

This feature is available while operating in Conventional communications mode.

10.8.1.14.42

Reprogram Request

This button-press allows you to send a request to the dispatcher for reassignment of Dynamic Regrouping.

The available features and settings of the Dynamic Regrouping talkgroup are defined and transmitted back by the dispatcher/console. The radio then automatically changes to the Dynamic Regrouping Zone and Dynamic Regrouping Channel. This feature is available while operating in Trunking communications mode.

IMPORTANT: For Trunking Systems, this Zone and Channel are defined by setting a Zone Channel Assignment's [Trunking Talkgroup on page 608](#) field to **DYN**. The Trunking Personality considered in this scenario must have this same Trunking [System on page 500](#) selected in its System field. Hence, only one Dynamic Regrouping channel may be defined per Trunking System.

10.8.1.14.43

Request-To-Talk (RTT)

This button-press allows you to send a Request-To-Talk (RTT) signaling packet to the dispatcher/console, requesting the ability to transmit voice.

This selection applies only when operating on an MDC System in Conventional communications mode.

10.8.1.14.44

Scan

Short Key-pressing this button allows you to toggle Scan Mode on and off for the radio's current channel.

Long Key-pressing this button allows for entry to the Scan List Edit mode for the radio's current channel's Scan List, which allows you to add or remove individual Scan List Member channels and modify scan priority.

10.8.1.14.45

Select Call

This button-press allows the radio-user to transmit a Conventional call.

10.8.1.14.46

Site Display/Srch

This button's Short Keypress Duration **Site Display** allows you to momentarily view the current Site ID and its corresponding received signal strength indicator (RSSI) on the radio's display.

This button's Long Keypress Duration **Site Search** enables a Site search for SmartZone operation. This feature is available while operating in Trunking communications mode.

10.8.1.14.47

Site Lock/Unlock

This button-press Short Keypress Duration **Site** allows you to view the lock status of the current Trunking site.

This button's Long Keypress Duration **Site Lock/Unlock** allows you to toggle between lock and unlock mode when using the SmartZone option.

IMPORTANT: Locking a site inhibits roaming to another site in a wide-area System. This feature is available while operating in Trunking communications mode.

10.8.1.14.48

Status

This button-press allows you to select from the Status Alias List of the current channel/mode.

NOTE: For your convenience, as part of this feature the display initially shows the last acknowledged Status call, or the first Status in the list. This feature is available while operating in Conventional or Trunking communications mode.

IMPORTANT:

While operating in Conventional communications mode with MDC/ASTRO/DVRS Signaling, the Conventional Status Alias List is used.

While operating in Trunking communications mode, the Trunking System-Status Alias List selected for the current Trunking Personality is used.

10.8.1.14.49

Talkaround/Direct

This button-press allows you to enable or disable the Direct/Talkaround mode for the current channel options profile.

This feature is available while operating in Conventional communications mode.

10.8.1.14.50

Talkgroup

This button-press allows you to switch from the preset Talkgroup to another Talkgroup from within the Conventional Personality's current Talkgroup List.

All Conventional Personalities using the same Talkgroup List are automatically switched to the selected Talkgroup.

10.8.1.14.51

Text Messaging Service (TMS)

This button's Short Keypress Duration **TMS** allows you to access the radio's TMS mode, seen in the radio's display.

This button's Long Keypress Duration allows you to directly enter the TMS **Inbox**, in order to view received text messages and access the programmed [Quick Text Message on page 340](#) entries (seen within the radio's display). See also the Trunking System or Conventional System, Text Messaging Service feature.

10.8.1.14.52

Third Party

This button-press allows you to initiate functionality in third-party accessories, such as compatible Whelen® Sirens.

WARNING: When the Dual Radio [Radio Selection](#) field is set to **Primary Radio** or **Secondary Radio**, this selection must be made for both Conventional and Trunking, where applicable, in order to be considered valid.

10.8.1.14.53

TMS Query

This button-press jumps you directly to the programmed Query Message entries of the Text Messaging Service feature.

You are then able to select from the list of predefined entries and easily transmit a Query with minimal effort.

NOTE: A TMS Query allows you to specify information in a pre-formatted query template and send this as a Message to a Query Server; the Server then responds with a text message containing the requested information.

When the Trunking System or Conventional System, Text Messaging Service feature is enabled on the radio's current channel, and when the TMS Query Service is currently available to the radio.

10.8.1.14.54

TMS Quick Text

This button-press jumps you directly to the Quick Text Message entries of the Text Messaging Service feature.

You are then able to select from the list of predefined entries and easily transmit a Quick Text Message with minimal effort.

When the Trunking System or Conventional System, Text Messaging Service feature is enabled on the radio's current channel.

10.8.1.14.55

Unprogrammed

Select this feature for a radio button that is not in use.

You will hear a chirp tone when pressing this button. This feature is available while operating in Conventional or Trunking communications mode.

10.8.1.14.56

ViQi: Virtual Partner

This button allows access to the Virtual Partner feature.

This feature is only available for Trunking if set to **LMR** operation in [ViQi: Virtual Partner Mode on page 107](#). This feature is available for Conventional and Trunking communications mode if set to **Disabled** and Broadband in [ViQi: Virtual Partner Mode on page 107](#).

10.8.1.14.57

ViQi: Voice Control

This button allows access to the Voice Control and the Virtual Partner feature.

When the radio is not in the Virtual Partner feature, all presses of this button will activate the Voice Control feature. When the user enters the Virtual Partner feature through a Voice Control command, the subsequent presses of the button will apply only to the Virtual Partner feature. Once Virtual partner session is over, this button will apply to Voice Control.

This feature is available for Conventional or Trunking communications mode.

Accessed Only: When the radio is model/option capable.

10.8.1.14.58

User

This button-press allows you to login to a specific Automatic Registration Service server or a User Authentication Unified Network Services (UNS) server with the appropriate Username, PIN/Password, and User Login Unit ID combination.

You may select Usernames and Unit ID from the programmed Data User List entries, or Usernames, PINs/Password and Unit IDs may be manually entered from the radio's keypad.

WARNING: This feature functions only when the radio's current (Conventional or Trunking) channel has its referenced Data Profile's, [ARS Mode on page 346](#) field is set to **Server**.

10.8.1.14.59

Voice Mute

This button-press allows you to toggle on and off Voice Mute functionality for In-Call User Alert-enabled channels.

When Voice Mute is active, the radio remains muted to all Conventional communications calls and affiliated Trunking Talkgroup calls. Group and individual Call Alert/Pages do unmute the radio for the alert tone; also, when Voice Mute is active, the radio does unmute to individual radio-to-radio calls such as Selective/Private Calls and Interconnect (phone mode) calls.

10.8.1.14.60

Volume Set Tone

This button-press causes one-or-the-other of the following radio behaviors.

When the [Volume Adjust Tone Offset on page 100](#) field is **Disabled**, this button-press allows you to sample the radio's current volume level for incoming transmissions unmuting to the radio's speaker. When this button is pressed, the tone sounds at the radio's current setting for as long as the button is held; as you adjust the volume, the tone's audio level is simultaneously adjusted.

10.8.1.14.61

Wi-Fi On/Off

This button-press allows you to activate and deactivate Wi-Fi capability.

This feature is available while operating in Conventional or Trunking communications mode.

10.8.1.14.62

Zone Bank Down

This button-press allows you to move-down (scroll in descending order) through the radio's Zone Banks.

When the Zone Bank Operations field is set to **Enhanced**, faster scrolling (in ascending order) is possible with a [Long Keypress Duration on page 135](#) of the button.

NOTE: The [Zone Bank Up on page 178](#) programmable button allows you to move-up (scroll in ascending order) through the radio's Zone Banks. This feature is available while operating in Conventional or Trunking communications mode.

IMPORTANT:

When assigning Zone Bank Up or Zone Bank Down to a programmable button, [Zone Select on page 188](#) is automatically assigned to the Three Position A/B/C Toggle switch.

The Rotary may then only be set to the [Channel Select on page 185](#) selection. Only 16 channels are possible per zone when using the Rotary as the channel selector.

10.8.1.14.63

Zone Bank Up

This button-press allows you to move-up (scroll in ascending order) through the radio's Zone Banks.

When the Zone Bank Operations field is set to **Enhanced**, faster scrolling (in ascending order) is possible with a [Long Keypress Duration on page 135](#) of the button.

NOTE: The [Zone Bank Down on page 178](#) programmable button allows you to move-down (scroll in descending order) through the radio's Zone Banks. This feature is available while operating in Conventional or Trunking communications mode.

IMPORTANT:

When assigning Zone Bank Up or Zone Bank Down to a programmable button, [Zone Select on page 188](#) is automatically assigned to the Three Position A/B/C Toggle switch.

The Rotary may then only be set to the [Channel Select on page 185](#) selection. Only 16 channels are possible per zone when using the Rotary as the channel selector.

10.8.1.14.64

Zone Down

This button-press allows you to scroll downward through the Zones in the radio.

Faster scrolling is possible with a [Long Keypress Duration on page 135](#) of the button. Upon reaching the first Zone in the list, continued scrolling causes the list to wrap around to the last Zone. Zones are defined in the Zone Channel Assignment Window.

NOTE: In certain Portable radios, Zones may also be grouped into Zone Banks, where individual banks can be selected with a [Zone Bank Up on page 178](#) or [Zone Bank Down on page 178](#) button-press.

10.8.1.14.65

Zone Up

This button-press allows you to scroll upward through the Zones in the radio.

Faster scrolling is possible with a [Long Keypress Duration on page 135](#) of the button. Upon reaching the last Zone in the list, continued scrolling causes the list to wrap around to the first Zone. Zones are defined in the Zone Channel Assignment Window's Zone Page. This feature is available while operating in Conventional or Trunking communications mode.

NOTE: In certain Portable radios, Zones may also be grouped into Zone Banks, where individual banks can be selected with a [Zone Bank Up on page 178](#) or [Zone Bank Down on page 178](#) button-press.

10.8.1.15

Smart Key Fob Buttons (Conventional)

This field selects the function for the Smart Key Fob (SKF) buttons that are programmable.

WARNING: You must not duplicate a function on multiple controls, i.e., on more than one button, on more than one switch or on a button and a switch. This may cause incorrect radio operation.

See [Button Selections](#) for the list of supported selections.

10.8.1.16

Smart Key Fob Buttons (Trunking)

This field selects the function for the Smart Key Fob (SKF) buttons that are programmable.

WARNING: You must not duplicate a function on multiple controls, i.e., on more than one button, on more than one switch or on a button and a switch. This may cause incorrect radio operation.

See [Button Selections](#) for the list of supported selections.

10.8.2

Switches

This section allows you to assign functionality to the radio Rotary, Toggle, Multi-Function, and Concentric switches.

The Rotary and Multi-Function Knob (MFK) assignment apply while the radio is operating in Conventional or Trunking communications mode. For the radio's Toggle and Concentric switches, there are separate selections for Conventional and Trunking modes.

NOTE: These selections are model/option dependent on a per-radio basis.

10.8.2.1

Rotary Selections

Selects the function of the Rotary Switch for Conventional and Trunking communications mode.

WARNING: You should not duplicate a function on multiple controls, i.e., on more than one button, on more than one switch or on a button and a switch. This may cause incorrect radio operation.

The following selections are supported:

Blank on page 185

(Intended for controls that are not in use.)

Channel/Sub Select ([Channel Select on page 185](#))

When the radio is model/option capable.

WARNING: This selection cannot be set concurrently on the Rotary Switch, Concentric Switches and Toggle Switch.

Zone/Sys Select ([Zone Select on page 188](#))

When the radio is model/option capable.

WARNING: This selection cannot be set concurrently on the Rotary Switch, Concentric Switches and Toggle Switch.

This is not a valid selection when [Zone Bank Up on page 178](#) or [Zone Bank Down on page 178](#) is set on a programmable button.

NOTE: These selections are model/option dependent on a per radio basis, and apply to Conventional and Trunking communications modes.

10.8.2.2

Concentric Switch Position A (Conventional)

Selects the function for the Portable radio's Concentric Switch Position A.

These assignments can be selected for the Conventional and Trunking communications mode.

WARNING: You must not duplicate a function on multiple controls, i.e., on more than one button, on more than one switch or on a button and a switch. This can cause incorrect radio operation.

See [Switch Selections on page 182](#) for a list of supported selections.

NOTE: These selections are model/option dependent on a per radio basis, and apply to Conventional and Trunking communications modes (except where noted).

10.8.2.3

Concentric Switch Position A (Trunking)

Selects the function for the Portable radio's Concentric Switch Position A.

WARNING: You must not duplicate a function on multiple controls, i.e., on more than one button, on more than one switch or on a button and a switch. This can cause incorrect radio operation.

See [Concentric Switch Position A \(Conventional\) on page 180](#) for notes and warnings.

See [Switch Selections on page 182](#) for a list of supported selections.

10.8.2.4

Concentric Switch Position B (Conventional)

Selects the function for the Portable radio's Concentric Switch Position B.

WARNING: You must not duplicate a function on multiple controls, i.e., on more than one button, on more than one switch or on a button and a switch. This can cause incorrect radio operation.

See [Concentric Switch Position A \(Conventional\) on page 180](#) for notes and warnings.

See [Switch Selections on page 182](#) for a list of supported selections.

10.8.2.5

Concentric Switch Position B (Trunking)

Selects the function for the Portable radio's Concentric Switch Position B.

WARNING: You must not duplicate a function on multiple controls, i.e., on more than one button, on more than one switch or on a button and a switch. This can cause incorrect radio operation.

See [Concentric Switch Position A \(Conventional\) on page 180](#) for notes and warnings.

See [Switch Selections on page 182](#) for a list of supported selections.

10.8.2.6

Toggle Switch Position A (Conventional)

Selects the function for the Portable radio's Toggle Switch Position A.

WARNING: You must not duplicate a function on multiple controls, i.e., on more than one button, on more than one switch or on a button and a switch. This can cause incorrect radio operation.

See [Concentric Switch Position A \(Conventional\) on page 180](#) for notes and warnings.

See [Switch Selections on page 182](#) for a list of supported selections.

10.8.2.7

Toggle Switch Position A (Trunking)

Selects the function for the Portable radio's Toggle Switch Position A.

WARNING: You must not duplicate a function on multiple controls, i.e., on more than one button, on more than one switch or on a button and a switch. This can cause incorrect radio operation.

See [Concentric Switch Position A \(Conventional\) on page 180](#) for notes and warnings.

See [Switch Selections on page 182](#) for a list of supported selections.

10.8.2.8

Toggle Switch Position B (Conventional)

Selects the function for the Portable radio's Toggle Switch Position B.

WARNING: You must not duplicate a function on multiple controls, i.e., on more than one button, on more than one switch or on a button and a switch. This can cause incorrect radio operation.

See [Concentric Switch Position A \(Conventional\) on page 180](#) for notes and warnings.

See [Switch Selections on page 182](#) for a list of supported selections.

10.8.2.9

Toggle Switch Position B (Trunking)

Selects the function for the Portable radio's Toggle Switch Position B.

WARNING: You must not duplicate a function on multiple controls, i.e., on more than one button, on more than one switch or on a button and a switch. This can cause incorrect radio operation.

See [Concentric Switch Position A \(Conventional\) on page 180](#) for notes and warnings.

See [Switch Selections on page 182](#) for a list of supported selections.

10.8.2.10

Toggle Switch Position C (Conventional)

Selects the function for the Portable radio's Toggle Switch Position C.

WARNING: You must not duplicate a function on multiple controls, i.e., on more than one button, on more than one switch or on a button and a switch. This can cause incorrect radio operation.

See [Concentric Switch Position A \(Conventional\) on page 180](#) for notes and warnings.

See [Switch Selections on page 182](#) for a list of supported selections.

10.8.2.11

Toggle Switch Position C (Trunking)

Selects the function for the Portable radio's Toggle Switch Position C.

WARNING: You must not duplicate a function on multiple controls, i.e., on more than one button, on more than one switch or on a button and a switch. This can cause incorrect radio operation.

See [Concentric Switch Position A \(Conventional\) on page 180](#) for notes and warnings.

See [Switch Selections on page 182](#) for a list of supported selections.

10.8.2.12

Switch Selections

This topic lists the switch selections and when the selections are available to the users.

Switch Selections:	This selection is only valid in RadioCentral, and/or available to the user:
Blank on page 185	(Intended for controls that are not in use.)

Switch Selections:	This selection is only valid in RadioCentral, and/or available to the user:
Channel Select on page 185	<p>When selected, always available to the user, and therefore not dependent on any RadioCentral feature or selection.</p> <p> WARNING: This selection cannot be set concurrently on the Rotary Switch, Concentric Switch and Toggle Switch.</p> <p>This selection must be assigned for both Conventional and Trunking communications modes and for all positions of the chosen switch.</p> <p>This is not a valid selection for the Two Position or Three Position Toggle switch, or on the concentric switch when Zone Bank Up on page 178 or Zone Bank Down on page 178 is set on a programmable button.</p> <p> IMPORTANT: When Conventional Concentric Switch Position A is set to Channel Select, the Conventional Concentric Switch Position B and the Trunking Concentric Switch Position A and Position B are automatically set to Channel Select and become view-only. Therefore, only Conventional Concentric Switch Position A can then be modified.</p> <p>When Conventional Toggle Switch Position A is set to Channel Select, the Conventional Toggle Switch Position B and Position C and the Trunking Toggle Switch Position A, Position B, and Position C are automatically set to Channel Select and become view-only. Therefore only Conventional Toggle Switch Position A can then be modified.</p>
Keypad/Controls Lock on page 186	<p>When the Radio Ergonomics Wide, Rotary Switch Lock Enable field is Enabled (all models), or when the Radio Ergonomics Wide, Side Buttons Lock Enable field is Enabled (all models), or when the radio has a keypad (model-specific).</p> <p> WARNING: This selection must not be set concurrently on both Position A and Position B of the Concentric Switch, or on all positions of the Toggle Switch; otherwise, Buttons, Menu Items, and Rotary Knob are inoperable by the user.</p>
PL Disable on page 186	<p>When operating in Conventional communications mode. Only available for Conventional.</p>
Scan on page 186	<p>For Conventional, when the Scan Type on page 617 is not set to Voting Scan, and when the Conventional Personality, Scan List Selection on page 429 field is not set to None, and when the Conventional Personality, Automatic Scan on page 430 field is Disabled for the radio's current channel.</p>

Switch Selections:	This selection is only valid in RadioCentral, and/or available to the user:
	<p>For Trunking, when the Trunking Personality, Scan List Selection on page 517 field is not set to None, and when the Trunking Personality, Automatic Scan on page 518 field is Disabled for the radio's current channel.</p> <p> WARNING: This selection cannot be programmed concurrently on Buttons, Switches and Menu Items; however, it can be set concurrently on Portable and Accessory Buttons.</p> <p> IMPORTANT: This selection can be set on the Conventional Concentric Switch (one position only) or the Conventional Toggle Switch (two positions maximum) but not both. The same constraint applies to Trunking switches.</p> <p>This selection can be set concurrently on the Conventional and Trunking Concentric and/or Toggle Switches, noting the previous constraint.</p>
Scan List Programming on page 187	<p>For Conventional, when the Conventional Personality, Scan List Selection on page 429 field is not set to None for the radio's current channel.</p> <p>For Trunking, when the Trunking Personality, Scan List Selection on page 517 field is not set to None for the radio's current channel.</p>
Talkaround/Direct on page 187	<p>When operating in Conventional communications mode, and when the Conventional Personality, Direct/Talkaround on page 397 field is Enabled for the radio's current channel. Only available for Conventional.</p> <p> WARNING: This selection cannot be set concurrently on Buttons, Switches and Menu Items; however, it can be set concurrently on Portable and Accessory Buttons.</p> <p>This selection can only be set on one switch.</p>
Tx Low Power on page 187	<p>When selected, always available to the user, and therefore not dependent on any RadioCentral feature or selection.</p>
Unprogrammed on page 188	<p>(Intended for controls that are not in use.)</p>

<p>Switch Selections:</p>	<p>This selection is only valid in RadioCentral, and/or available to the user:</p>
<p>Zone Select on page 188</p>	<p>When selected, always available to the user, and therefore not dependent on any RadioCentral feature or selection.</p> <p> WARNING: This selection must be set for both Conventional and Trunking communications modes and for all positions of the selected switch.</p> <p>This selection cannot be set concurrently on the Rotary Switch, Concentric Switch and Toggle Switch.</p> <p>This is not a valid selection for the Concentric Switch when Zone Bank Up on page 178 or Zone Bank Down on page 178 is set on a Button.</p> <p> IMPORTANT: When assigning Zone Bank Up or Zone Bank Down to a programmable button, Zone Select is automatically assigned to the three Position A/B/C Toggle switch.</p> <p>When Conventional Concentric Switch Position A is set to Zone Select, the Trunking Concentric Switch Position A and Position B and the Conventional Concentric Switch Position B are automatically set to Zone Select and become view-only. Therefore only Conventional Concentric Switch Position A can then be modified.</p> <p>When Conventional Toggle Switch Position A is set to Zone Select, the Trunking Toggle Switch Position A, Position B, and Position C and the Conventional Toggle Switch Position B and Position C are automatically set to Zone Select and become view-only. Therefore only Conventional Toggle Switch Position A can then be modified.</p>

10.8.2.12.1

Blank

Select this feature for a rotary, concentric or toggle switch, or Multi-Function Knob (MFK) function, that is not in use.

This feature is available for Conventional or Trunking communications mode.

10.8.2.12.2

Channel Select

This Rotary/switch-toggle or Multi-Function Knob (MFK) selection allows you to change the radio's channel.

This feature is available while operating in Conventional or Trunking communications mode.

IMPORTANT:

When defined for a Rotary switch, only the first 16 channels (see the Channels Page) defined for each zone are available on the Rotary.

When defined for a Two Position or Three Position Switch, only the first two or the first three channels (see the Channels Page) defined for each zone are available on the switch.

When selected for a Two Position or Three Position Switch, it must be selected for Conventional and Trunking and for all positions of that switch.

This selection may only be set to the radio's Rotary switch when either **Zone Bank Up** or **Zone Bank Down** is set to a programmable button. Only 16 channels are possible per zone when using the Rotary switch as the channel selector.

When selected as the Primary Function for an MFK, **Volume Select** must be selected as the Secondary Function in order to be considered valid.

10.8.2.12.3

Clear Tx Select

This switch-toggle allows you to disable secure transmissions.

This feature is available while operating in Conventional or Trunking communications mode.

10.8.2.12.4

Keypad/Controls Lock

This switch-toggle allows you to lock (or unlock) the radio's keypad (when available).

Additional control-locking functionality is possible (for all models) when the Rotary Switch Lock Enable field and/or Side Buttons Lock Enable field is **Enabled** (see Important Note). This feature is available while operating in Conventional or Trunking communications mode.

IMPORTANT:

When Rotary Switch Lock Enable is **Enabled**, this feature also locks in the radio's currently operating channel even when the rotary switch is moved to another position.

When Side Button Lock Enable is **Enabled**, this feature also locks the radio's Side Top, Side Middle, and Side Bottom buttons.

10.8.2.12.5

Mute

This switch-toggle allows you to enable or disable certain radio tones (for example, the keypad tones), as configured by the Enhanced Mute Tones Operation selection.

This feature is available for Conventional or Trunking communications mode.

10.8.2.12.6

PL Disable

This switch-toggle allows you to disable PL/DPL carrier squelch.

This feature is available while operating in Conventional communications mode.

10.8.2.12.7

Scan

This switch-toggle allows you to select Scan Lists and toggle Scan Mode on and off while operating in Conventional or Trunking communications mode.

10.8.2.12.8

Scan List Programming

This switch-toggle places the radio in a **Scan List Edit** mode.

While in this edit mode, you are able to add or remove individual Scan List members in the Scan List and modify the scan priority of any member. Over-the-Air communications are not possible when in this Scan List Edit Mode. This feature is available while operating in Conventional or Trunking communications mode.

IMPORTANT: The radio's Top Side Button automatically becomes the designated Select button while editing a scan list channel. This is only true while the radio is operating in this Scan List Programming mode.

10.8.2.12.9

Secure Tx Select

This switch-toggle allows you to choose secure encrypted (or clear) transmissions.

This feature is available while operating in Conventional or Trunking communications mode.

10.8.2.12.10

Talkaround/Direct

This switch-toggle allows you to enable or disable the Direct/Talkaround mode for the current channel options profile.

This feature is available while operating in Conventional communications mode.

10.8.2.12.11

Tx Inhibit

This switch-toggle allows you to disable all radio transmissions while operating in Conventional or Trunking communications mode.

IMPORTANT: This action may be necessary when entering hazardous environments with high sensitivity to RF fields, where a radio transmission could initiate an explosion or other dangerous reaction.

NOTE:

If you attempt to key up the radio while Tx Inhibit is **Enabled**, the radio generates a long, low-pitched Talk Prohibit Tone, indicating that transmissions are currently not allowed.

10.8.2.12.12

Tx Inhibit Disabled

This switch-toggle allows you to enable all radio transmissions while operating in Conventional or Trunking communications mode.

10.8.2.12.13

Tx Low Power

This switch-toggle allows you to change the radio's transmission power from low to high and back on a radio-wide basis.

Once initiated, this Low Power setting takes precedence over all individual Conventional Personality [Transmit Power Level on page 394](#) and Trunking System [TX Power Level on page 474](#) settings. The radio's power setting will also change to high power on a radio-wide basis when the switch is moved to another programmed selection. Powering off and back-on the radio resets all of the radio's channels to their programmed power setting.

10.8.2.12.14

Unprogrammed

Select this feature for a toggle switch that is not in use.

This feature is available while operating in Conventional or Trunking communications mode.

10.8.2.12.15

Zone Select

This Rotary/switch-toggle or Multi-Function Knob (MFK) selection allows you to select a Zone.

This feature is available while operating in Conventional or Trunking communications mode.

IMPORTANT:

When defined for a switch, only the first two or the first three zones defined in Zone Channel Assignment are available on the switch. See also Zone Bank, Zone Bank Up and Zone Bank Down.

When selected for a Two Position or Three Position Switch, it must be selected for Conventional and Trunking and for all positions of that switch.

This selection is automatically set to the radio's Three Position A/B/C Toggle switch when either **Zone Bank Up** or **Zone Bank Down** is set to a programmable button. See also the Zone Bank Keystone Concept.

When selected as the Primary Function for an MFK, **Volume Select** must be selected as the Secondary Function in order to be considered valid.

10.8.2.12.16

Volume Select

This Multi-Function Knob (MFK) selection allows you to change the radio's volume.

This feature is available while operating in Conventional or Trunking communications mode.

WARNING:

For dual-function operation:

- If the MFK's Primary Function is assigned with either **Zone Select** or **Channel Select**, then the Secondary Function must be assigned with **Volume Select** in order to be considered valid.
- If the MFK's Primary Function is assigned with **Volume Select**, then the Secondary Function must be assigned with either **Zone Select** or **Zone Select** in order to be considered valid.

For single-function operation: You must select **Volume Select** as the Primary function and **Blank** as the Secondary function in order to be considered valid.

10.8.3

Menu Items

The **Menu Items** section allows you to view or choose the selections that define menu functionality or features available in the radio's display.

Radio menu functionality is defined and operates separately for each of the two radio communications modes, Conventional and Trunking. That is, when the radio is operating on a Conventional channel,

only the selected Conventional features are available to you. Likewise, when the radio is operating on a Trunking channel, only the selected Trunking features are available.

IMPORTANT:

Certain Menu Item selections are automatically removed from the **Selected** Menu Item column if the selection is duplicated in the Button Selections or Switch Selections; however, certain Menu Item selections may be duplicated to accommodate your preference or convenience.

The APX™ 1000 1.5, APX™ 2000 1.5, and APX™ 4000Li 1.5 Portable models support a maximum of three (3) menu soft key selections (the normal limit is 24). When modifying these models' codeplugs in the application, if you attempt to select more than three menu items, the **Selected** field will become invalid.

NOTE: Some selections are model/option dependent on a per radio basis.

10.8.3.1

Available/Selected (Conventional)

This field allows you to add or remove menu item Conventional features.

From the **Available Items** column, you can select the features to appear in the radio's display (available for use) while operating in Conventional communications mode.

NOTE:

Clicking the **Add** or **Remove** button allows you to add or remove selected menu items to or from the **Selected** column.

There must be at least one menu item in the **Selected** column.

See [Menu Selections on page 189](#) for list of supported selections:

10.8.3.2

Available/Selected (Trunking)

This field allows you to add or remove menu item Trunking features.

From the **Available Items** column, you can select the features to appear in the radio's display (available for use) while operating in Trunking communications mode.

NOTE:

Clicking the **Add** or **Remove** button allows you to add or remove selected menu items to or from the **Selected** column.

There must be at least one menu item in the **Selected** column.

See [Menu Selections on page 189](#) for list of supported selections:

10.8.3.3

Menu Selections

This topic lists the menu items selections and when it is available to the users.

Menu Items Selections:	This selection is only valid in RadioCentral, and/or available to the user:
Battery on page 194 (BATT)	When selected, always available to the user, and therefore not dependent on any feature or selection.
Bluetooth on page 194 (BT)	When the Bluetooth Enable on page 126 field is Enabled .
Beacon on page 194 (BCON)	When the radio model/option capable.

Menu Items Selections:	This selection is only valid in RadioCentral, and/or available to the user:
Select/Private Call on page 194 (CALL)	<p>For Conventional, when the Conventional Personality, ASTRO Selective Call Rx/Tx on page 423 is set to Encode or Encode & Decode, or when the Conventional Personality, Non-ASTRO Selective Call Rx/Tx on page 419 is set to Encode or Encode & Decode for the radio's current channel.</p> <p>For Trunking, when the Trunking Personality, Private Call Type on page 514 is not set to Disabled for the radio's current channel.</p>
Channel Down on page 194 (CHDN)	When selected, always available to the user, and therefore not dependent on any feature or selection.
Channel Search on page 195 (CHSR)	When selected, always available to the user, and therefore not dependent on any feature or selection.
Channel Select on page 195 (CHAN)	When selected, always available to the user, and therefore not dependent on any feature or selection.
Channel Up on page 195 (CHUP)	When selected, always available to the user, and therefore not dependent on any feature or selection.
Clock on page 195 (CLCK)	When the Radio Wide, Time Format field is not set to Disabled .
Contacts on page 195 (CNTS)	When selected, always available to the user, and therefore not dependent on any feature or selection.
Dialer	When the radio model/option capable.
Direct/Talkaround on page 196 (DIR)	<p>When operating in Conventional communications mode, and when the Conventional Personality, Direct/Talkaround on page 397 field is Enabled for the radio's current channel.</p> <p> IMPORTANT: This selection cannot be programmed concurrently on Buttons, Switches and Menu Items.</p>
Dynamic ID on page 196 (DYID)	When operating in Conventional communications mode, and when the Conventional System, Dynamic ID Enable field is Enabled for the radio's current channel.
Dynamic Priority on page 196 (DYNP) 	When Scan Mode is enabled, and when the Scan Type on page 617 is Conventional , and when the Scan List, Dynamic Priority on page 620 field is enabled for the radio's current landed scan channel.
Erase on page 196 (ERAS)	When the Secure Wide, Secure Operation on page 272 field is set to Hardware or Software and Advanced Encrypted Standard (AES256) on page 273 is enabled.
Information on page 196 (INFO)	When selected, always available to the user, and therefore not dependent on any feature or selection.
Internet Protocol Address on page 196 (IP)	When selected, always available to the user, and therefore not dependent on any feature or selection.

Menu Items Selections:	This selection is only valid in RadioCentral, and/or available to the user:
Key on page 197 (KEY)	When the Conventional Personality, Voice Voice Key Strapping on page 438 field is set to Select for the radio's current channel.
Keypad on page 197 (KSET)	When the Secure Wide, Secure Operation on page 272 field is set to Hardware or Software , and Advanced Encrypted Standard (AES256) on page 273 is enabled, and User Selectable (Keypad) is enabled.
Location on page 197 (LOC)	When the Radio Wide, Location Enable on page 111 field is Enabled .
LTE on page 197 (LTE)	For Conventional, when the Data Profile Type on page 341 of the Conventional System's referenced Data Profile is Conventional & Broadband or Broadband-Only . For Trunking, when the Data Profile Type of the Trunking System's referenced Data Profile is Trunking & Broadband or Broadband-Only .
Message on page 197 (MSG)	For Conventional, when the Conventional System, Message field is Enabled for the radio's current channel. For Trunking, when the Trunking Personality, Message Enable on page 519 field is Enabled for the radio's current channel.
Mode Select on page 198 (MS01–MS05)	When selected, always available to the user, and therefore not dependent on any feature or selection.
Multiple Private Line on page 198 (MPL)	When the Conventional Personality, Rx Voice/Signal Type on page 390 field is set to Non-ASTRO or Mixed Mode , and when the Conventional Personality, User-Selectable PM [MPL] field is Enabled for the radio's current channel. Only available for Conventional.
Mute on page 198 (MUTE)	When the Radio Wide, Enhanced Mute Tones Operation on page 101 field is not Disabled .
My Radio Identification (MyID) on page 198 (MYID)	When the Radio Wide, Radio Alias field has an alias name defined.
Nuisance Delete on page 198 (NUIS)	When Scan Mode is Enabled .
Page on page 199 (PAGE)	For Conventional, when the Conventional Personality, ASTRO Call Alert Rx/Tx on page 424 field is set to Encode or Encode & Decode , or when the Conventional Personality, Non-ASTRO Call Alert Rx/Tx on page 420 field is set to Encode or Encode & Decode for the radio's current channel. For Trunking, when the Trunking Personality, Call Alert/Page Operation on page 515 field is set to List Only or Unlimited for the radio's current channel.
Password on page 199 (PSWD)	When the Radio Wide, Enable (Radio Lock) field is Enabled .

Menu Items Selections:	This selection is only valid in RadioCentral, and/or available to the user:
Phone on page 199 (PHON)	<p>For Conventional when the Conventional Personality, Phone Operation on page 517 field is not set to None for the radio's current channel.</p> <p>For Trunking, when the Trunking Personality, Phone Operation on page 517 field is not set to Disabled for the radio's current channel.</p>
Power on page 200 (PWR)	When selected, always available to the user, and therefore not dependent on any feature or selection.
Quik Call II on page 200 (QCII)	<p>When selected, the QCII is initiated by pressing PTT, which transmits the tones over the radio network.</p> <p>For Conventional, when the Conventional Personality, Tone Signaling List on page 583 field is set to a specific Tone Signaling List, and when the radio is model/option capable.</p> <p>For Trunking, when the Trunking Personality, Tone Signaling List on page 583 field is set to a specific Tone Signaling List, and when the radio is model/option capable.</p>
Radio Profiles on page 200 (PRFL)	When selected, always available to the user, and therefore not dependent on any feature or selection.
Recent Calls on page 200 (RCNT)	When selected, always available to the user, and therefore not dependent on any feature or selection.
Rekey Request on page 201 (REKY)	When the ASTRO OTAR Information, User Selectable Rekey Request on page 295 is not set to Disabled , or when the MDC OTAR, Rekey Request Mode on page 278 is not set to Disabled .
Remote Emergency on page 201 (REMG)	When selected, always available to you, and therefore not dependent on any feature or selection.
Scan on page 201 (SCAN)	<p>For Conventional, when the Scan Type on page 617 is not set to Voting Scan, and when the Conventional Personality, Scan List Selection on page 429 field is not set to None, and when the Conventional Personality, Automatic Scan on page 430 field is Disabled for the radio's current channel.</p> <p>For Trunking, when the Trunking Personality, Scan List Selection on page 517 field is not set to None, and when the Trunking Personality, Automatic Scan on page 518 field is Disabled for the radio's current channel.</p> <p> IMPORTANT: This selection cannot be set concurrently on Buttons, Switches and Menu Items; however, it can be set concurrently on Portable and Accessory Buttons.</p>
Scan List on page 201 (SCNL)	For Conventional, when the Conventional Personality, Scan List Selection on page 429 field is not set to None for the radio's current channel.

Menu Items Selections:	This selection is only valid in RadioCentral, and/or available to the user:
	For Trunking, when the Trunking Personality, Scan List Selection on page 517 field is not set to None for the radio's current channel.
Sensor on page 201 (SNSR)	When the radio is model/option capable.
Status on page 202 (STS)	For Conventional, when the Conventional System Status on page 380 field is Enabled for the radio's current channel. For Trunking, when the Trunking Personality Status Enable on page 519 field is Enabled for the radio's current channel.
Talkgroup on page 202 (TGRP)	When the Conventional Personality, ASTRO Talkgroup Selection Type on page 427 field is set to Selectable for the radio's current channel. Only available for Conventional.
Text Messaging Service on page 202 (TMS)	For Conventional, when the Conventional System, Text Messaging Service on page 382 field is set to List Only or Unlimited , and when that System's Data Profile Selection on page 379 is not set to Data Disabled for the radio's current channel. For Trunking, when the Trunking System, Text Messaging Service on page 480 field is set to List Only or Unlimited , and when that System's Data Profile Selection on page 529 is not set to Data Disabled for the radio's current channel.
Tx Inhibit on page 202 (TxIN)	For a Mobile codeplug: when the Radio Selection field is not set to Secondary Radio , or when the Enable Secondary Radio Tx field is Enabled .  IMPORTANT: For a Portable codeplug: this selection cannot be set concurrently with a Tx Inhibit on page 187 Switch selection.
User on page 202 (USER)	When selected, always available to the user, and therefore not dependent on any feature or selection.
Voice Mute on page 203 (VMUT) 	For Conventional, when the Conventional Personality, ASTRO Call, In-Call User Alert Enable field is Enabled for the radio's current channel, or when the Conventional Personality, Non-ASTRO Call In-Call User Alert Enable (Non-ASTRO) field is Enabled for the radio's current channel. When the Trunking Personality, In-Call User Alert Enable on page 516 field is Enabled for the radio's current channel.
Wi-Fi On/Off on page 178 (WIFI)	This menu-selection provides user with Wi-Fi information and options. This field is only enabled when the Wi-Fi Enable on page 331 field is Enabled .
Zone Down on page 203 (ZNDN)	When selected, always available to the user, and therefore not dependent on any feature or selection.

Menu Items Selections:	This selection is only valid in RadioCentral, and/or available to the user:
Dynamic Zone Programming on page 203 (ZNPR)	When the Zone Channel Assignment, Dynamic Zone Enable field has been Enabled for one or more radio zones.
Zone Select on page 203 (ZONE)	When selected, always available to the user, and therefore not dependent on any feature or selection.
Zone Up on page 203 (ZNUP)	When selected, always available to the user, and therefore not dependent on any feature or selection.

10.8.3.3.1

Battery

This menu-selection allows you to check the battery power level while operating in Conventional or Trunking communications mode.

10.8.3.3.2

Bluetooth

This menu-selection provides you with a list of Bluetooth status/information and Bluetooth options.

This feature is available while operating in Conventional or Trunking communications mode.

Bluetooth Configuration features include:

Bluetooth Status

Allows you to turn On and Off Bluetooth radio to Bluetooth device functionality.

Device Active

Allows you to view a list of all currently active (paired) Bluetooth devices.

Bluetooth Speaker

Allows you to turn On and Off a Bluetooth device's speaker.

10.8.3.3.3

Beacon

This menu-selection allows you to check the details of any recently received Emergency beacons.

This feature is available for Conventional or Trunking communications mode.

10.8.3.3.4

Select/Private Call

This menu-selection allows you to transmit a Conventional - Selective Call or a Trunking - Private Call.

You must select the required Contact/Call ID and then press the PTT button to initiate the Call.

Select Calls and Private Calls are typically used when the majority of transmissions are between you and a dispatcher, or a group of users.

You can directly enter or select targeted Calls based on the Call ID from the channel's Call Hot List. Select Calls and Private Calls are intended not so much to ensure privacy but rather to eliminate the annoyance of receiving traffic that does not pertain to them. See also Conventional - Selective Call Rx/Tx and Trunking - Private Call.

10.8.3.3.5

Channel Down

This menu-selection allows you to scroll down to other channels within the radio's current Zone.

Channels are defined in the Zone Channel Assignment Window. This feature is available while operating in Conventional or Trunking communications mode.

10.8.3.3.6

Channel Search

This menu-selection allows you to search for a channel/mode based on its programmed channel name, and directly switch to the found channel.

This feature is available while operating in Conventional or Trunking communications mode.

NOTE: These [Channel Name on page 607](#) can be viewed in the Zone Channel Assignment Window's Channels Page on a per zone basis.

10.8.3.3.7

Channel Select

This menu-selection allows you to jump to a channel in the radio by entering the channel number on the radio's keypad.

This feature applies while operating in Conventional or Trunking communications mode.

NOTE: These channel numbers must be programmed and can be viewed in the Zone Channel Assignment Window's Channels Page on a per zone basis.

10.8.3.3.8

Channel Up

This menu-selection allows you to scroll up to other channels within the radio's current Zone.

Channels are defined in the Zone Channel Assignment Window. This feature is available while operating in Conventional or Trunking communications mode.

10.8.3.3.9

Clock

This menu-selection allows you to view and modify clock settings.

The Time Format defines the default time mode within the radio's display. This feature applies while operating in Conventional or Trunking communications mode.

IMPORTANT: The Clock feature only appears in the radio's display when the Radio Wide, Time Format field is not set to **Disabled**.

10.8.3.3.10

Contacts

This menu-selection allows you to view/edit the Contacts of the radio's current channel.

Contacts are programmed in the Unified Call List. Contacts make up the members of Call Hot Lists.

You can select Hot List members/Contacts, allowing for call types such as Phone Calls, Selective/Private Calls, and Call Alerts/Pages to individual radios or to groups of radios. This feature applies while operating in Conventional or Trunking communications mode.

IMPORTANT: This feature is not available for Portable radios having only a top display.

10.8.3.3.11

Direct/Talkaround

This menu-selection allows you to enable or disable the Direct/Talkaround mode for the current channel options profile.

This feature is available while operating in Conventional communications mode.

10.8.3.3.12

Dynamic ID

This menu-selection allows for entry into the Dynamic ID edit mode, which allows you to view and/or edit the radio's Individual ID and/or MDC Primary ID for the current ASTRO and/or MDC system.

This feature is available while operating in Conventional communications mode.

10.8.3.3.13

Dynamic Priority

This menu-selection allows you to select the Dynamic Priority scan assignment.

This feature is available while operating in Conventional communications mode.

10.8.3.3.14

Erase

This menu-selection allows you to remove the current secure encryption key that is being used by the radio, or all of the radio's current encryption keys.

This selection applies while operating in Conventional or Trunking communications mode.

10.8.3.3.15

Information

This menu-selection allows you to retrieve and view basic radio information such as IP-related information and buttons/switches control mapping, as well as view or modify the Soft ID.

This feature applies only when operating on ASTRO - Conventional Systems. This is a Portable radio only feature.

IMPORTANT:

Modifying the Soft ID changes the radio's Username for Automatic Registration Service server or a User Authentication Unified Network Services (UNS) server logon. When editing the Username this way, the PIN/Password and Unit ID are blanked. Therefore, this can only be used when the server is expecting a blank PIN/Password and you do not want to use Unit ID.

This feature is not available for Portable radios having only a top display.

10.8.3.3.16

Internet Protocol Address

This menu-selection allows you to retrieve and view (in the radio's display) the radio's current IP address, device name and status.

This feature applies while operating in Conventional or Trunking communications mode.

10.8.3.3.17

Key

This menu-selection allows you to change the secure encryption Key for the current Conventional communications channel.

IMPORTANT:

These selectable Keys are uniquely defined with the [CKR Number on page 286](#) field.

When you select a new Key, all of the radio's Conventional channels having their [Voice Key Strapping on page 438](#) field is set to **Select** are automatically re-keyed with your same selected key.

Changing Keys is sometimes useful when an encryption key is known to be compromised.

10.8.3.3.18

Keyset

This menu-selection allows you to change to an alternate secure encryption Keyset when operating in Conventional or Trunking communications mode.

The selected Keyset then applies for both Conventional and Trunking communications modes.

IMPORTANT:

Alternate Keysets are available because of [PID Key Management for ASN Mode on page 284](#) PID Key Management compatibility or Over The Air Rekeying (OTAR).

Changing Keysets is sometimes useful when an encryption key is known to be compromised.

10.8.3.3.19

Location

This menu-selection allows you to determine their current location (latitude, longitude, time and date) and also the distance and bearing to another location ("waypoint").

This feature is available while operating in Conventional or Trunking communications mode.

IMPORTANT: If the Radio Wide, [User Selectable Location Enable on page 112](#) field is **Enabled**, you are also allowed to turn the outdoor location/Global Positioning System (GPS) functionality on or off for all location/GPS enabled Conventional or Trunking communications channels.

10.8.3.3.20

LTE

This menu-selection activates and deactivates the radio's LTE Broadband data capabilities.

This feature is available while operating in Conventional or Trunking communications mode.

IMPORTANT:

This menu-selection is only operational when a channel that is configured for LTE Broadband operation is selected. When a non-LTE channel is selected, the menu is hidden from you.

A channel is LTE capable when its Data Profile's [Data Profile Type on page 341](#) field is set to **Conventional & Broadband**, or **Trunking & Broadband**, or **Broadband-Only**, and its [Broadband Source](#) is **Internal LTE Modem**.

10.8.3.3.21

Message

This menu-selection allows you to display the last Message transmitted by the radio and acknowledged by the base station while operating in Conventional or Trunking communications mode.

10.8.3.3.22

Mode Select

These five menu-selections (MS01–MS05) allow you to program frequently-used or any desired zone and channel combination. If MSPR is selected, you can preset the configuration for MS01–MS05 on the radio.

Each of the menu selections may be programmed with a different zone/channel combination for later retrieval. The programming and use of these menu selections is very similar to the programming and use of a car radio's preset buttons. That is, once you navigate to an MSx option in the menu, a long-press of the Menu Select button programs the radio's current zone and channels into that MSx menu option; then once programmed, a short-press of the Menu Select button jumps the radio to the programmed zone and channel.

This feature is available while operating in Conventional or Trunking communications mode.

IMPORTANT: The [Short Keypress Duration on page 135](#) and [Long Keypress Duration on page 135](#) are both RadioCentral-defined.

10.8.3.3.23

Multiple Private Line

This menu-selection allows you to access a listing of the available MPL Lists.

NOTE: Each list is represented by a recognizable name . You are then able to select the desired Alias/PL settings. This feature is available while operating in Conventional communications mode.

10.8.3.3.24

Mute

This menu-selection allows you to enable or disable certain radio tones (for example, the keypad tones), as configured by the Enhanced Mute Tones Operation selection.

This feature is available for Conventional and Trunking communications modes.

10.8.3.3.25

My Radio Identification (MyID)

This menu-selection allows you to cause the Radio ID Alias to appear in the radio's display.

This feature applies while operating in Conventional or Trunking communications mode.

10.8.3.3.26

Nuisance Delete

This menu-selection allows you to temporarily remove a Scan List Member channel that continually generates unwanted carrier noise from the current Active Scan.

This feature applies while operating in Conventional or Trunking communications mode.

IMPORTANT:

Switching to another channel on the radio's channel selector, turning off scan mode and then back on, or turning off the radio and then back on effectively brings that temporarily removed Scan List Member channel back to an actively scanned status.

Nuisance Delete is not possible:

- For a Priority #1, or Priority #2 Scan List Member channel.
- When the [Designated Voice Tx Member Type on page 622](#) field is set to **Selected Channel** and the Landed Scan channel's Tx Frequency is the same as the Tx Frequency of the radio's currently-selected channel.
- If the current Scan List does not contain at least two members before a Nuisance Delete occurs.

10.8.3.3.27

Page

This menu-selection allows you to transmit a Call Alert for Conventional modes, or a Call Alert/Page for Trunking modes.

NOTE: Call Alert/Pages allow a dispatcher or radio-caller to notify you (or group of users) of a missed call. Receiving radios are targeted based on radio and system information managed by the Contacts and Call IDs in the radio's Call Hot Lists. You can directly enter or select Call IDs from the channel's Hot List. The receiving radio responds with both alert tones and visual alerts. The visual alert (flashing LED) persists until reset by your interaction with the radio.

10.8.3.3.28

Password

This menu-selection allows you to modify the Radio Lock/Tactical Inhibit Stun Unlock Password, and to modify the Tactical Inhibit Encode Password.

This feature applies while operating in Conventional or Trunking communications mode.

IMPORTANT:

This password must be composed of numeric values only that may be easily entered from the radio keypad. The password's largest possible value is determined in the Maximum Password Length field.

In the secure encryption version of the Radio Lock feature (see the Important Note in the Enable (Radio Lock) topic), the password must be manually set in the hardware encryption module with the radio keypad and this Password menu-selection.

In the clear/Tactical Inhibit version of the Radio Lock feature, the initial password must be programmed in the Unlock Password field.

10.8.3.3.29

Phone

This menu-selection allows you to initiate Phone Mode while operating in Conventional or Trunking communications mode.

10.8.3.3.30

Power

This menu-selection allows you to toggle the radio's transmission power from low to high and back for all Conventional Personalities or referenced Trunking Systems on a radio-wide basis.

IMPORTANT:

Once the setting in the radio's display has been change, this high or low power setting takes precedence over all individual Conventional [Transmit Power Level on page 394](#) settings or Trunking [TX Power Level on page 474](#) settings. That is, when you made the radio's **PWR** menu-selection, the radio displays *High Power* or *Low Power* depending on the status of the radio's current channel. You may then select to transmit in high or low power by selecting either choice from the radio's display.

Powering off and back-on the radio resets all the radio's channels to their programmed power setting.

10.8.3.3.31

Quik Call II

This option enables the launching of the QCII application and allows you to choose the tone to be transmitted.

This feature applies while operating in Conventional or Trunking communications mode.

10.8.3.3.32

Radio Profiles

This menu-selection allows you to select one of the programmed Radio Profiles in Zone-Channel Assignment, provided that the Radio Profile Selection field is set to Last Selected.

This feature applies while operating in Conventional or Trunking communications mode.

10.8.3.3.33

Radio Swap

This menu-selection allows you to switch back and forth between two radios (known as "the brick" part of the radio) that are attached to the same control head in a Dual Radio configuration.

This feature applies while operating in Conventional or Trunking communications mode.

IMPORTANT: If the Fixed Swap Menu field is **Enabled**, then a **Radio Swap** menu-selection always appears at the left-most menu position, even as you scroll through the soft-menu buttons, and regardless of whether this feature is programmed or not; however, if the Fixed Swap Menu field is **Disabled**, then this menu-selection is accessible with the standard scrolling menu.

10.8.3.3.34

Recent Calls

This menu-selection allows you to access the recent incoming and outgoing call information for the following call types: Call Alerts, Selective/Private Calls and (outgoing only) Phone calls.

This feature applies while operating in Conventional or Trunking communications mode.

10.8.3.3.35

Rekey Request

This menu-selection allows you to transmit an Over-The-Air-Rekeying (OTAR) rekey request to the dispatcher's (KMF or KMC) console while operating in Conventional or Trunking communications mode.

IMPORTANT:

For MDC OTAR (Conventional communications), the request protocol is determined by the [Rekey Request Mode on page 278](#) field.

For ASTRO OTAR (Conventional or Trunking communications), the [User Selectable Rekey Request on page 295](#) field must be **Enabled**, and the request protocol is determined by the [OTAR Tx Security Level on page 293](#) field.

10.8.3.3.36

Remote Emergency

This menu-selection activates the Remote Emergency Activation feature so an authorized user to encode this command can cause a target radio to initiate the Emergency feature without target user intervention.

NOTE: Remote Emergency is only supported on ASTRO Conventional and ASTRO 25 Trunking channels.

10.8.3.3.37

Scan

This menu-selection allows you to select Scan Lists and turn Scan Mode ON/OFF while operating in Conventional or Trunking communications mode.

10.8.3.3.38

Scan List

This menu-selection allows you to view individual Scan List members in the Scan List and also places the radio in a Scan List Edit mode.

While in this edit mode, you are able to add or remove scan list members and modify the scan priority of any member. This feature is available while operating in Conventional or Trunking communications mode.

IMPORTANT: The radio's Top Side Button automatically becomes the designated Select button while editing a scan list channel. This is only true while the radio is operating in this Scan List Programming mode.

10.8.3.3.39

Sensor

This button-press allows you to select the time of the Sensor Event Disable Time operation.

The [Sensor Event Disable Time on page 127](#) is a Radio Wide field. This feature applies while operating in Conventional or Trunking communications mode.

10.8.3.3.40

Status

This menu-selection allows you to select from the Status Alias List of the current channel/mode.

NOTE: For your convenience, as part of this feature the display initially shows the last acknowledged Status call, or the first Status in the list. This feature is available while operating in Conventional or Trunking communications mode.

IMPORTANT:

While operating in Conventional communications mode with MDC/ASTRO/DVRS Signaling, the Conventional Status Alias List is used.

While operating in Trunking communications mode, the Trunking System - Status Alias List selected for the current Trunking Personality is used.

10.8.3.3.41

Stun

This menu-selection allows you to transmit a Tactical Inhibit Stun command to a specific radio or group of radios.

IMPORTANT: This is only possible when the application's Conventional Personality, Tactical Inhibit Stun Operation field is set to **Encode** or **Decode & Encode**. Tactical Inhibit Stun Operation is defined on per Conventional Personality basis.

10.8.3.3.42

Talkgroup

This menu-selection allows you to switch from the preset Talkgroup to another Talkgroup from within the Conventional Personality's current Talkgroup List.

All Conventional Personalities using the same Talkgroup List are automatically switched to the selected Talkgroup.

10.8.3.3.43

Text Messaging Service

This menu-selection allows you to access the radio's TMS mode, seen in the radio's display.

See also the Trunking System or Conventional System, Text Messaging Service feature.

10.8.3.3.44

Tx Inhibit

This menu-selection allows you to disable all radio transmissions while operating in Conventional or Trunking communications mode.

IMPORTANT: This action may be necessary when entering hazardous environments with high sensitivity to RF fields, where a radio transmission could initiate an explosion or other dangerous reaction.

NOTE:

If you attempt to key up the radio while Tx Inhibit is **Enabled**, the radio generates a long, low-pitched Talk Prohibit Tone, indicating that transmissions are currently not allow.

10.8.3.3.45

User

This menu-selection allows you to log in to different Automatic Registration Service (ARS) Servers with the appropriate Username and Password (PIN) combination.

Usernames and PINs may be manually entered from the radio's keypad, or Usernames may be selected from [Data User List on page 338](#) entries (the PIN is then manually entered). This feature is available while operating in Conventional or Trunking communications mode. See also the Soft ID/Username field.

WARNING: This feature functions only when the Data Profiles, [ARS Mode on page 346](#) field is not set to **Disabled**.

10.8.3.3.46

Voice Mute

This menu-selection allows you to toggle on and off Voice Mute functionality for In-Call User Alert-enabled channels.

When Voice Mute is active, the radio remains muted to all Conventional communications calls and affiliated Trunking Talkgroup calls. Group and individual Call Alert/Pages do unmute the radio for the alert tone; also, when Voice Mute is active, the radio does unmute to individual radio-to-radio calls such as Selective/Private Calls and Interconnect (phone mode) calls.

10.8.3.3.47

Zone Down

This menu-selection allows you to scroll downward through the Zones in the radio.

Upon reaching the first Zone in the list, continued scrolling causes the list to wrap around to the last Zone. Zones are defined in the Zone Channel Assignment Window.

10.8.3.3.48

Dynamic Zone Programming

This menu-selection allows you to view or edit the channels in the radio's Dynamic Zone(s).

Dynamic Zones are enabled in the Zone Channel Assignment Window's Zone Page.

10.8.3.3.49

Zone Select

This menu-selection allows you to select a Zone while operating in Conventional or Trunking communications mode.

Zones are defined in the Zone Channel Assignment Window.

10.8.3.3.50

Zone Up

This menu-selection allows you to advance upward through the Zones in the radio.

Upon reaching the last Zone in the list, continued scrolling causes the list to wrap around to the first Zone. Zones are defined in the Zone Channel Assignment Window.

10.8.4

Keypad (Portable Control)

The **Keypad** section allows the user to view or select radio-wide programmable button functionality for both Conventional and Trunking communications modes. Button functionality is selected once and operates for both of the two radio communications modes.

NOTE: Some selections are model/option dependent on a per radio basis.

10.8.4.1

One (1)

Selects the function for the Keypad button One (1) on a Portable radio, Mobile Control Head or Keypad Mic (KPM).

See [Zero \(0\) on page 205](#) for notes and warnings.

See [Keypad Button Selections on page 206](#) for a list of supported selections:

10.8.4.2

Two (2)

Selects the function for the Keypad button Two (2) on a Portable radio, Mobile Control Head or Keypad Mic (KPM).

See [Zero \(0\) on page 205](#) for notes and warnings.

See [Keypad Button Selections on page 206](#) for a list of supported selections:

10.8.4.3

Three (3)

Selects the function for the Keypad button Three (3) on a Portable radio, Mobile Control Head or Keypad Mic (KPM).

See [Zero \(0\) on page 205](#) for notes and warnings.

See [Keypad Button Selections on page 206](#) for a list of supported selections:

10.8.4.4

Four (4)

Selects the function for the Keypad button Four (4) on a Portable radio, Mobile Control Head or Keypad Mic (KPM).

See [Zero \(0\) on page 205](#) for notes and warnings.

See [Keypad Button Selections on page 206](#) for a list of supported selections:

10.8.4.5

Five (5)

Selects the function for the Keypad button Five (5) on a Portable radio, Mobile Control Head or Keypad Mic (KPM).

See [Zero \(0\) on page 205](#) for notes and warnings.

See [Keypad Button Selections on page 206](#) for a list of supported selections:

10.8.4.6

Six (6)

Selects the function for the Keypad button Six (6) on a Portable radio, Mobile Control Head or Keypad Mic (KPM).

See [Zero \(0\) on page 205](#) for notes and warnings.

See [Keypad Button Selections on page 206](#) for a list of supported selections:

10.8.4.7

Seven (7)

Selects the function for the Keypad button Seven (7) on a Portable radio, Mobile Control Head or Keypad Mic (KPM).

See [Zero \(0\) on page 205](#) for notes and warnings.

See [Keypad Button Selections on page 206](#) for a list of supported selections:

10.8.4.8

Eight (8)

Selects the function for the Keypad button Eight (8) on a Portable radio, Mobile Control Head or Keypad Mic (KPM).

See [Zero \(0\) on page 205](#) for notes and warnings.

See [Keypad Button Selections on page 206](#) for a list of supported selections:

10.8.4.9

Nine (9)

Selects the function for the Keypad button Nine (9) on a Portable radio, Mobile Control Head or Keypad Mic (KPM).

See [Zero \(0\) on page 205](#) for notes and warnings.

See [Keypad Button Selections on page 206](#) for a list of supported selections:

10.8.4.10

Star (*)

Selects the function for the Keypad button Star (*) on a Portable radio, Mobile Control Head or Keypad Mic (KPM).

See [Zero \(0\) on page 205](#) for notes and warnings.

See [Keypad Button Selections on page 206](#) for a list of supported selections:

10.8.4.11

Zero (0)

Selects the function for the Keypad button Zero (0) on a Portable radio, Mobile Control Head or Keypad Mic (KPM).

These selections apply while operating in Conventional or Trunking communications mode.

IMPORTANT: When a radio comes factory-equipped with an O7 Control Head that has the optional Siren and Lights Keypad, the default Keypad button assignments are pre-configured to correspond with the Keypad's graphics.

WARNING: For a Dual Radio configuration: Button functions for Radio Wide features (Siren-related buttons, Aux Control (1-3), Dim, GunLock (1, 2, 3, or All), Relay Pattern, Radio Swap, and Third Party) must be configured the same for the Primary and Secondary radios; additionally, it is strongly recommended to configure all of the button functions the same for both radios, in order to avoid confusion.

See [Keypad Button Selections on page 206](#) for a list of supported selections:

10.8.4.12

Pound/Hash (#)

Selects the function for the Keypad button Pound/Hash (#) on a Portable radio, Mobile Control Head or Keypad Mic (KPM).

See [Zero \(0\) on page 205](#) for notes and warnings.

See [Keypad Button Selections](#) for a list of supported selections:

10.8.4.13

Keypad Button Selections

This topic lists the button selections and when it is available to the users.

Button Selections:	This selection is only valid in RadioCentral, and/or available to the user:
Keypad Digit on page 206	When selected, always available to the user, and therefore not dependent on any feature or selection.
MS01–MS13 on page 171 (Mode Select)	When selected, always available to the user, and therefore not dependent on any feature or selection.
Third Party on page 176	When selected, always available to the user, and therefore not dependent on any feature or selection.

10.8.4.13.1

Keypad Digit

Select this function to retain the standard operation for the associated Keypad button.

IMPORTANT: On a Portable radio, this is the only available function of the Star (*) and Pound/Hash (#) buttons.

10.8.5

Accessory Buttons (Portable Control)

The **Accessory Buttons** section allows the user to view or select radio-wide programmable button functionality for both Conventional and Trunking communications modes. Button functionality is selected and operates separately for each of the two radio communications modes. That is, when the radio is operating on a Conventional channel, only the selected Conventional features are available to the user. Likewise, when the radio is operating on a Trunking channel, only the selected Trunking features are available to the user.

NOTE: Some selections are model/option dependent on a per radio basis.

10.8.5.1

Accy Orange (Conventional)

Selects the function for the Accessory Accy Orange Button.

IMPORTANT: The Accessory Accy Orange Button selection automatically follows the Portable's Top Button selection.

See [Button Selections \(Top and Side\) on page 152](#) for a list of supported selections:

10.8.5.2

Accy Orange (Trunking)

Selects the function for the Accessory Accy Orange Button.

IMPORTANT: The Accessory Accy Orange Button selection automatically follows the Portable's Top Button selection.

See [Button Selections \(Top and Side\) on page 152](#) for a list of supported selections:

10.8.5.3

Accy no-dot (Conventional)

Selects the function for the Accessory Accy no-dot Button.

These selections apply while operating in Conventional or Trunking communications mode, as noted in the table below.

WARNING: The user should not duplicate a function on multiple controls, i.e., on more than one button, on more than one switch or on a button and a switch. This may cause incorrect radio operation.

IMPORTANT: When selecting an Up or Down Conventional feature, the Trunking feature is automatically set to the opposing feature in view-only mode. The selection of any other Conventional feature, enables the Trunking feature for selection.

See [Button Selections \(Top and Side\) on page 152](#) for a list of supported selections:

10.8.5.4

Accy no-dot (Trunking)

Selects the function for the Accessory Accy no-dot Button.

See [Accy no-dot \(Conventional\) on page 207](#) for notes and warnings.

See [Button Selections \(Top and Side\) on page 152](#) for a list of supported selections:

10.8.5.5

Accy 1-dot (Conventional)

Selects the function for the Accessory Accy 1-dot Button.

See [Accy no-dot \(Conventional\) on page 207](#) for notes and warnings.

See [Button Selections \(Top and Side\) on page 152](#) for a list of supported selections:

10.8.5.6

Accy 1-dot (Trunking)

Selects the function for the Accessory Accy 1-dot Button.

See [Accy no-dot \(Conventional\) on page 207](#) for notes and warnings.

See [Button Selections \(Top and Side\) on page 152](#) for a list of supported selections:

10.8.5.7

Accy 2-dot (Conventional)

Selects the function for the Accessory Accy 2-dot Button.

See [Accy no-dot \(Conventional\) on page 207](#) for notes and warnings.

See [Button Selections \(Top and Side\) on page 152](#) for a list of supported selections:

10.8.5.8

Accy 2-dot (Trunking)

Selects the function for the Accessory Accy 2-dot Button.

See [Accy no-dot \(Conventional\) on page 207](#) for notes and warnings.

See [Button Selections \(Top and Side\) on page 152](#) for a list of supported selections:

10.8.5.9

Accy 3-dot (Conventional)

Selects the function for the Accessory Accy 3-dot Button.

See [Accy no-dot \(Conventional\) on page 207](#) for notes and warnings.

See [Button Selections \(Top and Side\) on page 152](#) for a list of supported selections:

10.8.5.10

Accy 3-dot (Trunking)

Selects the function for the Accessory Accy 3-dot Button.

See [Accy no-dot \(Conventional\) on page 207](#) for notes and warnings.

See [Button Selections \(Top and Side\) on page 152](#) for a list of supported selections:

10.9

Display

The **Display** allows you to view or modify settings on a radio-wide basis for a radio's display and menu options.

10.9.1

General

This section allows you to view or define basic radio-wide settings relating to the appearance and the functionality of the radio's display.

10.9.1.1

Zone Text Size

This field selects the maximum number of characters allocated in the radio's front display for Zone Names.

This selection applies on a radio-wide basis.

NOTE:

Zone names/descriptions are defined in the Zone Channel Assignment [Zone Names on page 605](#) field.

You can select Zones with a [Zone Select on page 188](#) switch-toggle or Zone Select menu-selection.

Accessed Only: When the radio is model/option capable.

Whole numbers 0 to 14 are supported.

10.9.1.2

Channel Text Size

This field selects the maximum number of characters allocated in the radio's front display for the Channel names.

This selection applies on a radio-wide basis.

NOTE: Channel names/descriptions are defined in the Zone Channel Assignment Channel Name field. You can select channels with a Channel Select button-press, Channel Select switch-toggle or Channel Select menu-selection.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Range

Whole numbers 1 to 14.

10.9.1.3

Top Display Orientation

This field selects the default orientation of the top display of the radio, allowing you to flip the visual arrangement by 180 degrees, depending on your preference.

The Light/Flip (Display) programmable button selection allows you to change this orientation when needed. This selection applies on a radio-wide basis.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

- Normal
- Inverted

10.9.1.4

Slow Scroll Rate

This field selects the rate the display Slow Scrolls through a list.

The radio first Slow Scrolls, then it Fast Scrolls after the Slow Scroll Count expires. This feature applies on a radio-wide basis for Conventional and Trunking communications modes.

Table 44: Range

Minimum	Maximum	Increments
250 (ms)	6250 (ms)	250 (ms)

NOTE: The Slow Scroll Rate must be higher than or equal to the Fast Scroll Rate.

10.9.1.5

Fast Scroll Rate

This field selects the rate the display Fast Scrolls through a list.

The radio first Slow Scrolls, then it Fast Scrolls after the Slow Scroll Count expires. This feature applies on a radio-wide basis for Conventional and Trunking communications modes.

Table 45: Range

Minimum	Maximum	Increments
250 (ms)	6250 (ms)	250 (ms)

NOTE: The Fast Scroll Rate must be lower than or equal to the Slow Scroll Rate.

10.9.1.6

Slow Scroll Count

This field selects the number of menus scrolled through on the display before the radio switches to the Fast Scroll Rate.

This feature applies on a radio-wide basis for Conventional and Trunking communications modes.

Table 46: Range

Minimum	Maximum
0 menus	255 menus

10.9.1.7

Out of Range Indicator

This field selects the alert type used by the radio to indicate when it has left the coverage area of the Trunking System.

This feature applies for Trunking and DVRS-enabled P25 Conventional communications.

The following selections are supported:

No Indication

Feature disabled (in other words, no indication is given to you when the radio is in an out-of-range condition).

Alert Only

Audible indicator only. See also Out of Range Tone.

Display Only

The radio's display alternates between showing **NO SYS** (No System) and the radio's current zone and channel.

Alert & Display

Audible and visual indicators (see "Alert Only" and "Display Only" above).

10.9.1.8

Searching Site Indicator

This field allows you to select the types of alert when the radio is connecting to SmartConnect.

Table 47: Types of Alert Selections

Alert Selection Types	Description
No Indication	The feature is disabled and no indication is displayed when the radio is connecting to SmartConnect.
Display Only	The display shows <i>Searching site</i> .

10.9.1.9

Out of Range Early Detection

If this field is checked, the radio performs quicker detection of an Out of Range condition in less than one minute.

If this field is unchecked, the radio performs the traditional detection of an Out of Range condition.

10.9.1.10

Out Of Range Hold Off Timer

Selects the amount of hold off time for the Out of Range indicators to be prompted.

10.9.1.11

Imbalanced Coverage Indicator

This field selects the alert type used by the radio to indicate reduced communications due to unaffiliated status of the radio.

The unaffiliated status occurs when the radio is operating in an area of imbalanced coverage. This condition is detected upon retry failure of inbound communications. Imbalanced Coverage may take a few minutes to clear. This feature applies for Trunking and DVRS-enabled P25 Conventional communications.

NOTE: An Out of Range Indicator should be enabled when using this feature to indicate to you that Imbalanced Coverage Indicators alerts have stopped because the radio is out of range.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

No Indication

Feature disabled No indication is given to you when the radio is in an imbalanced coverage condition.

Alert Only

Audible indicator only.

Display Only

The radio's display alternates between showing **NO COMMS** (No Communications) and the radio's current zone and channel.

Alert & Display

Audible and Visual indicators (see "Alert Only" and "Display Only" above).

10.9.1.12

Site Trunking Indicator

This field selects the type of Site Trunking Indicator. Site Trunking is a unique Trunking mode that is considered to be an interim mode between SmartZone and Failsoft mode.

On a SmartZone system, if the zone controller goes down, the current site sends out a message indicating that it is now in Site Trunked mode. It will continue to send out this message until the zone controller comes back on-line. This selection applies when in SmartZone operation for all Trunking Systems and Trunking Personalities.

IMPORTANT: If Site Trunking communications should also fail, the radio goes into a Failsoft mode.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

No Indication

Feature disabled.

Alert Only

Audible indicator only.

Display Only

Enables the "Site Trunking" message to appear in the radio's display.

Alert & Display

Audible and Visual indicators (see "Alert Only" and "Display Only" above).

10.9.1.13

System Registration Indicator

This field selects the alert type used by the radio to indicate the status of the system registration process in the event that the subscriber failed to register on the system.

This feature applies to APCO P25 (ASTRO 25) Trunking communications.

The following selections are supported:

No Indication

Feature disabled.

Alert Only

Audible indicator only.

Display Only

The radio's display shows one of two possible messages: "Sys Reg Refused" (System Registration Refused) or "Sys Auth Failed" (System Authentication Failed).

Alert & Display

Audible and visual indicators (see "Alert Only" and "Display Only" above).

10.9.1.14

DVRS Local Only Indicator

This field selects the alert type used by the radio to indicate a Digital Vehicular Repeater System (DVRS) **Local Mode** condition.

This feature applies to DVRS Conventional communications.

Selections

No Indication

Feature disabled.

Alert Only

Audible indicator only.

Display Only

The radio's display shows one of two possible messages.

Alert & Display

Audible and visual indicators (see "Alert Only" and "Display Only" above).

10.9.2

Advanced

This section allows you to view or define diverse and complex radio display functionality on a radio-wide basis.

10.9.2.1 Auto Light

This field causes the radio front display, keypad, rotary switch, and top display backlight to illuminate each time a button, switch, or keypad button is pressed (except for the PTT button, Emergency button, or Monitor).

The lights stay illuminated for the amount of time specified in the [Display Light Time on page 213](#) field. When disabled, the Light/Flip (Display) selection turns the displays and keypad light on and off.

This selection also applies to a portable Accessory that has a display, such as the Display Remote Speaker Microphone (DRSM). This selection applies on a radio-wide basis.

Accessed Only: When the [Display Light Time on page 213](#) field is not set to **Infinite**, and the radio is model/option capable.

10.9.2.2 Display Light Time

This field selects the amount of time that the radio's Rotary switch, displays, and keypad lights remain illuminated once you press the Light/Flip (Display) button.

NOTE: This feature also applies to the display light on the Display Remote Speaker Microphone (DRSM) accessory. Time is in seconds. This selection applies on a radio-wide basis.

Accessed Only: When the radio is model/option capable.

NOTE: When set to **Infinite**, the display and keypad lights remain on until the [Light/Flip \(Display\) on page 170](#) button is pressed.

Table 48: Range

Minimum	Maximum	Increments
0 sec	60 sec	5 sec

10.9.2.3 Alternating Display Time

This field selects the length of time that alternating messages appear in the radio's display.

The Emergency Alarm Rx Indicator Type field is an example of a feature that uses the alternating display functionality, but only when it is set to **Display Only** or **Alert & Display**. This selection applies on a radio-wide basis.

Table 49: Selections

Minimum	Maximum	Increments
250 (ms)	6250 (ms)	250 (ms)

NOTE: ms = milliseconds

10.9.2.4 Temporary Message Display Time

This field selects the length of time that a temporary message appears in the radio display.

This selection applies on a radio-wide basis.

Table 50: Range

Minimum	Maximum	Increments
250 (ms)	6250 (ms)	250 (ms)

10.9.2.5

Feature Inactivity Alert Tone Selection

This field selects the Feature Inactivity Alert Tone type for the radio's Feature configuration menus.

This selection applies on a radio-wide basis.

IMPORTANT: Currently the periodic **Inactive Alert Tone** applies to the Call Alert/Page, Select/Private Call, Phone, Status, Message, and TMS configuration menus. Currently the **Feature Inactivity Exit Tone** applies to the Call Alert/Page, Select/Private Call, Phone, Status, Message, TMS, Zone Select, Channel Select, Location, Information, Radio Profiles, Recent Calls, and Contacts configuration menus.

The following selections are supported:

Disabled

Feature Alert Tones are deactivated. This selection is only valid when the Feature Inactivity Timeout field is not set to **Infinite**.

Exit Only

Enables a Feature Inactivity Exit Tone to notify you when the feature menu exits after the menu has been idle for the duration set in the Feature Inactivity Timeout. This selection is only valid when the Feature Inactivity Timeout field is not set to **Infinite**.

Inactivity Only (Factory Default)

Enables a periodic Inactive Alert Tone to notify you that the feature menu is idle.

Inactivity & Exit

Enables both an Inactive Alert Tone and a Feature Inactivity Exit Tone. This selection is only valid when the Feature Inactivity Timeout field is not set to **Infinite**.

10.9.2.6

Status Auto Exit

This field selects the method of how the radio exits the Status configuration menu Status has been sent to the dispatcher.

This selection applies on a radio-wide basis.

The following selections are supported:

On Successful Ack

The Status menu exits and the radio returns to normal dispatch operation only upon a successful acknowledgement from the Fixed Network Equipment (FNE)/dispatcher; the Status menu remains active if an acknowledgment is not received or the Status is denied.

Always

The Status menu automatically exits once an acknowledgement is received, or (in the case of Conventional dispatch) after all Status Number of Attempts have completed.

10.9.3

ID Display

This section allows you to view or modify PTT ID and Talkgroup functionality on the radio's display.

A PTT ID is transmitted when the PTT button is pressed for an MDC or ASTRO type Conventional System; therefore these PTT ID features apply only for Conventional communications channels.

10.9.3.1 PTT ID Display

This field selects the type of incoming transmission that qualifies for PTT ID display.

PTT ID Display enables the Caller ID of a Call List Contact Name to appear within the radio's display; if no Call List Contact Name exists, then the current Caller's PTT ID is displayed. This feature applies on a radio-wide basis for Conventional communications channels.

The following selections are supported:

- Disabled
- Dispatch
- Dispatch and Scan

10.9.3.2 End of Voice Timer

This field selects the amount of time that a PTT ID from another radio appears in this radio's display once the transmission is terminated.

This feature applies on a radio-wide basis for Conventional communications channels.

IMPORTANT: When this field is set to **0** seconds, a PTT-ID set to **Trailing Edge** sent from other radios does not have time to be seen within the current radio's display.

Accessed Only: When the [PTT ID Display on page 215](#) field is set to **Dispatch** or **Dispatch & Scan**, or when the Display Peer Location field is enabled.

Table 51: Range

Minimum	Maximum	Increments
0 seconds	7 seconds	1 second

10.9.3.3 Prefix ID Text Size

This field selects the number of characters to be used for the Radio IDs, Call Alerts, and Emergency Mode numbers.

This feature applies on a radio-wide basis for Conventional communications channels.

Accessed Only: When the PTT ID Display field is set to **Dispatch** or **Dispatch & Scan**

Whole numbers 1 to 6 are supported.

10.9.3.4 Talkgroup Display On PTT

This field enables display of the ASTRO Talkgroup List, Talkgroup Alias Text or the Talkgroup ID when the PTT button is pressed.

If the Talkgroup Alias feature is enabled, then the Talkgroup Alias Text will be displayed. Otherwise, the Talkgroup ID will be displayed. Enabling this field will take precedence over the setting of the Display On PTT field. This feature applies on a radio-wide basis for Conventional communications channels.

Accessed Only: When the radio is model/option capable.

10.9.3.5

Talkgroup Display On Mode Change

This field enables display of the ASTRO Talkgroup List, Talkgroup Alias Text or the Talkgroup ID upon channel change.

If the Talkgroup Alias feature is enabled, then the Talkgroup Alias Text will be displayed. Otherwise, the Talkgroup ID will be displayed. Enabling this field will take precedence over the setting of the Display on Mode Change field. This feature applies on a radio-wide basis for Conventional communications channels.

Accessed Only: When the radio is model/option capable.

10.9.3.6

Talkgroup Display On Receive

This field enables display of the ASTRO Talkgroup List, the Talkgroup Alias Text or the Talkgroup ID upon unmuting to a call.

If the Talkgroup Alias feature is enabled, then the Talkgroup Alias Text will be displayed. Otherwise, the Talkgroup ID will be displayed. This feature applies on a radio-wide basis for Conventional communications channels.

Accessed Only: When the radio is model/option capable.

10.9.3.7

ID Display Table (Display)

The **ID Display Table** section of the **Display** contains the following fields:

10.9.3.7.1

Feature Name

Displays the read-only name for the feature listed in the ID Display table for PTT ID, Emergency ID or Call Alert ID.

Accessed Only: When the [PTT ID Display on page 215](#) field is set to **Dispatch** or **Dispatch and Scan**.

10.9.3.7.2

Display

This field allows you to define recognizable text that prefixes the displayed PTT ID, Emergency ID or Call Alert ID number in the current record/row of the ID Display Table.

The field's length is determined by the Prefix ID Text Size field. This feature applies on a radio-wide basis for Conventional communications channels.

Accessed Only: When the PTT ID Display field is set to **Dispatch** or **Dispatch and Scan**.

NOTE:

Up to six (6) characters (as determined by the Prefix ID Text Size field), including numbers, letters and special characters may be used.

Examples: ID, EMERG, Elec01, CALL

10.10

Internal Mic Noise Reduction Profile Set

The **Internal Mic Noise Reduction Profile** set allows the user to view or define transmit noise reduction parameters for the internal microphones that target specific noise conditions.

These settings apply on a radio-wide basis.

NOTE: Noise Reduction improves voice clarity by reducing background noise. Noise Reduction occurs on the transmitting radio before transmission (in analog mode) and before voice coding (in digital mode). Not only does reducing background noise improve voice clarity for an analog mode transmission. In digital mode, a cleaner speech signal going into the voice-encoder (vocoder) results in clearer voice being received and decoded in the receiver.

WARNING:

These custom settings apply only when the Custom Noise Reduction (Radio) field is selected in the referenced Radio Profile.

Do not modify Noise Reduction settings unless the user is a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

The following fields are supported:

10.10.1

Radio Noise Reduction Profile Name

This field allows you to view or define recognizable names for the current Radio Noise Reduction Profile.

IMPORTANT: The [Radio Profiles on page 628](#) - Internal Mic Noise Reduction Settings are recommended for most noise environments.

WARNING:

These custom settings apply only when the Custom Noise Reduction (Radio) field is selected in the referenced Radio Profile.

Do not modify Noise Reduction settings unless you are a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

NOTE:

Examples: PER-001, #500, Ext Mic NR 3, # A5

Characters, numbers, spaces, and special characters can be used.

A total of 14 characters are possible.

10.10.1.1

QA09006–Adaptive Noise Suppression

This field indicates if the Adaptive Noise Suppression feature is purchased.

10.10.2

E Wind MAXS VECTOR

These settings allow you to adjust noise reduction parameters for specific noise conditions.

IMPORTANT:

The [Radio Profiles on page 628](#) - Radio Noise Reduction Settings are recommended for most noise environments.

This parameter has an effective range of 31 coefficient values of 16 bits each, which translates into 124 BCH (4-bit nibble) characters. However, this requires entering 32 coefficient values. When entering in the coefficients for this vector, the 32nd value is the right-most (or least significant) value - in other words, the last four BCH characters. Be sure to make this 32nd value the same as the 31st. The digital signal processor (DSP) of the radio ignores the 32nd value.

WARNING:

These custom settings apply only when the Custom Noise Reduction (Radio) field is selected in the referenced Radio Profile.

Do not modify Noise Reduction settings unless you are a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

10.10.3

E Wind NBANDS

These settings allow you to adjust noise reduction parameters for specific noise conditions.

IMPORTANT:

The [Radio Profiles on page 628](#) - Radio Noise Reduction Settings are recommended for most noise environments.

WARNING:

These custom settings apply only when the Custom Noise Reduction (Radio) field is selected in the referenced Radio Profile.

Do not modify Noise Reduction settings unless you are a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

There are two separate values that define the range.

Table 52: First Value

These settings allow you to adjust noise reduction parameters for specific noise conditions.

WARNING:

These custom settings apply only when the Custom Noise Reduction (Radio) field is selected in the referenced Radio Profile.

Do not modify Noise Reduction settings unless you are a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

IMPORTANT:

The [Radio Profiles on page 628](#) - Radio Noise Reduction Settings are recommended for most noise environments.

Although this field shows the value as an unsigned value, the radio firmware interprets the Hex value as a signed value. Therefore, enter the desired signed value in the Hex (right-most) box, not the Decimal box. For example, if you want to enter -1E00 (-7680), you would enter E200 (the 2's complement) in the Hex box. The Decimal box still shows 57856 but the firmware interprets E200 as a negative number in the radio.

There are two separate values that define the range.

Table 62: First Value

The [Radio Profiles on page 628](#) - Radio Noise Reduction Settings are recommended for most noise environments.

WARNING:

These custom settings apply only when the Custom Noise Reduction (Radio) field is selected in the referenced Radio Profile.

Do not modify Noise Reduction settings unless you are a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

There are two separate values that define the range.

Table 70: First Value

Minimum	Maximum	Increments
0	65535	1

Table 71: Second Value

Minimum	Maximum	Increments
0	FFFF (Hex)	1

10.10.13

Bad Mic R THRESH DBQ8

These settings allow you to adjust noise reduction parameters for specific noise conditions.

IMPORTANT:

The [Radio Profiles on page 628](#) - Radio Noise Reduction Settings are recommended for most noise environments.

Although this field shows the value as an unsigned value, the radio firmware interprets the Hex value as a signed value. Therefore, enter the desired signed value in the Hex (right-most) box, not the Decimal box. For example, if you want to enter -1E00 (-7680), you would enter E200 (the 2's complement) in the Hex box. The Decimal box still shows 57856 but the firmware interprets E200 as a negative number in the radio.

WARNING:

These custom settings apply only when the Custom Noise Reduction (Radio) field is selected in the referenced Radio Profile.

Do not modify Noise Reduction settings unless you are a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

There are two separate values that define the range.

Table 72: First Value

Minimum	Maximum	Increments
0	65535	1

Table 73: Second Value

Minimum	Maximum	Increments
0	FFFF (Hex)	1

10.10.14

DINC OUTPUT EQ VECTOR

This setting allows you to change the DINC (Dual Input Noise Canceller) OUTPUT EQ VECTOR parameter for the internal microphone.

WARNING:

This custom setting applies only when the Custom Noise Reduction (Radio) field is selected in the referenced Radio Profile.

Do not modify Noise Reduction settings unless you are a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail. Go to the Radio Noise Reduction Window.

10.10.15

DINC EP VECTOR

This setting allows you to change the DINC (Dual Input Noise Canceller) EP VECTOR parameter for the internal microphone.

WARNING:

This custom setting applies only when the Custom Noise Reduction (Radio) field is selected in the referenced Radio Profile.

Do not modify Noise Reduction settings unless you are a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail. Go to the Radio Noise Reduction Window.

10.10.16

RADIO AUTO NOISE BOUNDS DBQ8

This pair of numbers set the lower and upper noise bounds (in dB relative to full scale) for the automatic control of the noise reduction levels.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

The following selections are supported:

- RADIO AUTO NOISE BOUNDS DBQ8 length must be equal to 8, and
- [X] of RADIO AUTO NOISE BOUNDS DBQ8 is from "-23040" to "0", and
- [Y] of RADIO AUTO NOISE BOUNDS DBQ8 is from "-23040" to "0", and
- [X] is NOT greater than [Y].

NOTE: RADIO AUTO NOISE BOUNDS DBQ8 is the vector of two 16-bit integers. Each four hexadecimal numbers represents a 16-bit signed integer. The range for each of the two numbers ([X] and [Y]) is -23040 to 0 inclusive.

Accessed Only: When the radio is model and option capable.

10.10.17

RADIO AUTO MIN GAIN VECTOR

This vector sets the limits on the min gain for the auto mode of noise suppression.

 **WARNING:** The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

The following selections are supported:

- RADIO AUTO MIN GAIN VECTOR length must be equal to 8, and
- [X] of RADIO AUTO MIN GAIN VECTOR is from "0" to "32767", and
- [Y] of RADIO AUTO MIN GAIN VECTOR is from "0" to "32767", and
- [Y] is NOT greater than [X].

 **NOTE:** RADIO AUTO MIN GAIN VECTOR is the vector of two 16-bit integers: Each four hexadecimal numbers represents a 16-bit signed integer. The range for each of the two numbers ([X] and [Y]) is from 0 to 32767 in decimal.

Accessed Only: When the radio is model and option capable.

10.10.18

RADIO AUTO RELAXATION BOUNDS

This vector sets the limits on relaxation with frequency for the auto mode of noise suppression.

 **WARNING:** The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

The following selections are supported:

- RADIO AUTO RELAXATION BOUNDS length must be equal to 4, and
- [X] of RADIO AUTO RELAXATION BOUNDS is from "0" to "10", and
- [Y] of RADIO AUTO RELAXATION BOUNDS is from "0" to "10", and
- [X] is NOT greater than [Y].

 **NOTE:** RADIO AUTO RELAXATION BOUNDS is the vector of two 8-bit integers. Each two hexadecimal numbers represents an 8-bit signed integer. The range for each of the two numbers ([X] and [Y]) is 0 to 10 inclusive.

Accessed Only: When the radio is model and option capable.

10.10.19

RADIO PASS FILTER START

This field defines the frequency that is applied by the automatic PASS filter.

 **WARNING:** The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

Accessed Only: When the radio is model/option capable.

Table 74: Range

Minimum	Maximum	Increments
1	3999	1

10.10.20

RADIO SAM MIX MODE

This parameter controls how the audio input signal from the Speaker-as-Mic is formed.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

Accessed Only: When the radio is model/option capable.

Table 75: Range

Minimum	Maximum	Increments
0	2	1

10.10.21

RADIO SAM CUTOVER FREQUENCY

This field defines the frequency used by the Speaker-as-Mic input.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

Accessed Only: When the radio is model/option capable.

Table 76: Range

Minimum	Maximum	Increments
1	3999	1

10.10.22

RADIO HOT BEAM MIX RATE

This field controls the automatic hot-beam detection. The higher number switches slowly

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

Accessed Only: When the radio is model/option capable.

Table 77: Range

Minimum	Maximum	Increments
1	250	1

10.10.23

RADIO HOT BEAM MAX ATTENUATION DBQ8

This field sets the maximum level of attenuation that can be applied to either beam.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

Accessed Only: When the radio is model/option capable.

Table 78: Range

Minimum	Maximum	Increments
1	7680	1

10.11

External Mic Noise Reduction Profile Set

The **External Mic Noise Reduction Profile** set allows the user to view or define transmit noise reduction parameters for external microphones that target specific noise conditions.

These settings apply on a radio-wide basis.

NOTE: Noise Reduction improves voice clarity by reducing background noise. Noise Reduction occurs on the transmitting radio before transmission (in analog mode) and before voice coding (in digital mode). Not only does reducing background noise improve voice clarity for an analog mode transmission. In digital mode, a cleaner speech signal going into the voice-encoder (vocoder) results in clearer voice being received and decoded in the receiver.

WARNING:

These custom settings apply only when the Custom Noise Reduction (Accessory) field is selected in the referenced Radio Profile.

Do not modify Noise Reduction settings unless the user is Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

The following fields are supported:

10.11.1

Accessory Noise Reduction Profile Name

This field allows you to view or define recognizable names for the current Accessory Noise Reduction Profile.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

IMPORTANT: The Radio Profiles - External Mic Noise Reduction Settings are recommended for most noise environments.

WARNING:

These custom settings apply only when the Custom Noise Reduction (Accessory) field is selected in the referenced Radio Profile.

Do not modify Noise Reduction settings unless you are a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

NOTE:

Examples: NRP-001, #500, Ext Mic NR 3, # A5

Characters, numbers, spaces, and special characters can be used.

A total of 14 characters are possible.

10.11.2

E Wind DINC EWIND NBANDS

These settings allow you to adjust noise reduction parameters for specific noise conditions. The Radio Profiles - Noise Reduction Settings (Accessory) are recommended for most noise environments.

WARNING:

This custom setting applies only when the Custom Noise Reduction (Accessory) field is selected in the referenced Radio Profile.

Do not modify Noise Reduction settings unless you are a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

There are two separate values that define the range.

Table 79: First Value

Minimum	Maximum	Increments
0	65535	1

Table 80: Second Value

Minimum	Maximum	Increments
0	FFFF (Hex)	1

10.11.3

E Wind MAXS VECTOR

These settings allow you to adjust noise reduction parameters for specific noise conditions.

IMPORTANT:

The Radio Profiles - Accessory Noise Reduction Settings are recommended for most noise environments.

This parameter has an effective range of 31 coefficient values of 16 bits each, which translates into 124 BCH (4-bit nibble) characters. However, this requires entering 32 coefficient values. When entering in the coefficients for this vector, the 32nd value is the right-most (or least significant) value - in other words, the last four BCH characters. Be sure to make this 32nd value the same as the 31st. The digital signal processor (DSP) of the radio ignores the 32nd value.

WARNING:

This custom setting applies only when the Custom Noise Reduction (Accessory) field is selected in the referenced Radio Profile.

Do not modify Noise Reduction settings unless you are a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

10.11.4 **DINC ABF SS**

These settings allow you to adjust noise reduction parameters for specific noise conditions. The Radio Profiles - Accessory Noise Reduction Settings are recommended for most noise environments.

WARNING:

This custom setting applies only when the Custom Noise Reduction (Accessory) field is selected in the referenced Radio Profile.

Do not modify Noise Reduction settings unless you are a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

There are two separate values that define the range.

Table 81: First Value

Minimum	Maximum	Increments
0	65535	1

Table 82: Second Value

Minimum	Maximum	Increments
0	FFFF (Hex)	1

10.11.5 **DWF MIN GAIN**

These settings allow you to adjust noise reduction parameters for specific noise conditions. The Radio Profiles - Accessory Noise Reduction Settings are recommended for most noise environments.

WARNING:

This custom setting applies only when the Custom Noise Reduction (Accessory) field is selected in the referenced Radio Profile.

Do not modify Noise Reduction settings unless you are a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

There are two separate values that define the range.

Minimum	Maximum	Increments
0	FFFF (Hex)	1

10.11.14

DINC OUTPUT EQ VECTOR

This setting allows you to change the DINC (Dual Input Noise Canceller) OUTPUT EQ VECTOR parameter for the external microphone.

WARNING:

This custom setting applies only when the Custom Noise Reduction (Accessory) field is selected in the referenced Radio Profile.

Do not modify Noise Reduction settings unless you are a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

10.11.15

DINC EP VECTOR

This setting allows you to change the DINC (Dual Input Noise Canceller) EP VECTOR parameter for the external microphone.

WARNING:

This custom setting applies only when the Custom Noise Reduction (Accessory) field is selected in the referenced Radio Profile.

Do not modify Noise Reduction settings unless you are a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

10.11.16

ACCESSORY AUTO NOISE BOUNDS DBQ8

This pair of numbers set the lower and upper noise bounds (in dB relative to full scale) for the automatic control of the noise reduction levels.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

The following selections are supported:

- ACCESSORY AUTO NOISE BOUNDS DBQ8 length must be equal to 8, and
- [X] of ACCESSORY AUTO NOISE BOUNDS DBQ8 is from "-23040" to "0", and
- [Y] of ACCESSORY AUTO NOISE BOUNDS DBQ8 is from "-23040" to "0", and
- [X] is NOT greater than [Y].

NOTE: ACCESSORY AUTO NOISE BOUNDS DBQ8 is the vector of two 16-bit integers. Each four hexadecimal numbers represents a 16-bit signed integer. The range for the each of the two numbers ([X] and [Y]) is -23040 to 0 inclusive.

Accessed Only: When the radio is model and option capable.

10.11.17

ACCESSORY AUTO MIN GAIN VECTOR

This vector sets the limits on the min gain for the auto mode of noise suppression.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

The following selections are supported:

- ACCESSORY AUTO MIN GAIN VECTOR length must be equal to 8, and
- [X] of ACCESSORY AUTO MIN GAIN VECTOR is from "0" to "32767", and
- [Y] of ACCESSORY AUTO MIN GAIN VECTOR is from "0" to "32767", and
- [Y] is NOT greater than [X].

NOTE: ACCESSORY AUTO MIN GAIN VECTOR is the vector of two 16 bit integers: Each four hexadecimal numbers represents a 16 bit signed integer. The range for each of the two numbers ([X] and [Y]) is from 0 to 32767 in decimal.

Accessed Only: When the radio is model and option capable.

10.11.18

ACCESSORY AUTO RELAXATION BOUNDS

This vector sets the limits on relaxation with frequency for the auto mode of noise suppression.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

The following selections are supported:

- ACCESSORY AUTO RELAXATION BOUNDS length must be equal to 4, and
- [X] of ACCESSORY AUTO RELAXATION BOUNDS is from "0" to "10", and
- [Y] of ACCESSORY AUTO RELAXATION BOUNDS is from "0" to "10", and
- [X] is NOT greater than [Y].

NOTE: ACCESSORY AUTO RELAXATION BOUNDS is the vector of two 8-bit integers. Each two hexadecimal numbers represents a 8-bit signed integer. The range for each of the two numbers ([X] and [Y]) is 0 to 10 inclusive.

Accessed Only: When the radio is model and option capable.

10.11.19

ACCESSORY PASS FILTER START

This field defines the frequency that is applied by the automatic PASS filter.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

Table 101: Range

Minimum	Maximum	Increments
1	3999	1

Accessed Only: When the radio is model/option capable.

10.12

Global Noise Reduction List

The **Global Noise Reduction Profile** allows the user to view or define custom Dual Input Noise Canceller (DINC) parameters.

These settings apply on a radio-wide basis.

NOTE: Noise Reduction improves voice clarity by reducing background noise. Noise Reduction occurs on the transmitting radio before transmission (in analog mode) and before voice coding (in digital mode). Not only does reducing background noise improve voice clarity for an analog mode transmission. In digital mode, a cleaner speech signal going into the voice-encoder (vocoder) results in clearer voice being received and decoded in the receiver.

WARNING:

These custom settings apply only when the Custom Global Noise Reduction Enable field is selected in the referenced Radio Profile.

Do not modify Noise Reduction settings unless the user is a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

The following fields are supported:

10.12.1

DINC SPATIAL EQ1 VECTOR

This setting allows you to change the internal DINC (Dual Input Noise Canceller) SPATIAL EQ1 VECTOR parameter.

WARNING:

This custom setting applies only when the Custom Global Noise Reduction Enable field is selected in the referenced [Radio Profiles on page 628](#).

Do not modify Noise Reduction settings unless you are a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

10.12.2

DINC SPATIAL EQ1 VECTOR CONT

This setting allows you to change the internal DINC (Dual Input Noise Canceller) SPATIAL EQ1 VECTOR parameter.

The value of this field will be appended to the value of the [DINC SPATIAL EQ1 VECTOR on page 236](#) parameter to create the full sixty-six coefficients of the Spatial Vector.

WARNING:

This custom setting applies only when the Custom Global Noise Reduction Enable field is selected in the referenced [Radio Profiles on page 628](#).

Do not modify Noise Reduction settings unless you are a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

10.12.3

DINC SPATIAL EQ2 VECTOR

This setting allows you to change the internal DINC (Dual Input Noise Canceller) SPATIAL EQ2 VECTOR parameter.

WARNING:

This custom setting applies only when the Custom Global Noise Reduction Enable field is selected in the referenced [Radio Profiles on page 628](#).

Do not modify Noise Reduction settings unless you are a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

10.12.4

DINC SPATIAL EQ2 VECTOR CONT

This setting allows you to change the internal DINC (Dual Input Noise Canceller) SPATIAL EQ2 VECTOR parameter.

The value of this field will be appended to the value of the [DINC SPATIAL EQ2 VECTOR on page 237](#) parameter to create the full sixty-six coefficients of the Spatial Vector.

WARNING:

This custom setting applies only when the Custom Global Noise Reduction Enable field is selected in the referenced [Radio Profiles on page 628](#).

Do not modify Noise Reduction settings unless you are a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

10.12.5

DINC BF EQ VECTOR

This setting allows you to change the internal DINC (Dual Input Noise Canceller) BF EQ VECTOR parameter.

WARNING:

This custom setting applies only when the Custom Global Noise Reduction Enable field is selected in the referenced [Radio Profiles on page 628](#).

Do not modify Noise Reduction settings unless you are a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

10.12.6

DINC HOTBEAM HYSTERESIS

This setting allows you to change the internal DINC (Dual Input Noise Canceller) HOTBEAM HYSTERESIS parameter.

WARNING:

This custom setting applies only when the Custom Global Noise Reduction Enable field is selected in the referenced [Radio Profiles on page 628](#).

Do not modify Noise Reduction settings unless you are a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

There are two separate values that define the range.

Table 102: First Value

Minimum	Maximum	Increment
0	65535	1

Table 103: Second Value

Minimum	Maximum	Increment
0	FFFF (Hex)	1

10.12.7

DINC BAD MIC HYSTERESIS

This setting allows you to change the internal DINC (Dual Input Noise Canceller) BAD MIC HYSTERESIS parameter.

WARNING:

This custom setting applies only when the Custom Global Noise Reduction Enable field is selected in the referenced [Radio Profiles on page 628](#).

Do not modify Noise Reduction settings unless you are a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

There are two separate values that define the range.

Table 104: First Value

Minimum	Maximum	Increment
0	65535	1

Table 105: Second Value

Minimum	Maximum	Increment
0	FFFF (Hex)	1

10.13

Tone Signaling List

This section allows you to define individual Tone Signaling Lists. A maximum of 1000 records can be added in all Tone Signaling Lists.

NOTE:

When the Tone List Type is **Quik-Call II**, 10 separate Tone Signaling Lists are possible, with a maximum of 100 records each.

Individual Tone Signaling Lists are then selectable for Conventional and Trunking Personalities with their respective Tone Signaling List field.

For trunking communications, tone signaling applies only for trunking personalities that reference a trunking system and has its System Type field set to **ASTRO 25**.

When the Tone List Type is **Singletone**, maximum of 100 entries are allowed in one Tone Signaling List. Singletone Signaling Lists and Tone Alias records are then selectable for Conventional Personalities with their respective Tone Signaling Selection field.

NOTE: The radio can decode 1-10 tones in each list set and can encode all tones when Tone List Type is **Quik-Call II**.

10.13.1

Tone List Alias

This field allows you to define recognizable names for the current Tone Signaling List.

Once defined, individual Tone Signaling lists are then selectable for ASTRO Conventional and ASTRO 25 Trunking Personalities with their respective **Tone Signaling List** field.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

NOTE:

EMT-001, #500, Electric1, # A5.

Characters, numbers, spaces, and special characters can be used.

Up to 14 characters are possible.

10.13.2

Tone List Type

This field selects the tone signaling type in the current Tone Signaling List.

Tone Signaling List are selected in Conventional/Trunking Personalities Tone Signaling List, or selected in Conventional Personalities Repeater Access (RAC) Singletone List Selection.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Singletone

One of the Tone Signaling that allows you to selectively access repeaters in all Conventional analog signaling.

Quik-Call II

One of the individual Tone Signaling.

10.13.3

Tone Alias

This field allows you to define the Tone text for a single tone in the Tone Signaling Table.

Accessed Only: When the radio is model/option capable.

10.13.4

Tone 1 Freq

This field selects the receive Tone 1 frequency for the current Tone Signaling List (record/row).

Once selected, a two-tone sequence requires the selection of the Tone 2 Freq.

This selection applies only for ASTRO Conventional and ASTRO 25 Trunking communications.

WARNING:

The digital AMBE Vocoder technology used by both the dispatch console and the radio does not precisely encode/decode the corresponding (analog) Quik-Call II frequencies; instead, within the relevant range of frequencies available for Tone1 Freq and Tone2 Freq (265.625 Hz – 3109.375 Hz), the vocoder transforms evenly distributed groups of frequencies into a set of "standard" frequencies, where each group has an allowable frequency range, and a standard frequency is defined at the center of each group.

Therefore, when a programmed tone frequency is within the allowable range of one of the standard frequencies, it is decoded by the radio as that frequency.

Optimally, the programmed tone frequencies of the radio should match the tone frequencies programmed into the dispatch console, to avoid potentially missing a call.

Specific tone frequency group definitions are dependent on the Channel Type and, therefore TDMA (Time Division Multiple Access) versus FDMA (Frequency Division Multiple Access) channels.

- For TDMA channels, there are 91 groups, where each group covers a 31.25 Hz range.
- For FDMA channels, there are 72 groups, where some groups cover a 31.25 Hz range, and some groups cover a 62.5 Hz range.

When configuring tone frequencies:

- For a single two-tone frequency record, a combination where both Tone1 Freq and Tone2 Freq are configured as the same tone must be avoided, as that two-tone entry cannot be decoded by the radio.
- For a single two-tone frequency record, a combination where both Tone1 Freq and Tone2 Freq fall within the same frequency group must be avoided as they are decoded as the same tone. For example, a two-tone frequency record having 927 Hz and 940 Hz are both decoded to be 937.5 Hz.
- For two separate tone records, a combination where Tone1 Freq and Tone2 Freq in the two records respectively fall within the same frequency group must be avoided as they are decoded as the same tone sequence. For example, if the first record is 927 Hz and 1240 Hz, and the second record is 940 Hz and 1260 Hz, both records are decoded as 937.5 Hz and 1250 Hz.
- In certain cases, a digital tone frequency cannot be consistently decoded to a specific frequency value, instead it is decoded randomly to one of two different values. The table lists the tone frequencies that must be avoided for both FDMA and TDMA channels.

See [List of Unsupported Tone Frequencies on page 241](#).

Accessed Only: When [Tone List Type on page 239](#) is **Quik-Call II**, and when the radio is model/option capable.

Table 106: Range

Minimum	Maximum	Increments
288.5 Hz	3086.0 Hz	0.1 Hz

See [TDMA-applicable Standard Frequencies and Group Ranges on page 241](#).

See [FDMA-applicable Standard Frequencies and Group Ranges on page 244](#).

10.13.4.1

List of Unsupported Tone Frequencies

Unsupported Frequencies (Hz) for TDMA/FDMA.

Do NOT attempt to program the following frequencies:

Frequencies (Hz)			
296.8	578.1	1140.6	1953.1
296.9	578.2	1171.9	2015.6
297	609.4	1203.1	2046.9
328.1	640.6	1265.6	2171.9
328.2	640.7	1328.1	2234.4
359.3	703.1	1359.4	2296.9
359.4	703.2	1390.6	2328.1
359.5	765.6	1421.9	2390.6

546.8	1078.1	1828.1	
546.9	1109.4	1890.6	

10.13.4.2

TDMA-applicable Standard Frequencies and Group Ranges

For TDMA channels, there are 91 groups of frequencies, where each group covers a 31.25 Hz range. The table lists the standard frequency, and the corresponding minimum and maximum frequency, for each group.

Table 107: Frequencies

Index	Freq Range (Hz)	Decoded Freq (Hz)	Index	Freq Range (Hz)	Decoded Freq (Hz)	Index	Freq Range (Hz)	Decoded Freq (Hz)
1	265.7 - 296.8	281.25	32	1234.4 - 1265.6	1250	63	2203.2 - 2234.3	2218.75
2	296.9 - 328.1	312.5	33	1265.7 - 1296.8	1281.25	64	2234.4 - 2265.6	2250
3	328.2 - 359.3	343.75	34	1296.9 - 1328.1	1312.5	65	2265.7 - 2296.8	2281.25
4	359.4 - 390.6	375	35	1328.2 - 1359.3	1343.75	66	2296.9 - 2328.1	2312.5
5	390.7 - 421.8	406.25	36	1359.4 - 1390.6	1375	67	2328.2 - 2359.3	2343.75

7	453.2 - 484.3	468.75	38	1421.9 - 1453.1	1437.5	69	2390.7 - 2421.8	2406.25
8	484.4 - 515.6	500	39	1453.2 - 1484.3	1468.75	70	2421.9 - 2453.1	2437.5
9	515.7 - 546.8	531.25	40	1484.4 - 1515.6	1500	71	2453.2 - 2484.3	2468.75
10	546.9 - 578.1	562.5	41	1515.7 - 1546.8	1531.25	72	2484.4 - 2515.6	2500
11	578.2 - 609.3	593.75	42	1546.9 - 1578.1	1562.5	73	2515.7 - 2546.8	2531.25
12	609.4 - 640.6	625	43	1578.2 - 1609.3	1593.75	74	2546.9 - 2578.1	2562.5
13	640.7 - 671.8	656.25	44	1609.4 - 1640.6	1625	75	2578.2 - 2609.3	2593.75
14	671.9 - 703.1	687.5	45	1640.7 - 1671.8	1656.25	76	2609.4 - 2640.6	2635

Index	Freq Range (Hz)	Decoded Freq (Hz)	Index	Freq Range (Hz)	Decoded Freq (Hz)	Index	Freq Range (Hz)	Decoded Freq (Hz)
15	703.2 – 734.3	718.75	46	1671.9 – 1703.1	1687.5	77	2640.7 – 2671.8	2656.25
16	734.4 – 765.6	750	47	1703.2 – 1734.3	1718.75	78	2671.9 – 2703.1	2687.5
17	765.7 – 796.8	781.25	48	1734.4 – 1765.6	1750	79	2703.2 – 2734.3	2718.75
18	796.9 – 828.1	812.5	49	1765.7 – 1796.8	1781.75	80	2734.4 – 2765.6	2750
19	828.2 – 859.3	843.75	50	1796.9 – 1828.1	1812.5	81	2765.7 – 2796.8	2781.25
20	859.4 – 890.6	875	51	1828.2 – 1859.3	1843.75	82	2796.9 – 2828.1	2812.25
21	890.7 – 921.8	906.25	52	1859.4 – 1890.6	1875	83	2828.2 – 2859.3	2843.75
22	921.9 – 953.1	937.5	53	1890.7 – 1921.8	1906.25	84	2859.4 – 2890.6	2875
23	953.2 – 984.3	968.75	54	1921.9 – 1953.1	1937.5	85	2890.7 – 2921.8	2906.25
24	984.4 – 1015.6	1000	55	1953.2 – 1984.3	1968.75	86	2921.9 – 2953.1	2937.5
25	1015.7 – 1046.8	1031.25	56	1984.4 – 2015.6	2000	87	2953.2 – 2984.3	2968.75
26	1046.9 – 1078.1	1062.5	57	2015.7 – 2046.8	2031.25	88	2984.4 – 3015.6	3000
27	1078.2 – 1109.3	1093.75	58	2046.9 – 2078.1	2062.5	89	3015.7 – 3046.8	3031.25
28	1109.4 – 1140.6	1125	59	2078.2 – 2109.3	2093.75	90	3046.9 – 3078.1	3062.5
29	1140.7 – 1171.8	1156.25	60	2109.4 – 2140.6	2125	91	3078.2 – 3109.3	3093.75

Index	Freq Range (Hz)	Decoded Freq (Hz)	Index	Freq Range (Hz)	Decoded Freq (Hz)	Index	Freq Range (Hz)	Decoded Freq (Hz)
30	1171.9 - 1203.1	1187.5	61	2140.7 - 2171.8	2156.25			
31	1203.2 - 1234.3	1218.75	62	2171.9 - 2203.1	2187.5			

IMPORTANT:

When received by the radio, any tone frequency within a specific group (range) are decoded as the standard frequency for that group. For example, 937.5 Hz is a standard vocoder-supported tone frequency (for TDMA channels); therefore, any received tone frequency between 921.875 Hz and 953.125 Hz is decoded as a 937.5 Hz tone.

The Quik-Call II tone frequency range is 288.5 Hz – 3086 Hz. Per the above table, 288.5 Hz – 296.875 Hz is decoded by radio as 281.25 Hz, while 3046.875 Hz – 3086 Hz is decoded by radio as 3093.75 Hz.

10.13.4.3

FDMA-applicable Standard Frequencies and Group Ranges

For FDMA channels, there are 72 groups of frequencies, where some groups cover a 31.25 Hz, and some groups cover a 62.5 Hz range (bolded text below). The table lists the standard frequency, and the corresponding minimum and maximum frequency, for each group.

Table 108: Frequencies

Index	Freq Range (Hz)	Decoded Freq (Hz)	Index	Freq Range (Hz)	Decoded Freq (Hz)	Index	Freq Range (Hz)	Decoded Freq (Hz)
1	265.7 - 296.8	283	25	1015.7 - 1046.8	1032.5	49	1828.2 - 1859.3	1838.25
2	296.9 - 328.1	310.75	26	1046.9 - 1078.1	1055	50	1859.4 - 1890.6	1881.25
3	328.2 - 359.3	344.25	27	1078.2 - 1109.3	1103	51	1890.7 - 1953.1	1926.5
4	359.4 - 390.6	376.25	28	1109.4 - 1140.6	1128.75	52	1953.2 - 2015.6	1974
5	390.7 - 421.8	407.5	29	1140.7 - 1171.8	1155.75	53	2015.7 - 2046.8	2021.75
6	421.9 - 453.1	435.25	30	1171.9 - 1203.1	1184.5	54	2046.9 - 2078.1	2065

Index	Freq Range (Hz)	Decoded Freq (Hz)	Index	Freq Range (Hz)	Decoded Freq (Hz)	Index	Freq Range (Hz)	Decoded Freq (Hz)
7	453.2 – 484.3	467.25	31	1203.2 – 1234.3	1219	55	2078.2 – - 2140.6	2110
8	484.4 – 515.6	496.25	32	1234.4 – 1265.6	1242.75	56	2140.7 – - 2171.8	2156.75
9	515.7 – 546.8	528.5	33	1265.7 – 1296.8	1293.25	57	2171.9 – - 2234.3	2205.75
10	546.9 – 578.1	566	34	1296.9 – 1328.1	1320	58	2234.4 – - 2296.8	2257.5
11	578.2 – 609.3	598	35	1328.2 – 1359.3	1347.75	59	2296.9 – - 2328.1	2311.75
12	609.4 – 640.6	621.5	36	1359.4 – 1390.6	1376.75	60	2328.2 – - 2390.6	2369
13	640.7 – 671.8	660	37	1390.7 – 1421.8	1406.5	61	2390.7 – - 2421.8	2409.25
14	671.9 – 703.1	688.25	38	1421.9 – 1453.1	1437.75	62	2421.9 – - 2484.3	2461.5
15	703.2 – 734.3	719	39	1453.2 – 1484.3	1470.5	63	2484.4 – - 2546.8	2516.25
16	734.4 – 765.6	752.5	40	1484.4 – 1515.6	1505	64	2546.9 – - 2609.3	2573.5
17	765.7 – 796.8	789.75	41	1515.7 – 1546.8	1541.25	65	2609.4 – - 2671.8	2633.75
18	796.9 – 828.1	806.25	42	1546.9 – - 1609.3	1579.25	66	2671.9 – - 2734.3	2697
19	828.2 – 859.3	849	43	1609.4 – 1640.6	1616.75	67	2734.4 – - 2796.8	2763.75
20	859.4 – 890.6	880.5	44	1640.7 – 1671.8	1650	68	2796.9 – - 2859.3	2813.25
21	890.7 – 921.8	914.25	45	1671.9 – 1703.1	1684.75	69	2859.4 – - 2921.8	2875.5

Index	Freq Range (Hz)	Decoded Freq (Hz)	Index	Freq Range (Hz)	Decoded Freq (Hz)	Index	Freq Range (Hz)	Decoded Freq (Hz)
22	921.9 – 953.1	932	46	1703.2 – 1734.3	1721	70	2921.9 – - 2984.3	2941.25
23	953.2 – 984.3	970	47	1734.4 – 1765.6	1758.25	71	2984.4 – - 3046.8	3010
24	984.4 - 1015.6	1011	48	1765.7 – - 1828.1	1797.25	72	3046.9 – - 3109.3	3082.25

IMPORTANT:

When received by the radio, any tone frequency within a specific group (range) will be decoded as the standard frequency for that group. For example, 932 Hz is a standard vocoder-supported tone frequency (for FDMA channels); therefore, any received tone frequency between 921.875 Hz and 953.125 Hz will be decoded as a 932 Hz tone.

The Quik-Call II tone frequency range is 288.5 Hz – 3086 Hz. Per the above table, 288.5 Hz – 296.875 Hz is decoded by radio as 283 Hz, while 3046.875 Hz – 3086 Hz is decoded by radio as 3082.25 Hz.

10.13.5

Tone 2 Freq

This field selects the receive Tone 2 frequency for the current Tone Signaling List (record/row).

This is only required when a two-tone sequence is required, where Tone1 Freq and Tone2 Freq collectively define the desired sequence of tones in the current Tone Signaling List.

This selection applies only for ASTRO Conventional and ASTRO 25 Trunking communications.

WARNING:

The digital AMBE Vocoder technology used by both the dispatch console and the radio does not precisely encode/decode the corresponding (analog) Quik-Call II frequencies; instead, within the relevant range of frequencies available for Tone1 Freq and Tone2 Freq (265.625 Hz – 3109.375 Hz), the vocoder transforms evenly-distributed groups of frequencies into a set of "standard" frequencies, where each group has an allowable frequency range, and a standard frequency is defined at the center of each group.

Therefore, when a programmed tone frequency is within the allowable range of one of the standard frequencies, it is decoded by the radio as that frequency.

Optimally, the programmed tone frequencies of the radio should match the tone frequencies programmed into the dispatch console, to avoid potentially missing a call.

Specific tone frequency group definitions are dependent on the Channel Type and, therefore TDMA (Time Division Multiple Access) versus FDMA (Frequency Division Multiple Access) channels.

- For TDMA channels, there are 91 groups, where each group covers a 31.25 Hz range.
- For FDMA channels, there are 72 groups, where some groups cover a 31.25 Hz range, and some groups cover a 62.5 Hz range.

When configuring tone frequencies:

- For a single two-tone frequency record, a combination where both Tone1 Freq and Tone2 Freq are configured as the same tone must be avoided, as that two-tone entry cannot be decoded by the radio.
- For a single two-tone frequency record, a combination where both Tone1 Freq and Tone2 Freq fall within the same frequency group must be avoided as they are decoded as the same tone. For example, a two-tone frequency record having 927 Hz and 940 Hz are both decoded to be 937.5 Hz.
- For two separate tone records, a combination where Tone1 Freq and Tone2 Freq in the two records respectively fall within the same frequency group must be avoided as they are decoded as the same tone sequence. For example, if the first record is 927 Hz and 1240 Hz, and the second record is 940 Hz and 1260 Hz, both records are decoded as 937.5 Hz and 1250 Hz.
- In certain cases, a digital tone frequency cannot be consistently decoded to a specific frequency value, instead it is decoded randomly to one of two different values. The table lists the tone frequencies that must be avoided for both FDMA and TDMA channels.

See [List of Unsupported Tone Frequencies on page 241](#).

Accessed Only: When [Tone List Type on page 239](#) is **Quik-Call II**, and when the radio is model/option capable.

NOTE: When set to **Disabled**, only a single tone (Tone1 Freq) is applicable for the current Tone Signaling List member.

Table 109: Range

Minimum	Maximum	Increments
288.5 Hz	3086.0 Hz	0.1 Hz

See [TDMA-applicable Standard Frequencies and Group Ranges on page 241](#).

See [FDMA-applicable Standard Frequencies and Group Ranges on page 244](#).

10.13.6

Unmute Enable

This field enables the radio to remain muted to all received Conventional dispatch calls and affiliated Trunking group calls until the radio decodes the incoming Tone Signaling tones defined in the current record/row.

This selection applies only for ASTRO Conventional and ASTRO 25 Trunking communications.

NOTE:

- In situations where dispatch needs to sequentially transmit multiple signaling tones (for example, during an All-Call), the first qualified single tone (or tone pair) that matches the defined tone(s) unmutes the radio, and you can hear any subsequent tones prior to the voice message.
- This feature only operates on In-Call User Alert-enabled channels where Voice Mute is active.
- The Voice Mute button-press or Voice Mute menu-selection allows you to toggle on and off the Voice Mute functionality for In-Call User Alert-enabled channels.
- The radio can decode 1-10 tones and can encode all tones.

Accessed Only: When [Tone List Type on page 239](#) is **Quik-Call II**, and when the radio is model/option capable.

10.13.7

Alert Tone

This field selects a specific alert tone to play upon receiving the Tone Signaling tones defined in the current record/row.

When the radio decodes the tones, it unmutes the speaker and plays the associated alert tone, followed by any remaining voice audio.

This selection applies only for ASTRO Conventional and ASTRO 25 Trunking communications.

Accessed Only: When [Tone List Type on page 239](#) is **Quik-Call II**, and when the radio is model/option capable.

The following selections are supported:

- Disabled
- Standard
- Continuous
- Tone 1 to Tone 8

NOTE: The radio can decode 1-10 tones and can encode all tones.

10.13.8

Tone Freq

This field allows you to define the Singletone frequency for the Tone Signaling List.

Accessed Only: When [Tone List Type on page 239](#) is **Singletone**, and when the radio is model/option capable.

Table 110: Range

Minimum	Maximum	Increments
288.5 Hz	3086.0 Hz	0.1 Hz

10.13.9

Tone Duration

This field allows you to define the amount of time that the radio transmits a Singletone frequency tone.

Accessed Only: When [Tone List Type on page 239](#) is **Singletone**, and when the radio is model/option capable.

Table 111: Range

Minimum	Maximum	Increments
25 ms	6375 ms	25 ms

10.13.10

Tone Pretime

This field allows you to define the amount of time that the radio waits before sending a Singletone frequency tone.

Accessed Only: When [Tone List Type on page 239](#) is **Singletone**, and when the radio is model/option capable.

Table 112: Range

Minimum	Maximum	Increments
25 ms	6375 ms	25 ms

10.14

Language Set

The **Language** set allows the user to define a list of languages for the radio.

10.14.1

Language Selection

This field allows you to select the language to be used in the radio display. This selection applies on a radio-wide basis.

The application supports the following languages: The radios support the following languages:

- English (Australia)
- English (United States)
- French (Canada)
- Portuguese (Brazil)
- Spanish (Argentina)
- Spanish (Chile)
- Spanish (Colombia)

- Spanish (Mexico)

NOTE:

When the Radio Display Language is first set to a non-English language, the Write, Clone, FLASHing times take noticeably longer.

Depending on the Upgrade Radio Language setting, subsequent updates can be quicker.

10.15

ViQi: Virtual Partner Alert

The **ViQi: Virtual Partner Alert** set allows users to create a ViQi Virtual Partner Alert list with corresponding Alert Actions that are defined under **Action Consolidation**. ViQi Virtual Partner handles the initiation of a ViQi Virtual Partner Call by a user and remains active until the call ends.

NOTE:

The Alert list is a fixed set of 16 alerts that correspond to ViQi Virtual Partner Alerts from the system.

Each Alert has an Alert Action which is a ViQi Virtual Partner action in the Action Consolidation table, and is performed on the radio when the corresponding ViQi Virtual Partner Alert is received from the system.

10.15.1

Virtual Partner Alert List Name

This field allows you to view or define the user recognizable name for the current Virtual Partner Alert List.

NOTE:

The default value is "Virtual Partner List 1".

Characters, numbers, spaces, and special characters can be used.

A total of 14 characters are possible.

10.15.1.1

Alert Alias

This field allows you to define the radio-user recognizable name when a Virtual Partner alert is received from the system.

NOTE:

Characters, numbers, spaces, and special characters can be used.

A total of 14 characters are possible.

10.15.1.2

Alert Action

This field allows you to specify the action to be performed on the radio when a Virtual Partner alert is received from the system.

IMPORTANT: This field is a reference to a Virtual Partner action record in the Action Consolidation table. The default value is **Unassigned**.

10.16

Voice Announcement Wide

This section allows you to view or assign Motorola Voice Announcement (*.MVA) files to specific radio features.

You can hear these voice prompts when one of the assigned features is selected. These selection apply on a radio wide basis.

NOTE: The Voice Announcement List allows you to load Motorola Voice Announcement (*.MVA) files into the current codeplug.

10.16.1

General (Voice Announcement Wide)

The **General** section of the Voice Announcement Wide set allows the user to view or assign Motorola Voice Announcement (*.MVA) files to specific radio features. The radio-user is then able to hear these voice prompts when one of the assigned features is selected. These selection apply on a radio wide basis.

10.16.1.1

Voice Announcement Priority

This field selects whether or not Voice Announcement audio playback takes priority over the radio normal Receive (Rx) audio.

This selection applies on a radio wide basis.

IMPORTANT: This setting does not influence Voice Announcement interactions with alert tones. Momentary alert tones have higher priority than Voice Announcement audio, while Voice Announcement audio has higher priority than continuous alert tones.

The following selections are supported:

Low

Normal radio receive audio has priority.

This is also known as Tactical Emergency.

High

Voice Announcement audio playback has priority.

10.16.1.2

Scan On

This field selects which Motorola Voice Announcement (.MVA) file, if any, is assigned to a Scan Mode ON operation.

When you toggle Scan Mode On, a voice prompt plays.

You can toggle Scan Mode On with a Scan button-press or a Scan switch-toggle or a Scan menu-selection. If Text-to-Speech (TTS) is selected, the text in the corresponding Voice Command field is converted to speech and played as audio. This feature is not applicable when Automatic Scan is enabled on the operating channel of the radio.

This selection applies on a radio wide basis.

NOTE: The Voice Announcement List Page allows you to load Motorola Voice Announcement (*.MVA) files into the application's current codeplug.

The following selections are supported:

None

No voice prompt is needed for this radio feature.

TTS

When Voice Control feature is enabled, the text in the Voice Command field for Scan On is played as audio.

Motorola Voice Announcement (*.MVA) file

Lists all possible voice files defined in the Voice Announcement File List Page.

10.16.1.3

Scan On TTS Announcement

A common spoken word to reference the Scan On field for Text-to-Speech (TTS) announcements.

NOTE: This field is only applicable for APX NEXT and APX N70 radios.

When the **Play**  button is clicked, the application converts the text in the voice command field to speech and plays it through the speaker.

Accessed Only:

- [ViQi: Voice Control Priority on page 107](#) is not set to **Disabled**.
- [Scan On on page 251](#) is set to **TTS**.
- The radio is model or option capable.

NOTE:

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.4

Scan Off

This field selects which Motorola Voice Announcement (.MVA) file, if any, is assigned to a Scan Mode OFF operation.

When you toggle Scan Mode Off, a voice prompt plays.

You can toggle Scan Mode Off with a Scan button-press or a Scan switch-toggle or a Scan menu-selection. If Text-to-Speech (TTS) is selected, the text in the corresponding Voice Command field is converted to speech and played as audio. This feature is not applicable when Automatic Scan is enabled on the operating channel of the radio.

This selection applies on a radio wide basis.

NOTE: The Voice Announcement List Page allows you to load Motorola Voice Announcement (.MVA) files into the application's current codeplug.

The following selections are supported:

None

No voice prompt is needed for this radio feature.

TTS

When Voice Control feature is enabled, the text in the Voice Command field for Scan Off is played as audio.

Motorola Voice Announcement (.MVA) file

Lists all possible voice files defined in the Voice Announcement File List Page.

10.16.1.5

Scan Off TTS Announcement

A common spoken word to reference the Scan Off field for Text-to-Speech (TTS) announcements.

NOTE: This field is only applicable for APX NEXT and APX N70 radios.

When the **Play**  button is clicked, the application converts the text in the voice command field to speech and plays it through the speaker.

Accessed Only:

- [ViQi: Voice Control Priority on page 107](#) is not set to **Disabled**.
- [Scan Off on page 252](#) is set to **TTS**.
- The radio is model or option capable.

NOTE:

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.6

Monitor On

This field selects which Motorola Voice Announcement (*.MVA*) file, if any, is assigned to Monitor Mode On operation.

If Text-to-Speech (TTS) is selected, the text in the corresponding Voice Command field is converted to speech and played as audio. Monitor Mode is also known as PL Defeat. Monitor Mode allows you to monitor all carrier squelch activity on the current channel of the radio.

When you toggle Monitor Mode/PL Defeat On, a voice prompt plays. This selection applies only to Conventional communications.

WARNING:

- For Mobile radios the Voice Announcement file is only initiated on a Monitor button-press or a Monitor menu-selection.
- For Portable radios the Voice Announcement file is only initiated on a PL Disable switch-toggle.

NOTE:

- The Voice Announcement List Page allows you to load Motorola Voice Announcement (*.MVA*) files into the application's current codeplug.
- In Mobiles radios, you can toggle Monitor Mode Off with a Monitor button-press or a Monitor menu-selection.
- In Portable radios, you can toggle PL Defeat Off with a PL Disable switch-toggle.

The following selections are supported:

None

No voice prompt is needed for this radio feature.

TTS

When Voice Control feature is enabled, the text in the Voice Command field for Monitor On is played as audio.

Motorola Voice Announcement (.MVA) file

Lists all possible voice files defined in the Voice Announcement File List Page.

10.16.1.7

Monitor On TTS Announcement

A common spoken word to reference the Monitor On field for Text-to-Speech (TTS) announcements.

NOTE: This field is only applicable for APX NEXT and APX N70 radios.

When the **Play**  button is clicked, the application converts the text in the voice command field to speech and plays it through the speaker.

Accessed Only:

- [ViQi: Voice Control Priority on page 107](#) is not set to **Disabled**.
- [Monitor On on page 253](#) is set to **TTS**.
- The radio is model or option capable.

NOTE:

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.8

Monitor Off

This field selects which Motorola Voice Announcement (.MVA) file, if any, is assigned to Monitor Mode OFF operation.

If Text-to-Speech (TTS) is selected, the text in the corresponding Voice Command field is converted to speech and played as audio. Monitor Mode is also known as PL Defeat. Monitor Mode allows you to monitor all carrier squelch activity on the current channel of the radio.

When you toggle Monitor Mode/PL Defeat Off a voice prompt plays. This selection applies only to Conventional communications.

WARNING:

- For Mobile radios the Voice Announcement file is only initiated on a Monitor button-press or a Monitor menu-selection.
- For Portable radios the Voice Announcement file is only initiated on a PL Disable switch-toggle.

NOTE:

- The Voice Announcement List Page allows you to load Motorola Voice Announcement (.MVA) files into the application's current codeplug.
- In Mobiles radios, you can toggle Monitor Mode Off with a Monitor button-press or a Monitor menu-selection.
- In Portable radios, you can toggle PL Defeat Off with a PL Disable switch-toggle.

The following selections are supported:

None

No voice prompt is needed for this radio feature.

TTS

When Voice Control feature is enabled, the text in the Voice Command field for Monitor Off is played as audio.

Motorola Voice Announcement (.MVA) file

Lists all possible voice files defined in the Voice Announcement File List Page.

10.16.1.9

Monitor Off TTS Announcement

A common spoken word to reference the Monitor Off field for Text-to-Speech (TTS) announcements.

NOTE: This field is only applicable for APX NEXT and APX N70 radios.

When the **Play**  button is clicked, the application converts the text in the voice command field to speech and plays it through the speaker.

Accessed Only:

- [ViQi: Voice Control Priority on page 107](#) is not set to **Disabled**.
- [Monitor Off on page 254](#) is set to **TTS**.
- The radio is model or option capable.

NOTE:

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.10

Direct Mode On

This field selects which Motorola Voice Announcement (.MVA) file, if any, is assigned to a Direct Mode ON operation.

If Text-to-Speech (TTS) is selected, the text in the corresponding Voice Command field is converted to speech and played as audio. When you toggle Direct Mode On, a voice prompt plays. You can toggle Direct Mode On with a Direct Mode DEK (Direct Entry Keypad) button-press.

This selection applies on a radio wide basis.

NOTE: The Voice Announcement List Page allows you to load Motorola Voice Announcement (.MVA) files into the application's current codeplug.

The following selections are supported:

None

No voice prompt is needed for this radio feature.

TTS

When Voice Control feature is enabled, the text in the Voice Command field for Direct Mode On is played as audio.

Motorola Voice Announcement (.MVA) file

Lists all possible voice files defined in the Voice Announcement File List Page.

10.16.1.11

Direct Mode On TTS Announcement

A common spoken word to reference the Direct Mode On field for Text-to-Speech (TTS) announcements.

NOTE: This field is only applicable for APX NEXT and APX N70 radios.

When the **Play**  button is clicked, the application converts the text in the voice command field to speech and plays it through the speaker.

Accessed Only:

- [ViQi: Voice Control Priority on page 107](#) is not set to **Disabled**.
- [Direct Mode On on page 255](#) is set to **TTS**.
- The radio is model or option capable.

NOTE:

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.12

Direct Mode Off

This field selects which Motorola Voice Announcement (`.MVA`) file, if any, is assigned to a Direct Mode OFF operation.

If Text-to-Speech (TTS) is selected, the text in the corresponding Voice Command field is converted to speech and played as audio. When you toggle Direct Mode Off, a voice prompt plays. You can toggle Direct Mode Off with a Direct Mode DEK (Direct Entry Keypad) button-press.

This selection applies on a radio wide basis.

NOTE: The Voice Announcement List Page allows you to load Motorola Voice Announcement (`.MVA`) files into the current codeplug.

The following selections are supported:

None

No voice prompt is needed for this radio feature.

TTS

When Voice Control feature is enabled, the text in the Voice Command field for Direct Mode Off is played as audio.

Motorola Voice Announcement (`.MVA`) file

Lists all possible voice files defined in the Voice Announcement File List Page.

10.16.1.13

Direct Mode Off TTS Announcement

A common spoken word to reference the Direct Mode Off field for Text-to-Speech (TTS) announcements.

NOTE: This field is only applicable for APX NEXT and APX N70 radios.

When the **Play**  button is clicked, the application converts the text in the voice command field to speech and plays it through the speaker.

Accessed Only:

- [ViQi: Voice Control Priority on page 107](#) is not set to **Disabled**.
- [Direct Mode Off on page 256](#) is set to **TTS**.
- The radio is model or option capable.

NOTE:

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.14

Emergency On

This field selects which Motorola Voice Announcement (.MVA) file, if any, is assigned to an Emergency Mode ON operation.

If Text-to-Speech (TTS) is selected, the text in the corresponding Voice Command field is converted to speech and played as audio. When you toggle Emergency Mode On, a voice prompt plays.

You can initiate an Emergency transmission with an Emergency button-press, or a press of a footswitch, or even without your direct interaction with the emergency alarm Man Down feature.

This selection applies on a radio wide basis.

NOTE: The Voice Announcement List Page allows you to load Motorola Voice Announcement (.MVA) files into the application's current codeplug.

The following selections are supported:

None

No voice prompt is needed for this radio feature.

TTS

When Voice Control feature is enabled, the text in the Voice Command field for Emergency On is played as audio.

Motorola Voice Announcement (.MVA) file

Lists all possible voice files defined in the Voice Announcement File List Page.

10.16.1.15

Emergency On TTS Announcement

A common spoken word to reference the Emergency On field for Text-to-Speech (TTS) announcements.

NOTE: This field is only applicable for APX NEXT and APX N70 radios.

When the **Play**  button is clicked, the application converts the text in the voice command field to speech and plays it through the speaker.

Accessed Only:

- [ViQi: Voice Control Priority on page 107](#) is not set to **Disabled**.
- [Emergency On on page 257](#) is set to **TTS**.

- The radio is model or option capable.

NOTE:

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.16

Secure Tx Select On

This field selects which Motorola Voice Announcement (`.MVA`) file, if any, is assigned to toggling secure encrypted transmissions ON.

If Text-to-Speech (TTS) is selected, the text in the corresponding Voice Command field is converted to speech and played as audio. When you toggle secure encrypted transmissions On, a voice prompt plays.

You can toggle secure encrypted transmissions with a Secure Tx Select button-press or a Secure Tx Select switch-toggle, or the Secure menu-selection.

This selection applies on a radio wide basis.

NOTE: The Voice Announcement List Page allows you to load Motorola Voice Announcement (`.MVA`) files into the application's current codeplug.

The following selections are supported:

None

No voice prompt is needed for this radio feature.

TTS

When Voice Control feature is enabled, the text in the Voice Command field for Secure Tx Select On is played as audio.

Motorola Voice Announcement (`.MVA`) file

Lists all possible voice files defined in the Voice Announcement File List Page.

10.16.1.17

Secure Tx Select On TTS Announcement

A common spoken word to reference the Secure Tx Select On field for Text-to-Speech (TTS) announcements.

NOTE: This field is only applicable for APX NEXT and APX N70 radios.

When the **Play**  button is clicked, the application converts the text in the voice command field to speech and plays it through the speaker.

Accessed Only:

- [ViQi: Voice Control Priority on page 107](#) is not set to **Disabled**.
- [Secure Tx Select On on page 258](#) is set to **TTS**.
- The radio is model or option capable.

NOTE:

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.18

Secure Tx Select Off

This field selects which Motorola Voice Announcement (.MVA) file, if any, is assigned to toggling secure encrypted transmissions OFF (in other words, enabling "clear" transmissions).

If Text-to-Speech (TTS) is selected, the text in the corresponding Voice Command field is converted to speech and played as audio. When you toggle Secure Encrypted Transmissions Off, a voice prompt plays.

You can toggle Secure Encrypted Transmissions OFF with a Secure Tx Select button-press or a Secure Tx Select switch-toggle, or the Secure menu-selection.

This selection applies on a radio wide basis.

NOTE: The Voice Announcement List Page allows you to load Motorola Voice Announcement (.MVA) files into the application's current codeplug.

The following selections are supported:

None

No voice prompt is needed for this radio feature.

TTS

When Voice Control feature is enabled, the text in the Voice Command field for Secure Tx Select Off is played as audio.

Motorola Voice Announcement (.MVA) file

Lists all possible voice files defined in the Voice Announcement File List Page.

10.16.1.19

Secure Tx Select Off TTS Announcement

A common spoken word to reference the Secure Tx Select Off field for Text-to-Speech (TTS) announcements.

NOTE: This field is only applicable for APX NEXT and APX N70 radios.

When the **Play**  button is clicked, the application converts the text in the voice command field to speech and plays it through the speaker.

Accessed Only:

- [ViQi: Voice Control Priority on page 107](#) is not set to **Disabled**.
- [Secure Tx Select Off on page 259](#) is set to **TTS**.
- The radio is model or option capable.

NOTE:

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.20

Site Selectable Alert Allowed in Out of Range

This field enables the radio to continue providing ergonomic feedback associated with the last received Site Selectable Alert (SSA), in the event that, during the Alert, the radio has roamed outside the Site's coverage range.

Ergonomic feedback of the decoded SSA includes sounding the recurring Voice Announcement associated with the SSA, and displaying its Alert Alias with intelligent lighting, if enabled. This selection applies for Trunking communications.

When disabled, the radio stops providing ergonomic feedback for the last Site Selectable Alert once the radio has roamed outside the Site's coverage range.

NOTE:

- A Site Selectable Alert List is assigned to an ASTRO 25 Trunking System through its Site Selectable Alert List Selection field.
- You can activate and deactivate Site Selectable Alerts which have their **Subscriber Encodable** field **enabled** with a Site Selectable Alert menu-selection. Either a single site or all available sites in the Zone can be selected for activating or deactivating a Site Selectable Alert.

Accessed Only: When the radio is model/option capable.

10.16.1.21

Tx Inhibit On TTS Announcement

A common spoken word to reference the Tx Inhibit On field for Text-to-Speech (TTS) announcements.

NOTE: This field is only applicable for APX NEXT and APX N70 radios.

When the **Play**  button is clicked, the application converts the text in the voice command field to speech and plays it through the speaker.

Accessed Only:

- [ViQi: Voice Control Priority on page 107](#) is not set to **Disabled**.
- The corresponding Voice Announcement field is set to **TTS**.
- The radio is model or option capable.

NOTE:

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.22

Tx Inhibit Off TTS Announcement

A common spoken word to reference the Tx Inhibit Off field for Text-to-Speech (TTS) announcements.

NOTE: This field is only applicable for APX NEXT and APX N70 radios.

When the **Play**  button is clicked, the application converts the text in the voice command field to speech and plays it through the speaker.

Accessed Only:

- [ViQi: Voice Control Priority on page 107](#) is not set to **Disabled**.
- The corresponding Voice Announcement field is set to **TTS**.

- The radio is model or option capable.

NOTE:

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.23

In-Call User Alert Off TTS Announcement

A common spoken word to reference the In-Call User Alert Off field for Text-to-Speech (TTS) announcements.

NOTE: This field is only applicable for APX NEXT and APX N70 radios.

When the **Play**  button is clicked, the application converts the text in the voice command field to speech and plays it through the speaker.

Accessed Only:

- [ViQi: Voice Control Priority on page 107](#) is not set to **Disabled**.
- The corresponding Voice Announcement field is set to **TTS**.
- The radio is model or option capable.

NOTE:

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.24

In-Call User Alert On TTS Announcement

A common spoken word to reference the In-Call User Alert On field for Text-to-Speech (TTS) announcements.

NOTE: This field is only applicable for APX NEXT and APX N70 radios.

When the **Play**  button is clicked, the application converts the text in the voice command field to speech and plays it through the speaker.

Accessed Only:

- [ViQi: Voice Control Priority on page 107](#) is not set to **Disabled**.
- The corresponding Voice Announcement field is set to **TTS**.
- The radio is model or option capable.

NOTE:

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.25

Multi-Functional Button Primary Mode TTS Announcement

A common spoken word to reference the Multi-Functional Button Primary Mode field for Text-to-Speech (TTS) announcements.

NOTE: This field is only applicable for APX NEXT and APX N70 radios.

When the **Play**  button is clicked, the application converts the text in the voice command field to speech and plays it through the speaker.

Accessed Only:

- [ViQi: Voice Control Priority on page 107](#) is not set to **Disabled**.
- The corresponding Voice Announcement field is set to **TTS**.
- The radio is model or option capable.

NOTE:

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.26

Multi-Functional Button Secondary Mode TTS Announcement

A common spoken word to reference the Multi-Functional Button Secondary Mode field for Text-to-Speech (TTS) announcements.

NOTE: This field is only applicable for APX NEXT and APX N70 radios.

When the **Play**  button is clicked, the application converts the text in the voice command field to speech and plays it through the speaker.

Accessed Only:

- [ViQi: Voice Control Priority on page 107](#) is not set to **Disabled**.
- The corresponding Voice Announcement field is set to **TTS**.
- The radio is model or option capable.

NOTE:

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.27

Keypad/Controls Lock On TTS Announcement

A common spoken word to reference the Keypad/Controls Lock On field for Text-to-Speech (TTS) announcements.

NOTE: This field is only applicable for APX NEXT and APX N70 radios.

When the **Play**  button is clicked, the application converts the text in the voice command field to speech and plays it through the speaker.

Accessed Only:

- [ViQi: Voice Control Priority on page 107](#) is not set to **Disabled**.
- The corresponding Voice Announcement field is set to **TTS**.
- The radio is model or option capable.

NOTE:

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.28

Keypad/Controls Lock Off TTS Announcement

A common spoken word to reference the Keypad/Controls Lock Off field for Text-to-Speech (TTS) announcements.

NOTE: This field is only applicable for APX NEXT and APX N70 radios.

When the **Play**  button is clicked, the application converts the text in the voice command field to speech and plays it through the speaker.

Accessed Only:

- [ViQi: Voice Control Priority on page 107](#) is not set to **Disabled**.
- The corresponding Voice Announcement field is set to **TTS**.
- The radio is model or option capable.

NOTE:

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.29

In-Call User Alert On

This field selects which Motorola Voice Announcement (*.MVA*) file, if any, is assigned when Voice Mute functionality is toggled ON for In-Call User Alert-enabled channels.

If Text-to-Speech (TTS) is selected, the text in the corresponding Voice Command field is converted to speech and played as audio. When you toggle Voice Mute On for an In-Call User Alert-enabled channel, a voice prompt plays.

You can toggle Voice Mute On with a Voice Mute button-press or the Voice Mute menu-selection. This selection applies on a radio wide basis.

The following selections are supported:

None

No voice prompt is needed for this radio feature.

TTS

When Voice Control feature is enabled, the text in the Voice Command field for In-Call User Alert On is played as audio.

Motorola Voice Announcement (*.MVA*) file

Lists all possible voice files defined in the Voice Announcement File List Page.

10.16.1.30

In-Call User Alert Off

This field selects which Motorola Voice Announcement (.MVA) file, if any, is assigned when Voice Mute functionality is toggled OFF for In-Call User Alert-enabled channels.

If Text-to-Speech (TTS) is selected, the text in the corresponding Voice Command field is converted to speech and played as audio. When you toggles Voice Mute Off for an In-Call User Alert-enabled channel, a voice prompt plays.

You can toggle Voice Mute Off with a Voice Mute button-press or the Voice Mute menu-selection.

This selection applies on a radio wide basis.

NOTE: The Voice Announcement List Page allows you to load Motorola Voice Announcement (.MVA) files into the application's current codeplug.

The following selections are supported:

None

No voice prompt is needed for this radio feature.

TTS

When Voice Control feature is enabled, the text in the Voice Command field for In-Call User Alert Off is played as audio.

Motorola Voice Announcement (.MVA) file

Lists all possible voice files defined in the Voice Announcement File List Page.

10.16.1.31

Power Down

This field allows you to select the predefined Motorola Voice Announcement (.MVA) file that is assigned to the Power Down event. The radio prompts voice announcement when the event occurs.

NOTE: For the latest Fire Service Standards models, selecting **NONE** is disabled.

10.16.1.32

Power Down TTS

A common spoken word to reference the Power Down field for Text-to-Speech (TTS) announcements.

NOTE:

This field is only applicable for APX NEXT and APX N70 radios.

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.33

Out of Range

This field allows you to select the predefined Motorola Voice Announcement (.MVA) file that is assigned to the Out of Range event. The radio prompts voice announcement when the event occurs.

NOTE:

For the latest Fire Service Standards models, selecting **NONE** is disabled.

The Voice Over is heard when the Out of Range Indicator is set to **Alert or Alert & Display**.

When out of range is on the **Hazard Zone Mode** channel, the radio prompts voice announcement when the event occurs.

10.16.1.34

Out of Range TTS

A common spoken word to reference the Out of Range field for Text-to-Speech (TTS) announcements.

NOTE:

This field is only applicable for APX NEXT and APX N70 radios.

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.35

Self Check Failure

This field allows you to select the predefined Motorola Voice Announcement (.MVA) file that is assigned to the Self Check Failure operation. The radio prompts voice announcement when any of the operations fails.

The Self Check operation verifies the following:

- RSM Connection to the RF device.
- Loss of antenna connection to the RF device.
- Temperature is over the manufacturer recommended overheat temperature.
- Battery with at least 50% of the total capacity available (power-up only).

NOTE: For the latest Fire Service Standards models, selecting **NONE** is disabled.

10.16.1.36

Self Check Failure TTS

A common spoken word to reference the Self Check Failure field for Text-to-Speech (TTS) announcements.

NOTE:

This field is only applicable for APX NEXT and APX N70 radios.

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.37

Accessory Failure

This field allows you to select the predefined Motorola Voice Announcement (.MVA) file that is assigned to the Accessory Failure event. The radio prompts voice announcement when the event occurs.

NOTE: For the latest Fire Service Standards models, selecting **NONE** is disabled.

10.16.1.38

Accessory Failure TTS

A common spoken word to reference the Accessory Failure field for Text-to-Speech announcements.

NOTE:

This field is only applicable for APX NEXT and APX N70 radios.

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.39

Antenna Failure

This field allows you to select the predefined Motorola Voice Announcement (.MVA) file that is assigned to the Antenna Failure operation. The radio prompts voice announcement when the operations occur.

NOTE: This field is applicable for APX NEXT NFPA radios only.

10.16.1.40

Antenna Failure TTS

A common spoken word to reference the Antenna Failure TTS field for Text-to-Speech (TTS) announcements.

NOTE:

This field is only applicable for APX NEXT and APX N70 radios.

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.41

Over Temperature

This field allows you to select the predefined Motorola Voice Announcement (.MVA) file that is assigned to the Over Temperature event. The radio prompts voice announcement when the event occurs.

NOTE: For the latest Fire Service Standards models, selecting **NONE** is disabled.

10.16.1.42

Over Temperature TTS

A common spoken word to reference the Over Temperature TTS field for Text-to-Speech (TTS) announcements.

NOTE:

This field is only applicable for APX NEXT and APX N70 radios.

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.43

RF Device Cumulative Over Temperature

This field allows you to select the predefined Motorola Voice Announcement (.MVA) file that is assigned to the RF Device Cumulative Over Temperature event. The radio prompts voice announcement when the event occurs.

NOTE:

This field is only applicable for APX NEXT XN radios.

For the latest Fire Service Standards models, selecting **NONE** is disabled.

10.16.1.44

RF Device Cumulative Over Temperature TTS

A common spoken word to reference the RF Device Cumulative Over Temperature TTS field for Text-to-Speech (TTS) announcements.

NOTE:

This field is only applicable for APX NEXT XN radios.

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.45

Optional Component Cumulative Over Temperature

This field allows you to select the Motorola Voice Announcement (.MVA) file that is assigned to the Optional Component Cumulative Over Temperature operation. The radio prompts voice announcement when the operation occurs.

NOTE:

This field is only applicable for APX NEXT XN radios.

For the latest Fire Service Standards models, selecting **NONE** is disabled.

10.16.1.46

Optional Component Cumulative Over Temperature TTS

A common spoken word to reference the Optional Component Cumulative Over Temperature field for Text-to-Speech (TTS) announcements.

NOTE:

This field is only applicable for APX NEXT XN radios.

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.47

Exit Hazard Zone Mode

This field allows you to select the predefined Motorola Voice Announcement (.MVA) file that is assigned to the Exit Hazard Zone Mode event.

The radio prompts voice announcement when you toggle the two-way concentric switch to exit the mode.

NOTE: For the latest Fire Service Standards models, selecting **NONE** is disabled.

10.16.1.48

Exit Hazard Zone Mode TTS

A common spoken word to reference the Exit Hazard Zone Mode field for Text-to-Speech (TTS) announcements.

NOTE:
This field is only applicable for APX NEXT and APX N70 radios.

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.49

Non-Hazard Mode Accessory

This field allows you to select the predefined Motorola Voice Announcement (.MVA) file that is assigned to the Non-Hazard Mode Accessory event. The radio prompts voice announcement when the event occurs.

NOTE:
This field is only applicable for APX NEXT XN radios.

For the latest Fire Service Standards models, selecting **NONE** is disabled.

10.16.1.50

Non-Hazard Mode Accessory TTS

A common spoken word to reference the Non-Hazard Mode Accessory field for Text-to-Speech (TTS) announcements.

NOTE:
This field is only applicable for APX NEXT XN radios.

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.1.51

Battery Cumulative Over Temperature

This field allows you to select the Motorola Voice Announcement (.MVA) file that is assigned to the Battery Cumulative Over Temperature event. The radio prompts voice announcement when the event occurs.

NOTE:
This field is only applicable for APX NEXT XN radios.

For the latest Fire Service Standards models, selecting **NONE** is disabled.

10.16.1.52

Battery Cumulative Over Temperature TTS

A common spoken word to reference the Battery Cumulative Over Temperature field for Text-to-Speech (TTS) announcements.

NOTE:

This field is only applicable for APX NEXT XN radios.

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.16.2

Voice Announcement List

This section allows you to load Motorola Voice Announcement (*.MVA) files into the current codeplug.

NOTE:

During a Codeplug Comparison operation, this Voice Announcement List only supports the **Copy All Fields** functionality (that is, there will not be individual Copy buttons beside the voice file names). When the **Copy All Fields** feature is initiated, all voice files in the secondary codeplug are copied to the primary codeplug.

NOTE:

A Motorola Voice Announcement File (*.MVA) can only be generated from a *.WAV file using the Voice Announcement Converter Utility.

Once loaded into this list, voice/audio files are available for selection from any of the Voice Announcement fields on the Voice Announcement Wide Set, from the Alert Audio File field of the Site Selectable Alert List, and from the Zone Channel Assignment's, Channel Announcement and Zone Announcement fields.

NOTE:

Add a Voice File:

- The plus button on the Multiple Record Toolbar - Table View allows you to add one or more voice/audio files (and record/rows) to the current application codeplug.
- A Windows file selection dialog opens allowing you to navigate your computer's file system for the desired voice files

10.16.2.1

Voice File Name

This field allows you to view or rename recognizable names for the Motorola Voice Announcement (*.MVA) voice or audio file (record/row).

By default, each voice/audio file record inherits the filename of the *.mva file that was originally loaded.

Clicking and then typing text into this **Voice Filename** field, allows you to change the name that is given to a voice or audio file record.

However, this does not change the data of the originally selected voice or audio file.

10.17

Site Selectable Alert List

This section allows you to view or define individual Site Selectable Alerts for ASTRO 25 Trunking communications.

This feature applies for Trunking communications.

IMPORTANT:

Up to fifteen different Site Selectable Alerts (SSA) per List may be defined for encoding and/or decoding by the radio; however, you can only select an SSA that has its Subscriber Encodable field **enabled** for encoding (sending to the FNE). Once the FNE receives an SSA from a radio, it then broadcasts it to all radios at a site using a proprietary Motorola Solutions System Broadcast OSP (Outbound Signaling Packet) on the outbound Control Channel.

Audio from a standard Voice Announcement (a one-time event) is always given priority over Site Selectable Alert audio (a recurring event).

Only one Site Selectable Alert can be active at a site at any given time.

NOTE:

The appropriate Motorola Voice Announcement Files (*.MVA) must first be loaded into the Voice Announcement List before it can be selected for a Site Selectable Alert List record/row from the corresponding Alert Audio File field.

A Site Selectable Alert List can be assigned to a trunking system through its Site Selectable Alert List Selection field.

You can activate and deactivate Site Selectable Alerts which have their Subscriber Encodable field **enable** with a Site Selectable Alert menu-selection. Either a single site or all available sites in the Zone can be selected for activating or deactivating a Site Selectable Alert.

10.17.1

Site Selectable Alert List Name

This field allows you to view or define recognizable names for the current Site Selectable Alert in the current Site Selectable Alert List.

Site Selectable Alert Lists are selected for use from a Trunking System's **Site Selectable Alert List** selection field.

NOTE:

Iron Ore Mine, Copper Mine, SSA List #3.

Characters, numbers, spaces, and special characters can be used.

A total of 14 characters are possible.

10.17.2

Alert Alias

This field allows you to define recognizable names for the current Site Selectable Alert (record/row) of the current Site Selectable Alert List.

This Alias then appears in the radio's display when you scroll through the Site Selectable Alert List, or when the radio receives a Site Selectable Alert broadcast from the Fixed Network Equipment (FNE).

This selection applies for Trunking communications.

NOTE:

Evacuate, Park Up, Tornado Siren, Alert #1.

Characters, numbers, spaces, and special characters can be used.

A total of 14 characters are possible.

The Alert Alias appears in the display.

10.17.3

Alert Audio File

This field selects which Motorola Voice Announcement (*.MVA) file, if any, is assigned to the current Site Selectable Alert (record/row) of the current Site Selectable Alert List.

When the radio receives a Site Selectable Alert broadcast from the Fixed Network Equipment (FNE), the corresponding audio/voice prompt plays.

This selection applies for Trunking communications.

NOTE: The appropriate Motorola Voice Announcement Files (*.MVA) must first be loaded into the Voice Announcement List before they may be selected for a Site Selectable Alert List record/row.

The following selections are supported:

None

No audio/voice alert is needed for this radio feature.

Motorola Voice Announcement (*.MVA) file

Lists all possible audio/voice files loaded into the Voice Announcement File List Page.

10.17.4

Alert Period

This field selects the amount of time that the radio waits before replaying the Alert Audio File for the current Site Selectable Alert (record/row) in the current Site Selectable Alert List.

This selection applies for Trunking communications.

WARNING: The lower the Alert Period value, the more frequently the audio is played. Constant playing of the audio over hours/days can eventually diminish radio battery life.

Table 113: Range

Minimum	Maximum	Increments	Default Value
5 seconds	255 seconds	1 second	15 seconds

10.17.5

Subscriber Encodable

This field enables the Alert Alias of the current Site Selectable Alert (record/row) to be shown in the radio (subscriber unit) display, therefore making the selected Alert encodable for broadcast.

Using the Site Selectable Alerts menu-selection, you may then scroll through all encodable Alerts in the Site Selectable Alert List and activate, or subsequently deactivate, a selected Alert.

This selection applies for Trunking communications.

10.18

Secure Wide

This section allows you to view and define functionality for secure encoded transmit and receive communications.

NOTE: When a Secure/Clear Strapping field is set to **Select** for a certain channel, either the Secure Tx Select button-press, Secure Tx Select switch-toggle, or the Secure menu-selection allows you to toggle between Secure or Clear communications for that channel.

Accessed Only: When the radio is a model or option capable.

10.18.1

General

This section allows you to view or define basic secure encryption functionality.

NOTE: When a Secure/Clear Strapping field is set to **Select** for a certain channel, either the Secure Tx Select button-press, Secure Tx Select switch-toggle, or the Secure menu-selection allows you to toggle between Secure or Clear communications for that channel.

Accessed Only: When the radio is a model/option capable.

10.18.1.1

Secure Operation

This field selects the secure encrypted communications mode that is used on a radio-wide basis.

NOTE: When a [Secure/Clear Strapping on page 353](#) field is set to **Select** for a certain channel, either the Secure Tx Select button-press, [Secure Tx Select on page 187](#) switch-toggle, or the Secure menu-selection allows you to toggle between Secure or Clear communications for that channel.

WARNING: When the Tactical Inhibit Enable field is enabled, this field can only be set to **Disabled** or **Hardware**. Otherwise, the application considers it invalid.

Accessed Only: When the radio is a model/option capable.

The following selections are supported:

Disabled

Secure encryption is not possible.

Hardware

Encryption Services are performed by a separate hardware IC that is certified at FIPS (Federal Information Processing Standard) 140-2 levels 2 and 3, depending on the configuration of the Red Key Fill parameter, and can support multiple drop-in encryption algorithms for higher security.

Software

WARNING: Not possible for Type II Trunking.

The following two software encryption methods are supported:

Advanced Digital Privacy (ADP)

Encryption Services are performed by a software implementation of the RC-4 algorithm which is not subject to any FIPS certification level.

10.18.1.2

Advanced Digital Privacy (ADP)

This field enables the radio to use SW ADP Algorithm for encrypted voice.

WARNING: When the [Secure Operation on page 272](#) field is set to **Software**, enable Advanced Digital Privacy (ADP), [Advanced Encrypted Standard \(AES256\) on page 273](#), or [Data Encryption Standard \(DES\) on page 274](#).

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Software**, and when the radio is model/option capable.

10.18.1.3

Advanced Encrypted Standard (AES256)

This field enables the radio to transmit and received encrypted voice and data.

WARNING: When the [Secure Operation on page 272](#) field is set to **Software**, enable [Advanced Digital Privacy \(ADP\) on page 272](#), [Data Encryption Standard \(DES\) on page 274](#), or [Advanced Encrypted Standard \(AES256\)](#).

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Software**, and when the radio is model/option capable.

10.18.1.4

Keyloading Source

This field allows you to select the Keyloading Source.

The following selections are supported:

Encryption Key List

Allows you to enter secure keys in Encryption Key List. Only available for Advanced Digital Privacy (ADP).

KVL

Allows you to load software keys.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Software**, and when the radio is model/option capable.

10.18.1.5

OTAR Enable

Enables the Conventional - ASTRO OTAR (Over-The-Air-Rekeying) and/or the Conventional MDC OTAR and/or the Trunking - ASTRO 25 OTAR feature on a radio-wide basis.

WARNING: Either the ASTRO OTAR Enable or the MDC OTAR Enable field must then be enabled, otherwise they both become invalid.

NOTE:

On an individual Conventional Personality basis, ASTRO OTAR and or MDC OTAR is enabled with the personality's ASTRO OTAR and OTAR Tx fields.

On an individual Trunking System basis, OTAR is enabled from the ASTRO OTAR field and the OTAR Tx fields.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** and the radio is a model/option capable, or when the [Secure Operation on page 272](#) field is set to **Software** and the [Advanced Encrypted Standard \(AES256\) on page 273](#) field is enabled.

10.18.1.6

Enhanced SW Key Erase on Radio Inhibit

When enabled, the radio erases all Advanced Digital Privacy (ADP) or Advanced Encryption Standard (AES) encryption keys when the radio enters a Radio Inhibit state.

Radio Inhibit is enabled on a per Conventional System and/or Trunking System basis.

When disabled, all ADP or AES encryption keys are retained by the radio when the radio enters a Radio Inhibit state.

WARNING: This field is mutually-exclusive with [OTAR Enable on page 273](#).

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Software** and the radio is a model/option capable, and

when the [Advanced Digital Privacy \(ADP\) on page 272](#) field is enabled, or

when the [Advanced Encrypted Standard \(AES256\) on page 273](#) is enabled but the OTAR Operation field is **Disabled**.

10.18.1.7

Data Encryption Standard (DES)

This field enables the radio to transmit and received encrypted voice and data.

WARNING: When the [Secure Operation on page 272](#) field is set to **Software**, enable [Advanced Digital Privacy \(ADP\) on page 272](#), [Advanced Encrypted Standard \(AES256\) on page 273](#), or Data Encryption Standard (DES).

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Software**, and when the radio is model/option capable.

10.18.2

ASTRO OTAR

The **ASTRO OTAR** section allows you to view or define Over-The-Air-Rekeying (OTAR) ASTRO - Conventional and ASTRO 25 - Trunking communications features.

ASTRO uses a digital secure encrypted protocol. In addition to Rekey Requests, OTAR transmissions include: Delayed Acknowledgments and Power-up Acknowledgments.

WARNING: Some of the options selected may also need to be set up at the KMF (Key Management Facility) site to work properly.

NOTE:

ASTRO OTAR is enabled on a per Conventional Personality based on the [Rx Voice/Signal Type on page 390](#) field. The radio is further configured to initiate OTAR commands by enabling that Personality's ASTRO OTAR and or [OTAR Tx on page 441](#) fields.

ASTRO OTAR is enabled on a per Trunking System basis from the ASTRO OTAR field and the [OTAR Tx on page 557](#) fields.

Accessed Only: When the radio is a model/option capable.

10.18.2.1

ASTRO OTAR Enable

Enables the Conventional - ASTRO OTAR (Over-The-Air-Rekeying) and/or the Conventional MDC OTAR and/or the Trunking - ASTRO 25 OTAR feature on a radio-wide basis.

WARNING: Either the ASTRO OTAR Enable or the MDC OTAR Enable field must then be enabled, otherwise they both become invalid.

NOTE:

On an individual Conventional Personality basis, ASTRO OTAR and or MDC OTAR is enabled with the personality's ASTRO OTAR and OTAR Tx fields.

On an individual Trunking System basis, OTAR is enabled from the ASTRO OTAR field and the OTAR Tx fields.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware**, the [OTAR Enable on page 273](#) field is enabled, and the radio is model/option capable, or

When the [Secure Operation on page 272](#) field is set to **Software**, the [Advanced Encrypted Standard \(AES256\) on page 273](#) field is enabled, the [OTAR Enable on page 273](#) field is enabled, and the radio is model/option capable.

10.18.2.2

Radio Inhibit via ASTRO OTAR

This field enables the radio to receive and respond to an ASTRO Over-The-Air-Rekeying (OTAR) radio inhibit command.

This command is typically transmitted from a dispatcher or Key Management Facility (KMF) operator causing the radio to be inoperable. This feature applies to secure encrypted mode for ASTRO - Conventional and ASTRO 25 - Trunking communications.

WARNING:

When this field is enabled and the [ASTRO OTAR Enable on page 274](#) field is enabled for any Trunking Systems, Radio Inhibit is accomplished "via ASTRO OTAR".

When this field is enabled and the [ASTRO OTAR Enable on page 274](#) field is disabled for any Trunking Systems, the Radio Inhibit fields for those Trunking Systems must be enabled. This ensures that Radio Inhibit is possible via standard "Clear" (non-secure encrypted) ASTRO 25 Trunking.

When the [ASTRO OTAR Enable on page 274](#) field is enabled for any Trunking Systems and the Radio Inhibit field for those Trunking Systems is disabled, this field becomes view locked in an enabled state. This ensures that for those systems, Radio Inhibit is accomplished "via ASTRO OTAR".

IMPORTANT: In order to clear the inhibited state of the radio, send an uninhibit command to the radio or redo the Read/Write process of the radio.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware**, the [OTAR Enable on page 273](#) field is enabled, the [ASTRO OTAR Enable on page 274](#) field is enabled, and the radio is model/option capable, or

When the [Secure Operation on page 272](#) field is set to **Software**, the [Advanced Encrypted Standard \(AES256\) on page 273](#) field is enabled, the [OTAR Enable on page 273](#) field is enabled, the [ASTRO OTAR Enable on page 274](#) field is enabled, and the radio is model/option capable.

10.18.2.3

TKP Enabled

This field enables radio to perform Touchless Key Provisioning (TKP) that delivers end to end encryption keys to radios from a Key Management Facility (KMF) without first requiring Key Variable Loader (KVL) configuration of the radio.

NOTE:

The radio must have been provisioned at the Motorola factory for the capability to perform this function. Some radios may not be capable even if the feature is enabled if the radios are shipped prior to factory introduction of the feature.

The KMF operator must enable the Touchless Key Provisioning for that radio within the KMF configuration.

When this field is enabled, KMF server is notified during OTAR Registration.

10.18.2.4

Message Number Period

Message Number Period (MNP) defines a window of messages that can be accepted from a Key Management Facility (KMF). The radio is programmed with the MNP value in this field.

OTAR feature uses this value during the operations.

The intent of a small window size is to prevent an attacker from causing misconfiguration of the radio's keys by capturing messages sent from the KMF and re-sending them at a later time to the radio.

If the window is very small and messages are missed from the KMF due to the radio are out of the radio system coverage or turned off, the radio ignores the KMF messages, and force the KMF to initiate a recovery procedure.

Table 114: Range

Minimum	Maximum	Default
2	65535	65535

NOTE: A value of 65535 effectively disables protection from replay.

10.18.2.5

KMF RSI

The Key Management Facility Radio Set Indicator (KMF RSI) is the identifier of the KMF for OTAR, and must match the value assigned within the KMF. A radio with an improper setting for this value will have its messages ignored by the KMF.

The radio is programmed with the KMF RSI value in this field. OTAR feature uses this value during the operations.

Table 115: Range

Minimum	Maximum	Default
1	9999999	9999999

10.18.2.6

OTAR Parameters Source

When this field is set to **KVL**, the radio KMF RSI and Message Number Period (MNP) can only be updated through Key Variable Loader (KVL).

When it is set to **Parameter Management**, the radio is updated with the RadioCentral KMF RSI and MNP values, overwriting the current radio values. A subsequent KVL update overwrites the Radio Central provided values again.

10.18.3

MDC OTAR

This section allows you to view or define MDC Over-The-Air Rekeying (OTAR) features.

MDC OTAR features apply only when operating in secure encrypted mode and only for Conventional communications. In addition to Rekey Requests, OTAR transmissions include: Delayed Acknowledgments, and Power-up Acknowledgments.

NOTE:

MDC OTAR is enabled on a per Conventional Personality by way of the Non-ASTRO Signaling Type field. The radio is further configured to initiate OTAR commands by enabling that Personality's OTAR Tx field.

When a Secure/Clear Strapping field is set to **Select** for a certain channel, either the Secure Tx Select button-press, Secure Tx Select switch-toggle, or the Secure menu-selection allows you to toggle between Secure or Clear communications for that channel.

Accessed Only: When the radio is a model/option capable.

10.18.3.1

MDC OTAR Enable

Enables the MDC signaling version of the OTAR (Over-The-Air-Rekeying) feature.

This feature applies to secure encrypted mode for MDC OTAR communications.

WARNING: When the [OTAR Enable on page 273](#) field is enabled, the Radio Manager requires that either this field or the [ASTRO OTAR Enable on page 274](#) field must be enabled. Otherwise, they both become invalid. This ensures that OTAR is possible from an MDC or ASTRO - Conventional channel.

NOTE: MDC OTAR is enabled on a per Conventional Personality by way of the Non-ASTRO Signaling Type field. The radio is further configured to initiate OTAR commands by enabling that Personality's OTAR Tx field.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware**, the [OTAR Enable on page 273](#) field is enabled, and the radio is model/option capable.

10.18.3.2

Radio Inhibit via MDC OTAR

This field enables the radio to receive and respond to an MDC Over-The-Air-Rekeying (OTAR) radio inhibit command that temporarily causes the radio to be inoperable.

This command is typically transmitted from a dispatcher or Key Management Controller (KMC) operator. This feature applies to secure encrypted mode MDC OTAR communications.

IMPORTANT: In order to clear the inhibited state of the radio, send an uninhibit command to the radio or redo the Read/Write process of the radio.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware**, the OTAR Operation field is set to **MDC Only** or **ASTRO & MDC**, and the radio is model/option capable.

10.18.3.3

OTAR Acknowledgements Enable

This field enables the radio to acknowledge all MDC OTAR (Over-The-Air-Rekeying) messages that request an acknowledgement.

This feature applies to secure encrypted mode MDC OTAR communications.

WARNING: When disabled, you must ensure that all Stat-Alert features are also disabled in order to prevent compromising security. Stat-Alert features include: Radio Check, Remote Radio Mode; MDC Auto Select Call Transmit, Call Alert Rx/Tx, and Selective Call Rx/Tx.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware**, the OTAR Operation field is set to **MDC Only** or **ASTRO & MDC**, and the radio is model/option capable.

10.18.3.4

OTAR Acknowledgements Encrypted Only

This field enables the radio to encrypt all MDC OTAR acknowledgements.

This feature applies to secure encrypted mode MDC OTAR communications. When disabled, the radio sends MDC OTAR encrypted or clear acknowledgements as directed by the Key dispatcher's Key Management Controller (KMC).

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware**, the OTAR Operation field is set to **MDC Only** or **ASTRO & MDC**, and when the [OTAR Acknowledgements Enable on page 277](#) field is enabled, and the radio is model/option capable.

10.18.3.5

OTAR Acknowledgements Power-Up

This field selects exactly when the radio sends an MDC Over-The-Air-Rekeying (OTAR) Power-up acknowledgement to the Key Manager Controller (KMC).

This acknowledgement (Ack) allows the radio to log into the KMC for OTAR purposes. This feature applies to secure encrypted mode MDC OTAR communications.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware**, the OTAR Operation field is set to **MDC Only** or **ASTRO & MDC**, and the radio is model/option capable.

The following selections are supported:

Disabled

No Power-up Acks are sent.

Immediate

The Power-up Ack is sent when the radio is turned-on and once the radio has completed its power-up sequence.

Delayed

The radio transmits the Power-up Ack when a PTT button transmission is sent on an OTAR-enabled channel.

10.18.3.6

Rekey Request Mode

This field selects the protocol that is used when the radio transmits the MDC Over-The-Air-Rekeying (OTAR) Rekey Request.

A data transmission is sent to the dispatcher's Key Management Controller (KMC) console requesting OTAR rekeying of the radio. These features apply to secure encrypted mode MDC OTAR communications.

NOTE: You can initiate a Rekey Request with either a Rekey Request button-press or a [Rekey Request on page 201](#) menu-selection.

Accessed Only:

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware**, the OTAR Operation field is set to **MDC Only** or **ASTRO & MDC**, and the radio is model/option capable.

The following selections are supported:

Encrypted

The Rekey Request is secure encrypted.

Clear

The Rekey Request is not encrypted.

Disabled

The Rekey procedure may only be initiated by the KMC operator.

10.18.3.7

Rekey Request Status Alert Tone

This field enables the radio to generate a success or failure alert tone once the Rekey Request process is completed.

Selecting to enable this feature only affects the sounding of this alert tone when the Rekey Request section of the radio's menu is exited before the rekey request process is completed. Note that when the Rekey Request section of the radio's menu is not exited prior to the rekey request process being complete, the status alert tone is sounded regardless of the setting of this field. The status of the Rekey process also appears as a visual alert in the radio's display. These features apply to secure encrypted mode MDC OTAR communications.

NOTE: You can initiate the Rekey Request command with the Rekey menu-selection.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware**, the OTAR Operation field is set to **MDC Only** or **ASTRO & MDC**, and the radio is model/option capable.

10.18.3.8

Erase Previous On User Change

This field enables the erasing of ALL secure encryption keys in the previously active keyset (see Slot A, Slot B, and Indexed fields) after you initiate the keyset change.

You can initiate the keyset change with a Keyset menu-selection. This feature applies on a radio-wide basis.

WARNING:

When this field is enabled and when the MDC OTAR Erase Previous Index on Index Change is enabled, it is possible for you to erase both keysets and be momentarily without any secure encryption keys.

EXAMPLE:

The radio is currently operating on Keyset 1 when an OTAR Keyset Change occurs. It changes the radio to Keyset 2 and erases the radio's previous Keyset 1. Then, if you manually change back to Keyset 1 that has been erased, and the Erase Previous on User Change feature erases the previous Keyset 2, the radio remains keyless until you manually load new keys or request a manual OTAR Rekey.

Accessed Only: When the radio is model /option capable.

10.18.3.9

KMC ID

This field selects the radio's Key Manager Controller (KMC) ID allowing the radio to be uniquely identified by the KMC.

Each radio in a system should have a unique KMC ID, allowing each radio to communicate MDC OTAR commands to and from the KMC on an individual basis. This feature applies to secure encrypted mode MDC OTAR communications.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware**, the OTAR Operation field is set to **MDC Only** or **ASTRO & MDC**, and the radio is model/option capable.

Table 116: Range

Minimum	Maximum
0000 Hex	FFFF Hex

10.18.3.10

MDC OTAR System

This field selects the MDC Conventional System to be used by MDC Over-The-Air-Rekeying (OTAR) commands.

This feature applies to secure encrypted mode conventional communications.

IMPORTANT: An MDC OTAR System must have its Expanded MDC ID Range feature **Disabled**. Otherwise, the selection is considered to be invalid. These two features are incompatible.

NOTE:

Only MDC type Conventional Systems may be selected (see the System Type field). Once defined, Conventional Systems are referenced to Conventional Personalities.

MDC OTAR is then enabled on a per conventional personality by way of the Non-ASTRO Signaling Type field. The radio is further configured to initiate OTAR commands by enabling that personality's OTAR Tx field.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware**, the OTAR Operation field is set to **MDC Only** or **ASTRO & MDC**, and the radio is model/option capable.

10.18.4

Features

This section allows you to view or define diverse and sometimes complex secure encryption settings.

NOTE: When a Secure/Clear Strapping field is set to **Select** for a certain channel, either the Secure Tx Select button-press, Secure Tx Select switch-toggle, or the Secure menu-selection allows you to toggle between Secure or Clear communications for that channel.

Accessed Only: When the radio is a model/option capable.

10.18.4.1

Infinite Key Retention

If this field is enabled, the radio permanently stores encryption keys, even when the radio battery is removed or when the radio is reprogrammed. This feature requires hardware encryption.

When disabled, Unique Key Encryption Key (UKEK) encryption keys are erased or retained according to the setting of the Infinite UKEK Retention field.

WARNING:

When this feature is enabled, enabling the Infinite UKEK Retention field causes that field to become invalid. These two features are mutually exclusive.

Changes to the setting for this field can potentially impact the FIPS Mode of operation in the device. This impact causes all critical security parameters (key material and password) to be erased. See FIPS Modes of Operation for more information.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** and the radio is model/option capable.

10.18.4.2

Periodic Keyfail Alert Tone

This field enables a periodic alert tone to sound whenever the current radio channel has lost its secure encryption key.

And, when either of the following conditions is met: The current channel's [Secure/Clear Strapping on page 353](#) is set to **Secure**. Or when the current channel's [Secure/Clear Strapping on page 353](#) is set to **Select** and the radio's Secure Tx Select button-press or Secure Tx Select switch-toggle or Secure menu-selection is set to Secure mode (not clear).

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software** and the radio is model/option capable.

10.18.4.3

Clear Alert Tones

This field enables an alert tone to sound having to do with transmitting and or receiving secure encrypted mode communications versus clear mode communication.

Clear mode refers to standard non-encrypted communications. This selection applies on a radio-wide basis.

NOTE: When a Secure/Clear Strapping field is set to **Select** for a certain channel, the Secure Tx Select button-press or the Secure Tx Select switch-toggle or the Secure menu-selection allows you to toggle between Secure or Clear communications for that channel.

WARNING: When the Tactical Inhibit Enable field is enabled, this field can only be set to **Rx Only** or **Tx & Rx**. Otherwise, the application considers it invalid.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software** and the radio is model/option capable.

The following selections are supported:

None

No Clear Alert Tones are enabled.

Tx Only

Enables an alert tone to sound when the PTT button is pressed, alerting you when the radio is about to transmit in clear mode.

Rx Only

For Conventional analog signaling (MDC, DTMF, Quik-Call II), this feature applies only when the radio's current operating channel's analog Conventional Systems has its System Pretime set less than 1500 ms.

Tx & Rx

See "Tx Only" and "Rx Only" definitions above.

10.18.4.4

Ignore Secure/Clear Switch When Strapped

This field enables the radio to ignore the setting of the Secure Tx Select switch-toggle.

This causes the radio's transmission mode to be based on the current channel's - [Secure/Clear Strapping on page 353](#) field setting, **Secure** or **Clear**. This feature applies on a radio-wide basis.

WARNING: If this feature is disabled and the radio's active channel/mode is strapped to **Secure** or **Clear** (not selectable), the radio checks the position of the **Secure Tx Select** switch. If the active channel's strapped value does not match the setting of the switch, the radio will not transmit. The factory default is Disabled.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, a Conventional or Trunking "Position A" Concentric Switch is set to **Secure Tx Select**, and the radio is model/option capable.

10.18.4.5

Non-XL Scan Unsquelch Duration

This field selects the amount of time that the radio waits in active scan mode for a SecureNet-encrypted Non-XL (non-range extended) Cipher Feedback signal to be detected following a carrier detect.

This feature applies for conventional communications on a radio-wide basis. Time is in milliseconds.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software** and the radio is model/option capable.

Table 117: Range

Minimum	Maximum	Increments
0 (ms)	6375 (ms)	25 (ms)

10.18.4.6

XL Scan Unsquelch Duration

This field selects the amount of time that the radio waits in active scan mode for a SecureNet-encrypted Non-XL (non-range extended) Cipher Feedback signal to be detected following a carrier detect.

This feature applies for Conventional communications on a radio-wide basis. Time is in milliseconds.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Advanced Digital Privacy** and the radio is model/option capable.

Table 118: Range

Minimum	Maximum	Increments
0 (ms)	6375 (ms)	25 (ms)

10.18.4.7

Infinite UKEK Retention

This field enables the radio to permanently store UKEK (Unique Key Encryption Key) keys even when the radio's battery is removed.

A radio that possesses only UKEKs can be Over The Air Rekeyed (OTAR) but can not transmit or receive any other secure voice or data calls. When disabled, encryption keys are erased or retained according to the setting of the Infinite Key Retention field. When both fields are disabled, all encryption keys are erased whenever the radio's battery is removed or when the radio is reprogrammed.

WARNING: When the [Infinite Key Retention on page 280](#) field is enabled, this field must be disabled. Otherwise, the application considers it invalid. These two features are mutually exclusive.

WARNING: Changes to the setting for this field may potentially impact the FIPS Mode of operation in the device, which will cause all critical security parameters (key material and password) to be erased. See FIPS Modes of Operation for more information.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** and the radio is model/option capable.

10.18.4.8

Disable Hard Key Zeroize

This field allows you to zeroize the encryption keys on a radio by pressing the Side Top (Purple) and Orange Button simultaneously.

Press the Side Top (Purple) first to prevent initiating an emergency call.

Accessed Only: When the Secure Operation field is set to **Hardware**, and when the [Infinite Key Retention on page 280](#) field is set to **Enabled**, and when the [Tactical Inhibit Enable](#) field is set to **Disabled**,

Or the Secure Operation field is set to **Software**, and when the [Tactical Inhibit Enable](#) field is set to **Disabled**.

10.18.5

Multikey

This section allows you to view or define Multikey parameters which affect secure encrypted operations.

NOTE: When a Secure/Clear Strapping field is set to **Select** for a certain channel, either the Secure Tx Select button-press, Secure Tx Select switch-toggle, or the Secure menu-selection allows you to toggle between Secure or Clear communications for that channel.

Accessed Only: When the radio is a model/option capable.

10.18.5.1

Display On Secure Switch Select

This field selects the type of information that appears in the radio's display when you switch the radio's current channel to secure encrypted mode.

When a Secure/Clear Strapping field is set to **Select** for a certain channel, a Secure Tx Select button-press or a [Secure Tx Select on page 187](#) switch-toggle or a Secure menu-selection to secure mode causes this information to appear in the radio's display. This selection applies on a radio-wide basis.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Advanced Digital Privacy**, and the radio is model/option capable.

The following selections are supported:

Key Name

The content defined in the Key Name field appears in the radio's display.

WARNING: This selection is only valid when the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**.

Keyset Name

The Keyset Name appears in the radio's display. Keyset assignments are typically organized by a Key Management Facility (KMF) operator and transmitted with Over-the-Air Rekeying (OTAR). Keyset Names are by default "kset 1" and "kset 2".

WARNING: This selection is only valid when the [Secure Operation on page 272](#) field is set to **Hardware** or **Software** with the [Advanced Encrypted Standard \(AES256\) on page 273](#) field enabled.

Disabled

Nothing appears in the radio's display.

10.18.5.2

Display On PTT

This field selects the type of information that appears in the radio's display when you press the PTT button while the radio's current channel is operating in secure encryption mode.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software** and the radio is model/option capable.

The following selections are supported:

Key Name

The content defined in the Key Name field appears in the radio's display.

WARNING: This selection is only valid when the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**.

Keypad Name

The Keypad Name appears in the radio's display. Keypad assignments are typically organized by a Key Management Facility (KMF) operator and transmitted with Over-the-Air Rekeying (OTAR). Keypad Names are by default "kset 1" and "kset 2".

WARNING: This selection is only valid when the [Secure Operation on page 272](#) field is set to **Hardware** or **Software** with the [Advanced Encrypted Standard \(AES256\) on page 273](#) field enabled.

Disabled

Nothing appears in the radio's display.

10.18.5.3

Display On Mode Change

This field selects the type of information that appears in the radio's display when you change the radio's channel or mode to a channel that is strapped to secure encrypted mode (see Secure/Clear Strapping).

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software** and the radio is model/option capable.

The following selections are supported:

Key Name

The content defined in the Key Name field appears in the radio's display.

WARNING: This selection is only valid when the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**.

Keypad Name

The Keypad Name appears in the radio display. Keypad assignments are typically organized by a Key Management Facility (KMF) operator and transmitted with Over-the-Air Rekeying (OTAR). Keypad Names are by default "kset 1" and "kset 2".

WARNING: This selection is only valid when the [Secure Operation on page 272](#) field is set to **Hardware** or **Software** with the [Advanced Encrypted Standard \(AES256\) on page 273](#) field enabled.

Disabled

Nothing appears in the radio's display.

10.18.5.4

PID Key Management for ASN Mode

When this field is selected, it enables the use of Physical ID (PID) Key Management in the radio.

This field is automatically enabled and becomes view when the [MDC OTAR Enable on page 277](#) field is enabled. This feature applies to secure encryption mode on a radio-wide basis. PID key management is a legacy mechanism for managing keys that limits the radio to 16 keys with Physical IDs. When disabled, CKR (Common Key Reference) Key Management is used solely by the radio during secure encrypted communications. CKR Key management allows for more than 16 keys to be referenced and is required to be used with ASTRO OTAR (Over-The-Air-Rekeying).

IMPORTANT: When using the ASN (Advanced SecureNet) mode in the KVL 3000 or the KVL 3000 Plus Key-Variable Loader (KVL) device, encryption keys can only be loaded to the radio when PID Key Management has been enabled in the radio.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** and the radio is model/option capable.

10.18.5.5

Key ID - Rx Hang Time

This field selects the amount of time that the radio waits once a received secure call has ended before reloading your last selected or saved encryption key.

IMPORTANT: This hang time is only needed when the radio had to temporarily switch to another encryption key in order to receive a call that was transmitted with a different key. This feature applies to secure encryption mode for Conventional communications. Time is in milliseconds.

NOTE: This feature applies to secure encryption mode ([Secure Wide on page 271](#)) for Conventional and Trunking communications when [Auto Key ID Rx on page 563](#) is enabled.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software** and the radio is model/option capable.

Table 119: Range

Minimum	Maximum	Increments
0 (ms)	10000 (ms)	250 (ms)

10.18.5.6

Keyset ID - Tx Hang Time

This field selects the amount of time that the radio waits once a transmitted secure call has ended before reloading your last selected or saved encryption key.

IMPORTANT: This hang time is only needed when the radio temporarily switches to another encryption key in order to receive a call that was transmitted with a different key, and then the radio continued to use that switched-to encryption key for the return transmission. Time is in milliseconds.

NOTE: This feature applies to secure encryption mode ([Secure Wide on page 271](#)) for Conventional and Trunking communications when [Auto Key ID Rx on page 563](#) is enabled.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software** and the radio is model/option capable.

Table 120: Range

Minimum	Maximum	Increments
0 (ms)	10000 (ms)	250 (ms)

10.18.6

Encryption Key List

This section allows you to configure multiple Hardware or Software encryption keys for the purpose of secure encrypted voice and data communications.

NOTE:

The number of available encryption keys depends on the model tier of the radio: High tier = 128, Mid tier = 64, and Low tier = 48.

When a Secure/Clear Strapping field is set to **Select** for a certain channel, either the Secure Tx Select button-press, Secure Tx Select switch-toggle, or the Secure menu-selection allows you to toggle between Secure or Clear communications for that channel.

Accessed Only: When the radio is a model/option capable.

10.18.6.1

Key Name

This field allows you to define recognizable Key names for the current key (record/row) within the Encryption Key List.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software** and the radio is model/option capable.

The following selections are supported:

- Characters, numbers, spaces, and special characters can be used.
- The number of possible characters is radio model dependent.

10.18.6.2

CKR Number

This field allows you to define a key number for the current Common Key Reference (CKR) key (record/row) within the Encryption Key List.

This CKR number is referenced to personalities, talkgroups, or features, independent of the physical storage location of the key. This removes the radio programmer's need for mapping encryption keys to physical storage locations for different secure devices in the same in-the-field communications system.

WARNING: The application automatically assigns a "Blank" default "CKR Number" value. Each CKR number that exists must be defined as a number value in order to write or save to the current codeplug.

Each CKR Number must have a unique value.

Accessed Only: When the radio is model/option capable, and when the [Secure Operation on page 272](#) field is set to **Hardware**, or

When the radio is model/option capable, and when the [Secure Operation on page 272](#) field is set to **Software**, and the [Keyloading Source on page 273](#) field is set to **KVL**.

Table 121: Range

Minimum	Maximum
0001	4095

10.18.6.3

Indexed

This field enables indexing for the current Hardware encryption key (record/row) within the Encryption Key List.

Indexing allows for two unique sets of keys (Keysets) to exist within the radio. One Keyset exists in the Slot A field and the other exists in the Slot B field. Once Indexing is enabled for the current key (row/record), a second and unique encryption key is populated in the alternate Keyset "Slot B". Indexing also allows for two unique keys to exist per radio channel, instead of one key.

IMPORTANT:

When the Conventional Key menu-selection is programmed and when a pair of "Indexed" keys is selected for a certain channel, you are then able to alternate from the encryption key in Keyset A to the encryption key in Keyset B (and back) without changing the radio's channel. This is only possible for Conventional channels.

When the Keyset menu-selection is programmed on either Conventional or Trunking communications, then rekeying of the radio's current keyset is only possible on that type of communications channel. A Keyset does apply on a radio-wide basis and to both types of channels.

When both the Conventional and the Trunking Keyset selections are programmed, you can then change the Keyset for the entire radio, regardless of which channel the radio is currently operating.

Only eight keys can be indexed to Slot B and only 16 keys total are possible between Slot A and Slot B.

Accessed Only: When the radio is model/option capable, and when the [Secure Operation on page 272](#) field is set to **Hardware**, or

When the radio is model/option capable, and when the [Secure Operation on page 272](#) field is set to **Software**, and the [Keyloading Source on page 273](#) field is set to **KVL**.

10.18.6.4

Slot A

The application retrieves and allows you to view the Physical Identification (PID) Hardware key number for the current key (record/row) within the Encryption Key List.

This value is affected by the Indexed field's setting for the current record/row, enabled or disabled. When the Indexed field is enabled, it allows for two unique sets of keys ('Keysets') to exist, one in Slot A and one in Slot B.

IMPORTANT:

When the Conventional Key menu-selection is programmed and when a pair of "Indexed" keys is selected for a certain channel, you are then able to alternate from the encryption key in Keyset A to the encryption key in Keyset B (and back) without changing the radio's channel. This is only possible for conventional channels.

When the Conventional or Trunking Keyset menu-selection is programmed, you are able to change the Keyset on a radio-wide basis.

When both the Conventional and the Trunking Keyset selections are programmed, you can then change the Keyset for the entire radio, regardless of which channel the radio is currently operating.

Only eight keys can be indexed to Slot B and only 16 keys total are possible between Slot A and Slot B.

Accessed Only:

When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software** and when the [Keyloading Source on page 273](#) field is set to **KVL**, and when the [PID Key Management for ASN Mode on page 284](#) field is enabled,

And

When the number of records in the Encryption Key List is less than 9, or when the record number of the key in the [Secure Hardware Encryption Key References List on page 290](#) is between 9 and 16, and

- If anyone of the first eight [Indexed on page 287](#) fields is "Enabled", then Slot A of record 16 is inapplicable, or
- If any two of the first eight Indexed fields are "Enabled", then Slot A of records 15 and 16 is inapplicable, or
- If any three of the first eight Indexed fields are "Enabled", then Slot A of records 14, 15 and 16 is inapplicable (the remaining records follow the same rule,

Or

when the record number of the key in the Secure Hardware Encryption Key References List is greater than 16, then Slot A of that record cannot be accessed),

And, when the radio is model/option capable.

10.18.6.5 **Slot B**

The application retrieves and allows you to view the Physical Identification (PID) Hardware key number for the current key (record/row) within the Encryption Key List.

This value is affected by the Indexed field's setting for the current record/row, enabled or disabled. When the Indexed field is enabled, it allows for two unique sets of keys ('Keysets') to exist; one in Slot A and one in Slot B.

IMPORTANT:

When the Conventional Key menu-selection is programmed and when a pair of "Indexed" keys is selected for a certain channel, you are then able to alternate from the encryption key in Keyset A to the encryption key in Keyset B (and back) without changing the radio's channel. This is only possible for Conventional channels.

When the Conventional or Trunking Keyset menu-selection is programmed, you are then able to change the Keyset on a radio-wide basis.

When both the Conventional and the Trunking Keyset selections are programmed, you can then change the Keyset for the entire radio, regardless of which channel the radio is currently operating.

Only eight keys can be indexed to Slot B, and only 16 keys total are possible between Slot A and Slot B.

Accessed Only: When the radio is model/option capable.

10.18.6.6 **Selectable ADP Key Data**

This field allows you to define the Advanced Digital Privacy (ADP) key pattern for the current key (record/row) within the Encryption Key List.

Key patterns are a required element within the ADP secure algorithm for successful voice encryption communications to be possible.

WARNING:

ADP Keys are not cloned to the target radio when the source codeplug is read from a radio. When a codeplug containing ADP Keys is read from a radio, the ADP Keys are not loaded, which causes these ADP keys to appear in all asterisks (*). In this situation, the key data will not be cloned to a target radio. If sending ADP Key Data to the target radio is desired, you must re-enter the appropriate ADP Keys prior to initiating the Clone Radio process. Source codeplug ADP Key Data will overwrite the target radio's ADP Key Data when present.

When a codeplug file containing ADP Keys is opened, the ADP Keys are loaded and able to be cloned to the target radio. Source codeplug ADP Key Data will overwrite the target radio's ADP Key Data when present.

IMPORTANT:

When this field shows ten (10) asterisks "*****", there is no pattern defined.

To enter no Key Data pattern, enter ten (10) asterisks "*****".

For security purposes, when a codeplug is read from a radio, "*****" is displayed in this field, regardless of the data pattern that might be saved in the radio.

Whenever the Selectable ADP Key ID is modified, the Key Data pattern for the same row/record becomes invalid and must be redefined.

Up to 64 encryption keys are possible.

There is no mechanism to erase an ADP key from the radio. A field with "*****" simply implies it will not overwrite whatever key might actually be in the radio.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Software** and the [Keyloading Source on page 273](#) field is set to **Encryption Key List**, and the radio is model/option capable.

Table 122: Range

Minimum	Maximum
0000000000 Hex	FFFFFFFF Hex

10.18.6.7

Selectable ADP Key ID

This field allows you to define the ID number that represents the Advanced Digital Privacy (ADP) key for the current key (record/row) within the Encryption Key List.

The Key ID is transmitted along with the encrypted voice communications. Receiving radios recovering the Key ID are able to load the correct Selectable ADP Key Data pattern and thus decrypt the incoming voice call.

IMPORTANT:

All Selectable ADP Key IDs must be unique.

Up to 64 encryption keys are possible.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Software** and the [Keyloading Source on page 273](#) field is set to **Encryption Key List**, and the radio is model/option capable.

Table 123: Range

Minimum	Maximum
0000 Hex	FFFF Hex

10.18.6.8

Algorithm

This field allows the ADP key data of the selected entry to send to the Hardware Security Module (HSM) of the radio.

Currently, only ADP keys can be programmed into the HSM through RadioCentral. All other keys must be delivered to the radio from a Key Variable Loader (KVL) or Key Management Facility (KMF).

10.19

Secure KMF Profile Set

The **Secure Key Management Facility (KMF) Profile** set allows you to view or define ASTRO OTAR (Over-The-Air-Rekeying) parameters pertaining to KMF Profiles. KMF Profiles are defined to communicate with specific KMFs. Up to five (5) Secure KMF Profiles are possible. This entire node and all of its features are only available when the Secure Wide ASTRO OTAR Enable field is **Enabled**.

IMPORTANT: The intent of KMF Profiles is to allow the radio to operate with different KMFs, possibly on different systems. The drawback to this functionality is that the underlying encryption hardware cannot manage having multiple versions of the same key; for example, the user could not have the same CKR Number managed by both KMF#1 and KMF#2. Therefore, operators of KMF#1 and KMF#2, in this example, would have to agree not to manage the same CKR (Common Key Reference) numbers.

NOTE:

Once defined, Secure KMF Profiles are selected from the Trunking KMF Profile Index, the Conventional KMF Profile Index, and the ASTRO Talkgroup List KMF Profile Index fields.

ASTRO OTAR is enabled on a per Conventional Personality and based on the Rx Voice/Signal Type field. The radio is further configured to initiate OTAR commands by enabling that Personality's ASTRO OTAR and or OTAR Tx fields.

ASTRO OTAR is enabled on a per Trunking System basis from the ASTRO OTAR field and the OTAR Tx fields.

10.19.1

Secure Hardware Encryption Key References List

The **Secure Hardware Encryption Key References** section of the Secure KMF Profile allows you to view or define the set of CKRs (Common Key References) that this Secure Key Management Facility (KMF) Profile can access.

Encryption keys are thus referenced for use through a KMF Profile's Secure Hardware Encryption Key References List, which in turn references the underlying hardware keys of the Secure Encryption Key List. Each Key References List assigned to a KMF profile is configured to communicate with a specific KMF. When a KMF maintains the same CKRs, the KMF operator is able to control that radio from an ASTRO OTAR (Over-The-Air-Rekeying) perspective. Other KMF profiles communicate to other KMFs that can control different sets of CKRs for the radio.

IMPORTANT:

The maximum number of Secure Hardware Encryption Keys possible is equal to the current number of Secure Hardware Keys available in the Secure Encryption Key List.

Once defined, KMF Profiles are selected from the Trunking KMF Profile Index, the Conventional KMF Profile Index, and the ASTRO Talkgroup List KMF Profile Index fields.

For Conventional - channels having their Voice Key Strapping field set to **Select**, you can select a new Encryption Key from the menu-selection.

10.19.1.1

CKR Number

The application retrieves and displays the read-only Common Key Reference (CKR) values.

Each CKR value is based on the [Encryption Key Reference on page 291](#) field selection made for the same record/row of the current Secure Encryption Key References List, which applies to the current [ASTRO OTAR Profile](#).

NOTE:

This CKR value is defined in the [Secure Encryption Key List - CKR #](#) field.

Accessed Only: When the radio is model/option capable.

10.19.1.2

Encryption Key Reference

This field selects a Hardware Key or AES Key from the Secure Encryption Key List.

This selection applies for this record/row of the current Secure Hardware Encryption Key References List, which applies to the current [ASTRO OTAR Profile](#).

IMPORTANT:

Each Hardware Key and AES Key selection must be unique for the current ASTRO OTAR Profiles. Therefore the maximum number of Secure Encryption Keys (records/rows) possible is equal to the current number of Secure Keys available in the [Secure Encryption Key List](#).

Once defined, ASTRO OTAR Profiles are selected from the Trunking [ASTRO OTAR Profile Index on page 557](#), the Conventional ASTRO OTAR Profile Index, Data Profile ASTRO OTAR Profile Selection, and the ASTRO Talkgroup List [ASTRO OTAR Profile Index on page 373](#) fields.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the [Advanced Encrypted Standard \(AES256\) on page 273](#) field is set to **Enabled**, and when the [Over-The-Air-Rekeying \(OTAR\) Operation](#) field is set to **ASTRO Only** or **ASTRO & MDC**, and when the radio is model/option capable.

10.19.2

ASTRO OTAR Information

The **ASTRO OTAR (Over-The-Air-Rekeying) Information** section of the Secure KMF Profile allows you to view or define parameters for individual Secure KMF Profiles.

NOTE:

Once defined, KMF Profiles are selected from the Trunking KMF Profile Index, the Conventional KMF Profile Index, and the ASTRO Talkgroup List KMF Profile Index fields.

ASTRO OTAR is enabled on a per Conventional Personality based on the Rx Voice/Signal Type field. The radio is further configured to initiate OTAR commands by enabling that Personality's ASTRO OTAR and or OTAR Tx fields.

ASTRO OTAR is enabled on a per Trunking System basis from the ASTRO OTAR field and the OTAR Tx fields.

10.19.2.1

ASTRO OTAR Profile

This field allows you to create recognizable names for the current ASTRO Over-The-Air-Rekeying (OTAR) Profile.

NOTE:

Once defined, ASTRO OTAR Profiles are selected from the Trunking [ASTRO OTAR Profile Index on page 373](#), the Conventional [ASTRO OTAR Profile Index on page 373](#), and the ASTRO Talkgroup List [ASTRO OTAR Profile Index on page 373](#) fields.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

NOTE:

Examples: Profile-05, Electric1, #510

Characters, numbers, spaces, and special characters can be used.

Up to 14 characters are possible.

10.19.2.2

Erase Previous Keypad on OTAR Changeover

This field enables the erasing of ALL encryption keys in the previously active Keypad after an ASTRO OTAR (Over-The-Air-Rekeying) keypad change has occurred.

This feature applies to ASTRO OTAR operation for the current [ASTRO OTAR Profile](#).

NOTE: You can initiate an OTAR keypad change from the Key Management Facility (KMF) or a programmable Rekey menu selection.

IMPORTANT:

When this Erase Previous Keypad on OTAR Changeover field is enabled and when the Erase Previous On User Change is enabled, it is possible for you to erase both keypads and be momentarily without any secure encryption keys.

Example: The radio is operating on Keypad 1 when an OTAR Keypad Change occurs; it changes the radio to Keypad 2 and erases the radio's previous Keypad 1. Then if you manually change back to Keypad 1 that has been erased, and the Erase Previous on User Change feature erases the previous Keypad 2, then the radio would remain keyless until you manually load new keys, or request a manual OTAR Rekey.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware**, and when the [Over-The-Air-Rekeying \(OTAR\) Operation](#) field is set to **ASTRO Only** or **ASTRO & MDC**, and when the radio is model/option capable.

10.19.2.3

Number of Attempts

This field selects the number of attempts that the radio makes while waiting for registration confirmation from the Key Management Facility (KMF).

This feature applies to ASTRO OTAR operation for the current [ASTRO OTAR Profile](#).

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the [Advanced Encrypted Standard \(AES256\) on page 273](#) field is set to **Enabled**, and when the [Over-The-Air-Rekeying \(OTAR\) Operation](#) field is set to **ASTRO Only** or **ASTRO & MDC**, and when the [Response Kind on page 294](#) field is set to **Confirmed**, and when the radio is model/option capable.

Table 124: Range

Minimum	Maximum
1	10

10.19.2.4

OTAR Inactivity Timer

This field selects the amount of time that the Key Management Facility (KMF) has to communicate with the radio.

If the radio does not receive any information from the KMF when the timer has expired, the radio will try to re-establish communication.

This feature applies to ASTRO OTAR operation for the current [ASTRO OTAR Profile](#).

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the [Advanced Encrypted Standard \(AES256\) on page 273](#) field is set to **Enabled**, and when the [Over-The-Air-Rekeying \(OTAR\) Operation](#) field is set to **ASTRO Only** or **ASTRO & MDC**, and when the radio is model/option capable.

Table 125: Range

Minimum (hours)	Maximum (hours)
1	10

10.19.2.5

OTAR Rx Security Level

This field selects the receive security policy levels for Key Management Messages (KMMs).

This feature applies to ASTRO OTAR operation for the current [ASTRO OTAR Profile](#).

NOTE: At this time Rekey Request, Registration and Unable to Decrypt KMMs are always **Encrypted and Authenticated**.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the [Advanced Encrypted Standard \(AES256\) on page 273](#) field is set to **Enabled**, and when the [Over-The-Air-Rekeying \(OTAR\) Operation](#) field is set to **ASTRO Only** or **ASTRO & MDC**, and when the radio is model/option capable.

The following selections are supported:

Basic

The radio receives any format of KMM that is allowed by the Project 25 standard.

Enhanced

This selection is invalid when [Secure Operation on page 272](#) is set to **Software**.

The radio only receives the following KMMs:

- **Encrypted and Authenticated**
- **Encrypted Only**
- **Authenticated Only**

10.19.2.6

OTAR Tx Security Level

This field selects the receive security policy levels for Key Management Messages (KMMs).

This feature applies to ASTRO OTAR operation for the current [ASTRO OTAR Profile](#).

NOTE: At this time Rekey Request, Registration and Unable to Decrypt KMMs are always **Encrypted and Authenticated**.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the [Advanced Encrypted Standard \(AES256\) on page 273](#) field is set to **Enabled**, and when the [Over-The-Air-Rekeying \(OTAR\) Operation](#) field is set to **ASTRO Only** or **ASTRO & MDC**, and when the radio is model/option capable.

The following selections are supported:

Basic

The radio receives any format of KMM that is allowed by the Project 25 standard.

Enhanced

This selection is invalid when [Secure Operation on page 272](#) is set to **Software**.

The radio only receives the following KMMs:

- **Encrypted and Authenticated**
- **Encrypted Only**
- **Authenticated Only**

10.19.2.7

Rekey Request Status Alert Tone

This field enables the radio to generate a success or failure alert tone regarding rekey request completion.

This feature only affects the sounding of this alert tone when the Rekey Request section of the radio's menu is exited before the rekey request process is completed. When the Rekey Request section of the radio's menu is not exited before the rekey request process being complete, this status alert tone is sounded regardless of the setting of this field. This feature applies to ASTRO OTAR operation for the current [ASTRO OTAR Profile](#).

NOTE: The status of the Rekey process also appears as a visual alert in the display of the radio.

An OTAR encryption rekey operation is performed from the Key Management Facility (KMF) by the dispatcher upon receiving a rekey request from you.

You can initiate a Rekey Request with either a [Rekey Request on page 201](#) button-press or a [Rekey Request on page 201](#) menu-selection.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware**, and when the [Over-The-Air-Rekeying \(OTAR\) Operation](#) field is set to **ASTRO Only** or **ASTRO & MDC**, and when the radio is model/option capable.

10.19.2.8

Response Kind

This field selects the kind of response used when the radio communicates with the Key Management Facility (KMF).

This feature applies to ASTRO OTAR operation for the current [ASTRO OTAR Profile](#).

The following selections are supported:

Unconfirmed

ASTRO OTAR transmissions sent to the KMF (from the radio) are not confirmed/acknowledged indicating a transmission successfully received.

Confirmed

ASTRO OTAR transmissions sent to the KMF (from the radio) require a confirmation/ acknowledgement be sent back to the radio indicating a transmission successfully received.

When the [OTAR Transport on page 297](#) field is set to **Broadband Only** or **Broadband Preferred** and the radio performs Over-The-Air-Rekeying (OTAR) using broadband, the radio uses **Confirmed** as the Response Kind.

When the radio performs OTAR over Land Mobile Radio (LMR), the radio uses the value of this field as the Response Kind.

Accessed Only: When the following conditions are met:

- The [Secure Operation on page 272](#) field is set to **Hardware** or **Software**.
- The [Advanced Encrypted Standard \(AES256\) on page 273](#) field is set to **Enabled**.
- The [Over-The-Air-Rekeying \(OTAR\) Operation](#) field is set to **ASTRO Only** or **ASTRO & MDC**.
- The radio is model or option capable.

10.19.2.9

Time Between Attempts

This field selects the amount of time that the radio waits before sending a retry of the last message.

This feature applies to ASTRO OTAR operation for the current [ASTRO OTAR Profile](#).

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the [Advanced Encrypted Standard \(AES256\) on page 273](#) field is set to **Enabled**, and when the [Over-The-Air-Rekeying \(OTAR\) Operation](#) field is set to **ASTRO Only** or **ASTRO & MDC**, and when the [Response Kind on page 294](#) field is set to **Confirmed**, and radio is model/option capable.

Table 126: Range

Minimum	Maximum	Increments
5 seconds	90 seconds	5 seconds

10.19.2.10

User Selectable Rekey Request

This field enables the radio to transmit the ASTRO Over-The-Air-Rekeying (OTAR) Rekey Request.

The request is sent to the dispatcher's Key Management Facility (KMF) console. This feature applies to ASTRO OTAR operation for the current [ASTRO OTAR Profile](#).

NOTE: You can initiate a Rekey Request with either a [Rekey Request on page 174](#) button-press or a [Rekey Request on page 201](#) menu-selection.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the [Advanced Encrypted Standard \(AES256\) on page 273](#) field is set to **Enabled**, and when the [Over-The-Air-Rekeying \(OTAR\) Operation](#) field is set to **ASTRO Only** or **ASTRO & MDC**, and when the radio is model/option capable.

10.19.3

Data Transport

The **Data Transport** section of the Secure KMF Profile allows you to view or define settings to be used in sending and receiving KMMs (Key Management Messages) to and from the KMF (Key Management Facility).

IMPORTANT:

These Data Transport settings apply only to Trunking ASTRO OTAR (Over-The-Air-Rekeying), which is an IP-based data application in the radio. Conventional ASTRO OTAR communicates with the subscriber using the P25 Common Air Interface (CAI) protocol and is not IP-based. The files in this section apply for individual Secure KMF Profiles.

Once defined, KMF Profiles are selected from the Trunking KMF Profile Index, the Conventional KMF Profile Index, and the ASTRO Talkgroup List KMF Profile Index fields.

10.19.3.1

KMF IP Address

This field selects the Internet Protocol (IP) address of the Key Management Facility (KMF).

This selection applies to ASTRO Over-The-Air-Rekeying (OTAR) functionality and for the current [ASTRO OTAR Profile](#).

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the [Advanced Encrypted Standard \(AES256\) on page 273](#) field is set to **Enabled**, and when the [Over-The-Air-Rekeying \(OTAR\) Operation](#) field is set to **ASTRO Only** or **ASTRO & MDC**, and when the radio is model/option capable.

The following selections are supported:

- Valid IP Addresses whose values for each octet is between: [0-223] . [0-255] . [0-255] . [0-255]

10.19.3.2

KMF UDP Port

This field selects the User Datagram Protocol (UDP) port number.

The radio transmits KMMs (Key Management Messages) to this port when communicating to the KMF (Key Management Facility). This selection applies to ASTRO OTAR (Over-The-Air-Rekeying) functionality and for the current [ASTRO OTAR Profile](#).

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the [Advanced Encrypted Standard \(AES256\) on page 273](#) field is set to **Enabled**, and when the [Over-The-Air-Rekeying \(OTAR\) Operation](#) field is set to **ASTRO Only** or **ASTRO & MDC**, and when the radio is model/option capable.

Table 127: Range

Minimum	Maximum
0	65535

10.19.3.3

Subscriber OTAR Port

This field selects the Mobile Subscriber Unit (MSU) Over-The-Air-Rekeying (OTAR) port number to be used.

The radio receives KMMs (Key Management Messages) to this port when communicating with the KMF (Key Management Facility). This selection applies to ASTRO OTAR functionality and for the current [ASTRO OTAR Profile](#).

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the [Advanced Encrypted Standard \(AES256\) on page 273](#) field is set to **Enabled**, and when the [Over-The-Air-Rekeying \(OTAR\) Operation](#) field is set to **ASTRO Only** or **ASTRO & MDC**, and when the radio is model/option capable.

Table 128: Range

Minimum	Maximum
0	65535

10.19.3.4

OTAR Transport

This field selects the transport type for Over-The-Air-Rekeying (OTAR).

The following options are available:

LMR Only

OTAR is performed over Land Mobile Radio (LMR) only.

Broadband Only

OTAR is performed over Cellular Long Term Evolution (LTE) or Wi-Fi.

Accessed Only: When the following conditions are met:

- The radio model supports OTAR such as the Radio Next model.
- The [Secure Operation on page 272](#) field is set to **Hardware** or **Software**.
- The [Advanced Encrypted Standard \(AES256\) on page 273](#) field is enabled.
- The [OTAR Enable on page 273](#) field is enabled.
- The [ASTRO OTAR Enable on page 274](#) field is enabled.

10.19.3.5

KMF Broadband ID

This field allows you to enter a globally unique identifier of the Key Management Facility (KMF). The radio communicates with the KMF for Over-The-Air-Rekeying (OTAR) using broadband.

Accessed Only: When the following conditions are met:

- The radio model supports OTAR such as the Radio Next model.
- The [Secure Operation on page 272](#) field is set to **Hardware** or **Software**.
- The [Advanced Encrypted Standard \(AES256\) on page 273](#) field is enabled.
- The [OTAR Enable on page 273](#) field is enabled.
- The [ASTRO OTAR Enable on page 274](#) field is enabled.
- The [OTAR Transport on page 297](#) field is not set to **LMR Only**.

10.20

CA Certificate

This section allows you to load CA Certificate files into the current codeplug.

The maximum number of CA Certificate files that can be added in a codeplug is 20. CA Certificate files in the radio's codeplug are used by the radio to authenticate the SmartConnect Gateway server during a TLS session.

10.20.1

Certificate Name

This field allows you to define recognizable names of the CA Certificate file.

The following selections are supported:

NOTE:

Examples: EMT-001, #500, Electric1, # A5.

Maximum of 50 ASCII characters, numbers, spaces, and special characters can be used.

10.20.2

Certificate Filename

This field allows you to view or rename the CA Certificate file.

The following selections are supported:

NOTE:

Examples: EMT-001, #500, Electric1, # A5.

Maximum of 255 characters, numbers, spaces, and special characters can be used.

10.21

Emergency Wide

This section allows you to view or define emergency mode functionality that applies for both Conventional Emergency Profiles and Trunking Emergency Profiles.

These Emergency Profiles can then apply while operating in Conventional and Trunking communications.

NOTE:

Conventional Emergency Profiles are selected for use from the Conventional System Emergency Profile Selection field.

Trunking Emergency Profiles are selected for use from the Trunking Personality Emergency Profile Selection field.

Emergency mode functionality is launched with a programmed radio or by you initiating the feature.

10.21.1

General

This section allows you to view or define emergency mode functionality that applies for both Conventional Emergency Profiles and Trunking Emergency Profiles.

These Emergency Profiles can then apply while operating in Conventional and or Trunking communications.

NOTE:

Conventional Emergency Profiles are selected for use from the Conventional System's Emergency Profile Selection field.

Trunking Emergency Profiles are selected for use from the Trunking Personality's Emergency Profile Selection field.

Emergency mode functionality is launched with a programmed radio or by you initiating the feature.

10.21.1.1

Emergency Alarm Rx Indicator Type

This field selects the type of notification that you hear and or see when an Emergency alarm is received from another radio.

This feature must also be enabled (when appropriate) for the Individual MDC System or ASTRO System from the Emergency Alarm Rx Indicator field, or for the Trunking System from the Emergency Alarm Rx Indicator field. This selection applies while operating in Emergency Mode for both Conventional and Trunking communications.

IMPORTANT:

The Emergency Alarm Rx Indicator time lasts for 10 seconds. During these 10 seconds, you can deactivate the indicator by pressing any of the buttons of the radio except **Volume** and **Light** buttons.

Once the indicator clears or is cleared, retried emergency alarms from the same MDC Primary ID, or ASTRO System Individual ID, or Trunking Unit ID are ignored for the next 20 seconds.

Emergency alarms are not detected while the radio is in scan mode.

Emergency alarms are not detected while the radio is active on a voice channel.

The following selections are supported:

No Indication

No alerts are heard or seen.

Alert Only

Sounds an audio alert.

Display Only

A visual alert appears. The visual alert applies only for display model radios.

Alert & Display

Emergency alarms are not detected while the radio is active on a voice channel.

NOTE:

For the **Display Only** and the **Alert and Display** selections the following are true:

- When the radio detected an Emergency Alarm, **EA-RCVD** (Emergency Alarm Received) appears in the display of the radio.
- When the radio detected an Emergency Beacon, **BCON RX** (Emergency Find Me Beacon Received) appears in the display of the radio.

EA-RCVD is displayed alternately with either the MDC Primary ID, ASTRO System Individual ID, or the Trunking Unit ID of the radio that sent the Emergency Alarm, and continues for ten seconds. Reverse Aliasing/Caller ID is also possible.

10.21.1.2

Keep Alive

This field enables the radio to remain powered-on during an emergency mode transmission, regardless of the position of the power switch.

If the power switch of the radio is turned to the **OFF** position, the radio powers down once emergency mode is exited with a long keypress of the Emergency button. This selection applies while operating in emergency mode for both Conventional and Trunking communications.

Accessed Only: When the radio is model/option capable.

10.21.1.3

Disable Emergency Call Indications

This field enables all indications (display, LED alerts, and tones) normally associated with an Emergency Call (see Emergency Type) to be disabled when operating in Silent Alarm mode.

Only the audible and visual indications which occur during a standard Talkgroup/Conventional call are available; therefore, during the Emergency Call, it appears like an ordinary dispatch call is taking place. This selection applies while operating in emergency mode for both Conventional and Trunking communications.

WARNING: This Silent Emergency Call mode continues until you press and hold the Emergency button for the programmed Long Keypress Duration for Emergency to exit emergency mode.

IMPORTANT: When this selection is Enabled, the Disable Emergency Call Indications Extended Feature is **Used in Codeplug = Yes**.

Accessed Only: When the **Disable Emergency Call Indications** Extended Feature appears in the Extended Feature Name field and when the Silent Alarm field is enabled (if Disabled, then this selection must be Disabled; else, this field becomes invalid).

10.21.1.4

Unmute Option

This field enables the radio to unmute to voice traffic when operating in Silent Alarm mode.

The Unmute Option allows the dispatcher to provide feedback to your initiated emergency state through code words, and without drawing undesirable attention.

This selection applies while operating in Emergency Mode for both Conventional and Trunking communications.

WARNING: When the [Disable Emergency Call Indications on page 300](#) field is enabled, this Unmute Option field must be enabled; otherwise the application considers the value invalid.

Accessed Only: When the Silent Alarm field is enabled.

10.21.1.5

Channel Delay

This field selects the amount of time that the radio waits before transmitting emergency mode data when you are changing the channel of the radio.

This feature prevents the radio from unintentionally transmitting emergency data on channels when in emergency mode, and when you are changing the channel of the radio. This selection applies while operating in emergency mode for both Conventional and Trunking transmissions. Time is in second.

Accessed Only: When the radio is model/option capable.

Table 129: Range

Minimum	Maximum	Increment
0 sec	7 sec	1 sec

10.21.1.6

Distinguish Emergency Type

This field enables the radio to send different Location Request/Response Protocol (LRRP) message for Man Down, Impact Detect and other emergency.

This feature allows you to differentiate between false alarms and real emergencies.

The radio status events includes textual display of the condition and a different emergency tone plays at the selected speaker for the duration of alarms.

Accessed Only: When the Emergency Alarm Rx Indicator Type field is Display Only or Alert & Display.

10.21.2

Man Down

This section allows you to view or define Emergency Mode Man Down functionality.

The Man Down feature transmits an emergency based on a portable radio and its operator considered as being in a horizontal position, or in a horizontal position and motionless.

Therefore a Man Down Emergency Mode alerts dispatchers and other radios that a Man Down situation has occurred.

IMPORTANT: The Man Down feature can be configured to operate on a radio-wide basis or on a per Emergency Profile basis that includes customizable Alert Tones. See the Man-Down Configurability Level field and the Customizable Emergency Tones Page.

NOTE:

The Man Down Trigger field enables the feature and determines if a motion sensitivity threshold is also required to complete the Man Down condition. The Man-Down Configurability Level, the Pre-Alert Timer, the Pre-Alert Tone and the Post-Alert Timer must also be defined.

In-the-field: You are alerted both audibly and visually that the radio's programmed Man Down condition(s) have been met for the duration of the Pre-Alert Timer. Once the Pre-Alert Timer has expired, the Post-Alert Timer begins. Once the Post-Alert Timer has expired, the radio begins to transmit in Emergency Mode.

- At anytime during the period when the required Man Down conditions are considered to be true, if the Man Down conditions are interrupted due to repositioning of the radio, or you initiating the Man Down Clear button-press, then the Man-Down feature is automatically reset and no emergency transmission is sent.
- If the emergency is already being transmitted but not yet acknowledged, and the Man Down conditions are interrupted due to up-righting of the radio, or you initiating the Man Down Clear button-press, then the emergency transmission is canceled.

The angles of operation that determine an upright radio versus a horizontal radio are factory programmed.

The motion sensitivity threshold is factory programmed.

NOTE:

Conventional Emergency Profiles are selected for use from the Conventional System's Emergency Profile Selection field.

Trunking Emergency Profiles are selected for use from the Trunking Personality's Emergency Profile Selection field.

Emergency mode functionality is launched with a programmed radio or by you initiating the feature.

10.21.2.1

Man-Down Trigger

This field selects the type of Man Down condition that initiates the Emergency Mode Man Down feature.

This selection applies for both Conventional and Trunking communications.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Disabled

Disables the Man Down feature.

Horizontal Only

An emergency is transmitted when the radio is tilted to a perceived horizontal position.

Horizontal and Motionless

An emergency is transmitted if the radio is tilted to a perceived horizontal position, and the measured movement of the radio does not reach the factory-programmed movement sensitivity

threshold. Any radio motion that does not meet the movement threshold is considered as "Motionless".

NOTE: The motion sensitivity threshold is factory programmed.

NOTE: The angles of operation that determine an upright radio versus a horizontal radio are factory programmed.

10.21.2.2 Pre-Alert Timer

This field selects the amount of time that a Man Down condition must be present before you are notified with the selected Pre-Alert Tone.

This alert tone is also complimented visually with `Man Down` text appearing in the display of the radio. These alerts are to warn you that an Emergency Mode is about to be activated, therefore allowing you to bring the radio into a more vertical position and possibly avoid a false Emergency transmission.

This selection applies for both Conventional and Trunking communications.

IMPORTANT: In-the-field: If the Man Down condition is interrupted due to repositioning of the radio, or by you initiating the Man Down Clear button-press, then the Man-Down condition, the timers and alerts are reset, and the Emergency Mode transmission is canceled.

Accessed Only: When the radio is model/option capable and when the [Man-Down Trigger on page 302](#) field is not **Disabled**.

Table 130: Range

Minimum	Maximum	Increment
5 seconds	120 seconds	1 second

10.21.2.3 Post-Alert Timer

This field selects the amount of time after the Pre-Alert Timer has expired that a radio needs to remain in a Man Down condition before the Emergency Mode transmission begins.

This selection applies while operating for both Conventional and Trunking communications. Time is in seconds.

IMPORTANT: In-the-field: If the Man Down condition is interrupted due to repositioning of the radio, or by you initiating the Man Down Clear button-press, then the Man-Down condition, the timers, and alerts are reset, and the Emergency Mode transmission is canceled.

Accessed Only: When the radio is model/option capable and when the [Man-Down Trigger on page 302](#) field is not **Disabled**.

Table 131: Range

Minimum	Maximum	Increment
1 second	120 seconds	1 second

10.21.2.4 Pre-Alert Tone

This field selects the type of alert tone that sounds after the Pre-Alert Timer has expired.

The Pre-Alert Timer begins once the programmed Man Down condition is met (see [Man-Down Trigger on page 302](#)). Once this timer period expires, this selected alert tone is sounded. This alert tone is also complimented visually with `Man Down` text appearing in the display of the radio.

These audible and visual alerts are to warn you that an Emergency Mode is about to be activated, therefore allowing you to bring the radio into a more vertical position and possibly avoid a false Emergency transmission. This selection applies for both Conventional and Trunking communications.

IMPORTANT: To ensure that you hear this tone even when the radio volume is low, it is recommended to increase the Minimum Volume setting or the Volume Offset (dB) setting.

Accessed Only: When the radio is model/option capable and when the [Man-Down Trigger on page 302](#) field is not **Disabled**.

The following selections are supported:

Single Warning Tone

One tone is sounded at the expiration of the [Pre-Alert Timer on page 303](#).

Continuous Warning Tone

A continuous tone is sounded at the expiration of the [Pre-Alert Timer on page 303](#) and for the duration of the [Post-Alert Timer on page 303](#). Therefore, this alert tone ends once the Emergency Mode transmission begins.

10.21.2.5

Man-Down Configurability Level

This field selects either the Emergency Mode Man Down feature is defined on a radio-wide basis or on a per Emergency Profile basis.

This selection applies for both Conventional and Trunking communications.

Accessed Only: When the radio is model/option capable and when the [Man-Down Trigger on page 302](#) field is not **Disabled**.

The following selections are supported:

Radio Wide

The Man Down feature operates on a radio-wide basis.

Per Emergency Profile

Allows the Man Down feature to be enabled on a per Conventional Emergency Profile or per Trunking Emergency Profile basis by selecting the corresponding Man Down Enable field. See also the [Man-Down Emergency Tone Trigger on page 305](#).

10.21.3

Customizable Emergency Tones

This section allows you to view or define Emergency Mode Man Down functionality related to the per Emergency Profile Emergency Tone Lists.

NOTE:

Conventional Emergency Profiles are selected for use from the Conventional System's Emergency Profile Selection field.

Trunking Emergency Profiles are selected for use from the Trunking Personality's Emergency Profile Selection field.

Emergency mode functionality is launched with a programmed radio or by you initiating the feature.

10.21.3.1

Man-Down Emergency Tone Trigger

This field enables a customizable Emergency Tone List to be used, on a per Emergency Profile basis, when Emergency Mode has been initiated by a Man Down situation.

This selection applies while operating in Emergency Mode for both Conventional and Trunking communications.

Accessed Only: When the [Man-Down Trigger on page 302](#) field is not **Disabled** and when the [Man-Down Configurability Level on page 304](#) field is set to **Per Emergency Profile**, and when the radio is model/option capable and.

10.22

Conventional Emergency Profiles

The **Conventional Emergency Profiles** allows you to view or modify Conventional - emergency mode functionality.

Emergency transmissions have many possible defined settings. A variety of emergency profiles may be created.

NOTE: [Emergency Wide on page 298](#) features and settings apply to these profiles. Emergency Conventional Profiles are selected from the Conventional System's Emergency Profile Selection field.

Conventional Systems are referenced to Conventional Personalities from either the ASTRO System field or the Non-ASTRO System field; only ASTRO and MDC are capable of emergency mode transmissions.

Emergency mode functionality is launched with a programmed radio or by initiating the feature.

10.22.1

General

This section allows you to view or modify Conventional Emergency features for individual Conventional Emergency Profiles.

NOTE: [Emergency Wide on page 298](#) features and settings apply to these profiles. Emergency Conventional Profiles are selected from the Conventional System's Emergency Profile Selection field.

Conventional Systems are referenced to Conventional Personalities from either the ASTRO System field or the Non-ASTRO System field; only ASTRO and MDC are capable of emergency mode transmissions.

Emergency mode functionality is launched with a programmed radio or by you initiating the feature.

10.22.1.1

Emergency Profile Name

This field allows you to create recognizable names for the current Conventional Emergency Profiles.

Conventional Emergency Profiles are selected for use from the Conventional System Emergency Profile Selection field.

NOTE:
Examples: EMT-001, #500, Electric1, # A5.

Characters, numbers, spaces, and special characters can be used.

Up to 14 characters are possible.

10.22.1.2

Emergency Type

This field selects the desired radio functionality that occurs when you initiate emergency mode.

This selection applies for the current [Conventional Emergency Profiles on page 305](#).

IMPORTANT:

Both selections support Emergency Revert Channel, that is, transmitting emergency on a predetermined channel.

Once the radio has begun Emergency Call operation, only your long-press of the emergency button (see the Long Keypress Duration for Emergency field) or a radio power-down ceases this functionality.

The following selections are supported:

Alarm Only

Upon an Emergency button-press, an emergency alarm data packet initiating an emergency communication is repeatedly sent to the base station until it is canceled by one of the following choices:

- Both the programmed [Polite Retries on page 307](#) and [Impolite Retries on page 307](#) have been exhausted.
- An acknowledgement confirming the successful transmission of the emergency data packet is received back from the base station.
- A PTT button-press.
- A long-press of the emergency button (see the Long Keypress Duration for Emergency field).

Alarm & Call

Upon an Emergency button-press an emergency alarm data packet initiating an emergency communication is repeatedly sent to the base station until it is canceled by one of the following choices:

- Both the programmed [Polite Retries on page 307](#) and [Impolite Retries on page 307](#) have been exhausted.
- An acknowledgement confirming the successful transmission of the emergency data packet is received back from the base station.
- A PTT button-press.

When the Alarm data packet has ceased, then voice (Call) is able to transmit on the channel.

10.22.1.3

Console Ack Required (DVRS)

This field causes an extra console acknowledgement response ("console Ack") to be required when you initiate emergency mode.

When an emergency alarm has been sent (see the Emergency Type field), the radio always requires an acknowledgement from the Fixed Network Equipment (FNE); this feature requires an extra console Ack to be required from the dispatch/console application.

Receiving an FNE Ack confirms to you that the radio's current site has received the emergency alarm packet; receiving a console Ack ensures that the dispatch/console application is displaying the emergency condition to the dispatcher. Once the console Ack is received the radio sounds a four-beep alert tone.

This selection applies for the current Conventional Emergency Profile.

IMPORTANT:

This field is only applicable when the radio's current channel is operating on a Conventional Digital Vehicular Repeater System (DVRS) (that is, the current Conventional Personality references a DVRS Conventional System). This field has no impact on a non-DVRS Conventional System.

This feature must be disabled for **Hot Mic Emergency** or **Emergency via Silent Audio** to function properly. See the [Emergency Auto Transmit Mode on page 308](#) field.

10.22.1.4

Acknowledge Alert Tone

This field enables the radio to sound an audio tone once an emergency mode message has been received and a confirmation of the received message has arrived back to the radio from the base station.

An emergency acknowledge is a confirmation that the radio Emergency Alarm (see [Emergency Type on page 306](#)) has been successfully received by the base station. This feature applies for the current Conventional Emergency Profile.

10.22.1.5

Polite Retries

This field selects the number of times that the radio attempts to transmit a polite emergency mode Call (see Emergency Type).

A polite call is when the radio waits for a channel to be free of radio traffic before attempting to transmit. Polite Retries are aborted when an acknowledgment (Ack) of a successful emergency transmission is received back to the radio.

This selection applies for the current [Conventional Emergency Profiles on page 305](#).

IMPORTANT: If impolite emergency retries are complete before the Limited Patience timer expires, the radio will use polite transmission until the timer expires. After the timer expires, any remaining polite retries will be sent impolitely.

Table 132: Range

Minimum	Maximum	Increment
0 Attempt	15 Attempts	1 Attempt

Table 133: Range

Minimum	Maximum
0 Attempt	14 or infinite attempts

10.22.1.6

Impolite Retries

This field selects the number of times that the radio attempts to transmit an impolite emergency mode Call (see the Emergency Type field selections).

An impolite call is when the radio sends a transmission even when the channel is busy with other radio traffic. These transmissions proceed by stepping on other channel traffic. Impolite Retries are aborted when an acknowledgment (Ack) of a successful emergency transmission is received back to the radio.

This selection applies for the current [Conventional Emergency Profiles on page 305](#).

IMPORTANT: If impolite emergency retries are complete before the Limited Patience timer expires, the radio will use polite transmission until the timer expires. After the timer expires, any remaining polite retries will be sent impolitely.

Table 134: Range

Minimum	Maximum	Increment
1 Attempt	15 Attempts	1 Attempt

10.22.1.7

Emergency Exit on Channel Change

This field allows the radio to exit Emergency on mode change.

10.22.1.8

Man-Down Enable

This field enables Emergency Mode Man Down operation for the current Conventional Emergency Profiles.

Accessed Only: When the Man Down Trigger field is not set to **Disabled**, and when the Man-Down Configurability Level field is set to **Per Emergency Profile**, and when the radio is model/option capable.

10.22.1.9

Emergency Auto Transmit Mode

This field selects an additional and specific emergency transmission operation for the current Conventional Emergency Profiles set.

Emergency Hot Mic or Hot Mic Silent Audio are possible.

WARNING: When this feature is not disabled, the selected functionality overrides/enhances the emergency functionality described for the [Emergency Type on page 306](#) field's **Alarm and Emergency Call** selection.

The following selections are supported:

Disabled

No additional Auto Transmit functionality is selected.

Hot Mic Emergency

Once you initiate emergency mode with an Emergency button-press, after only one emergency alarm impolite transmission, this selection causes the radio to automatically key-up and transmit an emergency Call (see [Emergency Type on page 306](#)). The radio transmits with its microphone remaining automatically unmuted/open for the time selected by the Hot Mic Tx Period field. The radio is then in normal emergency Call mode. This is also known as Emergency with Voice to Follow.

When the Long Keypress for Emergency field is not set to **0**, the Emergency Call Mode is exited with a long-keypress of the Emergency button.

Available For: ASTRO and MDC - Conventional Systems.

WARNING:

The Emergency Type field for the current profile must be set to **Alarm and Call** or this selection becomes invalid.

Conventional Personalities using Hot Mic should have their transmit Time Out Timer set to a value greater than Hot Mic Tx Period; otherwise the Hot Mic transmission aborts when the Time Out Timer expires.

NOTE: The settings of [Polite Retries on page 307](#)/[Impolite Retries on page 307](#) are ignored when entering the Hot Mic state. Once Hot Mic or the emergency call state is exited, the values of the Polite Retries/Impolite Retries fields are restored to the profile/radio channel.

Emergency via Silent Audio

Once you initiate emergency mode with an Emergency button-press, after only one emergency alarm impolite transmission, this selection causes the radio to automatically key-up into emergency mode with its microphone remaining muted/closed. This transmission continues for the amount of time specified in the Silent Audio Tx Period field. The radio is then in normal emergency Call mode.

When the Long Keypress for Emergency field is not set to **0**, the Emergency Call Mode is exited with a long-keypress of the Emergency button.

Available For: ASTRO - Conventional Systems only.

WARNING:

The Emergency Type field for the current profile must be set to **Alarm and Call** or this selection becomes invalid.

Conventional Personalities using this feature should have the Time Out Timer set to a value greater than [Silent Audio Tx Period on page 310](#), otherwise the transmission aborts when the Time Out Timer expires.

NOTE: The settings of [Polite Retries on page 307](#)/[Impolite Retries on page 307](#) are ignored when entering the Silent Audio state. Once Silent Audio or the emergency call state is exited, the values of the Polite Retries/Impolite Retries fields are restored to the profile/radio channel.

10.22.1.10

Hot Mic Tx Period

This field selects the amount of time that the radio automatically keys-up and transmits while operating in the Hot Mic emergency mode (see Emergency Auto Transmit Mode).

This selection applies for the current [Conventional Emergency Profiles on page 305](#).

IMPORTANT: Conventional Personalities using this feature should have the Time Out Timer set to a value greater than [Silent Audio Tx Period on page 310](#), otherwise the transmission aborts when the Time Out Timer expires.

Accessed Only: When the [Emergency Type on page 306](#) field is set to **Alarm and Call**, and when the [Emergency Auto Transmit Mode on page 308](#) field is set to **Hot Mic Emergency**.

IMPORTANT: Older version of the codeplug must use the parameters below:

Table 135: Range

Minimum	Maximum	Increments
10 seconds	120 seconds	10 seconds

IMPORTANT: This applies to the codeplug version 19.00.00 and above:

Table 136: Range

Minimum	Maximum	Incremenst
1 seconds	120 seconds	10 seconds

10.22.1.11

Silent Audio Tx Period

This field selects the amount of time that the radio automatically keys-up and transmits while operating in the **Emergency via Silent Audio** Enable Emergency Mode.

See [Emergency Auto Transmit Mode on page 308](#).

This selection applies for the current [Conventional Emergency Profiles on page 305](#) and is only possible for ASTRO signaling systems.

Accessed Only: When the [Emergency Type on page 306](#) field is set to **Alarm and Call**, and when the [Emergency Auto Transmit Mode on page 308](#) field is set to **Emergency via Silent Audio**.

Table 137: Range

Minimum	Maximum	Increment
1 seconds	5 seconds	1 seconds

Table 138: Range

Minimum	Maximum
1 seconds	5 seconds

10.22.1.12

Tx Multiplier Enable

This field causes the selected Tx Multiplier Factor value to be doubled, which then determines how long the radio automatically continues to key up and transmit an Impolite Emergency Call (see Emergency Type).

This selection applies for the current [Conventional Emergency Profiles on page 305](#).

10.22.1.13

Tx Multiplier Factor

This field selects how long the radio to automatically continues to key up and transmit an Impolite Emergency Call (see Emergency Type).

This time begins only once the radio has exhausted all Emergency [Polite Retries on page 307](#) and [Impolite Retries on page 307](#) without receiving an acknowledge.

This selection applies for the current [Conventional Emergency Profiles on page 305](#).

IMPORTANT: When the Remote Radio Mode field is set to **Radio Trace** or **Radio Monitor**, this number is multiplied by the Tx Base Time to give a value in seconds.

The following selections are

Table 139: Range

Minimum	Maximum
0	3

10.22.1.14

Emergency Find Me

The Emergency Find Me feature provides an indication that notifies you when someone in your vicinity has an emergency activation.

When this feature is enabled, you can perform the following actions:

- Transmit a Bluetooth Low Energy (BLE) beacon every two seconds while the radio is in the Emergency feature.
- Receive emergency beacons and view the Beacon Received notification.
- Receive an alert tone when any beacon is received in the last ten seconds.
- Enter into menu option to view all the receiving beacons.
- Dismiss the notification to stop receiving the tones and display.

To enable the Emergency Find Me feature, you must enable the **Transmit Enable** and **Receive Enable** fields in the Emergency Find Me section of the Conventional Emergency Profile.

10.22.1.15

Transmit Enable

When this field is enabled, the radio can transmit the Emergency Find Me Beacon during emergency.

Emergency Beacon transmission is triggered through the Emergency feature such as pressing the Emergency switch or button, and Fall Alert (Man Down) Emergency. When you enter emergency, no additional action is required. When the radio enters emergency mode, Bluetooth is automatically turned on, and the beacons are sent. Emergency Beacons are sent every two seconds while the radio is in emergency mode.

For more information on the Emergency Find Me Feature, refer to [Emergency Find Me on page 311](#).

Accessed Only: When the radio is model/option capable.

10.22.1.16

Receive Enable

When this field is enabled, the radio receives the Emergency Find Me Beacon during emergency.

When you change to a channel in which Beacon Receive is enabled, Bluetooth is automatically turned on. When you receive an emergency beacon, the radio plays a tone and displays `Beacon Received` on the Top Display and Front Display Radio Control widget. The radio continues to play a tone every ten seconds while actively receiving beacons.

If the receiver dismisses the notification or if no beacons are received for four minutes, the Beacon Received notification disappears. If multiple beacons are available, the display shows the ID or alias of the device that enters emergency most recently.

For more information on the Emergency Find Me Feature, refer to [Emergency Find Me on page 311](#).

NOTE:

On APX Standard radios with front display, you can use the menu to view the radio ID of the transmitting radio and the Bluetooth Received Signal Strength Indicator (RSSI) level.

On APX NEXT radios, you can dismiss the beacon by tapping **DISMISS** in the notification. You can also view the list of senders by tapping **DETAILS**.

Accessed Only: When the radio is model/option capable.

10.22.1.17

Remote Activation of Emergency

This field selects specific functionality of the Remote Emergency Activation feature for the current Emergency Profile set. This feature will allow a source (encoding) radio to activate the Emergency feature on a target (decoding) radio via over the air communication as if the target user pressed the Emergency button.

This field is only valid when the radio is model or option capable with APCO 25 Conventional and/or APCO 25 Trunking operation.

The following selections are supported:

Disabled

No Remote Emergency Activation functionality is selected.

Encode Only

A radio is only allowed to initiate Remote Emergency communications to a target radio.

Decode Only

A radio is only allowed to receive Remote Emergency communications from a source radio and upon decoding the communications, the radio will immediately launch the Emergency feature.

Encode and Decode

A radio is allowed to both initiate Remote Emergency communications to a target radio and to receive Remote Emergency communications from a source radio.

NOTE: This field is disabled by default.

10.22.2

MDC

This section allows you to view or modify MDC - Conventional Emergency features for individual Conventional Emergency Profiles.

NOTE:

Emergency Wide features and settings apply to these profiles.

Emergency Conventional Profiles are selected from the Conventional System's Emergency Profile Selection field.

MDC type Conventional Systems are referenced to Conventional Personalities from the Non-ASTRO System field.

Emergency mode functionality is launched with a programmed radio or by you initiating the feature.

10.22.2.1

Emergency PTT-ID Sidetone

This field enables an alert tone to sound while transmitting an Emergency PTT ID and when the radio is in emergency mode.

The alert tone sounds when PTT button is pressed and continues until the Emergency PTT ID has transmitted. During this brief time, the radio's microphone and therefore voice transmission is automatically disabled. When the alert tone stops, it is meant to notify you that the radio's speaker is ready to accept voice for transmission.

This selection applies for the current [Conventional Emergency Profiles on page 305](#).

WARNING: This feature applies only when the Non-ASTRO Emergency PTT ID field is enabled in a Conventional Personality that references a Conventional System that references this Conventional Emergency Profile.

Accessed Only: When the [Emergency Type on page 306](#) field is set to **Alarm and Call**.

10.22.2.2

Emergency Remote Monitor Tx Base Time

This field selects a number used by the radio to calculate the amount of time that the radio automatically keys-up in the MDC Emergency Remote Monitor mode.

Once this transmit time has expired, the radio then de-keys for the amount of time defined by the [Emergency Remote Monitor Rx Base Time on page 313](#). This feature applies for the current Conventional Emergency Profile. Time is in seconds.

IMPORTANT:

The radio uses the Tx Multiplier value (delivered to the radio within an Emergency Call Acknowledgement **Ack**, or within a dispatcher sent Remote Monitor Command) multiplied by this Tx Base Time to determine the amount of Emergency Remote Monitor transmission time.

And if the Global Multiplier (delivered to the radio within an Emergency Call Acknowledgement **Ack**, or within a dispatcher sent Remote Monitor Command) is set to **True**, this calculated transmission time is doubled.

Accessed Only: When the Emergency Type field is set to **Alarm and Call**, and when the radio is model/option capable.

Table 140: Range

Minimum	Maximum	Increments
10 sec	120 sec	10 sec

10.22.2.3

Emergency Remote Monitor Rx Base Time

This field selects a number used by the radio to calculate the amount of time that the radio automatically de-keys and waits in the Emergency Remote Monitor mode.

This receive/wait time begins once the [Emergency Remote Monitor Tx Base Time on page 313](#) has expired. This feature applies for the current Conventional Emergency Profile. Time is in seconds.

IMPORTANT:

The radio uses the Rx Multiplier value (delivered to the radio within an Emergency Call Acknowledgement **Ack**, or within a dispatcher sent Remote Monitor Command) multiplied by this Rx Base Time to determine the amount of Emergency Remote Monitor receive/wait time.

And if the Global Multiplier (delivered to the radio within an Emergency Call Acknowledgement **Ack**, or within a dispatcher sent Remote Monitor Command) is set to **True**, the calculated receive/wait time is doubled.

Accessed Only: When the Emergency Type field is set to **Alarm and Call**, and when the radio is model/option capable.

Table 141: Range

Minimum	Maximum	Increments
10 sec	120 sec	10 sec

10.22.2.4

Emergency Remote Monitor Enable

This field enables emergency mode Remote Monitor operation.

Emergency Remote Monitor occurs on the radio once one of the two following scenarios is true. First, when an Emergency Alarm (see Alarm and Call in [Emergency Type on page 306](#)) is successfully received by the dispatcher/console, and then an Emergency Alarm Ack (acknowledge) is successfully received back to the radio. Second, when an MDC Remote Monitor Command has been received (by the radio) during emergency mode. Once the radio is in Emergency Remote Monitor mode, the radio

automatically keys-up and transmits surrounding audio from its "hot" microphone. This feature applies for the current [Conventional Emergency Profiles on page 305](#).

WARNING: The [Emergency Type on page 306](#) field must be set to **Alarm and Call** for this selection to be valid.

IMPORTANT:

Both the "Ack" and the "Remote Monitor Command" contain a Tx Multiplier value, an Rx Multiplier value and a Global Multiplier (set to **True** or **False**). These values are defined by the dispatcher/console.

The radio uses the Tx Multiplier (delivered by the Ack or the Remote Monitor Command) multiplied by the programmed Tx Base Time to determine the amount of time of this "hot" microphone transmission. If the Global Multiplier (delivered by the Ack or the Remote Monitor Command) is set to **True**, the calculated transmission time is doubled.

Once this transmit time has expired, the radio de-keys for the specific receive/wait-time. This receive/wait-time is determined by multiplying the Rx Multiplier (delivered by the Ack or the Remote Monitor Command) by the programmed Rx Base Time. Again, if the Global Multiplier (delivered by the Ack or the Remote Monitor Command) is set to **True**, the calculated receive/wait-time is doubled.

Once this transmit-time-period and then the receive/wait-time-period have both occurred, the radio then goes into an Emergency Alarm sequence (see Emergency Type **Alarm & Call**).

The Emergency Remote Monitor cycle begins again when either an Emergency Alarm Ack is received by the radio, or a Remote Monitor Command is received by the radio (during Emergency mode).

This Emergency Remote Monitor cycle is ended by either the dispatcher sending an Emergency Alarm Ack with a zero **0** Tx Multiplier value, and a zero **0** Rx Multiplier value (also known as the **Dispatch Console Values**), or when you press the PTT button is detected by the radio.

Accessed Only: When the radio is model/option capable.

10.22.3

Emergency Tone List

This section allows you to view or modify Emergency Mode Trigger and Alert Tone features for individual Conventional Emergency Profiles.

NOTE:

Emergency Wide features and settings apply to these profiles.

Emergency Conventional Profiles are selected from the Conventional System's Emergency Profile Selection field.

MDC type Conventional Systems are referenced to Conventional Personalities from the Non-ASTRO System field.

Emergency mode functionality is launched with a programmed radio or by you initiating the feature.

10.22.3.1

Trigger

This field selects the condition or trigger that initiates Emergency Mode in the current Conventional Emergency Profile.

Depending on the selected Emergency Tone type, the Tone Minimum Volume, Tone Period, and Audio Routing may also be configured in the same record/row of the Emergency Tone List.

Accessed Only: When the Man Down Trigger field is not set to **Disabled**, and when the Man-Down Emergency Tone Trigger is **Enabled**, and when the radio is model/option capable.

The following selection is supported:

Man-Down

A Man Down condition initiates Emergency Mode in the current [Conventional Emergency Profiles on page 305](#).

Applies Only: When the [Man-Down Enable on page 308](#) field is enabled in the current Conventional Emergency Profile.

10.22.3.2

Tone

This field selects the type of Alert Tone that sounds once an Emergency Mode transmission has commenced with the corresponding Trigger selection.

This selection applies for the current Conventional Emergency Profile.

Accessed Only: When the Man Down Trigger field is not set to **Disabled**, and when the Man-Down Emergency Tone Trigger is enabled, and when the radio is model/option capable.

The following selections are supported:

Legacy Emergency Tone

The legacy Emergency Alert Tone and audio levels are used.

Critical Emergency Tone

The Critical Emergency Alert Tone sounds. The Tone Minimum Volume, Tone Period, and Audio Routing must also be defined.

10.22.3.3

Tone Minimum Volume

This field selects the minimum audio level for sounding the corresponding Emergency Mode Alert Tone.

If the value is higher than the radio's current volume level, then the value is used, otherwise, the radio's current volume level is used. This feature applies for the current [Conventional Emergency Profiles on page 305](#).

Accessed Only: When the [Tone on page 316](#) field is set to **Critical Emergency Tone**, and when the radio is model/option capable.

Table 142: Range

Minimum	Maximum	Increments
0	255	1

10.22.3.4

Tone Period

This field allows you to select the specified Emergency Mode Alert Tone to a temporary tone or a repetitive tone.

User can determine the periodic timer of the repetitive tone. This feature applies for the current Conventional Emergency Profile.

Accessed Only: When the [Tone on page 316](#) field is set to **Critical Emergency Tone**, and when the radio is model/option capable.

NOTE: When set to **0-Once** (Zero Time), the alert tone specified in the Tone field sounds only once while emergency mode is active.

Table 143: Range

Minimum	Maximum	Increment
5	255	1

10.22.3.5

Audio Routing

This field selects the routing of the Alert Tone and incoming audio to a specific speaker when an Emergency Mode transmission begins through the corresponding Trigger selection.

This selection applies for the current Conventional Emergency Profile Set.

Accessed Only: When the [Tone on page 316](#) field is set to **Critical Emergency Tone**, and when the [Tone Period on page 316](#) field is not set to **Once**, and when the radio is model/option capable.

The following selections are supported:

Normal Audio Routing

The Alert Tone and any incoming audio are routed according to the radio's current speaker audio routing selections (see also Speaker Audio Routing and the Bluetooth Audio Reroute button-press).

Internal Speaker Audio Routing

The Alert Tone and any incoming audio are routed to the radio's internal speaker, regardless of any external accessory that may be connected, or the channel's current Speaker Audio Routing selection.

10.22.4

Emergency Compatibility Options

This section is intended for Harris system interoperability.

It allows you to control the cancellation of Emergency Call (by you, console or both) and re-initiate Hot Mic.

NOTE: [Emergency Wide on page 298](#) features and settings apply to these profiles. Emergency Conventional Profiles are selected from the Conventional System's Emergency Profile Selection field.

Conventional Systems are referenced to Conventional Personalities from either the ASTRO System field or the Non-ASTRO System field; only ASTRO and MDC are capable of emergency mode transmissions.

Emergency mode functionality is launched with a programmed radio or by you initiating the feature.

10.22.4.1

Emergency Exit Control

This field allows configuration in the radio to exit emergency by you, console or both.

The following selections are supported:

Subscriber Only

Default value

Console Only

Selectable if Emergency Operation is set to Emergency Alarm and Call, System Type is DVRS and Signal Type is ASTRO.

Both Subscriber and Console

Selectable if Emergency Operation is set to Emergency Alarm and Call, System Type is DVRS and Signal Type is ASTRO.

Accessed Only: When the radio is model/option capable.

10.22.4.2

Emergency Hot Mic Restart

This field allows hot mic audio to be retransmitted upon emergency button press while in an emergency.

Accessed Only: When [Emergency Type on page 306](#) field is set to **Alarm and Call**, and when the System Type field is set to **DVRS**, and when the Rx Voice/Signal Type and Tx Voice/Signal Type field is set to **ASTRO**, and when the radio is model/option capable.

10.23

Trunking Emergency Profiles

The **Trunking Emergency Profiles** allows you to view or modify Trunking - emergency mode functionality.

Emergency transmissions have many possible programmed settings. A variety of emergency profiles may be created. Both Trunking communications Protocol Types **ASTRO 25** and **Type II** are capable of emergency mode transmissions.

10.23.1

General

This section allows you to view or modify Trunking Emergency features for individual Trunking Emergency Profiles.

Both Trunking communications Protocol Types **ASTRO 25** and **Type II** are capable of emergency mode transmissions.

NOTE: [Emergency Wide on page 298](#) features and settings apply to these profiles. Emergency Trunking Profiles are selected from the Trunking Personality's Emergency Profile Selection field.

Emergency mode functionality is launched with a programmed radio or by you initiating the feature.

10.23.1.1

Emergency Profiles Name

This field allows you to create recognizable names for the current Trunking Emergency Profile.

Emergency Trunking Profiles are selected from the Trunking Personality's Emergency Profile Selection field.

NOTE:
Examples: EMT-001, #500, Electric1, # A5.

Characters, numbers, spaces, and special characters can be used.

Up to 14 characters are possible.

10.23.1.2

Emergency Operation

This field selects the desired radio functionality that occurs when you initiate emergency mode.

This selection applies for the current Trunking Emergency Profile.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Alarm Only

Upon an Emergency button-press, transmits an Emergency Alarm packet to the dispatcher. The emergency alarm packet is retried until an acknowledgement is received or until a number of attempts specified by the Retry Counter are exhausted. The type of acknowledgement expected is governed by the **Console Acknowledge Required** field.

Call Only

Upon an Emergency button-press, the radio enters into the Emergency Call mode. In this mode, PTT requests and voice transmissions from you or other radios are marked as emergency, and it gets emergency level priority on the current Trunking - Talkgroup.

Alarm and Call

Upon an Emergency button-press, once the Emergency Alarm sequence has been acknowledged or retries have been exhausted, the radio enters into Emergency Call mode.

10.23.1.3

Retry Counter

This field selects how many times that the Emergency Alarm is transmitted when an acknowledgement "Ack" of a successful emergency alarm transmission has not been received.

NOTE: For a normal Trunking call, if the radio is unsuccessful in sending a transmission, the radio retries for one Inbound Signal Data (ISD) sequence before quitting. For Emergency Alarms, the radio retries for the number of ISD sequences selected for this counter.

This selection applies for the current Trunking Emergency Profile.

Accessed Only: When the radio is model/option capable.

Table 144: Range

Minimum	Maximum	Increments
1	255	1

NOTE: When set to **Infinite**, the Number of Retries is Unlimited.

10.23.1.4

Console Ack Required

This field causes an additional console acknowledgement response ("console Ack") to be required.

When an emergency alarm has been sent, the radio always requires an acknowledgement from the Fixed Network Equipment (FNE). This feature requires an additional Ack to be required from the dispatch application. Receiving an FNE Ack assures you that the radio's current site has received the emergency alarm packet. Receiving a console Ack ensures that the dispatch application is displaying

the emergency condition to the dispatcher. Once the console Ack is received the radio sounds a four beep alert tone. This selection applies for the current Trunking Emergency Profile.

IMPORTANT: This feature must be disabled for **Hot Mic Emergency** or **Emergency via Silent Audio** to function properly.

Accessed Only: When the Emergency Operation field is set to **Alarm Only** or **Alarm and Call**, and when the radio is model/option capable.

10.23.1.5

Emergency Talkback

This field selects the desired transmit channel/channel type (Tactical or Non-Tactical) that the radio uses while operating in emergency mode.

This selection applies for the current Trunking Emergency Profile.

IMPORTANT: If emergency mode is entered from an Announcement Group or from a Dynamic Regrouping, the Emergency Talkback Revert Talkgroup (of the Trunking Personality that references this Trunking Emergency Profile) is used for these transmissions, whether this field is set to **Tactical** Emergency or **Revert** Non-Tactical Emergency.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Tactical

Emergency Alarms and Emergency Calls are transmitted on the radio's currently selected channel/Talkgroup.

This is also known as Tactical Emergency.

WARNING: Tactical does not work if the radio's current Trunking channel has its Transmit Mode field set to **TG/AG Disabled**.

Revert (Non-Tactical)

Emergency Alarms and Emergency Calls are transmitted on a specific channel. This channel is determined by the Emergency Revert Type field selection of the Trunking Personality that references this Trunking Emergency Profile.

NOTE: This is also known as Non-Tactical Emergency.

10.23.1.6

Revert PTT ID

This field causes the Emergency Talkback Revert Talkgroup of the Trunking Personality that references this Trunking Emergency Profile to use the "PTT-ID" Conversation Type while in Emergency Call mode.

This selection applies for the current Trunking Emergency Profile.

When disabled and while operating in Emergency Call mode, if the Trunking Personality that references this Emergency Profile is using the "Transmission" Conversation Type, the radio forces the "PTT-ID" Conversation Type. This selection applies for the current Trunking Emergency Profile or this personality's selected Announcement Group.

NOTE: This feature is also known as "Default PTT ID".

WARNING: This feature applies only when the Emergency Talkback field is set to **Revert**.

Accessed Only: When the radio is model/option capable.

10.23.1.7

Emergency Exit on Channel Change

This field allows the radio to exit Emergency on mode change.

10.23.1.8

Man-Down Enable

This field enables Emergency Mode Man Down operation for the current Trunking Emergency Profile.

Accessed Only: When the Man Down Trigger field is not set to **Disabled**, and when the Man-Down Configurability Level field is set to **Per Emergency Profile**, and when the radio is model/option capable.

10.23.1.9

Emergency Auto Transmit Mode

This field selects an additional and specific emergency mode transmission operation for the current Trunking Emergency Profile.

Emergency Hot Mic or Hot Mic Silent Audio is possible.

WARNING: When this feature is not disabled, the selected functionality overrides/enhances the emergency functionality described for the **Emergency Operation** field's "Alarm and Call" selection.

Accessed Only: For radio models with R16.00.00 or higher software version, when the [Emergency Operation on page 319](#) field is set to **Alarm and Call**, and when the [Console Ack Required on page 319](#) field is **Disabled**, and when the [Revert PTT ID on page 320](#) field is **Enabled**.

The following selections are supported:

Disabled

No additional Auto Transmit functionality is selected.

Hot Mic Emergency

Once emergency mode has been initiated with an Emergency button press, and then once an Emergency Alarm acknowledge has been received back to the radio (from the dispatcher/console), or all alarm retries have been exhausted, Hot Mic Emergency causes the radio to automatically key-up and transmit an emergency Call. The radio transmits with its microphone remaining automatically unmuted/open for the time selected by the **Hot Mic Tx Period** field. The radio is then in normal emergency Call mode. This is also known as Emergency with Voice to Follow.

When the Long Keypress for Emergency field is not set to **0**, the Emergency Call Mode is exited with a long-keypress of the Emergency button.

NOTE: This is also known as "Trunking Emergency with Voice to Follow".

WARNING:

Another press of the Emergency button does not re-initiate another Emergency Hot Mic transmission. Emergency mode must be exited and then re-initiated in order for the "automatic key-up" Hot Mic transmission to re-occur.

Exiting emergency mode is accomplished with a Long Keypress Duration of the Emergency Button or by powering-off the radio.

Emergency via Silent Audio

Once emergency mode has been initiated with an Emergency button-press, and then once an emergency alarm acknowledge has been received back to the radio (from the dispatcher/console),

or all alarm retries have been exhausted, the radio automatically keys-up into this emergency mode with its microphone remaining muted/closed. This transmission continues for the amount of time specified in the Silent Audio Tx Period field. The radio is then in normal emergency Call mode.

When the Long Keypress for Emergency field is not set to **0**, the Emergency Call Mode is exited with a long-keypress of the Emergency button.

IMPORTANT: Available for ASTRO 25 Trunking communications ONLY.

10.23.1.10

Hot Mic Tx Period

This field selects the amount of time that the radio automatically keys up/transmits during "Hot Mic Emergency" operation.

Selects a specific emergency mode transmission operation for the current Trunking Emergency Profile.

Accessed Only: When the Emergency Auto Transmit Mode field is set to **Hot Mic Emergency**, and when the Emergency Operation field is **Alarm and Call**, and when the Revert PTT ID field is **Enabled**, and when the Console Acknowledge Required field is **Disabled**, and when the radio is model/option capable.

IMPORTANT: Older version of the codeplug must use the parameters below:

Table 145: Range

Minimum	Maximum	Increment
10 seconds	120 seconds	10 seconds

IMPORTANT: This applies to the codeplug version 19.00.00 and above:

Table 146: Range

Minimum	Maximum	Increment
1 seconds	120 seconds	10 seconds

10.23.1.11

Silent Audio Tx Period

This field selects the amount of time that the radio automatically keys- up/transmits (with its microphone remaining muted/closed) during **Emergency via Silent Audio** operation.

Selects a specific emergency mode transmission operation for the current Trunking Emergency Profile.

Accessed Only: When the Emergency Auto Transmit Mode field is set to **Emergency via Silent Audio**, and when the Emergency Operation field is **Alarm and Call**, and when the Revert PTT ID field is **Enabled**, and when the Console Acknowledge Required field is **Disabled**, and when the radio is model/option capable.

Table 147: Range

Minimum	Maximum
1 sec	5 sec

10.23.1.12

Emergency Find Me

The Emergency Find Me feature provides an indication that notifies you when someone in your vicinity has an emergency activation.

When this feature is enabled, you can perform the following actions:

- Transmit a Bluetooth Low Energy (BLE) beacon every two seconds while the radio is in the Emergency feature.
- Receive emergency beacons and view the Beacon Received notification.
- Receive an alert tone when any beacon is received in the last ten seconds.
- Enter into menu option to view all the receiving beacons.
- Dismiss the notification to stop receiving the tones and display.

To enable the Emergency Find Me feature, you must enable the **Transmit Enable** and **Receive Enable** fields in the Emergency Find Me section of the Trunking Emergency Profile.

10.23.1.13

Transmit Enable

When this field is enabled, the radio can transmit the Emergency Find Me Beacon during emergency.

Emergency Beacon transmission is triggered through the Emergency feature such as pressing the Emergency switch or button, and Fall Alert (Man Down) Emergency. When you enter emergency, no additional action is required. When the radio enters emergency mode, Bluetooth is automatically turned on, and the beacons are sent. Emergency Beacons are sent every two seconds while the radio is in emergency mode.

For more information on the Emergency Find Me Feature, refer to [Emergency Find Me on page 323](#).

Accessed Only: When the radio is model/option capable.

10.23.1.14

Receive Enable

When this field is enabled, the radio receives the Emergency Find Me Beacon during emergency.

When you change to a channel in which Beacon Receive is enabled, Bluetooth is automatically turned on. When you receive an emergency beacon, the radio plays a tone and displays `Beacon Received` on the Top Display and Front Display Radio Control widget. The radio continues to play a tone every ten seconds while actively receiving beacons.

If the receiver dismisses the notification or if no beacons are received for four minutes, the Beacon Received notification disappears. If multiple beacons are available, the display shows the ID or alias of the device that enters emergency most recently.

For more information on the Emergency Find Me Feature, refer to [Emergency Find Me on page 323](#).

NOTE:

On APX Standard radios with front display, you can use the menu to view the radio ID of the transmitting radio and the Bluetooth Received Signal Strength Indicator (RSSI) level.

On APX NEXT radios, you can dismiss the beacon by tapping **DISMISS** in the notification. You can also view the list of senders by tapping **DETAILS**.

Accessed Only: When the radio is model/option capable.

10.23.1.15

Remote Activation of Emergency

This field selects specific functionality of the Remote Emergency Activation feature for the current Emergency Profile set. This feature will allow a source (encoding) radio to activate the Emergency feature on a target (decoding) radio via over the air communication as if the target user pressed the Emergency button.

This field is only valid when the radio is model or option capable with APCO 25 Conventional and/or APCO 25 Trunking operation.

The following selections are supported:

Disabled

No Remote Emergency Activation functionality is selected.

Encode Only

A radio is only allowed to initiate Remote Emergency communications to a target radio.

Decode Only

A radio is only allowed to receive Remote Emergency communications from a source radio and upon decoding the communications, the radio will immediately launch the Emergency feature.

Encode and Decode

A radio is allowed to both initiate Remote Emergency communications to a target radio and to receive Remote Emergency communications from a source radio.

NOTE: This field is disabled by default.

10.23.2

Emergency Tone List

This section allows you to view or modify Emergency Mode Trigger and Alert Tone features for individual Trunking Emergency Profiles.

NOTE: [Emergency Wide on page 298](#) features and settings apply to these profiles. Emergency Trunking Profiles are selected from the Trunking Personality's Emergency Profile Selection field.

Emergency mode functionality is launched with a programmed radio or by you initiating the feature.

10.23.2.1

Trigger

This field selects the condition/trigger that initiates Emergency Mode in the current Trunking Emergency Profile.

Depending on the selected Emergency Tone type, the Tone Minimum Volume, Tone Period, and Audio Routing may also be configured in the same record/row of the Emergency Tone List.

Accessed Only: When the Man Down Trigger field is not set to **Disabled**, and when the Man-Down Emergency Tone Trigger is set to **Enabled**, and when the radio is model/option capable.

The following selections are supported:

Man-Down

A Man Down condition initiates Emergency Mode in the current Trunking Emergency Profile.

Applies Only: When the Man Down Enable field is **Enabled** in the current Trunking Emergency Profile.

10.23.2.2

Tone

This field selects the type of Alert Tone that sounds once an Emergency Mode transmission has commenced with the corresponding Trigger selection.

This selection applies for the current Trunking Emergency Profile.

Accessed Only: When the Man Down Trigger field is not set to **Disabled**, and when the Man-Down Emergency Tone Trigger is **Enabled**, and when the radio is model/option capable.

Legacy Emergency Tone

The legacy Emergency Alert Tone and audio levels are used.

Critical Emergency Tone

The Critical Emergency Alert Tone sounds. The Tone Minimum Volume, Tone Period, and Audio Routing must also be defined.

10.23.2.3

Tone Minimum Volume

This field selects the minimum audio level for sounding the corresponding Emergency Mode Alert Tone.

If this value is higher than the radio's current volume level, then this value is used; otherwise, the radio's current volume level is used. This feature applies for the current Trunking Emergency Profile.

Accessed Only: When the Tone field is set to **Critical Emergency Tone**, and when the radio is model/option capable.

Table 148: Range

Minimum	Maximum	Increments
0	255	1

10.23.2.4

Tone Period

This field selects whether the specified Emergency Mode Alert Tone will be a temporary tone or a repetitive tone.

You can determine the periodic timer of the repetitive tone.

This feature applies for the current Trunking Emergency Profile.

Accessed Only: When the Tone field is set to **Critical Emergency Tone**, and when the radio is model/option capable.

NOTE: When set to **0 = Once** (Zero Time), the alert tone specified in the Tone field sounds only once while Emergency Mode is active.

Table 149: Range

Minimum	Maximum	Increments
5	255	1

10.23.2.5

Audio Routing

This field selects the routing of the Alert Tone and incoming audio to a specific speaker when an Emergency Mode transmission has commenced with the corresponding Trigger selection.

This selection applies for the current Trunking Emergency Profile.

Accessed Only: When the Tone field is set to **Critical Emergency Tone**, and when the Tone Period field is not set to **Once**, and when the radio is model/option capable.

Normal Audio Routing

The Alert Tone and any incoming audio are routed according to the radio's current speaker audio routing selections.

Internal Speaker Audio Routing

The Alert Tone and any incoming audio are routed to the radio's internal speaker, regardless of any external accessory that may be connected, or the channel's current Speaker Audio Routing selection.

10.23.3

Emergency Compatibility Options

This section is intended for Harris system interoperability.

It allows you to control the cancellation of Emergency Call (by you, console or both) and re-initiate Hot Mic.

NOTE: [Emergency Wide on page 298](#) features and settings apply to these profiles.

Emergency Trunking Profiles are selected from the Trunking Personality's Emergency Profile Selection field.

Emergency mode functionality is launched with a programmed radio or by you initiating the feature.

10.23.3.1

Emergency Exit Control

This field allows configuration in the radio to exit emergency by you, console or both.

The following selections are supported:

Subscriber Only

Default value

Console Only

Selectable if Emergency Operation field is set to **Call Only** or **Emergency Alarm and Call**, on P25 trunking system and Motorola Proprietary Features is disabled.

Both Subscriber and Console

Selectable if Emergency Operation field is set to **Call Only** or **Emergency Alarm and Call**, on P25 trunking system and Motorola Proprietary Features is disabled.

Supervisor

Selectable if Emergency Operation field is set to **Call Only** or **Alarm and Call** on P25 trunking system, Motorola Proprietary Features is disabled and DVRS Profile Selection is **DVRS Disabled**. For Dual Radio, Radio Selection is set to **Standalone Radio** or **Primary Radio**.

Accessed Only: When the radio is model/option capable.

10.23.3.2

Emergency Hot Mic Restart

This field allows hot mic audio to be retransmitted upon emergency button press while in emergency.

Accessed Only: When [Emergency Type on page 306](#) field is set to **Call Only, Alarm and Call**, and when the Emergency Auto Transmit Mode field is set to **Hot Mic Emergency**, and when the System Type field is set to **ASTRO 25**, and when the Motorola Proprietary Features field is disabled, and when the radio is model/option capable.

10.24

Data Wide

This section allows you to view or modify data settings that apply for all Data Profiles.

Data Profiles are defined to communicate radio data over Conventional or Trunking channels, and communicate radio data over an LTE Broadband network.

IMPORTANT:

Data Profiles are selected from the Trunking System Data Profile Selection field, or from the Conventional System Data Profile Selection field.

For Conventional communications, Data Profiles apply only for Conventional Systems that have their System Type field set to **ASTRO**.

For Trunking communications, Data Profiles apply only for Trunking Systems that have their System Type field set to **ASTRO 25**.

10.24.1

General

This section allows you to view or modify data settings that apply for all Data Profiles.

IMPORTANT:

Data Profiles are selected from the Trunking System's Data Profile Selection field, or from the Conventional System's Data Profile Selection field.

For Conventional communications, Data Profiles apply only for Conventional Systems that have their System Type field set to **ASTRO**.

For Trunking communications, Data Profiles apply only for Trunking Systems that have their System Type field set to **ASTRO 25**.

10.24.1.1

SNMP Traps

When this field is selected, it enables Simple Network Management Protocol (SNMP) trap generation over the serial link.

This feature applies for all Data Profiles.

When not selected, the radio does not generate traps unless requested with the trap registration Management Information Base (MIB).

10.24.1.2

Context Deactivation Alert Tone

This field enables the radio to sound an alert tone when a data session has ended.

A data session is considered active once data communications are established. This feature applies for all Data Profiles.

10.24.1.3

ICMP Echo

This field enables the radio to send back an acknowledgement (Ack) when an Internet Control Message Protocol (ICMP) echo request (ping) has been received.

For APX NEXT and APX N70 radios, this feature only applies to LMR data.

This feature applies for all Data Profiles.

10.24.1.4

Peer IP Address Assignment Type 1

This field selects the Internet Protocol (IP) Address assignment method assigned to the Subscriber Unit (SU) end of serial link1.

This feature applies in all cases except Conventional Systems having a selected Data Profile. When a Conventional System has a Data Profile selected, the Conventional System uses the Peer IP Address defined in the Data Profile Peer IP Address field.

NOTE:

When assigning an IP address, ensure that the IP address does not conflict with any other IP address or Subnet used by the radio. External devices such as Wi-Fi, External Data Modem, and Si500 can assign IP Addresses to some interface. If conflicting IP addresses or Subnets are in use, data features can not be guaranteed to work reliably.

169. 254. X. X. Subnet is reserved for Zone to Zone Cloning feature, so any IP address cannot start with 169. 254. X. X. otherwise this field will be invalid.

The following selections are supported:

Dynamic

The radio assigns the Peer IP Address to the Mobile Computer (MC) upon serial link establishment.

Static

The MC inserts an IP Address to use upon serial link establishment. This selection applies only for RS-232/PPP based serial links.

10.24.1.5

Direct TMS Content Display

This field enables the radio to directly access its Text Messaging Service (TMS) Inbox and immediately see the content of the text message without your interaction.

This feature applies for all Data Profiles.

NOTE:

The display's **Unread** icon is removed since the text message's contents are already displayed.

When the radio is in this display state and another incoming text message is received, the display is updated to show the latest incoming message. You still have the ability to navigate to other messages in the radio's Inbox.

This state exits when there is a mode change, when you launch another Menu configuration feature, or when you press the **Home** button or selects the **Exit** soft menu.

When disabled, you must follow the standard TMS procedures for accessing text messages in the radio's Inbox.

10.24.1.6

Internal Radio Subnet

This field allows you to define the internal radio subnet (first three octets) of the Internet Protocol (IP) Address that is used at radio power-up to establish internal communications between the radio and its Option Board.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This selection applies for Broadband communications.

Accessed Only: When the radio is model/option capable.

The following values are supported:

- The three octets of this IP Address Subnet must be in the range of 193.0.0 to 207.255.255 inclusive.
- This IP Address Subnet cannot be equal to the first three octets of any other IP Addresses defined for the radio. Otherwise, the application considers this value invalid.
- This Subnet's Default Value = 199.0.0

10.24.1.7

Sensor Measurement Reporting

This field enables the radio to process Sensor Data messages.

This is required when the radio exchanges Sensor Data information with a Sensor Data Server within a Conventional and Trunking communications infrastructure. This feature applies on a radio-wide basis.

Accessed Only: When the radio is model/option capable.

10.24.1.8

Acknowledged Weapon Fired Event Reporting Enable

This feature enables weapon fired events to be transmitted in the control channel.

Accessed Only: When the radio is model/option capable and Sensor Measurement Reporting field is enabled.

10.24.2

LTE

The Long Term Evolution (LTE) section allows you to view or define LTE functionality.

These settings apply for all **Broadband** Data Profile Type - Data Profiles.

IMPORTANT:

Data Profiles are selected from the Trunking System's Data Profile Selection field, or from the Conventional System's Data Profile Selection field.

For Conventional communications, Data Profiles apply only for Conventional Systems that have their System Type field set to **ASTRO**.

For Trunking communications, Data Profiles apply only for Trunking Systems that have their System Type field set to **ASTRO 25**.

10.24.2.1

LTE Out-Of-Range Threshold Time

This field selects the amount of time that an LTE Broadband signal is lost before determining that the radio is out-of-range of LTE coverage.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This selection applies for all "Broadband" Data Profile Type - Data Profiles. Time is in seconds.

Accessed Only: When the radio is model/option capable.

This selection is only available in Expert View (see Codeplug View).

Table 150: Range

Minimum	Maximum
60 (seconds)	3600 (seconds)

10.24.2.2

Data On Roaming

Data On Roaming allows the user to enable user data (not attach) while roaming.

10.24.2.3

Access Point Name

This field allows you to define recognizable names used by the radio for a Class 3 LTE connection.

WARNING: The value in this field must only be modified by Qualified Service Personnel at the request of the LTE carrier. Improper settings can cause unpredictable results in the radio.

WARNING: This value should only be modified by field technicians at the request of the LTE carrier.

This selection applies for all "Broadband" Data Profile Type - Data Profiles.

Accessed Only: When the radio is model/option capable.

This selection is only available in Expert View (see Codeplug View).

10.24.3

Wi-Fi

This section allows you to view or modify Wi-Fi settings that apply for all Data Profiles.

IMPORTANT:

Data Profiles are selected from the Trunking System's Data Profile Selection field, or from the Conventional System's Data Profile Selection field.

For Conventional communications, Data Profiles apply only for Conventional Systems that have their System Type field set to **ASTRO**.

For Trunking communications, Data Profiles apply only for Trunking Systems that have their System Type field set to **ASTRO 25**.

For security reasons, assigning templates and importing *.csv files are allowed if you enter the correct password(s) of each network entry in the Wi-Fi table. You must also enter the correct password(s) in the Standalone application for Clone/Clone Express and Batch Programming tasks.

10.24.3.1

Wi-Fi Enable

This field specifies whether Wi-Fi is enabled or disabled on the radio.

This feature applies for all Data Profiles.

Accessed Only: When the radio is model/option capable.

10.24.3.2

Allow User Control

This field allows user to control the Wi-Fi.

This feature applies for all Data Profiles.

Accessed Only: When the radio is model/option capable.

10.24.3.3

Network Priority

This field defines the priority of the available Wi-Fi networks.

The lower the number, the higher the priority.

Accessed Only: When the [Wi-Fi Enable on page 331](#) field is **Enabled** and the radio is model/option capable.

Table 151: Range

Minimum	Maximum	Increments
1	255	1

10.24.3.4

Network SSID

This field specifies the network name (SSID) of a Wi-Fi network in the list of configured networks.

NOTE:

The SSID cannot be saved if left blank or empty.

The SSID must be ASCII characters and duplicated SSIDs are not accepted.

Accessed Only: When the [Wi-Fi Enable on page 331](#) field is **Enabled** and the radio is model/option capable.

10.24.3.5

Security Type

This field specifies the security protocol used for the Wi-Fi network.

The following selections are supported:

- **NONE**
- **WEP**
- **WPA2/WPA**

Accessed Only: When the [Wi-Fi Enable on page 331](#) field is **Enabled** and the radio is model/option capable.

10.24.3.6

Encrypted Network Password

The 63-characters password for the Wi-Fi network.

NOTE:

For Security Type **WEP**, the password will be either 5 characters or 13 characters long. For every other type, password will be at least 8 characters and cannot be left blank or null. For all security types, ASCII are allowed.

The Subscriber Unit (SU) supports WEP key configuration in ASCII mode only for the WEP security. Therefore, WEP40 (5-character key such as “abcde”) or WEP104 (13-character key such as “1234567890123”) ASCII configuration are supported in the SU. The SU does not support the WEP Hex key configuration.

Accessed Only: When the [Wi-Fi Enable on page 331](#) field is **Enabled**, the [Security Type on page 331](#) is anything other than **None**, and the radio is model/option capable.

10.24.4

NAT List

This section allows you to view or define up to 16 sets of static port-based Network Address Translation (NAT) rules for the NAT List.

These settings apply for all Trunking - [Data Profiles on page 340](#), or for all Conventional - [Data Profiles on page 340](#) when the Data Profiles, NAT Enable field is **Enabled**.

IMPORTANT:

When any of the 5 following features is enabled, one of the possible 16 NAT rules (record/rows) is used by RadioCentral:

- Text Message Service (TMS)
- Automatic Registration Service (ARS) - see the ARS Mode field
- [Location Enable on page 111](#)
- Over The Air Rekeying (OTAR) - see the OTAR Enable field

Data Profiles are selected from the Trunking System's Data Profile Selection field, or from the Conventional System's Data Profile Selection field.

For Conventional communications, Data Profiles apply only for Conventional Systems that have their System Type field set to **ASTRO**.

For Trunking communications, Data Profiles apply only for Trunking Systems that have their System Type field set to **ASTRO 25**.

10.24.4.1

LAN Port

This field selects the Local Area Network (LAN) Port for the current Network Address Translation (NAT) rule (record/row) of the NAT List.

Example: Static NATing can forward all external requests coming into port 90 of the radio to port 80 of the MC (Mobile Computer). In this example, the static NAT IP Address would be the MC's IP Address, the LAN Port would be the MC's port (80), and the WAN port would be the radio's external port (90).

Applies Only:

- For all Trunking-Data Profiles
- For all Conventional-Data Profiles when the Data Profiles NAT Enable field is **Enabled**.

Accessed Only: When the radio is model/option capable.

Table 152: Range

Minimum	Maximum
1	65535

WARNING: The Default of "0" is considered to be invalid by the Radio Manager and must be properly defined.

10.24.4.2

Static NAT IP Address

This field selects the Network Address Translation (NAT) Local Area Network (LAN) Internet Protocol (IP) address that provides a mapping between internal application or Mobile Computer (MC) IP Addresses and system-assigned IP Addresses.

This selection applies for the current NAT rule (record/row) of the NAT List.

Example: Static NATing can forward all external requests coming into port 90 of the radio to port 80 of the MC. In this example, the static NAT IP Address would be the MC's IP Address, the LAN Port would be the MC's port (80) and the WAN port would be the radio's external port (90).

Applies Only:

- For all Trunking - Data Profiles
- For all Conventional - Data Profiles when the Data Profiles NAT Enable field is **Enabled**

Accessed Only: When the radio is model/option capable.

NOTE: Each Octet of the IP Address must be between: [0-223] . [0-255] . [0-255] . [0-255]

WARNING: The Default of 0 . 0 . 0 . 0 is considered invalid by the Radio Manager and must be properly defined.

10.24.4.3

WAN Port

This field selects the Wide Area Network (WAN) Port for the current Network Address Translation (NAT) rule (record/row) of the NAT List.

Example: Static NATing can forward all external requests coming into port 90 of the radio to port 80 of the mobile computer. In this example, the static NAT IP Address would be the MC's IP Address, the LAN Port would be the MC's port (80), and the WAN port would be the radio's external port (90).

Applies Only:

- For all Trunking - Data Profiles
- For all Conventional - Data Profiles when the Data Profiles NAT Enable field is **Enabled**

Accessed Only: When the radio is model/option capable.

Table 153: Range

Minimum	Maximum
1	65535

WARNING: The Default of "0" is considered to be invalid by the Radio Manager and must be properly defined.

10.24.5

Data Protocol Configuration

This section allows you to view or modify settings related to Internet Protocol (IP) Header Compression Algorithms.

These selections apply for all Data Profiles.

IMPORTANT:

Data Profiles are selected from the Trunking System's Data Profile Selection field, or from the Conventional System's Data Profile Selection field.

For Conventional communications, Data Profiles apply only for Conventional Systems that have their System Type field set to **ASTRO**.

For Trunking communications, Data Profiles apply only for Trunking Systems that have their System Type field set to **ASTRO 25**.

WARNING: These settings should only be modified as necessary by Qualified Service Personnel. Failure to accurately configure the Data Protocol Configuration may seriously degrade the radio and/or system performance.

10.24.5.1

Max # of Non-TCP IP Header Compression Contexts

This field selects the maximum number of non-TCP IP (Transmission Control Protocol - Internet Protocol) header compression contexts allowed per subscriber.

Guidelines are in accordance with document RFC2507 created and maintained by the IETF (Internet Engineering Task Force). The RFC2507 document describes standards for IP Header Compression Algorithms. This selection applies for all Data Profiles.

WARNING: This field should only be modified when deemed necessary by Qualified Service Personnel. Failure to accurately configure the Data Protocol Configuration may seriously degrade the radio and/or system performance.

Table 154: Range

Minimum	Maximum
0	16

10.24.5.2

Max # of Compressed Headers Between Full Headers

This field selects the maximum number of compressed non-TCP IP (Transmission Control Protocol - Internet Protocol) headers sent between full headers.

Guidelines are in accordance with document RFC2507 created and maintained by the IETF (Internet Engineering Task Force). The RFC2507 document describes standards for IP Header Compression Algorithms. This selection applies for all Data Profiles.

WARNING: This field should only be modified when deemed necessary by Qualified Service Personnel. Failure to accurately configure the Data Protocol Configuration may seriously degrade the radio and/or system performance.

Table 155: Range

Minimum	Maximum	Increments
0	4080	16

10.24.5.3

Max Header Size Allowed for Compression

This field selects the maximum header size that may be compressed for header compression.

Guidelines are in accordance with document RFC2507 created and maintained by the IETF (Internet Engineering Task Force). The RFC2507 document describes standards for IP (Internet Protocol) Header Compression Algorithms. This selection applies for all Data Profiles.

WARNING: This field should only be modified when deemed necessary by Qualified Service Personnel. Failure to accurately configure the Data Protocol Configuration may seriously degrade the radio and/or system performance.

Table 156: Range

Minimum	Maximum
60	255

10.24.5.4

Max Time Between Full Headers

This field selects the maximum time between full headers compression contexts.

Compressed non-TCP headers may not be sent after this amount of time has expired after sending the last full header. Guidelines are in accordance with document RFC2507 created and maintained by the IETF (Internet Engineering Task Force). The RFC2507 document describes standards for IP (Internet Protocol) Header Compression Algorithms. This selection applies for all Data Profiles. Time is in seconds.

WARNING: This field should only be modified when deemed necessary by Qualified Service Personnel. Failure to accurately configure the Data Protocol Configuration may seriously degrade the radio and/or system performance.

Table 157: Range

Minimum	Maximum	Increments
0 (seconds)	1275 (seconds)	5 (seconds)

10.24.5.5

Max Setup Time for Controlled Channel Access

This field selects the time required to access the controlled channel access packet data channel for slotted data transmission.

The radio uses this field to determine if packet data channel access timing can delay the transmission past the required slot. If so, controlled channel access procedures are not initiated. This selection applies for all Data Profiles. Time is in milliseconds.

WARNING: This field should only be modified when deemed necessary by Qualified Service Personnel. Failure to accurately configure the Data Protocol Configuration may seriously degrade the radio and/or system performance.

Table 158: Range

Minimum	Maximum
0 (ms)	65535 (ms)

10.24.5.6

Time Source Variation

This field selects the amount of time (microslots) before and after microslot zero during which the two clock sources that generate sync broadcast time are misaligned.

This entire time period is considered a vulnerability window during which sync broadcasts may contain faulty or misleading information. All sync broadcasts received during this period are ignored by the DSP (Digital Signal Processor) and are not used to establish or maintain synchronization with the system time. This selection applies for all Data Profiles.

WARNING: This field should only be modified when deemed necessary by Qualified Service Personnel. Failure to accurately configure the Data Protocol Configuration may seriously degrade the radio and/or system performance.

Table 159: Range

Minimum	Maximum	Increments
0 (microslots)	268 (microslots)	2 (microslots)

NOTE: One microslot is equal to 7.5 milliseconds.

10.24.6

Port Configuration

This section you to view or define settings used in transferring Keys between a Key Variable Loader (KVL) and a radio. These settings apply for all Data Profiles.

IMPORTANT:

Data Profiles are selected from the Trunking System's Data Profile Selection field, or from the Conventional System's Data Profile Selection field.

For Trunking communications, Data Profiles apply only for Trunking Systems that have their System Type field set to **ASTRO 25**.

10.24.6.1

Authentication UDP Port

This field selects the User Datagram Protocol (UDP) port number for the port used to communicate with the Key Variable Loader (KVL).

A KVL is used for supplying Authentication Keys to the radio. This feature applies for APCO P25 (ASTRO 25) Trunking Systems.

Accessed Only: When the radio is model/option capable.

Table 160: Range

Minimum	Maximum
49152	65535

10.24.6.2

P25 Location Reporting UDP Port

This field selects the User Datagram Protocol (UDP) port number for the Location Server to which the radio listens to and transmits P25 Location Reporting data.

This feature applies for ASTRO 25 (APCO P25) Trunking Systems.

WARNING: This selection is only valid when it is not equal to the value of the Authentication UDP Port, LAN Port, WAN Port, PAD Destination Port, Subscriber OTAR Port, KMF UDP Port, or the KMF/OTAR Server Port (64414) and when it is not equal to the reserved UDP Port values used by any other Service, as follows:

- 0161 SNMP Agent Application – GET/SET
- 0162 SNMP Agent – Traps reported
- 4000 UDP Loopback Port (for internal tests)
- 4001 Position Services Application within the Global Core Platform
- 4002 Diagnostics Application – expected to handle diagnostics delivered from internal radio components to a Mobile Computer.
- 4003 System Application – offers services for accessing internal resources of the subscriber unit such as keys, displays, communications, etc.
- 4004 A "proxy" port number that the System Application starts on behalf of a third-party application running on a non-IP capable peripheral device.
- 4005 PN Server (ARS)
- 4006 Dynamic Host Configuration Protocol (DHCP) Server
- 4007 APCO Text Messaging Service
- 4011 UDP Diagnostic Request Reply
- 4012 UDP Diagnostic Broadcast
- 4050 OTAR Application
- 49223 Send/Receive User Authentication messages

Accessed Only: When the Location Enable field is enabled, the P25 Location Reporting field is enabled, and the radio is model/option capable.

Table 161: Range

Minimum	Maximum
1	65535

10.24.6.3

Sensor Measurement Reporting UDP Port

This field selects the User Datagram Protocol (UDP) port number for the Sensor Data Server to which the radio listens and transmits Sensor Reporting data.

This field applies to both Conventional and Trunking communications infrastructure.

NOTE:

This field will be applicable when [Sensor Measurement Reporting on page 329](#) is enabled.

The Sensor Management Reporting UDP Port value should not be equal to the value of any of these fields (RadioCentral configurable): LAN Port, WAN Port, Authentication UDP Port, P25 Location Reporting UDP Port, Wireless Programming TCP Port, Port Number, Subscriber OTAR Port, KMF UDP Port, and PAD Destination Port.

Table 162: Range

Minimum	Maximum
49625	65535

Accessed Only: When the radio is model/option capable, and when the Sensor Measurement Reporting field is enabled.

10.24.6.4

KVL Keyloading UDP Port

This field allows you to enter the User Datagram Protocol (UDP) port number for the Key-Variable Loader (KVL) Keyloading.

WARNING: The KVL Keyloading UDP Port value must not be equal to any of the following fields:

- [LAN Port on page 332](#)
- [WAN Port on page 333](#)
- [Authentication UDP Port on page 336](#)
- [P25 Location Reporting UDP Port on page 336](#)
- [Wireless Programming TCP Port](#)
- [Port Number on page 363](#)
- [Subscriber OTAR Port on page 296](#)
- [KMF UDP Port on page 296](#)
- [PAD Destination Port on page 351](#)
- [Sensor Measurement Reporting UDP Port on page 337](#)

Table 163: Range

Minimum	Maximum	Increment
49152	65535	1

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Software**, and when the [Keyloading Source on page 273](#) is set to **KVL**, and when the radio is model/option capable.

10.25

Data User List

This section you to view or define Automatic Registration Service and for User Authentication Usernames and Unit IDs to be selected for use when alternate-server login credentials are needed.

Additionally, targeted radio Radio IDs (see Conventional System - ASTRO - Individual IDs, and the Trunking System - ASTRO 25 - Unit IDs) can also be defined for selection. These Usernames and Unit IDs and Radio IDs are used for data-related applications such as Text Messaging.

NOTE:

Default Usernames and Unit ID values can be programmed.

Data Profiles may be selected from the Trunking System's Data Profile Selection field.

Data Profiles may be selected from the Conventional System's Data Profile Selection field.

The User button-press and the User menu-selection allow you to login to a specific Automatic Registration Service server or a User Authentication UNS (Unified Network Services) server with the appropriate Usernames, PIN/Password, and User Login Unit ID combination. Usernames, PINs and Unit IDs may also be manually entered from the radio's keypad.

10.25.1

Data User Name

This field allows you to view or define Automatic Registration Service and for User Authentication Usernames and Unit IDs to be selected for use when alternate server login credentials are needed.

Additionally, targeted radio Radio IDs (see Conventional System - ASTRO - Individual IDs, and the Trunking System - ASTRO 25 - Unit IDs) can also be defined for selection. These Usernames, Unit IDs, and Radio IDs are used for data-related applications such as Text Messaging.

NOTE:

Default Usernames and Unit ID values can be programmed.

Data Profiles may be selected from the Trunking System's Data Profile Selection field.

Data Profiles may be selected from the Conventional System's Data Profile Selection field.

The User button-press and the User menu-selection allows you to login to a specific Automatic Registration Service server or a User Authentication UNS (Unified Network Services) server with the appropriate Usernames, PIN/Password, and User Login Unit ID combination. Usernames, PINs and Unit IDs may also be manually entered from the radio's keypad.

Accessed Only: When the radio is model/option capable.

NOTE:

Examples: EMT-001, #500, DATAUSER 1, # A5

A to Z, a to z, 0 to 9, -, *, #, &, \$, /, +, % and spaces can be used for Usernames.

Up to 40 characters are possible.

Minimum number of List entries is 1, to a Maximum of 100.

10.26

Quick Text Message List Set

The **Quick Text Message List** set allows the user to view or define Quick Text / Query Messages that contain frequently needed Text Message Service content. The radio-user is then able to select from the list of Quick Text / Query Messages and easily transmit a message with minimal effort. Once selected, a Quick Text / Query Messages may be edited by the radio-user prior to transmission (provided the Text Messaging Service is set to **Unlimited**). Edits apply only for that transmission. The original remains as defined in the Quick Text Message List. A TMS (Text Messaging Service) Query allows the radio-user to specify information in a pre-formatted query template and send this as a Message to a Query Server; the Server then responds with a text message containing the requested information.

Accessed Only: When the TMS Query Service is only available with Single Factor or Two Factor User Authentication and SmartMessaging Mode is set to **LMR**.

NOTE:

The TMS feature is enabled on a per Trunking System or Conventional System basis.

Text Messaging is accessed by the radio-user with the Text Messaging Service button-press, or the Text Messaging Service menu-selection.

The TMS Quick Text and TMS Query button-press allows for direct radio-user access to the Quick Text and the Query Message features.

The following field is supported:

10.26.1

Quick Text Message

This field allows you to view or define Quick Text/Query Messages that contain frequently needed Text Message Service content.

You are then able to select from the list of Quick Text/Query Messages and easily transmit a message with minimal effort.

Once selected, you may edit a Quick Text/Query Messages prior to transmission (provided the Text Messaging Service is set to **Unlimited**). Edits apply only for that transmission. The original remains as defined. A TMS Query allows you to specify information in a pre-formatted query template and send this as a Message to a Query Server. The Server then responds with a text message containing the requested information.

Accessed Only: When the radio is model/option capable and when the TMS Query Service is only available with Single Factor or Two Factor User Authentication.

NOTE:

The Text Messaging Service feature is enabled on a per [Trunking System](#) or [Conventional System on page 375](#) basis.

You can access Text Messaging with the [Text Messaging Service](#) button-press, or the [Text Messaging Service on page 202](#) menu-selection.

The [TMS Quick Text on page 176](#) and [TMS Query on page 176](#) button-press allows you to directly access to the Quick Text and the Query Message features. Default Usernames and Unit ID values can be programmed.

10.27

Data Profiles

The **Data Profiles** allows you to define individual data profiles for different types and requirements of data communications.

Ultimately, Data Profiles are defined to communicate radio data over Conventional or Trunking channels, and/or communicate radio data over an LTE Broadband network.

IMPORTANT:

Data Wide Features and Selections can apply to all Data Profiles.

Depending on the Data Profile Type selection, Data Profiles are selected from the Trunking System's Data Profile Selection field and/or from the Conventional System's Data Profile Selection field.

For Conventional communications, Data Profiles apply only for Conventional Systems that have their System Type field set to **ASTRO**.

For Trunking communications, Data Profiles apply only for Trunking Systems that have their System Type field set to **ASTRO 25**.

10.27.1

General

This section allows you to view or modify data settings for individual Data Profiles.

NOTE:

Data Profiles are selected from the Trunking System's Data Profile Selection field, or from the Conventional System's Data Profile Selection field.

For Conventional communications, Data Profiles apply only for Conventional Systems that have their System Type field set to **ASTRO**.

For Trunking communications, Data Profiles apply only for Trunking Systems that have their System Type field set to **ASTRO 25**.

10.27.1.1

Data Profile Name

This field allows you to create a recognizable name for the current Data Profile.

Data Profiles are selected from the Trunking System's Data Profile Selection field, or from the Conventional System's Data Profile Selection field.

The following selections are available:

- Characters, numbers, spaces, and special characters can be used.
- Up to 14 characters are possible.
- **Examples:** EMT-001, #500, Electric1, # A5
- See also: Name Field Data Validation.

10.27.1.2

Data Profile Type

This field selects the radio data communications capabilities for the current Data Profile.

Data Profiles are selected from the Trunking System's Data Profile Selection field, or from the Conventional System's Data Profile Selection field.

Accessed Only: When the radio is model/option capable.

The following selections are available:

Conventional

The radio sends and receives data (and voice) only over an ASTRO Conventional FNE (Fixed Network Equipment) System.

Trunking

The radio sends and receives data (and voice) only over an ASTRO 25 Trunking IV&D (Integrated Voice & Data) System.

Broadband-Only

The radio sends and receives data only over an LTE Broadband data network (voice operations continue over the ASTRO Conventional or ASTRO 25 Trunking System).

Conventional & Broadband

The radio can send and receive data over an ASTRO Conventional FNE system or an LTE Broadband data network (voice operations continue over the ASTRO Conventional FNE System). When both systems/networks are available for data transmissions, the LTE network is given priority.

WARNING: When selected, the Packet Data Mode field must be set to "FNE".

Trunking & Broadband

The radio can send and receive data over an ASTRO 25 Trunking IV&D System or an LTE Broadband data network (voice operations continue over the ASTRO 25 Trunking System). When both systems/networks are available for data transmissions, the LTE network is given priority.

10.27.1.3

Queue Dwell Timer

This field selects the amount of time an IP (Internet Protocol) datagram stays in the radio's queue.

This setting determines how long data is allowed to wait in the radio without being transmitted before the data is purged from the queue. When data is sent from the Mobile Computer (MC) to the radio, the radio sometimes receives the data faster than it can send it, and the data must then wait in the radio's queue. This selection applies for the current Data Profile. Time is in seconds.

Accessed Only: When the [Data Profile Type on page 341](#) field is not set to **Broadband-Only** and the radio is model/option capable.

Table 164: Range

Minimum	Maximum
15 seconds	120 seconds

10.27.1.4

Rx Voice Interrupts Data

This field enables a received (Rx) voice transmission to interrupt a data communication.

Data communications are interrupted whenever an appropriate incoming voice transmission is sensed by the radio. This feature applies for the current Trunking - Data Profiles.

Accessed Only: When the [Data Profile Type on page 341](#) is set to **Trunking** or **Trunking & Broadband** and the radio is model/option capable.

IMPORTANT: If the radio is in Priority Monitor Scan (see Scan Type), only the selected talkgroup voice activity interrupts a data communication.

10.27.1.5

Priority Scan RX Voice Interrupts Data

This field enables a received (Rx) voice transmission to interrupt a data communication when radio is in priority monitor scan and receiving the priority member activity.

Accessed Only: When the [Data Profile Type on page 341](#) is set to **Trunking** or **Trunking & Broadband** and [Rx Voice Interrupts Data on page 342](#) is enabled.

10.27.1.6

Limited Broadcast

This field enables the radio to route limited broadcast datagrams from the Mobile Computer (MC) over the air.

The feature applies for the current Data Profile.

When disabled, limited broadcast datagrams from the MC are blocked from being sent over the air.

Accessed Only: When the [Data Profile Type on page 341](#) field is not set to **Broadband-only** and when the radio is model/option capable.

10.27.1.7

Intersystem Data

This field enables a radio to automatically attempt context activation while roaming on a foreign Trunking System.

Facilitates access to data services (such as Location and OTAR) on that system (see also Inter-WACN Roaming). Applies only to ISSI 8000-connected ASTRO 25 systems that operate within a combined (foreign + home system) Customer Enterprise Network (CEN). Selection applies for the current Trunking - Data Profile.

IMPORTANT: If context activation succeeds on the foreign Trunking System, the radio can typically access all available data services on that system. It does not respond to system-wide data broadcasts.

Accessed Only: When the [Data Profile Type on page 341](#) field is set to **Trunking** or **Trunking & Broadband** and the radio is model/option capable.

10.27.1.8

Random Holdoff Time

This field enables the radio to calculate a random hold off value between 0 (zero) and the Context Activation Hold Off Time that is used during system context activation.

This feature applies only for the current Trunking - Data Profile. When disabled, the Context Activation Hold Off Time value is used.

Accessed Only: When the [Data Profile Type on page 341](#) is set to **Trunking** or **Trunking & Broadband**.

10.27.1.9

Context Activation Holdoff Time

This field selects the maximum amount of time that the radio may hold off attempts at system context activation.

The timer starts following the first rejected context activation request. The Random Hold Off Time field may further define how this value is used. The Context Activation Holdoff Mode selection may further determine when this value is used. This selection applies only for the current Trunking - Data Profile. Time is in minutes.

Accessed Only: When the [Data Profile Type on page 341](#) is set to **Trunking** or **Trunking & Broadband**.

Table 165: Range

Disabled	Minimum	Maximum
0 - Disabled	1 min	60 min

10.27.1.10

Packet Data Registration Version

This field selects between two Sub Network Dependent Convergence Protocol (SNDCP) versions for slotted data.

This selection applies only for the current Trunking - Data Profile.

Accessed Only: When the [Data Profile Type on page 341](#) is set to **Trunking** or **Trunking & Broadband**.

The following selections are available:

SNDCPv1

SNDCP Version 1 allows for packet data registration messages to be exchanged with a pre-7.3 ASTRO 25 system. This selection is invalid if the following scenario is true: Data Profile Type is set to **Trunking** or **Trunking & Broadband** and the Enhanced Data - Port List Selection is not **Disabled**.

SNDCPv3

SNDCP Version 3 allows for packet data registration messages to be exchanged with an ASTRO 25 7.3 system or later.

10.27.1.11

IP Header Compression Enable

This field enables the radio to provide a more efficient transfer of messages by reducing a relatively large number of active data users per packet data channel.

Excess UDP (User Datagram Protocol)/IP (Internet Protocol) headers are compressed before transmission to their destination. This selection applies only for the current Trunking - Data Profile.

WARNING: This feature is not compatible with Secure/Clear Strapping being set to **Secure**.

Accessed Only: When the [Data Profile Type on page 341](#) field is set to **Trunking** or **Trunking & Broadband**, and when the [Packet Data Registration Version on page 343](#) field is set to **SNDCPv3**.

10.27.2

Features

This section allows you to view or modify data settings for individual Data Profiles.

NOTE:

Data Profiles are selected from the Trunking System's Data Profile Selection field, or from the Conventional System's Data Profile Selection field.

For Conventional communications, Data Profiles apply only for Conventional Systems that have their System Type field set to **ASTRO**.

For Trunking communications, Data Profiles apply only for Trunking Systems that have their System Type field set to **ASTRO 25**.

10.27.2.1

Terminal Data

This field enables the Mobile Computer (MC) to transmit or receive packet data over-the-air.

This feature applies for the current Data Profile.

When disabled, the MC is still able to communicate with radio internal data applications; radio internal data applications can still communicate over-the-air.

Accessed Only: When the radio is model/option capable.

10.27.2.2

Context Activation Holdoff Mode

This field selects the conditions as to when the Context Activation Hold Off Time is used by the radio.

The timer and this selected Holdoff Mode limit radio requests for system context activation. The Random Hold Off Time field setting determines how the Context Activation Holdoff Time is used for the current Trunking System. This selection applies for the current Data Profile.

The following selections are available:

Holdoff Always

The radio uses the Context Activation Hold Off Time: failed attempt at initial System Context Activation, context has failed, or loss of context due to a context deactivation command received by the system and reactivation is needed.

Holdoff Upon Failure

The radio uses the Context Activation Hold Off Time only once System Context Activation has failed.

10.27.2.3

Retry Long Timer

This field selects the amount of time that the radio waits after all registration retries to the Automatic Registration Server fail.

There are a total of five registration tries hard-coded (not modifiable) in the radio, one initial try and four retries. The timer begins after the fourth retry is transmitted. This selection applies for the current Data Profile.

Accessed Only: When the radio is model/option capable.

The following selections are available:

NOTE: When set to **0-Disabled**, the radio no longer waters for ARS Server registration to occur - 0 (zero minutes)

Table 166: Range

Minimum	Maximum	Increments
5 (minutes)	300 (minutes)	1 (minute)

Table 167: Range

Disabled	Minimum	Maximum
4 - Disabled	5 minutes	300 minutes

10.27.2.4

Retry Short Timer

This field selects the amount of time between the Retry Number of Attempts.

Retries are sometimes needed for certain data application procedures. This selection applies for the current Data Profile.

Accessed Only: When the radio is model/option capable.

Table 168: Range

Minimum	Maximum	Increments
5 seconds	90 seconds	5 seconds

10.27.2.5

Retry Number of Attempts

This field selects the number of attempts that the radio pursues (until successful) for certain data application procedures.

The amount of time that the radio waits between these attempts is determined by the [Retry Short Timer on page 345](#) field. This selection applies for the current Data Profile.

Accessed Only: When the radio is model/option capable.

Table 169: Range

Minimum	Maximum
1	10

10.27.2.6

ARS Mode

This field selects the Automatic Registration Service (ARS) mode for the current Data Profile.

Accessed Only: When the radio is model/option capable.

The following selections are available:

Disabled

ARS mode is disabled.

Server

Use this setting when an ARS is being utilized in the system. This selection is applicable to both a legacy ARS Presence Notification (PN) server and a User Authentication server.

Non-Server

Use this setting when name resolution services are required and an ARS is not available. This selection is only valid: When the Data Profile Type is **Conventional** or **Conventional & Broadband**, and when the Packet Data Mode field is not set to **FNE**.

Enhanced Server

Enables the enhanced ARS registration that is only supported by UNS software version 5.1 or above.

10.27.2.7

Automatic Registration Server Address

This field allows you to define the IP (Internet Protocol) address of the Automatic Registration Server (ARS) for the current Data Profile.

Accessed Only: When the [ARS Mode on page 346](#) field is set to **Server** and the radio is model/option capable.

Selections are valid when the following is true:

- The four octets must be in the range: [1-223] . [0-255] . [0-255] . [0-255]
- IP Address cannot be the Limited Broadcast Address: 255 . 255 . 255 . 255

And, IP Address must be a valid Class A, B, or C address:

- The IP Address is considered Class A when octet 1 is between 0-127; the Network ID is then this first octet:
 - When the IP Address is Class A, then the IP Address can be 1 . 0 . 0 . 1 to 126 . 255 . 255 . 254
 - When the IP Address is Class A, then the IP Address cannot be 0 . xxx . xxx . xxx or xxx . 255 . 255 . 255 or xxx . 0 . 0 . 0 or 127 . xxx . xxx . xxx
- The IP Address is considered Class B when octet 1 is between 128-191; the Network ID is then the first 2 octets:
 - when the IP Address is Class B, then the IP Address can be 128 . 1 . 0 . 1 to 191 . 255 . 255 . 254

- when the IP Address is Class B, then the IP Address cannot be 128.0.xxx.xxx or xxx.xxx.255.255 or xxx.xxx.0.0
- **The IP Address is considered Class C when octet 1 is between 192 -223; the Network ID is then the first 3 octets:**
 - when the IP Address is Class C, then the IP Address can be 192.0.1.1 to 223.255.255.254
 - when the IP Address is Class C, then the IP Address cannot be 192.0.0.xxx or xxx.xxx.xxx.255 or xxx.xxx.xxx.0

10.27.2.8

Direct Location Registration

This field enables the radio to directly register on a Location Server that supports the P25 (Project 25) Location Reporting data format (see also P25 Location Reporting).

The radio notifies the Location Server through an LRRP (Location Request/Response Protocol) message about its availability and then registers on the Server. This feature applies for the current Data Profile.

Accessed Only: When the Location Enable field is enabled, the P25 Location Reporting field is enabled, the [ARS Mode on page 346](#) field is not set to **Server**, and the radio is model/option capable.

10.27.2.9

Location Server IP Address

This field allows you to define the IP (Internet Protocol) Address of the Location Server to which the radio will directly register when an ARS (Automatic Registration Server) or UNS (Unified Network Services) server is unavailable (see also Direct Location Registration).

This feature applies for the current Data Profile.

NOTE:

When assigning an IP address, ensure that the IP address does not conflict with any other IP address or Subnet used by the radio. External devices such as Wi-Fi, External Data Modem, and Si500 can assign IP Addresses to some interface. If conflicting IP addresses or Subnets are in use, data features can not be guaranteed to work reliably.

169. 254. X. X. Subnet is reserved for Zone to Zone Cloning, so any IP address cannot start with 169. 254. X. X otherwise this field will be invalid.

Accessed Only: When the following fields are enabled: Location Enable, P25 Location Reporting, and Direct Location Registration. The [ARS Mode on page 346](#) field is not set to **Server**. The radio is model/option capable.

Selections are valid when the following is true:

- The four octets must be in the range: [1-223] . [0-255] . [0-255] . [0-255], and
- this IP Address cannot be the Limited Broadcast Address: 255.255.255.255

And, this IP Address:

- Cannot be completely equal to the Subscriber IP Address 1, and
- Cannot be completely equal to the Subscriber IP Address, and
- Cannot be equal to the Subscriber Air-Interface IP Address, and
- Cannot be equal to the Bluetooth Subscriber IP Address, or the Bluetooth Subscriber IP Address, and
- Cannot be equal to the Bluetooth PAN Network Base Address, and
- Cannot be completely equal to the Internal Radio Subnet on any Data Profile.

- Cannot be equal to the Serial Link IP Address 1 and Serial Link IP Address 2

And, the IP Address must be a valid Class A, B, or C address:

- **The IP Address is considered Class A when octet 1 is between 0-127; the Network ID is then this first octet:**
 - when the IP Address is Class A, then the IP Address can be 1.0.0.1 to 126.255.255.254
 - when the IP Address is Class A, then the IP Address cannot be 0.xxx.xxx.xxx or xxx.255.255.255 or xxx.0.0.0 or 127.xxx.xxx.xxx
- **The IP Address is considered Class B when octet 1 is between 128-191; the Network ID is then the first 2 octets:**
 - when the IP Address is Class B, then the IP Address can be 128.1.0.1 to 191.255.255.254
 - when the IP Address is Class B, then the IP Address cannot be 128.0.xxx.xxx or xxx.xxx.255.255 or xxx.xxx.0.0
- The IP Address is considered Class C when octet 1 is between 192 -223; the Network ID is then the first 3 octets:
 - when the IP Address is Class C, then the IP Address can be 192.0.1.1 to 223.255.255.254
 - when the IP Address is Class C, then the IP Address cannot be 192.0.0.xxx or xxx.xxx.xxx.255 or xxx.xxx.xxx.0

10.27.2.10

PAD Mode

This field selects the mode of operation for Protocol Assembler/Disassembler (PAD) application.

The [PAD Destination Address on page 350](#) and the [PAD Destination Port on page 351](#) must be defined whenever this field is not **Disabled**. This selection applies for the current Data Profile.

WARNING: When the [Data Profile Type on page 341](#) is **Broadband-Only** or **Conventional & Broadband** or **Trunking & Broadband**, this field must be set to **Disabled**. Otherwise, the application considers it to be invalid.

The following selections are supported:

Disabled

PAD Mode is not used.

Continuous

Used for devices/applications that need to transmit packet data of certain fixed length every time.

Sentence

Used for sending packet data based on certain start and stop characters (like a sentence in GPS data). The PAD Start Sequence and the PAD Stop Sequence must be defined.

Immediate

A raw data transfer where all the data (regardless of the size) is transmitted as is.

10.27.2.11

PAD Start Sequence

This field allows you to enter the Start Sequence for the **Sentence** Protocol Assembler/Disassembler (PAD) Mode.

This entry is used by the Networking PAD Application to detect the Start of the 'Sentence' in the Data by matching up this sequence of byte values. The Start and [PAD Stop Sequence on page 349](#) must both be defined for the "Sentence" PAD Mode. This selection applies for the current Data Profile.

Accessed Only: When the [PAD Mode on page 348](#) field is set to **Sentence**.

The following selections are supported:

- Entries must be hexadecimal, (0 thru 9 and A thru F)
- Entries must be an even number of characters
- Entries must be:
 - a minimum of 2 characters
 - a maximum of 18 characters

10.27.2.12

PAD Stop Sequence

This field allows you to enter the Stop Sequence for the **Sentence** Protocol Assembler/Disassembler (PAD) Mode.

This entry is used by the Networking PAD Application to detect the Stop of the 'Sentence' in the Data by matching up this sequence of byte values. The [PAD Start Sequence on page 348](#) and Stop Sequence must both be defined for the "Sentence" PAD Mode. This selection applies for the current Data Profile.

Accessed Only: When the [PAD Mode on page 348](#) field is set to **Sentence**.

The following selections are supported:

- Entries must be hexadecimal, (0 thru 9 and A thru F)
- Entries must be an even number of characters
- Entries must be:
 - a minimum of 2 characters
 - a maximum of 18 characters

10.27.2.13

PAD Escape Sequence

This field allows you to enter the Escape Sequence for the **Sentence** Protocol Assembler/Disassembler (PAD) Mode.

This optional byte sequence is used to 'escape' or bypass the detection of any Start and the Stop Sequences should they occur as part of regular data, so that they are not mistaken as Sentence Start or Stop. This selection applies for the current Data Profile.

Accessed Only: When the [PAD Mode on page 348](#) field is set to **Sentence**.

The following selections are supported:

- Entries must be hexadecimal, (0 thru 9 and A thru F)
- Entries must be an even number of characters
- Entries must be between:
 - a minimum of 0 characters
 - a maximum of 10 characters

10.27.2.14

PAD Receive Idle TimeOut

This field selects the timeout value used in the **Continuous** and **Sentence** Protocol Assembler/Disassembler (PAD) Modes .

In **Continuous PAD Mode on page 348**, this timeout is used to trigger the transmission of the data collected by the PAD Application even though it has not reached the Maximum buffer threshold. This selection applies for the current Data Profile. Time is in milliseconds.

Accessed Only: When the **PAD Mode on page 348** field is set to **Sentence** or **Continuous**.

Table 170: Range

Minimum	Maximum
0 (ms) (0 = Disabled)	15000 (ms)

10.27.2.15

PAD Transmission Inhibit Value

This field selects the amount of time that a data chunk transmission (sent from the Protocol Assembler/Disassembler (PAD) Application) is delayed from the previous data chunk transmission, evenly spacing these transmissions (flow control).

Therefore, the PAD application can only send (at most) one data chunk within this amount of time. This amount of time is used to delay transmissions in all PAD Modes. This selection applies for the current Data Profile.

Accessed Only: When the **PAD Mode on page 348** field is not set to **Disabled**.

Table 171: Range

Minimum	Maximum
0 (ms) (0=Disabled)	15000 (ms)

10.27.2.16

Maximum Buffer Threshold

This field selects the maximum buffer threshold (in bytes) that is used to trigger transmissions in the "Continuous" PAD Mode.

This selection represents the length of data collected in the "Continuous" PAD Mode before the data is sent out. As soon as this buffered data threshold is reached, the PAD application sends the buffer (only applicable in Continuous Mode). This selection applies for the current Data Profile.

Accessed Only: When the **PAD Mode on page 348** field is set to **Sentence** or **Continuous**.

Table 172: Range

Minimum	Maximum
1 byte	3000 bytes

10.27.2.17

PAD Destination Address

This field allows you to enter the IP Destination Address (remote end) for the PAD (Protocol Assembler/Disassembler) application.

This entry represents the address part in the address-port combination that makes up the destination (remote end) for the data packets generated by the PAD application. This selection applies for the current Data Profile.

Accessed Only: When the [PAD Mode on page 348](#) field is not set to **Disabled**.

NOTE:

The IP address can be any valid address entered in dotted decimal format.

10.27.2.18

PAD Destination Port

This field allows you to enter the IP Destination Port (remote end) for the PAD (Protocol Assembler/Disassembler) application.

This entry represents the port part in the address-port combination that makes up the destination (remote end) for the data packets generated by the PAD application. This selection applies for the current Data Profile.

Accessed Only: When the [PAD Mode on page 348](#) field is not set to **Disabled**.

Table 173: Range

Minimum	Maximum
1	65535

IMPORTANT: The Default Value of "0" is an invalid entry. When this field is applicable, the value must be changed to a valid entry.

10.27.3

Trunking Group ID

This section allows you to view or modify ASTRO 25 Common Air Interface (CAI) Data Group IDs 1 through 8.

These Group IDs are used for address decoding pertaining only to receiving data.

NOTE: Data Groups allow the radio to receive group data messages sent to these Data Group IDs, and to receive broadcast packets sent to the radio's ALL CALL ID (IP = 255.255.255.255). These selections apply only for the current Trunking - Data Profile.

IMPORTANT:

Trunking Data Profiles are selected from the Trunking System's Data Profile Selection field.

For Trunking communications, Data Profiles apply only for Trunking Systems that have their System Type field set to **ASTRO 25**.

10.27.3.1

ASTRO 25 Data Group ID

This field selects (in decimal or hex format) the ASTRO 25 Common Air Interface (CAI) Data Group ID for the current record/row (1 through 8).

This Group ID is used for address decoding pertaining only to receiving data. Data Groups allow the radio to receive group data messages sent to these Data Group IDs and to receive broadcast packets sent to the radio's ALL CALL ID (IP = 255.255.255.255). This selection applies only for the current Trunking - Data Profile.

IMPORTANT: 6777215 (0xFFFFFFF Hex) is the ALL CALL ID; this ID may not be entered because it already exists in the radio.

Accessed Only: When the [Data Profile Type on page 341](#) is set to **Trunking** or **Trunking & Broadband**.

Table 174: Range

Minimum	Maximum
10000000 (989680 Hex)	16777214 (FFFFFE Hex)

10.27.4

Broadband

This section allows you to view or define LTE (Long Term Evolution) functionality. These settings apply only to individual Data Profiles.

IMPORTANT:

Data Profiles are selected from the Trunking System's Data Profile Selection field.

For Trunking communications, Data Profiles apply only for Trunking Systems that have their System Type field set to **ASTRO 25**.

LTE Broadband is another wireless data infrastructure solution for Land Mobile Radio (LMR) data applications and services. The LTE Broadband feature can greatly increase data capacity and data speed for wireless application to radio Over The Air Programming (OTAP). LTE Broadband can also apply for Data Applications and Data Services such as Text Messaging Service (TMS), GPS Location, Automatic Registration Service (ARS), and Over-The-Air-Rekeying (OTAR). Broadband interfaces with standard cell phone infrastructure to provide wireless, high-speed, IP address-based connections. Secure encryption for radio broadband data is accomplished with the programmed Virtual Private Network (VPN) technologies. Radio voice communications are not possible with LTE Broadband; therefore, digital voice communications do continue over the ASTRO Conventional or ASTRO 25 Trunking Land Mobile Radio (LMR) infrastructure.

WARNING: LTE-capable radios do not support COTS (commercial-off-the-shelf) Bluetooth devices. However, the Low Frequency Motorola Proprietary Pairing (LF MPP) Bluetooth Pairing Type is possible on LTE Broadband enabled channels.

NOTE: LTE is currently only available for APX 7000L portable radios.

10.27.4.1

LTE Enable

Enables LTE (Long Term Evolution) Broadband data operation for the current Data Profile.

WARNING: When the [Data Profile Type on page 341](#) field is set to **Conventional & Broadband, Trunking & Broadband**, or **Broadband-Only**, this field must be **Enabled**. Otherwise, the RadioCentral considers this selection to be invalid.

Accessed Only: When the [Data Profile Type on page 341](#) field is set to either **Broadband-Only** or **Conventional & Broadband** or **Trunking & Broadband** and the radio is model/option capable.

10.27.4.2

SmartConnect Gateway Hostname

SmartConnect Gateway Hostname defines the location of the SmartConnect Gateway in the form of a fully qualified domain hostname (FQDN).

The maximum number of ASCII characters is 63.

Accessed Only: When the radio is model/option capable.

10.27.4.3

SmartConnect Gateway TLS Port Number

This field allows you to select the TLS port number used for the SmartConnect feature.

The SmartConnect Gateway TLS Port Number should be unique to any other configurable port in the application.

Table 175: Range

Default	Minimum	Maximum	Increments
49665	1	65535	1

Accessed Only: When the radio is model/option capable.

10.27.5

Network Layer Security

This section allows you to view or modify the data settings for secure encrypted data communications, and for secure-encrypted data communications with a Virtual Private Network (VPN).

See also [LTE Broadband Feature](#).

These settings apply for individual Data Profiles.

NOTE:

Data Profiles are selected from the Trunking System's Data Profile Selection field, or from the Conventional System's Data Profile Selection field.

For Conventional communications, Data Profiles apply only for Conventional Systems that have their System Type field set to **ASTRO**.

For Trunking communications, Data Profiles apply only for Trunking Systems that have their System Type field set to **ASTRO 25**.

10.27.5.1

Secure/Clear Strapping

This field selects secure encryption or no secure encryption for Packet Data being transmitted and received.

Secure encrypted Packet Data is transmitted within the Network Layer (Layer Three) of the Open Systems Interconnection (OSI) Seven Layer Model for layered communications. This feature applies for the current Trunking - Data Profiles.

Accessed Only: When [Secure Operation on page 272](#) is set to **Hardware** or **Software**, and when the [Advanced Encrypted Standard \(AES256\) on page 273](#) field is enabled,

And

when the [Data Profile Type on page 341](#) is set to **Trunking** or **Trunking & Broadband**, and the radio is model/option capable.

The following selections are available:

Clear

Straps or commits the Trunking APCO 25 Packet Data transmission to be normal (clear/not encrypted).

Secure

Straps or commits the Trunking APCO 25 Packet Data transmissions to be encrypted.

WARNING: Only valid when the IP Header Compression Enable field is disabled and all DAC Operation Mode - records are not set to **Controlled Channel Access**.

10.27.5.2

KMF Profile Selection

Selects the Secure KMF Profile to be associated with the current Trunking - Data Profile.

Secure encrypted Packet Data is transmitted within the Network Layer (Layer Three) of the OSI (Open Systems Interconnection) Seven Layer Model for layered communications.

WARNING: This field is invalid when the selected Secure KMF Profile's - KMF IP Address field is set to 0.0.0.0

IMPORTANT:

When this field is not set to **Disabled**, the [Key Selection on page 354](#) field for the current Data Profile can only select keys from the Secure Hardware Encryption Key References List of this selected Secure KMF Profile.

The application is actually pointing to the Keys of the Encryption Key List for this selection. Individual Keys from the Secure Hardware Encryption Key References List reference the Encryption Key List Keys from the Encryption Key Reference field. Any key selected when ASTRO OTAR is enabled, must first be defined in the Secure Hardware Encryption Key References List.

When this field is set to **Disabled**, the [Key Selection on page 354](#) value for the current Data Profile is directly chosen from the Secure Wide Window's Encryption Key List.

Accessed Only: When the [Data Profile Type on page 341](#) is set to **Trunking** or **Trunking & Broadband**, the [Secure/Clear Strapping on page 353](#) field is applicable and set to **Secure**, and the radio is model/option capable.

The following selections are available:

Disabled

See Important Note above.

Browse

Available Secure KMF Profiles - Secure KMF Profile selections apply only when the Secure Wide OTAR Enable field is enabled and the Secure Wide ASTRO OTAR Enable field is enabled.

10.27.5.3

Key Selection

This field selects the secure encryption key to be used for Packet Data being transmitted and received.

Secure encrypted Packet Data is transmitted within the Network Layer (Layer Three) of the Open Systems Interconnection (OSI) Seven Layer Model for layered communications. This selection applies for the current Trunking - Data Profile.

IMPORTANT:

When the ASTRO OTAR Profile Selection field is not set to **Disabled**, this field, for the current Data Profile can only select keys from the Secure Hardware Encryption Key References List of this selected Secure ASTRO OTAR Profile.

The application is actually pointing to the Keys of the Encryption Key List for this selection. Individual Keys from the Secure Encryption Key References List reference the Encryption Key List's Keys from the Encryption Key Reference field. Therefore any key selected when ASTRO OTAR Profile Index field is enabled, must first be defined in the Secure Encryption Key References List. Keys taken from ASTRO OTAR Profile with Independent Key List field enabled are available.

When the ASTRO OTAR Profile Selection field is set to **Disabled**, this value for the current Data Profile is directly chosen from the Secure Wide Window's Encryption Key List.

Accessed Only: When the [Data Profile Type on page 341](#) is set to **Trunking** or **Trunking & Broadband**, the [Secure/Clear Strapping on page 353](#) field is applicable and set to **Secure**, and the radio is model/option capable.

The following selections are available:

Sec Key 1

See Important Note above.

Available Secure Wide selections

10.27.5.4

Encrypted Gateway Address

This field allows you to enter the Internet Protocol version 4 (IPv4) Destination Address of the encrypted Packet Data gateway.

This feature applies for the current Trunking - Data Profiles.

Accessed Only: When the [Data Profile Type on page 341](#) is set to **Trunking** or **Trunking & Broadband**, [Secure/Clear Strapping on page 353](#) field is applicable and set to **Secure**, and the radio is model/option capable.

Selections are valid when the following is true:

- The four octets must be in the range: [1-223] . [0-255] . [0-255] . [0-255]
- This IP Address cannot be the Limited Broadcast Address: 225 . 255 . 255 . 255

The IP Address must be a valid Class A, B, or C address:

- The IP Address is considered Class A under these circumstances:
 - Octet 1 is between 0-127; the Network ID is then this first octet
 - The IP Address is Class A, then the IP Address can be 1 . 0 . 0 . 0 to 126 . 255 . 255 . 255
 - The IP Address cannot be 0 . xxx . xxx . xxx or 127 . xxx . xxx . xxx
- The IP Address is considered Class B under these circumstances:
 - Octet 1 is between 128-191; the Network ID is then the first 2 octets
 - The IP Address can be 128 . 0 . 0 . 0 to 191 . 255 . 255 . 255
 - The IP Address cannot be x . x . 255 . 255
- The IP Address is considered Class C under these circumstances:

- Octet 1 is between 192 -223; the Network ID is then the first 3 octets
- The IP Address is Class C, then the IP can be 192.0.0.0 to 223.255.255.255
- The IP Address cannot be x.x.x.255

10.27.5.5

Allow Rx Clear Packet Data

This field enables the receiving of clear (un-encrypted) Packet Data, even when **Secure** strapping has been selected in the Packet Data Secure/Clear Strapping field.

This feature applies for the current Trunking - Data Profiles.

Accessed Only: When the [Data Profile Type on page 341](#) is set to **Trunking** or **Trunking & Broadband**, the [Secure/Clear Strapping on page 353](#) is applicable and set to **Secure**, and the radio is model option capable.

10.27.5.6

VPN Secure/Clear Strapping

This field selects secure encryption or no secure encryption for LTE Broadband data being transmitted and received over a Virtual Private Network (VPN).

NOTE: Following authentication using a secure key during the Internet Key Exchange (IKE) negotiations (see [VPN Key Selection on page 356](#)), broadband data is secure-encrypted using Internet Protocol Security (IPsec) protocols and transmitted across the LTE Network through a secure VPN tunnel that connects the radio to a VPN gateway residing within the Customer Enterprise Network (CEN). This feature applies for the current Data Profile.

Accessed Only: When Secure Operation is set to **Hardware**; the [Data Profile Type on page 341](#) field is set to **Broadband-Only**, **Conventional & Broadband**, or **Trunking & Broadband**; and the radio is model/option capable.

The following selections are available:

Clear

Straps or commits the LTE Broadband data transmission to be normal (clear/not encrypted).

Secure

Straps or commits the LTE Broadband data transmissions to be encrypted.

10.27.5.7

VPN Key Selection

This field selects the secure encryption key that will be used in the Authentication phase of the IKE (Internet Key Exchange) protocol while establishing a secure tunnel with the Virtual Private Network (VPN) Gateway.

It is not the key that will be used to secure the tunnel with the VPN gateway, as those keys are derived session keys which are part of the IKE standard. This selection applies to secure encryption for LTE Broadband data communications and only for the current Data Profile.

IMPORTANT: This key must be an Advanced Encryption Standard AES-256 key for this feature to work. Otherwise, an error message displays while attempting to establish the tunnel with the VPN Gateway. The VPN Key Selection value for the current Data Profile is directly chosen from the Secure Wide Window Encryption Key List.

Accessed Only: When Secure Operation is set to **Hardware**; the [Data Profile Type on page 341](#) field is set to **Broadband-Only**, **Conventional & Broadband**, or **Trunking & Broadband**; [VPN Secure/Clear Strapping on page 356](#) is set to **Secure**; and the radio is model/option capable.

10.27.5.8

VPN Gateway IP Address

This field allows you to enter the Internet Protocol version 4 (IPv4) Destination Address of the Virtual Private Network (VPN) Gateway that resides in the Customer Enterprise Network (CEN).

This selection applies to secure encryption for LTE Broadband data communications, and only for the current Data Profile.

NOTE:

When assigning an IP address, ensure that the IP address does not conflict with any other IP address or Subnet used by the radio. External devices such as Wi-Fi, External Data Modem, and Si500 can assign IP Addresses to some interface. If conflicting IP addresses or Subnets are in use, data features can not be guaranteed to work reliably.

169. 254. X. X. Subnet is reserved for Zone to Zone Cloning feature, so any IP address cannot start with 169. 254. X. X. otherwise this field will be invalid.

Accessed Only: When Secure Operation is set to **Hardware**, and when the [Data Profile Type on page 341](#) field is set to **Broadband-Only** or **Conventional & Broadband** or **Trunking & Broadband**, [VPN Secure/Clear Strapping on page 356](#) is set to **Secure**, and the radio is model/option capable.

Selections are valid when the following is true:

- The four octets must be in the range: [1-223] . [0-255] . [0-255] . [0-255]
- This IP Address's Default Value = 0.0.0.0 and must be defined.

The IP Address must be a valid Class A, B, or C address:

- The IP Address is considered Class A under these circumstances:
 - Octet 1 is between 0-127; the Network ID is then this first octet
 - The IP Address is Class A, then the IP Address can be 1.0.0.1 to 126.255.255.254
 - The IP Address cannot be 0.xxx.xxx.xxx or 127.xxx.xxx.xxx
- The IP Address is considered Class B under these circumstances:
 - Octet 1 is between 128-191; the Network ID is then the first 2 octets
 - The IP Address is Class B, then the IP Address can be 128.1.1.0 to 191.255.255.254
- The IP Address is considered Class C under these circumstances:
 - Octet 1 is between 192 -223; the Network ID is then the first 3 octets
 - The IP Address is Class C, then the IP can be 192.0.1.1 to 223.255.255.254
 - The IP Address cannot be x.x.x.0 or x.x.x.255

10.27.5.9

VPN Message Re-transmission Time

This field selects the Virtual Private Network (VPN) message re-transmission attempt and retry interval.

See [VPN Message Re-transmission Attempts on page 358](#).

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This selection applies to secure encryption for LTE Broadband data communications and only for the current Data Profile.

Accessed Only: When Secure Operation is set to **Hardware**; the [Data Profile Type on page 341](#) field is set to **Broadband-Only**, **Conventional & Broadband**, or **Trunking & Broadband**; [VPN Secure/Clear Strapping on page 356](#) is set to **Secure**, and the radio is model/option capable.

Table 176: Range

Minimum	Maximum	Increments
10 (seconds)	60 (seconds)	1 (second)

10.27.5.10

VPN Message Re-transmission Attempts

This field selects the maximum number of times that a Virtual Private Network (VPN) message is retransmitted in intervals before considering the remote end as unresponsive.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

These retries continue until an acknowledgement confirming the successful receipt of transmission or until the selected number of attempts is reached. This selection applies to secure encryption for LTE Broadband data communications and only for the current Data Profile.

Accessed Only: When Secure Operation is set to **Hardware**; the [Data Profile Type on page 341](#) field is set to **Broadband-Only**, **Conventional & Broadband**, or **Trunking & Broadband**; [VPN Secure/Clear Strapping on page 356](#) is set to **Secure**, and the radio is model/option capable.

Table 177: Range

Minimum	Maximum
2	10

10.27.5.11

VPN Dead Peer Detection Interval

This field selects the maximum amount of idle time before the determination that the Virtual Private Network (VPN) connection has been lost.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This selection applies to secure encryption for LTE Broadband data communications, and only for the current Data Profile. Time is in minutes.

Accessed Only: When Secure Operation is set to **Hardware**, the [Data Profile Type on page 341](#) field is set to **Broadband-Only** or **Conventional & Broadband** or **Trunking & Broadband**, the [VPN Secure/Clear Strapping on page 356](#) field is set to **Secure**, and the radio is model/option capable.

Table 178: Range

Minimum	Maximum	Increments
5 (minutes)	60 (minutes)	1 (minute)

10.27.5.12

VPN Rekey Margin

This field selects the time before the Virtual Private Network (VPN) connection or keying-channel terminates before attempting to renegotiate a connection/rekey.

See [VPN Re-Key attempts on page 359](#).

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This selection applies to secure encryption for LTE Broadband data communications and only for the current Data Profile. Time is in minutes.

Accessed Only: When Secure Operation is set to **Hardware**; the [Data Profile Type on page 341](#) field is set to **Broadband-Only, Conventional & Broadband**, or **Trunking & Broadband**; [VPN Secure/Clear Strapping on page 356](#) is set to **Secure**; and the radio is model/option capable.

NOTE: This feature is only available in Expert View (see Codeplug View)

Table 179: Range

Minimum	Maximum	Increments
1 (minute)	9 (minutes)	1 (minute)

10.27.5.13

VPN Re-Key attempts

This field selects the number of attempts to negotiate a Virtual Private Network (VPN) connection, or a replacement for one, before giving up.

See [VPN Rekey Margin on page 358](#).

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This selection applies to secure encryption for LTE Broadband data communications and only for the current Data Profile.

Accessed Only: When Secure Operation is set to **Hardware**; the [Data Profile Type on page 341](#) field is set to **Broadband-Only, Conventional & Broadband**, or **Trunking & Broadband**; [VPN Secure/Clear Strapping on page 356](#) is set to **Secure**, and the radio is model/option capable.

NOTE: This feature is only available in Expert View (see Codeplug View)

Table 180: Range

Minimum	Maximum
1	10

10.27.6

Bypass List

This section allows you to view or modify the Internet Protocol version 4 (IPv4) source address, destination address, or both, of data packets that should bypass secure processing.

The Bypass List feature applies only to **Trunking, Broadband Only** and **Trunking & Broadband** Data Profile Types where profiles are defined to communicated radio data over Trunking channels, and/or communicate radio data over an LTE Broadband network.

Accessed Only: When the radio is model/option capable, and

- When the [Data Profile Type on page 341](#) is set to **Trunking**, and when the [Secure/Clear Strapping on page 353](#) field is set to **Secure**, or
- When the Data Profile Type is set to **Broadband Only** or **Conventional & Broadband**, and when the [VPN Secure/Clear Strapping on page 356](#) field is set to **Secure**, or

- When the Data Profile Type is set to **Trunking & Broadband**, and when the Secure/Clear Strapping field is set to **Secure** or the VPN Secure/Clear Strapping field is set to **Secure**.

10.27.6.1

IP Address

This field allows you to define Bypass Internet Protocol version 4 (IPv4) addresses for the current Data Profile.

Bypass IP Addresses are designed for data packets that are allowed to bypass secure processing. Multiple Bypass IP Address (record/rows) may be created for the Bypass list/table of each Data Profile.

NOTE:

When assigning an IP address, ensure that the IP address does not conflict with any other IP address or Subnet used by the radio. External devices such as Wi-Fi, External Data Modem, and Si500 can assign IP Addresses to some interface. If conflicting IP addresses or Subnets are in use, data features can not be guaranteed to work reliably.

169. 254. X. X. Subnet is reserved for Zone to Zone Cloning feature, so any IP address cannot start with 169. 254. X. X. otherwise this field will be invalid.

Accessed Only: When the radio is model/option capable. and

- The [Data Profile Type on page 341](#) is set to **Trunking** and the [Secure/Clear Strapping on page 353](#) field is set to **Secure**, or
- The [Data Profile Type on page 341](#) is set to **Broadband Only** or **Conventional & Broadband** and the [VPN Secure/Clear Strapping on page 356](#) field is set to **Secure**, or
- The [Data Profile Type on page 341](#) is set to **Trunking & Broadband** and the [Secure/Clear Strapping on page 353](#) field is set to **Secure** or the [VPN Secure/Clear Strapping on page 356](#) field is set to **Secure**

Selections are valid when the following is true:

- The four octets must be in the range: [1-223] . [0-255] . [0-255] . [0-255]
- This IP Address can be the Limited Broadcast Address: 255.255.255.255
- The IP Address must be a valid Class A, B, or C address:
 - The IP Address is considered Class A when:
 - + Octet 1 is between 0-127; the Network ID is then this first octet
 - + The IP Address can be 1.0.0.0 to 126.255.255.255
 - + The IP Address cannot be 0 . XXX . XXX . XXX or 127 . XXX . XXX . XXX
 - The IP Address is considered Class B when octet 1 is between 128-191; the Network ID is then the first 2 octets
 - + The IP Address is Class B, then the IP Address can be 128.0.0.0 to 191.255.255.255
 - The IP Address is considered Class C when octet 1 is between 192 -223; the Network ID is then the first 3 octets
 - + The IP Address is Class C, then the IP Address can be 192.0.0.0 to 223.255.255.255

10.27.6.2

Address Type

This field selects the IP Bypass Address Type for the current Bypass IP address (record/row).

Bypass IP Addresses are designed for data packets that are allowed to bypass secure processing. Multiple Bypass IP Address (record/rows) may be created within the Bypass list/table of each Data Profile.

Accessed Only: When the radio is model/option capable and:

- The [Data Profile Type on page 341](#) is set to **Trunking** and the [Secure/Clear Strapping on page 353](#) field is set to **Secure** or
- The [Data Profile Type on page 341](#) is set to **Broadband Only** or **Conventional & Broadband** and the [VPN Secure/Clear Strapping on page 356](#) field is set to **Secure**, or
- The [Data Profile Type on page 341](#) is set to **Trunking & Broadband** and the [Secure/Clear Strapping on page 353](#) field is set to **Secure** or the [VPN Secure/Clear Strapping on page 356](#) field is set to **Secure**

The following selections are supported:

Source

Allows the current Bypass IP Address (record/row) to not require secure encryption when receiving data packets. Therefore, data packets may be received in an un-encrypted clear mode.

Destination

Allows the current Bypass IP Address (record/row) to not require secure encryption when transmitting data packets. Therefore, data packets may be transmitted in an un-encrypted clear mode.

Both

Allows the current Bypass IP Address (record/row) to not require secure encryption when both transmitting and receiving data packets. Therefore, data packets may be both transmitted and received in an un-encrypted clear mode.

10.27.7

Enhanced Data

This section allows you to view or modify Enhanced Data functionality.

NOTE: Enhanced Data provides a P25 Phase 2 TDMA (time-division multiple access) slotted data communications channel, which offers greater capacity and improved reliability compared to a Phase 1 FDMA (frequency-division multiple access) data channel.

IMPORTANT:

Enhanced Data procedures only apply to short inbound (radio-to-infrastructure) messages, such as GPS location updates, using reserved slots assigned by the Fixed Network Equipment (FNE). These settings apply only to individual Data Profiles used for Trunking communications.

IMPORTANT:

For Trunking communications, Data Profiles apply only for Trunking Systems that have their System Type field set to **ASTRO 25**.

Data Profiles are selected from the Trunking System's Data Profile Selection field.

10.27.7.1

Port List Selection

This field allows you to select the appropriate Enhanced Data Port List to be used with the current Data Profile.

NOTE: The names that appear for selection are defined in the Port List Alias field.

Accessed Only: When the [Data Profile Type on page 341](#) is set to **Trunking** or **Trunking & Broadband** and the radio is model/option capable.

The following selections are supported:

- Disabled

- Browse (Available Enhanced Data Port Lists)

10.27.7.2

Allow Enhanced Data On Classic Data Channel

This field enables an inbound datagram destined for one of the programmed Enhanced Data Ports to be sent over a P25 Classic Data channel.

Occurs when an Enhanced Data channel is not available or when the radio is already on a P25 Classic Data channel. This feature applies to the current Data Profile.

When disabled, the datagram is discarded when:

- The radio is already on a P25 Classic Data channel, and the inbound Enhanced Data datagram is forced over an Enhanced Data Channel, or
- An Enhanced Data channel is not available

Accessed Only: When the [Data Profile Type on page 341](#) is set to **Trunking** or **Trunking & Broadband**, the [Port List Selection on page 361](#) is not **Disabled**, and the radio is model/option capable.

10.27.7.3

Enhanced Data Queue Dwell Timer

This field selects the amount of time an Enhanced Data datagram is allowed to wait in the radio's queue without being transmitted before the datagram is purged from the queue.

NOTE: When data comes from an internal application, or is sent from a Mobile Computer (MC) to the radio, the radio sometimes receives the data faster than it can send it. The data must then sometimes wait in the radio's queue. This selection applies for the current Data Profile. Time is in seconds.

Accessed Only: When the [Data Profile Type on page 341](#) is set to **Trunking** or **Trunking & Broadband**, the [Port List Selection on page 361](#) is not **Disabled**, and the radio is model/option capable.

Table 181: Range

Minimum	Maximum	Increments
5 seconds	120 seconds	1 second

10.27.7.4

Send Data During Emergency Hangtime

Enables data to be sent during an emergency hangtime condition.

10.27.8

ATAK Data Enable/Disable

This field enables or disables ATAK Data from the ATAK application on the radio.

10.28

Enhanced Data Port List

The **Enhanced Data Port List** allows you to view or define lists of UDP (User Datagram Protocol) destination ports for which Enhanced Data transmission is allowed. Up to twenty Enhanced Data Port Lists are possible.

NOTE: Once defined, an Enhanced Data Port List is then selectable on a per Data Profile basis from the Port List Selection field.

10.28.1

Port List Alias

This field allows you to define recognizable names for the current Enhanced Data Port List.

Once defined, an Enhanced Data Port List is then selectable on a per [Data Profiles on page 340](#) basis from the [Port List Selection on page 361](#) field.

Accessed Only: When the radio is model/option capable.

NOTE:

Examples: GPS 5, Port List 1, Enh Data #14

Characters, numbers, spaces, and special characters can be used.

Up to 14 characters are possible.

10.28.2

Port Number

This field selects a UDP (User Datagram Protocol) destination port number for a port associated with sending Enhanced Data for the current record/row of the current Enhanced Data Port List.

Once defined, an Enhanced Data Port List is then selectable on a per [Data Profiles on page 340](#) basis from the [Port List Selection on page 361](#) field.

WARNING:

This selection is only valid:

When the value is unique for each Enhanced Data Port List record/row, and

When it is not equal to the value of the [Authentication UDP Port on page 336](#), [Subscriber OTAR Port on page 296](#), or [KMF UDP Port on page 296](#), and

When it is not equal to the value of a Port used by any other Service: **4005** (PN Server (ARS)), **4007** (Text Messaging Service), **4000** (UDP Loopback Port), **64414** (KMF Server (OTAR)), **162** (SNMP (Simple Network Management Protocol) Agent), **49223** (User Authentication), and **49165** (Radio Authentication).

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Table 182: Range

Minimum	Maximum	Increments
1	65535	1

10.29

Conventional Wide

This section allows you to view or define functionality applying on a radio-wide basis to all Conventional Personalities.

This functionality does not apply while operating in Trunking communications mode.

10.29.1

General

This section allows you to view or define basic radio-wide functionality applying only to the Conventional communications mode.

10.29.1.1

Monitor Type

This field selects how the radio unmutes when the Monitor button is pressed. Silent Monitor, also called PL Defeat, allows you to monitor the channel before transmitting.

This selection applies for Conventional communications.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Silent

Disables PL or DPL

Open Squelch

Disables squelch which unmutes the radio speaker to any carrier signal currently on the channel regardless of signal strength. If no carrier signal is present, then the radio unmutes to noise.

10.29.1.2

Direct Frequency Enable

This field allows the Direct/Talkaround Direct Talkaround parameters to be individually defined for all Frequency Options profile.

When disabled, all Direct/Talkaround parameters revert to the settings of the Rx parameter fields for Direct/Talkaround functionality. This feature applies on a radio-wide basis only while operating in Conventional communications mode.

NOTE:

The Conventional Personality Direct/Talkaround field toggles Direct/Talkaround mode on or off on a per Conventional Personality Frequency Options basis.

You can select Direct/Talkaround with the Direct/Talkaround button-press, the Talkaround / Direct switch-selection, or the Direct/Talkaround menu-selection.

10.29.1.3

Latch Enable Tone

This field causes the radio to emit an alert tone each time the "Monitor" feature is latched (see the Monitor Type feature).

Pressing the Monitor button for the Latch Enable Time latches the Monitor feature; this alert tone indicates that latching has occurred. Once "Monitor" is latched, pressing the Monitor button again cancels the latched mode. This feature also applies for Conventional communications.

Accessed Only: When the radio is model/option capable.

10.29.1.4

Latch Enable Time

This field selects the amount of time that you must press the Monitor button in order for the **Monitor** feature to remain continuously latched.

When this time threshold is reached, you may release the Monitor button and the "Monitor" mode remains active. If this time threshold is not reached, then releasing the Monitor button, ends the Monitor mode (latching does not occur) and the radio returns to normal operation. Once "Monitor" is latched, pressing the Monitor button again cancels the latched mode. This feature also applies for Conventional communications.

See the [Monitor Type on page 364](#) selection for further reference.

Accessed Only: When the radio is model/option capable.

NOTE: When set to Disabled, there is no timer - 0 (zero seconds). "Monitor" latches immediately with a Monitor button-press.

Table 183: Range

Minimum	Maximum	Increments
0.5 sec	6 sec	0.5 sec

10.29.2

Features

This section allows you to view or modify functionality that can apply to all Conventional Personalities.

10.29.2.1

Smart PTT Quick Key Timer

This field selects the maximum amount of time between PTT button-presses that determines how fast you must press the PTT button to effect a Quick Key press.

A Quick Key (double press) of the PTT button can override the Smart PTT Type, **Tx Inhibit on** selection for a chosen Conventional Personality, thus allowing the radio to transmit when the current channel is busy (see also Smart PTT Retry Timer).

Table 184: Range

Minimum	Maximum	Increments
100 ms	5000 ms	100 ms

10.29.2.2

Smart PTT Retry Timer

This field selects the amount of time at which the radio samples for an empty channel (with no carrier).

This timer is used when one of the Smart PTT Type, **Tx Inhibit on** selections is chosen for a Conventional Personality. When the PTT button is pressed, and this sampling time determines that the current channel is busy, the radio automatically sounds a continuous alert tone until the PTT button is released.

IMPORTANT: The Quick Key Override field is an override feature that allows you to transmit regardless of the currently-selected Smart PTT Type, Tx "Inhibit on" rule. See also Smart PTT Quick Key Timer.

Table 185: Range

Minimum	Maximum	Increments
0 ms	5000 ms	25 ms

10.29.2.3

Status Number of Attempts

This field selects the maximum number of times that the radio attempts to send an RadioCentral-defined Status.

The radio continues these retries until it receives an acknowledgement confirming the successful receipt of the Status transmission, or until the selected number of Status attempts is reached. See also Status Auto Exit. This selection applies for all Conventional Systems.

Table 186: Range

Minimum	Maximum
1 attempt	14 attempts

10.29.3

ASTRO Group ID Set

The **ASTRO Group ID** set allows the user to view or modify functionality that can apply to all ASTRO type Conventional Systems and therefore to all Conventional Personalities having ASTRO System functionality.

Accessed Only: When the radio is model or option capable.

The following field is supported:

10.29.3.1

Group ID

This field selects (in decimal or Hex format) the Common Air Interface (CAI) Data Group ID used only when address decoding on data receives.

This Group ID number associates the radio with a specific data group for group addressing of data messages. When data is being transmitted by the radio, the Data Group ID is not used. This selection applies for the current Group ID (record/row) which applies for ASTRO type Conventional Systems.

10.29.4

ASTRO Data

This section allows you to view or modify functionality that can apply to all ASTRO type Conventional Systems and therefore to all Conventional Personalities having ASTRO System functionality.

NOTE: For more details on data channel access operation, refer to the APCO 25 Common Air Interface Operational Description for Conventional communications channels.

Accessed Only: When the radio is model/option capable.

10.29.4.1

CAI Data Max Tx Attempts

This field selects the maximum number of times that the radio attempts to send a Common Air Interface (CAI) data packet transmission.

The radio continues these retries until it receives an acknowledgment confirming the successful receipt of transmission, or until the selected number of Tx Attempts is reached.

NOTE: This selection applies for all ASTRO type Conventional Systems.

Table 187: Range

Minimum	Maximum	Increment
2 attempts	10 attempts	1 attempt

10.29.4.2

CAI Data Response Timer

This field selects the amount of time that the radio waits for an acknowledge of a successful Common Air Interface (CAI) transmission before re-sending another CAI data packet.

NOTE: This selection applies for all ASTRO type Conventional Systems.

Table 188: Range

Minimum	Maximum	Increments
100 ms	5000 ms	100 ms

10.29.4.3

CAI Data Min Response Timer

This field selects the minimum amount of time that the radio waits for an acknowledgment of a successful Common Air Interface (CAI) to be sent across the channel.

This parameter should be slightly greater than the Data Throughout Delay from the RNC (Radio Network Controller) to the radio. This selection applies for all ASTRO type Conventional Systems.

IMPORTANT: Do not attempt to change this setting without first verifying the particular throughout the system.

Table 189: Range

Minimum	Maximum	Increments
50 ms	2000 ms	50 ms

10.29.4.4

Max Packet Size

This field selects the maximum number of bytes that can be transported in a single Common Air Interface (CAI) data packet. This selection applies for all ASTRO type Conventional Systems.

Table 190: Range

Minimum	Maximum	Increments
16 bytes	512 bytes	16 bytes

10.29.4.5

Frame Sync Seek Period

This field selects the amount of time that the radio listens for a Frame Sync Sequence. A Frame Sync Sequence on the channel indicates that there is channel activity.

If a Frame Sync Sequence is not detected within this time, the radio assumes the channel is idle and then transmits the next Common Air Interface (CAI) packet queued for transmission. This selection applies for all ASTRO type Conventional Systems. Time is in milliseconds.

IMPORTANT: This value should be set to the maximum over-the-air Data Packet Duration. Example: For a maximum CAI packet size of 512 bytes, this value should be set to 750 ms. For proper operation on a channel with ASTRO voice present, due to the ASTRO voice frame size, this value should be set greater than 200 ms.

Table 191: Range

Minimum	Maximum	Increments
0 ms	5000 ms	50 ms

10.29.4.6

Tx Short Random Range

This field selects the maximum amount of time that the radio waits to transmit once the first qualified Frame Sync Sequence has been received indicating that the channel is clear.

The radio randomly checks channel access status based on this maximum wait time. This selection applies for all ASTRO type Conventional Systems. Time is in milliseconds.

IMPORTANT: Increasing this value reduces the potential of collision with other radios attempting to transmit data (seize the channel), but it also increases the channel access delay.

Table 192: Range

Minimum	Maximum	Increments
50 ms	500 ms	50 ms

10.29.4.7

Tx Long Random Range

This field selects the maximum amount of time the radio waits before rechecking a channel's status once a Busy Channel Status Symbol has been received.

Once a clear channel status has been received, the radio is then able to transmit the next Common Air Interface (CAI) packet queued for transmission. The radio randomly checks channel access status based on this maximum wait time. This selection applies for all ASTRO type Conventional Systems. Time is in milliseconds.

Table 193: Range

Minimum	Maximum	Increments
50 ms	5000 ms	50 ms

10.29.4.8

Tx Resp Random Range

This field selects the maximum amount of time the radio waits before rechecking a channel's status once a busy Channel Status Symbol has been received.

This selection applies only to Common Air Interface (CAI) acknowledgements. Once a clear channel status has been received, the radio is then able to transmit the next Common Air Interface (CAI) acknowledgment queued for transmission. The radio randomly checks channel access status based on this maximum wait time. This selection applies for all ASTRO type Conventional Systems. Time is in milliseconds.

IMPORTANT: Increasing this value reduces the potential of conflict with other radios attempting to transmit data (seize the channel), but it also increases the channel access delay.

Table 194: Range

Minimum	Maximum	Increments
50 ms	1000 ms	50 ms

10.29.4.9

Tx Limited Patience

This field selects the maximum amount of time that the radio attempts to transmit a Common Air Interface (CAI) data packet.

Once this time expires, the radio ceases to attempt transmissions. This selection applies for all ASTRO type Conventional Systems. Time is in seconds.

Accessed Only: When the radio is model/option capable.

NOTE: When set to **Infinite**, no timer is used, therefore there is no transmit time limit.

Table 195: Range

Minimum	Maximum	Increments
2 secs	255 secs	1 sec

10.29.4.10

ARP Cache Depth

This field selects how many entries are stored in the radio's Address Resolution Protocol (ARP) Table.

The radio's ARP Table is a memory cache that stores mappings between IP addresses and Individual IDs. The ARP Cache Depth allows the radio to be most efficient when its RadioCentral-selected number equals the expected number of devices (with unique IP addresses) that the radio communicates with. This selection applies for all ASTRO type Conventional Systems.

Accessed Only: When the radio is model/option capable.

Table 196: Range

Minimum	Maximum
0	50

NOTE: Selecting a Cache Depth of "0" indicates that no IP Addresses can be cached; thus effectively disabling ARP caching.

10.29.4.11

ARP Cache Time

This field selects the amount of time that cache entries are stored in the ARP Cache Depth. If all communicating devices in a network have static/fixed IP addresses, then it is recommended to set this Cache Time to **Infinite** (an infinite cache time), this allows the ARP Cache entries to continually remained cached.

If the ARP Cache Time is not set to **Infinite**, then ARP Cache entries are purged when this timer expires. This selection applies for all ASTRO type Conventional Systems. Time is in hours.

Accessed Only: When the radio is model/option capable, and when the ARP Cache Depth field is not set to **0**.

NOTE: When set to Infinite, the ARP Cache entries remain cached indefinitely.

Table 197: Range

Minimum	Maximum	Increments
1 hour	24 hours	1 hour

10.29.4.12

Conventional Customer ID (hex)

This field selects a valid Advanced Conventional Key (ACK) "System ID" number (see System Key Report) which allows for Tactical Services Operation - Inhibit command.

An ACK's "System ID" number can only be selected when the ACK is currently loaded into the RadioCentral. ACKs are loaded into the RadioCentral through the USB port of the computer with the use of Key Devices inserted into a USB Port Key Device Reader. This selection applies radio wide for all ASTRO - Conventional Systems.

WARNING:

Once the Tactical Services Operation field is either **Decode** or **Decode and Encode**, and the Radio Uninhibit Decode Action is **Disabled**, this field must contain a valid ACK number.

Once a valid ACK number has been entered, a codeplug-write to the radio may only occur when that ACK is currently loaded into the RadioCentral (see System Key Report).

Accessed Only: When the Tactical Inhibit Enable field is **Enabled** and when the radio is model/option capable, and once a valid ACK number has been entered in this field and saved, this value may not be modified unless its ACK number is currently loaded into the RadioCentral (see System Key Report).

The following selection is supported:

- Factory Default value is **0000**.

10.30

Conventional Status Alias List

The **Conventional Status Alias List** allows you to view or define Conventional Statuses.

Your status can only be transmitted from a radio unit to a dispatcher (base unit). Your status makes more efficient use of a channel as compared to a voice transmission. This feature applies only when operating in Conventional communications mode.

NOTE:

The Status Alias must be set up identically (or with the same meaning) for the dispatcher and the radio units. That is, the Status 1 Alias from the dispatching unit must be identical (or have the same meaning) as the Status 1 Alias for the radio unit.

MDC, DVRS and ASTRO Messages are enabled individually on a per [Conventional System on page 375](#) basis from the [Status on page 380](#) field.

You can then activate the Status feature with a Status button-press, a Direct Status button-press, or a Status menu-selection (see also [Status Number of Attempts on page 366](#) and [Status Auto Exit on page 214](#)).

10.30.1

Status Alias Number

This field selects a unique number for the current Status (record/row).

This number is matched up between the transmitting and the receiving radios; this match then determines which Status Alias Text appears in the receiving radio's display.

Accessed Only: When the radio is model/option capable.

10.30.2

Status Alias Text

This field allows you to define recognizable names for the current Status (record/row).

The [Status Alias Number on page 371](#) is matched between the transmitting and the receiving radios; this match then determines the Status Alias Text that appears in the receiving radio's display.

Accessed Only: When the radio is model/option capable.

NOTE:

Examples: MESSAGE-5, #510, Electric1

Characters, numbers, spaces, and special characters can be used.

A total of 14 characters are possible.

See also: [CPS Name Field Data Validation](#)

10.31

Repeater ID List

The **Repeater ID List** allows you to view or define IDs for accessing repeaters while operating in conventional communications mode.

This is only true when one or both of the Conventional Personality repeater access Code Type fields is set to **MDC** for any individual Conventional Personality.

NOTE: Repeater IDs are selected for use in the Conventional Personality MDC Repeater ID fields.

10.31.1

Repeater ID

This field selects the Repeater ID (record/row) that is transmitted by the radio to gain repeater access to a Conventional communications channel.

Repeater IDs must then be selected for use with specific Conventional channels from the Conventional Personality MDC Repeater ID fields. A Repeater Access Code (RAC) allows the radio to access a specific repeater(s).

IMPORTANT: This is only true when one or both of the Conventional Personality repeater access Code Type (Repeater Access Button 1/PTT) and Code Type (Repeater Access Button 2) fields are set to **MDC** for any individual [Conventional Personality on page 388](#).

Table 198: Range

Minimum	Maximum	Increments
1	9999	1

10.31.2

Tone (Hz)

Selects the Singletone Tone (frequency) that is transmitted by the radio to gain repeater access to a Conventional communications channel.

Singletone Tones (frequencies) must then be selected for use with specific Conventional channels from the Conventional Personality Singletone frequency fields. Each "Repeater Access Code" (RAC) allows the radio to access a specific repeater.

IMPORTANT: This is only true when one or both of the Conventional Personality repeater access Code Type fields is set to **Singletone** for any individual [Conventional Personality on page 388](#) within the RAC (Conventional Personality) section.

Table 199: Range

Minimum	Maximum	Increments
300 Hz	3000 Hz	0.1 Hz

10.32

ASTRO Talkgroup List

The **ASTRO Talkgroup List** allows you to define functionality for individual talkgroup members within the current ASTRO Talkgroup List. ASTRO Talkgroups are only used with Conventional Personalities using ASTRO type Conventional Systems.

NOTE:

A Talkgroup List may be referenced to a Conventional Personality with the Talkgroup List field.

Once a Talkgroup List is selected for a personality, a default Talkgroup may then be selected for that same personality from the Frequency Option's ASTRO Talkgroup ID field.

Depending on the Conventional Personality Selection Type field choice, you will have the ability to access an entire Talkgroup List or a single Talkgroup strapped to that channel.

10.32.1

General

This section allows you to define functionality for individual ASTRO Talkgroup Lists as well as the Talkgroup Members within each list.

ASTRO Talkgroups are only used with Conventional Personalities using ASTRO type Conventional Systems. ASTRO Talkgroup List Members are available to you for Selective Call or Call Alert operations. Depending on the Conventional Personality Selection Type field choice, you will have the ability to access an entire Talkgroup List or a single Talkgroup strapped to that channel.

NOTE:

A Talkgroup List may be referenced to a Conventional Personality with the Talkgroup List field. Once a Talkgroup List is selected for a personality, a default Talkgroup may then be selected for that same personality from the Channel Option's ASTRO Talkgroup field.

10.32.1.1

ASTRO Talkgroup List Name

This field allows you to create recognizable names for the current ASTRO Talkgroup List.

ASTRO Talkgroup List are selected for use from the Conventional Personality's ASTRO Talkgroup List field.

NOTE:

Characters, numbers, spaces, and special characters can be used.

Up to 14 characters are possible.

10.32.1.2

Talkgroup Alias

This field enables the Talkgroup Alias Text information to appear in the display.

This feature applies for the current ASTRO Talkgroup List.

Talkgroup Alias allows your recognizable name to appear when you are scrolling through the ASTRO Talkgroup List.

When disabled, the Talkgroup IDs appear in the radio display.

Accessed Only: When the radio is model/option capable.

10.32.1.3

ASTRO OTAR Profile Index

This field selects the Secure KMF Profile to be used by the current ASTRO Talkgroup List.

IMPORTANT:

When this field is not set to **Disabled**, the Key Select field for the current ASTRO Talkgroup List can only select keys from the Secure Hardware Encryption Key References List of this selected Secure KMF Profile

Be aware that The RadioCentral is actually pointing to the Keys of the Encryption Key List for this selection; individual Keys from the Secure Hardware Encryption Key References List reference the Encryption Key List's Keys from the Encryption Key Reference field . Therefore any key selected when this field is not set to **Disabled**, must first be defined in the Secure Hardware Encryption Key References List .

When this field is set to **Disabled** or not applicable (grayed-out), the Key Select field value is directly chosen from the Encryption Key List of the Secure Wide Window

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and [Advanced Encrypted Standard \(AES256\) on page 273](#) is enabled, and when the [OTAR Enable on page 273](#) field is enabled, when the [ASTRO OTAR Enable on page 274](#) field is enabled, and when the radio is model/option capable.

10.32.2

Talkgroup List

This section allows you to define functionality for individual talkgroup members within the current ASTRO Talkgroup List.

ASTRO Talkgroups are only used with Conventional Personalities using ASTRO type Conventional Systems.

NOTE:

A Talkgroup List may be referenced to a Conventional Personality with the Talkgroup List field. Once a Talkgroup List is selected for a personality, a default Talkgroup may then be selected for that same personality from the Frequency Option's ASTRO Talkgroup ID field.

Depending on the Conventional Personality Selection Type field choice, you will have the ability to access an entire Talkgroup List or a single Talkgroup strapped to that channel.

10.32.2.1

Talkgroup Alias

This field enables the Talkgroup Alias Text information to appear in the display.

This feature applies for the current ASTRO Talkgroup List.

Talkgroup Alias allows your recognizable name to appear when you are scrolling through the ASTRO Talkgroup List.

When disabled, the Talkgroup IDs appear in the radio display.

Accessed Only: When the radio is model/option capable.

10.32.2.2

Talkgroup ID

This field selects (in decimal or hex format) a unique identification number for the current talkgroup.

This selection applies for the current talkgroup (record/row) of the current [ASTRO Talkgroup List on page 372](#).

Table 200: Range

Minimum	Maximum
0	65535

IMPORTANT:

Talkgroup "65535" (FFFF Hex) is a System Wide "All-Call" Talkgroup. All other talkgroups unmute to a Talkgroup "65535" transmission and a talkgroup set to "65535" unmutes to any Talkgroup IDs..

Talkgroup "0" is a System Wide 'Receive-Only' talkgroup that receives "All-Call" transmissions sent on the "65535" talkgroup. Talkgroup "0" also receives Selective Call transmissions sent to your particular ASTRO Individual ID. This condition is only possible when the ASTRO Rx Unmute Rule of a channel/personality that has this Talkgroup ID selected is set to **Selective Squelch**.

Accessed Only: When the radio is model/option capable.

10.32.2.3

Voice Secure/Clear Strapping

This field selects the transmit mode for the current talkgroup.

This selection applies for the current talkgroup (record/row) of the current [ASTRO Talkgroup List on page 372](#).

The following selections are supported:

Select

Allows you to toggle on or off secure encrypted communications.

NOTE:

Either the Secure Tx Select button-press or the Secure Tx Select switch-toggle or the Secure menu-selection allows for your access to secure-encrypted communications.

Clear

Straps or commits the channel to normal (non-secure) Conventional communications operation.

Secure

Straps or commits the channel to secure encrypted operation.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**.

10.32.2.4

Key Select

This field selects the secure encryption key to be used in secure encryption mode for the current talkgroup (record/row).

This selection applies for the current talkgroup of the current Trunking Personality.

IMPORTANT:

When the [ASTRO OTAR Profile Index on page 373](#) field is not Disabled for the current ASTRO Talkgroup List, this Key Select value is chosen from the [Secure Hardware Encryption Key References List on page 290](#) of the Secure KMF Profile selected in the KMF Profile Index field.

WARNING: Be aware that the RadioCentral is actually pointing to the Keys of the [Encryption Key List on page 286](#) for this selection; individual Keys from the Secure Hardware Encryption Key References List reference the Encryption Key List's Keys from the [Encryption Key Reference on page 291](#) field. Therefore any key selected when ASTRO OTAR is enabled, must first be defined in the Secure Hardware Encryption Key References List.

When the KMF Profile Index field is Disabled or not applicable (grayed-out) for the current ASTRO Talkgroup List, this Key Select value is directly chosen from the Secure Encryption Key List.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the [Voice Secure/Clear Strapping on page 375](#) field is set to **Secure** or **Select**, and when the radio is model/option capable.

10.33

Conventional System

The **Conventional Systems** allows you to view or define individual Signaling Systems.

Signaling system types include: **ASTRO**, **MDC**, **DVRS**, and **Quik-Call II**. Individual Signaling Systems are selected for use with Conventional Personalities.

NOTE: Conventional Systems are selected for use from the Conventional Personality's ASTRO System field or Non-ASTRO System field.

10.33.1

General

The **General** section allows you to view or define basic functionality for individual Conventional communications signaling systems.

NOTE:

The fields that are supported are dependent on the value set for System Type.

Conventional Systems are selected for use from the Conventional Personality's ASTRO System field or Non-ASTRO System field.

10.33.1.1

ASTRO or DVRS System

The following fields are supported when System Type is set to **ASTRO** or **DVRS**:

10.33.1.1.1

Conventional System Name

This field allows you to create recognizable names for the current Conventional System.

Conventional Systems are selected for use from the Conventional Personality's ASTRO System field or Non-ASTRO System field.

NOTE:

Examples: Byrne004, Power03, #510

Characters, numbers, spaces, and special characters can be used.

Up to 14 characters are possible.

10.33.1.1.2

System Type

This field allows you to select the desired System Type for the current Conventional System.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

- ASTRO
- MDC
- DVRS
- DTMF
- Quik-Call II
- Singletone

NOTE: These selections are model/option dependent.

10.33.1.1.3

System Group Number

This field allows you to define a System Group Number for an ASTRO Conventional System not defined in the current codeplug.

The System Group Number provides a way to logically group multiple Conventional Systems in the codeplug that are really the same over-the-air system.

IMPORTANT:

This selection only applies when the System Name field is set to **Customized** for the current record/row. Therefore, this selection corresponds to an in-the-field ASTRO Conventional System. This selection applies to the current Call ID set (record/row) of the current Contact within the Unified Call List. This Call ID set can then be selected from the [Call ID on page 603](#) field.

Accessed Only: When the System Type field is set to **Customized** or when the radio is model/option capable.

10.33.1.1.4

System Wide Talkgroup Hang Time

This field selects the amount of time that the radio waits once a system wide Talkgroup call has ended.

During this wait time, Talkgroup ID 65535 (FFFF Hex) is used for all ASTRO Talkgroup calls. This selection applies while operating on the current ASTRO Conventional System. Time is in seconds.

Accessed Only: When the System Type field is set to **ASTRO**, and when the radio is model/option capable.

The following selections are supported:

- Disabled
- 12 Hour
- 24 Hour

NOTE: The time is in seconds.

10.33.1.1.5

Preamble Length

This field selects the amount of time that determines the minimum number of bit sync preamble packets that are sent at the beginning of all ASTRO transmissions.

These packets allow transmitting and receiving radios to synchronize with each other prior to an ASTRO Systems transmission. The amount of time is equal to this Preamble Length setting multiplied by 0.2083 milliseconds (ms). This selection applies while operating on the current ASTRO Conventional System.

IMPORTANT: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Advanced Digital Privacy (ADP)**, the radio transmits a minimum of 50 milliseconds of preamble due to the delays encountered when encrypting the data stream.

Accessed Only: When the System Type field is set to **ASTRO** or **DVRS**.

Table 201: Range

Minimum	Maximum
0	1275

10.33.1.1.6

Limited Patience

This field selects the amount of time that the radio politely waits for the current channel traffic to clear.

Examples of transmissions using this value are: Call Alerts, Selective Calls, Messages, Statuses, and Emergency transmissions. This selection applies for the current Conventional System. In the emergency case, the radio politely waits after the Impolite Retries expires.

Accessed Only: When the System Type field is set to **ASTRO**, **DVRS** or **MDC**.

NOTE: When set to Infinite, no timer is used, therefore there is an infinite wait period.

Table 202: Range

Minimum	Maximum	Increments
1 s	255 s	1

10.33.1.1.7

Emergency Profile Selection

This field allows you to select the appropriate Conventional Emergency Profile to be used with the current Conventional System.

You can initiate Emergency Mode with the Emergency button-press

NOTE: The name(s) that appear for selection are defined in the Emergency Profile Name field.

Accessed Only: When the System Type field is set to **DVRS** or **MDC**, or (when the System Type field is set to **ASTRO**, and when the Remote Site Interface System field is disabled).

The following selections are supported:

- Emergency Tx Disabled
- Available Conventional Emergency Profiles

10.33.1.1.8

Data Profile Selection

This field allows you to select the appropriate Data Profile to be used with the current ASTRO or DVRS Conventional System.

WARNING:

For the **DVRS** System Type, a Data Profile is only valid when Data Profile Type is set to **Trunking**, and when Rx Voice Interrupts Data is **Enabled**, and when Limited Broadcast is **Disabled**, and when IP Header Compression Enable is **Disabled**, and when Terminal Data is **Disabled**, and when PAD Mode is set to **Disabled**, and when all of the DAC List entries have Operational Mode set to **Classic APCO 25**, and when the (Packet Data APCO 25) Secure/Clear Strapping is set to **Clear** or **Secure**, and when the Port List Selection is set to **Disabled**.

When the Dual Radio - Radio Selection field is set to **Secondary Radio** and the Enable Secondary Radio Tx field is **Disabled**, this field must be set to **Data Disabled** to be considered valid.

IMPORTANT: ASTRO and DVRS Conventional Systems are selected for use from the Conventional Personality's ASTRO System field.

Accessed Only: When the System Type field is set to **DVRS**, or (when the System Type field is set to **ASTRO**, and when the Remote Site Interface System field is disabled).

The following selections are supported:

- Data Disabled
- Available Data Profiles

10.33.2

Features

This section allows you to view or define basic functionality of individual ASTRO Signaling Systems.

NOTE: Conventional Systems are selected for use from the Conventional Personality's ASTRO System field or Non-ASTRO System field.

10.33.2.1

Radio Inhibit

This field enables the radio to receive a remote Inhibit signal while operating on the current Conventional System.

This inhibit signal is a shutdown command sent from the dispatcher unit. Upon receipt of this command, the radio transmits a quick acknowledgement to the dispatch equipment. The radio then goes into a dormant state during which the receiver audio is muted and the transmit audio path is blocked. While inhibited all your controls are rendered inoperative; Scan mode is stopped on the operating mode/channel which received the command, and all Radio LED's are turned off.

IMPORTANT: In order to clear the inhibited state of the radio, send an uninhibit command to the radio or redo the Read/Write process of the radio.

Accessed Only: When the System Type field is set to **DVRS** or **MDC** or (when the System Type field is set to **ASTRO**, and when the Remote Site Interface System field is disabled.)

10.33.2.2

Radio Check

This field allows the radio to decode and automatically respond to a Radio Check.

Radio Checks allow a dispatcher to check the state of the radio (turned on or off), as long as the radio is within the range of the system. This feature applies for the current Conventional System.

Accessed Only: When the System Type field is set to **DVRS** or **MDC**) or (when the System Type field is set to **ASTRO**, and when the Remote Site Interface System field is disabled.)

10.33.2.3

Status

This field enables the Status feature for the current Conventional System.

The Status feature allows you to select and transmit a specific Status from the programmed Status Alias List Window. You can activate the Status feature with a Status button-press, a Direct Status button-press, or a Status menu-selection (see also Status Number of Attempts and Status Auto Exit).

Accessed Only: When the radio is model/option capable, and ((when the System Type field is set to **DVRS** or **MDC**), or (when the System Type field is set to **ASTRO**, and when the Remote Site Interface System field is disabled)).

10.33.2.4

Status Request

This field enables the radio to automatically respond to a remote status interrogation with the last attempted status. This feature applies for the current Conventional System.

Accessed Only: When the radio is model/option capable, and when the Status field is enabled, and ((when the System Type field is set to **DVRS** or **MDC**), or (when the System Type field is set to **ASTRO**, and when the Remote Site Interface System field is disabled)).

10.33.2.5

Emergency Alarm Rx Indicator

This field selects the type of notification that you hear and sees when an Emergency alarm is received from another radio.

This feature must also be enabled (when appropriate) for the Individual MDC System or ASTRO System from the Emergency Alarm Rx Indicator field, or for the Trunking System from the Emergency Alarm Rx Indicator field. This selection applies while operating in Emergency Mode for both Conventional and Trunking communications.

IMPORTANT:

The Emergency Alarm Rx Indicator time lasts for 10 seconds. During these 10 seconds, you can deactivate the indicator by pressing any of the radio's buttons except **volume** and **light**.

Once the indicator clears or is cleared, retried emergency alarms from the same MDC Primary ID, or ASTRO System Individual ID, are ignored for the next 20 seconds.

Emergency alarms are not detected while the radio is in scan mode.

Emergency alarms are not detected while the radio is active on a voice channel.

The following selections are supported:

No Indication

No alerts are heard or seen.

Alert Only

Sounds an audio alert.

Display Only

A visual alert appears. The visual alert applies only for display model radios.

Alert & Display

Sounds an audio alert and a visual alert appears. The visual alert applies only for display model radios.

NOTE:

For the **Display Only** and the **Alert and Display** selections the following are true: When an Emergency Alarm is detected by the radio, **EA-RCVD** (Emergency Alarm Received) appears in the radio's display. When an Emergency Fine Me Beacon is detected by the radio, **BCON RX** (Emergency Beacon Received) appears in the radio's display.

EA-RCVD is displayed alternately with either the MDC Primary ID, ASTRO System Individual ID, or the Trunking Unit ID of the radio that sent the Emergency Alarm, and continues for ten seconds. Reverse Aliasing / Caller ID is also possible.

10.33.2.6

POP25 Enable

This field enables the radio to receive Programming Over Project 25 (POP25) communications while operating on the current ASTRO Conventional System.

POP25 is also referred to as OTAP (Over The Air Programming).

IMPORTANT: For POP25 to be accomplished on an ASTRO System, an Advanced Conventional Key (ACK) or an Advanced System Key (ASK) with OTAP / POP25 access must be loaded in the RadioCentral.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware**, when the System Type field is set to **ASTRO**, and when a valid referenced Data Profile has been selected for the current System, when the Remote Site Interface System field is disabled, and when the radio is model/option capable.

10.33.2.7

CAI Data Registration

This field enables the radio to register on the data portion of the Fixed Network Equipment (FNE) infrastructure; the FNE is also referred to as "The System".

The data portion of the system then sends a Common Air Interface (CAI) Data Registration response or acknowledgement confirming the registration back to the radio. The radio events that trigger this registration include: radio power up, mode change, exiting scan, and radio power down. This feature applies for the current Conventional System.

WARNING:

This field becomes invalid if one of the following scenarios is true:

- When the System Type is set to **ASTRO**, when the referenced Data Profile's Data Profile Type is **Broadband-Only**, and when this field is set to **Enabled**.
- When the System Type is set to **ASTRO**, and when the referenced Data Profile's Data Profile Type is **Conventional & Broadband**, and when this field is set to **Disabled**.

IMPORTANT:

The radio only attempts CAI Data Registration when there is a data feature enabled on the radio's selected personality/channel.

The radio's data features are only available once the radio successfully registers with the system, and then when the radio receives back an acknowledgement of successful registration from the system.

Accessed Only: When the System Type field is set to **ASTRO**, when the Remote Site Interface System field is disabled, and when the radio is model/option capable.

10.33.2.8

Send Location to Peer/on PTT

ASTRO system enables a transmitting radio to encode its location coordinates in its ASTRO voice transmissions in a manner similar to PTT ID (see also Display Peer Location).

WARNING: ARS Mode must be set as **Enhanced Server** in the Data Profile record to prevent invalid Fields Report when System Type is DVRS.

IMPORTANT:

In ASTRO system, the radio-to-radio voice transmissions support encoding the location coordinates in the voice stream; in other words, Conventional Pages and Selective Calls support Display Peer Location, however, DVRS, phone mode and other infrastructure-dependent features do not support Display Peer Location. In DVRS system, the radio-to-infrastructure voice transmission supports encoding the location coordinates in the voice stream.

If location coordinates are not obtainable from the radio's GPS receiver (either because the GPS signal is disrupted in some way, or User Selectable Location Enable is enabled and you have turned OFF the GPS feature with Location button-press or Location menu-selection), the radio encodes the last-saved location coordinates into the voice stream.

If the update interval since the last-saved location coordinates exceeds an internal timer, then the radio marks the location coordinates in the voice stream as being "stale"; if there are no saved location coordinates, the radio sends the voice stream without any location data.

Accessed Only: When the radio is model/option capable, and when the System Type field is set to **ASTRO**, and when the System Type field is set to **DVRS**, and ARS Mode is **Enhanced Server** in its Data Profile, and when the Location Enable field is enabled.

10.33.2.9

Text Messaging Service

This field selects the Text Messaging mode for the current ASTRO Conventional System.

WARNING: When Text Messaging Service is used while in Data Scan and the Data Scan Preamble Length is increased or decreased from the default value, the Retry Short Timer needs to be increased or decreased accordingly. For example in Direct Data Mode of operation (see Packet Data Mode), if the value of the Data Scan Preamble Length is increased to 30 (from the default of 20), then the Retry Short Timer should be increased to 25 seconds (from the default of 15). For every 10 units added for Data Scan Preamble Length, the Retry Short Timer should be increased by 10 seconds.

IMPORTANT:

You can access Text Messaging with the Text Messaging Service button-press, or the Text Messaging Service menu-selection.

You can access Quick Text Messaging with the TMS Quick Text button-press.

You can access Query Messaging with the TMS Query button-press.

Accessed Only: When the System Type field is set to **ASTRO**, and when a valid referenced Data Profile has been selected for the current System, when Data Profile Selection is not set to **Data Disabled**, SmartMessaging Mode is set to **LMR**, and when the radio is model/option capable.

The following selections are supported:

None

Feature is disabled.

List Only

Allows you to only select Text Messages from the programmed Quick Text Messages List.

Unlimited

Allows you to select from the Quick Text Messages, and enter your own text message from the radio keypad.

WARNING: This selection is only available on radios that have a keypad or Keypad Mic.

NOTE: This selection is not applicable to APX N70.

10.33.2.10

Group Text Messaging Service

This field selects the Group Text Messaging mode for the current ASTRO or DVRS Conventional System.

Accessed Only: When the System Type field is set to **ASTRO** or **DVRS**, and when the radio is model/option capable.

The following selections are supported:

Disabled

Group Text Message will not be received.

Full Decode

Group Text Message will be received.

10.33.2.11

Select Call/In-Call Reset

This field selects a timed or manual unmute-exception to the programmed Conventional Personality ASTRO Rx Unmute Rule, and a timed or manual Unmute-exception for call alerts when you activate the channel Voice Mute (see the Conventional Personality In-Call User Alert Enable feature).

The exception time (timed or manual) is known as the Release Squelch State. For the two timed selections below, the Auto Reset Time field partially determines how long the Release Squelch State continues. This selection applies for the current Conventional System.

NOTE: ASTRO and DVRS Conventional Systems are selected for use from the Conventional Personality's ASTRO System field.

IMPORTANT:

For call alerts, the Release Squelch State begins when the Voice Mute In-Call User Alert Enable feature is active and the radio has unmuted.

For ASTRO System Calls when the Voice Mute In-Call User Alert feature is not active, the Release Squelch State begins when the Personality's ASTRO Rx Unmute Rule are met and the radio has unmuted. When you activate the Voice Mute In-Call User Alert feature, the Release Squelch state applies only to Call Alerts. This is true due to the Voice Mute feature only allowing the radio to unmute to Call Alerts.

Accessed Only:

- When the System Type field is set to **DVRS**, or
- When the System Type field is set to **ASTRO**, and when the Remote Site Interface System field is disabled.

The following selections are supported:

Selective Call : For the two timed selections, while the Auto Reset Time is running, whenever the radio's PTT button is pressed the timer is stopped and reset; once the PTT button is released the timer is then re-started (from zero) thus extending the Release Squelch State even further.

Manual

- For Mobile: Currently this selection does not apply for Selective Calls.
- For Portable: Pressing the "Monitor" button ends the Release Squelch State.

Auto

If the timer expires regardless of whether the radio is muted or unmuted, the Release Squelch State is ended and the radio's ASTRO Rx Unmute Rules are again required in order to unmute to any future transmissions.

Auto w/carrier

If the radio is unmuted when the timer expires (due to carrier override) the radio remains unmuted until carrier is dropped. Once carrier is dropped and the radio is muted, the timer is reset and re-started in-effect extending the Release Squelch state again; if the radio then remains muted for an entire timer period (without any carrier override), the Release Squelch State is ended and the ASTRO Rx Unmute Rules are again required in order to unmute to any future transmissions.

Call Alert

Manual

The following two manual methods of ending the Release Squelch State, also apply to you when "Auto" or "Auto w/carrier" are selected.

- When the Voice Mute In-Call User Alert Enable feature is active, pressing the Voice Mute button, or the Voice Mute menu-selection deactivates Voice Mute and ends the Release Squelch State.
- Pressing the PTT button ends the Release Squelch State.

Auto

If the timer expires, regardless of whether the radio is muted or unmuted, the Release Squelch State is ended and the Voice Mute In-Call User Alert Enable rules are again required in order to unmute to any future transmissions.

Auto w/carrier

If the radio is unmuted when the timer expires (due to carrier override) the radio remains unmuted until carrier is dropped. Once carrier is dropped and the radio is muted, the timer is reset and re-started in-effect extending the Release Squelch state again; if the radio then remains muted for an entire timer period (without any carrier override), the Release Squelch State is ended and the Voice Mute In-Call User Alert Enable rules are again required in order to unmute to any future transmissions.

10.33.2.12

Auto Reset Time

This field selects an amount of time used during the unmute-exception to the programmed ASTRO Rx Unmute Rule or Non-ASTRO Unmute Type and selects an amount of time used during the Unmute-exception for Call Alerts when you activate the channel Voice Mute (see the ASTRO In-Call User Alert Enable field or the Non-ASTRO In-Call User Alert Enable).

The exception time is known as the Release Squelch State. This timer is only relevant to the two Select Call/In-Call Reset timed selections. This selection applies for the current Conventional System. Time is measured in seconds.

Accessed Only: When the Select Call/In-Call Reset field is not set to **Manual**, when the System Type field is set to **DVRS, MDC, DTMF, Quik-Call II, or ASTRO**, and when the Remote Site Interface System field is disabled.

Table 203: Range

Minimum	Maximum
0 s	255 s

10.33.2.13

Remote Radio Mode

This field allows the radio to decode a Remote Monitor or Radio Trace command for the current Conventional System.

NOTE:

The radio's Tx LED becomes solid red indicating that the radio is transmitting in this Remote Monitor mode.

You can break out of a Remote Monitor mode with a manual channel change or by powering-off the radio.

Accessed Only: When the System Type field is set to **ASTRO** or **MDC**, and when the radio is model/option capable.

The following selections are supported:

Disabled

Remote Radio Mode is not available.

Radio Trace (Not possible for MDC)

The radio automatically keys-up sending unmodulated carrier allowing a lost or stolen radio to be found. The radio keys-up for the time selected by the Tx Base Time.

Remote Monitor

The radio automatically keys-up transmitting audio. This is especially useful in an emergency man-down situation. The radio keys-up for the time selected by the Tx Base Time.

10.33.2.14

Tx Base Time

This field selects the amount of time that the radio remains keyed-up once a Remote Radio Mode command has been received.

This selection applies for the current Conventional System. Time is in seconds.

Accessed Only: When the System Type field is set to **ASTRO** or **MDC**, and when the Remote Radio Mode field is set to **Radio Trace** or **Remote Monitor**, and when the radio is model/option capable.

Table 204: Range

Minimum	Maximum	Increments
10 sec	120 sec	10 sec

10.33.2.15

OTA Radio Alias Type

This field configures the encoding (transmitting) and decoding (receiving) of the Over-the-Air (OTA) Radio Alias feature.

WARNING: Radio cannot display alias if the radio receives duplicated IDs until the duplication is removed. Writing the codeplug to the radio will cause the call list to return to its original state and all OTA alias updates will be lost.

IMPORTANT: If OTA alias update did not show up on the display, you must update the radio call list in RadioCentral or provisioning manager.

The following selections are supported:

Disabled

The radio does not transmit or receive the Radio Alias data.

Leading Only

Radio Alias data transmits before voice only.

WARNING: This selection is only valid when the [Tx Voice/Signal Type on page 393](#) field is set to **ASTRO**, and when the referenced Conventional System is not DVRS.

Trailing Only

Radio Alias data transmits after voice only.

WARNING: This selection is only valid when the Tx Voice/Signal Type field is set to **ASTRO**, and when the referenced Conventional System is not DVRS.

Leading and Trailing

Radio Alias data transmits before and after voice.

WARNING: This selection is only valid when the Tx Voice/Signal Type field is set to **ASTRO**, and when the referenced Conventional System is not DVRS.

Decode Only

Radio Alias data receives the data without limitation.

Accessed Only: When the radio is model/option capable.

10.33.2.16

OTA Radio Alias Update Enable

This field allows the current system to update the radio alias.

Accessed Only: When the Radio ID Enable is enabled, and when [Rx Voice/Signal Type on page 390](#) is not **Non-ASTRO**, and [ASTRO System on page 414](#) is referencing a DVRS system, and when [OTA Radio Alias Type on page 386](#) is not **Disabled**, and when the radio is model/option capable.

10.33.2.17

Personnel Accountability List Selection

This field allows you to select a personnel accountability list to be used while operating Conventional System.

Accessed Only: When the System Type field is set to **ASTRO** or **DVRS**, and when the radio is model/option capable.

The following selections are supported:

- Disabled
- Available Personnel Accountability

10.33.2.18

Qualify Emergency Alarm Rx

If this field is enabled, the radio is restricted from receiving Motorola Data Communications (MDC) Emergency Alarms when the incoming transmission is Private Line (PL) or Digital Private Line (DPL) qualified. This qualification means that the incoming transmission matches the RX/TA Squelch Type and RX/TA Squelch Code of the Conventional Personality.

When appropriate, you must also enable this feature from the **Emergency Alarm Rx Indicator** field. This selection applies to the current Conventional MDC System.

IMPORTANT: If this field is enabled and the incoming signal fails the PL or DPL qualification, the emergency alarms are not detected.

Assessed Only: When the System Type field is set to **MDC** and the Emergency Alarm Rx Indicator field is enabled.

10.33.2.19

Text Messaging Service

This field selects the Text Messaging mode for the current ASTRO Conventional System.

WARNING: When Text Messaging Service is used while in Data Scan and the Data Scan Preamble Length is increased or decreased from the default value, the Retry Short Timer needs to be increased or decreased accordingly. For example in Direct Data Mode of operation (see Packet Data Mode), if the value of the Data Scan Preamble Length is increased to 30 (from the default of 20), then the Retry Short Timer should be increased to 25 seconds (from the default of 15). For every 10 units added for Data Scan Preamble Length, the Retry Short Timer should be increased by 10 seconds.

IMPORTANT: You can access Text Messaging with the Text Messaging Service button-press, or the Text Messaging Service menu-selection.

You can access Quick Text Messaging with the TMS Quick Text button-press.

You can access Query Messaging with the TMS Query button-press.

Accessed Only: When the System Type field is set to **ASTRO**, and when a valid referenced Data Profile has been selected for the current System, when Data Profile Selection is not set to **Data Disabled**, SmartMessaging Mode is set to **LMR**, and when the radio is model/option capable.

The following selections are supported:

None

Feature is disabled.

List Only

Allows you to only select Text Messages from the programmed Quick Text Messages List.

Unlimited

Allows you to select from the Quick Text Messages, and enter your own text message from the radio keypad.

WARNING: This selection is only available on radios that have a keypad or Keypad Mic.

NOTE: This selection is not applicable to APX N70.

10.33.3

Quik-Call II

This section allows you to view or define Quik-Call II (QCII) Tone functionality for individual QCII Conventional Systems.

NOTE: Quik-Call II Conventional Systems are selected for use from the Conventional Personality's Non-ASTRO System field.

Accessed Only: When the System Type field is set to **Quik-Call II**, and when the radio is model/option capable.

10.33.3.1

QCII Decode

This feature refers to the available Quik-Call II (QCII) system that will co-exist with the selected Motorola Data Communications (MDC). This feature provides the ability to decode and encode QCII, and to encode or decode MDC on the same channel.

If this feature is enabled, you can select Call Format. It also allows you to select the different tones available in Digital Tone Signaling in Analog.

NOTE: This feature cannot be enabled with Instant Recall.

10.34

Conventional Personality

The **Conventional Personality** allows you to create and delete Conventional Personalities, as well as define individual Conventional Personalities. Conventional and Trunking are the two radio communications modes.

Conventional Personalities types include **ASTRO**, **DVRS**, **Mixed Mode**, **MDC**, **Quik-Call II**, and **No Signaling**.

NOTE: Once the features of the Conventional Personalities have been uniquely defined, each personality may then be assigned to the desired position of the radio's channel selector. This is accomplished from the Zone Channel Assignment's Channels Page.

10.34.1

General

This section allows you to view or define functionality for individual Conventional Personalities.

NOTE: Once the features of the Conventional Personalities have been uniquely defined, each personality may then be assigned to the desired position of the radio's channel selector. This is accomplished from the Zone Channel Assignment's Channels Page.

10.34.1.1

Conventional Personality Name

This field allows you to define a recognizable name for the current Conventional Personality.

NOTE:
Examples: Fire005, Electric1, #510.

Characters, numbers, spaces, and special characters can be used.

Up to 14 characters are possible.

10.34.1.2

Conventional Personality Type

This field displays the type that was selected when the personality was created.

Conventional Personalities types include **ASTRO**, **DVRS**, **Mixed Mode**, **MDC**, **Quik-Call II**, and **No Signaling**.

10.34.1.3

Advanced RF AGC

This field selects the type of Receive Frequency (RF) Automatic Gain Control (AGC) that applies for the current Conventional Personality.

The following selections are supported:

Disabled

Even when **Disabled**, the radio uses a basic form of AGC built into the radio's receiver. This built-in protection helps to avoid signal clipping and receiver saturation that may damage radio components.

Standard

Enables an Advanced form of RF AGC, which attempts to protect against intermodulation (IM) interference by detecting and removing any received interference due to external sources.

Enhanced

Enables the radio to use additional schemes to reduce IM interference, which cleans up the signal.

Smart

Enables the radio to use a unique scheme to improve interference immunity when close to Linear Simulcast and APCO phase 2 Base stations. Smart option is mutually exclusive to the Broadband Protection checkbox.

IMPORTANT: **Standard** and **Enhanced** Advanced RF AGC may degrade performance on channels that do not experience any IM interference. Therefore, only enable these selections on channels known to experience IM interference.

10.34.2

Rx Options

This section allows you to view or define functionality having to do only with the radio's receive (Rx) mode for individual Conventional Personalities.

NOTE: Once the features of the Conventional Personalities have been uniquely defined, each personality may then be assigned to the desired position of the radio's channel selector. This is accomplished from the Zone Channel Assignment's Channels Page.

10.34.2.1

Receive Only Personality

This field causes the radio to not have transmit capability while operating on the current Conventional Personality.

Receiving calls will be the only operation permitted on this personality.

NOTE: If the personality is created by the Zone Cloning feature, the personality cannot be a Receive Only Personality.

Accessed Only: When the personality is not created by the Zone Cloning feature.

10.34.2.2

Rx Voice/Signal Type

This field selects the signaling mode when receiving (Rx) voice for the current Conventional Personality.

WARNING:

When the Remote Site Interface (RSI) System field in the referenced Conventional System is **Enabled**, this field must be set to **ASTRO**; otherwise the RadioCentral considers this field's value invalid.

When the Analog Flat Audio field is **Enabled**, this field must be set to **Non-ASTRO**; otherwise the RadioCentral considers this field's value invalid.

When the [Mixed Vote Scan Enable on page 431](#) field is **Enabled**, this field must be set to **Non-ASTRO** or **ASTRO**; otherwise the RadioCentral considers this field's value invalid.

The following selections are supported:

Non-ASTRO

Only Non-ASTRO analog type signals are received.

An **MDC** or **QCII** System Type must be selected in the Non-ASTRO Signaling Type and then a Non-ASTRO System must be selected.

Mixed Mode

Both ASTRO digital and Non-ASTRO analog type signals can be received.

An ASTRO - Conventional Systems must be selected in the ASTRO System field, and an **MDC** or **QCII** System Type must be selected in the Non-ASTRO Signaling Type and then a Non-ASTRO System must be selected.

IMPORTANT: ASTRO communications take priority over receiving Non-ASTRO Signaling Type communications.

ASTRO

Only ASTRO digital type signals are received.

An ASTRO - Conventional Systems must be selected in the [ASTRO System on page 414](#) field.

10.34.2.3

Unmute/Mute Type

This field selects the rule that determines when a radio opens and closes its speaker to receive audio for the current Conventional Personality.

The Unmute/Mute rules apply only when PL is the selected [Rx/TA Squelch Type on page 402](#) for the current Conventional channel.

NOTE: Unmuting opens the radio's speaker to receive audio. Muting closes the radio's speaker to receive audio.

The following selections are supported:

Standard

To unmute on Proper Private Line (PL) code detection, and to mute on loss of proper PL code.

Unmute, Standard Mute

To unmute on Proper PL code detection and carrier squelch detect, and to mute on loss of proper PL code.

Unmute, Or Mute

To unmute on Proper PL code detection and Carrier Squelch detect, and to mute on loss of proper PL code or loss of Carrier Squelch detect.

NOTE: Proper refers to there being a code match between the transmitting radio's [Tx PL Code on page 411](#), and the receiving radio's [Rx/TA PL Code on page 405](#). The transmitting radio's [Tx Squelch Type on page 409](#) and the receiving radio's Rx/TA Squelch Type must also be a match; that is, Tx TPL for Rx TPL, or Tx DPL for Rx DPL.

10.34.2.4

Rx Unmute Delay

This field selects the amount of time that the radio stays muted once carrier squelch has been detected for the current Conventional Personality.

This delay is sometimes needed to allow signaling data to arrive silently. Time is in milliseconds.

Table 205: Range

Minimum	Maximum
0 ms	2150 ms

10.34.2.5

Squelch (Fine Tune)

This field selects the value that is combined with the master squelch value that determines the overall carrier squelch threshold for the current Conventional Personality.

The higher this number is set, the tighter the squelch threshold. A tighter threshold causes a stronger carrier signal to be required for the radio's speaker to unmute. This helps to reduce interference.

Accessed Only: When the Squelch Per Personality field is **Enabled**.

Table 206: Range

Minimum	Maximum
0	15

10.34.2.6

Busy LED

This field enables the yellow LED to indicate the presence of a carrier (busy channel) for the current Conventional Personality.

10.34.2.7

Rx De-Emphasis

This field enables Receive (Rx) De-Emphasis for the current Conventional Personality.

NOTE:

De-emphasis reverses a pre-emphasized signal when received by the radio.

Transmit emphasis audio filtering ([Transmit Pre-Emphasis on page 394](#)) increases the signal-to-noise ratio for higher frequencies. More simply put, the lower frequency's "noise" is reduced and the higher frequency's "voice" is increased.

10.34.2.8

HearClear

This field selects to enhance audio clarity by applying a compression/expansion algorithm to the transmitted and received signals respectively.

This feature applies for the current Conventional Personality.

IMPORTANT: With companding, the dynamic range of the transmit audio is compressed and then expanded to its original level in the receive audio. Therefore, companding must be enabled on both the transmitting and the receiving radios or distorted audio will result. Since the compression/expansion algorithm is active both on transmit and receive audio, expanding uncompressed audio or compressing audio without subsequently expanding it will both result in unnatural-sounding audio output. The audio path to the dispatcher must also be companded.

This feature applies only for analog signals.

Accessed Only: When the [Rx Voice/Signal Type on page 390](#) field is set to **Non-ASTRO** or **Mixed Mode**, and when the referenced Conventional System selected in the ASTRO System field is not a DVRS System Type, and when the DVRS Hardware Enable field is **Disabled**.

The following selections are supported:

Disabled

No noise canceling or companding is applied to the transmit/receive signals.

Companding Only

Companding is applied to both the transmit and receive audio (see Important Note).

Noise Cancellation Only

Noise cancellation is applied to the receive audio.

Companding and Noise Cancellation

Companding is applied to both the transmit and receive audio (see Important Note) and noise cancellation is applied to the receive audio.

NOTE: The **Noise Cancellation Only** and **Companding and Noise Cancellation** settings can only be applied if all frequencies on the current personality are in the 900 MHz range.

10.34.2.9

Concurrent Rx Enable

When this field is enabled together with the [Concurrent Rx Enable](#) field in Radio Wide, you can control Concurrent Rx on a personality basis instead of a radio-wide basis.

NOTE: This field is enabled by default.

Accessed Only: When Concurrent Rx Enable field in Radio Wide is enabled.

10.34.3

Tx Options

This section allows you to view or define functionality having only to do with the radio's transmit mode for individual Conventional Personalities.

NOTE: Once the features of the Conventional Personalities have been uniquely defined, each personality may then be assigned to the desired position of the radio's channel selector. This is accomplished from the Zone Channel Assignment's Channels Page.

Accessed Only: When the Receive Only Personality field is **Disabled**.

10.34.3.1

Tx Voice/Signal Type

This field selects the voice-transmit (Tx) signaling mode that applies when the Rx Voice/Signal Type field for the current Conventional Personality is set to **Mixed Mode**.

IMPORTANT:

When the [Rx Voice/Signal Type on page 390](#) field is set to **Non-ASTRO** or **ASTRO** mode, this selection must exactly follow the Rx Voice/Signal Type selection for the current Conventional Personality in order to be considered valid by the RadioCentral.

This field remains accessible even when this personality's [Receive Only Personality on page 389](#) field is **Enabled**, because this personality will still be capable of initiating Emergency Mode when the [Emergency Revert Type on page 417](#) is set to **Revert Channel**, [Emergency Revert Zone on page 417](#) and [Emergency Revert Channel on page 418](#) assignments are defined for this personality.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

ASTRO

Only ASTRO System digital signals are transmitted.

Non-ASTRO

Analog signals are transmitted.

NOTE: Depending on the RadioCentral version in use and/or the capability of the radio, Phone Mode operation may be unavailable in **ASTRO** mode.

10.34.3.2

Time Out Timer

This field selects the amount of time that the radio is able to transmit.

When this timer expires, the radio is automatically de-keyed and a continuous alert tone is sounded for as long as the PTT button is pressed. To continue transmitting, the PTT button must be released and the radio re-keyed. This feature applies for the current Conventional Personality. Time is in seconds.

Accessed Only: When the [Receive Only Personality on page 389](#) field is **Disabled**, and (if the [Rx Voice/Signal Type on page 390](#) field is set to **ASTRO**, then the Remote Site Interface System field in the referenced Conventional System must be **Disabled**).

NOTE: When set to **Infinite**, no timer is used for Non-APX4000XH Radios; therefore there is an infinite talk time. This selection is invalid for APX4000XH Radios.

Table 207: Range (for Non-APX4000XH Radios)

Minimum	Maximum	Increments
15 sec	465 sec	15 sec

Table 208: Range (for APX4000XH Radios)

Minimum	Maximum	Increments
15 sec	60 sec	15 sec

10.34.3.3

Transmit Pre-Emphasis

This field enables transmit (Tx) pre-emphasis audio filtering for the current Conventional Personality.

NOTE: Pre-emphasis increases the signal-to-noise ratio for higher frequencies; that is, the lower frequencies noise is reduced and the higher frequencies voice is increased.

NOTE: [Rx De-Emphasis on page 391](#) reverses a pre-emphasized signal when received by the radio.

WARNING: When this feature is enabled, it becomes invalid when the Analog Flat Audio field is also **Enabled**. Therefore both features may not be enabled on the same Personality.

Accessed Only: When the [Receive Only Personality on page 389](#) field is **Disabled**.

10.34.3.4

Reverse Burst/Turn-Off Code

This field enables either the Tone Private Line (TPL) Reverse Burst or Digital Private Line (DPL) Turn-Off Code to be transmitted when the radio is de-keyed.

This is based on the [Tx Squelch Type on page 409](#) (TPL or DPL) selected for the current Conventional Personality.

NOTE: Both features transmit a sub-audible tone that causes the receiving radio to mute its speaker before loss of a carrier is detected. Muting the speaker eliminates unwanted noise (squelch tail) during loss of carrier detection.

Accessed Only: When the [Receive Only Personality on page 389](#) field is **Disabled**.

10.34.3.5

Transmit Power Level

This field selects the radio's power level for transmitting while operating on the current Conventional Personality.

NOTE: The Tx Low Power button-press, the Tx Low Power switch-toggle, and the Power menu-selection take precedence over this setting when selected by you.

During Emergency Mode the radio automatically transmits at high power.

Accessed Only: When the [Receive Only Personality on page 389](#) field is **Disabled**.

The following selections are supported:

Low

Used when communicating in close proximity, and to keep the radio from transmitting into other geographical groups operating on the same frequency.

High

Used when a stronger signal is needed to extend transmission distances.

10.34.3.6

Adaptive Power

This field enables the radio to use a mid-power operation level if the signal strength report from the dispatch station indicates a strong received signal.

The radio always transmits initially with full power. Once the radio de-keys it looks for a data message from the station. If the station reports that the last reception was strong, the radio automatically

switches to a mid-power setting. This feature applies while operating in ASTRO Signaling mode and when on the current Conventional Personality.

NOTE: Adaptive power is only available on ASTRO Tx channels.

Accessed Only: (When the radio is model/option capable, and when the [Transmit Power Level on page 394](#) field is **High**), and ((when the [Rx Voice/Signal Type on page 390](#) field is **Mixed Mode**), or (when the Rx Voice/Signal Type field is **ASTRO**, and when the Remote Site Interface System field in the referenced Conventional System is **Disabled**)).

10.34.4

Frequency Options

This section allows you to view or define many Conventional transmit, receive and Direct/Talkaround settings within unique profiles for the current Conventional Personality.

IMPORTANT: If [Mixed Vote Scan Enable on page 431](#) is **Enable** for the current Personality, then all of the Frequency Options records/rows associated with the current Personality are used to form the Voting Scan list. The maximum number of Frequency Options is limited to 15.

NOTE: Once the features of the Conventional Personalities have been uniquely defined, each personality may then be assigned to the desired position of the radio's channel selector. This is accomplished from the [Channels on page 607](#) section of the [Zones Channel Assignment on page 605](#).

If the personality is created by the Zone Cloning feature, the Frequency Option List can only contain one record.

10.34.4.1

LTE Interference Frequency Present

This field enabling this feature makes the RadioCentral aware that this Frequency Options table contains one or more 700MHz frequencies on this non-LTE Broadband-enabled personality/channel.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

Due to LTE also operating on the 700MHz band, frequency interference detrimental to radio communications is possible. This feature applies for all Frequency Options profiles (record/rows) of the current Conventional Personality.

When this personality/channel is LTE Broadband-enabled, this feature must be **Disabled**, otherwise, it becomes invalid.

NOTE: A Conventional channel is LTE enabled when the Personality's referenced ASTRO - Conventional System has a referenced Data Profile having a Data Profile Type equal to **Conventional & Broadband** or **Broadband-Only**, and when that Data Profile's Broadband Source is **Internal LTE Modem**.

NOTE: Frequency Option profiles can be selected for use within the Zone Channel Assignment's Channels Page; first, the personality is selected in the Personality field, and then the Frequency Options profile is selected in the Frequency Options field.

Accessed Only: When the radio is model/option capable.

10.34.4.2

Frequency Options Name

This field allows you to modify the default name assigned by RadioCentral for the Frequency Options.

NOTE:

Examples: Frequencies004, Power03, #510

Characters, numbers, spaces, and special characters can be used.

Up to 14 characters are supported.

10.34.4.3

Rx/TA Frequency

This field selects the designated frequency used for receiving the carrier signal of a radio communication, and optionally for transmitting the carrier signal while Direct/Talkaround is activated on the channel.

This selection applies only for the current Frequency Options profile (record/row) of the current Conventional Personality.

WARNING: 6.25 kHz step size for the 800 MHz frequency band:

Starting with Release R09.01.00, when the [Tx Deviation/Channel Spacing on page 398](#) is **2.5 kHz / 12.5 kHz**, the RadioCentral allows a 6.25 kHz step size for Conventional frequencies in the 800 MHz frequency band, to meet regulatory compliance in certain (non-FCC) countries; however, be aware that two radios operating on adjacent channels separated by 6.25 kHz only may experience undesirable crosstalk phenomena.

NOTE: Frequency Option profiles are selected for use within the Zone Channel Assignment's Channels Page; first, the personality is selected in the [Personality on page 608](#) field, and then the Frequency Options profile is selected in the [Conventional Frequency Option on page 609](#) field.

IMPORTANT: (applicable to ASTRO Signaling)

When [Direct/Talkaround on page 397](#) is **Enabled** for this Frequency Options profile and the [Direct Frequency Enable on page 364](#) field is **Enabled**, the Direct Network ID can then be modified on a per Frequency Options profile basis. When you initiate Direct/Talkaround mode, the radio then transmits and receives on the Direct Frequency instead of this Rx/TA Frequency.

When Direct/Talkaround is **Enabled** for this Frequency Options profile and the Direct Frequency field is **Disabled**, the Rx/TA Frequency and [Rx Network ID on page 399](#) settings are used whenever you initiate Direct/Talkaround mode.

Direct/Talkaround must be **Enabled** on a Frequency Options profile in order to be available to you for a radio channel. You can select Direct/Talkaround mode with the [Talkaround/Direct on page 176](#) button-press, the [Talkaround/Direct on page 187](#) switch-selection, or the [Direct/Talkaround on page 196](#) menu-selection.

IMPORTANT: applicable to Non-ASTRO (MDC, DTMF, Quik-Call II, and Singletone) Signaling

When Direct/Talkaround is **Enabled** for this Frequency Options profile and the Direct Frequency field is **Enabled**, the Direct/Talkaround parameters can then be modified on a per Frequency Options profile basis. When you initiate Direct/Talkaround mode, the radio then transmits and receives on the Direct Frequency using these frequency parameters.

When Direct/Talkaround is **Enabled** for this Frequency Options profile and the Direct Frequency Enable field is **Disabled**, the settings for the Rx parameter fields are used whenever you initiate Direct/Talkaround mode.

Direct/Talkaround must be **Enabled** on a Frequency Options profile in order to be available to you for a radio channel. You can select Direct/Talkaround mode with the Direct/Talkaround button-press, the Talkaround/Direct switch-selection, or the Direct/Talkaround menu-selection.

Accessed Only: When the radio is model/option capable.

10.34.4.4

Tx Frequency

This field selects the designated frequency used for transmitting the carrier signal of a radio communication.

This selection applies only for current [Frequency Options on page 395](#) profile (record/row) of the current [Conventional Personality on page 388](#).

WARNING:

When the [Mixed Vote Scan Enable on page 431](#) field is **Enabled** and the [Mixed Vote Scan Tx Steering on page 431](#) field is **Disabled**, this field must be a match for all Frequency Options in the current Personality; otherwise the application considers this field's value invalid.

6.25 kHz step size for the 800 MHz frequency band:

Starting with Release R09.01.00, when the [Tx Deviation/Channel Spacing on page 398](#) is **2.5 kHz / 12.5 kHz**, the application allows a 6.25 kHz step size for Conventional frequencies in the 800 MHz frequency band, to meet regulatory compliance in certain (non-FCC) countries; however, be aware that two radios operating on adjacent channels separated by 6.25 kHz only may experience undesirable crosstalk phenomena.

NOTE: Frequency Option profiles can be selected for use within the Zone Channel Assignment's Channels Page; first, the personality is selected in the [Personality on page 608](#) field, and then the Frequency Options profile is selected in the [Conventional Frequency Option on page 609](#) field.

Accessed Only: When the [Receive Only Personality on page 389](#) field is **Disabled**, and when the radio is model/option capable.

10.34.4.5

Direct/Talkaround

This field enables Direct/Talkaround functionality for the current Frequency Options profile.

Direct/Talkaround is typically initiated by you for direct radio-to-radio communications in close proximity or when a repeater is not operational or is out of range. This feature applies only for current Frequency Options profile (record/row) of the current Conventional Personality.

NOTE: Frequency Option profiles can be selected for use within the Zone Channel Assignment's Channels Page; first, the personality is selected in the [Personality on page 608](#) field, and then the Frequency Options profile is selected in the [Conventional Frequency Option on page 609](#) field.

IMPORTANT: (applicable to ASTRO Signaling)
When Direct/Talkaround is **Enabled** for this Frequency Options profile and the [Direct Frequency Enable on page 364](#) field is **Enabled**, the Direct Network ID can then be modified on a per Frequency Options profile basis. When you initiate Direct/Talkaround mode, the radio then transmits and receives on the Direct Frequency instead of the [Rx/TA Frequency on page 396](#).

When Direct/Talkaround is **Enabled** for this Frequency Options profile and the Direct Frequency field is **Disabled**, the Rx/TA Frequency and [Rx Network ID on page 399](#) settings are used whenever you initiate Direct/Talkaround mode.

Direct/Talkaround must be **Enabled** on a Frequency Options profile in order to be available to you for a radio channel. You can select Direct/Talkaround mode with the [Talkaround/Direct on page 176](#) button-press, the [Talkaround/Direct on page 187](#) switch-selection, or the [Direct/Talkaround on page 196](#) menu-selection.

IMPORTANT: applicable to Non-ASTRO (MDC, DTMF, Quik-Call II, and Singletone) Signaling
When Direct/Talkaround is **Enabled** for this Frequency Options profile and the Direct Frequency Enable field is **Enabled**, the Direct/Talkaround parameters can then be modified on a per Frequency Options profile basis. When you initiate Direct/Talkaround mode, the radio then transmits and receives on the Direct Frequency using these frequency parameters.

When Direct/Talkaround is **Enabled** for this Frequency Options profile and the Direct Frequency Enable field is **Disabled**, the settings for the Rx parameter fields are used whenever you initiate Direct/Talkaround mode.

Direct/Talkaround must be **Enabled** on a Frequency Options profile in order to be available to you for a radio channel. You can select Direct/Talkaround mode with the Direct/Talkaround button-press, the Talkaround/Direct switch-selection, or the Direct/Talkaround menu-selection.

Accessed Only: When the [Receive Only Personality on page 389](#) field is **Disabled**, and (if the [Rx Voice/Signal Type on page 390](#) field is set to **ASTRO**, then the Remote Site Interface System field in the referenced Conventional System must be **Disabled**), and (when the [Tx Voice/Signal Type on page 393](#) field is **Non-ASTRO**, and when the [Rx/TA Frequency on page 396](#) field is not equal to the [Tx Frequency on page 397](#) field, or when the [Rx/TA Squelch Type on page 402](#) index is not equal to the [Tx Squelch Type on page 409](#) index, or when Rx/TA Squelch Type is not **CSQ**, and ((when Rx/TA Squelch Type is not PL or the [Rx/TA PL Frequency on page 403](#) index is not equal to the [Tx PL Frequency on page 409](#) index), and (when Rx/TA Squelch Type is not **DPL** or the [Rx/TA PL Code on page 405](#) index is not equal to [Tx DPL Code on page 412](#) index or the [Rx/TA DPL Invert on page 408](#) value is not equal to the [Tx DPL Invert on page 413](#) value.))) or (when [Tx Voice/Signal Type on page 393](#) is not **Non-ASTRO**, and (Rx/TA Frequency is not equal to Tx Frequency, or [Rx Network ID on page 399](#) is not equal to [Tx Network ID on page 400](#).)

10.34.4.6

Tx Deviation/Channel Spacing

This field selects the transmit (Tx) deviation and corresponding channel spacing for the current Frequency Options profile (record/row) of the current Conventional Personality.

The Tx deviation is the maximum variation (in kHz) that the selected carrier - frequency can differ or swing from its un-modulated center frequency. Channel spacing refers to the allotted frequency difference between adjacent channels within a specific frequency band.

NOTE: The radio also uses the selected Tx Deviation/Channel Spacing values when this personality is operating in [Direct/Talkaround on page 397](#) mode.

WARNING: When the [Mixed Vote Scan Enable on page 431](#) field is **Enabled** and the [Mixed Vote Scan Tx Steering on page 431](#) field is **Disabled**, this field must be a match for all Frequency Options in the current Personality; otherwise the RadioCentral considers this field's value invalid.

NOTE: Frequency Option profiles can be selected for use within the Zone Channel Assignment's Channels Page; first, the personality is selected in the [Personality on page 608](#) field, and then the Frequency Options profile is selected in the [Conventional Frequency Option on page 609](#) field.

Accessed Only: When the [Receive Only Personality on page 389](#) field is **Disabled**.

The following selections are supported:

4 kHz / 20 kHz

821 MHz Band using 20 kHz Channel Spacing.

WARNING: This selection is invalid if the following scenario is true when the 12.5 kHz FCC Narrowbanding Mandate applies for this codeplug, and when the value of the [Tx Frequency on page 397](#) or ([Direct Frequency](#) or [Rx/TA Frequency on page 396](#) when enabled for Direct/Talkaround operation) falls into one of the FCC Requirement ranges.

5 kHz / 25 kHz

VHF, UHF, and 800 MHz Bands using 30/25/25 kHz Channel Spacing.

WARNING: This selection is invalid if the following scenario is true when the 12.5 kHz FCC Narrowbanding Mandate applies for this codeplug, and when the value of the Tx Frequency or ([Direct Frequency](#) or [TA Frequency](#) when enabled for Direct/Talkaround operation) falls into one of the FCC Requirement ranges.

2.5 kHz / 12.5 kHz

VHF, UHF, 800 MHz, and 900 MHz Band Analog and 12.5 kHz Channel Spacing.

WARNING: When Tx Frequency falls within the 900 MHz Band, this is the only valid selection and this field becomes view-only.

This selection is invalid if either of the following scenarios is true:

(When the [Rx Voice/Signal Type on page 390](#) field is **Non-ASTRO Mode**, and when the [Secure Operation on page 272](#) field is set to **Hardware**, and when the [Voice Secure/Clear Strapping on page 438](#) field is not set to **Clear**) or (when the [Rx Voice/Signal Type on page 390](#) field is **Mixed Mode** or **ASTRO Mode**, and when the [ASTRO ASTRO Digital Modulator Type on page 414](#) field is **Wide**).

10.34.4.7

Rx Network ID

This field selects (in decimal or hex format) a Receive (Rx) Network Access Code (NAC) ID to be used while operating in ASTRO System (digital) mode.

This allows the radio to selectively access one of several repeaters within overlapping coverage areas, thus allowing the radio to listen to a specific repeater. Ultimately, this ID allows for the separation of addressing modes among co-channel and adjacent channel users; this serves the same purpose as

Private Line (PL), which is used in analog mode. This selection applies only for the current Frequency Options profile (record/row) of the current Conventional Personality.

WARNING: When the [Mixed Vote Scan Enable on page 431](#) field is **Enabled** and the [Mixed Vote Scan Tx Steering on page 431](#) field is **Disabled**, this field must be a match for all Frequency Options in the current Personality; otherwise the application considers this field's value invalid.

NOTE: Frequency Options profiles can be selected for use within the Zone Channel Assignment's Channels Page; first, the personality is selected in the [Personality on page 608](#) field, and then the Frequency Options profile is selected in the [Conventional Frequency Option on page 609](#) field.

IMPORTANT: When [Direct/Talkaround on page 397](#) is **Enabled** for this Frequency Options profile and the [Direct Frequency Enable on page 364](#) field is **Enabled**, the Direct Network ID can then be modified on a per Frequency Options profile basis. When you initiate Direct/Talkaround mode, the radio then transmits and receives on the Direct Frequency (MHz) instead of the [Rx/TA Frequency on page 396](#).

When Direct/Talkaround is **Enabled** for this Frequency Options profile and the Direct Frequency field is **Disabled**, the Rx/TA Frequency and this Rx/TA Network ID setting are used whenever you initiate Direct/Talkaround mode.

Direct/Talkaround must be **Enabled** on a Frequency Options profile in order to be available to you for a radio channel. You can select Direct/Talkaround mode with the [Talkaround/Direct on page 176](#) button-press, the [Talkaround/Direct on page 187](#) switch-selection, or the [Direct/Talkaround on page 196](#) menu-selection.

Accessed Only: When the [Rx Voice/Signal Type on page 390](#) field is **ASTRO Mode** or **Mixed Mode**, and when the radio is model/option capable.

The following selections are supported:

Table 209: Range

Minimum	Maximum	NAC Monitor
0 Hex	FFF Hex	F7E Hex

IMPORTANT: When this Rx NAC ID is set to **F7E**, the radio unmutes to any ASTRO call regardless of the call's NAC ID or the radio's [ASTRO Rx Unmute Rule on page 415](#) set for the current Frequency Options profile.

10.34.4.8

Tx Network ID

This field selects (in decimal or hex format) a transmit (Tx) Network Access Code (NAC) ID number to be used while operating in ASTRO System (digital) mode.

This allows the radio to selectively access one of several repeaters within overlapping coverage areas, thus allowing the radio to cause a specific repeater to re-transmit the signal. Ultimately, this ID allows for the separation of addressing modes among co-channel and adjacent channel users; this serves the

same purpose as Private Line (PL), which is used in analog mode. This selection applies only for the current Frequency Options profile (record/row) of the current Conventional Personality.

WARNING: When the [Mixed Vote Scan Enable on page 431](#) field is **Enabled** and the [Mixed Vote Scan Tx Steering on page 431](#) field is **Disabled**, this field must be a match for all Frequency Options in the current Personality; otherwise the RadioCentral considers this field's value invalid.

NOTE: Frequency Option profiles can be selected for use within the Zone Channel Assignment's Channels Page; first, the personality is selected in the [Personality on page 608](#) field, and then the Frequency Options profile is selected in the [Conventional Frequency Option on page 609](#) field.

Accessed Only: When the [Rx Voice/Signal Type on page 390](#) field is **ASTRO** or **Mixed Mode**, and when the radio is model/option capable.

The following selections are supported:

Table 210: Range

Minimum	Maximum
0 Hex	FFF Hex

WARNING: **F7E** is an invalid selection; for more information see the [Rx Network ID on page 399](#) field.

10.34.4.9

ASTRO Talkgroup ID

This field selects a default talkgroup from the ASTRO Talkgroup List selected in this personality's Talkgroup List field.

This selection always applies for you when the Talkgroup [Selection Type on page 427](#) field is set to **Strapped**. However, when the Selection Type field is set to **Selectable**, this talkgroup only applies until you choose another ID from the selected Talkgroup List. This selection applies only for current Frequency Options profile (record / row) of the current Conventional Personality.

NOTE: Frequency Option profiles can be selected for use within the [Channels on page 607](#) section of the [Zones Channel Assignment on page 605](#) page; first, the personality is selected in the [Personality on page 608](#) field, and then the Frequency Options profile is selected in the Frequency Options field.

Accessed Only: When the [Rx Voice/Signal Type on page 390](#) field is set to **ASTRO** or **Mixed Mode**, and when the Talkgroup field is enabled, and when the personality is not automatically created by the Zone Cloning feature.

The following selections are supported:

Talkgroup Selections

Talkgroups appearing for selection are based on the ASTRO Talkgroup List selected in this personality's Talkgroup List field.

DYN (Dynamic Regrouping)

WARNING: A Dynamic Regrouping configuration is only valid when Dynamic Regrouping Enable is enabled.

NOTE:

Only one Dynamic Regrouping channel may be defined per referenced Trunking System.

You may request a new Dynamic Regrouping assignment from the dispatcher with a Reprogram Request button-press or a Reprogram Request menu-selection. The available features and settings of the Dynamic Regrouping talkgroup are defined and transmitted back by the dispatcher

For the Dynamic Regrouping talkgroup to be capable of transmitting in Secure mode, either the Secure Tx Select button-press or the Secure Tx Select switch-toggle or the Secure menu-selection is needed; otherwise Dynamic Regrouping talkgroup transmissions are strapped to transmitting in "Clear" mode.

ATG (Announcement Group)

Currently not supported

10.34.4.10

Rx/TA Squelch Type

This field selects the type of receive Private Line (PL) or carrier squelch needed to communicate with another radio.

IMPORTANT: The selected [Unmute/Mute Type on page 390](#) for the personality also determines if a call can be received. This selection applies only for current Frequency Options profile (record/row) of the current Conventional Personality.

WARNING: When the [Mixed Vote Scan Enable on page 431](#) field is **Enabled** and the [Mixed Vote Scan Tx Steering on page 431](#) field is **Disabled**, this field must be a match for all Frequency Options in the current Personality; otherwise the RadioCentral considers this field's value invalid.

NOTE: Frequency Option profiles can be selected for use within the Zone Channel Assignment's Channels Page; first, the personality is selected in the [Personality on page 608](#) field, and then the Frequency Options profile is selected in the [Conventional Frequency Option on page 609](#) field.

IMPORTANT:

When [Direct/Talkaround on page 397](#) is **Enabled** for this Frequency Options profile and the [Direct Frequency Enable on page 364](#) field is **Enabled**, the Direct/Talkaround parameters can then be modified on a per Frequency Options profile basis. When you initiate Direct/Talkaround mode, the radio then transmits and receives on the Direct Frequency using these frequency parameters.

When Direct/Talkaround is **Enabled** for this Frequency Options profile and the Direct Frequency Enable field is **Disabled**, the settings for the Rx parameter fields are used whenever you initiate Direct/Talkaround mode.

Direct/Talkaround must be **Enabled** on a Frequency Options profile in order to be available to you for a radio channel. You can select Direct/Talkaround mode with the [Talkaround/Direct on page 176](#) button-press, the [Talkaround/Direct on page 187](#) switch-selection, or the [Direct/Talkaround on page 196](#) menu-selection.

Accessed Only: When the [Rx Voice/Signal Type on page 390](#) field is **Non-ASTRO** or **Mixed Mode**, and when the User-Selectable PL [MPL] field is **Disabled** or **Tx**.

The following selections are supported:

- CSQ (Carrier Squelch)

- PL (Tone Private Line)
- DPL (Digital Private Line)

10.34.4.11

Rx/TA PL Frequency

This field selects a designated frequency used when receiving a Private Line (PL) communication from another radio.

NOTE: This frequency directly correlates to the [Rx/TA PL Code on page 405](#); selecting a value for this field automatically selects an Rx PL Code and vice versa. This selection applies only for current Frequency Options profile (record/row) of the current Conventional Personality.

WARNING: When the [Mixed Vote Scan Enable on page 431](#) field is **Enabled** and the [Mixed Vote Scan Tx Steering on page 431](#) field is **Disabled**, this field must be a match for all Frequency Options in the current Personality; otherwise the RadioCentral considers this field's value invalid.

NOTE: Frequency Option profiles can be selected for use within the Zone Channel Assignment's Channels Page; first, the personality is selected in the [Personality on page 608](#) field, and then the Frequency Options profile is selected in the [Conventional Frequency Option on page 609](#) field.

IMPORTANT: When [Direct/Talkaround on page 397](#) is **Enabled** for this Frequency Options profile and the [Direct Frequency Enable on page 364](#) field is **Enabled**, the Direct/Talkaround parameters can then be modified on a per Frequency Options profile basis. When you initiate Direct/Talkaround mode, the radio then transmits and receives on the Direct Frequency (MHz) using these frequency parameters.

When Direct/Talkaround is **Enabled** for this Frequency Options profile and the Direct Frequency Enable field is **Disabled**, the settings for the Rx parameter fields are used whenever you initiates Direct/Talkaround mode.

Direct/Talkaround must be **Enabled** on a Frequency Options profile in order to be available to you for a radio channel. You can select Direct/Talkaround mode with the [Talkaround/Direct on page 176](#) button-press, the [Talkaround/Direct on page 187](#) switch-selection, or the [Direct/Talkaround on page 196](#) menu-selection.

Accessed Only: When the [Rx/TA Squelch Type on page 402](#) field is **PL**, and when the User-Selectable PL [MPL] field is **Disabled** or **Tx**.

The following selections are supported:

Table 211: TPL Squelch Frequencies & Codes

Freq (Hz) = Code		Freq (Hz) = Code	
67.0	XZ	159.8	159.8
69.3	WZ	162.2	5B

10.34.4.12
Rx/TA PL Code

This field selects the specific code accepted when receiving a Private Line (PL) communication from another radio.

NOTE: This code directly correlates to the [Rx/TA PL Frequency on page 403](#); selecting a value for this field automatically selects an Rx/TA PL Frequency and vice versa. This selection applies only for current Frequency Options profile (record/row) of the current Conventional Personality.

WARNING: When the [Mixed Vote Scan Enable on page 431](#) field is **Enabled** and the [Mixed Vote Scan Tx Steering on page 431](#) field is **Disabled**, this field must be a match for all Frequency Options in the current Personality; otherwise the RadioCentral considers this field's value invalid.

NOTE: Frequency Option profiles can be selected for use within the Zone Channel Assignment's Channels Page; first, the personality is selected in the [Personality on page 608](#) field, and then the Frequency Options profile is selected in the [Conventional Frequency Option on page 609](#) field.

IMPORTANT: When [Direct/Talkaround on page 397](#) is **Enabled** for this Frequency Options profile and the [Direct Frequency Enable on page 364](#) field is **Enabled**, the Direct/Talkaround parameters can then be modified on a per Frequency Options profile basis. When you initiate Direct/Talkaround mode, the radio then transmits and receives on the Direct Frequency (MHz) using these frequency parameters.

When Direct/Talkaround is **Enabled** for this Frequency Options profile and the Direct Frequency Enable field is **Disabled**, the settings for the Rx parameter fields are used whenever you initiate Direct/Talkaround mode.

Direct/Talkaround must be **Enabled** on a Frequency Options profile in order to be available to you for a radio channel. You can select Direct/Talkaround mode with the [Talkaround/Direct on page 176](#) button-press, the [Talkaround/Direct on page 187](#) switch-selection, or the [Direct/Talkaround on page 196](#) menu-selection.

Accessed Only: When the [Rx/TA Squelch Type on page 402](#) field is **PL**, and when the User-Selectable PL [MPL] field is **Disabled** or **Tx**.

The following selections are supported:

Table 212: TPL Squelch Frequencies & Codes

Freq (Hz) = Code		Freq (Hz) = Code	
67.0	XZ	159.8	159.8

159.5	159.5		

10.34.4.13

Rx/TA DPL Code

This field selects the specific code accepted when receiving a Digital Private Line (DPL) communication from another radio.

This selection applies only for current Frequency Options profile (record/row) of the current Conventional Personality.

WARNING: When the [Mixed Vote Scan Enable on page 431](#) field is **Enabled** and the [Mixed Vote Scan Tx Steering on page 431](#) field is **Disabled**, this field must be a match for all Frequency Options in the current Personality; otherwise the application considers this field's value invalid.

NOTE: Frequency Option profiles can be selected for use within the Zone Channel Assignment's Channels Page; first, the personality is selected in the [Personality on page 608 Conventional Frequency Option on page 609](#) field.

IMPORTANT: When [Direct/Talkaround on page 397](#) is **Enabled** for this Frequency Options profile and the [Direct Frequency Enable on page 364](#) field is **Enabled**, the Direct/Talkaround parameters can then be modified on a per Frequency Options profile basis. When you initiate Direct/Talkaround mode, the radio then transmits and receives on the Direct Frequency (MHz) using these frequency parameters.

When Direct/Talkaround is **Enabled** for this Frequency Options profile and the Direct Frequency Enable field is **Disabled**, the settings for the Rx parameter fields are used whenever you initiate Direct/Talkaround mode.

Direct/Talkaround must be **Enabled** on a Frequency Options profile in order to be available to you for a radio channel. You can select Direct/Talkaround mode with the [Talkaround/Direct on page 176](#) button-press, the [Talkaround/Direct on page 187](#) switch-selection, or the [Direct/Talkaround on page 196](#) menu-selection.

Accessed Only: When the [Rx/TA Squelch Type on page 402](#) field is **DPL**, and when the User-Selectable PL [MPL] field is **Disabled** or **Tx**.

The following selections are supported:

Table 213: DPL Squelch Codes

Code	Code	Code	Code
023	152	343	565
025	155	346	606
026	156	351	612

125	271	506	743
131	306	516	754
132	311	525*	
134	315	532	
143	331	546	

NOTE: The codes marked with an asterisk are not part of the 83 standard EIA/TIA-603 codes.

10.34.4.14

Rx/TA DPL Invert

This field causes Digital Private Line (DPL) signals to be inverted when they are received by the radio.

NOTE: Inverted coding allows for more traffic/usage on frequencies.

IMPORTANT: DPL Invert must be set on both receiving and transmitting radios for communication to occur. This feature applies only for current Frequency Options profile (record/row) of the current Conventional Personality.

WARNING: When the [Mixed Vote Scan Enable on page 431](#) field is **Enabled** and the [Mixed Vote Scan Tx Steering on page 431](#) field is **Disabled**, this field must be a match for all Frequency Options in the current Personality; otherwise the RadioCentral considers this field's value invalid.

NOTE: Frequency Option profiles can be selected for use within the Zone Channel Assignment's Channels Page; first, the personality is selected in the [Personality on page 608](#) field, and then the Frequency Options profile is selected in the [Conventional Frequency Option on page 609](#) field.

IMPORTANT: When [Direct/Talkaround on page 397](#) is **Enabled** for this Frequency Options profile and the [Direct Frequency Enable on page 364](#) field is **Enabled**, the Direct/Talkaround parameters can then be modified on a per Frequency Options profile basis. When you initiate Direct/Talkaround mode, the radio then transmits and receives on the Direct Frequency using these frequency parameters.

When Direct / Talkaround is **Enabled** for this Frequency Options profile and the Direct Frequency field is **Disabled**, the settings for the Rx parameter fields are used whenever you initiate Direct/Talkaround mode.

Direct/Talkaround must be **Enabled** on a Frequency Options profile in order to be available to you for a radio channel. You can select Direct/Talkaround mode with the [Talkaround/Direct on page 176](#) button-press, the [Talkaround/Direct on page 187](#) switch-selection, or the [Direct/Talkaround on page 196](#) menu-selection.

Accessed Only: When the [Rx/TA Squelch Type on page 402](#) field is **DPL**, and when the User-Selectable PL [MPL] field is **Disabled** or **Tx**.

10.34.4.15

Tx Squelch Type

This field selects the type of transmit Private Line (PL) or carrier squelch needed to communicate with another radio.

IMPORTANT: The selected [Unmute/Mute Type on page 390](#) for the personality also determines if a call can be received. This selection applies only for current Frequency Options profile (record/row) of the current Conventional Personality.

WARNING: When the [Mixed Vote Scan Enable on page 431](#) field is **Enabled** and the [Mixed Vote Scan Tx Steering on page 431](#) field is **Disabled**, this field must be a match for all Frequency Options in the current Personality; otherwise the RadioCentral considers this field's value invalid.

NOTE: Frequency Option profiles can be selected for use within the Zone Channel Assignment's Channels Page; first, the personality is selected in the [Personality on page 608](#) field, and then the Frequency Options profile is selected in the [Conventional Frequency Option on page 609](#) field.

Accessed Only: When the [Rx Voice/Signal Type on page 390](#) field is **Non-ASTRO** or **Mixed Mode**, and when the [Receive Only Personality on page 389](#) field is **Disabled**, and when the User-Selectable PL [MPL] field is **Disabled** or **Rx**.

The following selections are supported:

- Disabled
- PL (Tone Private Line)
- DPL (Digital Private Line)

10.34.4.16

Tx PL Frequency

This field selects a designated frequency used to transmit a Private Line (PL) communication to another radio.

NOTE: This frequency directly correlates to the [Tx PL Code on page 411](#); selecting a value for this field automatically selects a Tx PL Code and vice versa. This selection applies only for current Frequency Options profile (record/row) of the current Conventional Personality.

WARNING: When the [Mixed Vote Scan Enable on page 431](#) field is **Enabled** and the [Mixed Vote Scan Tx Steering on page 431](#) field is **Disabled**, this field must be a match for all Frequency Options in the current Personality; otherwise the RadioCentral considers this field's value invalid.

NOTE: Frequency Option profiles can be selected for use within the Zone Channel Assignment's Channels Page; first, the personality is selected in the [Personality on page 608](#) field, and then the Frequency Options profile is selected in the [Conventional Frequency Option on page 609](#) field.

Accessed Only: When the [Receive Only Personality on page 389](#) field is **Disabled**, and when the [Tx Squelch Type on page 409](#) field is **PL**, and when the User-Selectable PL [MPL] field is **Disabled** or **Rx**.

The following selections are supported:

Table 214: TPL Squelch Frequencies & Codes

Freq (Hz) = Code		Freq (Hz) = Code	
67.0	XZ	159.8	159.8

156.7	5A	254.1	0Z
159.5	159.5		

10.34.4.17

Tx PL Code

This field selects the specific code used when transmitting a Private Line (PL) communication to another radio.

NOTE: This code directly correlates to the [Tx PL Frequency on page 409](#); selecting a value for this field automatically selects a Tx PL Frequency and vice versa. This selection applies only for current Frequency Options profile (record/row) of the current Conventional Personality.

WARNING: When the [Mixed Vote Scan Enable on page 431](#) field is **Enabled** and the [Mixed Vote Scan Tx Steering on page 431](#) field is **Disabled**, this field must be a match for all Frequency Options in the current Personality; otherwise the RadioCentral considers this field's value invalid.

NOTE: Frequency Option profiles can be selected for use within the Zone Channel Assignment's Channels Page; first, the personality is selected in the [Personality on page 608](#) field, and then the Frequency Options profile is selected in the [Conventional Frequency Option on page 609](#) field.

Accessed Only: When the [Receive Only Personality on page 389](#) field is **Disabled**, and when the [Tx Squelch Type on page 409](#) field is **PL**, and when the User-Selectable PL [MPL] field is **Disabled** or **Rx**.

The following selections are supported:

Table 215: TPL Squelch Frequencies & Codes

Freq (Hz) = Code		Freq (Hz) = Code	
67.0	XZ	159.8	159.8
69.3	WZ	162.2	5B
71.9	XA	165.1	165.1
74.4	WA	165.5	165.5

156.7	5A	254.1	0Z
159.5	159.5		

10.34.4.18

Tx DPL Code

This field selects the Digital Private Line (DPL) code that transmits once the PTT button is pressed.

This selection applies only for current Frequency Options profile (record/row) of the current Conventional Personality.

WARNING: When the [Mixed Vote Scan Enable on page 431](#) field is **Enabled** and the [Mixed Vote Scan Tx Steering on page 431](#) field is **Disabled**, this field must be a match for all Frequency Options in the current Personality; otherwise the RadioCentral considers this field's value invalid.

NOTE: Frequency Option profiles can be selected for use within the Zone Channel Assignment's Channels Page; first, the personality is selected in the [Personality on page 608](#) field, and then the Frequency Options profile is selected in the [Conventional Frequency Option on page 609](#) field.

Accessed Only: When the [Receive Only Personality on page 389](#) field is **Disabled**, and when the [Tx Squelch Type on page 409](#) field is **DPL**, and when the User-Selectable PL [MPL] field is **Disabled** or **Rx**.

The following selections are supported:

Table 216: DPL Squelch Codes

Code	Code	Code	Code
023	152	343	565
025	155	346	606
026	156	351	612
031	162	364	624
032	165	365	627

Code	Code	Code	Code
043	172	371	631
047	174	411	632
051	205	412	645*
054	223	413	654
065	226	423	662
071	243	431	664
072	244	432	703
073	245	445	712
074	251	464	723
114	261	465	731
115	263	466	732
116	265	503	734
125	271	506	743
131	306	516	754
132	311	525*	
134	315	532	
143	331	546	

NOTE: The codes marked with an asterisk are not part of the 83 standard EIA/TIA-603 codes.

10.34.4.19

Tx DPL Invert

This field causes Digital Private Line (DPL) signals to be inverted before they are transmitted.

NOTE: Inverted coding allows for more traffic/usage on frequencies.

IMPORTANT: Tx DPL Invert must be set on both receiving and transmitting radios for communication to occur. This feature applies only for current Frequency Options profile (record/row) of the current Conventional Personality.

WARNING: When the [Mixed Vote Scan Enable on page 431](#) field is **Enabled** and the [Mixed Vote Scan Tx Steering on page 431](#) field is **Disabled**, this field must be a match for all Frequency Options in the current Personality; otherwise the RadioCentral considers this field's value invalid.

NOTE: Frequency Option profiles can be selected for use within the Zone Channel Assignment's Channels Page; first, the personality is selected in the [Personality on page 608](#) field, and then the Frequency Options profile is selected in the [Conventional Frequency Option on page 609](#) field.

Accessed Only: When the [Receive Only Personality on page 389](#) field is **Disabled**, and when the [Tx Squelch Type on page 409](#) field is **DPL**, and when the User-Selectable PL [MPL] field is **Disabled** or **Rx**.

10.34.4.20

Mixed Vote Scan Persistent Member

This field causes the radio to always check the selected Rx/TA Frequency (of this record/row) when operating in Scan Mode and actively scanning this Mixed Vote Scan Enabled Conventional Personality.

This is even true when there are stronger frequencies/channels found in the same Scan List where this Conventional Personality is selected. This feature applies only for the current Frequency Options profile (record/row) of the current Conventional Personality.

NOTE: Frequency Option profiles can be selected for use within the Zone Channel Assignment's Channels Page; first, the personality is selected in the Personality field, and then the Frequency Options profile is selected in the Frequency Options field.

Accessed Only: When the [Mixed Vote Scan Enable on page 431](#) field is **Enabled**.

10.34.5

Signaling

This section allows you to view or define ASTRO Signaling and Non-ASTRO Signaling (MDC, DTMF, Quik-Call II, and Singletone) functionality for individual Conventional Personalities.

NOTE: Once the features of the Conventional Personalities have been uniquely defined, each personality may then be assigned to the desired position of the radio's channel selector. This is accomplished from the Zone Channel Assignment's Channels Page.

10.34.5.1

ASTRO System

This field selects the desired ASTRO or DVRS Signaling System to be used for the current Conventional Personality.

This previously-defined Conventional System and all of its programmed settings then apply for this channel.

IMPORTANT: Only Conventional Systems having an ASTRO or DVRS System type (previously defined in the System's System Type field) may be selected in this field.

NOTE: The value of the ASTRO System is referred to the first Conventional System record if the personality is not automatically created by the Zone Cloning feature. The value cannot be changed.

Accessed Only: When the [Rx Voice/Signal Type on page 390](#) field is **ASTRO** or **Mixed Mode**, and when the radio is model/option capable.

10.34.5.2

ASTRO Digital Modulator Type

This field selects the Digital Modulator Type while operating in ASTRO signaling mode and on the current Conventional Personality.

Accessed Only: When the [Rx Voice/Signal Type on page 390](#) field is **ASTRO** or **Mixed Mode**, and when the radio is model/option capable.

The following selections are supported:

C4FM

Continuous 4-Level Frequency Modulation for non-simulcast operation.

CQPSK

Compatible Quadrature Phase Shift Keying for narrowband simulcast operation. Available when the radio model is equipped for Common Air Interface (CAI) Digital Operation.

WIDE

Wideband simulcast operation. Available when the [Tx Deviation/Channel Spacing on page 398](#) field is not set to **2.5 kHz**.

WARNING: This selection is invalid if the following is true when the Rx Voice/Signal Type field is **ASTRO** or **Mixed Mode**, and ((when the Primary Frequency Band is **900 MHz**), or (when the Allow Invalid Frequencies field is **Enabled**, and when the 900 MHz Used in Codeplug field is **Enabled**)).

10.34.5.3

ASTRO Rx Unmute Rule

This field selects the radio's ASTRO receive (Rx) unmute mode while operating in ASTRO or DVRS signaling mode and when on the current Conventional Personality.

WARNING:

When the System Wide All-Call Talkgroup ID **65535** is selected for the current channel/personality (selected in the ASTRO Talkgroup ID field), and when the [Selection Type on page 427](#) field is **Strapped, Normal Squelch** is the only valid selection for this field.

When the System Wide Receive-Only Talkgroup ID **0** (a receive-only Talkgroup) is selected for the current channel/personality, **Selective Squelch** is the only valid selection for this field.

NOTE: When transmitting on the System Wide All-Call Talkgroup ID **65535** (for the current channel/personality), the radio automatically receives ASTRO voice on the **Normal Squelch** setting, regardless of the setting of this field.

Accessed Only: When the [Rx Voice/Signal Type on page 390](#) field is **ASTRO** or **Mixed Mode**, and when the radio is model/option capable.

The following selections are supported:

Normal Squelch

The radio unmutes upon decoding a [Rx Network ID on page 399](#) match. The radio unmutes even when it is expecting DES-XL but receives DES-OFB (see the [DES-XL Tx Default on page 437](#) field).

NOTE: Available when the [Talkgroup on page 427](#) field or the [Selective Call Rx/Tx on page 423](#) field is **Enabled**.

Selective Squelch

The radio unmutes upon decoding a Network ID match and (either a Talkgroup ID match or a Selective Call.) If the DES-XL Tx Default selection determines the type of encryption algorithm that the radio expects to receive when in this mode.

NOTE: Available when the Talkgroup field or the Selective Call Rx/Tx field is **Enabled**.

Data And Squelch

The radio unmutes upon decoding a Network ID match and a Selective Call.

NOTE: Available when the Selective Call Rx/Tx field is **Enabled**.

Digital CSQ

The radio unmutes to all Digital CAI Operation compliant voice signals.

10.34.5.4

ASTRO Late Entry Fast Unmute

This field enables the radio to unmute to a call already in progress prior to determining if the call is a Secure call.

This feature allows calls to unmute 180 to 360 ms faster. This feature applies while operating in ASTRO signaling mode and on the current Conventional Personality.

IMPORTANT: It is recommended that this feature only be used on non-secure channels because radios receiving secure calls will unmute to unintelligible audio until the call is recognized as secure.

Accessed Only: When the [Rx Voice/Signal Type on page 390](#) field is **ASTRO** or **Mixed Mode**, and when the radio is model/option capable.

10.34.5.5

Non-ASTRO Signaling Type

This field selects the type of analog signaling system used for receive and transmit communications while operating on the current Conventional Personality.

WARNING: When the Analog Flat Audio field is **Enabled**, this field must be set to **None**; otherwise it becomes invalid. Therefore both features may not be enabled on the same Personality.

Accessed Only: When the [Rx Voice/Signal Type on page 390](#) field is **Non-ASTRO** or **Mixed Mode** and the personality is not automatically created by the Zone Cloning feature.

The following selections are supported:

- None
- MDC
- DTMF
- Quik-Call II

NOTE: Selections are radio model/option dependent.

10.34.5.6

System Number

10.34.5.7

Non-ASTRO PTT ID

This field enables the MDC or DTMF PTT ID to transmit with each outbound communication.

NOTE: The PTT ID is equivalent to the RadioCentral-defined Primary ID. Transmitting the Primary ID allows for Caller ID on the receiving radio. This feature applies for the current Conventional Personality.

NOTE: When the PTT-ID field selection is **Leading Edge** or **Both**, the PTT ID is transmitted each time the PTT button is pressed/keyed.

When the PTT-ID field selection is **Trailing Edge** or **Both**, c

WARNING: The PTT-ID must not be set to **None** in the referenced MDC or DTMF Conventional System.

Accessed Only: When the [Rx Voice/Signal Type on page 390](#) field is **Non-ASTRO** or **Mixed Mode**, and when the Non-ASTRO Signaling Type field is **MDC** or **DTMF**, and when the [Receive Only Personality on page 389](#) field is **Disabled**.

10.34.5.8

Emergency PTT ID

This field enables the radio's currently-selected MDC Unit/Primary ID Primary ID to transmit with each Emergency Mode Call.

Therefore, Emergency PTT ID only applies when the Emergency Type field is set to **Alarm & Call**. This feature applies for the current Conventional Personality.

NOTE: The actual transmitted Emergency PTT ID is determined by the current Conventional Personality's selected (MDC only) System Number.

Accessed Only: When the [Receive Only Personality on page 389](#) field is **Disabled**, and when the [Rx Voice/Signal Type on page 390](#) field is **Non-ASTRO** or **Mixed Mode**, and when the Non-ASTRO Signaling Type field is **MDC**, and when an **MDC** System Type referenced Conventional System having a referenced Conventional Emergency Profile has been selected, and when that referenced Emergency Profile has its Emergency Type field set to **Alarm & Call**.

10.34.5.9

Emergency Revert Type

This field selects the type of emergency revert to be used for the current Conventional Personality.

Accessed Only: (When the [Tx Voice/Signal Type on page 393](#) field is set to **ASTRO**, and when an ASTRO System Type referenced Conventional System having a referenced Conventional Emergency Profile has been selected) or (when the Tx Voice / Signal Type field is set to **Non-ASTRO**, and when the Non-ASTRO Signaling Type field is set to **MDC**, and when an MDC System Type referenced Conventional System having a referenced Conventional Emergency Profile has been selected.)

The following selections are supported:

Selected Channel

No Revert Channel is used; emergencies transmit on the radio's currently-selected channel.

Revert Channel

The [Emergency Revert Zone on page 417](#) and [Emergency Revert Channel on page 418](#) selected for this Personality are used for emergency transmissions.

Revert Talkgroup

The Revert Talkgroup selected for this Personality is used for emergency transmissions.

This selection is Accessed Only when the radio is DVRS Portable Subscriber Unit (PSU) capable.

WARNING: This selection is only valid when a **DVRS** System Type referenced Conventional System having a referenced Conventional Emergency Profile has been selected, and the [Talkgroup on page 427](#) field is **Enabled**.

10.34.5.10

Emergency Revert Zone

This field selects Zone that is used for the duration of an emergency mode transmission.

This selection applies for the current Conventional Personality.

NOTE:

Once the zone is selected, the [Emergency Revert Channel on page 418](#) may then be selected.

Zones and their channels must be previously defined in the Zone Channel Assignment Window.

WARNING: Only non-Dynamic Zones (zones that have Dynamic Zone Enable **Disabled**) can be selected; otherwise, this field becomes invalid.

Accessed Only: When the [Emergency Revert Type on page 417](#) field is set to **Revert Channel**, and (when the [Tx Voice/Signal Type on page 393](#) field is set to **ASTRO**, and when an ASTRO System Type referenced Conventional System having a referenced Conventional Emergency Profile has been selected) or (when the Tx Voice/Signal Type field is set to **Non-ASTRO**, and when the Non-ASTRO Signaling Type field is set to **MDC**, and when an MDC System Type referenced Conventional System having a referenced Conventional Emergency Profile has been selected).

10.34.5.11

Emergency Revert Channel

This field selects a designated Conventional channel that is used for the duration of an emergency mode transmission.

This selection applies for the current Conventional Personality.

NOTE:

The [Emergency Revert Zone on page 417](#) must be selected prior to selecting this channel.

Zones and their channels must be previously defined in the Zone Channel Assignment.

WARNING:

In order for a Trunking channel to be selected as the Emergency Revert Channel, the **Multiple Emergency Revert** Extended Feature must appear in the Extended Feature Name field.

This Emergency Revert Channel selection is only considered valid when the Trunking Talkgroup field for the selected Trunking Personality/channel is not set to **DYN** or **ATG**, and when the [Receive Only Personality on page 389](#) field for the selected Conventional Personality/channel is **Disabled**, and when the ASTRO Talkgroup ID field for the selected Conventional Personality/channel is not set to **DYN** or **ATG**, and when the Transmit Mode field for the selected Trunking Personality/channel is not set to **TG/AG Disabled (Listen-Only)**, and when the Emergency Profile Selection for the selected channel is not **Emergency TX Disabled**.

Accessed Only: When the [Emergency Revert Type on page 417](#) field is set to **Revert Channel**, and when the Revert Zone field is not set to a Dynamic Zone, and (When the [Tx Voice/Signal Type on page 393](#) field is set to **ASTRO**, and when an ASTRO System Type referenced Conventional System having a referenced Conventional Emergency Profile has been selected) or (when the Tx Voice/Signal Type field is set to **Non-ASTRO**, and when the Non-ASTRO Signaling Type field is set to **MDC**, and when an MDC System Type referenced Conventional System having a referenced Conventional Emergency Profile has been selected.)

10.34.5.12

Tone Signaling List

This field selects the Tone Signaling List to be used on the current Conventional Personality.

NOTE: Tone Signaling List functionality is defined in the Tone Signaling List Page.

Accessed Only: When the Tone Signaling List is set to **Tone Signaling Disabled**, or when the [Rx Voice/Signal Type on page 390](#) field is set to **Non-ASTRO**, and when the Signaling Type is set to **Quik-Call II**, or when the Rx Voice/Signal Type field is set to **Mixed Mode**, and when the [Tx Voice/Signal Type on page 393](#) is set to **Non-ASTRO**, and when the Signaling Type is set to **Quik-Call II**

or when the Rx Voice/Signal Type field is not set to **Non-ASTRO**, or when the radio is a model/option capable.

The following selections are supported:

- Tone Signaling Disabled
- Available Tone Signaling Lists

10.34.6

Non-ASTRO Call

This section allows you to view or define features relating to Non-ASTRO or analog mode signaling such as: MDC, DTMF, Quik-Call II and Singletone.

NOTE:

Conventional Systems defined as having the **MDC**, **DTMF**, **Quik-Call II** or **Singletone** System Type can be selected from the Conventional Personality's Non-ASTRO System field, allowing for that specific System Type communications to occur.

Once the features of the Conventional Personalities have been uniquely defined, each personality may then be assigned to the desired position of the radio's channel selector. This is accomplished from the Zone Channel Assignment's Channels Page.

10.34.6.1

Selective Call Rx/Tx

This field selects whether Non-ASTRO (MDC, DTMF, and Quik-Call II) Selective Calls can be transmitted or received (or both) for the current Conventional Personality.

WARNING:

When the Expanded MDC ID Range field is **Enabled**, this field must be set to **Disabled** otherwise it is considered to be invalid by the RadioCentral. These two features are incompatible.

When the Non-ASTRO Signaling Type field is **Quik-Call II**, and when the DVRS Hardware Enable field is **Enabled**, and when the current Personality's referenced DVRS Profile has its DVRS Remote Activation field set to **Via Call Alert**, this feature must be **Disabled** otherwise it is considered to be invalid by the RadioCentral. These two features are incompatible.

When the Non-ASTRO Signaling Type field is **Quik-Call II**, this feature and [Call Alert Rx/Tx on page 420](#) are mutually exclusive; therefore, one of these features must be **Disabled**, otherwise both features are considered to be invalid.

NOTE: You can activate a Selective Call encode (transmit) with a Select/Private Call button-press or Select/Private Call menu-selection.

Accessed Only: When the [Rx Voice/Signal Type on page 390](#) field is **Non-ASTRO** or **Mixed Mode**, and when the Non-ASTRO Signaling Type field is **MDC**, **DTMF**, or **Quik-Call II**, and when the radio is model/option capable.

The following selections are supported:

Disabled

No Call Alerts are possible on the current Personality.

Decode

Selective Calls may only be received (decoded).

Encode

Selective Calls may only be transmitted (encoded).

WARNING: When the Non-ASTRO Signaling Type field is **Quik-Call II**, this selection is invalid.

Decode & Encode

Selective Calls may be received and transmitted.

WARNING: When the Non-ASTRO Signaling Type field is **Quik-Call II**, this selection is invalid.

10.34.6.2

Unmute Type

This field selects the unmute condition for the current Non-ASTRO (MDC, DTMF, or Quik-Call II) Conventional Personality.

This unmute rule applies only to the detection of Selective Calls.

Accessed Only: When the [Rx Voice/Signal Type on page 390](#) field is **Non-ASTRO** or **Mixed Mode**, and when the Non-ASTRO Signaling Type field is **MDC**, **DTMF**, or **Quik-Call II**, and when the [Selective Call Rx/Tx on page 419](#) field is set to **Decode** or **Decode & Encode**, and when the radio is model/option capable.

The following selections are supported:

And

Both the current personality's selected [Unmute/Mute Type on page 390](#) rule, and Selective Call detection must be satisfied before unmute occurs.

Or

Either the current personality's selected Unmute/Mute Type rule, or Selective Call detection will unmute the radio's speaker to receive audio.

10.34.6.3

Call Alert Rx/Tx

This field selects whether Non-ASTRO (MDC, DTMF, Quik-Call II, and Singletone) Call Alerts can be transmitted or received (or both) for the current Conventional Personality.

WARNING:

When the Expanded MDC ID Range field is **Enabled**, this field must be set to **Disabled** otherwise it is considered to be invalid by the RadioCentral. These two features are incompatible.

When the Non-ASTRO Signaling Type field is **Quik-Call II**, this feature and [Selective Call Rx/Tx on page 419](#) are mutually exclusive; therefore, one of these features must be **Disabled**, otherwise both features are considered to be invalid by the RadioCentral.

NOTE: Call Alert is activated with a Call Alert button-press or Page (Call Alert) menu-selection.

Accessed Only: (When the radio is model/option capable, and when the [Rx Voice/Signal Type on page 390](#) field is **Non-ASTRO** or **Mixed Mode**, and when the Non-ASTRO Signaling Type field is **MDC**, **DTMF**, or **Quik-Call II** for the current personality), and (when the DVRS Hardware Enable field is **Disabled**), or (when the DVRS Hardware Enable field is **Enabled**, and when the current Personality's referenced DVRS Profile has its DVRS Remote Activation field set to **Disabled**.)

The following selections are supported:

Disabled

No Call Alerts are possible on the current Personality.

Decode

Call Alerts may only be received (decoded).

Encode

Call Alerts may only be transmitted (encoded).

WARNING: When the Non-ASTRO Signaling Type field is **Quik-Call II**, this selection is invalid.

Decode & Encode

Call Alerts may be received and transmitted.

WARNING: When the Non-ASTRO Signaling Type field is **Quik-Call II**, this selection is invalid.

10.34.6.4

MDC RTT Button Access

This field selects the Request-To-Talk (RTT) mode for the current Conventional Personality.

When enabled with either the **Manual** (the MDC RTT button-press or [Request-To-Talk](#) menu-selection) or the **Auto** (PTT button) selections, the radio sends an RTT signaling packet to the dispatcher requesting the ability to transmit voice on the channel. The radio's microphone then immediately keys-up for 2 to 3 seconds allowing you the time to pick up the microphone and begin a voice transmission. From this point, the radio has "normal" voice access to this channel.

NOTE: This feature allows the dispatcher to manage channel traffic for voice communications. This feature applies while operating in MDC System mode and on the current Conventional Personality.

WARNING: If the [Access Type](#) field is set to **Auto**, this field may not be set to **Auto**. These two field settings are mutually exclusive.

Accessed Only: When the [Tx Voice/Signal Type on page 393](#) is set to **Non-ASTRO**, and when the Non-ASTRO Signaling Type field for the current personality is set to **MDC**.

The following selections are supported:

None

Feature is disabled.

Manual

Each time you initiate the RTT button-press or RTT menu-selection, the RTT signaling packet is transmitted to the dispatcher/console requesting the ability to transmit voice.

WARNING: This selection is only valid when [Receive Only Personality on page 389](#) is **Disabled**, and when [Repeater Access](#) is **Enabled**.

Auto

Each time you press the PTT button, the RTT signaling packet is transmitted to the dispatcher/console requesting the ability to transmit voice.

WARNING: This selection is only valid when Receive Only Personality is **Disabled**, when Repeater Access is **Enabled**, and when [Access Type](#) is not set to **Auto**.

10.34.6.5

MDC Auto Select Call Transmit

When enabled, once you select to send an MDC - Selective Call, and selects a call recipient from the Non-ASTRO Call Hot List, a Selective Call data packet is transmitted each time the radio's PTT button is pressed.

This feature applies while operating in MDC System mode and on the current Conventional Personality.

When disabled, an MDC Selective Call data packet is transmitted only when a Selective Call is initiated. That is, the Selective Call data packet is transmitted once you select to send a Selective Call, selects a call recipient from the Call List, and then presses the PTT button. Subsequent PTT presses do not send a Selective Call data packet.

Accessed Only: When the [Rx Voice/Signal Type on page 390](#) field is **Non-ASTRO** or **Mixed Mode**, and when the Non-ASTRO Signaling Type for the current personality is set to **MDC**, and when the [Selective Call Rx/Tx on page 419](#) field is set to **Encode** or **Decode & Encode**, and when the radio is model/option capable.

10.34.6.6

MDC Unlimited Calling

This field allows you to manually enter the ID of a targeted radio for a Selective Call or a Call Alert, also known as a direct entry.

Once the Call type is selected and the MDC Call Hot List appears in the radio display, direct entry of a desired MDC Radio ID (with a keypad) is then possible. Pressing the PTT button then transmits the call to the target radio(s) of the entered ID. This feature applies while operating in MDC System mode and on the current Conventional Personality.

Accessed Only: When the [Selective Call Rx/Tx on page 419](#) field is set to **Encode** or **Decode & Encode**, or when the [Call Alert Rx/Tx on page 420](#) field is set to **Encode** or **Decode & Encode**, and when the [Rx Voice/Signal Type on page 390](#) field is set to **Non-ASTRO** or **Mixed Mode**, and when the Non-ASTRO Signaling Type field is set to **MDC**, and when the radio is model/option capable.

10.34.6.7

Non-ASTRO Call Hot List

This field selects the Non-ASTRO Hot List (MDC, DTMF, or Quik-Call II) to be used for the current Conventional Personality.

You are then able to select individual Call Hot List members while operating in Conventional communications mode. Call Hot List Members allow for Selective Call or Call Alert communications to individual or groups of radios.

Accessed Only: When the [Rx Voice/Signal Type on page 390](#) field is **Non-ASTRO** or **Mixed Mode**, and when the Non-ASTRO Signaling Type field is not equal to **None**.

10.34.6.8

In-Call User Alert Enable

This field causes the radio to remain muted to normal dispatch calls whenever you activate the Voice Mute functionality.

Group and individual Call Alerts do unmute the radio for the alert tone to sound. The radio also unmutes to individual radio-to-radio calls such as Selective Calls and Interconnect (Phone Mode) calls. This feature is very useful when you prefer not to hear normal dispatch traffic, however needs to remain in radio contact. This feature applies while operating in Non-ASTRO System mode (MDC, DTMF, and QCII) and when on the current Conventional Personality.

When disabled, you are not able to toggle-on this feature for the current Conventional Personality.

NOTE: The Voice Mute button-press or the Voice Mute menu-selection allows you to toggle on and off the Voice Mute functionality for an In-Call User Alert enabled channel.

WARNING: This Non-ASTRO In-Call User Alert field must be **Enabled** when the [Rx Voice/Signal Type on page 390](#) field is set to **Mixed Mode** and when the Signaling Type field is set to either **MDC** or **DTMF** or **Quik-Call II**.

IMPORTANT: When Voice Mute is Active, Individual or Group Call Alerts decoded by the radio do unmute the radio for the Release Squelch period. The Release Squelch period is defined by this personality's ASTRO System Select Call/In-Call Reset field selection. Once the Call Alert (sent as an individual call or a group call) unmutes the radio, a voice call that follows can then be a group call that is heard over the radio's speaker, but only until the Release Squelch period has ended.

If the radio's channel is changed, Voice Mute is deactivated by the radio; Voice Mute must be reactivated if desired when returning to the channel.

If you press the PTT button, or launches Emergency Mode, or powers the radio off and back on, Voice Mute is deactivated by the radio.

MDC Radio Inhibit functionality is available.

The Scan mode and Monitor mode features are not available.

Other display indications (from group calls) such as receiving LED and PTT-ID (if enabled) function normally.

Accessed Only: When the [Call Alert Rx/Tx on page 420](#) field is set to **Decode** or **Decode & Encode**, and when the [Rx Voice/Signal Type on page 390](#) field is set to **Non-ASTRO** or **Mixed Mode**, and when the [Non-ASTRO Signaling Type on page 416](#) field is set to **MDC** or **Quik-Call II** or **DTMF**.

10.34.7

ASTRO Call

This section allows you to view or define ASTRO or DVRS Call Alert and Selective Call functionality for individual Conventional Personalities.

NOTE:

Conventional Systems defined as having the "ASTRO" or "DVRS" System Type may be selected from the Conventional Personality's ASTRO System field, allowing for ASTRO Systems communications to occur.

Once the features of the Conventional Personalities have been uniquely defined, each personality may then be assigned to the desired position of the radio's channel selector. This is accomplished from the Zone Channel Assignment's Channels Page.

10.34.7.1

Selective Call Rx/Tx

This field selects whether an ASTRO/DVRS - Call can be transmitted, received, or both.

This feature applies while operating in ASTRO System or DVRS mode and on the current Conventional Personality.

IMPORTANT:

When the referenced Conventional System is an ASTRO System Type, this feature enables Conventional Selective Call functionality.

When the referenced Conventional System is a DVRS System Type, this feature enables Trunking Private Call functionality.

NOTE: You can activate a Selective or Private Call with a Select/Private Call button-press or a Select/Private Call menu-selection.

Accessed Only: When the radio is model/option capable, and when the personality is not automatically created by Zone Cloning feature, and

((when the [Rx Voice/Signal Type on page 390](#) field is set to **Mixed Mode**), or (when the Rx Voice/Signal Type field is set to **ASTRO**, and when the Remote Site Interface System field in the referenced Conventional System is **Disabled**)).

The following selections are supported:

Disabled

No Selective/Private Calls are possible on the current Personality.

Decode

Selective/Private Calls may only be received (decoded).

Encode

Selective/Private Calls may only be transmitted (encoded).

Decode & Encode

Selective/Private Calls may be received and transmitted.

10.34.7.2

Auto Selective Call Transmit

When enabled, once you select to send an ASTRO - Selective Call and selects a call recipient from the ASTRO Call Hot List, a Selective Call data packet is transmitted each time the radio's PTT button is pressed.

This feature applies while operating in ASTRO System mode and when on the current Conventional Personality.

When disabled, a Selective Call data packet is transmitted only when you initiate a Selective Call. That is, when you select to send a Selective Call, selects a call recipient from the Call Hot List, and then presses the PTT button, the Selective Call data packet is transmitted once. Subsequent PTT presses do not send a Selective Call data packet.

NOTE: You can activate Selective Call with a Select/Private Call button-press or a Select/Private Call menu-selection.

Accessed Only: (When the radio is model/option capable, and when the [Selective Call Rx/Tx on page 423](#) field is **Encode** or **Decode and Encode**, and when the referenced Conventional System selected in the ASTRO System field is not a **DVRS** System Type), and ((when the [Rx Voice/Signal Type on page 390](#) field is set to **Mixed Mode**), or (when the Rx Voice/Signal Type field is set to **ASTRO**, and when the Remote Site Interface System field in the referenced Conventional System is **Disabled**)).

10.34.7.3

Call Alert Rx/Tx

This field selects whether Call Alerts (also known as Pages), can be transmitted or received, (or both).

This feature applies while operating in ASTRO System mode and when on the current Conventional Personality.

NOTE: You can activate Call Alert with a Call Alert button-press or Page (Call Alert) menu-selection.

Accessed Only: When the radio is model/option capable, and ((when the [Rx Voice/Signal Type on page 390](#) field is set to **Mixed Mode**), or (when the Rx Voice/Signal Type field is set to **ASTRO**, and when the Remote Site Interface System field in the referenced Conventional System is **Disabled**)), and ((when the DVRS Hardware Enable field is **Disabled**), or (when the DVRS Hardware Enable field is **Enabled**, and when the current Personality's referenced DVRS Profile has its DVRS Remote Activation field set to **Disabled**)).

The following selections are supported:

Disabled

No Call Alerts are possible on the current Personality.

Decode

Call Alerts may only be received (decoded).

Encode

Call Alerts may only be transmitted (encoded).

Decode & Encode

Call Alerts may be received and transmitted.

10.34.7.4

ASTRO Unlimited Calling

This field allows you to manually enter the ID of a targeted radio for a Selective Call, Call Alert, or Tactical Services. The action is known as a direct entry.

Once the call type is selected and the ASTRO Call Hot List appears in the radio display, direct entry of a desired ASTRO Radio ID (with a keypad) is possible. For Selective Call and Call Alert, pressing the **PTT** button transmits the call to one or more target radios of the entered ID. For Tactical Services, pressing the **Send** softkey menu transmits the Tactical Services command to one or more target radios of the entered ID.

The feature applies while operating in ASTRO System or DVRS mode, and on the current Conventional Personality.

IMPORTANT: When the referenced Conventional System is a DVRS System Type, then this feature enables Trunking Private Call functionality.

Accessed Only: This field can be accessed when the radio is model or option capable, and when one of the following conditions are met:

- The [Rx Voice/Signal Type on page 390](#) field is set to **Mixed Mode**.
- The Rx Voice/Signal Type field is set to **ASTRO**, and the Remote Site Interface System field in the referenced Conventional System is **Disabled**.
- The [Selective Call Rx/Tx on page 423](#) field, or the [Call Alert Rx/Tx on page 424](#) field is set to **Encode**, or **Decode & Encode**.
- The Kill Operation field, or the Stun Operation field is set to **Encode**, or **Decode & Encode**.
- The Tactical Services Operation field is set to **Encode**, or **Decode & Encode**.

10.34.7.5

ASTRO Call Hot List

This field selects the ASTRO Conventional Hot List to be used for the current Conventional Personality.

You are able to select individual Call List members while operating in Conventional communications mode. Call List Members allow for Selective Call, Call Alert, or Tactical Services communications to one or more radios. The feature applies while operating in ASTRO System mode and on the current Conventional Personality.

Accessed Only: This field can be accessed when the radio is model or option capable, and when one of the following conditions are met:

- The [Rx Voice/Signal Type on page 390](#) field is set to **Mixed Mode**.
- The Rx Voice/Signal Type field is set to **ASTRO**, and when the Remote Site Interface System field in the referenced Conventional System is **Disabled**.

10.34.7.6

In-Call User Alert Enable

This field causes the radio to remain muted to normal dispatch calls whenever you activate the Voice Mute functionality.

Group and individual Call Alerts do unmute the radio for the alert tone to sound. The radio also unmutes for individual radio-to-radio calls such as Selective Calls, Tone Signaling calls and Interconnect (Phone Mode) calls. This feature is very useful when you prefer not to hear normal dispatch traffic, however needs to remain in radio contact. This feature applies while operating in ASTRO System mode and on the current Conventional Personality.

When disabled, you are not able to toggle-on this feature for the current Conventional Personality.

NOTE: The Voice Mute button-press or Voice Mute menu-selection allows you to toggle on and off the Voice Mute functionality for an In-Call User Alert enabled channel.

WARNING: This ASTRO In-Call User Alert field must be **Enabled** when the [Rx Voice/Signal Type on page 390](#) field is set to **Mixed Mode** and when the Signaling Type field is set to either **MDC** or **DTMF** or **Quik-Call II**.

IMPORTANT: When Voice Mute is Active, Individual or Group Call Alerts decoded by the radio do unmute the radio for the Release Squelch period. The Release Squelch period is defined by this personality's ASTRO System Select Call/In-Call Reset field selection. Once the Call Alert (sent as an individual call or a group call), unmutes the radio, a voice call that follows can then be a group call that is heard over the radio's speaker, but only until the Release Squelch period has ended.

If the radio's channel is changed and Voice Mute is deactivated by the radio; Voice Mute must be reactivated if desired when returning to the channel.

If you press the PTT button, launches Emergency Mode, or powers the radio off and back on, Voice Mute is deactivated by the radio.

ASTRO Radio Inhibit functionality is available.

The Scan mode and Monitor mode features are not available.

Other display indications from group call such as receiving LED and PTT-ID (if enabled) function normally.

Accessed Only: When the radio is model/option capable, and (when the [Call Alert Rx/Tx on page 424](#) field is **Decode** or **Decode and Encode**, and when the [Rx Voice/Signal Type on page 390](#) field is set to **Mixed Mode**), or (when the Call Alert Rx/Tx field is **Decode** or **Decode and Encode**, and when the Rx Voice/Signal Type field is set to **ASTRO**, and when the Remote Site Interface System field in the referenced Conventional System is **Disabled**), or (when the Rx Voice/Signal Type field is not set to

Non-ASTRO, and when the current Conventional Personality's Tone Signaling List field is referencing a Tone Signaling List that has at least one record/row where Unmute Enable is **Enabled**).

10.34.8

ASTRO Talkgroup

This section allows you to view or define ASTRO System ASTRO Talkgroup List functionality for individual Conventional Personalities.

NOTE:

Conventional Systems defined as having the **ASTRO** System Type can be selected from the Conventional Personality's ASTRO System field, allowing for ASTRO Systems communications to occur.

Once the features of the Conventional Personalities have been uniquely defined, each personality can then be assigned to the desired position of the radio's channel selector. This is accomplished from the Zone Channel Assignment's Channels Page.

10.34.8.1

Talkgroup

This field enables talkgroup functionality while operating in ASTRO System mode and on the current Conventional Personality.

NOTE: ASTRO Systems are selected for individual Conventional Personalities from the ASTRO System field.

WARNING: The [Rx Voice/Signal Type on page 390](#) must be set to **ASTRO** or **Mixed Mode** for the current Personality; otherwise, this field's value becomes invalid.

Accessed Only: When the radio is model/option capable, and (when the Remote Site Interface System field in the referenced Conventional System is **Disabled**; if **Enabled**, then the Rx Voice/Signal Type field must be set to **ASTRO**, and this Talkgroup selection must be **Disabled**; else, this field becomes invalid).

10.34.8.2

Selection Type

This field allows you the ability to choose a talkgroup from the selected ASTRO Talkgroup List, or to not give you the ability to change the talkgroup.

The Talkgroup List is selected from the [Talkgroup List on page 428](#) on this same page. This selection applies while operating in ASTRO System mode and on the current Conventional Personality.

Accessed Only: When the [Rx Voice/Signal Type on page 390](#) field is set to **ASTRO** or **Mixed Mode**, and when the [Talkgroup on page 427](#) field is **Enabled**, and when the personality is not automatically created by the Zone Cloning feature.

The following selections are supported:

Strapped

The Talkgroup selected by the ASTRO Talkgroup ID field is strapped to the current Conventional Personality and cannot be changed.

Selectable

You are able to switch from the preset Talkgroup ID to another Talkgroup ID from within the Conventional Personality's Talkgroup List, selected on this same page.

You are only able to switch Talkgroups with a Talkgroup button-press or Talkgroup menu-selection.

10.34.8.3

Talkgroup List

This field selects an ASTRO Talkgroup List to be used while operating in ASTRO System mode and on the current Conventional Personality.

WARNING:

When the [ASTRO OTAR on page 442](#) field is **Enabled** for the current Conventional Personality, only those ASTRO Talkgroup Lists that are referencing the same Secure KMF Profile, from the Talkgroup List's KMF Profile Index field, that the current Conventional Personality is referencing (from the Personality's [ASTRO OTAR Profile Index on page 443](#) field) may be selected.

When the ASTRO OTAR field is **Disabled** for the current Conventional Personality, any Talkgroup List may be selected.

Accessed Only: When the [Rx Voice/Signal Type on page 390](#) field is set to **ASTRO** or **Mixed Mode**, and when the [Talkgroup on page 427](#) field is **Enabled**, when the personality is not automatically created by the Zone Cloning feature.

10.34.9

Features

This section allows you to view or define miscellaneous Conventional communications features.

NOTE: Once the features of the Conventional Personalities have been uniquely defined, each personality may then be assigned to the desired position of the radio's channel selector. This is accomplished from the Zone Channel Assignment's Channels Page.

10.34.9.1

OTACR/OTACS Messaging

Enables Over-The-Air-Channel-Reassignment (OTACR) and Over-The-Air-Channel-Steering (OTACS) Messaging.

WARNING: This feature is currently not available.

This feature applies while operating on the current [Conventional Personality on page 388](#).

WARNING: When the referenced [Conventional System on page 375](#) (selected in the [ASTRO System on page 414](#) field) has a referenced [Data Profile](#) whose [Data Profile Type on page 341](#) is **Conventional & Broadband** or **Broadband-Only**, this field must be set to **Disabled**; otherwise, it is considered invalid.

Accessed Only: When the [Rx Voice/Signal Type on page 390](#) is **ASTRO** or **Mixed Mode**, and when the [OTACR Feature](#) is **Enabled** or the [OTACS Feature](#) is **Enabled**, and when the referenced [Conventional System on page 375](#) selected in the [ASTRO System on page 414](#) field is not a [DVRS System Type on page 376](#), and when the radio is model/option capable.

10.34.9.2

Tactical Rekey Enable

This field enables the radio to receive Rekey commands that have been sent from other radios or Subscriber Units (SUs) rather than from a Fixed Network Equipment (FNE) or a Key Management Facility (KMF).

Rekeying is the process of changing the radio's current secure encryption keys. Secure encryption keys allow for secure communications to occur.

NOTE: In order to use this radio as an RF modem to transmit Tactical Rekey commands, please refer to the Terminal Data field.

Accessed Only: When the Secure Operation field is **Hardware**, and when the [Rx Voice/Signal Type on page 390](#) is **ASTRO** or **Mixed Mode**, and when the [Tx Voice/Signal Type on page 393](#) field is **ASTRO**, and when an ASTRO System Type referenced Conventional System having a valid referenced Data Profile has been selected, and when the Data Profile Type is **Conventional** in that referenced Data Profile, and when the radio is model/option capable.

10.34.9.3

Hot Keypad

This field enables you to enter telephone numbers using the radio's keypad, even when the radio is not in Phone Mode.

This hot keypad mode is initiated by pressing and holding the PTT button while pressing the required numbers. This feature applies while operating on the current Conventional Personality.

Accessed Only: When [Receive Only Personality on page 389](#) field is **Disabled**, and Tone Signaling H-Option is present, and when the radio is model/option capable.

10.34.9.4

DTMF Mic Enable

This field allows you to transmit DTMF tones using the radio's keypad, even when the radio is not in Phone Mode.

You can initiate DTMF Mic by pressing and holding the Top or Side or Control Head button, while the required DTMF keypad number is sent out. This selection applies while operating on the current Conventional Personality.

Accessed Only: When [Receive Only Personality on page 389](#) field is **Disabled**, and Tone Signaling H-Option is present, and when the radio is model/option capable.

10.34.9.5

End Tx on Voice Absence

This field enables the radio, during a Conventional voice transmission, to automatically de-key when its on-board Digital Signal Processor (DSP) detects a lack of voice from the microphone for a period that exceeds the Voice Absence Timer.

This selection applies while operating on the current Conventional Personality.

WARNING: The feature does not operate when an in-the-field radio:

- Is operating in Emergency Mode and either **Hot Mic Emergency** or **Emergency via Silent Audio** is currently active (see also Emergency Auto Transmit Mode), or
- Is currently being remotely-monitored (see also Remote Radio Mode and Emergency Remote Monitor Enable).

Accessed Only: When the radio is model/option capable.

10.34.9.6

Scan List Selection

This field selects which Scan List is used by the radio while operating in Scan Mode for the current Conventional Personality.

This Scan List then determines which calls the radio scans for (actively listens for), and considers unmuting to the current Conventional channel.

WARNING:

When the Analog Flat Audio field is **Enabled**, this field must be set to **None**; otherwise, it becomes invalid. Therefore both features may not be enabled on the same Personality.

When the [Mixed Vote Scan Enable on page 431](#) field is **Enabled** for the current Personality, this field must be set to a **Conventional Scan Type on page 617**; otherwise, it becomes invalid.

When the referenced Conventional System selected in the [ASTRO System on page 414](#) field is a DVRS System Type, this field must be set to **None**; otherwise, it becomes invalid.

The RadioCentral considers this selection invalid when this personality is LTE Broadband-enabled, and this selected Scan List has any Scan List Member Channels having the following condition:

- their Conventional Personality's [LTE Interference Frequency Present on page 395](#) field set to **Enabled**, or
- their Trunking System's LTE Interference Freq Present field is **True**, or
- their Trunking System's Coverage Type field set to **Inter-WACN Roaming**.

NOTE: A conventional channel is LTE enabled when the Personality's referenced ASTRO- Conventional System has a referenced Data Profile having a Data Profile Type selection equal to **Conventional & Broadband** or **Broadband-Only**, and when that Data Profile's Broadband Source is **Internal LTE Modem**.

The RadioCentral considers this selection invalid when the current Conventional Personality's LTE Interference Frequency Present field is **Enabled**, and this Scan List Selection is referencing a Scan List with a Designated Data Member LTE Broadband-enabled channel.

NOTE: A conventional channel is LTE enabled when the Personality's referenced ASTRO- Conventional System has a referenced Data Profile having a Data Profile Type equal to **Conventional & Broadband** or **Broadband-Only**, and when that Data Profile's LTE Enable field is **Enabled**.

NOTE:

Scan List and Scan List Member functionality are defined in the Scan List Window.

Only Scan Lists having the **Conventional** or **Talkgroup** selection in the Scan Type field are valid Scan List Selections for the current Conventional Personality.

Scan Lists having the **Intelligent Priority** selection in the Scan Type field are valid Scan List Selections for the current Conventional Personality without DVRS system.

You can initiate Scan List editing with a Scan List Programming switch-toggle, a Scan List menu-selection, or a long keypress duration of a Scan button-press.

Voting Scan is an invalid selection on a clonable personality.

Accessed Only: When the Remote Site Interface System field in the referenced Conventional System is **Disabled**;

if **Enabled**, then the [Rx Voice/Signal Type on page 390](#) field must be set to **ASTRO**, and this Scan List Selection must be **None**; else, this field becomes invalid.

10.34.9.7

Automatic Scan

This field causes the radio to automatically enter scan mode when you select (with the channel selector) the current Conventional Personality.

Auto Scan is also invoked when the radio is powered-on to the current Personality.

When disabled, you are able to invoke Scan Mode operation through a Scan button-press, a Scan switch-toggle or a Scan menu-selection, while operating on the current Conventional Personality.

Accessed Only: When the [Scan List Selection on page 429](#) field is not set to **None**.

10.34.9.8

Mixed Vote Scan Enable

This field enables Conventional Mixed Vote Scan for the current Conventional Personality.

When this field is **Enabled**, all of the Frequency Options (records/rows) in the current Personality are used to form the Voting Scan list.

IMPORTANT: Additionally, when this field is enabled, the maximum number of Frequency Options is limited to 15.

NOTE: Frequency Option profiles can be selected for use within the Zone Channel Assignment's Channels Page; first, the Personality is selected in the Personality field, and then the Frequency Options profile is selected in the Frequency Options field.

Accessed Only: When the radio is model/option capable, and when the personality is not automatically created by the Zone Cloning feature, and

(when the Remote Site Interface System field in the referenced Conventional System is **Disabled**; if **Enabled**, then the [Rx Voice/Signal Type on page 390](#) field must be set to **ASTRO**, and this Mixed Vote Scan Enable selection must be **Disabled**; else, this field becomes invalid).

10.34.9.9

Mixed Vote Scan Tx Steering

This field enables the Frequency Options profiles of the current Conventional Personality to vary when that Personality has been Conventional Mixed Vote Scan enabled.

See the [Mixed Vote Scan Enable on page 431](#) field. When disabled, all Tx Frequency Options, and specific Rx Frequency Options, for the current Conventional Personality must be the same.

Accessed Only: When the Mixed Vote Scan Enable field is **Enabled**.

10.34.9.10

Smart PTT Type

This field allows you to select a channel lockout rule that prevents the radio from transmitting while the selected Tx **Inhibit On** condition exists.

This selection applies while operating on the current Conventional Personality.

IMPORTANT: The [Quick Key Override on page 432](#) field is an override feature pertaining to these Tx **Inhibit On** selections. This override feature allows you to transmit regardless of the currently-selected **Inhibit On** rule.

NOTE:

If you attempt to transmit (by pressing the PTT Button) while a selected Tx **Inhibit On** rule is disallowing that transmission, the radio will exhibit one of two behaviors:

- If the selected Tx **Inhibit On** condition is met but the radio is currently muted, a continuous alert tone sounds until the PTT button is released. This would include, for example, cases where the repeater is busy with an encrypted conversation, but the radio remains muted due to a lack of secure support (**Inhibit on Status Symbols**).
- If the radio is currently receiving and unmuted to a voice transmission, pressing the PTT button causes a short alert tone to sound; this is because the radio unmutes to the higher-priority voice audio after a brief interval.

Accessed Only: When the [Receive Only Personality on page 389](#) field is **Disabled**, and when the referenced Conventional System is not a DVRS System Type, and (if the [Rx Voice/Signal Type on page 390](#) field is set to **ASTRO**, then the Remote Site Interface System field in the referenced Conventional System must be **Disabled**).

The Smart PTT Type supports the following selections:

Disabled

Allows transmission when any transmission is detected on the current channel.

Inhibit On Wrong PL

For analog (Non-ASTRO) voice calls: Prevents transmission when carrier squelch is detected with a PL code that does not match for the current personality/channel; If the busy channel PL code is a match for the current personality, radio transmissions are permitted.

For digital (ASTRO) voice calls: Prevents transmission when the radio does not unmute due to receiving a Talkgroup ID that does not match the current personality/channel's Talkgroup ID. If the busy channel Talkgroup is a match for the current personality/channel's Talkgroup ID, radio transmissions are permitted.

NOTE: Permissible Talkgroups are determined by the personality's referenced ASTRO Talkgroup List.

Inhibit On Carrier

Prevents transmission when carrier squelch is detected on the current channel.

Inhibit on Correct NAC

Prevents transmission while the radio is receiving a digital (ASTRO) voice call that has a matching Network Access Code (NAC) for the current channel (see [Rx Network ID on page 399](#)).

Inhibit on Status Symbols

Prevents transmission while receiving a digital (ASTRO) voice call and when the 'last-received' signal status bit recorded was either **inbound busy** or **unknown**.

NOTE:

Receiving analog signals is only possible when the Rx Voice/Signal Type field is **Non-ASTRO** or **Mixed Mode**, and an MDC or QCII System Type has been selected in the Non-ASTRO Signaling Type field, and the corresponding Non-ASTRO System has been selected for the current Conventional Personality.

Receiving digital signals is only possible when the Rx Voice/Signal Type field is set to **ASTRO Mode** or **Mixed Mode**, and an ASTRO - Conventional System has been selected in the [ASTRO System on page 414](#) field.

10.34.9.11

Quick Key Override

This field allows you to override the selected Smart PTT Type field **Inhibit On** rule, thus allowing a transmission to be sent on a busy channel in an impolite fashion.

You can accomplish this by quick-keying the PTT button. Quick-keying is when the PTT button is pressed, released and quickly re-pressed, within the time specified by the Smart PTT Quick Key Timer field. This feature applies for the current Conventional Personality.

Accessed Only: When the [Receive Only Personality on page 389](#) field is **Disabled**, and when the [Smart PTT Type on page 431](#) field is not **Disabled**, and when the referenced Conventional System is not a DVRS System Type, and (if the [Rx Voice/Signal Type on page 390](#) field is set to **ASTRO**, then the Remote Site Interface System field in the referenced Conventional System must be **Disabled**).

10.34.9.12

Incident Signaling Type

This field selects either the Personnel Accountability or the Tactical Public Safety (TPS) signaling type for the current Conventional Personality.

NOTE: None of these selections have any influence on the [Tactical Public Safety UI Enable on page 435](#) feature.

Accessed Only: When the personality is not automatically created by the Zone Cloning feature and when the radio is model/option capable.

The following selections are supported:

Disabled

No Personnel Accountability or TPS Signaling is available to the radio.

Personnel Accountability

Enables Personnel Accountability Signaling for the current Conventional Personality.

WARNING: This selection is only valid when [Phone Operation](#) is set to **None**, and when [Tx Voice/Signal Type on page 393](#) is set to **ASTRO**, and when the referenced Conventional System is not a DVRS System Type, and when that Conventional System's referenced Data Profile has the **Conventional & Broadband** or **Broadband Only**.

Personnel Accountability with MDC

Enables Personnel accountability with MDC for the current Conventional Personality

WARNING: This selection is only valid when [Phone Operation](#) is set to **None**, and when [Tx Voice/Signal Type on page 393](#) is set to **ASTRO**, and when the Rx Voice / Signal Type is set to **Mixed Mode**, and when the Personnel Accountability Tx voice Type is set to **Analog** and when the Non-ASTRO signalling type is set to **MDC** and when the RAC/Repeater Access is disabled, and when the referenced Conventional System is set to ASTRO System Type, and when that Conventional System's referenced Data Profile has the **Conventional & Broadband** or **Broadband Only**.

Tactical Public Safety

Enables TPS Signaling for the current Conventional Personality.

WARNING: This selection is only valid when [Rx Voice/Signal Type on page 390](#) is set to **Mixed Mode**, and

when Tx Voice/Signal Type is set to **ASTRO**, and

when Non-ASTRO Signaling Type is set to **None**, and

when the [Talkgroup on page 427](#) field is **Disabled**, and

when the [Selective Call Rx/Tx on page 423](#) field is set to **Disabled** or **Decode**, and

when the referenced Conventional System is not a DVRS System Type, and

when that Conventional System's referenced Data Profile has the **Conventional & Broadband** or **Broadband Only**,

and

(when Secure Operation field is **Disabled**),

or

(when Secure Operation is set to **Hardware** or **Advanced Digital Privacy**, and when [Voice Secure/Clear Strapping on page 438](#) is set to **Clear**.)

10.34.9.13

Personnel Accountability Registration

This field enables the radio to register with the Personnel Accountability (PA) Incident Command Terminal (ICT).

Registration is accomplished by transmitting PA registration packets to the ICT with the expectation of receiving an

acknowledgement from the ICT of a successful registration transmission. If the registration packet transmission is not acknowledged, the radio continues to retry the packet transmission for the number of times defined in the Trunking Wide, [Max Tx Attempts on page 459](#) field. This feature applies when operating on the current Conventional Personality.

NOTE: The Radio Wide, Respond to Polls field determines how often (in minutes) that the registration attempt will re-occur.

Accessed Only: When the [Incident Signaling Type on page 433](#) field is set to **Personnel Accountability** or **Personnel Accountability with MDC**, and when the CAI Data Registration field in the current Conventional Personality's referenced Conventional System is **Disabled**, and when that Conventional System's referenced Data Profile has its ARS Mode field **Disabled**, and when the radio is model/option capable.

10.34.9.14

Tx Voice Type

This field selects the Transmit (Tx) Voice mode that is used during Personnel Accountability operation for the current Conventional Personality.

Accessed Only: When the [Incident Signaling Type on page 433](#) field is set to **Personnel Accountability** or **Personnel Accountability with MDC**, and when the radio is model/option capable.

The following selections are supported:

Digital

ASTRO digital mode is used to transmit voice during Personnel Accountability operation. ASTRO digital mode is not valid for Personnel Accountability with MDC.

Analog

Non-ASTRO analog mode is used to transmit voice during Personnel Accountability operation.

WARNING: This selection is only valid per a Conventional Personality basis when the [Rx Voice/Signal Type on page 390](#) field is set to **Mixed Mode**, and when the [Talkgroup on page 427](#) field is **Disabled**, and when the [Selective Call Rx/Tx on page 423](#) field is not set to **Encode** or **Decode & Encode**.

10.34.9.15

Tactical Public Safety UI Enable

This field enables several Tactical Public Safety (TPS) features that are related to Emergency Mode operation for the current Conventional Personality.

These features include the Radio Wide, Tactical Public Safety: Audible Emergency Beacon, Audible Emergency Beacon Routing, Emergency Call De-key Sidetone, and Emergency Alarm Retry Rate.

IMPORTANT: This feature applies for the current Conventional Personality regardless of this Personality's [Incident Signaling Type on page 433](#) selection.

Accessed Only: When the radio is model/option capable.

10.34.9.16

Hazard Zone Mode Personality

This field allows you to turn on the Hazard Zone Mode (HZM) using the concentric switch while operating on the current Conventional Personality.

NOTE: This field is only applicable for APX NEXT XN radio.

IMPORTANT: When HZM is **Enabled**, the following conditions must be fulfilled. ASTRO System field in Conventional Personality is set to an ASTRO system with the following settings:

- Emergency Profile Selection field is connected to a conventional emergency profile.
- Emergency Profile Selection field is not set to **Emergency Tx Disabled**.
- Emergency Alarm Rx Indicator field is **Enabled**.

Tx Voice/Signal Type and Rx Voice/Signal Type field is set to **ASTRO** or Incident Signaling Type field is not set to **Disabled**.

When HZM Personality field is checked, the Emergency Revert Type field is set to **Selected Channel**, or to another channel tied to a HZM personality.

Accessed Only: When the radio is the latest Fire Service Standards model.

10.34.9.17

Polite DVRS Inbound PTT Request

This field enables Polite PTT for Conventional DVRS mode. Polite Voice Access Requests are sent using Fast Retry instead of Limited Patience.

Accessed only: This field becomes applicable when the ASTRO System references a DVRS System.

10.34.10

Phone

This section allows you to view or define phone system or telephone dialing functionality for individual Conventional Personalities.

These settings apply when operating in Phone Mode.

NOTE:

Once the features of the Conventional Personalities have been uniquely defined, each personality may then be assigned to the desired position of the radio's channel selector. This is accomplished from the Zone Channel Assignment's Channels Page.

You can activate Phone Mode with a Call Response or Phone button-press or Phone menu-selection.

The following fields are supported:

10.34.10.1

DTMF Timing Select

This field selects a predefined set of DTMF timing parameters from the Phone Wide, DTMF Timing Page.

Each set defines parameters in the following three fields: Initial Delay, Digit Duration, and Interdigit Delay. This selection applies while operating in Phone Mode for the current Conventional Personality.

Accessed Only: (When the radio is model/option capable, and when the [Receive Only Personality on page 389](#) field is **Disabled**, and when the [Phone Operation](#) field is set to **List Only** or **Unlimited**, and when the referenced Conventional System selected in the ASTRO System field is not a DVRS System Type), and (if the [Rx Voice/Signal Type on page 390](#) field is set to **ASTRO**, then the Remote Site Interface System field in the referenced Conventional System must be **Disabled**).

10.34.10.2

Auto Access Code Select

This field selects a set of predefined DTMF - Access and Deaccess codes to be used in Phone Mode for communicating with a phone system.

Phone System Access and Deaccess codes are paired in sets that are named in the DTMF Codes Name field. This selection applies while operating in Phone Mode for the current Conventional Personality.

Accessed Only: (When the radio is model/option capable, and when the [Receive Only Personality on page 389](#) field is **Disabled**, and when the [Phone Operation](#) field is set to **List Only** or **Unlimited**, and when the referenced Conventional System selected in the ASTRO System field is not a DVRS System Type), and (if the [Rx Voice/Signal Type on page 390](#) field is set to **ASTRO**, then the Remote Site Interface System field in the referenced Conventional System must be **Disabled**).

10.34.11

Secure

This section allows you to view or define security functionality for secure transmit and receive encoded communications.

This functionality can be customized for individual Conventional Personality.

NOTE: Once the features of the Conventional Personalities have been uniquely defined, each personality may then be assigned to the desired position of the radio's channel selector. This is accomplished from the Zone Channel Assignment's Channels Page.

10.34.11.1

Secure Voice/Signal Type

This field selects the secure encrypted voice signaling mode for the current Conventional Personality.

WARNING:

When the [Rx Voice/Signal Type on page 390](#) field is **ASTRO** or **Mixed Mode**, ASTRO becomes the valid Secure Voice/Signal mode.

When the Rx Voice/Signal Type field is **Non-ASTRO**, SecureNet becomes the valid Secure Voice/Signal mode.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware**, or (when the [Secure Operation on page 272](#) field is set to **Software**, and when the [Rx Voice/Signal Type on page 390](#) field is set to **ASTRO** or **Mixed Mode**).

The following selections are supported:

ASTRO

When the Rx Voice/Signal Type field is set to **ASTRO** or **Mixed Mode**.

SecureNet

When the Rx Voice/Signal Type field is set to **Non-ASTRO**.

10.34.11.2

XL Transmit

This field enables analog/SecureNet™ Data Encryption Standard - Extended Range (DES-XL) for the current Conventional Personality.

DES XL is a Type 3 encryption standard (mid-level).

When disabled, analog/SecureNet Data Encryption Standard (DES) applies for the current Conventional Personality.

NOTE: The receive communications of the secure XL chip need not be configured since it automatically decrypts both XL and Non-XL data streams.

Accessed Only: When the Secure Operation field is set to **Hardware**, and when the [Rx Voice/Signal Type on page 390](#) field is **Non-ASTRO**, and when the [Voice Secure/Clear Strapping on page 438](#) field is not **Clear**, and when the [Secure Voice/Signal Type on page 437](#) field is **Securenet**, and when the radio is model/option capable.

10.34.11.3

DES-XL Tx Default

This field enables digital Data Encryption Standard - Extended Range (DES-XL) algorithm as the default for all encrypted voice and data transmissions while operating on the current Conventional Personality.

This is only true when you do not initiate transmission during the Key ID - Rx Hang Time. DES XL is a Type 3 encryption standard (mid-level).

When disabled, digital Data Encryption Standard - Output Feedback (DES-OFB) applies for the current Conventional Personality.

IMPORTANT: This feature only applies when the radio is equipped with a DES-XL/DES-OFB dual algorithm encryption module.

Accessed Only: When the radio is model/option capable, and when the [Rx Voice/Signal Type on page 390](#) is **ASTRO** or **Mixed Mode**, and when the [Secure Operation on page 272](#) field is set to **Hardware**, and (when the [Secure Voice/Signal Type on page 437](#) field is **ASTRO**, and when the [ASTRO Talkgroup on page 427](#) field is **Enabled**, or when the [Voice Secure/Clear Strapping on page](#)

438 field is **Select** or **Secure**, or (when an **ASTRO** System Type referenced Conventional System having a valid referenced Data Profile has been selected, and when the Terminal Data field in that Data Profile is **Enabled**), and when the [Packet Data Secure/Clear Strapping on page 439](#) field is **Select** or **Secure**)).

10.34.11.4

Voice Secure/Clear Strapping

This field selects the secure encryption transmit mode for the current Conventional Personality.

WARNING:

When the Analog Flat Audio field is **Enabled**, this field must be set to **Clear**; otherwise, it becomes invalid. Therefore both features may not be enabled on the same Personality.

(When the Primary Frequency Band is **900MHz**), or (when Allow Invalid Frequencies is **Enabled**, and when 900 MHz Used in Codeplug is **Enabled**), and (when the Secure Operation field is set to **Hardware**, and when the [Rx Voice/Signal Type on page 390](#) field is set to **Non-ASTRO**, and when the [Tx Deviation/Channel Spacing on page 398](#) for one of the current Frequency Options profiles (records/rows) is set to **2.5khz / 12.5khz**), then this field must be set to **Clear**; otherwise, it becomes invalid.

Accessed Only: (When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the [Talkgroup on page 427](#) field is disabled, and when the personality is not automatically created by the Zone Cloning feature, and

(when the [Rx Voice/Signal Type on page 390](#) field is **Mixed Mode** or **ASTRO**, and when the Remote Site Interface System field in the referenced Conventional System is disabled)),

Or

(when the [Secure Operation on page 272](#) field is set to **Hardware**, and when the [Rx Voice/Signal Type on page 390](#) field is **Non-ASTRO**).

The following selections are supported:

Select

Allows you to toggle on or off secure encrypted communications.

Either the Secure Tx Select button-press or the Secure Tx Select switch-toggle or the Secure menu-selection allows you to toggle between Secure or Clear communications for that channel.

Clear

Straps or commits the channel to normal (non-secure) Conventional operation.

Secure

Straps or commits the channel to secure encrypted operation.

10.34.11.5

Voice Key Strapping

This field selects if you can select the voice encryption key or not while operating on the current Conventional Personality.

Accessed Only: When the [Voice Secure/Clear Strapping on page 438](#) field is applicable and not set to **Clear**, and when the radio is model/option capable.

The following selections are supported:

Select

Allows you to select the appropriate secure encryption key.

Strapped

The key selected from the [Voice Key Select on page 439](#) field is permanently strapped to the current Conventional Personality.

WARNING: The key menu-selection must be chosen in order for you to be able to select keys for the current Conventional Personality.

10.34.11.6

Voice Key Select

This field selects the voice encryption key that applies while operating on the current Conventional Personality.

These keys are programmed in the Secure Encryption Key List.

IMPORTANT:

When the [ASTRO OTAR on page 442](#) field is **Enabled** for the current Conventional Personality, this Key Select value is chosen from the Secure Hardware Encryption Key References List of the Secure KMF Profile selected in the KMF Profile Index field for the current Conventional Personality.

WARNING: Be aware that the application is actually pointing to the Keys of the Encryption Key List for this selection; individual Keys from the Secure Hardware Encryption Key References List reference the Encryption Key List's Keys from the Encryption Key Reference field. Therefore any key selected when ASTRO OTAR is **Enabled**, must first be defined in the Secure Hardware Encryption Key References List.

When the ASTRO OTAR field is **Disabled** for the current Conventional Personality, this Key Select value is directly chosen from the Secure Wide Window's Encryption Key List.

Accessed Only: When the [Voice Secure/Clear Strapping on page 438](#) field is applicable and not set to **Clear**, and when the radio is model/option capable.

10.34.11.7

Ignore Rx Clear Voice

This field causes the radio to ignore all "Clear" (non-secure encrypted) voice communication while operating on the current Conventional Personality.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and (IF the [Rx Voice/Signal Type on page 390](#) field is set to **ASTRO**, THEN the Remote Site Interface System field in the referenced Conventional System must be disabled).

10.34.11.8

Packet Data Secure/Clear Strapping

This field selects the Association of Public-Safety Communications Officials (APCO) Packet Data transmit mode for the current Conventional Personality.

Accessed Only: (When the radio is model/option capable, and when the [Rx Voice/Signal Type on page 390](#) is set to **ASTRO Mode** or **Mixed Mode**, and when the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the referenced Conventional System is not a DVRS System Type, and when the personality is not automatically created by the Zone Cloning feature),

And

(when the Enable (Tactical Inhibit) field is enabled, or when the referenced Conventional System has a valid referenced [Data Profiles on page 340](#) selected, and when the [Terminal Data on page 344](#) field in that Data Profile is enabled.)

The following selections are supported:

Clear

The radio transmits APCO Packet Data in non-secure mode.

Secure

The radio transmits APCO Packet Data in secure encryption mode.

10.34.11.9

Packet Data Key Select

This field selects the encryption key to be used for Association of Public-Safety Communications Officials (APCO) Packet Data transmissions.

This selection applies for the current Conventional Personality.

IMPORTANT:

When the [ASTRO OTAR on page 442](#) field is **Enabled** for the current Conventional Personality, this Key Select value is chosen from the Secure Hardware Encryption Key References List of the Secure KMF Profile selected in the [ASTRO OTAR Profile Index on page 443](#) field for the current Conventional Personality.

WARNING: Be aware that the application is actually pointing to the Keys of the Encryption Key List for this selection; individual Keys from the Secure Hardware Encryption Key References List reference the Encryption Key List's Keys from the Encryption Key Reference field. Therefore any key selected when ASTRO OTAR is **Enabled**, must first be defined in the Secure Hardware Encryption Key References List.

When the ASTRO OTAR field is **Disabled** for the current Conventional Personality, this Key Select value is directly chosen from the Secure Wide Window's Encryption Key List.

Accessed Only: (When the radio is model/option capable, and when the [Rx Voice/Signal Type on page 390](#) is set to **ASTRO Mode** or **Mixed Mode**, and when the [Secure Operation on page 272](#) field is set to **Hardware**, and when the referenced Conventional System is not a DVRS System Type), and ((when the Tactical Inhibit Enable field is **Enabled**), or (when the referenced Conventional System has a valid referenced Data Profile selected, and when the Terminal Data field in that Data Profile is **Enabled**.)

10.34.11.10

Ignore Rx Clear Packet Data

This field causes the radio to ignore all "Clear" (non-secure encrypted) ASTRO Conventional Packet Data communications while operating on the current Conventional Personality.

NOTE: For more information on ASTRO Conventional Packet Data, see the Data Profile Window and the Conventional System. ASTRO, Data Profile Selection field.

Accessed Only: (When the [Rx Voice/Signal Type on page 390](#) is set to **ASTRO Mode** or **Mixed Mode**, and when the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the [Packet Data Secure/Clear Strapping on page 439](#) field is **Secure**, and when the radio is model/option capable),

And

(when the referenced Conventional System is not a DVRS System Type, and when that referenced Conventional System has a valid referenced Data Profile selected, and when the [Terminal Data on page 344](#) field in that Data Profile is enabled).

10.34.11.11

Proper Code Detect

This field causes the radio's speaker to unmute only on SecureNet™ data when the data is encrypted with the correct security key.

The encrypted security key is hard-coded to the radio with an internal encryption chip or a Key-Variable Loader (KVL) device. This feature applies for the current Conventional Personality.

Accessed Only: When the Secure Operation field is set to **Hardware**, and when the [Secure Voice/Signal Type on page 437](#) field is **Securenet**, and when the radio is model/option capable.

10.34.11.12

OTAR Tx

This field enables the radio to transmit ASTRO and MDC Over-The-Air-Rekeying (OTAR) for the current Conventional Personality.

OTAR transmissions include: Rekey Requests, Delayed Acks, or Power-up Acks.

WARNING: Your ability to initiate Rekey Requests must be programmed.

NOTE:

Rekey Requests: When the [ASTRO OTAR on page 442](#) field is enabled for the current channel, and ASTRO and MDC are both available to the channel (see [Rx Voice/Signal Type on page 390 Mixed Mode](#)), your initiated Rekey Requests are always transmitted using ASTRO OTAR. However, when the radio is responding to an OTAR transmission, the radio always transmits using the same type of OTAR that it had received.

Setting Up ASTRO and MDC Mixed Mode: When the Rx Voice/Signal Type field is set to **Mixed Mode**, an ASTRO System Type Conventional System must be selected in the [ASTRO System on page 414](#) field, and **MDC** must be selected in the Non-ASTRO Signaling Type field allowing an MDC System Type Conventional System to be selected in the Non-ASTRO System field.

Conventional System is not a DVRS System Type

Accessed Only: When the [Secure Operation on page 272](#) field is **Hardware** or **Software** and the [Advanced Encrypted Standard \(AES256\) on page 273](#) field is enabled, and

when the [OTAR Enable on page 273](#) field is enabled, and

when the [Receive Only Personality on page 389](#) field is disabled, and when the radio is model/option capable,

And

(when the [ASTRO OTAR Enable on page 274](#) field is enabled, and

when the [MDC OTAR Enable on page 277](#) field is enabled),

Or

(when the ASTRO OTAR Enable field is enabled, and

when the MDC OTAR Enable field is disabled, and

when the [Rx Voice/Signal Type on page 390](#) is **ASTRO** or **Mixed Mode**),

Or

(when the ASTRO OTAR Enable field is disabled, and

when the MDC OTAR Enable field is enabled, and

when the Rx Voice/Signal Type is **Non-ASTRO** or **Mixed Mode**,

and when the [Non-ASTRO Signaling Type on page 416](#) field is **MDC**).

Conventional System is a DVRS System Type

When the [Secure Operation on page 272](#) field is **Hardware** or **Software** and the [Advanced Encrypted Standard \(AES256\) on page 273](#) field is enabled, and

when the [OTAR Enable on page 273](#) field is enabled, and

when the [Receive Only Personality on page 389](#) field is disabled, and when the radio is model/option capable,

And

(when the [ASTRO OTAR Enable on page 274](#) field is enabled, and

when the [MDC OTAR Enable on page 277](#) field is enabled), and

when the [Rx Voice/Signal Type on page 390](#) is **Mixed Mode**, and

and when the [Non-ASTRO Signaling Type on page 416](#) field is **MDC**),

Or

(when the [ASTRO OTAR Enable](#) field is enabled, and

when the [Rx Voice/Signal Type on page 390](#) is not set to **Non-ASTRO**).

10.34.11.13

ASTRO OTAR

This field enables the radio's ability to receive ASTRO Over-The-Air-Rekeying (OTAR) and/or to receive MDC OTAR for the current Conventional Personality.

NOTE: In order for both ASTRO OTAR and MDC OTAR receive capability on the same channel, the [Rx Voice/Signal Type on page 390](#) field must be set to **Mixed Mode**. ASTRO OTAR takes precedence over MDC OTAR, however, if MDC OTAR is received, the radio will first try to respond with MDC OTAR.

IMPORTANT:

When the [ASTRO OTAR Enable on page 274](#) field is **Enabled** for the current Conventional Personality, Hardware Key Select values for this Personality use the [Secure Hardware Encryption Key References List on page 290](#) of the Secure KMF Profile selected in this KMF Profile Index field for the current Conventional Personality.

WARNING: Be aware that RadioCentral is actually pointing to the Keys of the [Encryption Key List on page 286](#) for this selection; individual Keys from the Secure Hardware Encryption Key References List reference the Encryption Key List's Keys from the [Encryption Key Reference on page 291](#) field. Therefore any key selected when ASTRO OTAR is enabled, must first be defined in the Secure Hardware Encryption Key References List.

When the [ASTRO OTAR Enable on page 274](#) field is **Disabled** for the current Conventional Personality, Hardware Key Select values are directly chosen from the Secure Wide Window's Encryption Key List.

Accessed Only: When the [Secure Operation on page 272](#) field is **Hardware** or **Software**, and when the [Advanced Encrypted Standard \(AES256\) on page 273](#) field is enabled, and

when the [Rx Voice/Signal Type on page 390](#) is **ASTRO Mode** or **Mixed Mode**, and

when the [OTAR Enable on page 273](#) field is **Enabled**, and

when the [ASTRO OTAR Enable on page 274](#) field is **Enabled**, and

when the personality is not automatically created by the Zone Cloning feature, and

when the radio is model/option capable.

10.34.11.14

ASTRO OTAR Profile Index

This field selects the Secure Key Management Facility (KMF) Profile to be used while operating in ASTRO Over the Air Rekeying (OTAR) mode.

This selection applies while operating on the current Conventional Personality.

NOTE: All ASTRO OTAR parameters specified in the selected KMF profile then apply to the current Conventional Personality.

WARNING: This field is invalid when this personality references a Conventional System (having a System Type of **ASTRO**), which references a Data Profile (having a Data Profile Type of **Conventional & Broadband** or **Broadband Only**), and when the KMF IP Address field is set to 0.0.0.0.

IMPORTANT:

When the [ASTRO OTAR on page 442](#) field is **Enabled** for the current Conventional Personality, Hardware Key Select values for this Personality use the Secure Hardware Encryption Key References List of the Secure KMF Profile selected in this KMF Profile Index field for the current Conventional Personality.

WARNING: Be aware that the application is actually pointing to the Keys of the Encryption Key List for this selection; individual Keys from the Secure Hardware Encryption Key References List reference the Encryption Key List's Keys from the Encryption Key Reference field. Therefore any key selected when ASTRO OTAR is **Enabled** must first be defined in the Secure Hardware Encryption Key References List.

When the ASTRO OTAR field is **Disabled** for the current Conventional Personality, Hardware Key Select values are directly chosen from the Secure Wide Window's Encryption Key List.

Accessed Only: When the [Secure Operation on page 272](#) field is **Hardware** or **Software**, and the [Advanced Encrypted Standard \(AES256\) on page 273](#) field is enabled, and

when the ASTRO OTAR field is **Enabled** and applicable, and

when the [Rx Voice/Signal Type on page 390](#) is **ASTRO** or **Mixed Mode**, and

when the [ASTRO OTAR Enable on page 274](#) field is enabled, and

when the [OTAR Enable on page 273](#) field is enabled, and

when the Tactical Rekey Enable field is disabled, and

when the radio is model/option capable.

The following selections are supported:

- Disabled
- Available Secure KMF Profiles

10.34.11.15

Echo Mute Time

This field selects the amount of time that the radio's speaker remains muted immediately following a secure encrypted transmission.

That is, for repeater systems having a large amount of data throughput delay, the tail end of your encrypted voice transmission may be heard again following de-keying. This time can allow for repeater system delays thus muting this possible echoing effect. This time begins once the PTT button is released. This selection applies for the current Conventional Personality.

Accessed Only: (When the ASTRO [Talkgroup on page 427](#) field is **Enabled**, or when the ASTRO Talkgroup field is **Disabled**, and when the [Voice Secure/Clear Strapping on page 438](#) field is **Select or Secure**), and

(when the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the [Rx Voice/Signal Type on page 390](#) field is set to **ASTRO** or **Mixed Mode**).

Table 217: Range

Minimum	Maximum	Increments
0 ms	1500 ms	50 ms

10.34.11.16

Scan Select

This field selects the amount of time that the radio waits during active scan mode for a SecureNet™ encoded (Non- ASTRO) transmission to be detected.

This wait period begins once carrier squelch has been detected. This feature applies to the selected [Scan List Selection on page 429](#) of the current Conventional Personality and only when scanning a SecureNet-encoded scan list member channel.

Accessed Only: When the Secure Operation field is set to **Hardware**, and when the [XL Transmit on page 437](#) field is **Disabled**, and when the [Secure Voice/Signal Type on page 437](#) field is **Securenet**, and when the radio is model/option capable.

The following selections are supported:

Non-XL

If a Scan List member channel is set to Non-XL SecureNet, the radio waits for the time period specified by the Non-XL Scan Unsquelch Duration field.

Non-XL & XL

If a Scan List member channel is set to Non-XL & XL SecureNet, then it waits for the time period specified by the field XL Scan Unsquelch Duration.

NOTE: XL requires a longer wait period.

10.34.11.17

Scan Holdoff Strapping

This field selects to optimize the scan unmuting algorithm having to do with SecureNet™ (Non-ASTRO) encoded calls.

The algorithm is also based on the selected [Unmute Type on page 420](#) setting for the current Conventional Personality. This functionality applies when attempting to unmute on Scan List Member (Conventional only) channels. This selection applies for the current Conventional Personality.

Accessed Only: When the Secure Operation field is set to **Hardware**, and when the [Rx Voice/Signal Type on page 390](#) field is **Non-ASTRO**, and when the radio is model/option capable.

The following selections are supported:

Both

This selection is the least efficient due to the consideration of all possible scan types.

Clear Only

Internal radio settings apply for PL, DPL, carrier squelch (CSQ) and Signaling.

Secure Only

Uses the appropriate Unsquelch Duration based on the XL or Non-XL [Scan Select on page 444](#) field selection.

10.34.11.18

Key ID

This field selects the Key ID method while operating on the current Conventional Personality.

Accessed Only: When the Secure Operation is set to **Hardware**, and when the Non-ASTRO Signaling Type field is **MDC**, and when the field is **Securenet**, and when the radio is model/option capable.

The following selections are supported:

Tx Only (Transmit)

Transmit the Key ID at the start of each transmission.

Rx Only (Receive)

Change its Key ID to that specified at the start of each receive message. If the received message does not specify a Key ID, the radio will use its current Key ID.

Tx & Rx (Receive/Transmit)

Selects both of the above features.

None

Selects none of the above features.

10.34.11.19

XL Delay Following Key ID

This field selects the amount of time that the radio waits following a Key ID opcode transmission before transmitting extended range (XL) encrypted audio.

This selection applies while operating on the current Conventional Personality.

Accessed Only: When the Secure Operation field is set to **Hardware**, and when the [Rx Voice/Signal Type on page 390](#) is **Non-ASTRO**, and when the Non-ASTRO Signaling Type is **MDC**, and when the [Voice Secure/Clear Strapping on page 438](#) field is not **Clear**, and when the [XL Transmit on page 437](#) field is **Enabled**, and when the [Secure Voice/Signal Type on page 437](#) field is **Securenet**, and when the [Key ID on page 445](#) field is **Tx Only** or **Tx & Rx**, and when the radio is model/option capable.

Table 218: Range

Minimum	Maximum
0	200

10.34.11.20

Broadband ASTRO OTAR

If this field is enabled, you can use Over-The-Air-Rekeying (OTAR) over broadband on analog channels.

Accessed Only: When the following conditions are met.

- The radio is model/option capable.
- The Secure Operation field is set to **Hardware** or it is set to **Software** and Advanced Encryption Standard (AES) Enable is enabled.
- The ASTRO OTAR Enable field is enabled.
- The Conventional Personality, Rx Voice/Signal Type field is set to **Non-ASTRO**.

- The Receive Only Personality is disabled.

10.34.12

Advanced

This section allows you to view or define diverse and sometimes complex functionality for individual Conventional Personalities.

NOTE: Once the features of the Conventional Personalities have been uniquely defined, each personality may then be assigned to the desired position of the radio's channel selector. This is accomplished from the Zone Channel Assignment's Channels Page.

10.34.12.1

Advanced RF AGC

This field selects the type of Receive Frequency (RF) Automatic Gain Control (AGC) that applies for the current Conventional Personality.

The following selections are supported:

Disabled

Even when **Disabled**, the radio uses a basic form of AGC built into the radio's receiver. This built-in protection helps to avoid signal clipping and receiver saturation that may damage radio components.

Standard

Enables an Advanced form of RF AGC, which attempts to protect against intermodulation (IM) interference by detecting and removing any received interference due to external sources.

Enhanced

Enables the radio to use additional schemes to reduce IM interference, which cleans up the signal.

Smart

Enables the radio to use a unique scheme to improve interference immunity when close to Linear Simulcast and APCO phase 2 Base stations. Smart option is mutually exclusive to the Broadband Protection checkbox.

IMPORTANT: **Standard** and **Enhanced** Advanced RF AGC may degrade performance on channels that do not experience any IM interference. Therefore, only enable these selections on channels known to experience IM interference.

10.34.13

One Touch

This section allows you to view or define specific One Touch **Feature** and **Index** selections for up to four One Touch button-presses or One Touch menu-selections.

One Touch allows you to create menu-navigation and/or button shortcuts. These shortcuts can greatly reduce your effort involved in launching a radio feature. A One Touch button-press or menu-selection can reduce down to a single button press, the launching of a radio feature; this same process might otherwise take many menu navigation steps to achieve. These selections apply for the current Conventional Personality.

NOTE: Once the features of the Conventional Personalities have been uniquely defined, each personality may then be assigned to the desired position of the radio's channel selector. This is accomplished from the Zone Channel Assignment's Channels Page.

10.34.13.1

Button

Displays the view-only the assigned name for the One Touch button-press or One Touch menu-selection.

NOTE: Individual Trunking Systems are referenced to a Trunking Personality. These Trunking Systems settings can then become functional for all channel types within that Trunking Personality.

10.34.13.2

One Touch Button Feature

This field selects the One Touch Feature for your One Touch button-press or One Touch menu-selection.

This selection applies for the current record/row, which applies for the current Trunking System.

IMPORTANT: Conventional One Touch Button 1, in other words, the first record/row would correspond to a One Touch 1 button-press, and/or a TCH1 or SIG1 menu-selection, and so on.

NOTE:
When any of the following One Touch Button Feature types is selected, a [One Touch Button Index on page 448](#) Index/List Member selection is also required for the current personality: Phone, Selective Call, Call Alert, Status, or Message.

The available One Touch Button Feature selections are model/option dependent.

Accessed Only: When the radio is model/option capable and (if the [Rx Voice/Signal Type on page 390](#) field is set to **ASTRO**, then the [Remote Site Interface System](#) field in the referenced Conventional System must be **Disabled**).

The following selections are supported:

Disabled

One Touch is not available for the current Button selection.

Phone

The [Phone Operation on page 517](#) feature is enabled for the current personality.

Select Call

The [Selective Call Rx/Tx on page 419](#) feature is set to **Decode & Encode** or **Encode**.

IMPORTANT: When the referenced Conventional System is a "DVRS" System Type, then this feature associates Trunking Private Call functionality with the One Touch button-press or [One Touch \(SIG1-SIG4/DISP\)](#) menu-selection.

Call Alert

The [Call Alert/Page Operation on page 515](#) field is set to **List Only** or **Unlimited** for the referenced Trunking Personality.

Status

The [Status on page 380](#) feature of the referenced Conventional System (to the current personality) is **Enabled**.

Message

The [Message](#) feature of the referenced Conventional System (to the current personality) is **Enabled**.

RAB1 (Repeater Access Button)

The [Repeater Access](#) feature is enabled for the current personality. When the [Access Type](#) field is set to **Auto**, this selection becomes invalid. When the Access Type field is **Manual**, the Code Type 1 for RAB1 selection applies to this button-press.

RAB2

The Repeater Access feature is enabled for the current personality. When the Access Type field is set to **Auto** and or Code Type 2 for RAB2 is set to **None**, this selection becomes invalid.

RTT (Request-To-Talk)

The Repeater Access feature is enabled and the Access Type feature is set to **Manual** for the current personality.

10.34.13.3

One Touch Button Index

This field selects the One Touch Index/List member for your One Touch button-press or One Touch menu-selection, pertaining to the selected One Touch Button Feature.

Index refers to the actual record/row of the list determined by the One Touch Button Feature selection. This selection applies for the current Conventional Personality.

IMPORTANT: Conventional One Touch Button 1, the first record/row will correspond to a One Touch 1 button-press, and a TCH1 or SIG1 menu-selection.

Accessed Only: When the [One Touch Button Feature on page 447](#) field is not **Disabled**, **RAB1**, **RAB2**, or **RTT**,

and if the [Rx Voice/Signal Type on page 390](#) field is set to **ASTRO**, then the [Remote Site Interface System](#) field in the referenced Conventional System must be disabled.

The following selections are supported:

Select Call

This "Index" number correlates to the row number of the Call Hot List.

Available to you when the [Selective Call Rx/Tx on page 419](#) is set to **Decode & Encode** or **Encode** for the current personality.

IMPORTANT: The Hot List Selection fields determine which Call Hot List is used for the current Personality.

Call Alert

This "Index" number correlates to the row number of the Call Hot List.

Available to you when the [Call Alert Rx/Tx on page 420](#) is set to "Decode & Encode" or "Encode" for the current personality.

IMPORTANT: The Hot List Selection fields determine which Call Hot List is used for the current Personality

Phone

This "Index" number correlates to the row number of the Phone Call Hot List.

Available to you when the [Phone Operation](#) feature is enabled for the current personality.

Status

This "Index" number correlates to the row number of the Status Alias List.

Available to you when the [Status on page 380](#) feature of the referenced [Conventional System on page 375](#) (to the current personality) is enabled.

Message

This "Index" number correlates to the row number of the Message Alias List.

Available to you when the [Message](#) feature of the referenced [Conventional System on page 375](#) (to the current personality) is enabled.

10.35

Trunking Wide

This section allows you to view or define functionality that can apply to all Trunking Systems and therefore to all Trunking Personalities.

10.35.1

General

This section allows you to view or define basic functionality that can apply to all Trunking Systems and therefore to all Trunking Personalities.

10.35.1.1

Individual Call Max Target Ring Time

This field selects the maximum amount of time that the subscriber unit (SU) rings upon receipt of an Individual Call request.

IMPORTANT: An Individual Call includes both Phone and unit-to-unit calls. If you answer the call before the timer expires, the timer and ring are both stopped. This selection applies for all Trunking Systems and therefore to all Trunking Personalities. Time is in seconds.

Accessed Only: When the radio is model/option capable.

NOTE: When set to **Infinite**, the ring time is unlimited.

Table 219: Range

Minimum	Maximum	Increments
61 sec	120 sec	1 sec

10.35.1.2

Private Call Max Initial Ring

This field selects the amount of time that the subscriber unit rings after initiating a unit-to-unit call request.

IMPORTANT: Phone call requests are not included. If the timer expires before the call is answered by the intended radio, the call attempt is dropped. The timer and the ring are both stopped if the target unit answers the call before the timer expires. This selection applies for all Trunking Systems and therefore to all Trunking Personalities. Time is in seconds.

Accessed Only: When the radio is model/option capable.

NOTE: When set to **Infinite**, the ring time is unlimited.

Table 220: Range

Minimum	Maximum	Increments
1 sec	255 sec	1 sec

10.35.1.3

Phone Auto Dial Holdoff

This field selects the amount of time that the radio waits once digital voice channel access has been granted to the phone system.

Once this timer expires, Type II Call Hot List-selected, pre-entered (speed dial), or [Hot Keypad \(DTMF\) on page 520](#) numbers are then transmitted.

IMPORTANT: This selection only applies to Digital Phone within Type II Trunking Systems and therefore to all Type II Trunking Personalities. See also the Trunking System, System Type field. Time is in milliseconds.

Accessed Only: When the radio is model/option capable.

Table 221: Range

Minimum	Maximum	Increments
0 ms	6375 ms	25 ms

10.35.1.4

Emergency Blocked In Failsoft

This field causes the radio to ignore any attempt to enter the Trunking communications Emergency Mode feature when the network is in the Failsoft condition.

This selection applies for all Trunking Systems and therefore to all Trunking Personalities.

Accessed Only: When the radio is model/option capable.

10.35.1.5

AFC Disable

This field causes the radio Automatic Frequency Control (AFC) algorithm to be disabled.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

AFC automatically corrects drifting of the radio's Reference Oscillator (RO) by resolving the frequency of the received RF signal and providing feedback on an error signal proportional to the degree to which the RO is mistuned, which in turn reduces the tuning error. However, it may be beneficial to disable AFC for noisy environments, where the error signal may track to an interference frequency instead of the allocated one.

IMPORTANT: When AFC is **Disabled**, the Reference Oscillator must be kept accurately tuned. This selection applies for all Trunking Systems and therefore to all Trunking Personalities.

Accessed Only: When the radio is model/option capable.

10.35.1.6

Bypass Quick Key Voice Channel Access

When enabling this field, the Quick Key feature is disabled (bypassed) for group voice calls.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

Therefore, upon receiving a Voice Channel access grant to a Dispatch Voice channel request, and the PTT button is no longer pressed, the radio ends the request sequence and returns to the idle state. This selection applies for all Trunking Systems and therefore to all Trunking Personalities.

When disabled, the Quick Key feature is enabled during group voice calls.

IMPORTANT:

Since, especially in a busy condition, a significant amount of time may pass between the initial PTT button-press that sends a Dispatch Voice request to the Trunking System and receipt of the Voice Channel access grant that allocates a voice channel to the requesting radio, you may decide to de-key the radio rather than allow the [Time Out Timer on page 393](#) to expire. When the Voice Channel access grant is eventually received, the radio plays a [Talk Permit Tone on page 519](#) and the Quick Key feature causes the radio to begin transmitting silent audio for three seconds, even though the PTT button is no longer pressed. If you press the PTT button before the Quick Key timer expires, the radio continues transmitting but with an active microphone; otherwise, the radio stops transmitting.

The Quick Key feature is always enabled for private calls and phone mode.

Accessed Only: When the radio is model/option capable.

NOTE: This is an advanced setting which is only available in Expert View (see Codeplug View).

10.35.1.7

Leave LMR RSSI Threshold

When the radio detects that all LMR sites filtered RSSI signal strength is less than the Leave LMR RSSI Threshold, the radio will automatically switch from LMR operation to broadband operation if available.

Table 222: Range

Default	Minimum	Maximum	Increments
34 (Hex)	0	FF (Hex)	1

Accessed Only: When the radio is model/option capable.

10.35.2

Filter Constants

This section allows you to view or define SmartZone functionality that can apply to all Trunking Systems and therefore to all Trunking Personalities.

SmartZone Received Signal Strength Indication (RSSI) Filter Constants allow the radio to interpret SmartZone receive communications based SmartZone Trunking System operating rules and configurations. In a SmartZone system, the constants K1, K2, and K3 are designed to reduce filter damping as time between RSSI sampling increases.

10.35.2.1

Filter Constant K1

This field selects the K1 Filter Constant value, which is used when less than eight seconds elapses between the Received Signal Strength Indication (RSSI) samples.

The selected Filter Constant K1 value is used by the [Filter Threshold Constant T1 on page 453](#). This selection can apply for all Trunking Systems and therefore to all Trunking Personalities.

WARNING: Modifications of Filter Constants should only be performed by a Motorola Solutions Field Technical Representative.

Accessed Only: When the radio is model/option capable.

Table 223: Range

Minimum	Maximum
0	9

NOTE:

The RSSI filter has the following characteristic $\text{Filter Val.} = (\text{Filter Val.} * K + \text{Current Reading} * (10 - K))/10$ where the domain of K is {K: K = K1, K2, K3} and 0 (no filter) $\leq K3 \leq K2 \leq K1 \leq 9$ (heavily damped filter).

In a SmartZone system, the constants K1, K2, and K3 are designed to reduce filter damping as time between sampling increases.

- K1 is used when less than 8 seconds elapses between RSSI samples.
- [Filter Constant K2 on page 452](#) is used when 8 to 16 seconds elapse between RSSI samples.
- [Filter Constant K3 on page 452](#) is used when more than 16 seconds elapse between RSSI samples.

10.35.2.2

Filter Constant K2

This field selects the K2 Filter Constant value, which is used when 8 to 16 seconds elapse between Received Signal Strength Indication (RSSI) samples.

The selected Filter Constant K2 value is used by the [Filter Threshold Constant T2 on page 454](#). This selection can apply for all Trunking Systems and therefore to all Trunking Personalities.

WARNING: Modifications of Filter Constants should only be performed by a Motorola Solutions Field Technical Representative.

Accessed Only: When the radio is model/option capable.

Table 224: Range

Minimum	Maximum
0	9

NOTE:

The RSSI filter has the following characteristic $\text{Filter Val.} = (\text{Filter Val.} * K + \text{Current Reading} * (10 - K))/10$ where the domain of K is {K: K = K1, K2, K3} and 0 (no filter) $\leq K3 \leq K2 \leq K1 \leq 9$ (heavily damped filter).

In a SmartZone system, the constants K1, K2, and K3 are designed to reduce filter damping as time between sampling increases.

- [Filter Constant K1 on page 451](#) is used when less than 8 seconds elapses between RSSI samples.
- K2 is used when 8 to 16 seconds elapse between RSSI samples.
- [Filter Constant K3 on page 452](#) is used when more than 16 seconds elapse between RSSI samples.

10.35.2.3

Filter Constant K3

This field selects the K3 Filter Constant value, which is used when more than 16 seconds elapse between Received Signal Strength Indication (RSSI) samples.

The selected Filter Constant K3 value is used by the [Filter Threshold Constant T3 on page 455](#). This selection can apply for all Trunking Systems and therefore to all Trunking Personalities.

WARNING: Modifications of Filter Constants should only be performed by a Motorola Solutions Field Technical Representative.

Accessed Only: When the radio is model/option capable.

Table 225: Range

Minimum	Maximum
0	9

NOTE:

The RSSI filter has the following characteristic $\text{Filter Val.} = (\text{Filter Val.} * K + \text{Current Reading} * (10 - K))/10$ where the domain of K is {K: K = K1, K2, K3} and $0 \text{ (no filter)} \leq K3 \leq K2 \leq K1 \leq 9$ (heavily damped filter).

In a SmartZone system, the constants K1, K2, and K3 are designed to reduce filter damping as time between sampling increases.

- [Filter Constant K1 on page 451](#) is used when less than 8 seconds elapses between RSSI samples.
- [Filter Constant K2 on page 452](#) is used when 8 to 16 seconds elapse between RSSI samples.
- K3 is used when more than 16 seconds elapse between RSSI samples.

10.35.2.4

Filter Threshold Constant T1

This field selects a value that creates a timed window that Received Signal Strength (RSS) samples must fall within to be considered valid.

This window is centered on the selected Received Signal Strength Indication (RSSI) [Filter Constant K1 on page 451](#) value. The window size is twice the value of the threshold constant. This T1 constant is used when less than eight seconds elapses between RSSI samples. This selection can apply for all Trunking Systems and therefore to all Trunking Personalities.

WARNING: Modifications of Filter Constants should only be performed by a Motorola Solutions Field Technical Representative.

Accessed Only: When the radio is model/option capable.

Table 226: Range

Minimum	Maximum
0 (hex)	FF (hex)

IMPORTANT: The Filter Threshold Constants (T1, T2, T3) are hexadecimal numbers ranging from 0 to FF and should only be modified in accordance with the following: (00 <= T1 <= T2 <= T3 <= FF)

NOTE: T1, T2, and T3 create a window that RSS samples must fall within to be considered valid. The window is centered on the current RSSI Filter Constant value ([Filter Constant K1 on page 451](#), [Filter Constant K2 on page 452](#), or [Filter Constant K3 on page 452](#)). The window size is twice the value of the threshold constant.

- T1 is used when less than 8 seconds elapse between RSSI samples.
- [Filter Threshold Constant T2 on page 454](#) is used when 8 to 16 seconds elapse between RSSI samples.
- [Filter Threshold Constant T3 on page 455](#) is used when more than 16 seconds elapse between RSSI samples.

10.35.2.5

Filter Threshold Constant T2

This field selects a value that creates a timed window that Received Signal Strength (RSS) samples must fall within to be considered valid.

This window is centered on the selected Received Signal Strength Indication (RSSI) [Filter Constant K2 on page 452](#) value. The window size is twice the value of the threshold constant. This T2 constant is used when 8 to 16 seconds elapse between RSSI samples. This selection can apply for all Trunking Systems and therefore to all Trunking Personalities.

WARNING: Modifications of Filter Constants should only be performed by a Motorola Solutions Field Technical Representative.

Accessed Only: When the radio is model/option capable.

Table 227: Range

Minimum	Maximum
0 (hex)	FF (hex)

IMPORTANT: The Filter Threshold Constants (T1, T2, T3) are hexadecimal numbers ranging from 0 to FF and should only be modified in accordance with the following: (00 <= T1 <= T2 <= T3 <= FF)

NOTE: T1, T2, and T3 create a window that RSS samples must fall within to be considered valid. The window is centered on the current RSSI Filter Constant value ([Filter Constant K1 on page 451](#), [Filter Constant K2 on page 452](#)^{K2}, or [Filter Constant K3 on page 452](#)^{K3}). The window size is twice the value of the threshold constant.

- [Filter Threshold Constant T1 on page 453](#) is used when less than 8 seconds elapse between RSSI samples.
- T2 is used when 8 to 16 seconds elapse between RSSI samples.
- [Filter Threshold Constant T3 on page 455](#) is used when more than 16 seconds elapse between RSSI samples.

10.35.2.6

Filter Threshold Constant T3

This field selects a value that creates a timed window that Received Signal Strength (RSS) samples must fall within to be considered valid.

This window is centered on the selected Received Signal Strength Indication (RSSI) [Filter Constant K3 on page 452](#) value. The window size is twice the value of the threshold constant. This T3 constant is used when more than 16 seconds elapse between RSSI samples. This selection can apply for all Trunking Systems and therefore to all Trunking Personalities.

WARNING: Modifications of Filter Constants should only be performed by a Motorola Solutions Field Technical Representative.

Accessed Only: When the radio is model/option capable.

Table 228: Range

Minimum	Maximum
0 (hex)	FF (hex)

IMPORTANT: The Filter Threshold Constants (T1, T2, T3) are hexadecimal numbers ranging from 0 to FF and should only be modified in accordance with the following: (00 <= T1 <= T2 <= T3 <= FF)

NOTE: T1, T2, and T3 create a window that RSS samples must fall within to be considered valid. The window is centered on the current RSSI Filter Constant value ([Filter Constant K1 on page 451](#), [Filter Constant K2 on page 452](#), or [Filter Constant K3 on page 452](#)). The window size is twice the value of the threshold constant.

- [Filter Threshold Constant T1 on page 453](#) is used when less than 8 seconds elapse between RSSI samples.
- [Filter Threshold Constant T2 on page 454](#) is used when 8 to 16 seconds elapse between RSSI samples.
- T3 is used when more than 16 seconds elapse between RSSI samples.

10.35.3

RSSI Thresholds

This section allows you to view or define the Received Signal Strength Indication (RSSI) functionality that can apply to all Trunking Systems and therefore to all Trunking Personalities.

RSSI Thresholds functionality allows the radio to interpret receive SmartZone communications based-on SmartZone Trunking System operating rules and configurations.

10.35.3.1

RSSI OSW Counter

This field selects the number of Outbound Signal Word (OSW) - (23 ms) intervals that the radio remains inactive on the Control Channel, before a set of Received Signal Strength Indication (RSSI) samples is taken.

Once these OSW intervals are completed, RSSI samples measure the strength of the current incoming signal. This selection can apply for all Trunking Systems and therefore to all Trunking Personalities.

WARNING: Do not attempt to modify this RSSI setting unless you are very knowledgeable in the workings of this feature. Incorrect settings may cause your radio to be incapable of communications with the Fixed Network Equipment (FNE).

Accessed Only: When the radio is model/option capable.

Table 229: Range

Minimum	Maximum
60	255

10.35.3.2

RSSI OSP Counter

This field selects the number of ASTRO 25 OSPs RSSI Outbound Signaling Packets (OSP) for which the radio must remain inactive on the Control Channel before a set of RSSI samples is taken.

This value should be set with the assumption of single Trunking Signaling Block (TSBK) channel format (1 OSP = 37.5 ms). If the channel is actually double or triple TSBK format, the codeplug value will be scaled so that the time interval the radio uses to remain inactive is equal to: RSSI OSP Counter * 37.5 ms. This selection can apply for all Trunking Systems and therefore to all Trunking Personalities.

WARNING: Do not attempt to modify this RSSI setting unless you are very knowledgeable in the workings of this feature. Incorrect settings may cause your radio to be incapable of communications with the Fixed Network Equipment (FNE).

Accessed Only: When the radio is model/option capable.

Table 230: Range

Minimum	Maximum
40	255

10.35.3.3

Desense Timer

This field selects the amount of time the radio continues scanning the current site after it has become desensed.

The radio is considered to be desensed if it encounters a strong RF signal which muffles out the control channel. Such a condition may arise if another high-power radio is transmitting in close physical proximity, not necessarily on the same frequency. The radio exits the desense condition if it finds a valid control channel at the home site or it finds failsoft. If the timer expires while the radio is still desensed, it looks for a valid control channel at an adjacent site, if any exist. This selection can apply for all Trunking Systems and therefore to all Trunking Personalities. Time is in seconds.

WARNING: Do not attempt to modify this RSSI setting unless you are very knowledgeable in the workings of this feature. Incorrect settings may cause your radio to be incapable of communications with the Fixed Network Equipment (FNE).

IMPORTANT: This field's value will not be copied when a Drag and Drop Across Frequency Bands procedure is performed (e.g. 700/800 to UHF).

Accessed Only: When the radio is model/option capable.

NOTE: When set to **Disabled**, the timer is disabled (0 sec).

Table 231: Range

Minimum	Maximum	Increments
1 sec	30 sec	1 sec

10.35.3.4

RSSI Acceptable Threshold

This field selects a signal strength that defines a receive SmartZone signal to be at the Poor/ Acceptable Threshold.

The SmartZone Trunking System then uses this information when determining signal priority. Received Signal Strength Indication (RSSI) is a measurement of incoming signal strength. This selection can apply for all Trunking Systems and therefore to all Trunking Personalities.

WARNING: Do not attempt to modify this RSSI setting unless the you are very knowledgeable in the workings of this feature. Incorrect settings may cause your radio to be incapable of communications with the Fixed Network Equipment (FNE).

Accessed Only: When the radio is model/option capable.

Table 232: Range

Minimum	Maximum
0 (hex)	FF (hex)

10.35.3.5

RSSI Good Threshold

This field selects a signal strength that defines a receive SmartZone signal to be at the Acceptable/ Good Threshold.

The SmartZone Trunking System then uses this information when determining signal priority. Received Signal Strength Indication (RSSI) is a measurement of incoming signal strength. This selection can apply for all Trunking Systems and therefore to all Trunking Personalities.

WARNING: Do not attempt to modify this RSSI setting unless you are very knowledgeable in the workings of this feature. Incorrect settings may cause your radio to be incapable of communications with the Fixed Network Equipment (FNE).

Accessed Only: When the radio is model/option capable.

Table 233: Range

Minimum	Maximum
0 (hex)	FF (hex)

10.35.3.6

RSSI Very Good Threshold

This field selects a signal strength that defines a receive SmartZone signal to be at the Good/Very Good Threshold.

The SmartZone Trunking System then uses this information when determining signal priority. Received Signal Strength Indication (RSSI) is a measurement of incoming signal strength. This selection can apply for all Trunking Systems and therefore to all Trunking Personalities.

WARNING: Do not attempt to modify this RSSI setting unless you are very knowledgeable in the workings of this feature. Incorrect settings may cause your radio to be incapable of communications with the Fixed Network Equipment (FNE).

Accessed Only: When the radio is model/option capable.

Table 234: Range

Minimum	Maximum
0 (hex)	FF (hex)

10.35.3.7

RSSI Excellent Threshold

This field selects a signal strength that defines a receive SmartZone signal to be at the Very Good/Excellent Threshold.

The SmartZone Trunking System then uses this information when determining signal priority. Received Signal Strength Indication (RSSI) is a measurement of incoming signal strength. This selection can apply for all Trunking Systems and therefore to all Trunking Personalities.

WARNING: Do not attempt to modify this RSSI setting unless you are very knowledgeable in the workings of this feature. Incorrect settings may cause your radio to be incapable of communications with the Fixed Network Equipment (FNE).

Accessed Only: When the radio is model/option capable.

Table 235: Range

Minimum	Maximum
0 (hex)	FF (hex)

10.35.3.8

Strong Signal Roaming

When enabled this field activates additional Receive Signal Strength Indication (RSSI).

Thresholds derived at regular intervals above the currently configured Very Good/Excellent Thresholds. This provides additional site switching among Strong Signal sites. Although there will be additional site switches when this field is enabled, two levels of improvement are required for a site switch to occur, to prevent excessive site switching.

When disabled, RSSI-based site switching is limited to improving signals up to the configured Excellent level.

This selection applies for all Trunking Systems, and therefore to all Trunking Personalities.

10.35.3.9

Return To LMR RSSI Threshold

Return To LMR RSSI Threshold feature is the signal strength that is used by the radio to determine that an LMR site has recovered sufficiently to switch from broadband to LMR operation.

Table 236: Range

Default	Minimum	Maximum	Increments
41 (Hex)	0	FF (Hex)	1

Accessed Only: When the radio is model/option capable.

10.35.4

CAI Data

The **Common Air Interface (CAI) Data** section allows you to view or define parameters that define the functionality or rules for data packets that are transmitted using the CAI protocol.

These selections can apply to all Trunking Systems and therefore to all Trunking Personalities.

10.35.4.1

Max Tx Attempts

This field selects the maximum numbers of times that the radio attempts to send a Common Air Interface (CAI) data packet transmission.

The radio continues these retries until it receives an acknowledgement confirming the successful receipt of transmission, or until this selected number of Tx Attempts is reached. This selection applies when in CAI operation for all Trunking Systems and Trunking Personalities.

Accessed Only: When the radio is model/option capable.

Table 237: Range

Minimum	Maximum
2	10

10.35.4.2

Response Timer

This field selects the amount of time that the radio waits for an acknowledge of a successful Common Air Interface (CAI) transmission before re-sending another CAI data packet.

This selection applies when in CAI operation for all Trunking Systems and Trunking Personalities. Time is in milliseconds.

Accessed Only: When the radio is model/option capable.

Table 238: Range

Minimum	Maximum	Increments
100 ms	5000 ms	100 ms

10.35.4.3

Min Response Time

This field selects the minimum amount of time that the radio waits for an acknowledgement of a successful Common Air Interface (CAI) to be sent across the channel.

This parameter should be slightly greater than the Data Throughput Delay from the Radio Network Controller - RNC (the data controller) to the radio. This selection applies when in CAI operation for all Trunking Systems and Trunking Personalities. Time is in milliseconds.

WARNING: Do not attempt to change this setting without first verifying the particular throughput of your system.

Accessed Only: When the radio is model/option capable.

Table 239: Range

Minimum	Maximum	Increments
50 ms	2000 ms	50 ms

10.35.4.4

Frame Sync Seek Period

This field selects the amount of time that the radio listens for a Frame Sync Sequence (FSS).

The presence of an FSS on a channel indicates that voice or data is currently being transmitted. If an FSS is not detected within this seek period, the radio assumes the channel is idle and then transmits the next Common Air Interface (CAI) packet queued for transmission. This selection applies when in CAI operation for all Trunking Systems and Trunking Personalities. Time is in milliseconds.

Accessed Only: When the radio is model/option capable.

Table 240: Range

Minimum	Maximum	Increments
0 ms	5000 ms	50 ms

10.35.4.5

Tx Short Random Range

This field selects the maximum amount of time that the radio waits to transmit once the first qualified Frame Sync Sequence (FSS) has been received indicating that the channel is clear.

The radio randomly checks channel access status based on this maximum wait time. This selection applies when in Common Air Interface (CAI) operation for all Trunking Systems and Trunking Personalities. Time is in milliseconds.

Accessed Only: When the radio is model/option capable.

Table 241: Range

Minimum	Maximum	Increments
50 ms	500 ms	50 ms

10.35.4.6

Tx Long Random Range

This field selects the upper bound of the uniform random range.

When the radio senses a busy channel-status, the radio then uses a random-time selection process within this range known as the "back off delay", to determine when to re-attempt to transmit the Common Air Interface (CAI) data message. This selection applies when in CAI operation for all Trunking Systems and Trunking Personalities. Time is in milliseconds.

IMPORTANT: The minimum value of this range is automatically set to 50 ms, and the uniform values of this range are in 50 ms increments.

Accessed Only: When the radio is model/option capable.

Table 242: Range

Minimum	Maximum	Increments
50 ms	5000 ms	50 ms

10.35.4.7

Tx Resp Random Range

This field selects the upper bound of the uniform random range.

When the radio senses a busy channel-status, the radio then uses a random-time selection process within this range known as the "back off delay", to determine when to re-attempt to transmit the Response Common Air Interface (CAI) data message. The Response is usually an Acknowledgment "Ack" to a message sent from the system. This selection applies when in CAI operation for all Trunking Systems and Trunking Personalities Time is in milliseconds.

IMPORTANT: The minimum value of this range is automatically set to 50 ms, and the uniform values of this range are in 50 ms increments.

Accessed Only: When the radio is model/option capable.

Table 243: Range

Minimum	Maximum	Increments
50 ms	1000 ms	50 ms

10.35.4.8

Tx Limited Patience

This field selects the maximum amount of time that the radio attempts to transmit a Common Air Interface (CAI) data packet.

Once this time expires, the radio ceases to attempt transmissions. This selection applies when in CAI operation for all Trunking Systems and Trunking Personalities. Time is in seconds.

Accessed Only: When the radio is model/option capable.

NOTE: When set to **Infinite**, no timer is used; therefore, there is no transmit time limit.

Table 244: Range

Minimum	Maximum	Increments
1 sec	255 sec	1 sec

10.35.5

Advanced

This section allows you to view or define SmartZone functionality that can apply to all Trunking Systems and therefore to all Trunking Personalities.

IMPORTANT: SmartZone is selected on a per Trunking System basis from the Coverage Type field.

10.35.5.1

SmartZone Failsoft Inactivity

This field selects the amount of Failsoft Mode inactivity time that determines when the radio attempts to search for a valid and active control channel.

This timer begins once all Failsoft receive and transmit communications have ceased; if the timer expires before any Failsoft communications occur, the radio begins searching for an available control channel. If communications do occur during this timer period, the timer is reset. This selection applies when in SmartZone operation for all Trunking Systems and Trunking Personalities. Time is in seconds.

Accessed Only: When the radio is model/option capable.

Table 245: Range

Minimum	Maximum
0 sec	255 sec

10.35.5.2

SmartZone Affiliation Hold Off

This field selects the amount of time that the radio waits before connecting to a new Trunking site.

This timer begins once the radio leaves the current Trunking site due to a control channel connection failure. This selected time is used by the radio as a randomized average. This selection applies only when in SmartZone operation for "Type II" Trunking Systems and therefore to all "Type II" Trunking Personalities.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

- 1 sec
- 3 sec
- 7 sec
- 15 sec
- 31 sec
- 63 sec
- 127 sec
- 255 sec

10.35.5.3

SmartZone Full Spectrum Control Channel Scan

This field enables the radio to automatically perform a Full Spectrum Control Channel Scan when the radio goes out of range of all its currently programmed controller information.

This feature causes the radio to search its entire codeplug for all channel definitions, while also scanning for any valid control channel activity on each channel definition found. This selection applies when in SmartZone operation for all Trunking Systems and Trunking Personalities.

Accessed Only: When the radio is model/option capable.

10.35.5.4

SmartZone Full Spectrum Control Channel Scan Timer

This field selects the amount of time that the radio is allocated to perform a Full Spectrum Control Channel Scan.

Once this timer has expired, the radio returns to normal control channel operations. This selection applies when in SmartZone operation for all Trunking Systems and Trunking Personalities. Time is in seconds.

Accessed Only: When the radio is model/option capable.

Table 246: Range

Minimum	Maximum
5 sec	31 sec

10.35.5.5

SmartZone Internal Radio Holdoff

This field selects the amount of Internal Radio Random Holdoff Time (IRHOT) that the radio should delay before registering at a new site when leaving a site which just incurred a failure or returning to a site which just recovered from a failure.

The radio then calculates a random value between 0 and the IRHOT value to wait before it registers after a site failure or recovery. IRHOT is only used if the [SmartZone Holdoff Delay on page 463](#) expires without the radio receiving an over-the-air packet indicating the holdoff period. This selection applies when in SmartZone operation and only to APCO Trunking Systems and Trunking Personalities. Time is in minutes.

Accessed Only: When the radio is model/option capable.

Table 247: Range

Minimum	Maximum
0 min	60 min

10.35.5.6

SmartZone Holdoff Delay

This field selects the amount of time that the radio should delay starting a holdoff time for registration or affiliation.

During this time, the radio waits for an over-the-air packet indicating the holdoff period. If an over-the-air value is not received by the end of the Holdoff Delay, the [SmartZone Internal Radio Holdoff on page](#)

463 time will be used. This selection applies when in SmartZone operation and only to APCO Trunking Systems and Trunking Personalities. Time is in seconds.

Accessed Only: When the radio is model/option capable.

Table 248: Range

Minimum	Maximum
5 sec	60 sec

10.35.5.7

ISW Window Adjustment

This field selects in decimal or hex format, a value that fine tunes the Inbound Signal Word (ISW) Window for the purpose of improving Trunking System performance.

The ISW Window is an amount of time that is synchronized between the radio and the Central Controller. This amount of time is allotted for the purpose of synchronizing the ISW transmission within the Central Controller's expected ISW arrival time. This selection applies only for Type II Trunking Systems and therefore to all Type II Trunking Personalities.

WARNING: Do not modify unless you are a Motorola Solutions Field Technical Representative. Improper adjustment can reduce Trunking System performance.

Accessed Only: When the radio is model/option capable.

Table 249: Range

Minimum	Maximum
0 (Hex)	FFFF (Hex)

10.35.5.8

ViQi: Virtual Partner Call Activity Timer (sec)

This field allows you to select the amount of time that you can remain active in the Virtual Partner channel before reverting to the selected talkgroup.

NOTE: This field is only applicable for APX NEXT and APX N70 radios.

Table 250: Range

Default Value	Minimum Value	Maximum Value	Increments
5 sec	5 sec	30 sec	1 sec

10.36

Type II Trunking System

The **Type II Trunking System** allows the user to create and delete Trunking Systems, as well as define individual Trunking System functionality. Trunking Systems are virtual configurations that mirror

actual (in-the-field) Trunking System configurations and functionality. Defining the RadioCentral system enables the radio to communicate with the actual systems.

WARNING: If a Trunking System's System Type field is modified, any Trunking Personalities previously assigned to that specific Trunking System will have to be reassigned to another system that carries the appropriate System Type selection. Otherwise, a codeplug error will occur when writing the codeplug to the radio. Trunking System addressing schemes can be either **Type II** or **ASTRO 25**.

NOTE: Trunking Systems are referenced to a Trunking Personality. Trunking Systems settings can become functional for all Trunking - channel types.

10.36.1

General (Type II Trunking System)

The **General** section of the Type II Trunking System set allows the user to view or define basic functionality for individual Trunking Systems.

NOTE: Individual Trunking Systems are referenced to a Trunking Personality. Once reference, these Trunking Systems settings can become functional for all channel types within that Trunking Personality.

10.36.1.1

Trunking System Name

This field allows you to define a recognizable name for the current Trunking System.

NOTE: Individual Trunking Systems are assigned to a Trunking Personality through the System field by selecting this name. These Trunking Systems settings can then become functional for all channel types within that Trunking Personality.

When **Priority Monitor** is selected as the Scan Type for Scan List Member channels, this Trunking System name must be selected for the current Scan List through the Trunking System Record field.

Accessed Only: When the radio is model/option capable.

NOTE: Examples: EMT-001, #500, Electric1, # A5

Characters, numbers, spaces, and special characters can be used.

Leading blanks are substituted with underscores in the radio's display.

Leading periods do not appear in the radio's display.

10.36.1.2

System Key Type

This field displays the read-only of selected System Key Type for the current Trunking System; either **System Key** or **WACN Key**.

When the [Coverage Type on page 466](#) is set to **Intra-WACN Roaming**, then the System Key Type is **WACN Key**, otherwise it is **System Key**.

Accessed Only: When the radio is model/option capable.

10.36.1.3

System Key Present

The application retrieves and displays the read-only if a Software System Key File or Advanced (Hardware) Key is loaded and is a match for the ID selected in the System ID or Home WACN ID field for the current Trunking System.

See also [System Key Type on page 465](#).

Accessed Only: When the radio is model/option capable.

10.36.1.4

Allow Legacy Software Key

Allow Legacy Software Key allows the user to temporarily bypass the need to use ASKs when programming a radio.

Accessed Only: When the H-Option for enforcing Hardware Keys or ASKs is enabled and when an unlimited use ASK matching the Owner/Home System ID of the radio is loaded.

10.36.1.5

Coverage Type

This field selects the geographic Coverage Type of the radio and therefore specific methods of determining radio-to-radio communications within Trunking Systems.

Coverage Type applies for the current Trunking System.

Accessed Only: When the radio is model/option capable, and when a Software System Key File or an Advanced System Key with access is selected in the System ID field or, an Advanced WACN Key with access is selected in the Home WACN ID field.

NOTE: These selections are radio model/option dependent.

The following selections are supported:

Disabled = SmartNet

When the radio is model/option capable of SmartZone, disabling this field causes the Trunking System to use SmartNet.

NOTE: SmartNet operation amounts to single site SmartZone.

SmartZone

SmartZone operation allows the radio to determine through Received Signal Strength Indication (RSSI) polling samples, the best Trunking Site to be used for SmartZone-enabled Trunking channels.

NOTE:

For ASTRO 25 Systems: Operation is limited to Sites within a single Zone of a single Trunking System.

For Type II Systems: Operation is limited to the Sites within a single Trunking System.

SmartZone and OmniLink

gives the SmartZone-capable radio the ability to roam from one SmartZone Zone to another SmartZone Zone within the same OmniLink System. OmniLink applies for OmniLink-enabled Trunking channels.

NOTE:

For ASTRO 25 Systems: Operation is limited to Sites and Zones within a single OmniLink System.

For Type II Systems: Operation is limited to Sites within a set of interconnected Trunking Systems.

Intra-WACN Roaming

Intra-WACN Roaming gives the Project 25-capable radio the ability to automatically roam between all the System IDs within the same Wide Area Communication Network (WACN) without any of your intervention. See also Home WACN ID.

NOTE: For ASTRO 25 Systems: Operation is limited to Trunking Systems within a single WACN.

WARNING: Intra-WACN Roaming is invalid if one of the following scenarios is true:
When the System Type is Type II, or

When the DVRS Hardware Enable field is **Enabled**, or

When the Dual Radio - Radio Selection field is set to **Secondary Radio** and when the Enable Secondary Radio Tx field is **Disabled**.

Inter-WACN Roaming

Inter-WACN Roaming gives Project 25-capable radios on selected talkgroups the ability to automatically roam across different Wide Area Communications Networks (WACNs) without any of your intervention.

WARNING: Inter-WACN Roaming is invalid if one of the following scenarios is true:
When the System Type is Type II, or

When the DVRS Hardware Enable field is **Enabled**, or

When the Dual Radio - Radio Selection field is set to **Secondary Radio** and when the Enable Secondary Radio Tx field is **Disabled**, or

When this System is LTE Broadband **Enabled**.

A Trunking System is LTE enabled when a referenced Data Profile having a Data Profile Type selection equal to **Trunking and Broadband** or **Broadband-Only**, and when that Data Profile's Broadband Source is **Internal LTE Modem**.

SmartZone-capable and Project 25-capable systems are also configured from the Trunking Wide SmartZone fields and from the Trunking Wide Filter Constants fields.

10.36.1.6

System ID

This field allows you to view the in-the-field ASTRO 25 - System ID and Type II - System ID for the currently selected Trunking System.

The System Name field selects the desired Trunking System for the current record/row. This value applies to the current Call ID set (record/row) of the current Contact within the Unified Call List. This Call ID set can then be selected from the [Call ID on page 601](#) (ASTRO 25) [Call ID on page 602](#) (Type II) field.

Accessed Only: When the System Name field is not set to **Customized**, and when the radio is model/option capable.

10.36.1.7

Type II Frequency Band

This field selects the operating frequency band of the current Type II Trunking System.

IMPORTANT: Type II Trunking Systems may only operate on a single frequency band. This selection applies for the current Trunking System.

Accessed Only: When the System Type field is set to **Type II**, and when the radio is model/option capable.

The following selection is supported: VHF, UHF1, UHF2, 700/800 MHz, 900 MHz

10.36.1.8

Connect Tone

This field selects the Connect Tone frequency for the current Type II Trunking System.

This selection must match the tone expected on the traffic channel by the Trunking System's central controller, to verify that a radio transmission is occurring. Frequency is in Hz.

Accessed Only: When a Software System Key File or an Advanced System Key with access has been selected in the System ID field. When the System Type field is set to **Type II**, and when the radio is model/option capable.

10.36.1.9

Failsoft Connect Tone

This field selects the Failsoft Mode Connect Tone frequency for the current Trunking System.

Accessed Only: When the System Type field is set to **Type II**, and when the radio is model/option capable.

The following selection is supported:

Default

When the System Coverage Type is set to **SmartZone**, the "Default" selection uses 105.88 Hz.

When the System Coverage Type is set to **Disabled**, the "Default" selection uses the [Connect Tone on page 468](#) as the Failsoft Connect Tone.

10.36.1.10

Network ID

The application retrieves and allows you to view (in decimal and hex format) the Type II Network ID for the current Trunking System.

Accessed Only: When the System Type field is set to **Type II**, and when the radio is model/option capable.

10.36.1.11

Non-Adjacent Site Search

This field enables the radio to search its programmed list of Control Channels for a site with a stronger signal.

This allows the radio the ability to roam-to and use a site that is not Fixed Network Equipment (FNE) defined as being adjacent to the radio's current home site, but does have an "Acceptable" or stronger signal.

NOTE: This is only true when the current home site and its FNE-defined adjacent sites are all registering at a certain threshold amount below the RSSI Acceptable Threshold level. This feature applies for the current Trunking System.

IMPORTANT: When operating in a poor coverage area, this feature causes the radio to search the programmed list of Control Channels approximately once every two minutes. During this search time, the radio is not monitoring the home site's control channel and therefore may miss some audio. Based on the number of Control Channels contained within the appropriate Control Channels list for this Trunking System, this search could take up to four seconds.

Accessed Only: When the [Coverage Type on page 466](#) field is not set to **Disabled**, and when the radio is model/option capable.

10.36.2

OBT Channel Assignment

The **Other Band Trunking (OBT) Channel Assignment** section allows you to view or define frequency-related parameters for OBT Type II communications.

IMPORTANT: The OBT Channel Assignment section is only viewable when the radio is operating within a UHF/VHF - frequency band.

NOTE:

These parameters are used to validate all OBT Type II Control Channel and Failsort frequencies that are entered. These settings apply for individual Trunking Systems.

Once the parameters for the OBT channel assignments are defined, Trunking System Control Channel frequencies and Trunking Personality Failsort frequencies may be defined.

Trunking Systems are referenced to a Trunking Personality. Trunking Systems settings can then become functional for all Trunking - channel types.

Accessed Only: When the System Type Field is set to **Type II**, and when the Type II Frequency Band field is set to a VHF/UHF - frequency band.

10.36.2.1

Rx Enable

This field enables a frequency split for the current OBT Receive (Rx) Channel Range.

This selection applies for the current [Type II Trunking System on page 464](#).

WARNING:

The first record/row within this OBT Channel Assignment section must be enabled to be considered valid.

This setting must exactly match the same Central Controller setting for Trunking System communications to be possible.

Accessed Only: When the System Type field is set to **Type II**, and when the [Type II Frequency Band on page 468](#) field is set to a **VHF**, **UHF1** or **UHF2** OBT - frequency band, and when the radio is model/option capable.

10.36.2.2

Rx Spacing

This field selects the spacing (in kHz) between Receive (Rx) frequencies for the current OBT - Channel Range.

IMPORTANT: The [Rx Start Frequency on page 470](#) and [Rx End Frequency on page 470](#) define the current receive frequency range. This selection applies for the current Trunking System.

NOTE: The ([Rx End Frequency on page 470](#) - [Rx Start Frequency on page 470](#)) range value must be evenly divisible by this channel spacing. This allows the range to be divided into an integer value to properly assign the Control Channel number.

WARNING: This setting must exactly match the same Central Controller setting for Trunking System communications to be possible.

Accessed Only: When the System Type field is set to **Type II**, and when the [Type II Frequency Band on page 468](#) field is set to a **VHF**, **UHF1** or **UHF2** OBT - frequency band, and when the radio is model/option capable.

10.36.2.3

Rx Start Frequency

This field allows you to enter the start point (in MHz) for the Receive (Rx) frequency range for the current OBT - Channel Range.

IMPORTANT: The Rx Start Frequency must be less than or equal to the [Rx End Frequency on page 470](#). This selection applies for the current Trunking System.

WARNING: This setting must exactly match the same Central Controller setting for Trunking System communications to be possible.

Accessed Only: When the System Type field is set to **Type II**, and when the [Type II Frequency Band on page 468](#) field is set to a **VHF**, **UHF1** or **UHF2** OBT - frequency band, and when the radio is model/option capable.

10.36.2.4

Rx End Frequency

This field allows you to enter the end point (in MHz) for the Receive (Rx) frequency range for the current OBT - Channel Range.

IMPORTANT: The Rx End Frequency must be greater than or equal to the [Rx Spacing on page 470](#). This selection applies for the current Trunking System.

WARNING: This setting must exactly match the same Central Controller setting for Trunking System communications to be possible.

Accessed Only: When the System Type field is set to **Type II**, and when the [Type II Frequency Band on page 468](#) field is set to a **VHF**, **UHF1** or **UHF2** OBT - frequency band, and when the radio is model/option capable.

10.36.2.5

Tx Enable

This field enables a frequency split for the current OBT Receive (Tx) Channel Range.

This selection applies for the current [Type II Trunking System on page 464](#).

WARNING:

The first record/row within this OBT Channel Assignment section must be enabled to be considered valid.

This setting must exactly match the same Central Controller setting for Trunking System communications to be possible.

Accessed Only: When the System Type field is set to **Type II**, and when the [Type II Frequency Band on page 468](#) field is set to a **VHF**, **UHF1** or **UHF2** OBT - frequency band, and when the radio is model/option capable.

10.36.2.6

Tx Spacing

This field selects the spacing (in kHz) between Receive (Tx) frequencies for the current OBT - Channel Range.

IMPORTANT: The [Tx Start Frequency on page 471](#) and [Tx End Frequency on page 472](#) define the current receive frequency range. This selection applies for the current Trunking System.

NOTE: The ([Tx End Frequency on page 472](#) - [Tx Start Frequency on page 471](#)) range value must be evenly divisible by this channel spacing. This allows the range to be divided into an integer value to properly assign the Control Channel number.

WARNING: This setting must exactly match the same Central Controller setting for Trunking System communications to be possible.

Accessed Only: When the System Type field is set to **Type II**, and when the [Type II Frequency Band on page 468](#) field is set to a **VHF**, **UHF1** or **UHF2** OBT - frequency band, and when the radio is model/option capable.

10.36.2.7

Tx Start Frequency

This field selects the spacing (in kHz) between Receive (Tx) frequencies for the current OBT - Channel Range.

IMPORTANT: The [Tx Start Frequency on page 471](#) and [Tx End Frequency on page 472](#) define the current receive frequency range. This selection applies for the current Trunking System.

NOTE: The ([Tx End Frequency on page 472](#) - [Tx Start Frequency on page 471](#)) range value must be evenly divisible by this channel spacing. This allows the range to be divided into an integer value to properly assign the Control Channel number.

WARNING: This setting must exactly match the same Central Controller setting for Trunking System communications to be possible.

Accessed Only: When the System Type field is set to **Type II**, and when the [Type II Frequency Band on page 468](#) field is set to a **VHF**, **UHF1** or **UHF2** OBT - frequency band, and when the radio is model/option capable.

10.36.2.8

Tx End Frequency

This field allows you to enter the end point (in MHz) for the Receive (Tx) frequency range for the current OBT - Channel Range.

IMPORTANT: The Tx End Frequency must be greater than or equal to the [Tx Spacing on page 471](#). This selection applies for the current Trunking System.

WARNING: This setting must exactly match the same Central Controller setting for Trunking System communications to be possible.

Accessed Only: When the System Type field is set to **Type II**, and when the [Type II Frequency Band on page 468](#) field is set to a **VHF**, **UHF1** or **UHF2** OBT - frequency band, and when the radio is model/option capable.

10.36.3

Control Channels (Type II Trunking System)

The **Control Channels** section of the Type II Trunking System set allows the user to view or define Receive and Transmit frequencies for Control Channels. Up to a maximum of 250 Control Channels may be created for individual Trunking Systems, as required.

NOTE: For radio models containing firmware prior to version R12.01.00, the maximum number of Control Channels is 128.

IMPORTANT: Individual Trunking Systems are referenced to a Trunking Personality. Once reference, these Trunking Systems settings can become functional for all channel types within that Trunking Personality.

It is beneficial to sort the control channel frequencies in ascending order in a SmartZone system. In a Failsoft situation, the radio uses the first channel from the Control Channel as its Failsoft channel. If channels are sorted (or at least sorted in an order designed to facilitate Failsoft operations), potential problems such as having multiple radios on different Failsoft channels can be avoided.

10.36.3.1

Rx Frequency

This field allows you to enter a Control Channel Rx (Receive) Frequency for the current Trunking System.

WARNING: The Trunking Frequency Constraints applies to this selection are determined by this System's frequency band.

Accessed Only: (When a Software System Key File or an Advanced System Key with access is selected in the System ID field or, an Advanced WACN Key with access is selected in the Home WACN ID field), and when the radio is model/option capable.

10.36.3.2

Tx Frequency

This field selects a Control Channel Tx (Transmit) Frequency for the current Trunking System.

WARNING: The Trunking Frequency Constraints applies to this selection are determined by this System's System Type and frequency band. For Type II Trunking Systems, this field is a view-only status when [Type II Frequency Band on page 468](#) is 700/800 MHz or 900 MHz.

Accessed Only: When a Software System Key File or an Advanced System Key with access is selected in the System ID field or an Advanced WACN Key with access is selected in the Home WACN

ID field, When the System Type field is set to **Type II**, and [Type II Frequency Band on page 468](#) field is not set to **700/800** MHz or **900** MHz, and when the radio is model/option capable.

10.36.4

Features (Type II Trunking System)

The **Features** section of the Type II Trunking System set allows the user to view or modify settings for individual Trunking System.

NOTE: Individual Trunking Systems are referenced to a Trunking Personality. These Trunking Systems settings can then become functional for all channel types within that Trunking Personality.

10.36.4.1

Radio Inhibit

This field enables the radio to receive and respond to a Remote Inhibit command while operating on the current Trunking System.

This inhibit command is sent from the dispatcher. Upon successful receipt, the radio transmits an acknowledgement back to the dispatch equipment and then goes into a dormant state. While inhibited, the receiver audio is muted and the transmit audio path is blocked; all your controls are rendered inoperative; scan mode is stopped on the operating channel which received the command, and all Radio LED's are turned off.

WARNING:

When the System Type field is set to **ASTRO 25** and when the **ASTRO OTAR Profile Index** field is enabled (for the current Trunking System), and when the Secure Configuration, **Radio Inhibit via ASTRO OTAR** is enabled, this field may be disabled. In this case, Radio Inhibit is accomplished "via ASTRO OTAR".

When the System Type field is set to **ASTRO 25** and when the ASTRO OTAR Profile Index field is disabled (for the current Trunking System), this field must be enabled. This insures that Radio Inhibit is possible with **ASTRO 25** Trunking.

When the System Type field is set to **Type II** and when the value of the Trunking System's System ID field matches the **Key ID** of one of the loaded Software System Key Files or Advanced System Keys (see the System Key Report), this field may be disabled. In this case, Radio Inhibit commands received on this Trunking System will be ignored, and the radio continues to operate normally.

When the Secure Configuration, **Radio Inhibit via ASTRO OTAR Profile Index** is enabled, and when the **ASTRO OTAR Profile Index field** is enabled (for the current Trunking System), this field may be disabled. In this case Radio Inhibit is accomplished "via ASTRO OTAR".

When the ASTRO OTAR Profile Index field is disabled (for the current Trunking System), this field must be enabled. This insures that Radio Inhibit is possible with **ASTRO 25** Trunking.

IMPORTANT: In order to clear this inhibited state on the radio, an uninhibit command must be sent to the radio.

Accessed Only: When the radio is model/option capable.

10.36.4.2

OTA Radio Alias Type

This field configures the encoding (transmitting) and decoding (receiving) of the Over the Air (OTA) Radio Alias feature.

WARNING: Radio cannot display alias if the radio receives duplicated IDs until the duplication is removed. Writing the application's codeplug to a radio will cause the call list to return to its original state and all OTA alias updates will be lost.

IMPORTANT: If OTA alias update did not show up on the display, you must update the radio call list or provisioning manager.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Disabled

The radio does not transmit or receive the Radio Alias data.

Decode Only

Radio Alias data receives the data without limitation.

10.36.4.3

TX Power Level

This field selects the radio's power level for transmitting for the current Trunking System.

The Tx Low Power button-press, the Tx Low Power switch-toggle, and the Power menu-selection take precedence over this setting when selected by you.

NOTE:

During Emergency Mode the radio automatically transmits at high power.

The transmit power may be reduced 1 watt for 800 models, and 2 watts for VHF and UHF models.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Low

Used when communicating in close proximity, and to keep the radio from transmitting into other geographical groups operating on the same frequency.

High

Used when a stronger signal is needed to extend transmission distances.

10.36.4.4

HearClear

This field selects to enhance audio clarity by applying noise cancellation and/or a companding algorithm to the radio signal.

This feature applies for the current Trunking System.

IMPORTANT: With companding, the dynamic range of the transmit audio is compressed and then expanded to its original level in the receive audio. Therefore, companding must be enabled on both the transmitting and the receiving radios or distorted audio will result. Since the compression/expansion algorithm is active both on transmit and receive audio, expanding uncompressed audio or compressing audio without subsequently expanding it will both result in unnatural-sounding audio output. The audio path to the dispatcher must also be companded.

Accessed Only: When the System Type field is set to **Type II**, and when the DVRS Hardware Enable field is disabled.

The following selections are supported:

Disabled

No noise canceling or companding is applied to the transmit/receive signals.

Companding Only

Companding is applied to both the transmit and receive audio. See Important Note.

Noise Cancellation Only

Noise cancellation is applied to the receive audio.

Companding and Noise Cancellation

Companding is applied to both the transmit and receive audio (see Important Note) and noise cancellation is applied to the receive audio.

NOTE: The **Noise Cancellation Only** and **Companding and Noise Cancellation** settings can only be applied if all frequencies on the current personality are in the 900 MHz range.

10.36.4.5

Remote Monitor/Radio Trace Enable

This field enables the radio to decode a Remote Monitor or Radio Trace command for the current Trunking System.

WARNING: **Radio Trace** applies only for System Type **Type II**. Also only for a **Type II** System, and applying to both **Remote Monitor** and **Radio Trace**, the radio keys-up for the time selected by the Remote Monitor/Radio Trace Tx Base Time.

NOTE: For a **ASTRO 25** System Type, the in-the-field radio's transmit time is defined by a dispatcher and contained within the transmitted **Remote Monitor** command.

When a **Remote Monitor** command has been received, the radio automatically keys-up and transmits surrounding audio from its "hot" microphone. This is especially useful in an emergency man-down situation.

Remote Monitor is also known as **Radio Unit Monitor**.

When a **Radio Trace** command has been received, the radio automatically keys-up, sending unmodulated carrier, allowing a lost or stolen radio to be found. **Radio Trace** applies only for System Type **Type II**.

Applies only:

For APX 7000XE and APX 6000, this feature applies only when System Option H43 is available to the radio. In addition, the radio requires firmware version R05.xx.xx or higher, and the APX must be R05.xx.xx or higher.

For APX 6500 this feature applies only when System Option G170 is available to the radio. In addition, the radio requires firmware version R05.xx.xx or higher, and the APX must be R05.xx.xx or higher.

10.36.4.6

Remote Monitor/Radio Trace Tx Base Time

This field selects the amount of time that the remotely-monitored radio transmits once a Remote Monitor or Radio Trace command has been received for the current Trunking System.

NOTE: This application field setting is not supported for third party accessories. Any changes in the settings must be done through your accessory developer.

Applies only:

For APX 7000XE and APX 6000, this feature applies only when System Option H43 is available to the radio. In addition, the radio requires firmware version R05.xx.xx or higher, and the APX must be R05.xx.xx or higher.

For APX 6500 this feature applies only when System Option G170 is available to the radio. In addition, the radio requires firmware version R05.xx.xx or higher, and the APX must be R05.xx.xx or higher.

Accessed Only: When the System Type field is set to **Type II**, and when the Remote Monitor/Radio Trace Enable field is enabled, and when the radio is model/option capable.

The following selections are supported:

- 15
- 30
- 45
- 60

10.36.4.7

Emergency Alarm Rx Indicator

This field enables an audio or visual, or both indicator to occur on the radio when an Emergency Alarm is detected and received from another radio.

The type of Emergency Indicator is determined by the Emergency Alarm Rx Indicator Type setting. This feature applies for the current Trunking System.

IMPORTANT:

The Emergency Alarm Rx Indicator time lasts for 10 seconds. During these 10 seconds, you can deactivate the indicator by pressing any of the radio's buttons except Volume and Light/Flip (Display).

Once the indicator clears or is cleared, retried emergency alarms from the same Trunking System Unit ID are ignored for the next 20 seconds.

Emergency alarms are not detected while the radio is in scan mode.

Emergency alarms may not be detected any time the radio is not monitoring or decoding the control channel, for example, activity on a voice or data channel, RSSI sampling, etc.

Accessed Only: When the Emergency Alarm Rx Indicator Type field is not set to **No Indication**, and when the radio is model/option capable.

10.36.4.8

Secure LED

This field enables the yellow busy LED to flash whenever a secure encrypted voice call is received, and will continue to flash as long as the current voice activity is secure.

The yellow busy LED will flash under these conditions regardless of whether the specific radio can unmute the voice signal. Secure LED applies for the current Trunking System.

Accessed Only: When the radio is model/option capable.

10.36.4.9

Dynamic Regrouping Enable

This field enables a Dynamic Regrouping talkgroup for a Trunking Personality or channel that references the current Trunking System.

NOTE:

When this field is enabled, a [Dynamic Regrouping Zone on page 478](#) and [Dynamic Regrouping Channel on page 478](#) must be selected for that Trunking System.

WARNING: A Dynamic Regrouping configuration is only valid: when one of the Trunking Personalities referenced to a channel has its Trunking Talkgroup field set to **DYN** (Dynamic Regrouping), and that Personality's selected Zone and Channel match the selections for Dynamic Regrouping Zone and Dynamic Regrouping Channel in the Personalities' referenced Trunking System.

IMPORTANT: Therefore, only one channel within a given Trunking System, can be the Dynamic Regrouping channel.

You may request a new Dynamic Regrouping assignment from the dispatcher with a Reprogram Request button-press or a Reprogram Request menu-selection. The actual features and settings of the Dynamic Regrouping talkgroup are defined and transmitted back by the dispatcher.

For the Dynamic Regrouping talkgroup to be capable of transmitting in Secure mode, the Secure Tx Select button-press or the Secure Tx Select switch-toggle or the Secure menu-selection is needed; otherwise Dynamic Regrouping talkgroup transmissions are strapped to transmitting in **Clear** mode.

Accessed Only: When the radio is model/option capable.

10.36.4.10

Dynamic Regrouping Zone

This field selects the zone of the Dynamic Regrouping Trunking Personality/channel that references the current Trunking System.

WARNING: Remote Site Interface (RSI) zones are invalid and cannot be selected (zones that have RSI Mode enabled).

NOTE:

You may request a new Dynamic Regrouping assignment from the dispatcher with a Reprogram Request button-press or a Reprogram Request menu-selection. The actual features and settings of the Dynamic Regrouping talkgroup are defined and transmitted back by the dispatcher.

For the Dynamic Regrouping talkgroup to be capable of transmitting in Secure mode, the Secure Tx Select button-press or the Secure Tx Select switch-toggle or the Secure menu-selection is needed; otherwise Dynamic Regrouping talkgroup transmissions are strapped to transmitting in **Clear** mode.

When [Dynamic Regrouping Enable on page 477](#) is **Enabled**, a Dynamic Regrouping Zone and [Dynamic Regrouping Channel on page 478](#) must be selected for that Trunking System.

WARNING:

Zones selected in this field must have Dynamic Zone Enable disabled; otherwise, this field becomes invalid.

A Dynamic Regrouping configuration is only valid when one of the Trunking Personalities referenced to a channel has its Trunking Talkgroup field set to **DYN** (Dynamic Regrouping), and that Personality's selected Zone and Channel match the selections for Dynamic Regrouping Zone and Dynamic Regrouping Channel in the Personalities' referenced Trunking System.

IMPORTANT: Therefore, only one channel (within a given Trunking System) can be the Dynamic Regrouping channel.

Accessed Only: When the [Dynamic Regrouping Enable on page 477](#) field is set to **Enabled**, and when the radio is model/option capable.

10.36.4.11

Dynamic Regrouping Channel

This field selects a Dynamic Regrouping Trunking Personality/channel that references the current Trunking System.

See also [Dynamic Regrouping Zone on page 478](#).

NOTE:

You may request a new Dynamic Regrouping assignment from the dispatcher with a Reprogram Request button-press or a Reprogram Request menu-selection. The actual features and settings of the Dynamic Regrouping talkgroup are defined and transmitted back by the dispatcher.

For the Dynamic Regrouping talkgroup to be capable of transmitting in Secure mode, the Secure Tx Select button-press or the Secure Tx Select switch-toggle or the Secure menu-selection is needed; otherwise Dynamic Regrouping talkgroup transmissions are strapped to transmitting in **Clear** mode.

When [Dynamic Regrouping Enable on page 477](#) is **Enabled**, a Dynamic Regrouping Zone and Dynamic Regrouping Channel must be selected for that Trunking System.

WARNING: A Dynamic Regrouping configuration is only valid when one of the Trunking Personalities referenced to a channel has its Trunking Talkgroup field set to **DYN** (Dynamic Regrouping), and that Personality's selected Zone and Channel match the selections for Dynamic Regrouping Zone and Dynamic Regrouping Channel in the Personalities' referenced Trunking System.

IMPORTANT: Therefore, only one channel within a given Trunking System, can be the Dynamic Regrouping channel.

WARNING: For APX™ 3000 Portable codeplugs, only the first 48 channels in the selected Dynamic Regrouping Zone are considered valid selections.

Accessed Only: When the [Dynamic Regrouping Enable on page 477](#) field is set to **Enabled**, and when the Dynamic Regrouping Zone field is not set to a Dynamic Zone, and when the radio is model/option capable.

10.36.4.12

ICUA Reset

This field selects a timed or manual unmute, exception for Trunking call alerts/pages when the channel is Voice Mute In-Call User Alert Enabled.

The exception time (timed or manual) is known as the Release Squelch State. For the two timed selections, the [ICUA Auto Reset Time on page 480](#) field (for this Trunking System) partially determines how long the Release Squelch State continues. The Release Squelch State begins when the Voice Mute In-Call User Alert feature is active and the radio has unmuted. This selection applies for the current Trunking System.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Manual

When the Voice Mute In-Call User Alert Enabled feature is active, Voice Mute button is pressed, or the Voice Mute menu-selection deactivates Voice Mute and ends the Release Squelch State. Pressing the PTT button ends the Release Squelch State.

Auto

If the timer expires regardless of whether the radio is muted or unmuted, the Release Squelch State is ended and the Voice Mute In-Call User Alert Enabled rules are again required in order to unmute to any future transmissions.

Auto with carrier

If the radio is unmuted when the timer expires due to Carrier Squelch being satisfied, the radio remains unmuted until carrier is dropped. Once carrier is dropped and the radio is muted, the timer is reset and re-started, in effect extending the Release Squelch State again; if the radio then

remains muted for an entire timer period without any carrier override, the Release Squelch State is ended and the Voice Mute In-Call User Alert Enabled rules are again required in order to unmute to any future transmissions.

10.36.4.13

ICUA Auto Reset Time

This field selects an amount of time used during the unmute-exception for Trunking call alerts/pages when the channel is Voice Mute In-Call User Alert Enabled.

The exception time is known as the Release Squelch State. This timer is only relevant to the two In-Call Reset timed selections. This selection applies for the current Trunking System. Time is in seconds.

Accessed Only: When the [ICUA Reset on page 479](#) field is not set to **Manual**, and when the radio is model/option capable.

Table 251: Range

Minimum	Maximum	Increments
0 sec	255 sec	1 sec

10.36.4.14

Text Messaging Service

This field selects the Text Messaging mode for the current Trunking System.

NOTE:

Text Messaging is accessed by you with the Text Messaging Service button-press, or the Text Messaging Service menu-selection.

Quick Text Messaging is accessed by you with the TMS Quick Text button-press.

Query Messaging is accessed by you with the TMS Query button-press.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the current Trunking System has a referenced Data Profile, and when Data Profile Selection is not set to **Data Disabled**.

The following selections are supported:

None

The feature is disabled.

List Only

Allows you to only select Text Messages from the Quick Text Messages List.

Unlimited

Allows you to select from the Quick Text Messages, and enter your own text message from the radio keypad.

WARNING: This selection is only available on radios that have a keypad or Keypad Mic.

NOTE: This selection is not applicable to APX N70.

10.36.5

Message Alias

This section allows you to view or define Message functionality for individual Trunking Systems.

You are then able to select and transmit these Messages. Messages can be sent from a dispatcher unit to a portable or mobile unit, or from a portable or mobile unit to a dispatcher unit. However, a Message may not be sent from a portable or mobile unit to a portable or mobile unit.

WARNING:

This feature applies only when the [Type II Trunking Personality on page 499](#) that references this Trunking System has its Message Enable field enabled.

Each Message Alias must be set up identically (or with the same meaning) for the dispatcher and the portable or mobile units. That is, the Message 1 Alias from the dispatching unit must be identical (or have the same meaning) as the Message 1 Alias for the portable or mobile unit.

NOTE:

A Message transmission makes more efficient use of a channel as compared to a voice transmission.

Messages are only applicable to display models.

Accessed Only: When [Message Alias Enable on page 481](#) field is enabled, and when the System Type field is set to **Type II**, and when the radio is model/option capable.

10.36.5.1

Message Alias Enable

This field enables the ability to define Messages for the current Trunking System.

WARNING:

This feature applies only when the [Type II Trunking Personality on page 499](#) that references this Trunking System has its Message Enable field enabled.

Once enabled, you must then set up each radio Message Alias (Message Alias Name and Message Alias Number of the same record/row) to match identically (or have the same meaning) as the corresponding dispatcher unit Message Alias.

Once defined, you can access the Message feature with a [Message on page 171](#) button-press, a Direct Message button-press, or a [Message on page 197](#) menu-selection.

Accessed Only: When the System Type field is set to **Type II**, and when the radio is model/option capable.

10.36.5.2

Message Alias Number

This field selects a number that identifies the current Message.

This selection applies for the current message (record/row) which applies for the current Trunking System.

WARNING:

This feature applies only when the Trunking Personality that references this Trunking System has its [Message Enable on page 519](#) field enabled.

Once defined, you can access the Message feature with a Message button-press, a Direct Message button-press, or a Message menu-selection.

Accessed Only: When [Message Alias Enable](#) field is enabled, and when the System Type field is set to **Type II**, and when the radio is model/option capable.

10.36.5.3

Message Alias Text

This field allows you to define recognizable names for the current Message (record/row).

This selection applies for the current Trunking System.

WARNING:

This feature applies only when the Trunking Personality that references this Trunking System has its [Message Enable on page 519](#) field enabled.

Once defined, you can access the Message feature with a Message button-press, a Direct Message button-press, or a Message menu-selection.

NOTE: The Message Alias must be set up identically (or with the same meaning) for the dispatcher and the portable or mobile units. That is, the Message 1 Alias from the dispatching unit must be identical (or have the same meaning) as the Message 1 Alias for the portable or mobile unit.

Accessed Only: When [Message Alias Enable](#) field is enabled, and when the System Type field is set to **Type II**, and when the radio is model/option capable.

NOTE:

Examples: MESSAGE-01, Electric1, #510

Characters, numbers, spaces, and special characters can be used.

Up to 14 characters are possible.

10.36.6

Type II Channel Setup

This section allows you to view or define features specific to the Type II Trunking System.

IMPORTANT: Individual Trunking Systems are referenced to a Trunking Personality. These Trunking Systems settings can then become functional for all channel types within that [Type II Trunking Personality on page 499](#).

Accessed Only: When the System Type field is set to **Type II**, and when the radio is model/option capable.

10.36.6.1

Splinter Channel

This field enables Splinter Channel operation for supporting Trunking Systems that operate as a "splinter system" (800 MHz only).

NOTE: In this case, Control channel frequencies and Failsoft frequencies operate using "splinter channels" which are in between the "normal" frequencies of the 800 MHz band plan, and are hence shifted down 12.5 kHz. The radio then interprets the channel numbers received over the air as splinter channels. This feature applies to the current Trunking System.

Accessed Only: When the radio is operating within the 800 MHz frequencies band, and when a Software System Key File or an Advanced System Key with access has been selected in the System ID field, and when the System Type field is set to **Type II**, and when the radio is model/option capable.

10.36.6.2

Legacy Transit System

This field enabling this feature restricts the use of the current Trunking System to the legacy frequency format for compatibility with legacy transit systems.

WARNING: DO NOT MODIFY this feature unless explicitly instructed by a Motorola Solutions Field Technical Representative.

Accessed Only: When the System Type field is set to **Type II**, and when the radio is model/option capable.

10.36.6.3

Channel Bandwidth

This field selects the Channel Bandwidth for the current Trunking System.

For the 800 MHz domestic trunked system configuration, this field is the designated 806 Channel Bandwidth; that is, this selection specifies the Channel Bandwidth of the frequencies in the range of 806 MHz–821 MHz.

IMPORTANT:

The bandwidth for the frequencies in the range 821 MHz to 824 MHz are set in the [NPSPAC Channel Bandwidth on page 483](#) field.

When **12.5 kHz** is selected and when a group's Voice and Signal Type is set to **Analog**, the [AG Secure/Clear Strapping on page 510](#) field and the Talkgroup Secure/Clear Strapping fields are forced to **Clear**.

Accessed Only: When the System Type field is set to **Type II**, and when the radio is not operating within the 900 MHz frequency band, and when an Advanced System Key with access has been selected in the System ID field, and when the radio is model/option capable.

The following selections are supported:

25.0 kHz

20.0 kHz

WARNING:

20.0 kHz and 25.0 kHz are invalid if the following scenario is true:

When the 12.5 kHz FCC Narrowbanding Mandate applies for this codeplug, and when the Trunking System, [Type II Frequency Band on page 468](#) is Other Band Trunking (OBT), and

when any of the records/rows on the OBT Channel Assignment Page has its: ([Tx Enable on page 470](#) field **Enabled**, and [Tx Start Frequency on page 471](#) OR [Tx End Frequency on page 472](#) falls into one of FCC Requirement ranges).

12.5 kHz

Always available

10.36.6.4

NPSPAC Channel Bandwidth

This field selects the National Public Safety Planning Advisor Committee (NPSPAC) Channel Bandwidth for the current Trunking System.

This selection specifies the Channel Bandwidth of the frequencies in the range of 821 MHz to 824 MHz.

NOTE:

The bandwidth for the frequencies in the range 806 MHz to 821 MHz are set in the [Channel Bandwidth on page 483](#) field.

When **12.5 kHz** is selected and when a group's Voice and Signal Type is set to **Analog**, the [AG Secure/Clear Strapping on page 510](#) field and the Talkgroup Secure/Clear Strapping fields are forced to **Clear**.

Accessed Only: When the System Type field is set to **Type II**, and when the radio is operating within the 800 MHz frequency band, and when the radio is model/option capable.

The following selections are supported:

- 20.0 kHz
- 12.5 kHz

10.36.6.5

Channel Assignment Type

This field selects a slight variation in frequency band split (in MHz) and also adjusts channel spacing bandwidth (in kHz).

This selection applies for the current Trunking System.

Accessed Only: When the System Type field is set to **Type II**, and when the radio is operating within the 800 MHz frequency band, and when the radio is model/option capable.

The following selections are supported:

Domestic

25.0 kHz Channel Spacing used in the USA.

International

12.5 kHz Channel Spacing used outside the USA.

10.36.7

Status Alias (Type II Trunking System)

The **Status Alias** section of the Type II Trunking System set allows the user to view or define Statuses for individual Trunking Systems. Users are then able to select and transmit their current Status to a dispatcher (base unit) with a Status button-press, a Direct Status button-press, or a Status menu-selection.

NOTE:

Status transmissions make more efficient use of a channel as compared to a voice transmission.

For non-keypad models this feature can be used only with the One Touch Button Feature.

WARNING:

This feature applies only when the Trunking Personality that references this Trunking System has its Status Enable field enabled.

Each Status Alias must be set up identically (or with the same meaning) for the dispatcher and the portable or mobile units. That is, the Status 1 Alias from the dispatching unit must be identical (or have the same meaning) as the Status 1 Alias for the portable or mobile unit.

Accessed Only: When the radio is model/option capable.

10.36.7.1

Status Alias Enable

This field enables the ability to define Status for the current Trunking System.

WARNING:

This feature applies only when the Trunking Personality that references this Trunking System has its Status Enable field enabled.

Once enabled, you must then set up each radio Status Alias (Status Alias Name and Status Alias Number of the same record/row) to match identically or have the same meaning as the corresponding dispatcher unit Status Alias.

Once defined, you can access the Status feature with a Status button-press, a Direct Status button-press, or a Status menu-selection.

For non-keypad models, the Status feature can be used only with the One Touch Button feature.

Accessed Only: When the radio is model/option capable.

10.36.7.2

Status Alias Number

This field selects a number that identifies the current Status.

This selection applies for the current Status (record/row) which applies for the current trunking system.

WARNING:

- This feature applies only when the trunking personality that references this trunking system has its Status Enable field enabled.
- Once defined, you can access the status feature with a status button-press, a direct status button-press, or a status menu-selection.

IMPORTANT: The Status Alias must be set up identically (or with the same meaning) for the dispatcher and the portable or mobile units. That is, the Status 1 Alias from the dispatching unit must be identical (or have the same meaning) as the Status 1 Alias for the portable or mobile unit.

Accessed Only: When [Status Alias Enable on page 484](#) field is enabled, and when the radio is model/option capable.

10.36.7.3

Status Alias Text

This field allows you to define recognizable names for the current Status (record/row).

This selection applies for the current trunking system.

NOTE:

- This feature applies only when the Trunking Personality that references this Trunking System has its Status Enable field enabled.
- Once defined, you can access the Status feature with a Status button-press, a Direct Status button-press, or a Status menu-selection.

IMPORTANT: The Status Alias must be set up identically (or with the same meaning) for the dispatcher and the portable or mobile units. That is, the Status 1 Alias from the dispatching unit must be identical (or have the same meaning) as the Status 1 Alias for the portable or mobile unit.

Accessed Only: When [Status Alias Enable on page 484](#) field is enabled, and when the radio is model/option capable.

NOTE:

Characters, numbers, spaces, and special characters can be used.

Up to 14 characters are possible.

Examples: STATUS-01, Electric1, #510

10.36.8

Site Alias (Type II Trunking System)

The **Site Alias** section of the Type II Trunking System set allows the user to view or define user-friendly aliases that identify either Trunking Systems or individual sites within those Systems that a radio may encounter as it roams across sites, Trunking Systems or even Wide Area Communications

Networks (WACNs). Aliases can also identify calls (via PTT IDs) received from radios outside of the radio's selected (home) Trunking System.

IMPORTANT: Only Site Aliases defined in the user's currently-selected Trunking System are available to the radio.

NOTE:

The Site Alias Type determines what the Site Alias Text is being assigned to, either a Trunking System or a site within a System.

IMPORTANT: A Trunking System is always defined by its Home RAS WACN Number and System Number, while a site is defined by specific combinations of its Home RAS WACN Number, System Number, RFSS Alias Number and Site ID, depending on the current Trunking System's Coverage Type and System Type.

Viewing the current Site Alias and its corresponding received signal strength indicator (RSSI), or changing the current site, is activated with a Site Display/Srch button-press. A radio-user activated Site Lock/Unlock button-press or a Site menu-selection can view or change the current site lock status.

Individual Trunking Systems are referenced to a Trunking Personality. These Trunking Systems settings can then become functional for all channel types within that Trunking Personality.

10.36.8.1

Site Alias Enable

This field enables the Site Alias fields for the current Site ID (record/row), which also applies to the current Trunking System.

NOTE:

Viewing the current Site Alias and its corresponding received signal strength indicator (RSSI), or changing the current site, is activated with a Site Display/Srch button-press.

A Site Lock/Unlock button-press or a Site menu-selection can view or change the current site lock status.

NOTE: Automatic Multiple Site Select (AMSS) is not supported in this product.

Accessed Only: When the System Type field is set to **Type II**, and when the [Coverage Type on page 466](#) field is set to **SmartZone**, and when the radio is model/option capable,

Or when the System Type field is set to **ASTRO 25**, and when the Coverage Type field is not set to **Disabled**, and when the radio is model/option capable.

10.36.8.2

Site ID

This field allows you to enter (in decimal or hex format) the ID number that identifies the site for the current (record/row).

To support roaming between different sites, each Site ID must be unique within a Radio Frequency Sub-System (RFSS). This selection also applies the current Trunking System.

Accessed Only: When the [Site Alias Enable on page 486](#) field is enabled, and when the System Type field is set to **Type II**, and when the Coverage Type field is set to **SmartZone**, and when the radio is model/option capable,

Or when the [Site Alias Enable on page 486](#) field is enabled, and when the [Site Alias Type on page 545](#) field is set to **Site**, and when the System Type field is set to **ASTRO 25**, and when the Coverage Type field is not set to **Disabled**, and when the radio is model/option capable.

Table 252: Range

Minimum	Maximum
0 (Hex)	FE (Hex)

10.36.8.3

Site Alias Text

This field allows you to define recognizable names for the current Site Alias (record/row) which applies to the current Trunking System.

See also [Site Alias Type on page 545](#). You can activate the Site Alias Text with Site Display/Srch button-press, Site Lock/Unlock button-press, and the Site menu-selection features.

Accessed Only: When the [Site Alias Enable on page 486](#) field is enabled, and when the System Type field is set to **Type II**, and when the Coverage Type field is set to **SmartZone**, and when the radio is model/option capable,

Or when the [Site Alias Enable on page 486](#) field is enabled, and when the System Type field is set to **ASTRO 25**, and when the Coverage Type field is not set to **Disabled**, and when the radio is model/option capable.

NOTE:

Characters, numbers, spaces, and special characters can be used.

Up to 14 characters are possible.

Examples: EMT-001, #500, Electric1, Site Alias 01

10.36.9

One Touch (Type II Trunking System)

The **One Touch** section of the Type II Trunking System set allows the user to view or define specific One Touch [One Touch Button Feature on page 488](#) and [One Touch Button Index on page 488](#) selections for up to four (4) One Touch button-presses or One Touch menu-selections.

One Touch allows the user to create menu-navigation and/or button shortcuts for the radio user. These shortcuts can greatly reduce the radio-user effort involved in launching a radio feature. A One Touch button-press or menu-selection can reduce down to a single button press, the launching of a radio feature; this same process might otherwise take many menu navigation steps to achieve. These selections apply for the current Trunking System.

NOTE: Individual Trunking Systems are referenced to a Trunking Personality. These Trunking Systems settings can then become functional for all channel types within that Trunking Personality.

10.36.9.1

Button

Displays the view-only the assigned name for the One Touch button-press or One Touch menu-selection.

NOTE: Individual Trunking Systems are referenced to a Trunking Personality. These Trunking Systems settings can then become functional for all channel types within that Trunking Personality.

10.36.9.2

One Touch Button Feature

This field selects the One Touch Feature for your One Touch button-press or One Touch menu-selection.

This selection applies for the current record/row, which applies for the current Trunking System.

IMPORTANT: Trunking One Touch Button 1, in other words, the first record/row would correspond to a One Touch 1 button-press, and/or a TCH1 or SIG1 menu-selection, and so on.

NOTE: With any of these Feature selections, the One Touch Button Index selection must also be defined.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Disabled

One Touch is not available for the current Button selection.

Phone

The [Phone Operation on page 517](#) feature is set to **List Only** or **Unlimited** for the referenced Trunking Personality.

Private Call

The [Private Call Type on page 514](#) is not **Disabled**, and the [Private Call Operation on page 514](#) field is set to **List Only** or **Unlimited** for the referenced Trunking Personality.

Call Alert

The [Call Alert/Page Operation on page 515](#) field is set to **List Only** or **Unlimited** for the referenced Trunking Personality.

Status

The [Status Alias Enable on page 484](#) feature is enabled for the current Trunking System.

Message

The Message feature is enabled for the current Trunking System.

NOTE: The available One Touch Button Feature selections are model/option dependent.

10.36.9.3

One Touch Button Index

This field selects the One Touch Index/List member for your One Touch button-press or One Touch menu-selection, pertaining to the selected One Touch Button Feature.

Index refers to the actual record/row of the list determined by the One Touch Button Feature selection. This selection applies for the current Trunking System.

IMPORTANT: Trunking One Touch Button 1, the first record/row will correspond to a One Touch 1 button-press, and a TCH1 or SIG1 menu-selection.

Accessed Only: When the [One Touch Button Feature on page 488](#) field for the current record/row is not set to **Disabled**, and when the radio is model/option capable.

The following selections are supported:

Private Call

This Index number correlates to the row number of the Type II, or ASTRO 25 Call Hot List.

IMPORTANT: The [Trunking Call Hot List on page 515](#) selection determines which Call Hot List is used for the referenced Trunking Personality.

Available to you when the [Private Call Type on page 514](#) is not **Disabled**, and the [Private Call Operation on page 514](#) field is set to **List Only** or **Unlimited** for the referenced Trunking Personality.

Call Alert

This Index number correlates to the row number of the Type II, or ASTRO 25 Call Hot List.

IMPORTANT: The Trunking Call Hot List selection which Call Hot List is used for the referenced Trunking Personality.

Available to you when the [Call Alert/Page Operation on page 515](#) field is set to **List Only** or **Unlimited** for the referenced Trunking Personality.

Phone

This Index number correlates to the row number of the Phone Call Hot List.

Available to you when the [Phone Operation on page 517](#) feature is set to **List Only** or **Unlimited** for the referenced Trunking Personality.

Status

This Index number correlates to the position/row number of the Status Alias List members.

Available to you when the [Status Alias Enable on page 484](#) feature is **Enabled** for the current Trunking System.

Message

This Index number correlates to the position/row number of the Message Alias List members.

Available to you when the Message feature is **Enabled** for the current Trunking System.

10.36.10

Digital (ASTRO 25 Trunking System)

The **Digital** section of the ASTRO 25 Trunking System set allows the user to view or define digital communication functionality.

NOTE: Individual Trunking Systems are referenced to a Trunking Personality. These Trunking Systems settings can then become functional for all channel types within that Trunking Personality.

10.36.10.1

Adaptive Power

This field enables the radio to automatically adjust its transmitter power level on the voice channel, not on the control channel, based on the signal strength of the Auto Power Adaptation Link Control (APA LC) information received over the air.

If the signal strength is better than the acceptable threshold, the radio transmits in mid power instead of high power. This selection applies for the current Trunking System.

NOTE: If you press the PTT button a second time within 30 seconds when APA is enabled for F2 TDMA secure mode, the radio transmits on medium power if the current power level is set to high. If the time exceeds 30 seconds, the power level remains high.

Accessed Only: When the [TX Power Level on page 474](#) Tx Power Level field is not set to **Low**, and when the radio is model/option capable.

10.36.10.2

Preamble Length

This field selects a number that determines the amount of time that bit sync preamble packets are sent at the beginning of all ASTRO 25 Voice Channel transmissions for the current Trunking System.

These packets allow transmitting and receiving radios to synchronize with each other before an ASTRO 25 transmission.

NOTE: The Preamble duration is equal to this Preamble Length value multiplied by 0.2083 ms.

Accessed Only: When the radio is model/option capable.

Table 253: Range

Minimum	Maximum
0	255

10.36.10.3

Digital Modulator Type

This field selects the Digital Modulator Type for the current Trunking System.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

C4FM (Factory Default for Type II Trunking)

Continuous 4-Level Frequency Modulation for non-simulcast operation.

CQPSK (Factory Default for ASTRO 25 Trunking)

Compatible Quadrature Phase Shift Keying for narrowband simulcast operation and non-simulcast operation.

IMPORTANT: This selection is only available to radio models equipped with Common Air Interface (CAI) Digital Operation.

WIDE

Wideband simulcast operation.

IMPORTANT: This selection cannot be chosen if a Channel Bandwidth of 12.5 kHz is selected.

10.36.10.4

TDMA Frame Sync BER Threshold

This field selects the maximum allowable Time Division Multiple Access (TDMA) Bit Error Rate (BER) tolerated by a radio on an X2 or Phase 2 TDMA voice channel.

NOTE: The TDMA BER is calculated during the frame sync portion of a TDMA voice transmission. If a BER greater than this maximum is detected, the radio attempts to switch to a better site when available. This selection applies for the current Trunking System.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the [Phase 2 Voice Capable on page 552](#) field is **Enabled** and when the radio is model/option capable.

Table 254: Range

Minimum	Maximum	Increments
Disabled	25.4%	0.1%

10.36.10.5

FDMA Frame Sync/NID BER Threshold

This field selects the maximum allowable Frequency Division Multiple Access (FDMA) Frame Sync/ Network ID (NID) Bit Error Rate (BER) tolerated by a radio on a Trunking site.

This maximum applies to both the control channel and the voice channel. If a BER greater than this maximum is detected, the radio attempts to switch to a better site when available. This selection applies for the current Trunking System.

Accessed Only: When the [Coverage Type on page 466](#) field is not set to **Disabled**, and when the radio is model/option capable.

Table 255: Range

Minimum	Maximum	Increments
Disabled	25.4%	0.1%

10.36.11

Secure / Multikey (Type II Trunking System)

The **Secure / Multikey** section of the Type II Trunking System set allows the user to view or define security and multikey functionality for secure-encoded transmit and receive communications. This functionality can be customized on a per Trunking System basis.

NOTE: Individual Trunking Systems are referenced to a Trunking Personality. These Trunking Systems settings can then become functional for all channel types within that Trunking Personality.

10.36.11.1

DES-XL Tx/Rx Default

This field enables only digital Data Encryption Standard - Extended Range (DES-XL) to be used for all secure encrypted voice calls.

DES-XL is a Type 3 encryption standard (mid-level). This selection applies for the current Trunking System.

When disabled, only digital Data Encryption Standard - Output Feedback (DES-OFB) is used for all secure encrypted voice calls. DES-OFB is a Type 3 encryption standard (mid-level).

WARNING: This feature only applies when the radio is equipped with a DES-XL/DES-OFB dual algorithm encryption module.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware**, and when the radio is model/option capable.

10.36.11.2

Patch Key Select

This field selects the secure encryption key to be used during Patch Talkgroup communications while operating in secure encrypted mode.

Patch Talkgroups allow a dispatcher to join multiple talkgroups or users together so that all may communicate as one talkgroup. This selection applies for the current Trunking System.

IMPORTANT:

When the [ASTRO OTAR on page 557](#) field is **Enabled** for the current Trunking System, this Key Select value is chosen from the Secure Hardware Encryption Key References List of the Secure KMF Profile selected in the [ASTRO OTAR Profile Index on page 557](#) field for the current Trunking System.

WARNING: Be aware that it is actually pointing to the Keys of the Encryption Key List for this selection; individual Keys from the Secure Hardware Encryption Key References List reference the Encryption Key List's Keys from the Encryption Key Reference field. Therefore any key selected when ASTRO OTAR is enabled, must first be defined in the Secure Hardware Encryption Key References List.

When this ASTRO OTAR field is **Disabled** for the current Trunking System, Hardware Key Select values are directly chosen from the Secure Wide Window's Encryption Key List.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware**, and when the radio is model/option capable,

Or when the [Secure Operation on page 272](#) field is set to **Software**, and when the System Type field is set to **ASTRO 25**, and when the radio is model/option capable.

10.36.11.3

Failsoft Secure/Clear Strapping

This field selects the strapping type used for Failsoft.

When the radio is model/option capable.

Select

Allows you to toggle on or off secure encrypted communications.

NOTE:

Either the Secure Tx Select button-press or the Secure Tx Select switch-toggle or the Secure menu-selection allows for your access to secure-encrypted communications.

Clear

Straps or commits the channel to normal (non-secure) Conventional communications operation.

Secure

Straps or commits the channel to Secure encrypted operation.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**.

10.36.11.4

Failsoft Key Select

This field selects the secure encryption key to be used for failsoft mode while operating in secure encrypted mode.

This selection applies for the current Trunking System.

IMPORTANT:

When the [ASTRO OTAR on page 557](#) field is **Enabled** for the current Trunking System, this Key Select value is chosen from the Secure Hardware Encryption Key References List of the Secure KMF Profile selected in the [ASTRO OTAR Profile Index on page 557](#) field for the current Trunking System.

WARNING: Be aware that it is actually pointing to the Keys of the Encryption Key List for this selection; individual Keys from the Secure Hardware Encryption Key References List reference the Encryption Key List's Keys from the Hardware Key Reference field. Therefore any key selected when ASTRO OTAR is enabled must first be defined in the Secure Hardware Encryption Key References List.

When the ASTRO OTAR field is **Disabled** for the current Trunking System, this Key Select value is directly chosen from the Secure Wide Window's Encryption Key List.

Accessed Only: When the radio is model/option capable, and when the [Secure Operation on page 272](#) field is set to **Hardware**,

Or when the [Secure Operation on page 272](#) field is set to **Software**, and when the System Type field is set to **ASTRO 25**, and when the Failsoft Secure/Clear Strapping field is not set to **Clear**

10.36.11.5

Private Call Secure/Clear Strapping

This field selects the strapping type used for Private Call.

When the radio is model/option capable.

Select

Allows you to toggle on or off secure encrypted communications.

NOTE:

Either the Secure Tx Select button-press or the Secure Tx Select switch-toggle or the Secure menu-selection allows for your access to secure-encrypted communications.

Clear

Straps or commits the channel to normal (non-secure) Conventional communications operation.

Secure

Straps or commits the channel to Secure encrypted operation.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**.

10.36.11.6

Private Call Key Select

This field selects the secure encryption key to be used for Private Call while operating in secure encrypted mode.

This selection applies for the current Trunking System. When the ASTRO OTAR Profile Index field for the current Trunking System is set to **Enabled**, the value for this field is selected from the Secure Encryption Key Reference List.

IMPORTANT: The application points to the Keys of the Encryption Key List for this selection. Individual Keys from the Secure Encryption Key References List reference the keys of the Encryption Key List from the Encryption Key References field. Therefore, keys must be defined in the Secure Encryption Key References List before the keys are available for selection. Keys taken from OTAR Profile with Independent Key List field enabled are available.

When the ASTRO OTAR Profile Index field for the current Trunking system is **Disabled**, the value for this field is selected from the Encryption Key List within the Secure Wide window.

Accessed Only: When the radio is model/option capable, and when the [Secure Operation on page 272](#) field is set to **Hardware**,

Or when the [Secure Operation on page 272](#) field is set to **Software**, and when the System Type field is set to **ASTRO 25**, and when the Private Secure/Clear Strapping field is not set to **Hardware**

10.36.11.7

Interconnect Secure/Clear Strapping

This field selects the strapping type used for Interconnect.

When the radio is model/option capable.

Select

Allows you to toggle on or off secure encrypted communications.

NOTE:

Either the Secure Tx Select button-press or the Secure Tx Select switch-toggle or the Secure menu-selection allows for your access to secure-encrypted communications.

Clear

Straps or commits the channel to normal (non-secure) Conventional communications operation.

Secure

Straps or commits the channel to Secure encrypted operation.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**.

10.36.11.8

Interconnect Key Select

This field selects the secure encryption key to be used for an Interconnect call (phone mode) while operating in secure encrypted mode.

This selection applies for the current Trunking System.

IMPORTANT:

When the ASTRO OTAR Profile Index field is **Enabled** for the current Trunking System, this Key Select value is chosen from the Secure Encryption Key References List of the ASTRO OTAR Profile selected in the ASTRO OTAR Profile Index field for the current Trunking System.

WARNING: Be aware that it is actually pointing to the Keys of the Encryption Key List for this selection; individual Keys from the Secure Encryption Key References List reference the Encryption Key List's Keys from the Hardware Key Reference field. Therefore any key selected when ASTRO OTAR Profile Index is enabled must first be defined in the Secure Encryption Key References List. Keys taken from OTAR Profile with Independent Key List field enabled are available.

The application points to the Keys of the Encryption Key List for this selection. Individual Keys from the Secure Encryption Key References List reference the keys of the Encryption Key List from the Encryption Key References field. Therefore, keys must be defined in the Secure Encryption Key References List before the keys are available for selection.

When the ASTRO OTAR Profile Index field for the current Trunking system is **Disabled**, the value for this field is selected from the Encryption Key List within the Secure Wide window.

Accessed Only: When the radio is model/option capable, and when the [Secure Operation on page 272](#) field is set to **Hardware**,

Or when the [Secure Operation on page 272](#) field is set to **Software**, and when the System Type field is set to **ASTRO 25**, and when the Interconnect Secure/Clear Strapping field is not set to **Hardware**

10.36.11.9

Dynamic Regrouping Secure/Clear Strapping

This field selects the strapping type used for Dynamic Regrouping.

When the radio is model/option capable.

10.36.11.10

Dynamic Talkgroup Key Select

This field selects the secure encryption key to be used for a Dynamic Regrouping (Dynamic Talkgroup) while operating in secure encrypted mode.

This selection applies for the current Trunking System.

IMPORTANT:

When the [ASTRO OTAR on page 557](#) field is **Enabled** for the current Trunking System, this Key Select value is chosen from the Secure Hardware Encryption Key References List of the Secure KMF Profile selected in the [ASTRO OTAR Profile Index on page 557](#) field for the current Trunking System.

WARNING: Be aware that it is actually pointing to the Keys of the Encryption Key List for this selection; individual Keys from the Secure Hardware Encryption Key References List reference the Encryption Key List's Keys from the Encryption Key Reference field. Therefore any key selected when ASTRO OTAR is enabled must first be defined in the Secure Hardware Encryption Key References List.

When the ASTRO OTAR field is **Disabled** for the current Trunking System, this Key Select value is directly chosen from the Secure Wide Window's Encryption Key List.

Accessed Only: When the radio is model/option capable, when the [Dynamic Regrouping Enable on page 477](#) field is **Enabled**, and when the Secure Operation field is set to **Hardware**,

Or when the [Secure Operation on page 272](#) field is set to **Software**, and when the System Type field is set to **ASTRO 25**, and when the Dynamic Regrouping Secure/Clear Strapping field is not set to **Hardware**

10.36.11.11

Dynamic AG Key Select

This field selects the secure encryption key to be used for a Dynamic Announcement Grouping while operating in secure encrypted mode.

This selection applies for the current Trunking System.

IMPORTANT:

When the [ASTRO OTAR on page 557](#) field is **Enabled** for the current Trunking System, this Key Select value is chosen from the [Secure Hardware Encryption Key References List on page 290](#) of the Secure KMF Profile Set selected in the [ASTRO OTAR Profile Index on page 557](#) field for the current Trunking System.

WARNING: Be aware that it is actually pointing to the Keys of the [Encryption Key List on page 286](#) for this selection; individual Keys from the [Secure Hardware Encryption Key References List on page 290](#) reference the Encryption Key List's Keys from the [Encryption Key Reference on page 291](#) field. Therefore any key selected when ASTRO OTAR is enabled must first be defined in the Secure Hardware Encryption Key References.

When the ASTRO OTAR field is **Disabled** for the current Trunking System, this Key Select value is directly chosen from the Secure Wide Window's Encryption Key List.

Accessed Only: When the [Dynamic Regrouping Enable on page 477](#) field is enabled, and when the [Secure Operation on page 272](#) field is set to **Hardware**, and when the System Type field is set to **Type**

II, and when the Dynamic Regrouping Secure/Clear Strapping field is set to **Type II**, and when the radio is model/option capable.

10.36.12

Talkgroup (Type II Trunking System)

The **Talkgroup** section of the Type II Trunking System set allows the user to view or define individual Talkgroup functionality for individual Trunking Systems. A Talkgroup is an RadioCentral defined grouping of radios created for the purpose of frequent and convenient communication with each other.

NOTE: Talkgroup frequencies are determined by the in-the-field Trunking System and are not setup in RadioCentral.

NOTE: Trunking Personality Failsoft Frequencies must be setup within RadioCentral.

Once defined, a Talkgroup can be assigned to one or more channels of the radio's Channel Selector from the [Zones Channel Assignment on page 605](#) and Channel List Set Trunking Talkgroup field.

The following field is supported:

10.36.12.1

Talkgroup Name

This field allows you to define recognizable names for the current Talkgroup (record/row).

This selection applies to the current Trunking Personality.

Accessed Only: When the radio is model/option capable.

NOTE: **Examples:** PerTG-001, #500, Electric1, # A5.

Characters, numbers, spaces, and special characters can be used.

Leading blanks are substituted with underscores in the radio's display.

Leading periods do not appear in the radio's display.

10.36.12.2

Talkgroup ID

This field allows you to enter (in decimal or hex format) the Talkgroup number that uniquely identifies the current talkgroup (record/row).

This selection applies to the current Trunking Personality.

Accessed Only: When the referenced Trunking System has ((a Software System Key File or an Advanced System Key with access selected in the System ID field) Or, (an Advanced WACN Key with access selected in the Home WACN ID field)),

And, when the radio is model/option capable.

Table 256: Range

For Protocol Type	Disabled	Minimum	Maximum
ASTRO 25	None	0001 hex	FFFE hex

For Protocol Type	Disabled	Minimum	Maximum
Type II	None	001 hex	FFE hex

IMPORTANT: The selection range may be modified on a per Advanced Key basis by the Advanced Keys Administrator program.

10.36.12.3

Tx Voice/Signal Type

This field selects the transmit signaling mode for the current talkgroup (record/row).

This selection applies for the current trunking personality.

Accessed Only: Digital is only accessed when the [Protocol Type](#) field is set to **Type II**, and when the [Type II Frequency Band on page 468](#) is not **900 MHz**.

The following selections are supported:

- Analog
- Digital

10.36.12.4

Secure/Clear Strapping

This field selects the secure encryption transmit and receive mode for the current talkgroup (record/row).

This selection applies for the current Trunking Personality.

Accessed Only: When the referenced Trunking System has ((a Software System Key File or an Advanced System Key with access selected in the [System ID on page 467](#) field) or (an Advanced WACN Key with access selected in the [Home WACN ID on page 598](#) field)), and when the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the [Protocol Type](#) field is set to **ASTRO 25**, and when the radio is model/option capable.

The following selections are supported:

Clear

Straps or commits the channel to normal (non-secure) communications.

Select

Allows you to toggle on or off secure encryption mode. Either the Secure Tx Select button-press, the [Secure Tx Select on page 187](#) switch-toggle, or the Secure menu-selection must be selected in order for you to toggle on or off Secure-encrypted communications.

Secure

Straps or commits the channel to secure encrypted communications.

10.36.12.5

Key Select

This field selects the secure encryption key to be used in secure encryption mode for the current talkgroup (record/row).

This selection applies for the current talkgroup of the current Trunking Personality.

IMPORTANT:

When the [ASTRO OTAR Profile Index on page 373](#) field is not Disabled for the current ASTRO Talkgroup List, this Key Select value is chosen from the [Secure Hardware Encryption Key References List on page 290](#) of the Secure KMF Profile selected in the KMF Profile Index field.

WARNING: Be aware that the RadioCentral is actually pointing to the Keys of the [Encryption Key List on page 286](#) for this selection; individual Keys from the Secure Hardware Encryption Key References List reference the Encryption Key List's Keys from the [Encryption Key Reference on page 291](#) field. Therefore any key selected when ASTRO OTAR is enabled, must first be defined in the Secure Hardware Encryption Key References List.

When the KMF Profile Index field is Disabled or not applicable (grayed-out) for the current ASTRO Talkgroup List, this Key Select value is directly chosen from the Secure Encryption Key List.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the [Voice Secure/Clear Strapping on page 375](#) field is set to **Secure** or **Select**, and when the radio is model/option capable.

10.36.12.6

Talkgroup Failsoft

This field enables failsoft operation for the current talkgroup (record/row).

This selection applies for the current [Trunking Personality](#).

Accessed Only: When the referenced Trunking System has a Software System Key File or an Advanced System Key with access selected in the [System ID on page 467](#) field or an Advanced WACN Key with access selected in the [Home WACN ID on page 598](#) field, and when the [Failsoft Type on page 502](#) field is set to **Talkgroup**, and when the radio is model/option capable.

10.36.12.7

Failsoft Rx Frequency

This field allows you to enter the failsoft Receive (Rx) frequency for the current talkgroup (record/row).

This selection applies for the current Trunking Personality.

WARNING: The Trunking Frequency Constraints applied to this selection are determined by this Personality's setting and the frequency band of the referenced Trunking System.

Accessed Only: When the referenced Trunking System has a Software System Key File or an Advanced System Key with access selected in the [System ID on page 467](#) field or an Advanced WACN Key with access selected in the [Home WACN ID on page 598](#) field, and when the [Failsoft Type on page 502](#) field is set to **Talkgroup**, and when the [Talkgroup Failsoft on page 498](#) field is **Enabled**, and when the radio is model/option capable.

10.36.12.8

Failsoft Tx Frequency

This field allows you to enter the failsoft Transmit (Tx) frequency for the current talkgroup (record/row).

This selection applies for the current [Trunking Personality](#).

WARNING: The Trunking Frequency Constraints applied to this selection are determined by this Personality's setting and the frequency band of the referenced Trunking System.

Accessed Only: When the referenced Trunking System has a Software System Key File or an Advanced System Key with access selected in the [System ID on page 467](#) field or an Advanced

WACN Key with access selected in the Home WACN ID field, and when the [Failsoft Type on page 502](#) field is set to **Talkgroup**, and when the [Talkgroup Failsoft on page 498](#) field is **Enabled**, and when the radio is model/option capable.

10.36.12.9

TG Secondary Failsoft

This field enables secondary failsoft operation for the current talkgroup (record/row).

This selection applies for the current trunking personality.

Accessed Only: When the [Failsoft Type on page 502](#) field is set to **Talkgroup**, and when the [Talkgroup Failsoft on page 498](#) field is enabled, and when the radio is model/option capable.

10.36.12.10

Secondary Failsoft Rx Frequency

This field allows you to enter the secondary failsoft Receive (Rx) frequency for the current talkgroup (record/row).

This selection applies for the current trunking personality.

WARNING: The Trunking Frequency Constraints applied to this selection are determined by this personality's [Protocol Type](#) setting and the frequency band of the referenced [Trunking System](#).

Accessed Only: When the [Failsoft Type on page 502](#) field is set to **Talkgroup**, and when the [Talkgroup Failsoft on page 498](#) field is **Enabled**, and when the [TG Secondary Failsoft on page 499](#) field is **Enabled**, and when the radio is model/option capable.

10.36.12.11

Secondary Failsoft Tx Frequency

This field allows you to enter the secondary failsoft transmit (Tx) frequency for the current talkgroup (record/row).

This selection applies for the current trunking personality.

IMPORTANT: The Trunking Frequency Constraints applied to this selection are determined by this personality's [Protocol Type](#) setting and the frequency band of the referenced [Trunking System](#).

Accessed Only: When the [Failsoft Type on page 502](#) field is set to **Talkgroup**, and when the [Talkgroup Failsoft on page 498](#) field is **Enabled**, and when the [TG Secondary Failsoft on page 499](#) field is **Enabled**, and when the radio is model/option capable.

10.37

Type II Trunking Personality

The **Type II Trunking Personality** allows the user to create and delete Trunking Personalities, as well as define individual Trunking Personalities. Trunking and conventional are the two radio communications modes.

NOTE: Trunking Systems are referenced to a Trunking Personalities. Trunking System settings can become functional for all Trunking - channel types.

Once the features of the Trunking Personalities have been uniquely defined, each Personality may then be assigned to the desired position of the radio's channel selector with the Zone Channel Assignment feature.

10.37.1

General (Type II Trunking Personality)

The **General** section of the Type II Trunking Personality set allows the user to view or define basic functionality for individual Trunking Personalities.

NOTE: Once the features of the Trunking Personalities have been uniquely defined, each Personality can then be assigned to the desired position of the radio's channel selector using the Zone Channel Assignment feature.

10.37.1.1

Trunking Personality Name

This field allows you to define a recognizable name for the current Trunking Personality.

NOTE: Once the features of the Trunking Personalities have been uniquely defined, each Personality may then be assigned to the desired position of the radio's channel selector with the Zone Channel Assignment feature. This name is used to select the current Personality on the Channels Page of that feature.

Accessed Only: When the radio is model/option capable.

NOTE:

Examples: Personality-01, #500, Electric1, # A5

Characters, numbers, spaces, and special characters can be used.

Leading blanks are substituted with underscores in the radio's display.

Leading periods do not appear in the radio's display.

10.37.1.2

System

This field selects the programmed Trunking System for the current Trunking Personality.

IMPORTANT:

Only Trunking Systems having a System Type matching the current Personalities' Protocol Type should be selected.

Only Trunking Systems with Software System Key Files or Advanced (Hardware) Keys that have no field or feature protection (unlimited access) can be selected; otherwise this field is marked invalid.

When this field's value is marked invalid, all System Key protected fields in the current Trunking Personality are displayed as read-only.

Accessed Only: When the radio is model/option capable.

10.37.1.3

Time Out Timer

This field selects the amount of time that the radio can continuously transmit for the current Trunking Personality.

When this time is about to expire, the radio sounds an alert tone and automatically stops transmitting. Time is in seconds.

Accessed Only: When the radio is model/option capable.

NOTE: When set to **Infinite:**

No timer used for APX Next and APX N70 Radios; therefore an infinite talk time.

Table 257: Range

Radio Type	Minimum	Maximum	Increments
Non-APX4000XH Radios	15 sec	465 sec	15 sec
APX4000XH Radios	15 sec	60 sec	15 sec

Table 258: Range

Radio Type	Minimum	Maximum	Increments
APX NEXT	0 sec	465 sec	15 sec

10.37.1.4

Advanced RF AGC

This field selects the type of Receive Frequency (RF) Automatic Gain Control (AGC) for the current Trunking Personality.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Disabled

When **Disabled**, the radio uses a basic form of AGC built in to radio's receiver. This built-in protection helps to avoid signal clipping and receiver saturation that may damage radio components.

Standard

Enables an Advanced form of RF AGC, which attempts to protect against intermodulation (IM) interference by detecting and removing any received interference due to external sources.

Enhanced

Enables the radio to use additional schemes to reduce IM interference, which cleans up the signal.

Smart

Enables the radio to use a unique scheme to improve interference immunity when close to Linear Simulcast and APCO phase 2 Base stations. Smart option is mutually exclusive to the Broadband Protection checkbox.

IMPORTANT: **Standard** and **Enhanced** Advanced RF AGC may degrade performance on channels that do not experience any IM interference. Therefore, only enable these selections on channels known to experience IM interference.

10.37.1.5

Broadband Protection

This field allows you to enable Broadband Protection of the current Trunking Personality.

Broadband Protection enhances Advanced RF AGC by adding a high selectivity broadband filter when receiving at selected frequencies within the 700 MHz and 800 MHz bands.

10.37.1.6

Conversation Type

This field selects the communication mode for the current Trunking Personality.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Message

The system assigns a traffic channel for the duration of a single transmission by one radio. When the radio de-keys, all radio remain on the traffic channel until the traffic channel hang time expires. Once the hang time expires the radios return to the control channel. Any radio involved in the call may key up while it is on the traffic channel without returning to the control channel. Message trunking is available on 3600 baud control channel systems.

WARNING: Message trunking is not compatible with ASTRO 25 Systems.

Transmission

The system assigns a traffic channel for the duration of a single transmission by one radio. When the radio de-keys, the traffic channel is deallocated and all subscribers involved in the call return to the control channel. Any subsequent traffic channel requests are sent in on the control channel by the requesting radio.

PTT ID

The system assigns a traffic channel for the duration of the entire conversation as follows. After a radio de-keys, the voice channel stays active (hang time) during which time the radios stay idle on the voice channel. Any radio responding during this hang time will first key up on the control channel to send a message with the unit's PTT-ID (Unit ID) indicating the radio wants to send audio now for this call; the system then sends a grant message directing the radio back to the same voice channel acting as the new source.

10.37.1.7

Failsoft Type

This field selects the type of Failsoft for the current Trunking Personality.

NOTE: Failsoft offers two-way Conventional Mode operation during Trunking system failure. The Radio automatically returns to the Trunked mode once the Trunking System is restored.

Accessed Only: When the referenced Trunking System has a Software System Key File or an Advanced System Key with access selected in the System ID field, or an Advanced WACN Key with access selected in the Home WACN ID field, and when the radio is model/option capable.

The following selections are supported:

Selections	Definitions	Available to you when	
		Protocol Type Equals	Coverage Type Equals
Disabled	No Failsoft is used.	Any	Any
Personality	<p>When the Coverage Type on page 466 is Disabled, which is SmartNet, Failsoft uses the Personality Failsoft Frequencies for all Talkgroups within this Trunking personality.</p> <p>When the Coverage Type equals SmartZone the Personality Failsoft Frequencies are not used; instead:</p> <ul style="list-style-type: none"> • When the radio is Site Locked, Failsoft uses the last active control channel. • When the radio is Site Unlocked, Failsoft uses the last active control channel. If Failsoft is still not 	Type II	Any

Selections	Definitions	Available to you when	
		Protocol Type Equals	Coverage Type Equals
	found, the radio scans the List of Control Channels for Failsoft.		
Talkgroup	<p>When the Coverage Type is Disabled, which is SmartNet:</p> <ul style="list-style-type: none"> Failsoft uses the Failsoft Talkgroup Frequencies, or  WARNING: The Talkgroup Failsoft field must be Enabled. Failsoft may use the Announcement Group Failsoft Frequencies when Failsoft is called from an Announcement Group.  WARNING: The Announcement Group Failsoft on page 512 field must be Enabled. If neither of above fields are Enabled, the radio uses the last active control channel. <p>When the Coverage Type equals SmartZone:</p> <ul style="list-style-type: none"> When the radio is Site Locked and when the Talkgroup Failsoft field is Enabled, Failsoft uses the Failsoft Talkgroup Frequencies; if Failsoft is still not found, Failsoft uses the last active control channel. If the Talkgroup Failsoft field is not Enabled, Failsoft uses the last active control channel. When the radio is Site Unlocked and when the Talkgroup Failsoft field is Enabled, Failsoft uses the Failsoft Talkgroup Frequencies; if Failsoft is still not found, Failsoft uses the last active control channel. If Failsoft is still not found, the radio scans the List of Control Channels from the referenced Trunking System for Failsoft. If the Talkgroup Failsoft field is not Enabled, Failsoft uses the last active control channel and then may still need to scan the list of Control Channels. 	Any	Any

10.37.1.8

Rx Failsoft Frequency by Personality

This field selects the Receive (Rx) frequency to be used during SmartNet Failsoft operation for the current Trunking Personality.

This is only true for SmartNet operation (see Coverage Type).

IMPORTANT: For Coverage Type equals **SmartZone** the Personality Failsoft Frequencies are not used. Failsoft is attempted on Control Channels defined in the referenced Trunking System's List of Control Channels.

Accessed Only:

When the referenced Trunking System has a Software System Key File or an Advanced System Key with access selected in the System ID field, and

when the referenced Trunking System's Coverage Type field is set to **Disabled**, and when the Protocol Type field is set to **Type II**, and when the Failsoft Type field is set to **Personality**, and the radio is model/option capable.

10.37.1.9

Tx Failsoft Frequency by Personality

This field selects the Transmit (Tx) frequency to be used during SmartNet Failsoft operation for the current Trunking Personality.

This is only true for SmartNet operation (see Coverage Type).

IMPORTANT: For Coverage Type equals **SmartZone** the Personality Failsoft Frequencies are not used. Failsoft is attempted on Control Channels defined in the referenced Trunking System's List of Control Channels.

Accessed Only:

When the referenced Trunking System has a Software System Key File or an Advanced System Key with access selected in the System ID field, and

when the referenced Trunking System's Coverage Type field is set to **Disabled**, and when the Protocol Type field is set to **Type II**, and when the Failsoft Type field is set to **Personality**, and the radio is model/option capable.

10.37.1.10

Secondary Failsoft by Personality

This field enables the selection of the Secondary Receive (Rx) and Transmit (Tx) frequencies to be used during SmartNet Failsoft operation for the current Trunking Personality.

This is only true for SmartNet operation (see [Coverage Type on page 466](#)).

IMPORTANT: For [Coverage Type on page 466](#) equals SmartZone, the Personality Failsoft Frequencies are not used. Failsoft is attempted on Control Channels defined in the referenced [Trunking System's List of Control Channels](#).

Accessed Only: When the referenced Trunking System's [Coverage Type on page 466](#) field set is to **Disabled**, and when [Protocol Type](#) field is set to **Type II**, and when the Failsoft Type field is set to **Personality**, and when the radio is model/option capable.

10.37.1.11

Secondary Rx Failsoft Frequency by Personality

This field selects the Secondary Receive (Rx) frequency to be used during SmartNet Failsoft operation for the current Trunking Personality.

This is only true for SmartNet operation (see Coverage Type).

IMPORTANT: For Coverage Type equals SmartZone the Personality Failsoft Frequencies are not used. Failsoft is attempted on Control Channels defined in the referenced Trunking System's List of Control Channels.

Accessed Only: When the referenced Trunking System's Coverage Type field set is to **Disabled**, and when the Protocol Type field is set to **Type II**, and when the Failsoft Type field is set to **Personality**, and the Secondary Failsoft field is enabled, and the radio is model/option capable.

10.37.1.12

Secondary Tx Failsoft Frequency by Personality

This field selects the Secondary Transmit (Tx) frequency to be used during SmartNet Failsoft operation for the current Trunking Personality.

This is only true for SmartNet operation (see [Coverage Type on page 466](#)).

IMPORTANT: For Coverage Type equals SmartZone, the Personality Failsoft Frequencies are not used. Failsoft is attempted on Control Channels defined in the referenced Trunking System's List of Control Channels.

Accessed Only: When the referenced Trunking System's Coverage Type field set is to **Disabled**, and when the Protocol Type field is set to **Type II**, and when the Failsoft Type field is set to **Personality**, and the Secondary Failsoft field is enabled, and the radio is model/option capable.

10.37.1.13

Transmit Mode

This field selects whether the personality or channel will have full transmit functionality, or will be restricted from transmitting Talkgroup (TG) and Announcement Group (AG) voice communications.

This selection applies for the current Trunking Personality.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Unrestricted

No limits are placed on the transmit functionality.

TG/AG Disabled (Listen-only)

The radio is not able to transmit on the selected TG or AG. See the Trunking Talkgroup field. The radio is able to receive voice transmissions on the channel's selected mode.

WARNING:

Dynamic Regrouping is not compatible with this selection.

This Personality's [Emergency Profile Selection on page 505](#) must either be set to **Emergency Tx Disabled**, or the selected Profile must have its [Emergency Talkback on page 320](#) field set to **Revert**; otherwise the Emergency Profile field selection is considered invalid.

This Personality's referenced Scan List must not have its [Designated Voice Tx Member Type on page 622](#) field set to **Selected Channel**, meaning this channel; otherwise the [Scan List Selection on page 517](#) becomes invalid.

The [Hot Keypad \(DTMF\) on page 520](#) is not possible with this selection.

10.37.1.14

Emergency Profile Selection

This field selects the Trunking Emergency Profile to be used with the current Trunking Personality.

You can initiate Emergency mode functionality or launch it with a programmed radio

WARNING: When the [Transmit Mode on page 505](#) field is set to **TG/AG Disabled** (Listen-only mode) for the current Trunking Personality, this Profile selection must either be **Emergency Tx Disabled**, or the selected Profile must have its [Emergency Talkback on page 320](#) field set to **Revert**; otherwise it considers this selection invalid.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

- Emergency Tx Disabled

- Available Trunking Emergency Profiles

10.37.1.15

Emergency Revert Type

This field selects the **Non-Tactical** emergency revert type to be used while operating in emergency mode on the current Trunking Personality.

See also [Emergency Talkback on page 320](#).

WARNING: You can initiate Emergency mode functionality or launch it with a programmed radio.

Accessed Only: When the **Multiple Emergency Revert** Extended Feature appears in the Extended Feature Name field, and when a referenced Trunking Emergency Profile is selected for the current Trunking Personality, and when that Trunking Emergency Profile has its Emergency Talkback field set to **Revert**, and when the radio is model/option capable.

The following selections are supported:

Talkgroup Revert

The radio uses the Emergency Talkback Revert Talkgroup ID defined for the current Trunking Personality to transmit Emergency Alarms and/or Emergency Calls.

System Revert

The radio uses the [Emergency System Revert Zone on page 508](#) and the [Emergency System Revert Channel on page 509](#) to transmit Emergency Alarms and/or Emergency Calls. Emergency transmissions are also sent to the dispatcher console.

WARNING: Dynamic Regrouping is not compatible with this selection.

10.37.1.16

Emergency Talkback Revert Talkgroup ID

This field allows you to enter in decimal or hex format, the Talkgroup number that uniquely identifies the current talkgroup (record/row).

This selection applies to the current [Trunking Personality](#).

Accessed Only: When the referenced Trunking System has a Software System Key File or an Advanced System Key with access selected in the [System ID on page 467](#) field, or an Advanced WACN Key with access selected in the [Home WACN ID on page 598](#) field, and when the radio is model/option capable.

Table 259: Range

For Protocol Type:	Disabled	Minimum	Maximum
ASTRO 25	None	0001 (Hex)	FFFE (Hex)
Type II	None	001 (Hex)	FFE (Hex)

IMPORTANT: The selection range may be modified on a per Advanced Key basis by the Advanced Keys Administrator program.

10.37.1.17

Emergency Talkback Revert Voice/Signal Type

This field selects the signaling transmit mode while operating in emergency mode for the Emergency Talkback Revert Talkgroup.

This selection applies for the current Trunking Personality.

Accessed Only: Digital is only accessed when the Protocol Type field is set to **Type II**, and the Type II frequency band is not **900 MHz**

The following selections are supported:

Analog

Not possible for ASTRO 25 Trunking

Digital

10.37.1.18

Emergency Talkback Revert Secure/Clear Strapping

This field selects the transmit mode while operating in emergency mode for the Emergency Talkback Revert Talkgroup.

This selection applies for the current Trunking Personality.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the Protocol Type field is set to **ASTRO 25**.

The following selections are supported:

Clear

Straps or commits the talkgroup/channel to normal (non-secure) Trunking operation.

Select

Allows you to toggle on or off secure encrypted operation for the current the talkgroup. The Secure Tx Select button-press or the [Secure Tx Select on page 187](#) switch-toggle or the Secure menu-selection allows you to toggle on or off Secure encrypted communications.

Secure

Straps or commits the talkgroup to Secure encrypted operation.

10.37.1.19

Emergency Talkback Revert Key Select

This field selects the secure encryption key used while operating in emergency mode for the Emergency Talkback Revert Talkgroup.

This selection applies for the current Trunking Personality.

IMPORTANT:

When the [ASTRO OTAR Profile Index on page 557](#) field is **Enabled** for the referenced Trunking System, this Key Select value is chosen from the Secure Encryption Key References List of the ASTRO OTAR Profile selected in the ASTRO OTAR Profile Index field of the referenced Trunking System.

WARNING: Be aware that the it is actually pointing to the Keys of the Encryption Key List for this selection; individual Keys from the Secure Encryption Key References List reference the Encryption Key List's Keys from the Encryption Key Reference field. Therefore any key selected when ASTRO OTAR Profile Index field is enabled, must first be defined in the Secure Encryption Key References List. Keys taken from OTAR Profile with Independent Key List field enabled are available.

When the ASTRO OTAR Profile Index field is **Disabled** for the referenced Trunking System, this Key Select value is directly chosen from the Secure Wide Window's Encryption Key List.

WARNING:

When there is a match between the normal Talkgroup ID being used by other radios and this radio's Emergency Talkback Revert Talkgroup ID, and...

when there is not a match between the normal Talkgroup Key being used by other radios and this Emergency Revert Talkgroup Key...

The following is true:

- When this radio switches to its Emergency Talkback Revert Talkgroup ID using this key, this radio's emergency transmission is not heard by these other radios.
- However, the emergency transmission may be picked up by scan, even when there is not a key match.

Accessed Only: When the Emergency Talkback [Emergency Talkback Revert Secure/Clear Strapping on page 507](#) field is set to **Secure** or **Select**, and

When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the Protocol Type field is set to **ASTRO 25**, and when the radio is model/option capable.

10.37.1.20

Emergency System Revert Zone

This field selects a zone to be used for the duration of an emergency mode transmission.

This selection applies for the current Trunking Personality.

NOTE:

Once this zone is selected, the [Emergency System Revert Channel on page 509](#) may then be selected.

Zones and their channels must be previously defined in the Zone Channel Assignment Window.

WARNING: Only non-Dynamic Zones, zones that have Dynamic Zone Enable **Disabled** can be selected; otherwise, this field becomes invalid.

Accessed Only: When the **Multiple Emergency Revert** Extended Feature appears in the Extended Feature Name field, and when a valid referenced Trunking Emergency Profile is selected for the current Trunking Personality, and when that Trunking Emergency Profile has its [Emergency Talkback on page 320](#) field set to **Revert**, and when the [Emergency Revert Type on page 506](#) field is set to **System Revert**, and when the radio is model/option capable.

10.37.1.21

Emergency System Revert Channel

This field selects a Trunking or Conventional channel that is used for the duration of an emergency mode transmission.

This selection applies for the current Trunking Personality.

NOTE:

The [Emergency System Revert Zone on page 508](#) must be selected prior to selecting this channel.

Zones and their channels must be previously defined in the Zone Channel Assignment Window.

WARNING:

For APX™ 3000 Portable codeplugs, only the first 48 channels in the selected [Emergency System Revert Zone on page 508](#) are considered valid selections.

This Emergency System Revert Channel selection is only considered valid: when the [Trunking Talkgroup on page 608](#) field for the selected Trunking Personality/channel is not set to **DYN** or **ATG**, and when the [Receive Only Personality on page 389](#) field for the selected Conventional Personality/channel is **Disabled**, and when the ASTRO Talkgroup ID field for the selected Conventional Personality/channel is not set to **DYN** or **ATG**, and when the [Transmit Mode on page 505](#) field for the selected Trunking Personality/channel is not set to **TG/AG Disabled (Listen-only)**, and when the [Emergency Profile Selection on page 505](#) for the selected channel is not **Emergency TX Disabled**.

Accessed Only: When the **Multiple Emergency Revert** Extended Feature appears in the Extended Feature Name field, and when a referenced Trunking Emergency Profile is selected for the current Trunking Personality, and when that Trunking Emergency Profile has its [Emergency Talkback on page 320](#) field set to **Revert**, and when the [Emergency Revert Type on page 506](#) field is set to **System Revert**, and when the [Emergency System Revert Zone on page 508](#) field is not set to a Dynamic Zone, and when the radio is model/option capable.

10.37.2

Announcement Group (Type II Trunking Personality)

The **Announcement Group** section of the Type II Trunking Personality set allows the user to view and define Announcement Group parameters of individual Trunking Personalities. Announcement Groups allows the radio-user to initiate and communicate on one large communication channel comprised of all Talkgroups defined for the current Trunking Personality.

NOTE:

An Announcement Group (ATG) must be selected for this Trunking Personality from the [Zones Channel Assignment on page 605](#) and Channel List Set Trunking Talkgroup field. The ATG selection allows a channel to be specifically designated for Announcement Group purposes.

Once the features of the Trunking Personalities have been uniquely defined, each Personality can then be assigned to the desired position of the radio's channel selector using the Zone Channel Assignment feature.

10.37.2.1

Announcement Group

This field allows you to enter in decimal or hex format, the ID that uniquely defines the Announcement Group for the current Trunking Personality.

NOTE: Announcement Groups allow the radio to initiate and communicate on one large communication channel comprised of all talkgroups defined for the current Trunking Personality.

WARNING:

Announcement Group (ATG) must be selected for this Trunking Personality from the Zone Channel Assignment Channels Page's, [Trunking Talkgroup on page 608](#) field. The ATG selection allows a channel to be specifically designated for Announcement Group purposes.

The Personality is selected from the Zone Channel Assignment Channels Page's, [Personality on page 608](#) field.

Accessed Only: When the referenced Trunking System has a Software System Key File or an Advanced System Key with access selected in the [System ID on page 467](#) field, or an Advanced WACN Key with access selected in the [Home WACN ID on page 598](#) field, and when the radio is model/option capable.

Table 260: Range

For Protocol Type	Disabled	Minimum	Maximum
ASTRO 25	None	0001 (Hex)	FFFE (Hex)
Type II	None	001 (Hex)	FFE (Hex)

IMPORTANT: The selection range may be modified on a per Advanced Key basis by the Advanced Keys Administrator program.

10.37.2.2

AG Voice/Signal Type

This field selects the transmit and receive mode of the Announcement Group for the current Trunking Personality.

Announcement Groups allow the radio to initiate and communicate on one large communication channel comprised of all talkgroups defined for the current Trunking Personality.

Accessed Only: Digital is only accessed when the Protocol Type field is set to **Type II**, and when the Type II Frequency Band is not **900 MHz**, and the Announcement Group field is not set to **None**.

The following selections are supported:

- Analog
- Digital

10.37.2.3

AG Secure/Clear Strapping

This field selects the transmit and the receive mode for the Announcement Group of the current Trunking Personality.

Accessed Only: When the [Announcement Group on page 510](#) field is not set to **None**, and when the radio is model/option capable,

And

When the [Secure Operation on page 272](#) field must be set to **Hardware**, and when the [AG Voice/Signal Type on page 510](#) field is set to **Digital**, and when the referenced Trunking System's Channel Bandwidth is not set to **12.5 kHz**,

Or

When the Protocol Type field is set to **ASTRO 25**, and when the [Secure Operation on page 272](#) field must be set to **Hardware** or **Software**.

The following selections are supported:

Clear

Straps or commits the channel to normal (non-secure) Trunking Communications.

Select

Allows you to toggle on or off secure encryption mode.

The Secure Tx Select button-press or the [Secure Tx Select on page 187](#) switch-toggle or the Secure menu-selection must be selected in order for you to toggle on or off Secure encrypted communications.

Secure

Straps or commits the channel to secure encryption mode.

10.37.2.4

AG Key Select

This field selects the secure encryption key to be used for the Announcement Group of the current Trunking Personality.

This selection applies while operating in secure encrypted mode.

IMPORTANT:

When the [ASTRO OTAR on page 557](#) field is **Enabled** for the referenced Trunking System, this Key Select value is chosen from the Secure Encryption Key References List of the ASTRO OTAR Profile selected in the [ASTRO OTAR Profile Index on page 557](#) field of the referenced Trunking System.

WARNING: Be aware that it is actually pointing to the Keys of the Encryption Key List for this selection; individual Keys from the Secure Encryption Key References List reference the Encryption Key List's Keys from the [Encryption Key Reference on page 291](#) field. Therefore any key selected when ASTRO OTAR Profile is enabled must first be defined in the Secure Encryption Key References List. Keys taken from ASTRO OTAR Profile with Independent Key List field enabled are available.

When the ASTRO OTAR field is **Disabled** for the referenced Trunking System, this Key Select value is directly chosen from the Secure Wide Window's Encryption Key List.

Accessed Only: When the [AG Secure/Clear Strapping on page 510](#) field is not set to **Clear**, and when the [Announcement Group on page 510](#) field is not set to **None**, and when the radio is model/option capable,

And

When the [Secure Operation on page 272](#) field is set to **Hardware**, and when the [AG Voice/Signal Type on page 510](#) field is set to **Digital**,

Or

When the Secure Operation field is set to **Hardware**, and when the AG Voice/Signal Type field is set to **Analog**, and when the referenced Trunking System's Channel Bandwidth is not set to **12.5 kHz**,

Or

when the Protocol Type field is set to **ASTRO 25**, and when the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**.

10.37.2.5

Announcement Group Failsoft

This field enables Failsoft for the Announcement Group of the current Trunking Personality.

Accessed Only: When the referenced Trunking System has a Software System Key File or an Advanced System Key with access selected in the System ID field, or an Advanced WACN Key with access selected in the Home WACN ID field, and when the [Failsoft Type on page 502](#) field is set to **Talkgroup**, and when the [Announcement Group on page 510](#) field is not set to **None**, and when the radio is model/option capable.

10.37.2.6

AG Failsoft Rx Frequency

This field allows you to enter the Receive (Rx) frequency to be used during Failsoft operation for the Announcement Group of the current Trunking Personality.

WARNING: The Trunking Frequency Constraints applies to this selection are determined by this Personality's Protocol Type setting and the frequency band of the referenced Trunking System.

Accessed Only: When the referenced Trunking System has a Software System Key File or an Advanced System Key with access selected in the System ID field, or an Advanced WACN Key with access selected in the Home WACN ID field, and when the [Failsoft Type on page 502](#) field is set to **Talkgroup**, and when the [Announcement Group on page 510](#) field is not set to **None**, and when the [Announcement Group Failsoft on page 512](#) field is **Enabled**, and when the radio is model/option capable.

10.37.2.7

AG Failsoft Tx Frequency

This field allows you to enter the Transmit (Tx) frequency to be used during Failsoft operation for the Announcement Group of the current Trunking Personality.

WARNING: The Trunking Frequency Constraints applies to this selection are determined by this Personality's Protocol Type setting and the frequency band of the referenced Trunking System.

Accessed Only: When the referenced Trunking System has a Software System Key File or an Advanced System Key with access selected in the System ID field, or an Advanced WACN Key with access selected in the Home WACN ID field, and when the [Failsoft Type on page 502](#) field is set to **Talkgroup**, and when the [Announcement Group on page 510](#) field is not set to **None**, and when the [Announcement Group Failsoft on page 512](#) field is **Enabled**, and when the radio is model/option capable.

10.37.2.8

AG Secondary Failsoft

This field enables secondary Failsoft for the Announcement Group of the current Trunking Personality.

Accessed Only: When the [Failsoft Type on page 502](#) field is set to **Talkgroup**, and when the [Announcement Group on page 510](#) field is not set to **None**, and when the [Announcement Group Failsoft on page 512](#) field is **Enabled**, and when the radio is model/option capable.

10.37.2.9

AG Secondary F/S Rx Frequency

This field allows you to enter the secondary Receive (Rx) frequency to be used during Failsaft operation for the Announcement Group of the current Trunking Personality.

WARNING: The Trunking Frequency Constraints applies to this selection are determined by this Personality's Protocol Type setting and the frequency band of the referenced Trunking System.

Accessed Only: When the [Failsaft Type on page 502](#) field is set to **Talkgroup**, and when the [Announcement Group on page 510](#) field is not set to **None**, and when the [Announcement Group Failsaft on page 512](#) field is **Enabled**, and when the [AG Secondary Failsaft on page 512](#) field is **Enabled**, and when the radio is model/option capable.

10.37.2.10

AG Secondary F/S Tx Frequency

This field allows you to enter the secondary Transmit (Tx) frequency to be used during Failsaft operation for the Announcement Group of the current Trunking Personality.

WARNING: The Trunking Frequency Constraints applies to this selection are determined by this Personality's Protocol Type setting and the frequency band of the referenced Trunking System.

Accessed Only: When the [Failsaft Type on page 502](#) field is set to **Talkgroup**, and when the [Announcement Group on page 510](#) field is not set to **None**, and when the [Announcement Group Failsaft on page 512](#) field is **Enabled**, and when the [AG Secondary Failsaft on page 512](#) field is **Enabled**, and when the radio is model/option capable.

10.37.3

Talkgroup (Type II Trunking Personality)

The **Talkgroup** section of the Type II Trunking Personality set allows the user to view or define individual Talkgroup functionality for individual Trunking Personalities. A Talkgroup is an RadioCentral defined grouping of radios created for the purpose of frequent and convenient communication with each other.

NOTE: Talkgroup frequencies are determined by the in-the-field Trunking System and are not setup in RadioCentral.

NOTE: Trunking Personality Failsaft Frequencies must be setup within RadioCentral.

Once defined, a Talkgroup can be assigned to one or more channels of the radio's Channel Selector from the [Zones Channel Assignment on page 605](#) and Channel List set Trunking Talkgroup field.

10.37.3.1

Talkgroup

Displays the RadioCentral-user recognizable name for the current Talkgroup (record/row).

This selection applies to the current Trunking Personality or ASTRO 25 Trunking Personality.

Accessed Only: When the radio is model/option capable.

10.37.4

Call / Page (Type II Trunking Personality)

The **Call / Page** section of the Type II Trunking Personality set allows the user to view or define Private Call and Page functionality for individual Trunking Personalities. This functionality can apply to Trunking Call Hot List functionality.

NOTE: Once the features of the Trunking Personalities have been uniquely defined, each Personality can then be assigned to the desired position of the radio's channel selector using the Zone Channel Assignment feature.

10.37.4.1

Private Call Type

This field selects the type of Private Call for the current Trunking Personality.

You can initiate a Private Call with a Select/Private Call button-press or a [Select/Private Call on page 194](#) Call menu-selection. User in turn responds to a Private Call with a [Call Response on page 167](#) button-press.

The following selections are supported:

Disabled

The Private Call feature is disabled.

Available When the Protocol Type is Type II, or ASTRO 25

PC II

Private Call II permits call between two individual radios, regardless of talkgroups, without requiring the receiving radio to acknowledge the incoming call.

Available When the Protocol Type is Type II, or ASTRO 25

Enhanced Unit-to-Unit

Enhanced Private Call or Unit-to-Unit Private Call permits calls between two individual radios, regardless of talkgroup. The receiving radio will ring and is required to acknowledge the incoming call.

Available When the Protocol Type is Type II, or ASTRO 25

PC with CA

Enhanced Private Call or Unit-to-Unit Private Call, followed by an optional private Call Alert. See [Automatic Call Alert on page 516](#).

Available When the Protocol Type is Type II, or ASTRO 25

NOTE:

PC II is supported in "Analog" Trunking operation. See [AG Voice/Signal Type on page 510](#) and [Talkgroup on page 513](#) fields in the [Type II Trunking Personality on page 499](#).

There is a two minute delay for a PC II and Enhanced Private Call when operating in a 3600 trunking system, and six second delay when operating in a 9600 trunking system. No indication is displayed during the delay.

Accessed Only: When the radio is model/option capable.

10.37.4.2

Private Call Operation

This field selects the operation mode of the Private Call feature for the current Trunking Personality.

You can initiate a Private Call with a Select/Private Call button-press or a [Select/Private Call on page 194](#) menu-selection. User in turn responds to a Private Call with a [Call Response on page 167](#) button-press.

Accessed Only: When [Private Call Type on page 514](#) field is not set to **Disabled**, and when the radio is model/option capable.

The following selections are supported:

Response Only (Resp Only)

Allows the radio to accept Pages only.

List Only

Allows you to send Pages from the Call Hot List. For non-keypad models this option can be used only with the One Touch Button Feature. This feature is model/option dependent.

Unlimited

Allows you to send Pages from the Call Hot List and from the radio's keypad. This feature is model/option dependent.

WARNING: This selection is not available for Portable radios having only a top display.

10.37.4.3

Call Alert/Page Operation

This field selects Call Alert/Page functionality for the current Trunking Personality.

You can activate Call Alert Page Operation with a [Call Alert on page 167](#) button-press or [Page on page 199](#) menu-selection.

Accessed Only: When the radio is model/option capable, and when the DVRS Hardware Enable field is **Disabled**, or when the DVRS Hardware Enable field is **Enabled**, and when the current Trunking Personality's referenced DVRS Profile has its DVRS Remote Activation field set to **Disabled**.

The following selections are supported:

Disabled

Call Alert/Page functionality is unavailable.

Response Only (Resp Only)

Allows the radio to accept Pages only.

List Only

Allows you to send Pages from the Call Hot List. For non-keypad models this option can be used only with the One Touch Button Feature. This feature is model/option dependent.

Unlimited

Allows you to send Pages from the Call Hot List and from the radio's keypad. This feature is model/option dependent.

WARNING: This selection is not available for Portable radios having only a top display.

10.37.4.4

Trunking Call Hot List

This field selects the Call Hot List to be used for the current Trunking Personality.

The Call Hot List that is used is dependent on the Protocol Type field selection **Type II** or **ASTRO 25** for the current Trunking Personality. User uses the Call Hot List to transmit Private Calls and Pages.

Accessed Only: When [Private Call Operation on page 514](#) field is set to **List Only** or **Unlimited**, or when [Call Alert/Page Operation on page 515](#) field is set to **List Only** or **Unlimited**, and when the radio is model/option capable.

10.37.4.5

In-Call User Alert Enable

This field allows the radio to remain muted to affiliated talkgroup calls while operating on the current Trunking Personality.

Group and individual pages do unmute the radio for the alert tone to sound. The radio also unmutes to individual radio-to-radio calls such as Private Calls, Tone Signaling calls and Interconnect phone mode calls. This feature is very useful when you prefer to not hear affiliated talkgroup traffic, however needs-to remain in radio contact. The [Voice Mute on page 177](#) button-press or the [Voice Mute on page 203](#) menu-selection allows you to toggle-on and off Voice Mute functionality for an In-Call User Alert enabled channel.

WARNING: When disabled, you are not able to toggle-on this feature for the current Trunking Personality.

IMPORTANT: Also, when Voice Mute is active:

An Individual or Group Page received by the radio does unmute the radio. Once the Page unmutes the radio, a voice call that follows can then be a group call that is heard over the radio's speaker.

If the radio's channel is changed Voice Mute is deactivated by the radio; Voice Mute must be reactivated if desired when returning to the channel.

If you press the PTT button, or launch Emergency Mode, or powers the radio off and back on, Voice Mute is deactivated by the radio.

The following call types may also be received:

- [Dynamic Regrouping Enable on page 477](#)
- [Radio Inhibit on page 473](#)
- [Out of Range Indicator on page 210](#)
- Failsoft
- [Site Trunking Indicator on page 211](#)
 - The Scan feature is not available.
 - Other display indications from group call such as receiving LED and PTT-ID (if enabled) function normally.

Accessed Only: When the radio is model/option capable, and when the [Call Alert/Page Operation on page 515](#) field is not set to **Disabled**,

Or when the Protocol Type field is set to **ASTRO 25**, and when the current Trunking Personality's [Tone Signaling List on page 583](#) field is referencing a Tone Signaling List that has at least one record/row where Unmute Enable is **Enabled**.

10.37.4.6

Automatic Call Alert

This field enables the radio to automatically transmit a private Call Alert in the event that the recipient of an enhanced or unit-to-unit Private Call did not respond to that call within a certain time period.

This feature applies for the current Trunking Personality and is applicable for both the ASTRO 25 and Type II Protocol Types.

Accessed Only: When the [Private Call Type on page 514](#) field is set to **PC with CA**, and when the radio is model/option capable.

10.37.5

Features (Type II Trunking Personality)

The **Features** section of the Type II Trunking Personality set allows the user to view or modify miscellaneous Trunking Personalities features for the current Trunking Personality.

NOTE: Once the features of the Trunking Personalities have been uniquely defined, each Personality can then be assigned to the desired position of the radio's channel selector using the Zone Channel Assignment feature.

10.37.5.1

Phone Operation

This field selects phone functionality when operating in phone mode for the current Trunking Personality.

You can initiate the Phone Mode feature with a Phone or Call Response button-press or a Phone menu-selection.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Disabled

Phone mode is unavailable.

Answer Only

Allows the radio to accept Calls only.

List Only

Allows you to make Calls only from the radio's Phone Hot List.

WARNING: If the Call List Wide, [Phone Number Editable on page 592](#) field is **Enabled**, you can modify the Phone Numbers within the radio's Unified Call List.

Unlimited

Allows you to make Calls from the phone list, or from a keypad.

10.37.5.2

Scan List Selection

This field selects which Scan List is used by the radio while operating in the Scan Mode for the current Trunking Personality.

This Scan List then determines which calls the radio scans for, actively looks or listens for, and then considers unmuting for the current Trunking channel.

NOTE:

Scan List and Scan List Member functionality are defined in the Scan List Window.

Only Scan Lists having the **Priority Monitor** or the **Multi-System Talkgroup** selection in the [Scan Type on page 617](#) field are valid Scan List Selections for the current Trunking Personality.

Scan Lists having the **Intelligent Priority** selection in the Scan Type field are valid Scan List Selections for the current Conventional Personality without DVRS system.

You can initiate Scan List editing with a Scan List Programming switch-toggle, a Scan List menu-selection, or a long keypress duration of a Scan button-press.

WARNING:

When the [Transmit Mode on page 505](#) field is set to **TG/AG Disabled (Listen-only)** mode for the current Trunking Personality, this Personality's referenced Scan List must not have its [Designated Voice Tx Member Type on page 622](#) field set to **Selected Channel** (meaning this channel); otherwise it considers this selection invalid.

When the [Site Selectable Alert List Selection on page 536](#) for the referenced Trunking System is not **Disabled**, then this Personality's referenced Scan List must not be a **Multi-System Talkgroup** Scan Type; otherwise it considers this selection invalid.

The application considers this selection invalid when this personality is LTE Broadband-enabled, and this selected Scan List has any Scan List Member Channels having the following dependencies:

- Their Conventional Personality's [LTE Interference Frequency Present on page 395](#) field set to **Enabled**, or
- Their Trunking System's [LTE Interference Frequency Present on page 539](#) field is **True**, or
- Their Trunking System's [Coverage Type on page 466](#) field set to **Inter-WACN Roaming**.

A Trunking channel is LTE enabled when the Personality's referenced Trunking System has a referenced Data Profile having a [Data Profile Type on page 341](#) selection equal to **Trunking & Broadband** or **Broadband-Only**, and when that Data Profile's Broadband Source is **Internal LTE Modem**.

When the Personnel Accountability List Selection referenced Trunking System is not **Disabled**, then this Personality's referenced Scan List must not be **Multi-System Talkgroup** Scan Type; otherwise the it considers this selection invalid.

Accessed Only: When the radio is model/option capable.

10.37.5.3

Automatic Scan

This field causes the radio to automatically enter the Scan Mode, when you select (with the Channel Selector) the current Trunking Personality.

Automatic Scan is also invoked when the radio powers-up to the current channel.

When disabled, you are able to invoke the Scan Mode operation through a Scan button-press, a Scan switch-toggle or a Scan menu-selection, while operating on the current Trunking personality.

Accessed Only: When [Scan List Selection on page 517](#) field is not set to **None**, and when the radio is model/option capable.

10.37.5.4

Status Enable

This field enables you to select and transmit a programmed Status for the current Trunking Personality.

The statuses available to you are dependent the Personality's referenced Trunking System.

You can initiate the Status feature with a Status button-press, a Direct Status button-press, or Status menu-selection.

Accessed Only: When the radio is model/option capable.

10.37.5.5

Message Enable

This field enables you to select and transmit a programmed message for the current Trunking Personality.

The messages available to you are dependent on the personality's referenced Trunking System.

You can activate the Message feature with a [Message on page 171](#) button-press, a [Direct Message](#) button-press, or [Message on page 197](#) menu selection.

Accessed Only: When the Protocol Type field is set to **Type II**, and when the radio is model/option capable.

10.37.5.6

Talk Permit Tone

This field enables the radio to sound an alert tone when a Control Channel access grant has been received from a repeater.

The feature applies for the current Trunking Personality.

Accessed Only: When the radio is model/option capable.

10.37.5.7

Secure Proper Code Detect

This field enables the radio to unmute to SecureNet™ encrypted communications.

This feature applies for the current Trunking Personality.

Accessed Only: When the Protocol Type field is set to **Type II**, and when the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and the radio is model/option capable.

10.37.5.8

Ignore Rx Clear Voice

This field causes the radio to ignore all **Clear** (non-secure encrypted) voice communication while operating on the current Trunking Personality.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**.

10.37.5.9

End Tx on Voice Absence

This field enables the radio, during a Trunking voice transmission, to automatically de-key when its on-board Digital Signal Processor (DSP) detects a lack of voice from the microphone for a period that exceeds the Voice Absence Timer.

This selection applies while operating on the current Trunking Personality.

WARNING: The feature does not operate when:

- An in-the-field radio is operating in Emergency Mode and either **Hot Mic Emergency** or **Emergency via Silent Audio** is currently active (see also Emergency Auto Transmit Mode), or
- The in-the-field radio is currently being remotely-monitored (see also Remote Monitor/Radio Trace Enable).

Accessed Only: When the radio is model/option capable.

10.37.5.10

Hot Keypad (DTMF)

This field allows you to transmit DTMF tones using the radio's keypad, even when the radio is not in Phone Mode.

You can initiate Hot Keypad mode by pressing and holding the PTT button while dialing the required DTMF keypad numbers. This feature applies for the current Trunking Personality.

Accessed Only: When the radio is model/option capable.

WARNING:

This feature does not work when the [Transmit Mode on page 505](#) field is set to **TG/AG Disabled (Listen-only)** mode.

10.37.5.11

DTMF Mic Enable

This field allows you to transmit DTMF tones using the radio's keypad, even when the radio is not in Phone Mode.

You can initiate DTMF Mic by pressing and holding the Top or Side or Control Head button while the required DTMF keypad number is sent out.

DTMF Mic Enable applies for the current Trunking Personality.

WARNING: This feature does not work when the [Transmit Mode on page 505](#) field is set to **TG/AG Disabled (Listen-only)** mode.

10.37.5.12

Priority Dispatch Time Out Timer

This field selects the amount of time needed for you to press the Priority Dispatch button until Priority Dispatch exits. Time is in seconds.

Table 261: Range

Minimum	Maximum	Increments
1	255	1

Accessed Only: When the System Type field is set to **ASTRO 25**, and when DVRS Profile Selection field set to **Disabled**.

10.37.6

Preferred Sites (Type II Trunking Personality)

The **Preferred Sites** section of the Type II Trunking Personality set allows the user to view or define multi-site Trunking Site preferences for individual Trunking Personalities. When a radio roams into an

overlapped coverage area of multiple Sites within a Trunking System or Wide Area Communications Network (WACN), it searches for a Site that is operationally preferred by evaluating all other available sites on a priority basis, according to their corresponding Preferred Status selection. This capability provides more intelligent management and conservation of repeater resources in coverage overlap areas.

IMPORTANT:

The referenced Trunking System's Coverage Type field determines the single site (SmartNet) or multi-site configuration. In a multi-site configuration, SmartZone operation allows the radio to determine, through RSSI polling samples, the best site to be used for Trunking communications.

Also see the Trunking System's Trunking Wide Advanced fields and the Filter Constant fields.

Once the features of the Trunking Personalities have been uniquely defined, each Personality may then be assigned to the desired position of the radio's channel selector with the Zone Channel Assignment feature.

10.37.6.1

Ignore Site Resource Preference

This field enables the radio to ignore site resources information received in adjacent Control Channel Outbound Signal Words (OSWs), i.e. if the site has ASTRO, 12 Kbit Secure, or Analog Clear repeaters.

The feature applies for the current Trunking Personality and only when operating in SmartZone operation.

If **Disabled**, the radio selects sites based on this site resources information. For example, if a radio has selected an ASTRO Talkgroup.

Accessed Only: When the referenced Trunking System has its [Coverage Type on page 466](#) field not set to **Disabled**, and when the radio is model/option capable.

10.37.6.2

Site List Type

This field allows you to select the type of Site List for the Trunking Personality.

The Site List Type defines the way that the radio will use the sites identified in the following Site List. Site Preference and Mobility (Roaming) access is defined by the Site List Type.

Accessed Only: When the referenced Trunking System has its [Coverage Type on page 466](#) field not set to **Disabled**, and when the radio is model/option capable.

The following selections are supported:

Preferred List

This is the legacy and default selection. There is no access restrictions or preference implied for the sites that are not listed.

Allowed List

Radio is allowed to roam to listed sites only and defined preferences will be applied. The system may still deny access to a site in the allowed list after 'attachment' to the system is attempted on the site. If the radio is not in range of at least one of the sites listed, the radio will remain out of range.

Blocked List

Radio is not allowed to roam to any sites listed. All other sites are treated as allowed sites with no defined preference.

10.37.6.3

Site ID

This field allows you to enter in decimal or hex format, the ID number identifying the current SmartZone site (record/row), which applies to the current Trunking Personality.

WARNING: To support roaming between different sites, each Site ID must be unique within a Radio Frequency Sub-System (RFSS).

Accessed Only: When the referenced Trunking System has its [Coverage Type on page 466](#) field not set to **Disabled**, and when the radio is model/option capable.

Table 262: Range

Coverage Type	Minimum	Maximum
ASTRO 25	1	FE hex
Type II	1	40 hex

10.37.6.4

Preferred Status

This field selects the preferred status for the SmartZone site when determining through RSSI polling samples, the best site to be used for Trunking communications.

This selection applies for the current site (record/row) which applies for the current Trunking Personality.

Accessed Only: When the referenced Trunking System has its [Coverage Type on page 466](#) field not set to **Disabled**, and when the radio is model/option capable.

The following selections are supported:

None

The site is given no preference.

IMPORTANT: If a site is not listed here, the radio automatically assigns it no preference.

Least-Preferred

The site will be avoided unless it is the only usable site for operation.

Preferred

The site will be used over all non-preferred sites. Radio will leave this site if it goes into Site Trunking.

Always-Preferred

The site will be used over all non-preferred sites, even if the site goes into Site Trunking.

10.37.6.5

RFSS ID

This field allows you to enter in decimal or hex format, the ASTRO 25 Radio Frequency Sub-System (RFSS) ID that corresponds to the current Site ID in the current site (record/row), which applies for the current Trunking Personality.

WARNING: To support roaming between different RFSS's within a Trunking System, each RFSS must have a unique number.

NOTE: An RFSS is made up of one or more Sites.

Accessed Only: When the referenced Trunking System has its [Coverage Type on page 466](#) field set to **SmartZone & OmniLink** or **Intra-WACN Roaming** or **Inter-WACN Roaming**, and when the Protocol Type field is set to **Type II**, and when the radio is model/option capable.

Table 263: Range

Minimum	Maximum
1	FE hex

10.37.6.6

System ID

This field allows you to enter in decimal or hex format, the Type II or ASTRO 25 System ID that corresponds to the Site ID in the current site (record/row), which applies for the current Trunking Personality.

WARNING: To support roaming between different Trunking Systems composing Wide Area Communications Networks (WACNs), each Trunking Systems must have a unique System ID.

NOTE: A Trunking System is made up of one or more Radio Frequency Sub-Systems (RFSS).

Accessed Only: When the Protocol Type field is set to **Type II**, and when the referenced Trunking System has its [Coverage Type on page 466](#) field set to **SmartZone & OmniLink**, and when the radio is model/option capable,

Or when the Protocol Type field is set to **ASTRO 25**, and when the referenced Trunking System has its Coverage Type field set to **Intra-WACN Roaming** or **Inter-WACN Roaming**, and when the radio is model/option capable.

Table 264: Range

Coverage Type	Minimum	Maximum
ASTRO 25	0	0FFE hex
Type II	0	FFFE hex

10.37.6.7

RAS WACN ID

This field allows you to enter in decimal or hex format, the Remote Access Server (RAS) Wide Area Communications Network (WACN) ID for the current Site ID (record/row).

WARNING: To support roaming between different WACNs, each WACN must have a unique number.

NOTE: A WACN is made up of one or more Trunking Systems. This selection also applies for the current Trunking Personality.

Accessed Only: When the Protocol Type field is set to **ASTRO 25**, and when the referenced Trunking System has its [Coverage Type on page 466](#) field set to **Inter-WACN Roaming**, and when the radio is model/option capable.

Table 265: Range

Minimum	Maximum
0	FFFFE hex

10.37.6.8

Wildcard

This field defines the type of entry in the Site List. The selection is a wildcard type that will determine which site or group of sites will be **Preferred**, **Allowed** or **Blocked**.

Accessed Only: When the referenced Trunking System has its [Coverage Type on page 466](#) field not set to **Disabled**, and when the radio is model/option capable.

The following selections are supported:

No Wildcard

This is the default selection.

Any Site

All sites in a RFSS, System, WACN applicable based on Coverage Type field selection

Any RFSS

All sites, RFSS in a System, WACN applicable based on Coverage Type field selection

Any System

All sites, RFSS, Systems in a WACN applicable based on Coverage Type field selection

10.37.6.9

Allow Emergency at Blocked Site

If this field is enabled, the radio attempts to register the selected talkgroup on a site that is set as blocked in the RadioCentral when the radio is in the emergency mode. When the emergency is cleared, the radio continues to block the selected talkgroup.

Accessed Only: This field can be accessed only when the following conditions are met:

- The **Site List Type** field is set to **Blocked**.
- The **Coverage Type** field of the referenced Trunking System is **not** set to **Disabled**.

10.38

ASTRO 25 Trunking System

The **ASTRO 25 Trunking System** set allows the user to create and delete Trunking Systems, as well as define individual Trunking System functionality. Trunking Systems are virtual configurations that mirror actual (in-the-field) Trunking System configurations and functionality; defining the RadioCentral systems enables the radio to communicate with the actual systems.

WARNING:

If a Trunking System's, System Type field is modified, any Trunking Personalities previously assigned to that specific Trunking System will have to be reassigned to another system that carries the appropriate System Type selection. Otherwise, a codeplug error will occur when writing the codeplug to the radio. Trunking System addressing schemes can be either Type II, or ASTRO 25.

NOTE:

Trunking Systems are referenced to a Trunking Personality. Trunking Systems settings can then become functional for all Trunking - channel types.

10.38.1

General (ASTRO 25 Trunking System)

The **General** section of the ASTRO 25 Trunking System set allows the user to view or define basic functionality for individual Trunking Systems.

NOTE: Individual Trunking Systems are referenced to a Trunking Personality. Once reference, these Trunking Systems settings can become functional for all channel types within that Trunking Personality.

10.38.1.1

Trunking System Name

This field allows you to define a recognizable name for the current Trunking System.

NOTE: Individual Trunking Systems are assigned to a Trunking Personality through the System field by selecting this name. These Trunking Systems settings can then become functional for all channel types within that Trunking Personality.

When **Priority Monitor** is selected as the Scan Type for Scan List Member channels, this Trunking System name must be selected for the current Scan List through the Trunking System Record field.

Accessed Only: When the radio is model/option capable.

NOTE:
Examples: EMT-001, #500, Electric1, # A5

Characters, numbers, spaces, and special characters can be used.

Leading blanks are substituted with underscores in the radio's display.

Leading periods do not appear in the radio's display.

10.38.1.2

System Key Type

This field displays the read-only of selected System Key Type for the current Trunking System; either **System Key** or **WACN Key**.

When the [Coverage Type on page 466](#) is set to **Intra-WACN Roaming**, then the System Key Type is **WACN Key**, otherwise it is **System Key**.

Accessed Only: When the radio is model/option capable.

10.38.1.3

System Key Present

The application retrieves and displays the read-only if a Software System Key File or Advanced (Hardware) Key is loaded and is a match for the ID selected in the System ID or Home WACN ID field for the current Trunking System.

See also [System Key Type on page 465](#).

Accessed Only: When the radio is model/option capable.

10.38.1.4

Coverage Type

This field selects the geographic Coverage Type of the radio and therefore specific methods of determining radio-to-radio communications within Trunking Systems.

Coverage Type applies for the current Trunking System.

Accessed Only: When the radio is model/option capable, and when a Software System Key File or an Advanced System Key with access is selected in the System ID field or, an Advanced WACN Key with access is selected in the Home WACN ID field.

NOTE: These selections are radio model/option dependent.

The following selections are supported:

Disabled = SmartNet

When the radio is model/option capable of SmartZone, disabling this field causes the Trunking System to use SmartNet.

NOTE: SmartNet operation amounts to single site SmartZone.

SmartZone

SmartZone operation allows the radio to determine through Received Signal Strength Indication (RSSI) polling samples, the best Trunking Site to be used for SmartZone-enabled Trunking channels.

NOTE:

For ASTRO 25 Systems: Operation is limited to Sites within a single Zone of a single Trunking System.

For Type II Systems: Operation is limited to the Sites within a single Trunking System.

SmartZone and OmniLink

gives the SmartZone-capable radio the ability to roam from one SmartZone Zone to another SmartZone Zone within the same OmniLink System. OmniLink applies for OmniLink-enabled Trunking channels.

NOTE:

For ASTRO 25 Systems: Operation is limited to Sites and Zones within a single OmniLink System.

For Type II Systems: Operation is limited to Sites within a set of interconnected Trunking Systems.

Intra-WACN Roaming

Intra-WACN Roaming gives the Project 25-capable radio the ability to automatically roam between all the System IDs within the same Wide Area Communication Network (WACN) without any of your intervention. See also Home WACN ID.

NOTE: For ASTRO 25 Systems: Operation is limited to Trunking Systems within a single WACN.

WARNING: Intra-WACN Roaming is invalid if one of the following scenarios is true:

When the System Type is Type II, or

When the DVRS Hardware Enable field is **Enabled**, or

When the Dual Radio - Radio Selection field is set to **Secondary Radio** and when the Enable Secondary Radio Tx field is **Disabled**.

Inter-WACN Roaming

Inter-WACN Roaming gives Project 25-capable radios on selected talkgroups the ability to automatically roam across different Wide Area Communications Networks (WACNs) without any of your intervention.

WARNING: Inter-WACN Roaming is invalid if one of the following scenarios is true:

When the System Type is Type II, or

When the DVRS Hardware Enable field is **Enabled**, or

When the Dual Radio - Radio Selection field is set to **Secondary Radio** and when the Enable Secondary Radio Tx field is **Disabled**, or

When this System is LTE Broadband **Enabled**.

A Trunking System is LTE enabled when a referenced Data Profile having a Data Profile Type selection equal to **Trunking and Broadband** or **Broadband-Only**, and when that Data Profile's Broadband Source is **Internal LTE Modem**.

SmartZone-capable and Project 25-capable systems are also configured from the Trunking Wide SmartZone fields and from the Trunking Wide Filter Constants fields.

10.38.1.5

RFSS ID

This field selects in decimal or hex format, the identification number of the ASTRO 25 Trunking Radio Frequency Sub-System (RFSS).

NOTE: An RFSS is made up of one or more sites. This selection applies for the current Trunking System.

Accessed Only: When a Software System Key File or an Advanced System Key with access is selected in the System ID field or, an Advanced WACN Key with access is selected in the Home WACN ID field, when the System Type field is set to **ASTRO 25**, and when the [Coverage Type on page 466](#) field is set to **SmartZone** or **Disabled**, and when the radio is model/option capable.

WARNING: The selection range may be modified on a per Advanced Key basis by the Advanced Keys Administrator program.

Table 266: Range

Minimum	Maximum
01 (Hex)	FE (Hex)

10.38.1.6

Site ID

Selects (in decimal or hex format) the identification number of the preferred Status Site for the current ASTRO 25 - Trunking System.

Accessed Only: When a Software System Key File or an Advanced System Key with access is selected in the System ID field, or an Advanced WACN Key with access is selected in the Home WACN ID field, when the System Type field is set to **ASTRO 25**, and when the [Coverage Type on page 466](#) field is set to **Disabled**, and when the radio is model/option capable.

WARNING: This selection range may be modified on a per Advanced Key basis by the Advanced Keys Administrator tool.

Table 267: Range

Minimum	Maximum
01 (Hex)	FE (Hex)

10.38.1.7

RFSS Response Time

This field selects the Radio Frequency Sub-System (RFSS) Response Time.

This is the base (minimum amount of) response time that the receiving radio (fixed end) waits between retries for the Fixed Network Equipment (FNE) to respond to the radio's Inbound Signaling Packet.

NOTE: An additional random time is added to this base time to prevent all radios in the system from attempting a retry at the same time. This selection applies for the current Trunking System. Time is in milliseconds.

Accessed Only: When the radio is model/option capable.

Table 268: Range

Minimum	Maximum	Increments
25 ms	6375 ms	25 ms

10.38.1.8

RFSS Debounce Timer

This field selects the minimum amount of time that the radio's Radio Frequency Sub-System (RFSS) Debounce Timer holds off its registration/affiliation when bouncing between different RF Sub-Systems.

NOTE: After a radio affiliates with an RFSS, a request to switch to a different RFSS will not be sent to the system until this timer has expired. This selection applies for the current Trunking System.

Accessed Only: When the [Coverage Type on page 466](#) field is set to **SmartZone and OmniLink** or **Intra-WACN Roaming** or **Inter-WACN Roaming**, and when the radio is model/option capable.

Table 269: Range

Minimum	Maximum
1 sec	10 sec

10.38.1.9

Non-Adjacent Site Search

This field enables the radio to search its programmed list of Control Channels for a site with a stronger signal.

This allows the radio the ability to roam-to and use a site that is not Fixed Network Equipment (FNE) defined as being adjacent to the radio's current home site, but does have an "Acceptable" or stronger signal.

NOTE: This is only true when the current home site and its FNE-defined adjacent sites are all registering at a certain threshold amount below the RSSI Acceptable Threshold level. This feature applies for the current Trunking System.

IMPORTANT: When operating in a poor coverage area, this feature causes the radio to search the programmed list of Control Channels approximately once every two minutes. During this search time, the radio is not monitoring the home site's control channel and therefore may miss some audio. Based on the number of Control Channels contained within the appropriate Control Channels list for this Trunking System, this search could take up to four seconds.

Accessed Only: When the [Coverage Type on page 466](#) field is not set to **Disabled**, and when the radio is model/option capable.

10.38.1.10

Data Profile Selection

This field selects the Data Profile to be used with the current ASTRO 25 - Trunking System.

WARNING: When the Dual Radio - Radio Selection field is set to **Secondary Radio** and the Enable Secondary Radio Tx field is **Disabled**, this field must be set to **Data Disabled**, otherwise it is considered invalid.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the radio is model/option capable.

The following selections are supported:

Data Disabled

No data capabilities.

Available Data Profiles

WARNING:

An LTE Broadband-enabled Data Profile cannot be selected when the current Trunking System's [Coverage Type on page 466](#) is set to **Inter-WACN Roaming**, or when the current Trunking System's LTE Interference Frequency Present field is **True**.

A Data Profile is LTE enabled for a Trunking System when the Data Profile has a Data Profile Type selection equal to **Trunking & Broadband** or **Broadband-Only**.

10.38.2

Control Channels (ASTRO 25 Trunking System)

The **Control Channels** section of the ASTRO 25 Trunking System set allows the user to view or define Receive and Transmit frequencies for Control Channels. Up to a maximum of 250 Control Channels may be created for individual Trunking Systems, as required.

NOTE: For radio models containing firmware prior to version R12.01.00, the maximum number of Control Channels is 128.

IMPORTANT:

Individual Trunking Systems are referenced to a Trunking Personality. Once reference, these Trunking Systems settings can become functional for all channel types within that Trunking Personality.

It is beneficial to sort the control channel frequencies in ascending order in a SmartZone system. In a Failsoft situation, the radio uses the first channel from the Control Channel as its Failsoft channel. If channels are sorted (or at least sorted in an order designed to facilitate Failsoft operations), potential problems such as having multiple radios on different Failsoft channels can be avoided.

The following fields are supported:

10.38.2.1

Rx Frequency

This field allows you to enter a Control Channel Rx (Receive) Frequency for the current Trunking System.

WARNING: The Trunking Frequency Constraints applies to this selection are determined by this System's frequency band.

Accessed Only: (When a Software System Key File or an Advanced System Key with access is selected in the System ID field or, an Advanced WACN Key with access is selected in the Home WACN ID field), and when the radio is model/option capable.

10.38.2.2

Tx Frequency

This field selects a Control Channel Tx (Transmit) Frequency for the current Trunking System.

WARNING: The Trunking Frequency Constraints applies to this selection are determined by this System's System Type and frequency band. For Type II Trunking Systems, this field is a view-only status when [Type II Frequency Band on page 468](#) is 700/800 MHz or 900 MHz.

Accessed Only: When a Software System Key File or an Advanced System Key with access is selected in the System ID field or an Advanced WACN Key with access is selected in the Home WACN ID field, When the System Type field is set to **Type II**, and [Type II Frequency Band on page 468](#) field is not set to **700/800** MHz or **900** MHz, and when the radio is model/option capable.

10.38.3

ASTRO 25 Channel ID

This section allows you to view or define frequency-related parameters for ASTRO 25 communications.

WARNING: These parameters are used to validate all Other Band Trunking (OBT) or 700/800/900 MHz ASTRO 25 Control Channel and Failsoft frequencies that are entered. These settings apply for individual Trunking Systems.

NOTE:

Once the parameters for these ASTRO 25 Channel IDs are defined, Trunking System Control Channel frequencies and Trunking Personality Failsoft frequencies may be defined.

Individual Trunking Systems are referenced to a Trunking Personality. These Trunking Systems settings can then become functional for all channel types within that Trunking Personality.

WARNING: Each record of Channel ID selections contains frequency-related parameters that are used - Trunking frequency constraint rules to validate all ASTRO 25 OBT or 700/800/900 MHz Control Channel and Failsoft frequencies entered.

Accessed Only: When the System Type field is set to **ASTRO 25**.

10.38.3.1

Identifier Enable

This field enables the Channel Identifier (ID) selections for the same Channel ID (record/row).

This selection applies for the current ASTRO 25 Trunking System.

WARNING: Each record of Channel ID selections contains frequency-related parameters - trunking frequency constraint rules to validate all ASTRO 25 OBT or 700/800/900 MHz Control Channel and Failsoft frequencies entered.

NOTE:

The first record/row within this ASTRO 25 Channel ID page must be enabled to be considered valid.

Once the records/rows of ASTRO 25 Channel ID parameters are defined, Trunking System Control Channel frequencies and Trunking Personality Failsoft frequencies may be defined.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when a Software System Key File or an Advanced System Key with access is selected in the System ID field or an Advanced WACN Key with access is selected in the Home WACN ID field, and when the radio is model/option capable.

10.38.3.2

Channel Type

This field selects the type of traffic channel protocol to be used for the current ASTRO 25 Channel ID (record/row), either Frequency Division Multiple Access (FDMA) or Time Division Multiple Access (TMDA).

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the [Identifier Enable on page 531](#) field is enabled for the current ASTRO 25 Channel ID (record/row), and when the radio is model/option capable.

The following selections are supported:

FDMA

Selects for Frequency Division Multiple Access Trunking System compatibility.

TDMA

Selects for Time Division Multiple Access Trunking System compatibility.

NOTE: This applies to the voice channel.

10.38.3.3

Transmit Offset Sign

This field selects the Transmit Offset Sign (plus or minus) for the current ASTRO 25 Channel ID (record/row).

This selection applies for the current ASTRO 25 Trunking System.

WARNING: Each record of Channel ID selections contains frequency-related parameters - trunking frequency constraint rules to validate all ASTRO 25 OBT or 700/800/900 MHz Control Channel and Failsoft frequencies entered.

Accessed Only: ((When a Software System Key File or an Advanced System Key with access is selected in the System ID field) or (an Advanced WACN Key with access is selected in the Home WACN ID field)), when the System Type field is set to **ASTRO 25**, and when the [Identifier Enable on page 531](#) field is enabled for the current ASTRO 25 Channel ID (record/row), and when the radio is model/option capable.

10.38.3.4

Transmit Offset

This field allows you to enter the Transmit Offset value (in MHz) for the current ASTRO 25 Channel ID (record/row).

This selection applies for the current ASTRO 25 Trunking System.

WARNING: Each record of Channel ID selections contains frequency-related parameters - trunking frequency constraint rules to validate all ASTRO 25 OBT or 700/800/900 MHz Control Channel and Failsoft frequencies entered.

Accessed Only: ((When a Software System Key File or an Advanced System Key with access is selected in the System ID field) or (an Advanced WACN Key with access is selected in the Home WACN ID field)), when the System Type field is set to **ASTRO 25**, and when the [Identifier Enable on page 531](#) field is enabled for the current ASTRO 25 Channel ID (record/row), and when the radio is model/option capable.

10.38.3.5

Channel Spacing

This field allows you to enter the Channel Spacing value for the current ASTRO 25 Channel ID (record/row).

This selection applies for the current ASTRO 25 Trunking System.

WARNING: Each record of Channel ID selections contains frequency-related parameters - trunking frequency constraint rules to validate all ASTRO 25 OBT or 700/800/900 MHz Control Channel and Failsoft frequencies entered.

Accessed Only: ((When a Software System Key File or an Advanced System Key with access is selected in the System ID field) or (an Advanced WACN Key with access is selected in the Home WACN ID field)), when the System Type field is set to **ASTRO 25**, and when the [Identifier Enable on page 531](#) field is enabled for the current ASTRO 25 Channel ID (record/row), and when the radio is model/option capable.

10.38.3.6

Base Frequency

This field allows you to enter any frequency within the range of the radio's frequency band(s) as the Base Frequency value for the current ASTRO 25 Channel ID (record/row).

WARNING: Each record of Channel ID selections contains frequency-related parameters - trunking frequency constraint rules to validate all ASTRO 25 OBT or 700/800/900 MHz Control Channel and Failsoft frequencies entered.

IMPORTANT:

Once the records/rows of ASTRO 25 Channel ID parameters are defined, Trunking System Control Channel frequencies and Trunking Personality Failsoft frequencies may be defined.

In order for the internal algorithm to be valid, this Base Frequency must be equal to or smaller in value than the Control Channel and Failsoft Receive frequencies.

Accessed Only: When the System Type field is set to **ASTRO 25**, and ((when a Software System Key File or an Advanced System Key with access is selected in the System ID field) or (an Advanced WACN Key with access is selected in the Home WACN ID field)), and when the [Identifier Enable on page 531](#) field is enabled for the current ASTRO 25 Channel ID (record/row), and when the radio is model/option capable.

Any frequency within the range of the radio's frequency band(s).

10.38.4

Features (ASTRO 25 Trunking System)

The **Features** section of the ASTRO 25 Trunking System set allows the user to view or modify settings for individual Trunking System.

NOTE: Individual Trunking Systems are referenced to a Trunking Personality. These Trunking Systems settings can then become functional for all channel types within that Trunking Personality.

10.38.4.1

Radio Inhibit

This field enables the radio to receive and respond to a Remote Inhibit command while operating on the current Trunking System.

This inhibit command is sent from the dispatcher. Upon successful receipt, the radio transmits an acknowledgement back to the dispatch equipment and then goes into a dormant state. While inhibited, the receiver audio is muted and the transmit audio path is blocked; all your controls are rendered

inoperative; scan mode is stopped on the operating channel which received the command, and all Radio LED's are turned off.

WARNING:

When the System Type field is set to **ASTRO 25** and when the **ASTRO OTAR Profile Index** field is enabled (for the current Trunking System), and when the Secure Configuration, **Radio Inhibit via ASTRO OTAR** is enabled, this field may be disabled. In this case, Radio Inhibit is accomplished "via ASTRO OTAR".

When the System Type field is set to **ASTRO 25** and when the ASTRO OTAR Profile Index field is disabled (for the current Trunking System), this field must be enabled. This insures that Radio Inhibit is possible with **ASTRO 25** Trunking.

When the System Type field is set to **Type II** and when the value of the Trunking System's System ID field matches the **Key ID** of one of the loaded Software System Key Files or Advanced System Keys (see the System Key Report), this field may be disabled. In this case, Radio Inhibit commands received on this Trunking System will be ignored, and the radio continues to operate normally.

When the Secure Configuration, **Radio Inhibit via ASTRO OTAR Profile Index** is enabled, and when the **ASTRO OTAR Profile Index field** is enabled (for the current Trunking System), this field may be disabled. In this case Radio Inhibit is accomplished "via ASTRO OTAR".

When the ASTRO OTAR Profile Index field is disabled (for the current Trunking System), this field must be enabled. This insures that Radio Inhibit is possible with **ASTRO 25** Trunking.

IMPORTANT: In order to clear this inhibited state on the radio, an uninhibit command must be sent to the radio.

Accessed Only: When the radio is model/option capable.

10.38.4.2

Text Messaging Service

This field selects the Text Messaging mode for the current Trunking System.

NOTE:

Text Messaging is accessed by you with the Text Messaging Service button-press, or the Text Messaging Service menu-selection.

Quick Text Messaging is accessed by you with the TMS Quick Text button-press.

Query Messaging is accessed by you with the TMS Query button-press.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the current Trunking System has a referenced Data Profile, and when Data Profile Selection is not set to **Data Disabled**.

The following selections are supported:

None

The feature is disabled.

List Only

Allows you to only select Text Messages from the Quick Text Messages List.

Unlimited

Allows you to select from the Quick Text Messages, and enter your own text message from the radio keypad.

WARNING: This selection is only available on radios that have a keypad or Keypad Mic.

NOTE: This selection is not applicable to APX N70.

10.38.4.3

TX Power Level

This field selects the radio's power level for transmitting for the current Trunking System.

The Tx Low Power button-press, the Tx Low Power switch-toggle, and the Power menu-selection take precedence over this setting when selected by you.

NOTE:

During Emergency Mode the radio automatically transmits at high power.

The transmit power may be reduced 1 watt for 800 models, and 2 watts for VHF and UHF models.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Low

Used when communicating in close proximity, and to keep the radio from transmitting into other geographical groups operating on the same frequency.

High

Used when a stronger signal is needed to extend transmission distances.

10.38.4.4

Remote Monitor/Radio Trace Enable

This field enables the radio to decode a Remote Monitor or Radio Trace command for the current Trunking System.

WARNING: Radio Trace applies only for System Type **Type II**. Also only for a **Type II** System, and applying to both **Remote Monitor** and **Radio Trace**, the radio keys-up for the time selected by the Remote Monitor/Radio Trace Tx Base Time.

NOTE:

For a **ASTRO 25** System Type, the in-the-field radio's transmit time is defined by a dispatcher and contained within the transmitted **Remote Monitor** command.

When a **Remote Monitor** command has been received, the radio automatically keys-up and transmits surrounding audio from its "hot" microphone. This is especially useful in an emergency man-down situation.

Remote Monitor is also known as **Radio Unit Monitor**.

When a **Radio Trace** command has been received, the radio automatically keys-up, sending unmodulated carrier, allowing a lost or stolen radio to be found. **Radio Trace** applies only for System Type **Type II**.

Applies only:

For APX 7000XE and APX 6000, this feature applies only when System Option H43 is available to the radio. In addition, the radio requires firmware version R05.xx.xx or higher, and the APX must be R05.xx.xx or higher.

For APX 6500 this feature applies only when System Option G170 is available to the radio. In addition, the radio requires firmware version R05.xx.xx or higher, and the APX must be R05.xx.xx or higher.

10.38.4.5

Emergency Alarm Rx Indicator

This field enables an audio or visual, or both indicator to occur on the radio when an Emergency Alarm is detected and received from another radio.

The type of Emergency Indicator is determined by the Emergency Alarm Rx Indicator Type setting. This feature applies for the current Trunking System.

IMPORTANT:

The Emergency Alarm Rx Indicator time lasts for 10 seconds. During these 10 seconds, you can deactivate the indicator by pressing any of the radio's buttons except Volume and Light/Flip (Display).

Once the indicator clears or is cleared, retried emergency alarms from the same Trunking System Unit ID are ignored for the next 20 seconds.

Emergency alarms are not detected while the radio is in scan mode.

Emergency alarms may not be detected any time the radio is not monitoring or decoding the control channel, for example, activity on a voice or data channel, RSSI sampling, etc.

Accessed Only: When the Emergency Alarm Rx Indicator Type field is not set to **No Indication**, and when the radio is model/option capable.

10.38.4.6

Secure LED

This field enables the yellow busy LED to flash whenever a secure encrypted voice call is received, and will continue to flash as long as the current voice activity is secure.

The yellow busy LED will flash under these conditions regardless of whether the specific radio can unmute the voice signal. Secure LED applies for the current Trunking System.

Accessed Only: When the radio is model/option capable.

10.38.4.7

Site Selectable Alert List Selection

This field selects the Site Selectable Alert List to be used with the current ASTRO 25 Trunking System.

NOTE:

Site Selectable Alert List functionality is defined in the Site Selectable Alert List Page.

You can activate or deactivate Site Selectable Alerts with a Site Selectable Alert menu-selection. Either a single site or all available sites in the Zone can be selected for activating or deactivating a Site Selectable Alert.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the radio is model/option capable.

The following selections are supported:

- Disabled
- Available Site Selectable Alert Lists

WARNING: List selections may only be made when the [Coverage Type on page 466](#) field is set to **Disabled**, or when the Coverage Type field is not set to **Disabled**, and when the [Site Alias Enable on page 486](#) field is **Enabled**. Otherwise, a List selection is considered invalid.

10.38.4.8

Dynamic Regrouping Enable

This field enables a Dynamic Regrouping talkgroup for a Trunking Personality or channel that references the current Trunking System.

NOTE:

When this field is enabled, a [Dynamic Regrouping Zone on page 478](#) and [Dynamic Regrouping Channel on page 478](#) must be selected for that Trunking System.

WARNING: A Dynamic Regrouping configuration is only valid: when one of the Trunking Personalities referenced to a channel has its Trunking Talkgroup field set to **DYN** (Dynamic Regrouping), and that Personality's selected Zone and Channel match the selections for Dynamic Regrouping Zone and Dynamic Regrouping Channel in the Personalities' referenced Trunking System.

IMPORTANT: Therefore, only one channel within a given Trunking System, can be the Dynamic Regrouping channel.

You may request a new Dynamic Regrouping assignment from the dispatcher with a Reprogram Request button-press or a Reprogram Request menu-selection. The actual features and settings of the Dynamic Regrouping talkgroup are defined and transmitted back by the dispatcher.

For the Dynamic Regrouping talkgroup to be capable of transmitting in Secure mode, the Secure Tx Select button-press or the Secure Tx Select switch-toggle or the Secure menu-selection is needed; otherwise Dynamic Regrouping talkgroup transmissions are strapped to transmitting in **Clear** mode.

Accessed Only: When the radio is model/option capable.

10.38.4.9

Dynamic Regrouping Zone

This field selects the zone of the Dynamic Regrouping Trunking Personality/channel that references the current Trunking System.

WARNING: Remote Site Interface (RSI) zones are invalid and cannot be selected (zones that have RSI Mode enabled).

NOTE:

You may request a new Dynamic Regrouping assignment from the dispatcher with a Reprogram Request button-press or a Reprogram Request menu-selection. The actual features and settings of the Dynamic Regrouping talkgroup are defined and transmitted back by the dispatcher.

For the Dynamic Regrouping talkgroup to be capable of transmitting in Secure mode, the Secure Tx Select button-press or the Secure Tx Select switch-toggle or the Secure menu-selection is needed; otherwise Dynamic Regrouping talkgroup transmissions are strapped to transmitting in **Clear** mode.

When [Dynamic Regrouping Enable on page 477](#) is **Enabled**, a Dynamic Regrouping Zone and [Dynamic Regrouping Channel on page 478](#) must be selected for that Trunking System.

WARNING:

Zones selected in this field must have Dynamic Zone Enable disabled; otherwise, this field becomes invalid.

A Dynamic Regrouping configuration is only valid when one of the Trunking Personalities referenced to a channel has its Trunking Talkgroup field set to **DYN** (Dynamic Regrouping), and that Personality's selected Zone and Channel match the selections for Dynamic Regrouping Zone and Dynamic Regrouping Channel in the Personalities' referenced Trunking System.

IMPORTANT: Therefore, only one channel (within a given Trunking System) can be the Dynamic Regrouping channel.

Accessed Only: When the [Dynamic Regrouping Enable on page 477](#) field is set to **Enabled**, and when the radio is model/option capable.

10.38.4.10

Dynamic Regrouping Channel

This field selects a Dynamic Regrouping Trunking Personality/channel that references the current Trunking System.

See also [Dynamic Regrouping Zone on page 478](#).

NOTE:

You may request a new Dynamic Regrouping assignment from the dispatcher with a Reprogram Request button-press or a Reprogram Request menu-selection. The actual features and settings of the Dynamic Regrouping talkgroup are defined and transmitted back by the dispatcher.

For the Dynamic Regrouping talkgroup to be capable of transmitting in Secure mode, the Secure Tx Select button-press or the Secure Tx Select switch-toggle or the Secure menu-selection is needed; otherwise Dynamic Regrouping talkgroup transmissions are strapped to transmitting in **Clear** mode.

When [Dynamic Regrouping Enable on page 477](#) is **Enabled**, a Dynamic Regrouping Zone and Dynamic Regrouping Channel must be selected for that Trunking System.

WARNING: A Dynamic Regrouping configuration is only valid when one of the Trunking Personalities referenced to a channel has its Trunking Talkgroup field set to **DYN** (Dynamic Regrouping), and that Personality's selected Zone and Channel match the selections for Dynamic Regrouping Zone and Dynamic Regrouping Channel in the Personalities' referenced Trunking System.

IMPORTANT: Therefore, only one channel within a given Trunking System, can be the Dynamic Regrouping channel.

WARNING: For APX™ 3000 Portable codeplugs, only the first 48 channels in the selected Dynamic Regrouping Zone are considered valid selections.

Accessed Only: When the [Dynamic Regrouping Enable on page 477](#) field is set to **Enabled**, and when the Dynamic Regrouping Zone field is not set to a Dynamic Zone, and when the radio is model/option capable.

10.38.4.11

Group Text Messaging Service

This field selects the Group Text Messaging Service mode for the current ASTRO25 Trunking System.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the radio is model/option capable.

The following selections are supported:

Disabled

Group Text Message will not be received.

Full Decode

Group Text Message will be received.

10.38.4.12

LTE Interference Frequency Present

The application allows you to view (True or False) when the ASTRO 25 Channel ID table contains a 700MHz Base Frequency that can cause interference on this LTE Broadband channel.

A referenced Data Profile to a Trunking System having a **Broadband** Data Profile Type and Broadband Source is **Internal LTE Modem** creates an LTE Broadband capable Trunking channel. Therefore when LTE Broadband capability is the case, and any Base Frequency in the table contains a frequency in the 700MHz frequency band, this field warns **True** of potential frequency interference. This feature applies for the current ASTRO 25 Trunking System.

Accessed Only: When the radio is model/option capable.

IMPORTANT: This feature is only available in Expert View (see Codeplug View).

10.38.4.13

Personnel Accountability List Selection

This field allows you to select a personnel accountability list to be used while operating Trunking System.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the radio is model/option capable.

The following selections are supported:

- Disabled
- Available Personnel Accountability

10.38.4.14

Location on PTT

ASTRO 25 system enables APX radios to transmit the GPS location to infrastructure through voice frames on the voice channel after PTT operation.

This allows the transmitting radio's location to be seen on the mapping application.

WARNING: ARS Mode must be set as **Enhanced Server** in the Data Profile record to prevent invalid Fields Report.

Accessed Only: When the radio is model/option capable, and when the System Type field is set to **ASTRO 25**, and when the ARS Mode is **Enhanced Server** in its Data Profile, and when [Location Enable on page 111](#) field is enabled.

10.38.4.15

OTA Radio Alias Update Enable

Allows the current system to update the radio alias.

Accessed Only: When Radio Alias Enable is enabled, System Type is **ASTRO 25**, OTA Radio Alias Type field is not **Disabled**, and when the radio is model/option capable.

10.38.4.16

OTA Radio Alias Type

Configures the encoding (transmitting) and decoding (receiving) of the OTA (Over the Air) Radio Alias feature.

WARNING: Radio cannot display alias if the radio receives duplicated IDs until the duplication is removed. Writing to the radio will cause the call list to return to its original state and all OTA alias updates will be lost.

IMPORTANT: If OTA alias update did not show up on the display, radio-user must update the radio call list in RadioCentral or provisioning manager.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Disabled

The radio does not transmit or receive the Radio Alias data.

Decode Only

Radio Alias data receives the data without limitation.

10.38.4.17

ICUA Reset

This field selects a timed or manual unmute, exception for Trunking call alerts/pages when the channel is Voice Mute In-Call User Alert Enabled.

The exception time (timed or manual) is known as the Release Squelch State. For the two timed selections, the [ICUA Auto Reset Time on page 480](#) field (for this Trunking System) partially determines how long the Release Squelch State continues. The Release Squelch State begins when the Voice Mute In-Call User Alert feature is active and the radio has un-muted. This selection applies for the current Trunking System.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Manual

When the Voice Mute In-Call User Alert Enabled feature is active, Voice Mute button is pressed, or the Voice Mute menu-selection deactivates Voice Mute and ends the Release Squelch State. Pressing the PTT button ends the Release Squelch State.

Auto

If the timer expires regardless of whether the radio is muted or un-muted, the Release Squelch State is ended and the Voice Mute In-Call User Alert Enabled rules are again required in order to unmute to any future transmissions.

Auto with carrier

If the radio is un-muted when the timer expires due to Carrier Squelch being satisfied, the radio remains un-muted until carrier is dropped. Once carrier is dropped and the radio is muted, the timer is reset and re-started, in effect extending the Release Squelch State again; if the radio then remains muted for an entire timer period without any carrier override, the Release Squelch State is ended and the Voice Mute In-Call User Alert Enabled rules are again required in order to unmute to any future transmissions.

10.38.4.18

ICUA Auto Reset Time

This field selects an amount of time used during the unmute-exception for Trunking call alerts/pages when the channel is Voice Mute In-Call User Alert Enabled.

The exception time is known as the Release Squelch State. This timer is only relevant to the two In-Call Reset timed selections. This selection applies for the current Trunking System. Time is in seconds.

Accessed Only: When the [ICUA Reset on page 479](#) field is not set to **Manual**, and when the radio is model/option capable.

Table 270: Range

Minimum	Maximum	Increments
0 sec	255 sec	1 sec

10.38.4.19

Busy LED

When this field is enabled, the yellow busy LED blinks whenever a voice call is received.

NOTE: The yellow busy LED continues to blink as long as the current voice activity is ongoing.

10.38.5

Status Alias (ASTRO 25 Trunking System)

The **Status Alias** section of the ASTRO 25 Trunking System set allows the user to view or define Statuses for individual Trunking Systems. Users are then able to select and transmit their current Status to a dispatcher (base unit) with a Status button-press, a Direct Status button-press, or a Status menu-selection.

NOTE:

Status transmissions make more efficient use of a channel as compared to a voice transmission.

For non-keypad models this feature can be used only with the One Touch Button Feature.

WARNING:

This feature applies only when the Trunking Personality that references this Trunking System has its Status Enable field enabled.

Each Status Alias must be set up identically (or with the same meaning) for the dispatcher and the portable or mobile units. That is, the Status 1 Alias from the dispatching unit must be identical (or have the same meaning) as the Status 1 Alias for the portable or mobile unit.

Accessed Only: When the radio is model/option capable.

10.38.5.1

Status Alias Enable

This field enables the ability to define Status for the current Trunking System.

WARNING:

This feature applies only when the Trunking Personality that references this Trunking System has its Status Enable field enabled.

Once enabled, you must then set up each radio Status Alias (Status Alias Name and Status Alias Number of the same record/row) to match identically or have the same meaning as the corresponding dispatcher unit Status Alias.

Once defined, you can access the Status feature with a Status button-press, a Direct Status button-press, or a Status menu-selection.

For non-keypad models, the Status feature can be used only with the One Touch Button feature.

Accessed Only: When the radio is model/option capable.

10.38.5.2

Status Alias Number

This field selects a number that identifies the current Status.

This selection applies for the current Status (record/row) which applies for the current trunking system.

WARNING:

- This feature applies only when the trunking personality that references this trunking system has its Status Enable field enabled.
- Once defined, you can access the status feature with a status button-press, a direct status button-press, or a status menu-selection.

IMPORTANT: The Status Alias must be set up identically (or with the same meaning) for the dispatcher and the portable or mobile units. That is, the Status 1 Alias from the dispatching unit must be identical (or have the same meaning) as the Status 1 Alias for the portable or mobile unit.

Accessed Only: When [Status Alias Enable on page 484](#) field is enabled, and when the radio is model/option capable.

10.38.5.3

Status Alias Text

This field allows you to define recognizable names for the current Status (record/row).

This selection applies for the current trunking system.

NOTE:

- This feature applies only when the Trunking Personality that references this Trunking System has its Status Enable field enabled.
- Once defined, you can access the Status feature with a Status button-press, a Direct Status button-press, or a Status menu-selection.

IMPORTANT: The Status Alias must be set up identically (or with the same meaning) for the dispatcher and the portable or mobile units. That is, the Status 1 Alias from the dispatching unit must be identical (or have the same meaning) as the Status 1 Alias for the portable or mobile unit.

Accessed Only: When [Status Alias Enable on page 484](#) field is enabled, and when the radio is model/option capable.

NOTE:

Characters, numbers, spaces, and special characters can be used.

Up to 14 characters are possible.

Examples: STATUS-01, Electric1, #510

10.38.6

Site Alias (ASTRO 25 Trunking System)

The **Site Alias** section of the ASTRO 25 Trunking System set allows the user to view or define user-friendly aliases that identify either Trunking Systems or individual sites within those Systems that a radio may encounter as it roams across sites, Trunking Systems or even Wide Area Communications

Networks (WACNs). Aliases can also identify calls (via PTT IDs) received from radios outside of the radio's selected (home) Trunking System.

IMPORTANT: Only Site Aliases defined in the user's currently-selected Trunking System are available to the radio.

NOTE:

The Site Alias Type determines what the Site Alias Text is being assigned to, either a Trunking System or a site within a System.

IMPORTANT: A Trunking System is always defined by its Home RAS WACN Number and System Number, while a site is defined by specific combinations of its Home RAS WACN Number, System Number, RFSS Alias Number and Site ID, depending on the current Trunking System's Coverage Type and System Type.

Viewing the current Site Alias and its corresponding received signal strength indicator (RSSI), or changing the current site, is activated with a Site Display/Srch button-press. A user activated Site Lock/Unlock button-press or a Site menu-selection can view or change the current site lock status.

Individual Trunking Systems are referenced to a Trunking Personality. These Trunking Systems settings can then become functional for all channel types within that Trunking Personality.

10.38.6.1

Site Alias Enable

This field enables the Site Alias fields for the current Site ID (record/row), which also applies to the current Trunking System.

NOTE:

Viewing the current Site Alias and its corresponding received signal strength indicator (RSSI), or changing the current site, is activated with a Site Display/Srch button-press.

A Site Lock/Unlock button-press or a Site menu-selection can view or change the current site lock status.

NOTE: Automatic Multiple Site Select (AMSS) is not supported in this product.

Accessed Only: When the System Type field is set to **Type II**, and when the [Coverage Type on page 466](#) field is set to **SmartZone**, and when the radio is model/option capable,

Or when the System Type field is set to **ASTRO 25**, and when the Coverage Type field is not set to **Disabled**, and when the radio is model/option capable.

10.38.6.2

RFSS Alias Number

This field allows you to enter (in decimal format) the RFSS (Radio Frequency Sub-System) number that corresponds to the current Site ID (record/row).

To support roaming between different RFSS's within a Trunking System, each RFSS must have a unique number. An RFSS is made up of one or more sites. This selection also applies the current Trunking System.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the Coverage Type field is set to **SmartZone & OmniLink** or **Intra-WACN Roaming** or **Inter-WACN Roaming**, and when the [Site Alias Enable on page 486](#) field is enabled, and when the [Site Alias Type on page 545](#) field is set to **Site**, and when the radio is model/option capable.

Table 271: Range

Minimum	Maximum
1	254

10.38.6.3

Site ID

This field allows you to enter (in decimal or hex format) the ID number that identifies the site for the current (record/row).

To support roaming between different sites, each Site ID must be unique within a Radio Frequency Sub-System (RFSS). This selection also applies the current Trunking System.

Accessed Only: When the [Site Alias Enable on page 486](#) field is enabled, and when the System Type field is set to **Type II**, and when the Coverage Type field is set to **SmartZone**, and when the radio is model/option capable,

Or when the [Site Alias Enable on page 486](#) field is enabled, and when the [Site Alias Type on page 545](#) field is set to **Site**, and when the System Type field is set to **ASTRO 25**, and when the Coverage Type field is not set to **Disabled**, and when the radio is model/option capable.

Table 272: Range

Minimum	Maximum
0 (Hex)	FE (Hex)

10.38.6.4

Site Alias Text

This field allows you to define recognizable names for the current Site Alias (record/row) which applies to the current Trunking System.

See also [Site Alias Type on page 545](#). You can activate the Site Alias Text with Site Display/Srch button-press, Site Lock/Unlock button-press, and the Site menu-selection features.

Accessed Only: When the [Site Alias Enable on page 486](#) field is enabled, and when the System Type field is set to **Type II**, and when the Coverage Type field is set to **SmartZone**, and when the radio is model/option capable,

Or when the [Site Alias Enable on page 486](#) field is enabled, and when the System Type field is set to **ASTRO 25**, and when the Coverage Type field is not set to **Disabled**, and when the radio is model/option capable.

NOTE:

Characters, numbers, spaces, and special characters can be used.

Up to 14 characters are possible.

Examples: EMT-001, #500, Electric1, Site Alias 01

10.38.6.5

Site Alias Type

This field selects the assignment of the Site Alias Text, either to a Trunking System or a site within a System.

You may view the radio's current site alias or system alias with the Site Display/Srch button-press. This selection applies for the current site alias (record/row) which applies for the current Trunking System.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the Coverage Type is not set to **Disabled**, and when the [Site Alias Enable on page 486](#) field is enabled, and when the radio is model/option capable,

The following selections are supported:

Site

The is used as a "Site alias" for the radio's currently registered site. The Trunking System's Coverage Type selection determines how a site must be defined for site aliasing.

- For **SmartZone**, only the Site ID is needed.
- For **SmartZone & OmniLink**, the RFSS Alias Number and Site ID are needed.
- For **Intra-WACN Roaming**, the System Number, RFSS Alias Number, and Site ID are needed.
- For **Inter-WACN Roaming**, the System Number, RFSS Alias Number, Site ID and Home RAS WACN Number are needed.

System

The [Site Alias Text on page 487](#) is used as a system alias for the radio's currently registered foreign Trunking System. System aliases are defined by their Home RAS WACN Number and System Number. Only the Trunking System Coverage Type of **Inter-WACN Roaming** is possible for the System Alias Type. System Aliases are used to create a PTT-ID or a site alias:

- When the radio receives a call from a foreign radio, and a site alias for the site in the specified Trunking System is not defined, then this system alias and the Unit ID appears in the receiving radio's display, identifying the calling radio. If a system alias is not defined, the entire Subscriber Unit ID (SUID) of the foreign radio appears in the receiving radio's display; the SUID is a combination of the Home WACN ID, System ID and Unit ID.
- If the radio has roamed to a foreign Trunking System where no site alias is available for the current site, then this system alias, the Site ID and its corresponding received signal strength indicator (RSSI) level appears in the radio's display when you initiates a Site Display/Srch button-press. If a system alias is not defined for the currently registered foreign system, then the entire site ID (Home RAS WACN Number + System Number + Site ID + RSSI level) appears in the radio's display.

10.38.6.6

System Number

This field allows you to enter (in decimal or hex format) the System ID that corresponds to the current Site ID (record/row).

To support roaming between different trunking systems composing Wide Area Communications Networks (WACNs). Each trunking system must have a unique System ID. A trunking system is made up of one or more Radio Frequency Sub-Systems (RFSS). This selection also applies the current trunking system.

Accessed Only: When the radio is model/option capable, and when the [Site Alias Enable on page 486](#) field is enabled, and when the System Type field is set to **ASTRO 25**,

And when the Coverage Type field is set to **Intra-WACN Roaming** or **Inter-WACN Roaming**, and when the [Site Alias Type on page 545](#) field is set to **Site**,

Or when the Coverage Type field is not set to **Disabled**, and when the [Site Alias Type on page 545](#) field is set to **System**.

Table 273: Range

Minimum	Maximum
000 (Hex)	FFE (Hex)

IMPORTANT: A value of "0" causes the radio to copy the value of the System ID field for the current trunking system to this field.

10.38.6.7

Home RAS WACN Number

This field allows you to enter (in decimal or hex format) the Home Remote Access Server (RAS) Wide Area Communications Networks (WACN) ID that corresponds to the current Site ID (record/row).

To support roaming between different WACNs (see also Inter-WACN Roaming), each WACN must have a unique number. A WACN is made up of one or more Trunking Systems. This selection also applies for the current Trunking System.

Accessed Only: When the radio is model/option capable, and when the [Site Alias Enable on page 486](#) field is enabled, when the System Type field is set to **ASTRO 25**, and

And when the Coverage Type field is set to **Inter-WACN Roaming**, and when the [Site Alias Type on page 545](#) field is set to **Site**,

Or when the Coverage Type field is not set to **Disabled**, and when the [Site Alias Type on page 545](#) field is set to **System**.

Table 274: Range

Minimum	Maximum
00000 (Hex)	FFFFE (Hex)

IMPORTANT: Factory Default = 1. A value of "0" causes the radio to copy the value of the Home WACN ID field for the current Trunking System to this field.

10.38.7

One Touch

This section allows you to view or define specific One Touch **Feature** and **Index** selections for up to four One Touch button-presses or One Touch menu-selections.

One Touch allows you to create menu-navigation and button shortcuts. These shortcuts can greatly reduce your effort involved in launching a radio feature.

A One Touch button-press or menu-selection can reduce down to a single button press, the launching of a radio feature; this same process might otherwise take many menu navigation steps to achieve. These selections apply for the current Trunking System.

NOTE: Individual Trunking Systems are referenced to a Trunking Personality. These Trunking Systems settings can then become functional for all channel types within that Trunking Personality.

10.38.7.1

Button

Displays the view-only the assigned name for the One Touch button-press or One Touch menu-selection.

NOTE: Individual Trunking Systems are referenced to a Trunking Personality. These Trunking Systems settings can then become functional for all channel types within that Trunking Personality.

10.38.7.2

One Touch Button Feature

This field selects the One Touch Feature for your One Touch button-press or One Touch menu-selection.

This selection applies for the current record/row, which applies for the current Trunking System.

IMPORTANT: Trunking One Touch Button 1, in other words, the first record/row would correspond to a One Touch 1 button-press, and/or a TCH1 or SIG1 menu-selection, and so on.

NOTE: With any of these Feature selections, the One Touch Button Index selection must also be defined.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Disabled

One Touch is not available for the current Button selection.

Phone

The [Phone Operation on page 517](#) feature is set to **List Only** or **Unlimited** for the referenced Trunking Personality.

Private Call

The [Private Call Type on page 514](#) is not **Disabled**, and the [Private Call Operation on page 514](#) field is set to **List Only** or **Unlimited** for the referenced Trunking Personality.

Call Alert

The [Call Alert/Page Operation on page 515](#) field is set to **List Only** or **Unlimited** for the referenced Trunking Personality.

Status

The [Status Alias Enable on page 484](#) feature is enabled for the current Trunking System.

Message

The Message feature is enabled for the current Trunking System.

NOTE: The available One Touch Button Feature selections are model/option dependent.

10.38.7.3

One Touch Button Index

This field selects the One Touch Index/List member for your One Touch button-press or One Touch menu-selection, pertaining to the selected One Touch Button Feature.

Index refers to the actual record/row of the list determined by the One Touch Button Feature selection. This selection applies for the current Trunking System.

IMPORTANT: Trunking One Touch Button 1, the first record/row will correspond to a One Touch 1 button-press, and a TCH1 or SIG1 menu-selection.

Accessed Only: When the [One Touch Button Feature on page 488](#) field for the current record/row is not set to **Disabled**, and when the radio is model/option capable.

The following selections are supported:

Private Call

This Index number correlates to the row number of the Type II, or ASTRO 25 Call Hot List.

IMPORTANT: The [Trunking Call Hot List on page 515](#) selection determines which Call Hot List is used for the referenced Trunking Personality.

Available to you when the [Private Call Type on page 514](#) is not **Disabled**, and the [Private Call Operation on page 514](#) field is set to **List Only** or **Unlimited** for the referenced Trunking Personality.

Call Alert

This Index number correlates to the row number of the Type II, or ASTRO 25 Call Hot List.

IMPORTANT: The Trunking Call Hot List selection which Call Hot List is used for the referenced Trunking Personality.

Available to you when the [Call Alert/Page Operation on page 515](#) field is set to **List Only** or **Unlimited** for the referenced Trunking Personality.

Phone

This Index number correlates to the row number of the Phone Call Hot List.

Available to you when the [Phone Operation on page 517](#) feature is set to **List Only** or **Unlimited** for the referenced Trunking Personality.

Status

This Index number correlates to the position/row number of the Status Alias List members.

Available to you when the [Status Alias Enable on page 484](#) feature is **Enabled** for the current Trunking System.

Message

This Index number correlates to the position/row number of the Message Alias List members.

Available to you when the Message feature is **Enabled** for the current Trunking System.

10.38.8

ASTRO 25

This section allows you to view or modify basic functionality used while operating in ASTRO 25 mode.

These settings apply for individual Trunking Systems.

NOTE: Individual Trunking Systems are referenced to a Trunking Personality. These Trunking Systems settings can then become functional for all channel types within that Trunking Personality.

10.38.8.1

Motorola Proprietary Features

This field enables Motorola Proprietary Inbound Signaling Packet (ISP) transmissions to be sent by the radio.

This feature applies for the current Trunking System.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the radio is model/option capable.

10.38.8.2

ISP Sequence Length

This field selects the maximum time allowed per site for an Inbound Signaling Packet (ISP) retry sequence.

The radio retries five times or until this time expires, whichever comes first. This selection applies for the current Trunking System. Time is in seconds.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the radio is model/option capable.

NOTE: When set to **Infinite**, timer does not expire.

Table 275: Range

Minimum	Maximum	Increments
10 (second)	255 (seconds)	1 (second)

10.38.8.3

Maximum Slot Size

This field selects the maximum Inbound Signaling Packet (ISP) slot size the radio can use.

IMPORTANT: This value cannot be greater than the slot size allowed by the System.

NOTE: This value is used to speed the radio firmware's slot finding process. This selection applies for the current Trunking System. Time is in milliseconds.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the radio is model/option capable.

NOTE: When set to **Unbounded**, the slot size is unlimited.

Table 276: Range

Minimum	Maximum	Increments
37.5 (milliseconds)	142.550 (milliseconds)	7.5 (milliseconds)

10.38.8.4

Force Unmute Time

This field selects the maximum amount of time a radio remains muted to receive audio in anticipation of system throughput delay.

The timer begins just after the radio sends a transmission. If the radio's firmware confirms by other means that incoming audio is not its own, this time is disregarded. This selection applies for the current Trunking System. Time is in milliseconds.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the radio is model/option capable.

NOTE: When set to **Immediate** which means 0 (Zero Time), there is no mute time after transmission.

Table 277: Range

Minimum	Maximum	Increments
250 (ms)	6375 (ms)	25 (ms)

10.38.8.5

Quick Fade Protect

This field selects the amount of time the radio remains on the control channel once synchronization is lost and before attempting to re-synch.

This allows the radio time to recover the signal without a full re-synchronization of the channel. This selection applies for the current Trunking System. Time is in milliseconds.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the radio is model/option capable.

Table 278: Range

Minimum	Maximum	Increments
200 ms	6375 ms	25 ms

10.38.8.6

PTT Warning Time

This field selects the amount of time that the radio waits before sounding a Talk Prohibit Tone to warn you that a PTT request is being processed and you should release the PTT button.

This selection applies for the current Trunking System. Time is in milliseconds.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the radio is model/option capable.

NOTE: When set to **Disabled**, no warning is sounded.

Table 279: Range

Minimum	Maximum	Increments
0 ms	6375 ms	25 ms

10.38.8.7

Busy Update Time

This field selects the amount of time that the radio waits in the busy state for a grant, reject, or another busy update from the Fixed Network Equipment (FNE).

If this time expires, the radio no longer expects a response from the FNE and retries the transmission. This selection applies for the current Trunking System. Time is in seconds.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the radio is model/option capable.

NOTE: When set to **Infinite**, the radio waits indefinitely for a response.

Table 280: Range

Minimum	Maximum	Increments
150 (seconds)	945 (seconds)	15 (seconds)

10.38.8.8

Response Pending Time

This field selects the amount of time that the radio waits when expecting a further response to a request from the Fixed Network Equipment (FNE).

This situation occurs when the FNE sends an indication to the radio that its request is being processed and that further signaling is on the way. If this time expires, the radio no longer expects a response from the FNE and returns to an idle state. This selection applies for the current Trunking System. Time is in seconds.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the radio is model/option capable.

NOTE: When set to **Infinite**, the radio waits indefinitely for a further response from the FNE.

Table 281: Range

Minimum	Maximum	Increments
10 (second)	255 (seconds)	1 (second)

10.38.8.9

Default RCM ID

This field selects the Radio Control Manager (RCM) address used as the target address of Inbound Signaling Packet (ISP) transmissions directed to the FNE, for example, Status and Message transmissions.

This selection applies for the current Trunking System.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the radio is model/option capable.

Table 282: Range

Minimum	Maximum
000000 (Hex)	FFFFFF (Hex)

10.38.8.10

Phase 2 Voice Capable

This field enables the radio to transmit on a Trunking System that supports Project 25-standard Phase 2 Time Division Multiple Access (TDMA) voice communications.

NOTE: Phase 2 TDMA uses a two-slot TDMA protocol on a 12.5 kHz channel, which allows double the voice capacity compared to the Phase 1 Frequency Division Multiple Access (FDMA) implementation. This selection applies for the current Trunking System.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the radio is model/option capable.

10.38.8.11

End Phase 2 TDMA Transmit On Out Of Range

This field enables the radio to stop an ongoing Phase 2 TDMA (Time Division Multiple Access) transmission.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This function also alerts you that during the transmission, the radio has roamed outside of the coverage range of the Fixed Network Equipment (FNE). An audible alert tone persists for as long as the PTT button is held. This selection applies for the current Trunking System.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the [Phase 2 Voice Capable on page 552](#) field is **Enabled**.

10.38.8.12

Validate NAC Against System ID

This field causes the radio to validate the upper 8 bits of the 16-bit System ID against the upper 8 bits of the 12-bit Network Access Code (NAC) received on the Trunking - control channel.

If a match is not found, the radio does not attempt to register/affiliate to the Trunking site. Therefore enabling this field allows the radio to quickly match a site's NAC code with its System ID and quickly reject interfering Trunking System control channels. This selection applies for the current Trunking System.

WARNING: If any site in the Trunking System is not configured this way then this field must be disabled.

When disabled, the radio does not attempt to match the upper 8 bits of the 16-bit System ID with the upper 8 bits of the 12-bit NAC code. This allows the radio to operate on control channels having a NAC that is independent of this Trunking System's System ID. The radio may take longer to reject interfering Trunking System control channels. This selection applies for the current Trunking System.

WARNING:

When the [Coverage Type on page 466](#) field is set to **Inter-WACN Roaming**, this selection must be disabled; otherwise it considers this selection invalid.

When the [Coverage Type on page 466](#) field is set to **Intra-WACN Roaming**, and DVRS Hardware Enable field is enabled, this selection must be disabled; otherwise it considers this selection invalid.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the radio is model/option capable.

10.38.8.13

WUID Validity Support

This field causes the radio to periodically revalidate its Working Unit ID (WUID) with the Fixed Network Equipment (FNE).

A WUID is assigned to a radio during initial FNE registration/affiliation activity; any inbound Signaling Packet (ISP) request to the FNE containing the radio's WUID revalidates it with its current in-the-field Trunking System.

IMPORTANT: This selection is only required for an FNE that relies on the radio to track periods of inactivity and revalidate its WUID before it expires. This selection applies for the current Trunking System.

When disabled, the radio does not automatically revalidate its WUID because it is expecting the type of FNE that queries the radio after a period of inactivity before de-registering and removing the WUID from the Trunking System.

WARNING: When the [Coverage Type on page 466](#) field is set to **Inter-WACN Roaming**, this selection must be disabled; otherwise it considers this selection invalid.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the radio is model/option capable.

10.38.9

Digital (ASTRO 25 Trunking System)

The **Digital** section of the ASTRO 25 Trunking System set allows the user to view or define digital communication functionality.

NOTE: Individual Trunking Systems are referenced to a Trunking Personality. These Trunking Systems settings can then become functional for all channel types within that Trunking Personality.

10.38.9.1

Adaptive Power

This field enables the radio to automatically adjust its transmitter power level on the voice channel, not on the control channel, based on the signal strength of the Auto Power Adaptation Link Control (APA LC) information received over the air.

If the signal strength is better than the acceptable threshold, the radio transmits in mid power instead of high power. This selection applies for the current Trunking System.

NOTE: If you press the PTT button a second time within 30 seconds when APA is enabled for F2 TDMA secure mode, the radio transmits on medium power if the current power level is set to high. If the time exceeds 30 seconds, the power level remains high.

Accessed Only: When the [TX Power Level on page 474](#) Tx Power Level field is not set to **Low**, and when the radio is model/option capable.

10.38.9.2

Preamble Length

This field selects a number that determines the amount of time that bit sync preamble packets are sent at the beginning of all ASTRO 25 Voice Channel transmissions for the current Trunking System.

These packets allow transmitting and receiving radios to synchronize with each other before an ASTRO 25 transmission.

NOTE: The Preamble duration is equal to this Preamble Length value multiplied by 0.2083 ms.

Accessed Only: When the radio is model/option capable.

Table 283: Range

Minimum	Maximum
0	255

10.38.9.3

High Deviation Tx

This field enables the radio to transmit ASTRO voice and/or data with increased deviation.

A high transmit deviation is only necessary if the radio is to be used in vehicles or applications which subject the unit to a speed in excess of 160 mph (approx. 257 km/h). This feature applies for the current Trunking System.

WARNING: Do not enable this field unless the physical radio system has been similarly configured and increased transmit deviation has been identified as necessary. Enabling this parameter indiscriminately may result in severe degradation of radio performance.

Accessed Only: When the System Type field is set to **Type II**, and when the radio is model/option capable.

10.38.9.4

Digital Modulator Type

This field selects the Digital Modulator Type for the current Trunking System.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

C4FM (Factory Default for Type II Trunking)

Continuous 4-Level Frequency Modulation for non-simulcast operation.

CQPSK (Factory Default for ASTRO 25 Trunking)

Compatible Quadrature Phase Shift Keying for narrowband simulcast operation and non-simulcast operation.

IMPORTANT: This selection is only available to radio models equipped with Common Air Interface (CAI) Digital Operation.

WIDE

Wideband simulcast operation.

IMPORTANT: This selection cannot be chosen if a Channel Bandwidth of 12.5 kHz is selected.

10.38.9.5

TDMA Frame Sync BER Threshold

This field selects the maximum allowable Time Division Multiple Access (TDMA) Bit Error Rate (BER) tolerated by a radio on an X2 or Phase 2 TDMA voice channel.

NOTE: The TDMA BER is calculated during the frame sync portion of a TDMA voice transmission. If a BER greater than this maximum is detected, the radio attempts to switch to a better site when available. This selection applies for the current Trunking System.

Accessed Only: When the System Type field is set to **ASTRO 25**, and when the [Phase 2 Voice Capable on page 552](#) field is **Enabled** and when the radio is model/option capable.

Table 284: Range

Minimum	Maximum	Increments
Disabled	25.4%	0.1%

10.38.9.6

FDMA Frame Sync/NID BER Threshold

This field selects the maximum allowable Frequency Division Multiple Access (FDMA) Frame Sync/ Network ID (NID) Bit Error Rate (BER) tolerated by a radio on a Trunking site.

This maximum applies to both the control channel and the voice channel. If a BER greater than this maximum is detected, the radio attempts to switch to a better site when available. This selection applies for the current Trunking System.

Accessed Only: When the [Coverage Type on page 466](#) field is not set to **Disabled**, and when the radio is model/option capable.

Table 285: Range

Minimum	Maximum	Increments
Disabled	25.4%	0.1%

10.38.10

Secure / Multikey (ASTRO 25 Trunking System)

The **Secure / Multikey** section of the ASTRO 25 Trunking System set allows the user to view or define security and multikey functionality for secure-encoded transmit and receive communications. This functionality can be customized on a per Trunking System basis.

NOTE: Individual Trunking Systems are referenced to a Trunking Personality. These Trunking Systems settings can then become functional for all channel types within that Trunking Personality.

10.38.10.1

DES-XL Tx/Rx Default

This field enables only digital Data Encryption Standard - Extended Range (DES-XL) to be used for all secure encrypted voice calls.

DES-XL is a Type 3 encryption standard (mid-level). This selection applies for the current Trunking System.

When disabled, only digital Data Encryption Standard - Output Feedback (DES-OFB) is used for all secure encrypted voice calls. DES-OFB is a Type 3 encryption standard (mid-level).

WARNING: This feature only applies when the radio is equipped with a DES-XL/DES-OFB dual algorithm encryption module.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware**, and when the radio is model/option capable.

10.38.10.2

ASTRO OTAR

Enables the radio's ability to receive ASTRO 25 Over-The-Air-Rekeying (OTAR) for the current Trunking System.

IMPORTANT:

When this ASTRO OTAR field is **Enabled** for the current Trunking System, Hardware Key Select values are chosen from the Secure Hardware Encryption Key References List of the Secure KMF Profile selected in the [ASTRO OTAR Profile Index on page 557](#) field for the current Trunking System.

WARNING: Be aware that the RadioCentral is actually pointing to the Keys of the Encryption Key List for this selection; individual Keys from the Secure Hardware Encryption Key References List reference the Encryption Key List's Keys from the Encryption Key Reference field. Therefore any key selected when ASTRO OTAR is enabled, must first be defined in the Secure Hardware Encryption Key References List.

When this ASTRO OTAR field is **Disabled** for the current Trunking System, Hardware Key Select values are directly chosen from the Secure Wide Window's Encryption Key List.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the [Advanced Encrypted Standard \(AES256\) on page 273](#) field is enabled, and

when the [OTAR Enable on page 273](#) field is enabled, and

when the [ASTRO OTAR Enable on page 274](#) field is enabled, and

when the ASTRO OTAR field is enabled, and

when the current Trunking System has a referenced Data Profile, and

when the radio is model/option capable.

10.38.10.3

OTAR Tx

This field enables the radio to transmit ASTRO Over-The-Air-Rekeying (OTAR) information for the current Trunking System.

OTAR transmissions include: Rekey Requests and Delayed Acks.

WARNING: Your ability to initiate Rekey Requests must be programmed.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the [Advanced Encrypted Standard \(AES256\) on page 273](#) field is enabled, and

when the OTAR Operation field is set to **ASTRO Only** or **ASTRO & MDC**, and

when the System Type field is set to **ASTRO 25**, and

when the ASTRO OTAR Profile Index field is enabled, and

when the current Trunking System has a referenced Data Profile, and

when the radio is model/option capable.

10.38.10.4

ASTRO OTAR Profile Index

This field selects the Secure Key Management Facility (KMF) Profile to be used while operating in ASTRO OTAR mode.

This selection applies for the current Trunking System.

NOTE: All ASTRO OTAR parameters specified in the selected KMF profile then apply for the current Trunking System.

WARNING: This field is invalid when this system references a Data Profile having a Data Profile Type of **Trunking**, **Trunking & Broadband** or **Broadband Only**, and when the KMF IP Address field is set to 0.0.0.0.

IMPORTANT:

When the [ASTRO OTAR on page 557](#) field is **Disabled** for the current Trunking System, Hardware Key Select values are directly chosen from the Secure Wide Window's Encryption Key List.

When the ASTRO OTAR field is **Enabled** for the current Trunking System, Hardware Key Select values for this System use the Secure Hardware Encryption Key References List of the Secure KMF Profile selected in this [ASTRO OTAR Profile Index on page 557](#) field for the current Trunking System.

WARNING: Be aware that it is actually pointing to the Keys of the Encryption Key List for this selection; individual Keys from the Secure Hardware Encryption Key References List reference the Encryption Key List's Keys from the Hardware Key Reference field. Therefore any key selected when ASTRO OTAR is enabled, must first be defined in the Secure Hardware Encryption Key References List.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and [Advanced Encrypted Standard \(AES256\) on page 273](#) is enabled, and

when the OTAR Operation field is set to **ASTRO Only** or **ASTRO & MDC**, and

when the System Type is **ASTRO 25**, and

when the current Trunking System has a referenced Data Profile, and when the radio is model/option capable

The following selections are supported:

Disabled

ASTRO OTAR Profiles

10.38.10.5

Patch Key Select

This field selects the secure encryption key to be used during Patch Talkgroup communications while operating in secure encrypted mode.

Patch Talkgroups allow a dispatcher to join multiple talkgroups or users together so that all may communicate as one talkgroup. This selection applies for the current Trunking System.

IMPORTANT:

When the [ASTRO OTAR on page 557](#) field is **Enabled** for the current Trunking System, this Key Select value is chosen from the Secure Hardware Encryption Key References List of the Secure KMF Profile selected in the [ASTRO OTAR Profile Index on page 557](#) field for the current Trunking System.

WARNING: Be aware that it is actually pointing to the Keys of the Encryption Key List for this selection; individual Keys from the Secure Hardware Encryption Key References List reference the Encryption Key List's Keys from the Encryption Key Reference field. Therefore any key selected when ASTRO OTAR is enabled, must first be defined in the Secure Hardware Encryption Key References List.

When this ASTRO OTAR field is **Disabled** for the current Trunking System, Hardware Key Select values are directly chosen from the Secure Wide Window's Encryption Key List.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware**, and when the radio is model/option capable,

Or when the [Secure Operation on page 272](#) field is set to **Software**, and when the System Type field is set to **ASTRO 25**, and when the radio is model/option capable.

10.38.10.6

Failsoft Secure/Clear Strapping

This field selects the strapping type used for Failsoft.

When the radio is model/option capable.

Select

Allows you to toggle on or off secure encrypted communications.

NOTE:

Either the Secure Tx Select button-press or the Secure Tx Select switch-toggle or the Secure menu-selection allows for your access to secure-encrypted communications.

Clear

Straps or commits the channel to normal (non-secure) Conventional communications operation.

Secure

Straps or commits the channel to Secure encrypted operation.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**.

10.38.10.7

Failsoft Key Select

This field selects the secure encryption key to be used for failsoft mode while operating in secure encrypted mode.

This selection applies for the current Trunking System.

IMPORTANT:

When the [ASTRO OTAR on page 557](#) field is **Enabled** for the current Trunking System, this Key Select value is chosen from the Secure Hardware Encryption Key References List of the Secure KMF Profile selected in the [ASTRO OTAR Profile Index on page 557](#) field for the current Trunking System.

WARNING: Be aware that it is actually pointing to the Keys of the Encryption Key List for this selection; individual Keys from the Secure Hardware Encryption Key References List reference the Encryption Key List's Keys from the Hardware Key Reference field. Therefore any key selected when ASTRO OTAR is enabled must first be defined in the Secure Hardware Encryption Key References List.

When the ASTRO OTAR field is **Disabled** for the current Trunking System, this Key Select value is directly chosen from the Secure Wide Window's Encryption Key List.

Accessed Only: When the radio is model/option capable, and when the [Secure Operation on page 272](#) field is set to **Hardware**,

Or when the [Secure Operation on page 272](#) field is set to **Software**, and when the System Type field is set to **ASTRO 25**, and when the Failsoft Secure/Clear Strapping field is not set to **Clear**

10.38.10.8

Private Call Secure/Clear Strapping

This field selects the strapping type used for Private Call.

When the radio is model/option capable.

Select

Allows you to toggle on or off secure encrypted communications.

NOTE:

Either the Secure Tx Select button-press or the Secure Tx Select switch-toggle or the Secure menu-selection allows for your access to secure-encrypted communications.

Clear

Straps or commits the channel to normal (non-secure) Conventional communications operation.

Secure

Straps or commits the channel to Secure encrypted operation.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**.

10.38.10.9

Private Call Key Select

This field selects the secure encryption key to be used for Private Call while operating in secure encrypted mode.

This selection applies for the current Trunking System. When the ASTRO OTAR Profile Index field for the current Trunking System is set to **Enabled**, the value for this field is selected from the Secure Encryption Key Reference List.

IMPORTANT: The application points to the Keys of the Encryption Key List for this selection. Individual Keys from the Secure Encryption Key References List reference the keys of the Encryption Key List from the Encryption Key References field. Therefore, keys must be defined in the Secure Encryption Key References List before the keys are available for selection. Keys taken from OTAR Profile with Independent Key List field enabled are available. When the ASTRO OTAR Profile Index field for the current Trunking system is **Disabled**, the value for this field is selected from the Encryption Key List within the Secure Wide window.

Accessed Only: When the radio is model/option capable, and when the [Secure Operation on page 272](#) field is set to **Hardware**,

Or when the [Secure Operation on page 272](#) field is set to **Software**, and when the System Type field is set to **ASTRO 25**, and when the Private Secure/Clear Strapping field is not set to **Hardware**

10.38.10.10

Interconnect Secure/Clear Strapping

This field selects the strapping type used for Interconnect.

When the radio is model/option capable.

Select

Allows you to toggle on or off secure encrypted communications.

NOTE:

Either the Secure Tx Select button-press or the Secure Tx Select switch-toggle or the Secure menu-selection allows for your access to secure-encrypted communications.

Clear

Straps or commits the channel to normal (non-secure) Conventional communications operation.

Secure

Straps or commits the channel to Secure encrypted operation.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**.

10.38.10.11

Interconnect Key Select

This field selects the secure encryption key to be used for an Interconnect call (phone mode) while operating in secure encrypted mode.

This selection applies for the current Trunking System.

IMPORTANT:

When the ASTRO OTAR Profile Index field is **Enabled** for the current Trunking System, this Key Select value is chosen from the Secure Encryption Key References List of the ASTRO OTAR Profile selected in the ASTRO OTAR Profile Index field for the current Trunking System.

WARNING: Be aware that it is actually pointing to the Keys of the Encryption Key List for this selection; individual Keys from the Secure Encryption Key References List reference the Encryption Key List's Keys from the Hardware Key Reference field. Therefore any key selected when ASTRO OTAR Profile Index is enabled must first be defined in the Secure Encryption Key References List. Keys taken from OTAR Profile with Independent Key List field enabled are available.

The application points to the Keys of the Encryption Key List for this selection. Individual Keys from the Secure Encryption Key References List reference the keys of the Encryption Key List from the Encryption Key References field. Therefore, keys must be defined in the Secure Encryption Key References List before the keys are available for selection.

When the ASTRO OTAR Profile Index field for the current Trunking system is **Disabled**, the value for this field is selected from the Encryption Key List within the Secure Wide window.

Accessed Only: When the radio is model/option capable, and when the [Secure Operation on page 272](#) field is set to **Hardware**,

Or when the [Secure Operation on page 272](#) field is set to **Software**, and when the System Type field is set to **ASTRO 25**, and when the Interconnect Secure/Clear Strapping field is not set to **Hardware**

10.38.10.12

Dynamic Regrouping Secure/Clear Strapping

This field selects the strapping type used for Dynamic Regrouping.

When the radio is model/option capable.

10.38.10.13

Dynamic Talkgroup Key Select

This field selects the secure encryption key to be used for a Dynamic Regrouping (Dynamic Talkgroup) while operating in secure encrypted mode.

This selection applies for the current Trunking System.

IMPORTANT:

When the [ASTRO OTAR on page 557](#) field is **Enabled** for the current Trunking System, this Key Select value is chosen from the Secure Hardware Encryption Key References List of the Secure KMF Profile selected in the [ASTRO OTAR Profile Index on page 557](#) field for the current Trunking System.

WARNING: Be aware that it is actually pointing to the Keys of the Encryption Key List for this selection; individual Keys from the Secure Hardware Encryption Key References List reference the Encryption Key List's Keys from the Encryption Key Reference field. Therefore any key selected when ASTRO OTAR is enabled must first be defined in the Secure Hardware Encryption Key References List.

When the ASTRO OTAR field is **Disabled** for the current Trunking System, this Key Select value is directly chosen from the Secure Wide Window's Encryption Key List.

Accessed Only: When the radio is model/option capable, when the [Dynamic Regrouping Enable on page 477](#) field is **Enabled**, and when the Secure Operation field is set to **Hardware**,

Or when the [Secure Operation on page 272](#) field is set to **Software**, and when the System Type field is set to **ASTRO 25**, and when the Dynamic Regrouping Secure/Clear Strapping field is not set to **Hardware**

10.38.10.14

ViQi: Virtual Partner Secure/Clear Strapping

This field allows you to select the strapping type used for ViQi: Virtual Partner.

This selection applies to LMR operation.

Clear

Straps or commits the channel to normal (non-secure) Conventional communications operation.
This is the default setting.

Select

Allows the radio-user to toggle on or off secure encrypted communications.

NOTE:

Either the Secure Tx Select button-press or the Secure Tx Select switch-toggle or the Secure menu-selection allows for radio-user access to secure-encrypted communications.

Secure

Straps or commits the channel to Secure encrypted operation.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the radio is model/option capable.

10.38.10.15

ViQi: Virtual Partner Key Select

This field allows you to select the secure encryption key to be used for a ViQi: Virtual Partner while operating in secure encrypted mode.

This selection applies for the current Trunking System.

IMPORTANT:

When the [ASTRO OTAR on page 557](#) field is **Enabled** for the current Trunking System, this Key Select value is chosen from the Secure Hardware Encryption Key References List of the Secure KMF Profile selected in the [ASTRO OTAR Profile Index on page 557](#) field for the current Trunking System. This selection applies to LMR operation.

WARNING: Be aware that the program is pointing to the Keys of the Encryption Key List for this selection; individual Keys from the Secure Hardware Encryption Key References List reference the Encryption Key List's Keys from the Hardware Key Reference field. Any key selected when ASTRO OTAR is enabled must first be defined in the Secure Hardware Encryption Key References List.

When the ASTRO OTAR field is **Disabled** for the current Trunking System, this Key Select value is directly chosen from the Secure Wide Window's Encryption Key List.

Accessed Only: When the radio is model/option capable, and when the [Secure Operation on page 272](#) field is set to **Hardware** or when the [Secure Operation on page 272](#) field is set to **Software** for an [ASTRO 25 Trunking System on page 524](#).

10.38.10.16

Auto Key ID Rx

This field allows the radio to unmute Key ID (KID) and Algorithm ID (ALGID) received Over the Air (OTA) and Talkback using the OTA KID and ALGID during the configured Rx or Tx Key ID Hang Time.

NOTE: Receiving another call with a different Mismatch Key during either [Key ID - Rx Hang Time on page 285](#) or [Keyset ID - Tx Hang Time on page 285](#) overwrites the previously Mismatch Key with the new Key.

Accessed Only: When the [Secure Operation on page 272](#) field is not **Disabled**, and when the System Type field is set to "ASTRO 25", and the radio is model/option capable.

10.38.11

Talkgroup (ASTRO 25 Trunking System)

The **Talkgroup** section of the ASTRO Trunking System set allows the user to view or define individual Talkgroup functionality for individual Trunking Systems. A Talkgroup is an RadioCentral defined grouping of radios created for the purpose of frequent and convenient communication with each other.

NOTE: Talkgroup frequencies are determined by the in-the-field Trunking System and are not setup in RadioCentral.

NOTE: Trunking Personality Failsoft Frequencies must be setup within RadioCentral.

Once defined, a Talkgroup can be assigned to one or more channels of the radio's Channel Selector from the [Zones Channel Assignment on page 605](#) and Channel List Set Trunking Talkgroup field.

10.38.11.1

Talkgroup Name

This field allows you to define recognizable names for the current Talkgroup (record/row).

This selection applies to the current Trunking Personality.

Accessed Only: When the radio is model/option capable.

NOTE: **Examples:** PerTG-001, #500, Electric1, # A5.

Characters, numbers, spaces, and special characters can be used.

Leading blanks are substituted with underscores in the radio's display.

Leading periods do not appear in the radio's display.

10.38.11.2

Talkgroup ID

This field allows you to enter (in decimal or hex format) the Talkgroup number that uniquely identifies the current talkgroup (record/row).

This selection applies to the current Trunking Personality.

Accessed Only: When the referenced Trunking System has ((a Software System Key File or an Advanced System Key with access selected in the System ID field) Or, (an Advanced WACN Key with access selected in the Home WACN ID field)),

And, when the radio is model/option capable.

Table 286: Range

For Protocol Type	Disabled	Minimum	Maximum
ASTRO 25	None	0001 hex	FFFE hex
Type II	None	001 hex	FFE hex

IMPORTANT: The selection range may be modified on a per Advanced Key basis by the Advanced Keys Administrator program.

10.38.11.3

Priority Talkgroup

This field allows you to call the dispatcher when Priority Dispatch button is pressed and followed by the PTT button.

Accessed Only: When the System Type field is set to **ASTRO 25** and when the DVRS Profile field is set to **Disabled**.

The following selection is supported:

None

Default value. Applies to all the created talkgroups from the current Personality set.

10.38.11.4

Secure/Clear Strapping

This field selects the secure encryption transmit and receive mode for the current talkgroup (record/row).

This selection applies for the current Trunking Personality.

Accessed Only: When the referenced Trunking System has ((a Software System Key File or an Advanced System Key with access selected in the [System ID on page 467](#) field) or (an Advanced WACN Key with access selected in the [Home WACN ID on page 598](#) field)), and when the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the [Protocol Type](#) field is set to **ASTRO 25**, and when the radio is model/option capable.

The following selections are supported:

Clear

Straps or commits the channel to normal (non-secure) communications.

Select

Allows you to toggle on or off secure encryption mode. Either the Secure Tx Select button-press, the [Secure Tx Select on page 187](#) switch-toggle, or the Secure menu-selection must be selected in order for you to toggle on or off Secure-encrypted communications.

Secure

Straps or commits the channel to secure encrypted communications.

10.38.11.5

Key Select

This field selects the secure encryption key to be used in secure encryption mode for the current talkgroup (record/row).

This selection applies for the current talkgroup of the current Trunking Personality.

IMPORTANT:

When the [ASTRO OTAR Profile Index on page 373](#) field is not Disabled for the current ASTRO Talkgroup List, this Key Select value is chosen from the [Secure Hardware Encryption Key References List on page 290](#) of the Secure KMF Profile selected in the KMF Profile Index field.

WARNING: Be aware that the RadioCentral is actually pointing to the Keys of the [Encryption Key List on page 286](#) for this selection; individual Keys from the Secure Hardware Encryption Key References List reference the Encryption Key List's Keys from the [Encryption Key Reference on page 291](#) field. Therefore any key selected when ASTRO OTAR is enabled, must first be defined in the Secure Hardware Encryption Key References List.

When the KMF Profile Index field is Disabled or not applicable (grayed-out) for the current ASTRO Talkgroup List, this Key Select value is directly chosen from the Secure Encryption Key List.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the [Voice Secure/Clear Strapping on page 375](#) field is set to **Secure** or **Select**, and when the radio is model/option capable.

10.38.11.6

Talkgroup Failsoft

This field enables failsoft operation for the current talkgroup (record/row).

This selection applies for the current [Trunking Personality](#).

Accessed Only: When the referenced Trunking System has a Software System Key File or an Advanced System Key with access selected in the [System ID on page 467](#) field or an Advanced WACN Key with access selected in the [Home WACN ID on page 598](#) field, and when the [Failsoft Type on page 502](#) field is set to **Talkgroup**, and when the radio is model/option capable.

10.38.11.7

Failsoft Rx Frequency

This field allows you to enter the failsoft Receive (Rx) frequency for the current talkgroup (record/row).

This selection applies for the current Trunking Personality.

WARNING: The Trunking Frequency Constraints applied to this selection are determined by this Personality's setting and the frequency band of the referenced Trunking System.

Accessed Only: When the referenced Trunking System has a Software System Key File or an Advanced System Key with access selected in the [System ID on page 467](#) field or an Advanced WACN Key with access selected in the [Home WACN ID on page 598](#) field, and when the [Failsoft Type on page 502](#) field is set to **Talkgroup**, and when the [Talkgroup Failsoft on page 498](#) field is **Enabled**, and when the radio is model/option capable.

10.38.11.8

Failsoft Tx Frequency

This field allows you to enter the failsoft Transmit (Tx) frequency for the current talkgroup (record/row).

This selection applies for the current [Trunking Personality](#).

WARNING: The Trunking Frequency Constraints applied to this selection are determined by this Personality's setting and the frequency band of the referenced Trunking System.

Accessed Only: When the referenced Trunking System has a Software System Key File or an Advanced System Key with access selected in the [System ID on page 467](#) field or an Advanced

WACN Key with access selected in the Home WACN ID field, and when the [Failsoft Type on page 502](#) field is set to **Talkgroup**, and when the [Talkgroup Failsoft on page 498](#) field is **Enabled**, and when the radio is model/option capable.

10.38.11.9

TG Secondary Failsoft

This field enables secondary failsoft operation for the current talkgroup (record/row).

This selection applies for the current trunking personality.

Accessed Only: When the [Failsoft Type on page 502](#) field is set to **Talkgroup**, and when the [Talkgroup Failsoft on page 498](#) field is enabled, and when the radio is model/option capable.

10.38.11.10

Secondary Failsoft Rx Frequency

This field allows you to enter the secondary failsoft Receive (Rx) frequency for the current talkgroup (record/row).

This selection applies for the current trunking personality.

WARNING: The Trunking Frequency Constraints applied to this selection are determined by this personality's [Protocol Type](#) setting and the frequency band of the referenced [Trunking System](#).

Accessed Only: When the [Failsoft Type on page 502](#) field is set to **Talkgroup**, and when the [Talkgroup Failsoft on page 498](#) field is **Enabled**, and when the [TG Secondary Failsoft on page 499](#) field is **Enabled**, and when the radio is model/option capable.

10.38.11.11

Secondary Failsoft Tx Frequency

This field allows you to enter the secondary failsoft transmit (Tx) frequency for the current talkgroup (record/row).

This selection applies for the current trunking personality.

IMPORTANT: The Trunking Frequency Constraints applied to this selection are determined by this personality's [Protocol Type](#) setting and the frequency band of the referenced [Trunking System](#).

Accessed Only: When the [Failsoft Type on page 502](#) field is set to **Talkgroup**, and when the [Talkgroup Failsoft on page 498](#) field is **Enabled**, and when the [TG Secondary Failsoft on page 499](#) field is **Enabled**, and when the radio is model/option capable.

10.38.11.12

TG System ID

This field allows you to enter (in decimal or hex format) the three-digit Talkgroup System (Trunking System) ID that is needed when Intra-WACN Roaming or Inter-WACN Roaming is the referenced Trunking System's selected [Coverage Type on page 466](#)

This selection applies to the current talkgroup (record/row) which applies to the current [Trunking Personality](#).

Accessed Only: When the [Protocol Type](#) is set to **ASTRO 25**, and when the referenced Trunking System has its [Coverage Type on page 466](#) field set to **Intra-WACN Roaming** or **Inter-WACN Roaming**, and when the radio is model/option capable.

Table 287: Range

Minimum	Maximum
000 (Hex)	FFE (Hex)

IMPORTANT: Factory Default = 1. A value of "0" causes the radio to copy the value of the [System ID on page 467](#) field for the currently referenced [Trunking System](#) to this field.

10.38.11.13

TG WACN ID

This field allows you to enter (in decimal or hex format) the five-digit [Talkgroup](#) WACN (Wide Area Communications Network) ID that is needed when Inter-WACN Roaming is the referenced trunking system's selected [Coverage Type on page 466](#).

This selection applies to the current [Talkgroup](#) (record/row) which applies to the current [Trunking Personality](#).

Accessed Only: When the [Protocol Type](#) is set to **ASTRO 25**, and when the referenced Trunking System has its [Coverage Type on page 466](#) field set to **Inter-WACN Roaming**, and when the radio is model/option capable.

Table 288: Range

Minimum	Maximum
00000 (Hex)	FFFFE (Hex)

IMPORTANT: Factory Default = 1. A value of "0" causes the radio to copy the value of the [Home WACN ID on page 598](#) field for the currently referenced [Trunking System](#) to this field.

10.39

ASTRO 25 Trunking Personality

The **ASTRO 25 Trunking Personality** allows the user to create and delete Trunking Personalities, as well as define individual Trunking Personalities. Trunking and Conventional are the two radio communications modes.

NOTE: Trunking Systems are referenced to a Trunking Personalities. Trunking System settings can then become functional for all Trunking - channel types.

Once the features of the Trunking Personalities have been uniquely defined, each Personality may then be assigned to the desired position of the radio's channel selector with the Zone Channel Assignment feature.

10.39.1

General (ASTRO 25 Trunking Personality)

The **General** section of the ASTRO 25 Trunking Personality set allows the user to view or define basic functionality for individual Trunking Personalities.

NOTE: Once the features of the Trunking Personalities have been uniquely defined, each Personality can then be assigned to the desired position of the radio's channel selector using the Zone Channel Assignment feature.

10.39.1.1

Trunking Personality Name

This field allows you to define a recognizable name for the current Trunking Personality.

NOTE: Once the features of the Trunking Personalities have been uniquely defined, each Personality may then be assigned to the desired position of the radio's channel selector with the Zone Channel Assignment feature. This name is used to select the current Personality on the Channels Page of that feature.

Accessed Only: When the radio is model/option capable.

NOTE:
Examples: Personality-01, #500, Electric1, # A5
Characters, numbers, spaces, and special characters can be used.
Leading blanks are substituted with underscores in the radio's display.
Leading periods do not appear in the radio's display.

10.39.1.2

System

This field selects the programmed Trunking System for the current Trunking Personality.

IMPORTANT:
Only Trunking Systems having a System Type matching the current Personalities' Protocol Type should be selected.

Only Trunking Systems with Software System Key Files or Advanced (Hardware) Keys that have no field or feature protection (unlimited access) can be selected; otherwise this field is marked invalid.

When this field's value is marked invalid, all System Key protected fields in the current Trunking Personality are displayed as read-only.

Accessed Only: When the radio is model/option capable.

10.39.1.3

Time Out Timer

This field selects the amount of time that the radio can continuously transmit for the current Trunking Personality.

When this time is about to expire, the radio sounds an alert tone and automatically stops transmitting. Time is in seconds.

Accessed Only: When the radio is model/option capable.

NOTE: When set to **Infinite:**
No timer used for APX Next and APX N70 Radios; therefore an infinite talk time.

Table 289: Range

Radio Type	Minimum	Maximum	Increments
Non-APX4000XH Radios	15 sec	465 sec	15 sec
APX4000XH Radios	15 sec	60 sec	15 sec

Table 290: Range

Radio Type	Minimum	Maximum	Increments
APX NEXT	0 sec	465 sec	15 sec

10.39.1.4

Advanced RF AGC

This field selects the type of Receive Frequency (RF) Automatic Gain Control (AGC) for the current Trunking Personality.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Disabled

When **Disabled**, the radio uses a basic form of AGC built in to radio's receiver. This built-in protection helps to avoid signal clipping and receiver saturation that may damage radio components.

Standard

Enables an Advanced form of RF AGC, which attempts to protect against intermodulation (IM) interference by detecting and removing any received interference due to external sources.

Enhanced

Enables the radio to use additional schemes to reduce IM interference, which cleans up the signal.

Smart

Enables the radio to use a unique scheme to improve interference immunity when close to Linear Simulcast and APCO phase 2 Base stations. Smart option is mutually exclusive to the Broadband Protection checkbox.

IMPORTANT: **Standard** and **Enhanced** Advanced RF AGC may degrade performance on channels that do not experience any IM interference. Therefore, only enable these selections on channels known to experience IM interference.

10.39.1.5

Broadband Protection

This field allows you to enable Broadband Protection of the current Trunking Personality.

Broadband Protection enhances Advanced RF AGC by adding a high selectivity broadband filter when receiving at selected frequencies within the 700 MHz and 800 MHz bands.

10.39.1.6

Conversation Type

This field selects the communication mode for the current Trunking Personality.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Message

The system assigns a traffic channel for the duration of a single transmission by one radio. When the radio de-keys, all radio remain on the traffic channel until the traffic channel hang time expires. Once the hang time expires the radios return to the control channel. Any radio involved in the call may key up while it is on the traffic channel without returning to the control channel. Message trunking is available on 3600 baud control channel systems.

WARNING: Message trunking is not compatible with ASTRO 25 Systems.

Transmission

The system assigns a traffic channel for the duration of a single transmission by one radio. When the radio de-keys, the traffic channel is deallocated and all subscribers involved in the call return to the control channel. Any subsequent traffic channel requests are sent in on the control channel by the requesting radio.

PTT ID

The system assigns a traffic channel for the duration of the entire conversation as follows. After a radio de-keys, the voice channel stays active (hang time) during which time the radios stay idle on the voice channel. Any radio responding during this hang time will first key up on the control channel to send a message with the unit's PTT-ID (Unit ID) indicating the radio wants to send audio now for this call; the system then sends a grant message directing the radio back to the same voice channel acting as the new source.

10.39.1.7

Failsoft Type

This field selects the type of Failsoft for the current Trunking Personality.

NOTE: Failsoft offers two-way Conventional Mode operation during Trunking system failure. The Radio automatically returns to the Trunked mode once the Trunking System is restored.

Accessed Only: When the referenced Trunking System has a Software System Key File or an Advanced System Key with access selected in the System ID field, or an Advanced WACN Key with access selected in the Home WACN ID field, and when the radio is model/option capable.

The following selections are supported:

Selections	Definitions	Available to you when	
		Protocol Type Equals	Coverage Type Equals
Disabled	No Failsoft is used.	Any	Any
Personality	<p>When the Coverage Type on page 466 is Disabled, which is SmartNet, Failsoft uses the Personality Failsoft Frequencies for all Talkgroups within this Trunking personality.</p> <p>When the Coverage Type equals SmartZone the Personality Failsoft Frequencies are not used; instead:</p> <ul style="list-style-type: none"> • When the radio is Site Locked, Failsoft uses the last active control channel. • When the radio is Site Unlocked, Failsoft uses the last active control channel. If Failsoft is still not found, the radio scans the List of Control Channels for Failsoft. 	Type II	Any
Talkgroup	When the Coverage Type is Disabled , which is SmartNet:	Any	Any

Selections	Definitions	Available to you when	
		Protocol Type Equals	Coverage Type Equals
	<ul style="list-style-type: none"> Failsoft uses the Failsoft Talkgroup Frequencies, or  WARNING: The Talkgroup Failsoft field must be Enabled. Failsoft may use the Announcement Group Failsoft Frequencies when Failsoft is called from an Announcement Group.  WARNING: The Announcement Group Failsoft on page 512 field must be Enabled. If neither of above fields are Enabled, the radio uses the last active control channel. <p>When the Coverage Type equals SmartZone:</p> <ul style="list-style-type: none"> When the radio is Site Locked and when the Talkgroup Failsoft field is Enabled, Failsoft uses the Failsoft Talkgroup Frequencies; if Failsoft is still not found, Failsoft uses the last active control channel. If the Talkgroup Failsoft field is not Enabled, Failsoft uses the last active control channel. When the radio is Site Unlocked and when the Talkgroup Failsoft field is Enabled, Failsoft uses the Failsoft Talkgroup Frequencies; if Failsoft is still not found, Failsoft uses the last active control channel. If Failsoft is still not found, the radio scans the List of Control Channels from the referenced Trunking System for Failsoft. If the Talkgroup Failsoft field is not Enabled, Failsoft uses the last active control channel and then may still need to scan the list of Control Channels. 		

10.39.1.8

Transmit Mode

This field selects whether the personality or channel will have full transmit functionality, or will be restricted from transmitting Talkgroup (TG) and Announcement Group (AG) voice communications.

This selection applies for the current Trunking Personality.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Unrestricted

No limits are placed on the transmit functionality.

TG/AG Disabled (Listen-only)

The radio is not able to transmit on the selected TG or AG. See the Trunking Talkgroup field. The radio is able to receive voice transmissions on the channel's selected mode.

WARNING:

Dynamic Regrouping is not compatible with this selection.

This Personality's [Emergency Profile Selection on page 505](#) must either be set to **Emergency Tx Disabled**, or the selected Profile must have its [Emergency Talkback on page 320](#) field set to **Revert**; otherwise the Emergency Profile field selection is considered invalid.

This Personality's referenced Scan List must not have its [Designated Voice Tx Member Type on page 622](#) field set to **Selected Channel**, meaning this channel; otherwise the [Scan List Selection on page 517](#) becomes invalid.

The [Hot Keypad \(DTMF\) on page 520](#) is not possible with this selection.

10.39.1.9

Emergency Profile Selection

This field selects the Trunking Emergency Profile to be used with the current Trunking Personality.

You can initiate Emergency mode functionality or launch it with a programmed radio

WARNING: When the [Transmit Mode on page 505](#) field is set to **TG/AG Disabled** (Listen-only mode) for the current Trunking Personality, this Profile selection must either be **Emergency Tx Disabled**, or the selected Profile must have its [Emergency Talkback on page 320](#) field set to **Revert**; otherwise it considers this selection invalid.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

- Emergency Tx Disabled
- Available Trunking Emergency Profiles

10.39.1.10

Emergency Revert Type

This field selects the **Non-Tactical** emergency revert type to be used while operating in emergency mode on the current Trunking Personality.

See also [Emergency Talkback on page 320](#).

WARNING: You can initiate Emergency mode functionality or launch it with a programmed radio.

Accessed Only: When the **Multiple Emergency Revert** Extended Feature appears in the Extended Feature Name field, and when a referenced Trunking Emergency Profile is selected for the current Trunking Personality, and when that Trunking Emergency Profile has its Emergency Talkback field set to **Revert**, and when the radio is model/option capable.

The following selections are supported:

Talkgroup Revert

The radio uses the Emergency Talkback Revert Talkgroup ID defined for the current Trunking Personality to transmit Emergency Alarms and/or Emergency Calls.

System Revert

The radio uses the [Emergency System Revert Zone on page 508](#) and the [Emergency System Revert Channel on page 509](#) to transmit Emergency Alarms and/or Emergency Calls. Emergency transmissions are also sent to the dispatcher console.

WARNING: Dynamic Regrouping is not compatible with this selection.

10.39.1.11

Emergency Talkback Revert Talkgroup ID

This field allows you to enter in decimal or hex format, the Talkgroup number that uniquely identifies the current talkgroup (record/row).

This selection applies to the current [Trunking Personality](#).

Accessed Only: When the referenced Trunking System has a Software System Key File or an Advanced System Key with access selected in the [System ID on page 467](#) field, or an Advanced WACN Key with access selected in the [Home WACN ID on page 598](#) field, and when the radio is model/option capable.

Table 291: Range

For Protocol Type:	Disabled	Minimum	Maximum
ASTRO 25	None	0001 (Hex)	FFFE (Hex)
Type II	None	001 (Hex)	FFE (Hex)

IMPORTANT: The selection range may be modified on a per Advanced Key basis by the Advanced Keys Administrator program.

10.39.1.12

Emergency Talkback Revert Secure/Clear Strapping

This field selects the transmit mode while operating in emergency mode for the Emergency Talkback Revert Talkgroup.

This selection applies for the current Trunking Personality.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the Protocol Type field is set to **ASTRO 25**.

The following selections are supported:

Clear

Straps or commits the talkgroup/channel to normal (non-secure) Trunking operation.

Select

Allows you to toggle on or off secure encrypted operation for the current the talkgroup. The Secure Tx Select button-press or the [Secure Tx Select on page 187](#) switch-toggle or the Secure menu-selection allows you to toggle on or off Secure encrypted communications.

Secure

Straps or commits the talkgroup to Secure encrypted operation.

10.39.1.13

Emergency Talkback Revert Key Select

This field selects the secure encryption key used while operating in emergency mode for the Emergency Talkback Revert Talkgroup.

This selection applies for the current Trunking Personality.

IMPORTANT:

When the [ASTRO OTAR Profile Index on page 557](#) field is **Enabled** for the referenced Trunking System, this Key Select value is chosen from the Secure Encryption Key References List of the ASTRO OTAR Profile selected in the ASTRO OTAR Profile Index field of the referenced Trunking System.

WARNING: Be aware that the it is actually pointing to the Keys of the Encryption Key List for this selection; individual Keys from the Secure Encryption Key References List reference the Encryption Key List's Keys from the Encryption Key Reference field. Therefore any key selected when ASTRO OTAR Profile Index field is enabled, must first be defined in the Secure Encryption Key References List. Keys taken from OTAR Profile with Independent Key List field enabled are available.

When the ASTRO OTAR Profile Index field is **Disabled** for the referenced Trunking System, this Key Select value is directly chosen from the Secure Wide Window's Encryption Key List.

WARNING:

When there is a match between the normal Talkgroup ID being used by other radios and this radio's Emergency Talkback Revert Talkgroup ID, and...

when there is not a match between the normal Talkgroup Key being used by other radios and this Emergency Revert Talkgroup Key...

The following is true:

- When this radio switches to its Emergency Talkback Revert Talkgroup ID using this key, this radio's emergency transmission is not heard by these other radios.
- However, the emergency transmission may be picked up by scan, even when there is not a key match.

Accessed Only: When the Emergency Talkback [Emergency Talkback Revert Secure/Clear Strapping on page 507](#) field is set to **Secure** or **Select**, and

When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the Protocol Type field is set to **ASTRO 25**, and when the radio is model/option capable.

10.39.1.14

Emergency System Revert Zone

This field selects a zone to be used for the duration of an emergency mode transmission.

This selection applies for the current Trunking Personality.

NOTE:

Once this zone is selected, the [Emergency System Revert Channel on page 509](#) may then be selected.

Zones and their channels must be previously defined in the Zone Channel Assignment Window.

WARNING: Only non-Dynamic Zones, zones that have Dynamic Zone Enable **Disabled** can be selected; otherwise, this field becomes invalid.

Accessed Only: When the **Multiple Emergency Revert** Extended Feature appears in the Extended Feature Name field, and when a valid referenced Trunking Emergency Profile is selected for the current Trunking Personality, and when that Trunking Emergency Profile has its [Emergency Talkback on page 320](#) field set to **Revert**, and when the [Emergency Revert Type on page 506](#) field is set to **System Revert**, and when the radio is model/option capable.

10.39.1.15

Emergency System Revert Channel

This field selects a Trunking or Conventional channel that is used for the duration of an emergency mode transmission.

This selection applies for the current Trunking Personality.

NOTE:

The [Emergency System Revert Zone on page 508](#) must be selected prior to selecting this channel.

Zones and their channels must be previously defined in the Zone Channel Assignment Window.

WARNING:

For APX™ 3000 Portable codeplugs, only the first 48 channels in the selected [Emergency System Revert Zone on page 508](#) are considered valid selections.

This Emergency System Revert Channel selection is only considered valid: when the [Trunking Talkgroup on page 608](#) field for the selected Trunking Personality/channel is not set to **DYN** or **ATG**, and when the [Receive Only Personality on page 389](#) field for the selected Conventional Personality/channel is **Disabled**, and when the ASTRO Talkgroup ID field for the selected Conventional Personality/channel is not set to **DYN** or **ATG**, and when the [Transmit Mode on page 505](#) field for the selected Trunking Personality/channel is not set to **TG/AG Disabled (Listen-only)**, and when the [Emergency Profile Selection on page 505](#) for the selected channel is not **Emergency TX Disabled**.

Accessed Only: When the **Multiple Emergency Revert** Extended Feature appears in the Extended Feature Name field, and when a referenced Trunking Emergency Profile is selected for the current Trunking Personality, and when that Trunking Emergency Profile has its [Emergency Talkback on page 320](#) field set to **Revert**, and when the [Emergency Revert Type on page 506](#) field is set to **System Revert**, and when the [Emergency System Revert Zone on page 508](#) field is not set to a Dynamic Zone, and when the radio is model/option capable.

10.39.2

Announcement Group (ASTRO 25 Trunking Personality)

The **Announcement Group** section of the ASTRO 25 Trunking Personality set allows the user to view and define Announcement Group parameters of individual Trunking Personalities. Announcement Groups allows the radio-user to initiate and communicate on one large communication channel comprised of all Talkgroups defined for the current Trunking Personality.

NOTE:

An Announcement Group (ATG) must be selected for this Trunking Personality from the [Zones Channel Assignment on page 605](#) and Channel List Set Trunking Talkgroup field. The ATG selection allows a channel to be specifically designated for Announcement Group purposes.

Once the features of the Trunking Personalities have been uniquely defined, each Personality can then be assigned to the desired position of the radio's channel selector using the Zone Channel Assignment feature.

10.39.2.1

Announcement Group

This field allows you to enter in decimal or hex format, the ID that uniquely defines the Announcement Group for the current Trunking Personality.

NOTE: Announcement Groups allow the radio to initiate and communicate on one large communication channel comprised of all talkgroups defined for the current Trunking Personality.

WARNING:

Announcement Group (ATG) must be selected for this Trunking Personality from the Zone Channel Assignment Channels Page's, [Trunking Talkgroup on page 608](#) field. The ATG selection allows a channel to be specifically designated for Announcement Group purposes.

The Personality is selected from the Zone Channel Assignment Channels Page's, [Personality on page 608](#) field.

Accessed Only: When the referenced Trunking System has a Software System Key File or an Advanced System Key with access selected in the [System ID on page 467](#) field, or an Advanced WACN Key with access selected in the [Home WACN ID on page 598](#) field, and when the radio is model/option capable.

Table 292: Range

For Protocol Type	Disabled	Minimum	Maximum
ASTRO 25	None	0001 (Hex)	FFFE (Hex)
Type II	None	001 (Hex)	FFE (Hex)

IMPORTANT: The selection range may be modified on a per Advanced Key basis by the Advanced Keys Administrator program.

10.39.2.2

AG Secure/Clear Strapping

This field selects the transmit and the receive mode for the Announcement Group of the current Trunking Personality.

Accessed Only: When the [Announcement Group on page 510](#) field is not set to **None**, and when the radio is model/option capable,

And

When the [Secure Operation on page 272](#) field must be set to **Hardware**, and when the [AG Voice/Signal Type on page 510](#) field is set to **Digital**, and when the referenced Trunking System's Channel Bandwidth is not set to **12.5 kHz**,

Or

When the Protocol Type field is set to **ASTRO 25**, and when the [Secure Operation on page 272](#) field must be set to **Hardware** or **Software**.

The following selections are supported:

Clear

Straps or commits the channel to normal (non-secure) Trunking Communications.

Select

Allows you to toggle on or off secure encryption mode.

The Secure Tx Select button-press or the [Secure Tx Select on page 187](#) switch-toggle or the Secure menu-selection must be selected in order for you to toggle on or off Secure encrypted communications.

Secure

Straps or commits the channel to secure encryption mode.

10.39.2.3

AG Key Select

This field selects the secure encryption key to be used for the Announcement Group of the current Trunking Personality.

This selection applies while operating in secure encrypted mode.

IMPORTANT:

When the [ASTRO OTAR on page 557](#) field is **Enabled** for the referenced Trunking System, this Key Select value is chosen from the Secure Encryption Key References List of the ASTRO OTAR Profile selected in the [ASTRO OTAR Profile Index on page 557](#) field of the referenced Trunking System.

WARNING: Be aware that it is actually pointing to the Keys of the Encryption Key List for this selection; individual Keys from the Secure Encryption Key References List reference the Encryption Key List's Keys from the [Encryption Key Reference on page 291](#) field. Therefore any key selected when ASTRO OTAR Profile is enabled must first be defined in the Secure Encryption Key References List. Keys taken from ASTRO OTAR Profile with Independent Key List field enabled are available.

When the ASTRO OTAR field is **Disabled** for the referenced Trunking System, this Key Select value is directly chosen from the Secure Wide Window's Encryption Key List.

Accessed Only: When the [AG Secure/Clear Strapping on page 510](#) field is not set to **Clear**, and when the [Announcement Group on page 510](#) field is not set to **None**, and when the radio is model/option capable,

And

When the [Secure Operation on page 272](#) field is set to **Hardware**, and when the [AG Voice/Signal Type on page 510](#) field is set to **Digital**,

Or

When the Secure Operation field is set to **Hardware**, and when the AG Voice/Signal Type field is set to **Analog**, and when the referenced Trunking System's Channel Bandwidth is not set to **12.5 kHz**,

Or

when the Protocol Type field is set to **ASTRO 25**, and when the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**.

10.39.2.4

Announcement Group Failsoft

This field enables Failsoft for the Announcement Group of the current Trunking Personality.

Accessed Only: When the referenced Trunking System has a Software System Key File or an Advanced System Key with access selected in the System ID field, or an Advanced WACN Key with access selected in the Home WACN ID field, and when the [Failsoft Type on page 502](#) field is set to **Talkgroup**, and when the [Announcement Group on page 510](#) field is not set to **None**, and when the radio is model/option capable.

10.39.2.5

AG Failsoft Rx Frequency

This field allows you to enter the Receive (Rx) frequency to be used during Failsoft operation for the Announcement Group of the current Trunking Personality.

WARNING: The Trunking Frequency Constraints applies to this selection are determined by this Personality's Protocol Type setting and the frequency band of the referenced Trunking System.

Accessed Only: When the referenced Trunking System has a Software System Key File or an Advanced System Key with access selected in the System ID field, or an Advanced WACN Key with access selected in the Home WACN ID field, and when the [Failsoft Type on page 502](#) field is set to **Talkgroup**, and when the [Announcement Group on page 510](#) field is not set to **None**, and when the [Announcement Group Failsoft on page 512](#) field is **Enabled**, and when the radio is model/option capable.

10.39.2.6

AG Failsoft Tx Frequency

This field allows you to enter the Transmit (Tx) frequency to be used during Failsoft operation for the Announcement Group of the current Trunking Personality.

WARNING: The Trunking Frequency Constraints applies to this selection are determined by this Personality's Protocol Type setting and the frequency band of the referenced Trunking System.

Accessed Only: When the referenced Trunking System has a Software System Key File or an Advanced System Key with access selected in the System ID field, or an Advanced WACN Key with access selected in the Home WACN ID field, and when the [Failsoft Type on page 502](#) field is set to **Talkgroup**, and when the [Announcement Group on page 510](#) field is not set to **None**, and when the [Announcement Group Failsoft on page 512](#) field is **Enabled**, and when the radio is model/option capable.

10.39.2.7

AG Secondary Failsoft

This field enables secondary Failsoft for the Announcement Group of the current Trunking Personality.

Accessed Only: When the [Failsoft Type on page 502](#) field is set to **Talkgroup**, and when the [Announcement Group on page 510](#) field is not set to **None**, and when the [Announcement Group Failsoft on page 512](#) field is **Enabled**, and when the radio is model/option capable.

10.39.2.8

AG Secondary F/S Rx Frequency

This field allows you to enter the secondary Receive (Rx) frequency to be used during Failsoft operation for the Announcement Group of the current Trunking Personality.

WARNING: The Trunking Frequency Constraints applies to this selection are determined by this Personality's Protocol Type setting and the frequency band of the referenced Trunking System.

Accessed Only: When the [Failsoft Type on page 502](#) field is set to **Talkgroup**, and when the [Announcement Group on page 510](#) field is not set to **None**, and when the [Announcement Group Failsoft on page 512](#) field is **Enabled**, and when the [AG Secondary Failsoft on page 512](#) field is **Enabled**, and when the radio is model/option capable.

10.39.2.9

AG Secondary F/S Tx Frequency

This field allows you to enter the secondary Transmit (Tx) frequency to be used during Failsoft operation for the Announcement Group of the current Trunking Personality.

WARNING: The Trunking Frequency Constraints applies to this selection are determined by this Personality's Protocol Type setting and the frequency band of the referenced Trunking System.

Accessed Only: When the [Failsoft Type on page 502](#) field is set to **Talkgroup**, and when the [Announcement Group on page 510](#) field is not set to **None**, and when the [Announcement Group Failsoft on page 512](#) field is **Enabled**, and when the [AG Secondary Failsoft on page 512](#) field is **Enabled**, and when the radio is model/option capable.

10.39.2.10

AG System ID

This field allows you to enter in decimal or hex format, the three-digit Announcement Group System (Trunking System) ID that is needed when Inter-WACN Roaming is the referenced Trunking System's selected Coverage Type.

This selection applies to the current Trunking Personality.

Accessed Only: When the referenced Trunking System's System Type field is set to **ASTRO 25**, and when the [Coverage Type on page 466](#) field is set to **Inter-WACN Roaming** and when the radio is model/option capable.

Table 293: Range

Minimum	Maximum
000 hex	FFE hex

10.39.2.11

AG WACN ID

This field allows you to enter (in decimal or hex format) the five-digit Announcement Group Wide Area Communications Network (WACN) ID that is needed when Inter-WACN Roaming is the referenced Trunking System's selected Coverage Type.

AG WACN ID applies to the current Trunking Personality.

Accessed Only: When the referenced Trunking System's System Type field is set to **ASTRO 25**, and when its [Coverage Type on page 466](#) field is set to **Inter-WACN Roaming** and when the radio is model/option capable.

Table 294: Range

Minimum	Maximum
00000 (Hex)	FFFFE (Hex)

10.39.3

Talkgroup (ASTRO 25 Trunking Personality)

The **Talkgroup** section of the ASTRO 25 Trunking Personality set allows the user to view or define individual Talkgroup functionality for individual Trunking Personalities. A Talkgroup is an RadioCentral

defined grouping of radios created for the purpose of frequent and convenient communication with each other.

NOTE: Talkgroup frequencies are determined by the in-the-field Trunking System and are not setup in RadioCentral.

NOTE: Trunking Personality Failsoft Frequencies must be setup within RadioCentral.

Once defined, a Talkgroup can be assigned to one or more channels of the radio's Channel Selector from the [Zones Channel Assignment on page 605](#) and Channel List Set Trunking Talkgroup field.

10.39.3.1

Talkgroup

Displays the RadioCentral-user recognizable name for the current Talkgroup (record/row).

This selection applies to the current Trunking Personality or ASTRO 25 Trunking Personality.

Accessed Only: When the radio is model/option capable.

10.39.3.2

Key Select

This field selects the secure encryption key to be used for the current talkgroup (record/row).

This selection applies for the current Trunking Personality.

IMPORTANT:

When the [ASTRO OTAR on page 557](#) field is **Enabled** for the referenced [Trunking System](#), this Key Select value is chosen from the Secure Encryption Key References List of the ASTRO OTAR Profile selected in the [ASTRO OTAR Profile Index on page 557](#) field of the referenced Trunking System.

WARNING: Be aware that it is actually pointing to the Keys of the [Encryption Key List on page 286](#) for this selection; individual Keys from the Secure Encryption Key References List reference the Encryption Key List's Keys from the [Encryption Key Reference on page 291](#) field. Therefore any key selected when ASTRO OTAR Profile Index is enabled, must first be defined in the Secure Encryption Key References List. Keys taken from OTAR Profile with Independent Key List field enabled are available.

Accessed Only: When the referenced Trunking System has (a Software System Key File or an Advanced System Key with access selected in the System ID field) or (an Advanced WACN Key with access selected in the Home WACN ID field), and

when the [Secure/Clear Strapping on page 497](#) for the current row/Talkgroup (of this table) is not set to **Clear**.

And

when the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**, and when the Protocol Type field is set to **ASTRO 25**, and when the radio is model/option capable.

10.39.3.3

Priority Talkgroup

This field allows you to call the dispatcher when Priority Dispatch button is pressed and followed by the PTT button.

Accessed Only: When the System Type field is set to **ASTRO 25** and when the DVRS Profile field is set to **Disabled**.

The following selection is supported:

None

Default value. Applies to all the created talkgroups from the current Personality set.

10.39.4

Call / Page (ASTRO 25 Trunking Personality)

The **Call / Page** section of the ASTRO 25 Trunking Personality set allows the user to view or define Private Call and Page functionality for individual Trunking Personalities. This functionality can apply to Trunking Call Hot List functionality.

NOTE: Once the features of the Trunking Personalities have been uniquely defined, each Personality can then be assigned to the desired position of the radio's channel selector using the Zone Channel Assignment feature.

10.39.4.1

Private Call Type

This field selects the type of Private Call for the current Trunking Personality.

You can initiate a Private Call with a Select/Private Call button-press or a [Select/Private Call on page 194](#) Call menu-selection. User in turn responds to a Private Call with a [Call Response on page 167](#) button-press.

The following selections are supported:

Disabled

The Private Call feature is disabled.

Available When the Protocol Type is Type II, or ASTRO 25

PC II

Private Call II permits call between two individual radios, regardless of talkgroups, without requiring the receiving radio to acknowledge the incoming call.

Available When the Protocol Type is Type II, or ASTRO 25

Enhanced Unit-to-Unit

Enhanced Private Call or Unit-to-Unit Private Call permits calls between two individual radios, regardless of talkgroup. The receiving radio will ring and is required to acknowledge the incoming call.

Available When the Protocol Type is Type II, or ASTRO 25

PC with CA

Enhanced Private Call or Unit-to-Unit Private Call, followed by an optional private Call Alert. See [Automatic Call Alert on page 516](#).

Available When the Protocol Type is Type II, or ASTRO 25

NOTE:

PC II is supported in "Analog" Trunking operation. See [AG Voice/Signal Type on page 510](#) and [Talkgroup on page 513](#) fields in the [Type II Trunking Personality on page 499](#).

There is a two minute delay for a PC II and Enhanced Private Call when operating in a 3600 trunking system, and six second delay when operating in a 9600 trunking system. No indication is displayed during the delay.

Accessed Only: When the radio is model/option capable.

10.39.4.2

Private Call Operation

This field selects the operation mode of the Private Call feature for the current Trunking Personality.

You can initiate a Private Call with a Select/Private Call button-press or a [Select/Private Call on page 194](#) menu-selection. User in turn responds to a Private Call with a [Call Response on page 167](#) button-press.

Accessed Only: When [Private Call Type on page 514](#) field is not set to **Disabled**, and when the radio is model/option capable.

The following selections are supported:

Response Only (Resp Only)

Allows the radio to accept Pages only.

List Only

Allows you to send Pages from the Call Hot List. For non-keypad models this option can be used only with the One Touch Button Feature. This feature is model/option dependent.

Unlimited

Allows you to send Pages from the Call Hot List and from the radio's keypad. This feature is model/option dependent.

WARNING: This selection is not available for Portable radios having only a top display.

10.39.4.3

Call Alert/Page Operation

This field selects Call Alert/Page functionality for the current Trunking Personality.

You can activate Call Alert Page Operation with a [Call Alert on page 167](#) button-press or [Page on page 199](#) menu-selection.

Accessed Only: When the radio is model/option capable, and when the DVRS Hardware Enable field is **Disabled**, or when the DVRS Hardware Enable field is **Enabled**, and when the current Trunking Personality's referenced DVRS Profile has its DVRS Remote Activation field set to **Disabled**.

The following selections are supported:

Disabled

Call Alert/Page functionality is unavailable.

Response Only (Resp Only)

Allows the radio to accept Pages only.

List Only

Allows you to send Pages from the Call Hot List. For non-keypad models this option can be used only with the One Touch Button Feature. This feature is model/option dependent.

Unlimited

Allows you to send Pages from the Call Hot List and from the radio's keypad. This feature is model/option dependent.

WARNING: This selection is not available for Portable radios having only a top display.

10.39.4.4

Trunking Call Hot List

This field selects the Call Hot List to be used for the current Trunking Personality.

The Call Hot List that is used is dependent on the Protocol Type field selection **Type II** or **ASTRO 25** for the current Trunking Personality. User uses the Call Hot List to transmit Private Calls and Pages.

Accessed Only: When [Private Call Operation on page 514](#) field is set to **List Only** or **Unlimited**, or when [Call Alert/Page Operation on page 515](#) field is set to **List Only** or **Unlimited**, and when the radio is model/option capable.

10.39.4.5

Automatic Call Alert

This field enables the radio to automatically transmit a private Call Alert in the event that the recipient of an enhanced or unit-to-unit Private Call did not respond to that call within a certain time period.

This feature applies for the current Trunking Personality and is applicable for both the ASTRO 25 and Type II Protocol Types.

Accessed Only: When the [Private Call Type on page 514](#) field is set to **PC with CA**, and when the radio is model/option capable.

10.39.4.6

Tone Signaling List

This field selects the Tone Signaling List to be used while operating in ASTRO 25 mode and on the current Trunking Personality.

NOTE: Tone Signaling List functionality is defined in the Tone Signaling List Page.

Accessed Only: When the Protocol Type field is set to **ASTRO 25**, and when the radio is model/option capable.

WARNING: The Tone List Type in the Tone Signaling List must be **Quik Call II**.

The following selections are supported:

- Tone Signaling Disabled
- Available Tone Signaling List

10.39.4.7

In-Call User Alert Enable

This field allows the radio to remain muted to affiliated talkgroup calls while operating on the current Trunking Personality.

Group and individual pages do unmute the radio for the alert tone to sound. The radio also unmutes to individual radio-to-radio calls such as Private Calls, Tone Signaling calls and Interconnect phone mode calls. This feature is very useful when you prefer to not hear affiliated talkgroup traffic, however needs-to remain in radio contact. The [Voice Mute on page 177](#) button-press or the [Voice Mute on page](#)

203 menu-selection allows you to toggle-on and off Voice Mute functionality for an In-Call User Alert enabled channel.

WARNING: When disabled, you are not able to toggle-on this feature for the current Trunking Personality.

IMPORTANT: Also, when Voice Mute is active:
An Individual or Group Page received by the radio does unmute the radio. Once the Page unmutes the radio, a voice call that follows can then be a group call that is heard over the radio's speaker.

If the radio's channel is changed Voice Mute is deactivated by the radio; Voice Mute must be reactivated if desired when returning to the channel.

If you press the PTT button, or launch Emergency Mode, or powers the radio off and back on, Voice Mute is deactivated by the radio.

The following call types may also be received:

- [Dynamic Regrouping Enable on page 477](#)
- [Radio Inhibit on page 473](#)
- [Out of Range Indicator on page 210](#)
- Failsoft
- [Site Trunking Indicator on page 211](#)
 - The Scan feature is not available.
 - Other display indications from group call such as receiving LED and PTT-ID (if enabled) function normally.

Accessed Only: When the radio is model/option capable, and when the [Call Alert/Page Operation on page 515](#) field is not set to **Disabled**,

Or when the Protocol Type field is set to **ASTRO 25**, and when the current Trunking Personality's [Tone Signaling List on page 583](#) field is referencing a Tone Signaling List that has at least one record/row where Unmute Enable is **Enabled**.

10.39.5

Features (ASTRO 25 Trunking Personality)

The **Features** section of the ASTRO 25 Trunking Personality set allows the user to view or modify miscellaneous Trunking Personalities features for the current Trunking Personality.

NOTE: Once the features of the Trunking Personalities have been uniquely defined, each Personality can then be assigned to the desired position of the radio's channel selector using the Zone Channel Assignment feature.

10.39.5.1

Scan List Selection

This field selects which Scan List is used by the radio while operating in the Scan Mode for the current Trunking Personality.

This Scan List then determines which callers the radio scans for, actively looks or listens for, and then considers unmuting for the current Trunking channel.

**NOTE:**

Scan List and Scan List Member functionality are defined in the Scan List Window.

Only Scan Lists having the **Priority Monitor** or the **Multi-System Talkgroup** selection in the [Scan Type on page 617](#) field are valid Scan List Selections for the current Trunking Personality.

Scan Lists having the **Intelligent Priority** selection in the Scan Type field are valid Scan List Selections for the current Conventional Personality without DVRS system.

You can initiate Scan List editing with a Scan List Programming switch-toggle, a Scan List menu-selection, or a long keypress duration of a Scan button-press.

**WARNING:**

When the [Transmit Mode on page 505](#) field is set to **TG/AG Disabled (Listen-only)** mode for the current Trunking Personality, this Personality's referenced Scan List must not have its [Designated Voice Tx Member Type on page 622](#) field set to **Selected Channel** (meaning this channel); otherwise it considers this selection invalid.

When the [Site Selectable Alert List Selection on page 536](#) for the referenced Trunking System is not **Disabled**, then this Personality's referenced Scan List must not be a **Multi-System Talkgroup** Scan Type; otherwise it considers this selection invalid.

The application considers this selection invalid when this personality is LTE Broadband-enabled, and this selected Scan List has any Scan List Member Channels having the following dependencies:

- Their Conventional Personality's [LTE Interference Frequency Present on page 395](#) field set to **Enabled**, or
- Their Trunking System's [LTE Interference Frequency Present on page 539](#) field is **True**, or
- Their Trunking System's [Coverage Type on page 466](#) field set to **Inter-WACN Roaming**.

A Trunking channel is LTE enabled when the Personality's referenced Trunking System has a referenced Data Profile having a [Data Profile Type on page 341](#) selection equal to **Trunking & Broadband** or **Broadband-Only**, and when that Data Profile's Broadband Source is **Internal LTE Modem**.

When the Personnel Accountability List Selection referenced Trunking System is not **Disabled**, then this Personality's referenced Scan List must not be **Multi-System Talkgroup** Scan Type; otherwise the it considers this selection invalid.

Accessed Only: When the radio is model/option capable.

10.39.5.2

Automatic Scan

This field causes the radio to automatically enter the Scan Mode, when you select (with the Channel Selector) the current Trunking Personality.

Automatic Scan is also invoked when the radio powers-up to the current channel.

When disabled, you are able to invoke the Scan Mode operation through a Scan button-press, a Scan switch-toggle or a Scan menu-selection, while operating on the current Trunking personality.

Accessed Only: When [Scan List Selection on page 517](#) field is not set to **None**, and when the radio is model/option capable.

10.39.5.3

Status Enable

This field enables you to select and transmit a programmed Status for the current Trunking Personality.

The statuses available to you are dependent the Personality's referenced Trunking System.

You can initiate the Status feature with a Status button-press, a Direct Status button-press, or Status menu-selection.

Accessed Only: When the radio is model/option capable.

10.39.5.4

Talk Permit Tone

This field enables the radio to sound an alert tone when a Control Channel access grant has been received from a repeater.

The feature applies for the current Trunking Personality.

Accessed Only: When the radio is model/option capable.

10.39.5.5

Ignore Rx Clear Voice

This field causes the radio to ignore all **Clear** (non-secure encrypted) voice communication while operating on the current Trunking Personality.

Accessed Only: When the [Secure Operation on page 272](#) field is set to **Hardware** or **Software**.

10.39.5.6

End Tx on Voice Absence

This field enables the radio, during a Trunking voice transmission, to automatically de-key when its on-board Digital Signal Processor (DSP) detects a lack of voice from the microphone for a period that exceeds the Voice Absence Timer.

This selection applies while operating on the current Trunking Personality.

WARNING: The feature does not operate when:

- An in-the-field radio is operating in Emergency Mode and either **Hot Mic Emergency** or **Emergency via Silent Audio** is currently active (see also Emergency Auto Transmit Mode), or
- The in-the-field radio is currently being remotely-monitored (see also Remote Monitor/Radio Trace Enable).

Accessed Only: When the radio is model/option capable.

10.39.5.7

Priority Dispatch Time Out Timer

This field selects the amount of time needed for you to press the Priority Dispatch button until Priority Dispatch exits. Time is in seconds.

Table 295: Range

Minimum	Maximum	Increments
1	255	1

Accessed Only: When the System Type field is set to **ASTRO 25**, and when DVRS Profile Selection field set to **Disabled**.

10.39.5.8

Hazard Zone Mode Personality

This field allows you to turn on the Hazard Zone Mode (HZM) using the concentric switch while operating on the current Trunking Personality.

NOTE: This field is only applicable for APX NEXT XN radio.

IMPORTANT: When HZM is **Enabled**, the following conditions must be fulfilled:

The system selected for the current trunking personality is set to an ASTRO25 system and the Emergency Alarm Rx Indicator field is enabled in the selected system.

Trunking Emergency Profile Selection field is connected to a trunking emergency profile, and is not set to **Emergency Tx Disabled**.

If Emergency Revert Type field is set to **System Revert**, the Revert Channel must set to match the HZM personality when HZM Personality field is checked.

Accessed Only: When the radio is the latest Fire Service Standards model.

10.39.5.9

SmartConnect Operation

Enables the SmartConnect feature for the current Trunking personality.

The Protocol Type for the personality must be set to "ASTRO 25".

The following selections are supported:

LMR

The talkgroups contained in the current personality operate as LMR only.

LMR Preferred

The talkgroups in the current personality will automatically switch from LMR to broadband based on the [Leave LMR RSSI Threshold on page 451](#) configuration. The talkgroups in the current personality will automatically switch from broadband back to LMR based on the [Return To LMR RSSI Threshold on page 459](#) configuration. LMR Preferred and Broadband Only are valid selections when the current Trunking Personality is referencing an ASTRO 25 Trunking System. The Data Profile Selection must reference to a valid data profile in which the SmartConnect Gateway Hostname and SmartConnect Gateway TLS Port Number are configured.

Broadband Only

The talkgroups in the current personality will operate on broadband only.

Accessed Only: When the Protocol Type is set to "ASTRO 25" and when the radio is model/option capable.

10.39.5.10

Tactical Public Safety UI Enable

This field enables several Tactical Public Safety (TPS) features that are related to Emergency Mode operation for the current ASTRO 25 Trunking Personality.

These features include the Radio Wide, Tactical Public Safety: Audible Emergency Beacon, Audible Emergency Beacon Routing, and Emergency Call De-key Sidetone.

Accessed Only: When the radio is model/option capable.

10.39.6

Preferred Sites (ASTRO 25 Trunking Personality)

The **Preferred Sites** section of the ASTRO 25 Trunking Personality set allows the user to view or define multi-site Trunking Site preferences for individual Trunking Personalities. When a radio roams into an overlapped coverage area of multiple Sites within a Trunking System or Wide Area Communications Network (WACN), it searches for a Site that is operationally preferred by evaluating all other available sites on a priority basis, according to their corresponding Preferred Status selection. This capability provides more intelligent management and conservation of repeater resources in coverage overlap areas.

IMPORTANT:

The referenced Trunking System's Coverage Type field determines the single site (SmartNet) or multi-site configuration. In a multi-site configuration, SmartZone operation allows the radio to determine, through RSSI polling samples, the best site to be used for Trunking communications.

Also see the Trunking System's Trunking Wide Advanced fields and the Filter Constant fields.

Once the features of the Trunking Personalities have been uniquely defined, each Personality may then be assigned to the desired position of the radio's channel selector with the Zone Channel Assignment feature.

10.39.6.1

Ignore Site Resource Preference

This field enables the radio to ignore site resources information received in adjacent Control Channel Outbound Signal Words (OSWs), i.e. if the site has ASTRO, 12 Kbit Secure, or Analog Clear repeaters.

The feature applies for the current Trunking Personality and only when operating in SmartZone operation.

If **Disabled**, the radio selects sites based on this site resources information. For example, if a radio has selected an ASTRO Talkgroup.

Accessed Only: When the referenced Trunking System has its [Coverage Type on page 466](#) field not set to **Disabled**, and when the radio is model/option capable.

10.39.6.2

Site List Type

This field allows you to select the type of Site List for the Trunking Personality.

The Site List Type defines the way that the radio will use the sites identified in the following Site List. Site Preference and Mobility (Roaming) access is defined by the Site List Type.

Accessed Only: When the referenced Trunking System has its [Coverage Type on page 466](#) field not set to **Disabled**, and when the radio is model/option capable.

The following selections are supported:

Preferred List

This is the legacy and default selection. There is no access restrictions or preference implied for the sites that are not listed.

Allowed List

Radio is allowed to roam to listed sites only and defined preferences will be applied. The system may still deny access to a site in the allowed list after 'attachment' to the system is attempted on the site. If the radio is not in range of at least one of the sites listed, the radio will remain out of range.

Blocked List

Radio is not allowed to roam to any sites listed. All other sites are treated as allowed sites with no defined preference.

10.39.6.3

Site ID

This field allows you to enter in decimal or hex format, the ID number identifying the current SmartZone site (record/row), which applies to the current Trunking Personality.

WARNING: To support roaming between different sites, each Site ID must be unique within a Radio Frequency Sub-System (RFSS).

Accessed Only: When the referenced Trunking System has its [Coverage Type on page 466](#) field not set to **Disabled**, and when the radio is model/option capable.

Table 296: Range

Coverage Type	Minimum	Maximum
ASTRO 25	1	FE hex
Type II	1	40 hex

10.39.6.4

Preferred Status

This field selects the preferred status for the SmartZone site when determining through RSSI polling samples, the best site to be used for Trunking communications.

This selection applies for the current site (record/row) which applies for the current Trunking Personality.

Accessed Only: When the referenced Trunking System has its [Coverage Type on page 466](#) field not set to **Disabled**, and when the radio is model/option capable.

The following selections are supported:

None

The site is given no preference.

IMPORTANT: If a site is not listed here, the radio automatically assigns it no preference.

Least-Preferred

The site will be avoided unless it is the only usable site for operation.

Preferred

The site will be used over all non-preferred sites. Radio will leave this site if it goes into Site Trunking.

Always-Preferred

The site will be used over all non-preferred sites, even if the site goes into Site Trunking.

10.39.6.5 RFSS ID

This field allows you to enter in decimal or hex format, the ASTRO 25 Radio Frequency Sub-System (RFSS) ID that corresponds to the current Site ID in the current site (record/row), which applies for the current Trunking Personality.

WARNING: To support roaming between different RFSS's within a Trunking System, each RFSS must have a unique number.

NOTE: An RFSS is made up of one or more Sites.

Accessed Only: When the referenced Trunking System has its [Coverage Type on page 466](#) field set to **SmartZone & OmniLink** or **Intra-WACN Roaming** or **Inter-WACN Roaming**, and when the Protocol Type field is set to **Type II**, and when the radio is model/option capable.

Table 297: Range

Minimum	Maximum
1	FE hex

10.39.6.6 System ID

This field allows you to enter in decimal or hex format, the Type II or ASTRO 25 System ID that corresponds to the Site ID in the current site (record/row), which applies for the current Trunking Personality.

WARNING: To support roaming between different Trunking Systems composing Wide Area Communications Networks (WACNs), each Trunking Systems must have a unique System ID.

NOTE: A Trunking System is made up of one or more Radio Frequency Sub-Systems (RFSS).

Accessed Only: When the Protocol Type field is set to **Type II**, and when the referenced Trunking System has its [Coverage Type on page 466](#) field set to **SmartZone & OmniLink**, and when the radio is model/option capable,

Or when the Protocol Type field is set to **ASTRO 25**, and when the referenced Trunking System has its Coverage Type field set to **Intra-WACN Roaming** or **Inter-WACN Roaming**, and when the radio is model/option capable.

Table 298: Range

Coverage Type	Minimum	Maximum
ASTRO 25	0	0FFE hex
Type II	0	FFFE hex

10.39.6.7
RAS WACN ID

This field allows you to enter in decimal or hex format, the Remote Access Server (RAS) Wide Area Communications Network (WACN) ID for the current Site ID (record/row).

WARNING: To support roaming between different WACNs, each WACN must have a unique number.

NOTE: A WACN is made up of one or more Trunking Systems. This selection also applies for the current Trunking Personality.

Accessed Only: When the Protocol Type field is set to **ASTRO 25**, and when the referenced Trunking System has its [Coverage Type on page 466](#) field set to **Inter-WACN Roaming**, and when the radio is model/option capable.

Table 299: Range

Minimum	Maximum
0	FFFFE hex

10.39.6.8
Wildcard

This field defines the type of entry in the Site List. The selection is a wildcard type that will determine which site or group of sites will be **Preferred**, **Allowed** or **Blocked**.

Accessed Only: When the referenced Trunking System has its [Coverage Type on page 466](#) field not set to **Disabled**, and when the radio is model/option capable.

The following selections are supported:

No Wildcard

This is the default selection.

Any Site

All sites in a RFSS, System, WACN applicable based on Coverage Type field selection

Any RFSS

All sites, RFSS in a System, WACN applicable based on Coverage Type field selection

Any System

All sites, RFSS, Systems in a WACN applicable based on Coverage Type field selection

10.39.6.9
Allow Emergency at Blocked Site

If this field is enabled, the radio attempts to register the selected talkgroup on a site that is set as blocked in the RadioCentral when the radio is in the emergency mode. When the emergency is cleared, the radio continues to block the selected talkgroup.

Accessed Only: This field can be accessed only when the following conditions are met:

- The **Site List Type** field is set to **Blocked**.
- The **Coverage Type** field of the referenced Trunking System is **not** set to **Disabled**.

10.40

Call List Wide

The **Call List Wide** section allows you to selectively enable in-the-field changes to the Contact information.

10.40.1

UCL Editable

This field allows you to create Contacts within the radio's UCL (Unified Call List).

NOTE:

The entire UCL is saved to the radio along with all the codeplug's programmed features.

You can create Contacts with the Contacts button-press or Contacts menu-selection.

IMPORTANT: Enabling this field also enables the [Hot List Editable on page 592](#) field; however, disabling this field does not disable the Hot List Editable field.

Accessed Only: When the radio is model/option capable.

10.40.2

Hot List Editable

This field allows you to create, delete, or modify the list members of the radio's Individual Call Hot Lists.

NOTE: Individual Hot List are programmed into on a per channel basis, except for the [Phone Hot List](#) which applies on a radio-wide basis.

User access to the Hot List edit mode is initiated with Contacts button-press or Contacts menu-selection.

Accessed Only: When the radio is model/option capable.

10.40.3

Phone Number Editable

This field enables you to edit Phone Numbers within the radio's UCL (Unified Call List).

NOTE: The entire UCL is saved to the radio along with all the codeplug's programmed features.

User access to the Phone Numbers is initiated with Contacts button-press or Contacts menu-selection.

Accessed Only: When the radio is model/option capable and when the [UCL Editable on page 592](#) field is **Enabled**.

10.40.4

Radio ID Editable

This field enables you to edit Call IDs within the Call Hot Lists that are programmed into the radio.

User Call ID access to the Call Hot list is initiated with Contacts button-press or Contacts menu-selection.

Accessed Only: When the radio is model/option capable and when the [UCL Editable on page 592](#) field is **Enabled**.

10.40.5

Contact Data Order Indicator

This field allows you to specify the order in which the Unified Call List's (UCL) Call IDs for individual Contact entries appears in the radio's display.

To change the current order, select an item using the mouse cursor and drag it to a new position in the list.

You can initiate viewing or editing of contact entries with Contacts button-press or Contacts menu-selection. This selection applies on a radio-wide basis.

NOTE: The entire UCL is saved to the radio along with all the codeplug programmed features.

Accessed Only: When the radio is model/option capable.

10.41

Unified Call List

The **Unified Call List** section allows you to view or modify individual Call List Contacts.

Each contact may contain information pertaining to the different Conventional signaling types, Trunking coverage types, or Phone connectivity parameters.

NOTE:

Once defined, Contacts and Call IDs can be selected from the individual Hot Lists. These Contact and Call ID selections allow you to build the individual Hot Lists.

If the radio receives duplicated IDs, it cannot display an alias until the duplication is removed.

Writing the codeplug to a radio causes the call list to return to its original state and all OTA alias updates are lost.

10.41.1

Contact

The Contact allows the user to set system names and ID for ASTRO 25 Trunking ID, Type II Trunking ID, ASTRO Conventional ID, MDC Conventional ID, and Phone Number.

10.41.1.1

Contact Name

This field allows you to define recognizable names for the current Unified Call List Contact.

Multiple Conventional and Trunking communications Call IDs or Phone Numbers can then be defined for this Contact. Once defined, Contacts and Call IDs can be selected from the individual Hot Lists.

NOTE:

Examples: EMT 001, 500, Electric1.

Characters, numbers, and spaces can be used.

A total of 14 characters are possible.

10.41.1.2

Type II Trunking ID

The Type II Trunking ID of the Contact section allows you to view or modify Type II Trunking Call IDs for individual Contacts.

10.41.1.2.1

System Name

This field selects the desired Type II Trunking System, or allows you to create a customized ID set.

Selecting a Trunking System automatically selects the [System ID on page 467](#) value. This selection applies for the Call ID set (record/row) of the current [Contact](#) within the [Unified Call List on page 593](#). This Call ID set can then be selected from the [Call ID on page 602](#) field.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Unassigned

No selection.

Customized

Allows you to enter a [Custom System ID on page 594](#) for the current record/row. These IDs apply for a Type II Trunking System not defined in the current codeplug. This Call ID set can then be selected from the [Call ID on page 602](#) field.

Browse

Select a set from the available [Type II Trunking System on page 464](#).

10.41.1.2.2

System ID

This field allows you to view the in-the-field ASTRO 25 - System ID and Type II - System ID for the currently selected Trunking System.

The System Name field selects the desired Trunking System for the current record/row. This value applies to the current Call ID set (record/row) of the current [Contact](#) within the [Unified Call List](#). This Call ID set can then be selected from the [Call ID on page 601](#) (ASTRO 25) [Call ID on page 602](#) (Type II) field.

Accessed Only: When the System Name field is not set to **Customized**, and when the radio is model/option capable.

10.41.1.2.3

Custom System ID

This field allows you to define a Type II - System ID for a Trunking System not defined in the current codeplug.

This selection only applies when the Trunking [System Name on page 594](#) field is set to **Customized** for the current record/row. Therefore, this selection corresponds to an in-the-field [Trunking System](#). This selection applies to the current Call ID set (record/row) of the current [Contact](#) within the [Unified Call List on page 593](#). This Call ID set can then be selected from the [Call ID on page 602](#) field.

Accessed Only: When the [System Name on page 594](#) field is set to **Customized**, and when the radio is model/option capable.

NOTE: Selections are based on Software System Key Files or Advanced System Keys available to the application. The System Key Report allows you to view the currently available keys.

Table 300: Range

Minimum	Maximum	Increment
1	65535	1

10.41.1.2.4

Unit ID

This field selects the Type II Unit ID of the targeted radio operating in Type II Trunking communications mode.

This ID is a match for the [Unit ID](#) of the same [Trunking System](#) which has been defined in the targeted radio. This selection applies for the Call ID set (record/row) of the current [Contact](#) within the [Unified Call List on page 593](#). This Call ID set can then be selected from the [Call ID on page 602](#) field.

Accessed Only: When the radio is model/option capable.

WARNING: The selection range may be modified on a per Advanced (Hardware) Key basis by the Advanced Keys Administrator program.

Table 301: Range

Minimum	Maximum
000001	16777215

10.41.1.3

MDC Conventional ID

The MDC Conventional ID of the Contact section allows the user to view or modify sets of MDC Conventional IDs for individual Contacts.

10.41.1.3.1

System Name

This field selects the desired MDC Conventional System, or allows you to create a customized ID set.

Selecting an MDC Conventional System automatically selects the [System Group Number](#) value. This selection applies for the Call ID set (record/row) of the current [Contact](#) within the [Unified Call List on page 593](#). This Call ID set can then be selected from the [Call ID on page 604](#) field.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Unassigned

No selection.

Customized

Allows you to enter a [Custom Group Number on page 596](#) for the current record/row. These IDs apply for an MDC [Conventional System on page 375](#) not defined in the current codeplug. This Call ID set can then be selected from the [Call ID on page 604](#) field.

Possible Conventional Systems

Selects a programmed Conventional System from within the current codeplug.

10.41.1.3.2

System Group Number

Allows you to view-only the System Group Number for the currently selected MDC Conventional System. The System Name field selects the desired ASTRO System for the current record/row.

This value applies to the current Call ID set (record/row) of the current Contact within the Unified Call List. This Call ID set can then be selected from the [Call ID on page 604](#) field.

Accessed Only: When the System Type field is set to **Customized** or when the radio is model/option capable.

10.41.1.3.3

Custom Group Number

This field allows you to define a System Group Number for an MDC Conventional System not defined in the current codeplug.

This selection only applies when the [System Name on page 595](#) field is set to **Customized** for the current record/row. Therefore, this selection corresponds to an in-the-field MDC Conventional System. This selection applies to the current Call ID set of the current [Contact](#) within the [Unified Call List on page 593](#). This Call ID set can then be selected from the [Call ID on page 604](#) field.

Accessed Only: When the [System Name on page 596](#) field is set to **Customized**, and when the radio is model/option capable.

10.41.1.3.4

Primary ID

This field selects the Primary ID of the targeted radio operating in MDC Conventional mode.

This ID is a match for the [MDC Primary ID](#) of the same Conventional System which has been defined in the targeted radio. This selection applies for the Call ID set (record/row) of the current [Contact](#) within the [Unified Call List on page 593](#). This Call ID set can then be selected from the [Call ID on page 604](#) field.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Table 302: Range

Minimum	Maximum	Increment
0 (Hex)	FFFFFFFF (Hex)	1

10.41.1.4

ASTRO Conventional ID

The ASTRO Conventional ID of the Contact section allows you to view or modify ASTRO 25 Trunking Call IDs for individual Contacts.

10.41.1.4.1

System Name

This field selects the desired ASTRO Conventional System, or allows you to create a customized ID set.

Selecting a Conventional System automatically selects the [System Group Number](#) value. This selection applies for the Call ID set (record/row) of the current [Contact](#) within the [Unified Call List on page 593](#). This Call ID set can then be selected from the [Call ID on page 603](#) field.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Unassigned

No selection.

Customized

Allows you to enter a [Custom Group Number](#) for the current record/row. These IDs apply for an ASTRO [Conventional System on page 375](#) not defined in the current codeplug. This Call ID set can then be selected from the [Call ID on page 603](#) field.

Possible Conventional Systems

Selects a programmed Conventional System from within the current codeplug.

10.41.1.4.2

System Group Number

Allows you to view-only the ASTRO - System Group Number for the currently selected Conventional System. The System Name field selects the desired ASTRO System for the current record/row.

This value applies to the current Call ID set (record/row) of the current Contact within the Unified Call List. This Call ID set can then be selected from the [Call ID on page 603](#) field.

Accessed Only: When the System Type field is set to **Customized** or when the radio is model/option capable.

10.41.1.4.3

System Group Number

This field allows you to define a System Group Number for an ASTRO Conventional System not defined in the current codeplug.

The System Group Number provides a way to logically group multiple Conventional Systems in the codeplug that are really the same over-the-air system.

IMPORTANT:

This selection only applies when the System Name field is set to **Customized** for the current record/row. Therefore, this selection corresponds to an in-the-field ASTRO Conventional System. This selection applies to the current Call ID set (record/row) of the current Contact within the Unified Call List. This Call ID set can then be selected from the [Call ID on page 603](#) field.

Accessed Only: When the System Type field is set to **Customized** or when the radio is model/option capable.

10.41.1.4.4

Individual ID

This field selects the Individual ID of the targeted radio operating in ASTRO - Conventional mode.

This ID is a match for the Individual ID of the targeted radio. The Individual ID must also be a match for the Conventional System ([System Group Number](#)) selected in the [System Name on page 596](#) field for the same record/row. This selection applies for the Call ID set (record/row) of the current [Contact](#) within the [Unified Call List on page 593](#). This Call ID set can then be selected from the [Call ID on page 603](#) field.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Table 303: Range

Minimum	Maximum	Increment
1	16777215	1

10.41.1.4.5

Call Type

This field selects the Call Type of the targeted radio operating in ASTRO - Conventional mode.

This selection applies for the Call ID set (record/row) of the current [Contact](#) within the [Unified Call List on page 593](#). This Call ID set can then be selected from the [Call ID on page 603](#) field.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Individual

When the current Call ID set is targeted for an individual call.

Group

When the current Call ID set is targeted for a group call.

10.41.1.5

ASTRO 25 Trunking ID

The ASTRO 25 Trunking ID of the Contact section allows you to view or modify ASTRO 25 Trunking Call IDs for individual Contacts.

10.41.1.5.1

System Name

This field selects the desired Trunking System, or allows you to create a customized ID set.

Selecting a Trunking System automatically selects the [RAS/Home WACN ID](#) and [System ID on page 467](#) values. This selection applies for the Call ID set (record/row) of the current Contact within the Unified Call List. This Call ID set can then be selected from the [Call ID on page 601](#) field.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Unassigned

No selection.

Customized

Allows you to enter a Custom WACN ID, Custom System ID and Individual ID for the current record/row. These IDs apply for a Trunking System not defined in the current codeplug. This Call ID set can then be selected from the field.

Browse

Select a set from the available [ASTRO 25 Trunking System on page 524](#).

10.41.1.5.2

Home WACN ID

This field allows you to view the ASTRO 25 - RAS (Home) WACN ID for the currently selected Trunking System.

The [System Name on page 598](#) field selects the desired Trunking System for the current record/row. This value applies to the current Call ID set (record/row) of the current Contact within the Unified Call List. The Call ID set can then be selected from the [Call ID on page 601](#) field.

Accessed Only: When the [System Name on page 598](#) field is not set to **Customized**, and when the radio is model/option capable.

10.41.1.5.3

System ID

This field allows you to view the in-the-field ASTRO 25 - System ID and Type II - System ID for the currently selected Trunking System.

The System Name field selects the desired Trunking System for the current record/row. This value applies to the current Call ID set (record/row) of the current Contact within the Unified Call List. This Call ID set can then be selected from the [Call ID on page 601](#) (ASTRO 25) [Call ID on page 602](#) (Type II) field.

Accessed Only: When the System Name field is not set to **Customized**, and when the radio is model/option capable.

10.41.1.5.4

Unit ID

This field selects the ASTRO 25 Unit ID of the targeted radio operating in ASTRO 25 Trunking communications mode.

This ID is a match for the Unit ID of the targeted radio. The Unit ID must also be a match for the Trunking System ([System ID on page 467](#) and [Home WACN ID on page 598](#)) selected in the [System Name on page 598](#) field for the same record/row. This selection applies for the Call ID set (record/row) of the current [Contact](#) within the [Unified Call List on page 593](#). This Call ID set can then be selected from the [Call ID on page 601](#) field.

Accessed Only: When the radio is model/option capable.

WARNING: The selection range may be modified on a per Advanced (Hardware) Key basis by the Advanced Keys Administrator program.

Table 304: Range

Minimum	Maximum
000001	16777215

10.41.1.5.5

Custom System ID

This field allows you to define an ASTRO 25 - System ID (in decimal or hex format) for a Trunking System not defined in the current codeplug.

This selection only applies when the Trunking [System Name on page 598](#) field is set to **Customized** for the current record/row, and corresponds to an in-the-field [Trunking System](#). This selection applies to the current Call ID set (record/row) of the current [Contact](#) within the [Unified Call List on page 593](#). This Call ID set can then be selected from the [Call ID on page 601](#) field.

Accessed Only: When the [System Name on page 598](#) field is set to **Customized**, and when the radio is model/option capable.

NOTE: Selections are based-on Software System Key Files or Advanced (Hardware) Keys available to the application. The System Key Report allows you to view the currently available System Keys.

There are two separate values that define the range.

Table 305: First Value

Minimum	Maximum	Increment
1	65535	1

Table 306: Second Value

Minimum	Maximum	Increment
1	FFFF	1

10.41.1.5.6 Custom WACN ID

This field allows you to define an ASTRO 25 - WACN ID (in decimal or hex format) for a Trunking System not defined in the current codeplug.

This selection only applies when the Trunking [System Name on page 598](#) field is set to **Customized** for the current record/row. Therefore, this selection corresponds to an in-the-field Trunking System. This selection applies to the current Call ID set (record/row) of the current [Contact](#) within the [Unified Call List on page 593](#). This Call ID set can then be selected from the [Call ID on page 601](#) field.

Accessed Only: When the [System Name on page 598](#) field is set to **Customized**, and when the radio is model/option capable.

There are two separate values that define the range.

Table 307: First Value

Minimum	Maximum	Increment
1	1048574	1

Table 308: Second Value

Minimum	Maximum	Increment
1	FFFFE	1

10.42 ASTRO 25 Trunking Hot List

This allows you to view or define individual Call Hot Lists for ASTRO 25 Trunking communications.

You are able to select individual Call List members while operating in Trunking mode. Call List members allow for Call Types such as Private Calls and Pages to individual radios or to groups of radios.

The Trunking Call Hot List also allows for "Caller ID".

NOTE:

[Contacts](#) must first be defined in the [Unified Call List \(UCL\)](#) before they may be selected for an ASTRO 25 Trunking Call Hot List.

Sets of Call IDs must also be defined in the UCL's [ASTRO 25 Call Trunking IDs Page](#) before they may be selected for an ASTRO 25 Trunking Call Hot List.

Individual Hot lists are then selectable on a per [Trunking Personality](#) basis from the [Trunking Call Hot List on page 515](#) field.

You can initiate the Hot List edit mode with a [Contacts on page 168](#) button-press or [Contacts on page 195](#) menu-selection.

10.42.1 Hot List Alias

This field allows you to define a recognizable names for the current ASTRO 25 Trunking Hot List.

Once defined, individual ASTRO 25 Hot lists are then selectable on a per [Trunking Personality](#) basis from the [Trunking Call Hot List on page 515](#) field.

Accessed Only: When the radio is model/option capable.

NOTE:

Examples: EMT-001, #500, Electric1, # A5.

Characters, numbers, spaces, and special characters can be used. For unidentified unicode characters, such as emojis, the radio top display shows "squares" for these characters.

Up to 14 characters are possible.

10.42.2

Contact

This field selects the Contact for the current record/row of the current ASTRO 25 Trunking Hot List.

The [Contacts](#) must first be defined in the [Unified Call List \(UCL\)](#). Once this contact has been selected, the Call ID set (defined in the UCL's [ASTRO 25 Trunking ID Page](#)), may be selected from the [Call ID on page 601](#) field of this same record/row.

Accessed Only: When the radio is model/option capable.

10.42.3

Call ID

This field selects the Call ID set for the current record/row of the current ASTRO 25 Trunking Hot List.

This Call ID set is defined in the [Unified Call List's - ASTRO 25 Trunking ID Page](#). The [Contact on page 601](#) for the current record/row must be selected before this selection can be made.

Accessed Only: When the [Contact on page 601](#) field for the current record/row is not set to **Unassigned**, and when the radio is model/option capable.

10.43

Type II Trunking Hot List

This section allows you to view or define individual Call Hot Lists for Type II Trunking communications.

You are able to select individual Call List members while operating in Trunking mode. Call List members allow for Call Types such as Private Calls and Pages to individual radios or to groups of radios.

The Trunking Call Hot List also allows for "Caller ID".

NOTE:

[Contacts](#) must first be defined in the [Unified Call List \(UCL\)](#) before selecting them for a Type II Trunking Call Hot List.

Sets of Call IDs must also be defined in the UCL's [Type II Trunking IDs Page](#) before selecting them for a Type II Trunking Call Hot List.

Individual Hot lists are then selectable on a per [Trunking Personality](#) basis from the [Trunking Call Hot List on page 515](#) field.

You can initiate the Hot List edit mode with a [Contacts on page 168](#) button-press or [Contacts on page 195](#) menu-selection.

10.43.1

Hot List Alias

This field allows you to define recognizable names for the current Type II Trunking Hot List.

Once defined, individual Type II Call Hot lists are then selectable on a per [Trunking Personality](#) basis from the [Trunking Call Hot List on page 515](#) field.

Accessed Only: When the radio is model/option capable.

NOTE:

Examples: EMT-001, #500, Electric1, # A5.

Characters, numbers, spaces, and special characters can be used. For unidentified unicode characters, such as emojis, the radio top display shows "squares" for these characters.

Up to 14 characters are possible.

10.43.2

Contact

This field selects the Contact for the current record/row of the current Type II Trunking Hot List.

The contact must first be defined in the [Contact](#) field of the [Unified Call List on page 593](#). Once this contact has been selected, the ID set (defined in the UCL's [Type II Trunking ID Page](#)) may be selected from the [Call ID on page 602](#) field of this same record/row.

Accessed Only: When the radio is model/option capable.

10.43.3

Call ID

This field selects the Call ID set for the current record/row of the current Type II Trunking Hot List.

The Contact for the current record/row must be selected before this selection can be made.

Accessed Only: When the [Contact on page 602](#) field for the current record/row is not set to **Unassigned**, and when the radio is model/option capable.

10.44

ASTRO Conventional Hot List

This section allows you to view or define individual Call Hot Lists for Conventional communications.

You are able to select individual Call List members while operating in Conventional communications mode. Call List members allow for Call Types such as Selective Calls and Call Alerts to individual radios or to groups of radios.

The ASTRO Call Hot List also allows for "Caller ID".

NOTE:

[Contacts](#) must first be defined in the [Unified Call List \(UCL\)](#) before they may be selected for an ASTRO Call Hot List.

Sets of Call IDs must also be defined in the UCL's [ASTRO Conventional ID](#) before they may be selected for an ASTRO Call Hot List.

Individual Hot lists are then selectable on a per [Conventional Personality on page 388](#) basis from the [ASTRO Call Hot List on page 426](#) field.

You can initiate the Hot List edit mode with a [Contacts on page 168](#) button-press or [Contacts on page 195](#) menu-selection.

10.44.1

Hot List Alias

This field allows you to define a recognizable name for the current ASTRO Conventional Hot List.

Once defined, individual ASTRO Call Hot lists are then selectable on a per [Conventional Personality on page 388](#) basis from the [ASTRO Call Hot List on page 426](#) field.

Accessed Only: When the radio is model/option capable.

NOTE:

Examples: EMT-001, #500, Electric1, #A5.

Characters, numbers, spaces, and special characters can be used. For unidentified unicode characters, such as emojis, the radio top display shows "squares" for these characters.

Up to 14 characters are possible.

10.44.2

Contact

This field selects the Contact for the current record/row of the current ASTRO Conventional Hot List.

The contact must first be defined in the [Contacts](#) field of the [Unified Call List \(UCL\)](#). Once this contact has been selected, the Call ID set (defined in the UCL's [ASTRO Conventional ID Page](#)) may be selected from the [Call ID on page 603](#) field of this same record/row.

Accessed Only: When the radio is model/option capable.

10.44.3

Call ID

This field selects the Call ID set for the current record/row of the current ASTRO Conventional Hot List.

This Call ID set is defined in the Unified Call List's - ASTRO Conventional ID page. The Contact for the current record/row must be selected before this selection can be made.

Accessed Only: When the [Contact on page 603](#) field for the current record/row is not set to **Unassigned**, and when the radio is model/option capable.

10.45

MDC Conventional Hot List

This section allows you to view or define individual Call Hot Lists for MDC Conventional communications.

You are able to select individual Call List members while operating in Conventional mode. Call List members allow for Call Types such as Selective Calls and Call Alerts to individual radios or to groups of radios.

The MDC Call Hot List also allows for "Caller ID".

NOTE:

[Contacts](#) must first be defined in the [Unified Call List \(UCL\)](#) before selecting them for an MDC Call Hot List.

Sets of Call IDs must also be defined in the UCL's [MDC Conventional ID Page](#) before selecting them for an MDC Call Hot List.

Individual Hot lists are then selectable on a per [Conventional Personality on page 388](#) basis from the [Non-ASTRO Call Hot List on page 422](#) field.

You can initiate the Hot List edit mode with a [Contacts on page 168](#) button-press or [Contacts on page 195](#) menu-selection.

10.45.1

Hot List Alias

This field allows you to define recognizable names for the current MDC Conventional Hot List.

Once defined, individual MDC Call Hot lists are then selectable on a per [Conventional Personality on page 388](#) basis from the [Non-ASTRO Call Hot List on page 422](#) field.

NOTE:

Examples: EMT-001, #500, Electric1, #A5.

Characters, numbers, spaces, and special characters can be used. For unidentified unicode characters, such as emojis, the radio top display shows "squares" for these characters.

Up to 14 characters are possible.

10.45.2

Contact

This field selects the desired Contact for the current record/row of the current MDC Conventional Hot List.

The contact must first be defined in the [Contact](#) field of the [Unified Call List on page 593](#). Once this contact has been selected, the Call ID set (defined in the UCL's MDC Conventional ID (Contact) section) may be selected from the [Call ID on page 604](#) field of this same record/row.

Accessed Only: When the this field for the current record/row is not set to **Unassigned**, and when the radio is model/option capable.

10.45.3

Call ID

This field selects the Call ID set for the current record/row of the current MDC Conventional Hot List.

This Call ID set is defined in the [Unified Call List's - MDC Conventional ID Page](#). The [Contact on page 604](#) for the current record/row be selected before this selection can be made.

Accessed Only: When the [Contact on page 603](#) this field for the current record/row is not set to **Unassigned**, and when the radio is model/option capable.

10.45.4

Primary ID

This field selects the Primary ID of the targeted radio operating in MDC Conventional mode.

This ID is a match for the [MDC Primary ID](#) of the same Conventional System which has been defined in the targeted radio. This selection applies for the Call ID set (record/row) of the current [Contact](#) within the [Unified Call List on page 593](#). This Call ID set can then be selected from the [Call ID on page 604](#) field.

Accessed Only: When the radio is model/option capable.

The following selections are supported:

Table 309: Range

Minimum	Maximum	Increment
0 (Hex)	FFFFFFFF (Hex)	1

10.46

Zones Channel Assignment

The **Zone Channel Assignment** allows you to design and create zone and channel configurations.

Selecting Conventional Personalities for Conventional channels and Trunking Groups for Trunking channels ultimately creates the desired positions of the radio's channel selector for each zone.

NOTE:

You can select Zones with a Zone Select switch-toggle or with a Zone Select menu-selection.

10.46.1

Zone

This section allows you to view or modify recognizable names for each zone.

NOTE: Zone positions in the radio are determined by the order that they are defined in the application.

NOTE: Selecting Conventional Personalities for Conventional channels and Trunking Groups for Trunking channels ultimately creates the desired positions of the radio's channel selector for each zone.

You can select Zones with a Zone Select switch-toggle or with a Zone Select menu-selection.

10.46.1.1

Zone Names

This field allows you to define recognizable names for the current zone.

IMPORTANT: For portable radios, this name appears in the radio main display, not in the radio top display.

Accessed Only: When the [Zone Text Size on page 208](#) field is greater than 0.

NOTE:

Examples: EMT-001, #500, Electric1, #A5.

Characters, numbers, spaces, and special characters can be used. For unidentified unicode characters, such as emojis, the radio top display shows "squares" for these characters.

The actual number of Zone Name characters that appear in the radio main display is determined by the **Zone Text Size** field. Entries larger than this value are considered invalid.

The Zone Name appears above the Channel Name in the radio main display.

10.46.1.2

Top Display Zone Name

This field allows you to define recognizable top display names for the current zone.

This name appears only in the Top Display of the radio or also appears in the display of the optional Display Remote Speaker Microphone (DRSM). This selection applies for the current zone.

Accessed Only: When the radio is model/option capable.

NOTE:

Examples: EMT-001, #500, Electric1, #A5.

Characters, numbers, spaces, and special characters can be used.

The actual number of Zone Name characters that appear in the display of the radio is determined by the [Top Zone Text Size](#) field. Entries larger than this value are considered invalid.

When the total number of characters of the [Top Zone Text Size](#) field and the [Top Channel Text Size](#) field is less than 8, then this [Top Display Zone Name on page 605](#) Name and the [Top Display Channel Name on page 607](#) Name can appear at the same time in the top display of the radio. The Zone Name appears to the left of the Channel Name.

When the total number of characters of the [Top Zone Text Size](#) field and the [Top Channel Text Size](#) field is greater than 8, then this [Top Display Zone Name on page 605](#) Name and the [Top Display Channel Name on page 607](#) Name alternate in the top display of the radio.

10.46.1.3

Zone Announcement

This field selects the Motorola Voice Announcement ([.MVA](#)) file to be used for Voice Announcement on the current zone.

When you change the radio to this zone, a voice prompt plays. The [channel announcement](#) voice prompt may also play if applicable. If Text-to-Speech (TTS) is selected, the text in the corresponding Voice Command field is converted to speech and played as audio. See [Voice Announcement Priority on page 251](#) field.

NOTE: The [Voice Announcement List on page 269](#) page allows you to load Motorola Voice Announcement ([.MVA](#)) files into the current codeplug.

The following selections are supported:

None

No Voice prompt is needed for the current zone.

TTS

When Voice Control feature is enabled, the text in the Voice Command field for Zone Announcement is played as audio.

Motorola Voice Announcement ([.MVA](#)) file

Lists all possible voice files defined in the [Voice Announcement List on page 269](#) page.

10.46.1.4

Zone Voice Control Name/TTS Announcement

A common spoken word to reference this zone for Voice Control and Text-to-Speech (TTS) announcements.

When the "play button"  is clicked, RadioCentral converts the text in the voice command field to speech and plays it through the speaker.

IMPORTANT: This must be set in order to change the zone using voice control. Ensure that the words are unique and there are no two phonetically similar Zone Voice Control chosen as they will be flagged as invalid.

Accessed Only: When the radio is model/option capable.

NOTE:

Configured per zone.

The default value is blank.

Unicode characters.

Alphanumeric characters only with a maximum of 35 characters.

10.46.2

Channels

This section allows you to view or modify specific channel configurations within the desired zone.

NOTE:

Selecting [Conventional Personalities](#) for Conventional channels and Trunking Groups for Trunking channels ultimately creates the desired positions of the radio's channel selector for each zone.

You can select Channels with a [Channel Select](#) button-press, [Channel Select on page 185](#) switch-toggle, or [Channel Select on page 195](#) menu selection.

Accessed Only: When the [Dynamic Zone Enable](#) field is **Disabled**.

10.46.2.1

Channel Name

This field allows you to define recognizable names for the current channel (record/row).

IMPORTANT: For portable radios, this name appears in the radio main display, not in the radio [top display](#).

This selection applies for the current zone.

Accessed Only: When the [Dynamic Zone Enable](#) field is disabled.

NOTE:

Examples: EMT-001, #500, Electric1, #A5.

Characters, numbers, spaces, and special characters can be used. For unidentified unicode characters, such as emojis, the radio top display shows "squares" for these characters.

The actual number of Channel Name characters that appear in the radio main display is determined by the **Channel Text Size** field. Entries larger than this value are considered invalid.

The Zone Name appears above the Channel Name in the radio main display.

10.46.2.2

Top Display Channel Name

This field allows you to define recognizable top display name for the current channel (record/row).

This name appears only in the Top Display of the radio, and/or also appears in the display of the optional Display Remote Speaker Microphone (DRSM). This selection applies for the current zone.

Accessed Only: When the [Dynamic Zone Enable](#) field is disabled, and when the radio is model/option capable.

NOTE:

Examples: EMT-001, #500, Electric1, #A5.

Characters, numbers, spaces, and special characters can be used.

The actual number of Channel Name characters that appear in the display of the radio is determined by the [Top Channel Text Size](#) field. Entries larger than this value are considered invalid.

When the total number of characters of the [Top Zone Text Size](#) field and the [Top Channel Text Size](#) field is less than 8, then the [Top Display Zone Name on page 605](#) Name and this Top Display Channel Name can appear at the same time in the top display of the radio. The Zone Name appears to the left of the Channel Name.

When the total number of characters of the [Top Zone Text Size](#) field and the [Top Channel Text Size](#) field is greater than 8, then the [Top Display Zone Name on page 605](#) and this Top Display Channel Name alternate in the top display of the radio.

10.46.2.3

Channel Type

This field selects the radio communications type, Conventional or Trunking, for the current channel (record/row).

This selection applies for the current zone.

NOTE: Once this selection has been made, the [Personality on page 608](#) field selection may then be made.

Accessed Only: When the radio is model/option capable, and when the [Dynamic Zone Enable](#) field is disabled, and when the [Clone Enable](#) field is disabled.

The following selections are supported:

Trk

Trunking

Cnv

Conventional

10.46.2.4

Personality

This field selects the desired Conventional Personality or Trunking Personality for the current channel (record/row).

This selection applies for the current zone.

IMPORTANT:

The [Channel Type on page 608](#) field determines the Personality's communications type that is available for selection from this field.

Personalities must be created and defined before they can be selected from this field.

Accessed Only: When the [Dynamic Zone Enable](#) field and [Clone Enable](#) field are disabled.

10.46.2.5

Trunking Talkgroup

This field selects the Talkgroup or the Talkgroup type to be used for the current channel (record/row).

This selection applies for the current zone.

Accessed Only: When the [Dynamic Zone Enable](#) field is **Disabled**, when the [Channel Type on page 608](#) field is set to **Trk** (Trunking), and when the radio is model/option capable.

The following selections are supported:

Talkgroup Selections

Talkgroups appearing for selection are based on the [Trunking Personality](#) selected in this channel's [Personality on page 608](#) field.

A Talkgroup is a programmed grouping of radios created for the purpose of frequent and convenient communication with each other.

NOTE: Talkgroups are defined in the Personality's [Talkgroup](#) Page.

DYN (Dynamic Regrouping)

WARNING:

This selection is only valid when the [Transmit Mode on page 505](#) field for the Trunking Personality selected in this channel's [Personality on page 608](#) field is not set to **TG/AG Disabled** (Listen-only).

A Dynamic Regrouping configuration is only valid when a Trunking Personality referenced to a channel has this field set to **DYN**, and that Personality's selected Zone and Channel match the selections for [Dynamic Regrouping Zone on page 478](#) and [Dynamic Regrouping Channel on page 478](#) in the Personality's referenced Trunking System.

IMPORTANT: Only one Dynamic Regrouping channel may be defined per referenced Trunking System.

You may request a new Dynamic Regrouping assignment from the dispatcher with a [Reprogram Request on page 174](#) button-press or a [Reprogram Request](#) menu-selection. The available features and settings of the Dynamic Regrouping talkgroup are defined and transmitted back by the dispatcher.

For the Dynamic Regrouping talkgroup to be capable of transmitting in Secure mode, either the [Secure Tx Select](#) button-press or the [Secure Tx Select on page 187](#) switch-toggle or the [Secure](#) menu-selection is needed; otherwise Dynamic Regrouping talkgroup transmissions are strapped to transmitting in **Clear** mode.

ATG (Announcement Group)

This selection is only valid when the [Announcement Group on page 510](#) field for the Trunking Personality selected in this channel's [Personality on page 608](#) field is not set to **None**.

Announcement Groups allows you to initiate and communicate on one large communication channel comprised of all [Talkgroups](#) defined for the current Trunking Personality.

10.46.2.6

Conventional Frequency Option

This field selects the Conventional Frequency Options profile for the current channel (record/row).

This selection applies for the current zone.

NOTE:

The Conventional Personality must first be selected in the [Personality on page 608](#) field.

Frequency option profiles must be created and defined before they can be selected from this field.

Accessed Only: When the [Dynamic Zone Enable](#) field is disabled, and when the [Channel Type on page 608](#) field is set to **Cnv** (Conventional).

10.46.2.7

Radio Profile Selection

This field selects the radio profile for the current channel (record/row).

Radio profiles allow for designed groupings of audio settings to be designed for specific radio channels and or specific in-the-field usage scenarios.

You may select Radio profiles (on a per channel basis) with the [Radio Profiles on page 173](#) button-press or the [Radio Profiles on page 200](#) menu-selection.

This selection applies for the current zone.

Accessed Only: When the [Dynamic Zone Enable](#) field is disabled.

The following selections are supported:

Last Selected

The first record/row in [Radio Profiles on page 628](#) (regardless of the profile name) is used until you change to a different profile. After that, it locks your current profile selection to the channel until the profile selection is changed again.

Other Profile Names

Three pre-named profile records have been supplied for your convenience: **Default**, **Surveillance**, and **Loud Audio**. These profiles can be renamed, and should be defined according to your needs if more profiles may be created.

10.46.2.8

Channel Announcement

This field selects the Motorola Voice Announcement (.MVA) file to be used for Voice Announcement on the current channel/mode.

When you change the radio to this channel, a voice prompt plays. A [Channel Announcement on page 167](#) button-press allows you to hear the current channel voice recording of the radio whenever needed. See also the Voice Announcement Priority field. If Text-to-Speech(TTS) is selected, the text in the corresponding Voice Command field is converted to speech and played as audio.

This selection applies for the current zone.

NOTE: The [Voice Announcement List on page 269](#) page allows you to load Motorola Voice Announcement (.MVA) files into the current codeplug.

Accessed Only:

- [Dynamic Zone Enable](#) field is disabled.
- [RSI Mode](#) field is disabled for the current zone.

The following selections are supported:

None

No Voice prompt is needed for the current channel.

TTS

When Voice Control feature is enabled, the text in the Voice Command field for Channel Announcement is played as audio.

Motorola Voice Announcement (*.MVA) file

Lists all possible voice files defined in the [Voice Announcement List on page 269](#) Page.

10.46.2.9

Channel Voice Control Name/TTS Announcement

A common spoken word to reference this channel for Voice Control. This can also be used to set the channel announcement to this text, if channel announcement is set to Text-to-Speech (TTS).

When the "play button"  is clicked, RadioCentral converts the text in the voice command field to speech and plays it through the speaker.

IMPORTANT: This must be set in order to change the channel using voice control. Ensure that the words are unique and that there are no two phonetically similar Channel Voice Control chosen within a zone as they will be flagged as invalid.

Accessed Only: When the radio is model/option capable.

NOTE:
 Configured per channel.
 The default value is blank.
 Unicode characters.
 Alphanumeric characters only with a maximum of 35 characters.

10.46.2.10

Personnel Accountability Sector ID

This field selects the ID number that identifies the current Personnel Accountability Sector location for the current channel.

This selection applies for the current zone.

IMPORTANT: When you or a radio moves into a new sector, you can change the channel of the radio to the appropriate channel that is designated for the new sector location.

Accessed Only: When the radio is model/option capable, and when the [Channel Type on page 608](#) field is set to **Cnv** (Conventional), and when the [Conventional Personality on page 388](#) referenced to the current Conventional channel has its [Incident Signaling Type on page 433](#) field set to **Personnel Accountability** or **Personnel Accountability with MDC**.

Table 310: Range

Minimum	Maximum	Increments
0 (hex)	FF (hex)	1

NOTE: Each value must be unique for each channel. In other words, each value can only be used once per radio.

0 (the Factory-Default value) is used to designate non-Personnel Accountability channels, and therefore may be re-used as necessary.

10.46.2.11

Fallback Zone

This field describes the zone the radio must be switched to when Channel Fallback occurs.

If the Fallback Channel field is disabled, then Channel Fallback will be unable to arm on the selected channel.

Accessed only: When the Channel Fallback field is enabled.

10.46.2.12

Fallback Channel

This field selects the channel in the selected Fallback Zone that the radio must switch to when Channel Fallback occurs. If this field is disabled, then Channel Fallback cannot activate on the selected channel.

Accessed Only: When the **Channel Fallback Enable** field is enabled.

10.46.2.13

Channel Color Backlight Selection

This field allows you to select the backlight color for the current channel (record/row).

NOTE: This selection only applies to the current zone.

Accessed Only: When **Channel Color Backlight** is **Enabled**, and the Radio Profile Selection is not set to a profile with **Night Vision Goggles Enable** or **Disable Lights on page 629** enabled.

The following selections are supported:

- White
- Red
- Green
- Orange

10.47

Scan Wide

The **Scan Wide** section allows you to view or define scan functionality related to both Conventional and Trunking communications modes.

Scan Wide features may apply on a radio-wide basis to all [Scan List on page 616](#).

A Scan List allows for many possible receive channels while operating in Scan Mode.

NOTE: Individual Scan Lists can be assigned to **Conventional** and **Trunking** Personalities with their respective Scan List Selection field.

10.47.1

General

The **General** section allows you to view or define scan functionality related to both Conventional and Trunking communication modes.

Scan Wide features may apply on a radio-wide basis to all Scan Lists. A Scan List allows for many possible receive channels while operating in Scan Mode.

NOTE: Individual Scan Lists can be assigned to **Conventional Personality on page 388** and **ASTRO 25 Trunking Personality on page 567** with their respective Scan List Selection field.

10.47.1.1

Priority Scan Alert

This field enables the radio to audibly alert you.

This feature is enabled when a [Priority Member 1 on page 621](#) or a [Priority Member 2 on page 622 - Scan List Member](#) channel is landed while scanning.

One beep is generated for both Priority #1 and Priority #2 channels. This feature applies to all [Scan Types](#).

Accessed Only: When the Alert Tones field is **Enabled**, and when the radio is model/option capable.

10.47.1.2

Voice Rx Tx Hold Time

This field selects the amount of time that the radio remains on a Landed Scan Mode - Scan List Member channel before resuming in Active Scan Mode.

This timer begins once all receive and transmit voice communication has ceased. This feature applies to all [Scan Types](#) while operating in Scan Mode. Time is in seconds.

Table 311: Range

Minimum	Maximum
0 (second)	255 (seconds)

10.47.1.3

Data Rx Tx Hold Time

This field selects the amount of time that the radio remains on a Landed Scan Mode - Scan List Member channel before resuming in Active Scan Mode.

This timer begins once all receive and transmit data communication has ceased. This feature applies only for a [Scan List on page 616](#) that has its [Scan Type on page 617](#) field set to **Conventional**, and while operating in Scan Mode. Time is in seconds.

Accessed Only: When radio is model/option capable.

Table 312: Range

Minimum	Maximum
0 sec	255 sec

10.47.2

Conventional

This section allows you to view or define functionality for all that have a selected of **Conventional** or **Multi-System Talkgroup**.

NOTE: Individual Scan Lists can be assigned to [Conventional Personality on page 388](#) and [ASTRO 25 Trunking Personality on page 567](#) with their respective Scan List Selection field.

10.47.2.1

Carrier Detect Required

This field enables the radio to land on carrier squelch but to only unmute on Priority - Scan List Members or on a proper Private Line (PL) code detect.

This applies while making an active scan of a Conventional scan list member channel, while in scan mode.

10.47.2.2

Priority Channel Marking

This field enhances Priority Channel Scan performance by causing unqualified Priority Scan List Member transmissions to be "Marked" and temporarily removed from the scan list.

This is particularly effective when in Landed Scan Mode on a non-priority scan list member, and when the radio briefly mutes at specific [time intervals](#) to check for [Priority Member 1 on page 621](#) or [Priority Member 2 on page 622](#) Member activity.

This temporary Scan List Member removal allows this muting period to be a shorter amount of time, and a shorter interruption for the current call. This feature applies only to Conventional scan list member channels.

IMPORTANT:

An analog Priority Channel is "marked" when it is unsuccessfully scanned due to no TPL/DPL (PL) code where a PL code was expected, or where the PL code was incorrect.

A digital (ASTRO System) Priority Channel is "marked" when it is unsuccessfully scanned due to no Network Access Code (NAC) where a NAC code was expected, or where the NAC code was incorrect.

Once the PTT button is pressed, or when scan finds that carrier has dropped on a "marked" Priority channel, or the proper PL/NAC is detected on the "marked" channel, then the "marked" status is removed for that Priority channel and normal priority scanning is resumed.

NOTE: Analog and digital are determined by the [Rx Voice/Signal Type on page 390](#) field setting on a per channel basis.

10.47.2.3

Monitor Hold Time

This field selects the amount of time that the radio remains on the current Scan List Member channel waiting for channel activity.

This timer begins once you release the [Monitor on page 171](#) button-press. This selection applies only to Conventional scan list member channels. Time is in seconds.

NOTE: Pressing the Monitor button is sometimes used as a method to suspend scanning. Once the timer expires, the radio continues normal Scan Mode operation.

Table 313: Range

Minimum	Maximum
0 (second)	255 (seconds)

10.47.2.4

Time Between Priority Samples

This field selects the amount of time that the radio waits between taking samples.

Samples are taken to check for incoming [Priority Member 1 on page 621](#) or [Priority Member 2 on page 622](#) channel activity.

This sampling is needed when the radio is in Landed Scan Mode on a non-priority scan list member, or when landed on a Priority #2 Scan List member channel and checking for a Priority #1 transmission. When the sampling occurs, the radio briefly mutes potentially causing brief interruptions in the radio's

receive audio. This selection applies only to Conventional scan list member channels. Time is in milliseconds.

NOTE: See also [Priority Channel Marking on page 614](#).

Table 314: Range

Minimum	Maximum	Increments
250 ms	6375 ms	25 ms

10.47.2.5

RSSI Voting Threshold

This field selects a Received Signal Strength Indication (RSSI) strong signal level that is then required from a Scan List Member channel in order for the radio to unmute.

This feature applies only when the radio is capable of Conventional Voting Scan. When in a Voting Scan Conventional communications system, several repeaters re-broadcast the same transmission simultaneously on different frequencies; the radio then selects the strongest/clearest signal. Therefore, this threshold setting defines when the best signal is strong enough for the radio to unmute. If no Voting Scan - Scan List Member exceeds the threshold, then the channel with the highest RSSI value is selected for unmuting. This selection applies only to Conventional scan list member channels.

WARNING: This feature only functions: When a [Scan List on page 616](#) has its [Scan Type on page 617](#) field set to **Voting Scan**, and when none of the [Scan List Member](#) channels within that list has [Automatic Scan on page 430](#) **Enabled**, and when all Scan List Member channels use repeaters within a Conventional Voting Scan wide-area network.

Accessed Only: When the radio is model/option capable.

Table 315: Range

Minimum	Maximum
00 (Hex)	FF (Hex)

10.47.3

Trunking

This section allows you to view or define functionality for all Lists that have **Multi-System Talkgroup** selected for the Scan Type.

NOTE: Individual Scan Lists can be assigned to [Conventional Personality on page 388](#) and [ASTRO 25 Trunking Personality on page 567](#) with their respective Scan List Selection field.

10.47.3.1

Failsoft Hold Time

This field selects how long the radio remains unmuted on a (Trunking only) Landed Scan - Scan List Member channel once Failsoft has occurred.

During this time period, the radio is unmuted to the Failsoft channel listening to a silent Failsoft carrier or voice transmission. Once this timer has expired Active Scan Mode operation resumes. This

selection applies only to Scan Lists where **Multi-System Talkgroup** is the selected [Scan Type on page 617](#).

NOTE: Only a **Multi-System Talkgroup** type Scan List allows for Trunking channels with multiple [Trunking Systems](#). Therefore when Failsafe has occurred on a channel, and once this Hold Timer has expired, other working channels can then be scanned.

Accessed Only: When radio is model/option capable.

Table 316: Range

Minimum	Maximum
0 (second)	255 (seconds)

10.47.3.2

System Search Time

This field selects the amount of time that the radio remains muted on a Landed Scan control channel when scanning for Scan List Members.

During this time period the radio is decoding Trunking System channel grants looking for grants to its Trunking scan list members. Once this timer has expired without the radio receiving a channel grant, the radio begins actively scanning the next Conventional scan list member or returns to the radio's currently selected channel.

WARNING: This feature functions only for [Scan Lists](#) where **Multi-System Talkgroup** is the selected [Scan Type on page 617](#).

IMPORTANT:

While scanning a Trunked system from a conventional channel, the radio is not listening to the radio's currently selected Conventional channel. Consequently the longer this timer runs, the more time is spent off of the currently selected channel. Therefore this selection should only be set to a longer time value when scanning a control channel on a busy system and may be set to shorter time value when scanning a less busy system.

Only a [Scan List on page 616](#) with a **Multi-System Talkgroup**, and [Scan Type on page 617](#) allows for Trunking channels with multiple [Trunking Systems](#). Therefore this search timer allows for other Systems to be alternatively scanned.

Accessed Only: When radio is model/option capable.

Table 317: Range

Minimum	Maximum
1 (second)	255 (seconds)

10.48

Scan List

This section allows you to create and delete Scan Lists, as well as define individual Scan List functionality.

A Scan List contains desired groupings of Conventional and/or Trunking channels, which are selected for each list in the Scan List Member section.

The selected channels can then be checked for transmission activity one at a time when the radio is in Scan Mode. Therefore, allowing for many possible receive channels. The radio only scans its currently operating channel assigned Scan List.

NOTE:

Individual Scan Lists can be assigned to Conventional and Trunking Personalities with their respective Scan List Selection field.

You can initiate scan mode automatically through Automatic Scan or with a Scan button-press, Scan switch-toggle or Scan menu selection.

10.48.1

General

This section allows you to view or define functionality that applies to individual Scan Lists.

NOTE:

Scans Lists Types that allow Trunking Scan List Member channels are dependent on one or more [ASTRO 25 Trunking System on page 524](#). Therefore, the Trunking System must be defined prior to configuring Scan List features.

Individual Scan Lists can be assigned to [Conventional Personality on page 388](#) and [ASTRO 25 Trunking Personality on page 567](#) with their respective Scan List Selection field.

10.48.1.1

Scan List Alias

This field allows you to define recognizable names for the current Scan List.

NOTE:

Examples: Scan List 05, Electric1, #510.

Characters, numbers, spaces, and special characters can be used.

Up to 14 characters are possible.

10.48.1.2

Scan Type

This field selects the type of Scan List Member channels that can be selected for the current Scan List.

These Conventional or Trunking (or both) [Scan List Member](#) channels are then scanned for qualified transmission activity when the radio is operating in Scan Mode.

IMPORTANT: Scan Types that allow Trunking Scan List Member Personalities/channels may require certain selected [Trunking Systems](#). Therefore, Trunking System must be defined for these selected Trunking Personalities prior to configuring certain Trunking-related Scan List features. Trunking Systems are referenced to a Trunking Personality with the Trunking Personality [System on page 500](#) field.

Accessed Only: When radio is model/option capable.

The following selections are supported:

Conventional

Only Conventional channels may be selected for this Scan List type; including Conventional Personalities configured for Conventional Mixed Vote Scan designated by having their [Mixed Vote Scan Enable on page 431](#) field **Enabled**.

Up to 30 [Channel on page 627](#) per scan list is possible with the below conditions:

- When a Conventional Personalities has its Mixed Vote Scan Enable field **Enabled**, each Frequency Options (record/row) of that personality counts towards the 30 Scan List member maximum.

- Per Scan List, a maximum of three Mixed Vote Scan enabled Conventional Personalities are possible as Scan List Member channels.

Validity for Mixed Vote Scan Personalities:

WARNING: When the [Mixed Vote Scan Tx Steering on page 431](#) field is **Disabled** for this Scan List, any Scan List Member channel (selected for the current Scan List) must have its Frequency Options Transmit (Tx) parameters set according to following rules:

The [Tx Frequency on page 397](#) Tx Frequency must be a match for all channels in the Scan List.

The [Tx Deviation/Channel Spacing on page 398](#) must be a match for all channels in the Scan List.

The [Tx Network ID on page 400](#) must be a match for all channels in the Scan List.

or

The Tx Frequency must be a match for all channels in the Scan List.

The Tx Deviation/Channel Spacing must be a match for all channels in the Scan List.

The User Selectable PL (MPL) field must be **Disabled** for all channels in the Scan List.

The [Tx Squelch Type on page 409](#) must be a match for all channels in the Scan List. If the Tx Squelch Type is set to **PL**, then the [Tx PL Code on page 411](#) must be a match for all channels in the Scan List, or if the Tx Squelch Type is set to **DPL**, then the [Tx DPL Code on page 412](#) and the [Tx DPL Invert on page 413](#) must be a match for all channels in the Scan List.

Priority Monitor

Available on a model/option capable basis.

Only Trunking channels may be selected for this Scan List type.

Per Scan List, Priority Monitor Scan allows up to 50 Scan List Member channels.

The Trunking Talkgroup field for any of the Trunking Scan List Member channels selected for the current Scan List may not be set to **DYN** or **ATG**.

The Trunking System Record field's "System" selection (for the current Scan List) must match the referenced Trunking System field of all of the Trunking Scan List Member channels selected for the current Scan List.

If the [Coverage Type on page 466](#) field of the Trunking System Record field's Trunking System selection (for the current Scan List) is set to **Inter-WACN Roaming**, then that Trunking System's Home WACN ID and System ID must match the TG WACN ID and TG System ID of the Trunking Talkgroup for any of the Trunking Scan List Member channels selected for the current Scan List.

Multi-System Talkgroup

Available on a model/option capable basis.

Both Conventional and Trunking channels may be selected for this Scan List type.

Per Scan List, Multi-System Talkgroup Scan is limited to five Trunking Systems, with up to 50 Scan List Member channels per Trunking System, and may include up to 10 Conventional Scan List Member channels. However, the maximum per Scan List is 250 Scan List Member channels.

Not more than 50 of the selected Scan List Member channels may reference the same Trunking System.

The Trunking Talkgroup field for any of the Trunking Scan List Member channels selected for the current Scan List may not be set to **DYN** or **ATG**.

The Conventional Personality Mixed Vote Scan Enable field must be **Disabled** for all Scan List Member channels selected for this Scan List type.

WARNING: Common Air Interface (CAI) data operations are not supported in this Scan Type. This is true because of the conflicting nature of CAI data operation (which requires the radio to receive short bursty transmissions) and Multi-System Scan (which requires the radio to spend long periods of time monitoring secondary scan members).

Voting Scan

Available on a model/option capable basis.

Only Conventional channels may be selected for this Scan List type.

Voting Scan allows only up to 10 Scan List Member channels per Scan List.

WARNING: A Voting Scan system functions only when all Scan List Member channels (selected for the current Scan List) use repeaters within a Conventional Voting Scan wide-area network.

NOTE: When operating in a Voting Scan system, several repeaters re-broadcast the same transmission simultaneously on different frequencies; the radio is then able to select the strongest/clearest signal. The RSSI Voting Threshold setting defines when the best signal is strong enough for the radio to unmute. If no channel exceeds the threshold, then the channel with the highest RSSI value is selected for unmuting.

Validity for Scan List Channel:

The Conventional Personality Mixed Vote Scan Enable field must be **Disabled** for all Scan List Member channels selected for the current Scan List.

The [Automatic Scan on page 430](#) field must be **Disabled** for all Scan List Member channels selected for the current Scan List.

When the Tx Steering field is **Enabled** or **Disabled** for this Scan List, it is not a concern for any Scan List Member channel (selected for the current Scan List) that has its [Receive Only Personality on page 389](#) field **Enabled**.

WARNING:

However, when the Tx Steering field is **Disabled** for this Scan List, any Scan List Member channel (selected for the current Scan List) that has its Receive Only Personality field **Disabled** must also have its Transmit (Tx) parameters set according to following rules.

When all Scan List Member channels of the current Scan List have their [Tx Voice/Signal Type on page 393](#) set to **ASTRO** the following must be true:

The Tx Frequency must be a match for all channels in the Scan List.

The Tx Deviation/Channel Spacing must be a match for all channels in the Scan List.

The Tx Network ID must be a match for all channels in the Scan List.

or

The Tx Frequency must be a match for all channels in the Scan List.

The Tx Deviation/Channel Spacing must be a match for all channels in the Scan List.

The User Selectable PL (MPL) field must be **Disabled** for all channels in the Scan List.

Tx Squelch Type must be a match for all channels in the Scan List. If the Tx Squelch Type is set to **PL**, then the Tx PL Code must be a match for all channels in the Scan List, or if the Tx Squelch Type is set to **DPL**, then the Tx DPL Code and the Tx DPL Invert must be a match for all channels in the Scan List.

WARNING: Also be Aware: A Voting Scan type Scan List cannot combine Scan List Member Channels where some are of the **Non-ASTRO** Tx Voice/Signal Type and where some are of the **ASTRO** Tx Voice/Signal Type. Therefore, all **Voting Scan** Scan List Member channels must be of the same Tx Voice/Signal Type.

Intelligent Priority

Both Conventional and Trunking channels may be selected for this Scan List type.

This scan type is based upon Multi-system Talkgroup Scan, supporting the limits of that scan type. This scan type provides the ability to configure a Priority 1 and Priority 2 scan member.

NOTE: Priority scan activity will be received when the radio is scanning the same system as the Priority scan member. Priority scan activity will not be received while the radio is unmuted to a non-priority scan member, including the selected channel from a different system, conventional or trunking.

10.48.1.3

Trunking System Record

This field selects a Trunking System by its programmed name.

This Trunking System is then used for communications during Scan Mode for the current [Scan List on page 616](#).

IMPORTANT:

When the [Scan Type on page 617](#) field is set to **Priority Monitor**, this selected Trunking System must be the same (a match) for all selected Scan List Member channels for the current Scan List.

When [Trunking Personalities/channels](#) are selected for a Scan List, these "matching" Trunking Systems are referenced to a Trunking Personality with the Trunking Personality [System on page 500](#) field.

Accessed Only: When the [Scan Type on page 617](#) field is set to **Priority Monitor**, and when the radio is model/option capable.

10.48.1.4

Dynamic Priority

This field enables you to define the last channel that the radio's Scan Mode has landed and transmitted on to become the new Priority Member 2 channel.

This channel remains the Priority 2 channel until a new channel is transmitted on, or until Scan Mode is disabled. This feature applies for the current Scan List.

IMPORTANT:

Activate Dynamic Priority with a [Dynamic Priority on page 168](#) button-press or [Dynamic Priority on page 196](#) menu selection.

The [Priority Member 1 on page 621](#) channel is not affected.

Accessed Only: When the [Scan Type on page 617](#) field is set to **Conventional**.

10.48.1.5

Priority 1 - Type

This field selects the type of Priority Member 1 scan used for the current Scan List.

See also [Priority Channel PTT on page 172](#).

Accessed Only: When the [Scan Type on page 617](#) field is set to **Conventional**, **Priority Monitor**, or **Intelligent Priority**.

The following selections are supported:

Disabled

The [Priority Member 1 on page 621](#) channel is disabled.

Fixed

The Priority 1 channel is selected from the [Priority Member 1 on page 621](#) field and cannot be changed.

Selected Channel

The radio uses the current Channel Selector selected channel as the Priority Member 1.

Operator Select

Uses the selected [Priority Member 1 on page 621](#). However, you are able to modify this choice, through the [Scan List on page 201](#) menu-selection.

NOTE: Both Priority 1 - Type and [Priority 2 - Type on page 621](#) cannot be set to **Selected Channel**; either one must be different.

10.48.1.6

Priority Member 1

This field selects a Priority 1 Scan List Member channel/mode for the current Scan List.

This Scan List Member channel is selected by its programmed record number from the current Scan List. When the radio is actively scanning a Scan List, 50% of the scans are targeted at the Priority Member 1 channel. See also [Priority Channel PTT on page 172](#).

Example: If the Priority Member 1 is P1, and the non-priority Scan List Members are Nn, then the scanning sequence is: P1 N1, P1 N2, P1 N3, P1 N4, P1 N5, etc.

**IMPORTANT:**

When the radio's speaker is unmuted to a non-priority call (Landed Scan Mode), or is unmuted on the [Priority Member 2 on page 622](#) (if one exists), the radio continues to scan for transmission activity on the Priority Member 1 channel. If the radio discovers a valid Priority 1 transmission, it drops the current transmission, and unmutes to the Priority 1 call. See also [Priority Channel Marking on page 614](#) and [Time Between Priority Samples on page 614](#).

When the radio is in Landed Scan Mode for a Priority Member 1 call, priority member checking is not necessary.

Accessed Only: When the [Scan Type on page 617](#) field is set to **Conventional**, **Priority Monitor**, or **Intelligent Priority**, and when [Priority 1 - Type on page 620](#) is not set to **Selected Channel** or **Disabled**.

10.48.1.7

Priority 2 - Type

This field selects the type of Priority Member 2 scan used for the current Scan List.

Accessed Only: When the [Scan Type on page 617](#) field is set to **Priority Monitor** or **Intelligent Priority**, or (when the [Scan Type on page 617](#) field is set to **Conventional**, and when the [Dynamic Priority on page 620](#) field is **Disabled**).

The following selections are supported:

Disabled

The [Priority Member 1 on page 621](#) channel is disabled.

Fixed

The Priority 2 channel is selected from the [Priority Member 2 on page 622](#) field and cannot be changed.

Selected Channel

The radio uses the current Channel Selector selected channel as the Priority Member 2.

Operator Select

Uses the selected [Priority Member 2 on page 622](#). However, you are able to modify this choice, through the [Scan List on page 201](#) menu-selection.

NOTE: Both [Priority 1 - Type on page 620](#) and Priority 2 - Type cannot be set to **Selected Channel**; either one must be different.

10.48.1.8

Priority Member 2

This field selects a Priority 2 Scan List Member channel/mode for the current Scan List.

This Scan List Member channel is selected by its programmed record number. When the radio is actively scanning a Scan List, 33.33% of the scans are targeted at the Priority Member 2 channel. When a Priority Member 2 exists, scan checks for the [Priority Member 1 on page 621](#) are reduced from 50% to 33.33%.

Example: If the Priority Member 1 is P1, the Priority Member 2 is P2, and the non-priority Scan List Members are Nn, then the scanning sequence is: N1 P1 P2, N2 P1 P2, N3 P1 P2, etc.

IMPORTANT:

When the radio's speaker is unmuted to a non-priority call (Landed Scan Mode), the radio continues to scan for transmission activity on the Priority Member 2 channel. If the radio discovers a valid Priority 2 transmission, it drops the current transmission, and unmutes to the Priority 2 call. See also [Priority Channel Marking on page 614](#) and [Time Between Priority Samples on page 614](#).

If the radio is in Landed Scan Mode on a Priority 2 call, and it discovers a valid Priority 1 transmission, it drops the Priority 2 call and unmutes to the Priority 1 call.

When [Priority 2 - Type on page 621](#) field is set to **Operator Select** or **Fixed**, and (when the [Scan Type on page 617](#) field is set to **Priority Monitor** or **Intelligent Priority**, or when the [Scan Type on page 617](#) field is set to **Conventional**, and when the [Dynamic Priority on page 620](#) field is **Disabled**).

10.48.1.9

Non-Priority Members

This field selects whether the status of a Priority Scan List Member channel can be changed to a Non-Priority status.

This feature applies for the current Scan List.

Accessed Only: When the [Scan Type on page 617](#) field is not set to **Voting Scan**.

The following selections are supported:

Fixed

Scan List members that are programmed as having a [Priority Member 1 on page 621](#) or [Priority Member 2 on page 622](#) Scan List Member status cannot be changed.

Operator Selectable

Scan List members that are programmed as having a Priority Member 1 or Priority Member 2 Scan List Member status can be changed to a Non-Priority status, through the [Scan List on page 201](#) menu-selection.

10.48.1.10

Designated Voice Tx Member Type

This field selects the desired landed scan voice transmit channel type (fixed or variable) for the current Scan List.

This selection applies while operating in Scan Mode and once a Scan List Member channel has been landed.

IMPORTANT: This field is not available when the [Scan Type on page 617](#) field is set to **Voting Scan** and the [Tx Steering](#) field is **Enabled**, since the radio must use Talkback for Tx Steering.

Accessed Only: When the [Scan Type on page 617](#) field is not set to **Voting Scan**, or when the [Tx Steering](#) field is **Disabled**.

The following selections are supported:

Fixed

Allows you to select the designated/fixed transmit voice channel from the current Scan List.

The channel selection must then be made from the [Designated Voice Tx Member on page 623](#) field.

WARNING:

Fixed Voice Tx Members only work when the [Scan Type on page 617](#) field is set to **Conventional** or **Voting Scan**; and do not work when set to **Priority Monitor** or **Multi-System Talkgroup** scan.

Fixed Voice Tx Members do not work if the selected Conventional channel has its [Receive Only Personality on page 389](#) field **Enabled**.

Selected Channel

Causes the radio to transmit voice on the radio's currently-selected channel/mode (Conventional or Trunking communications).

WARNING:

Does not work if the radio's current Conventional channel has its [Receive Only Personality on page 389](#) field **Enabled**.

Does not work if the radio's current Trunking channel has its [Transmit Mode on page 505](#) field set to **TG/AG Disabled (Listen-only)**.

Talkback

Causes the radio to transmit voice on the radio's currently landed - [Scan List Member](#) channel/mode (Conventional or Trunking communications).

10.48.1.11

Designated Voice Tx Member

This field selects the landed scan voice transmit channel.

NOTE: Scan List Members are selected from the current Scan List. This selection applies while operating in Scan Mode for the current Scan List, and once a [Scan List Member](#) channel has been landed.

Accessed Only: When the [Designated Voice Tx Member Type on page 622](#) field is set to **Fixed**, and (when the [Scan Type on page 617](#) field is not set to **Voting Scan**, or when the [Tx Steering](#) field is **Disabled**).

WARNING: This field is not available when the [Scan Type on page 617](#) field is set to **Voting Scan** and the [Tx Steering](#) field is **Enabled**, since the radio must use Talkback for Tx Steering.

WARNING:

Fixed Voice Tx Members only work when the [Scan Type on page 617](#) field is set to **Conventional** or **Voting Scan**; and do not work when set to **Priority Monitor** or **Multi-System Talkgroup** scan.

Fixed Voice Tx Members do not work if the selected Conventional channel has its [Receive Only Personality on page 389](#) field **Enabled**.

Fixed Voice Tx Members do not work if the selected Zone and Channel is Dynamic Channel.

10.48.1.12

Designated Data Rx/Tx Type

This field selects the landed scan Common Air Interface (CAI) transmit data channel type (fixed or variable).

NOTE: [Scan List Members on page 626](#) are selected from the current Scan List. This selection applies while operating in Scan Mode and once a Scan List Member channel has been landed.

Accessed Only: When the [Scan Type on page 617](#) field is set to **Conventional**.

The following selections are supported:

None

Data scan is disabled.

Fixed

Allows you to select the designated/fixed transmit data channel from the current Scan List.

The data channel selection must then be made from the [Designated Data Member on page 624](#) field.

WARNING:

Fixed Data Tx Members only work when the [Scan Type on page 617](#) field is set to **Conventional**.

Fixed Data Tx Members do not work if a Conventional Personality that references a **Fixed** Scan List has its [Receive Only Personality on page 389](#) field **Enabled**.

Selected Channel

Causes the radio to transmit data on the radio's currently selected channel/mode (Conventional or Trunking communications).

WARNING: If [data](#) features are not available on the channel, data scan is inoperable.

10.48.1.13

Designated Data Member

This field determines the landed scan Common Air Interface (CAI) transmit data channel.

NOTE: This Scan List Member is selected from the current Scan List. This selection applies while operating in Scan Mode and when the Scan List Member channel is landed.

WARNING: Applies only when this Scan List is referenced to a Conventional Personality that has the following conditions: [Rx Voice/Signal Type on page 390](#) field set to **Mixed Mode** or **ASTRO**, and has a referenced Conventional System with a referenced Data Profile which has its Terminal Data field **Enabled**, and when the ASTRO OTAR Profile Index field is **Enabled** and not grayed-out.

Accessed Only: When the [Scan Type on page 617](#) field is set to **Conventional**, and when the [Designated Data Rx/Tx Type on page 624](#) field is set to **Fixed**, and when it is not a Dynamic Zone and Channel, and when the radio is model or option capable.

10.48.2

Advanced

This section allows you to view or define a variety of features or parameters that apply on a per Scan List basis.

NOTE: Individual Scan Lists can be assigned to [Conventional Personality on page 388](#) and [ASTRO 25 Trunking Personality on page 567](#) with their respective Scan List Selection field.

10.48.2.1

Data Tx Limited Patience Timer

This field defines the waiting duration of the radio to transmit data while in Scan Mode.

When the timer expires, the data is discarded. This selection applies to the current Scan List. The value of this field is in seconds.

NOTE:

Accessed Only: When the [Scan Type on page 617](#) field is set to **Conventional**, and when the [Designated Data Rx/Tx Type on page 624](#) field is not set to **None**, and when the radio is model or option dependent.

When set to **Infinite**, data transfer wait time of the radio is unlimited.

Table 318: Range

Minimum	Maximum	Increments
1 s	255 s	1 s

10.48.2.2

Voting Scan Delay Timer

This field defines the waiting duration of the radio before voting or selecting while actively scanning in either **Voting Scan** or **Conventional Mixed Vote Scan**.

See the [Mixed Vote Scan Enable on page 431](#) field.

See also the **Conventional** and **Voting Scan** selections from the [Scan Type on page 617](#) field.

For Voting Scan or Conventional Mixed Vote Scan, several repeaters rebroadcast the same transmission simultaneously on different frequencies. The radio is then able to select the strongest or clearest signal. This selection applies for the current Scan List.

NOTE: Accessed Only: When the [Scan Type on page 617](#) field is set to **Conventional** or **Voting Scan**, and when the radio is model or option dependent.

Table 319: Range

Minimum	Maximum	Increments
0 ms	255 ms	5 ms

10.48.2.3

Display Strongest Voted Channel

This field enables the landed scan Voting Scan channel to appear in the display of the radio.

When in a Voting Scan system, several repeaters rebroadcast the same transmission simultaneously on different frequencies. The radio is then able to select the strongest or clearest signal when in scan mode. The Voting Scan landed channel is based on the Received Signal Strength Indication (RSSI). See also the **Conventional** and **Voting Scan** selections from the [RSSI Voting Threshold on page 615](#) and the [Scan Type on page 617](#) fields. This feature applies for the current Scan List.

NOTE: Accessed Only: When the [Scan Type on page 617](#) field is set to **Conventional** or **Voting Scan**, and when the radio is model or option dependent.

10.48.2.4

Mixed Conventional Vote Scan Inactivity Timer

This field defines the waiting duration of the radio, when actively scanning in Conventional Mixed Vote Scan, before starting to scan additional frequencies or channels when no qualified activity has been found on the two currently strongest frequencies in the current Scan List.

The value of this field is in minutes.

NOTE: Accessed Only: When the [Scan Type on page 617](#) field is set to **Conventional**.

Table 320: Range

Minimum	Maximum	Increments
1 m	255 m	1 m

10.48.3

Scan List Members

This section allows you to select required Conventional and/or Trunking communications channels from specific zones for the current Scan List.

While the radio is operating in Scan Mode, these selected channels can then be scanned (one at a time) for transmission activity, thus allowing for many possible receive channels. Scan List Priority Member scanning must be programmed.

NOTE:

The radio only scans its currently-operating channel's assigned Scan List.

Scan List Member Trunking and/or Conventional Communication channels must be defined in the [Zones Channel Assignment on page 605](#) before building the Scan List.

Individual Scan Lists can be assigned to [Conventional Personality on page 388](#) and [ASTRO 25 Trunking Personality on page 567](#) with their respective Scan List Selection field.

You can initiate scan mode automatically through Automatic Scan or with a [Scan on page 175](#) button-press, [Scan on page 186](#) switch-toggle or [Scan on page 201](#) menu selection.

WARNING:

When a Scan List contains 250 or more Scan List Members (record/rows) and 5 or more [ASTRO 25 Trunking System on page 524](#) (within these channels), the radio's performance in Scan Mode may be greatly reduced.

For conditions that determine valid Scan List Member channel selections for the available Scan List Types, refer to the [Scan Type on page 617](#) selections.

10.48.3.1

Position

This read-only field is assigned by RadioCentral and identifies the order of the item in a list.

NOTE: Accessed Only: When the radio is model or option dependent.

10.48.3.2

Zone

This field selects a zone for the current Scan List Member (record or row) within the current Scan List.

When you select this zone, a channel from the zone must then be selected for the same record or row. See also the [Zones Channel Assignment on page 605](#) window.

WARNING:

If the extended feature **Dynamic Zone Scan Capability** is not available, Dynamic Zones are invalid, and cannot be selected (zones that have [Dynamic Zone Enable](#) enabled). Otherwise, Dynamic Zones can be selected.

Remote Site Interface (RSI) zones are invalid and cannot be selected (zones that have [RSI Mode](#) enabled).

10.48.3.3 Channel

This field selects a channel for the current Scan List Member (record/row) within the current Scan List.

The Scan List Member Zone field must be selected for the same record/row before this channel selection is possible.

WARNING:

For conditions that determine a valid channel selection for the different Scan List Types, refer to the [Scan Type on page 617](#) selections.

When the [Coverage Type on page 466](#) field for the referenced Trunking System is set to **Inter-WACN Roaming** and the Scan Type is **Multi-System Talkgroup**, then the [TG WACN ID on page 567](#) and [TG System ID on page 566](#) of the [Trunking Talkgroup on page 608](#) assigned to this channel selection must match the Home WACN ID and System ID of the Trunking System. Otherwise the application considers this channel selection invalid.

The application considers this channel selection invalid when the [Designated Data Member on page 624](#) field is referencing an LTE Broadband enabled Conventional channel, and another Scan List Member channel (of the same Scan List) references a Conventional channel having its [LTE Interference Frequency Present on page 395](#) field set to **Enabled**, or a Trunking channel whose [LTE Interference Frequency Present on page 539](#) field is set to **True**. A conventional channel is LTE enabled when the Personality's referenced ASTRO Conventional System has a referenced Data Profile with a [Data Profile Type on page 341](#) equal to **Conventional & Broadband** or **Broadband-Only**, and when that Data Profile's [Broadband Source](#) is **Internal LTE Modem**.

When the extended feature "Dynamic Zone Scan Capability" is available, and the channel is a Dynamic Channel:

- If the [Scan Type on page 617](#) is set to **Voting Scan**, Dynamic Channel is not valid.
- If the [Scan Type on page 617](#) is set to **Conventional**, **Priority Mon**, or **Multi-System Talkgroup**, Dynamic Channel without any assignment is valid.
- If the [Scan Type on page 617](#) is **Conventional**, **Priority Mon**, **Multi-System Talkgroup**, or **Intelligent Priority**, Dynamic Channel with assignment are regarded as other normal channels.

NOTE: Accessed Only:

- The [Zone on page 626](#) field is not set to **Unassigned** and the zone is not a Dynamic Zone.
- The [Zone on page 626](#) field is not set to **Unassigned**.
- The zone is a Dynamic Zone with the availability of **Dynamic Zone Scan Capability**.

10.49

Radio Profiles

The **Radio Profiles** section allows you to view or define individual Radio Profiles. Radio profiles allow for intended groupings of audio and indicator settings to be assembled for specific radio channels and or specific in-the-field usage scenarios.

NOTE:

Radio profiles are selected for use on a per channel basis from the Zone Channel Assignment Radio Profile field.

The Radio Profiles button-press or the Radio Profiles menu-selection allows you to modify a channel's Radio Profile assignment.

10.49.1

General

This section allows you to view or modify settings for individual Radio Profiles.

NOTE:

Radio profiles are selected for use on a per channel basis from the Zone Channel Assignment Radio Profile field.

The Radio Profiles button-press or the Radio Profiles menu-selection allows you to modify a channel's Radio Profile assignment.

10.49.1.1

Radio Profile Name

This field allows you to view or define recognizable names for the current Radio Profile.

Radio profiles are selected for use on a per channel basis from the Zone Channel Assignment Radio Profile field.

NOTE: Three pre-named radio profile records have been supplied for your convenience:

Default, Surveillance, and Loud Audio. You can rename all suggested names. These profiles should be defined according to your needs; more profiles may be created.

NOTE:

Examples: PROFILE-001, #500, Electric1, # A5.

Characters, numbers, spaces, and special characters can be used.

A total of 14 characters are possible.

The Radio Profile Name appears in the front display.

10.49.1.2

Permanent Front Display Backlight

This field causes the radio front display backlight to permanently illuminate.

This selection applies to the current Radio Profile.

IMPORTANT:

When this field is enabled, an approximate 20 minute drain in the standard battery life for a normal duty cycle will occur.

When the Disable Lights field is enabled, this feature will not apply.

Accessed Only: When the radio is model/option capable.

10.49.1.3

Permanent Top Display Backlight

If enabled, this field allows the radio top display backlight to permanently illuminate.

This selection applies to the current Radio Profile.

IMPORTANT:

When this field is enabled, an approximate 20 minute drain in the standard battery life for a normal duty cycle will occur.

When the Disable Lights field is enabled, this feature will not apply.

Accessed Only: When the radio is model/option capable.

10.49.1.4

Noise Sensing Volume Control

If this field is enabled, the radio automatically sets the speaker volume to a level appropriate for the listening environment.

This feature is not supported on wireless speakers or wired Radio Speaker Microphones (RSM).

Accessed Only: When the radio is model or option capable.

10.49.1.5

Speaker Audio Routing

This field selects the audio routing to the radio's internal speakers.

This selection applies to the current Radio Profile.

IMPORTANT:

The dual-display portable is equipped with two internal speakers, one on either side of the radio. For this model, you can route audio to either (or both) speakers independently.

The top display portable is equipped with a single speaker. For this model, you can enable or disable the audio to this speaker.

Accessed Only: When the radio is model/option capable.

10.49.1.6

Disable Lights

This field causes all of the LEDs and backlights of a radio and its accessories, such as a DRSM, to be disabled for the current Radio Profile.

This feature is useful during covert/surveillance operations.

IMPORTANT:

When disabled, radios equipped with Type 1 Encryption do not function. Type 1 Encryption requires that you are able to distinguish (from LED colors) a Type 1 incoming or outgoing encryption call.

On the Mobile O9 Control Head, the Stealth Mode Disable Lights/LEDs selection overrides this selection whenever the dedicated Stealth Mode button is toggled ON. Once the Stealth Mode is toggled OFF, the radio reverts back to its current Radio Profile settings.

10.49.1.7

Disable Tones

This field causes all of the radio alert tones, sidetones, and keypad tones to be disabled for the current Radio Profile.

This selection is useful during covert/surveillance operations.

NOTE: On the Mobile O9 Control Head, the Stealth Mode Disable Tones selection overrides this selection whenever the dedicated Stealth Mode button is toggled ON. Once the Stealth Mode is toggled OFF, the radio reverts back to its current Radio Profile settings.

10.49.1.8

Disable Emergency Notification

This field causes Intelligent Lighting that indicates Emergency Mode to be disabled.

This selection applies to the current Radio Profile.

NOTE: When the Disable Lights field is enabled, the colored backlight will not turn on.

10.49.1.9

Disable Critical Notification

This field causes Intelligent Lighting for self-diagnostic and failure detection to be disabled. This is applicable when the radio is the latest Fire Service Standards model and in Non-Hazard Mode capable channel.

This selection applies to the current Radio Profile.

NOTE: When the Disable Lights field is enabled, the colored backlight is disabled.

10.49.1.10

Disable Call Notification

This field causes Intelligent Lighting for received calls to be disabled.

This selection applies to the current Radio Profile.

IMPORTANT: When the [Disable Lights on page 629](#) field is enabled, the colored backlight will not turn on.

10.49.2

Audio Settings - Non APX3000 (Radio Profiles)

The **Audio Settings - Non APX3000** section of the Radio Profiles set allows the user to view or modify various microphone and audio settings, alert tone volume settings, and custom microphone and audio settings that apply for non-APX3000 radio profiles.

NOTE: Radio profiles are selected for use on a per channel basis from the Zone Channel Assignment Radio Profile field.

The Radio Profiles button-press or the Radio Profiles menu-selection allow the radio-user to modify a channel's Radio Profile assignment.

10.49.2.1

Noise Reduction Group Setting

This field predefines a set of value for Noise Reduction Section fields under Microphone/TX Settings Group.

When the Group Setting value changes from **Custom**, the value of the fields on that section change accordingly. When the group setting is not set to **Custom**, then all fields will become view-only.

The following list shows the selections and definitions for Noise Reduction Group Settings (Radio).

Off

The value of the following fields is set to: Custom Noise Reduction is **Disabled**, Background Noise Reduction Level is **Off**, Wind Noise Reduction Level is **Off**, PASS Alarm is **Disabled**, Noise Reduction Profile Selection is **Radio NR 1**, Background Noise Reduction Mode is **On/Applied**, Wind Noise Reduction Mode is **On/Active**, Source Mode is **Full Automatic**, and Directivity Mode is **On/Adapting**.

Normal

The value of the following fields is set to: Custom Noise Reduction is **Disabled**, Background Noise Reduction Level is **Normal**, Wind Noise Reduction Level is **Normal**, PASS Alarm is **Disabled**, Noise Reduction Profile Selection is **Radio NR 1**, Background Noise Reduction Mode is **On/Applied**, Wind Noise Reduction Mode is **On/Active**, Source Mode is **Full Automatic**, and Directivity Mode is **On/Adapting**.

Aggressive

The value of the following fields is set to: Custom Noise Reduction is **Disabled**, Background Noise Reduction Level is **Aggressive**, Wind Noise Reduction Level is **Normal**, PASS Alarm is **Disabled**, Noise Reduction Profile Selection is **Radio NR 1**, Background Noise Reduction Mode is **On/Applied**, Wind Noise Reduction Mode is **On/Active**, Source Mode is **Full Automatic**, and Directivity Mode is **On/Adapting**.

Extreme

The value of the following fields is set to: Custom Noise Reduction is **Disabled**, Background Noise Reduction Level is **Extreme_1-sided**, Wind Noise Reduction Level is **Normal**, PASS Alarm is **Enabled**, Noise Reduction Profile Selection is **Radio NR 1**, Background Noise Reduction Mode is **On/Applied**, Wind Noise Reduction Mode is **On/Active**, Source Mode is **Full Automatic**, and Directivity Mode is **On/Adapting**.

Auto

The value of the following fields is set to: Custom Noise Reduction is **Disabled**, Background Noise Reduction Level is **Auto**, Wind Noise Reduction Level is **Normal**, and PASS Alarm is **Enabled**. Enables the auto-aggressiveness profile of noise reduction. This selection applies only when the radio is model/option capable.

The following list shows the selections and definitions for Noise Reduction Group Settings (Accessory).

Off

The value of the following fields is set to: Custom Noise Reduction is **Disabled**, Background Noise Reduction Level is **Off**, Wind Noise Reduction Level is **Off**, PASS Alarm is **Disabled**, Noise Reduction Profile Selection is **Acc NR 1**, Background Noise Reduction Mode is **On/Applied**, Wind Noise Reduction Mode is **On/Active**, Source Mode is **Mic 1**, and Directivity Mode is **On/Adapting**.

Normal

The value of the following fields is set to: Custom Noise Reduction is **Disabled**, Background Noise Reduction Level is **Normal**, Wind Noise Reduction Level is **Normal**, PASS Alarm is **Disabled**, Noise Reduction Profile Selection is **Acc NR 1**, Background Noise Reduction Mode is **On/Applied**, Wind Noise Reduction Mode is **On/Active**, Source Mode is **Mic 1**, and Directivity Mode is **On/Adapting**.

Aggressive

The value of the following fields is set to: Custom Noise Reduction is **Disabled**, Background Noise Reduction Level is **Aggressive**, Wind Noise Reduction Level is **Normal**, PASS Alarm is **Disabled**, Noise Reduction Profile Selection is **Acc NR 1**, Background Noise Reduction Mode is **On/Applied**, Wind Noise Reduction Mode is **On/Active**, Source Mode is **Mic 1**, and Directivity Mode is **On/Adapting**.

Extreme

The value of the following fields is set to: Custom Noise Reduction is **Disabled**, Background Noise Reduction Level is **Extreme_1-sided**, Wind Noise Reduction Level is **Normal**, PASS Alarm is

Enabled, Noise Reduction Profile Selection is **Acc NR 1**, Background Noise Reduction Mode is **On/Applied**, Wind Noise Reduction Mode is **On/Active**, Source Mode is **Mic 1**, and Directivity Mode is **On/Adapting**.

Auto

The value of the following fields is set to: Custom Noise Reduction is **Disabled**, Background Noise Reduction Level is **Auto**, Wind Noise Reduction Level is **Normal**, and PASS Alarm is **Enabled**.

Enables the auto-aggressiveness profile of noise reduction. This selection applies only when the radio is model/option capable.

Accessed Only: This is an advanced setting which is only available in Full View (see Codeplug View).

10.49.2.2

Group Setting (Accessory)

The purpose of Noise Reduction Group Settings is to predefine a set of value for Noise Reduction Section fields under Microphone/TX Settings Group.

When the Group Setting value changes from **Custom**, the value of the fields on that section change accordingly. When the group setting is not set to **Custom**, then all fields will become view-only.

NOTE: For **Custom** setting, expert knowledge of the different Noise Reduction settings is highly recommended before making individual adjustments.

The following list shows the selections and definitions for Noise Reduction Group Settings (Accessory).

Off

The value of the following fields is set to: Custom Noise Reduction is **Disabled**, Background Noise Reduction Level is **Off**, Wind Noise Reduction Level is **Off**, PASS Alarm is **Disabled**, Noise Reduction Profile Selection is **Acc NR 1**, Background Noise Reduction Mode is **On/Applied**, Wind Noise Reduction Mode is **On/Active**, Source Mode is **Mic 1**, and Directivity Mode is **On/Adapting**.

Normal

The value of the following fields is set to: Custom Noise Reduction is **Disabled**, Background Noise Reduction Level is **Normal**, Wind Noise Reduction Level is **Normal**, PASS Alarm is **Disabled**, Noise Reduction Profile Selection is **Acc NR 1**, Background Noise Reduction Mode is **On/Applied**, Wind Noise Reduction Mode is **On/Active**, Source Mode is **Mic 1**, and Directivity Mode is **On/Adapting**.

Aggressive

The value of the following fields is set to: Custom Noise Reduction is **Disabled**, Background Noise Reduction Level is **Aggressive**, Wind Noise Reduction Level is **Normal**, PASS Alarm is **Disabled**, Noise Reduction Profile Selection is **Acc NR 1**, Background Noise Reduction Mode is **On/Applied**, Wind Noise Reduction Mode is **On/Active**, Source Mode is **Mic 1**, and Directivity Mode is **On/Adapting**.

Extreme

The value of the following fields is set to: Custom Noise Reduction is **Disabled**, Background Noise Reduction Level is **Extreme_1-sided**, Wind Noise Reduction Level is **Normal**, PASS Alarm is **Enabled**, Noise Reduction Profile Selection is **Acc NR 1**, Background Noise Reduction Mode is **On/Applied**, Wind Noise Reduction Mode is **On/Active**, Source Mode is **Mic 1**, and Directivity Mode is **On/Adapting**.

Auto

The value of the following fields is set to: Custom Noise Reduction is **Disabled**, Background Noise Reduction Level is **Auto**, Wind Noise Reduction Level is **Normal**, and PASS Alarm is **Enabled**.

Enables the auto-aggressiveness profile of noise reduction. This selection applies only when the radio is model/option capable.

Custom

Use the Custom option to individually set unique Speaker Audio Equalization gain settings for the radio that are not supported by the other options in the Group Setting menu. It is highly

recommended to avoid Maximum settings for same Frequency Bands between the Microphone and Speaker Equalizations.

10.49.2.3

Custom Noise Reduction

This field enables the radio Radio or Accessory microphones to use a custom Radio Noise Reduction Profile or Accessory Noise Reduction Profile that target specific noise conditions.

WARNING: Custom Mic Noise Reduction settings should only be attempted by Qualified Service Personnel. Failure to configure the settings properly may seriously degrade mic noise suppression and consequently the intelligibility of transmitted speech.

The Radio Noise Reduction Settings and Accessory Noise Reduction Settings are recommended for most noise environments.

NOTE: Noise Reduction improves voice clarity by reducing background noise. Noise Reduction occurs on the transmitting radio prior to transmission (in analog mode) and prior to voice coding (in digital mode). Not only does reducing background noise improve voice clarity for an analog mode transmission, in digital mode a cleaner speech signal going into the voice-encoder (vocoder) results in clearer voice being received and decoded in the receiver.

10.49.2.4

Custom Noise Reduction (Accessory)

Enables the radio's Radio/Accessory microphones to use a custom Radio Noise Reduction Profile or Accessory Noise Reduction Profile that target specific noise conditions.

WARNING: Custom Mic Noise Reduction settings should only be attempted by Qualified Service Personnel. Failure to configure the settings properly may seriously degrade mic noise suppression and consequently the intelligibility of transmitted speech.

The Radio Noise Reduction Settings and Accessory Noise Reduction Settings are recommended for most noise environments.

NOTE: Noise Reduction improves voice clarity by reducing background noise. Noise Reduction occurs on the transmitting radio prior to transmission (in analog mode) and prior to voice coding (in digital mode). Not only does reducing background noise improve voice clarity for an analog mode transmission, in digital mode a cleaner speech signal going into the voice-encoder (vocoder) results in clearer voice being received and decoded in the receiver.

10.49.2.5

Background Noise Reduction Level (Radio)

Selects the level of background noise reduction that is applied to the internal dual-microphones and an external microphone.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This selection applies to the current Radio Profile.

NOTE: Noise Reduction improves voice clarity by reducing background noise. Noise Reduction occurs on the transmitting radio prior to transmission (in analog mode) and prior to voice coding (in digital mode). Not only does reducing background noise improve voice clarity for an analog mode transmission, in digital mode a cleaner speech signal going into the voice-encoder (vocoder) results in clearer voice being received and decoded in the receiver.

Accessed Only: When the Custom Noise Reduction field is disabled.

The following list shows the selections and definitions for Background Noise Reduction Level (Radio).

Off

Disables dual-microphone background noise reduction. Both microphones remain active, and the radio-user can speak into either side of the radio, but no background noise reduction is applied.

Normal

Both microphones are active and continuously adapt to the voice signal for optimal clarity over a wide range of background noise. Recommended setting for most noise environments.

Aggressive

An increased level of background noise reduction is enabled. Recommended for VERY HIGH noise environments.

Xtreme 1_Sided

The Maximum amount of background noise reduction is enabled. Recommended for EXTREME HIGH noise environments, for example: Firefighter PASS (Personal Alert Safety System) alarm, low air alerts, pumper truck, gas fan, saw.

NOTE: This Setting requires the radio-user to speak into the side of the radio containing the large loudspeaker. This selection applies only when the radio is model/option capable.

Auto

Enables the auto-aggressiveness profile of noise reduction.

NOTE: This selection applies only when the radio is model/option capable.

The following list shows the selections and definitions for Background Noise Reduction Level (Accessory).

Off

Disables background noise reduction. The external microphone remains active, but no noise reduction is applied.

Normal

The external microphone continuously adapts to the voice signal for optimal clarity over a wide range of background noise. Recommended setting for most noise environments.

Xtreme 1_Sided

The Maximum amount of background noise reduction is enabled. Recommended for EXTREME HIGH noise environments, for example: Firefighter PASS alarm, low air alerts, pumper truck, gas fan, saw.

NOTE: This Setting requires the radio-user to speak into the side of the radio containing the large loudspeaker. This selection applies only when the radio is model/option capable.

Auto

Enables the auto-aggressiveness profile of noise reduction.

NOTE: This selection applies only when the radio is model/option capable.

10.49.2.6

Background Noise Reduction Level (Accessory)

Selects the level of background noise reduction that is applied to the internal dual-microphones and an external microphone.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This selection applies to the current Radio Profile.

NOTE: Noise Reduction improves voice clarity by reducing background noise. Noise Reduction occurs on the transmitting radio prior to transmission (in analog mode) and prior to voice coding (in digital mode). Not only does reducing background noise improve voice clarity for an analog mode transmission, in digital mode a cleaner speech signal going into the voice-encoder (vocoder) results in clearer voice being received and decoded in the receiver.

Accessed Only: When the Custom Noise Reduction field is disabled.

The following list shows the selections and definitions for Background Noise Reduction Level (Radio).

Off

Disables dual-microphone background noise reduction. Both microphones remain active, and the radio-user can speak into either side of the radio, but no background noise reduction is applied.

Normal

Both microphones are active and continuously adapt to the voice signal for optimal clarity over a wide range of background noise. Recommended setting for most noise environments.

Aggressive

An increased level of background noise reduction is enabled. Recommended for VERY HIGH noise environments.

Xtreme 1_Sided

The Maximum amount of background noise reduction is enabled. Recommended for EXTREME HIGH noise environments, for example: Firefighter Personal Alert Safety System (PASS) alarm, low air alerts, pumper truck, gas fan, saw.

NOTE: This Setting requires the radio-user to speak into the side of the radio containing the large loudspeaker. This selection applies only when the radio is model/option capable.

Auto

Enables the auto-aggressiveness profile of noise reduction.

NOTE: This selection applies only when the radio is model/option capable.

The following list shows the selections and definitions for Background Noise Reduction Level (Accessory).

Off

Disables background noise reduction. The external microphone remains active, but no noise reduction is applied.

Normal

The external microphone continuously adapts to the voice signal for optimal clarity over a wide range of background noise. Recommended setting for most noise environments.

Aggressive

An increased level of background noise reduction is enabled. Recommended for VERY HIGH noise environments.

Xtreme 1_Sided

The Maximum amount of background noise reduction is enabled. Recommended for EXTREME HIGH noise environments, for example: Firefighter PASS alarm, low air alerts, pumper truck, gas fan, saw.

NOTE: This Setting requires the radio-user to speak into the side of the radio containing the large loudspeaker. This selection applies only when the radio is model/option capable.

Auto

Enables the auto-aggressiveness profile of noise reduction.

NOTE: This selection applies only when the radio is model/option capable.

10.49.2.7

Wind Noise Reduction Level (Radio)

Selects the level of wind noise reduction that is applied to the internal dual-microphones and the external microphone.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This selection applies to the current Radio Profile.

NOTE: Noise Reduction improves voice clarity by reducing background noise. Noise Reduction occurs on the transmitting radio prior to transmission (in analog mode) and prior to voice coding (in digital mode). Not only does reducing background noise improve voice clarity for an analog mode transmission, in digital mode a cleaner speech signal going into the voice-encoder (vocoder) results in clearer voice being received and decoded in the receiver.

Accessed Only: When the Custom Noise Reduction field is disabled.

The following list shows the selections and definitions for Wind Noise Reduction Settings (Radio).

Off

Disables dual-microphone wind noise reduction. Both microphones remain active, and the radio-user can speak into either side of the radio, but no wind noise reduction is applied.

Normal

Both microphones are active and continuously adapt to the voice signal for optimal clarity over a wide range of noise.

NOTE: Recommended setting for most environments.

Aggressive

An increased level of wind noise reduction is enabled.

NOTE: Recommended for very high noise environments.

10.49.2.8

Wind Noise Reduction Level (Accessory)

The following table lists the selection and definition for Wind Noise Reduction Level (Accessory).

NOTE: This is a non-configurable field and the default setting is set to **Off**.

Off

Disables wind noise reduction. The external microphone remains active, but no wind noise reduction is applied.

10.49.2.9

PASS Alarm Filter (Radio)

Personal Alert Safety System (PASS) Alarm Filter (Radio) enables background noise reduction for the radio's internal microphone whenever the radio is transmitting in the presence of an active PASS alarm.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

PASS Alarm Filter (Accessory) enables background noise reduction for the radio's external microphone whenever the radio is transmitting in the presence of an active PASS alarm. This selection applies to the current Radio Profile.

The selections supported are **Disabled** and **Enabled**.

NOTE: Noise Reduction improves voice clarity by reducing background noise. Noise Reduction occurs on the transmitting radio prior to transmission (in analog mode) and prior to voice coding (in digital mode). Not only does reducing background noise improve voice clarity for an analog mode transmission, in digital mode a cleaner speech signal going into the voice-encoder (vocoder) results in clearer voice being received and decoded in the receiver.

Accessed Only:

When the Custom Noise Reduction Enable field is disabled, and

(When the Background Noise Reduction Level field is not set to **Off**, and when the Wind Noise Reduction Level field is not set to **Off**).

10.49.2.10

PASS Alarm Filter (Accessory)

Personal Alert Safety System (PASS) Alarm Filter enables background noise reduction for the radio's internal microphone whenever the radio is transmitting in the presence of an active PASS alarm.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

PASS Alarm Filter (Accessory) enables background noise reduction for the radio's external microphone whenever the radio is transmitting in the presence of an active PASS alarm. This selection applies to the current Radio Profile.

The selections supported are **Enabled** and **Disabled**.

NOTE: Noise Reduction improves voice clarity by reducing background noise. Noise Reduction occurs on the transmitting radio prior to transmission (in analog mode) and prior to voice coding (in digital mode). Not only does reducing background noise improve voice clarity for an analog mode transmission, in digital mode a cleaner speech signal going into the voice-encoder (vocoder) results in clearer voice being received and decoded in the receiver.

Accessed Only:

When the Custom Noise Reduction Enable field is disabled, and

(When the Background Noise Reduction Level field is not set to **Off**, and when the Wind Noise Reduction Level field is not set to **Off**).

10.49.2.11

Noise Reduction Profile Selection

These custom settings apply only when the Custom Noise Reduction field is selected in the referenced Radio Profile.

WARNING: Do not modify Custom Noise Reduction settings unless you are a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

Radio Profiles are referenced to a specific channel with the Zone Channel Assignment, Channel Page's **Radio Profile Selection** field.

10.49.2.12

Noise Reduction Profile Selection (Accessory)

Enables the radio's Radio/Accessory microphones to use a custom Radio Noise Reduction Profile or Accessory Noise Reduction Profile that target specific noise conditions.

WARNING: Custom Mic Noise Reduction settings should only be attempted by Qualified Service Personnel. Failure to configure the settings properly may seriously degrade mic noise suppression and consequently the intelligibility of transmitted speech.

The Radio Noise Reduction Settings and Accessory Noise Reduction Settings are recommended for most noise environments.

NOTE: Noise Reduction improves voice clarity by reducing background noise. Noise Reduction occurs on the transmitting radio prior to transmission (in analog mode) and prior to voice coding (in digital mode). Not only does reducing background noise improve voice clarity for an analog mode transmission, in digital mode a cleaner speech signal going into the voice-encoder (vocoder) results in clearer voice being received and decoded in the receiver.

10.49.2.13

Background Noise Reduction Mode (Radio)

These custom settings apply only when the Custom Noise Reduction field is selected in the referenced Radio Profile.

WARNING: Do not modify Custom Noise Reduction settings unless the user is a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

Radio Profiles are referenced to a specific channel with the Zone Channel Assignment, Channel Page's **Radio Profile Selection** field.

10.49.2.14

Background Noise Reduction Mode (Accessory)

These custom settings apply only when the Custom Noise Reduction field is selected in the referenced Radio Profile.

WARNING: Do not modify Custom Noise Reduction settings unless the user is a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

Radio Profiles are referenced to a specific channel with the Zone Channel Assignment, Channel Page's **Radio Profile Selection** field.

10.49.2.15

Wind Noise Reduction Mode (Radio)

These custom settings apply only when the Custom Noise Reduction field is selected in the referenced Radio Profile.

WARNING: Do not modify Custom Noise Reduction settings unless the user is a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

Radio Profiles are referenced to a specific channel with the Zone Channel Assignment, Channel Page's **Radio Profile Selection** field.

10.49.2.16

Wind Noise Reduction Mode (Accessory)

These custom settings apply only when the Custom Noise Reduction field is selected in the referenced Radio Profile.

WARNING: Do not modify Custom Noise Reduction settings unless the user is a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

Radio Profiles are referenced to a specific channel with the Zone Channel Assignment, Channel Page's **Radio Profile Selection** field.

10.49.2.17

Source Mode (Radio)

These custom settings apply only when the Custom Noise Reduction field is selected in the referenced Radio Profile.

WARNING: Do not modify Custom Noise Reduction settings unless the user is a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

Radio Profiles are referenced to a specific channel with the Zone Channel Assignment, Channel Page's Radio Profile Selection field.

The following selections are supported:

- Beam 1
- Beam 2
- Full Automatic
- Mic 1
- Mic 1 & Mic 2
- Mic 2
- Mic 3
- Off
- Proximity Mic 1
- Proximity Mic 2

10.49.2.18

Source Mode (Accessory)

These custom settings apply only when the Custom Noise Reduction field is selected in the referenced Radio Profile.

WARNING: Do not modify Custom Noise Reduction settings unless the user is Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

10.49.2.19

Directivity Mode (Radio)

These custom settings apply only when the Custom Noise Reduction field is selected in the referenced Radio Profile.

WARNING: Do not modify Custom Noise Reduction settings unless the user is a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

Radio Profiles are referenced to a specific channel with the Zone Channel Assignment, Channel Page's **Radio Profile Selection** field.

10.49.2.20

Directivity Mode (Accessory)

These custom settings apply only when the Custom Noise Reduction field is selected in the referenced Radio Profile.

WARNING: Do not modify Custom Noise Reduction settings unless the user is a Qualified Service Personnel. Improper settings can cause high levels of background noise to be transmitted with voice, which can cause communications to fail.

10.49.2.21

SAM Mode

Speaker-As-Microphone (SAM) is an alternative audio source.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

The audio performance improves in wind noise when you use the SAM Mode.

The available selections are **Off**, **On**, and **Wind_On**.

When you set this feature to **Wind_On**, the SAM audio input functions only in a windy condition.

Accessed Only: When the radio is model/option capable and when [Custom Noise Reduction on page 633](#) is **Enabled**.

10.49.2.22

Radio Mic Auto Mode

Radio Mic Auto Mode refers to the automatic setting of the Noise suppression aggressiveness for the radio.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

The available selections are **Off** and **On**.

Accessed Only: When the radio is model/option capable and when [Custom Noise Reduction on page 633](#) is **Enabled**.

10.49.2.23

Accessory Mic Auto Mode

Accessory Mic Auto Mode refers to the automatic setting of the Noise suppression aggressiveness level for accessory.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

The available selections are **Off** and **On**.

Accessed Only: When the radio is model/option capable and when [Custom Noise Reduction \(Accessory\) on page 633](#) is **Enabled**.

10.49.2.24

Overload Comp (Radio)

This field enables Automatic compensation for mic overload to improve performance of the noise reduction in very loud conditions.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

The selections are **Off** and **On**.

Accessed Only: When the radio is model/option capable and when [Custom Noise Reduction on page 633](#) is **Enabled**.

10.49.2.25

Group Setting (Radio)

This field predefines a set of value for Gain Sensitivity Section fields under Microphone/TX Settings Group.

When the Group Setting value is changed other than **Custom**, the value of the fields on that section change accordingly. When the group setting is not set to **Custom**, then all fields will become view-only.

The following lists the selections and definitions for both Gain Sensitivity Group Settings (Radio) and Gain Sensitivity Group Settings (Accessory).

Normal

The value of the following fields is set to: Analog AGC is **Enabled**, Digital AGC is **Enabled**, SecureNet AGC is **Enabled**, Analog Fixed Gain is **0**, Digital Fixed Gain is **0**, SecureNet Fixed Gain is **0**, Gain Control Output is **0**, Gain Control Total is **6**, and Digital / Analog Balance is **Disabled**.

Noise Optimize

The value of the following fields is set to: Analog AGC is **Disabled**, Digital AGC is **Disabled**, SecureNet AGC is **Disabled**, Analog Fixed Gain is **-6**, Digital Fixed Gain is **-6**, SecureNet Fixed Gain is **-6**, Gain Control Output is **0**, Gain Control Total is **6**, and Digital/Analog Balance is **Enabled**.

Loud Output

The value of the following fields is set to: Analog AGC is **Enabled**, Digital AGC is **Enabled**, SecureNet AGC is **Enabled**, Analog Fixed Gain is **0**, Digital Fixed Gain is **0**, SecureNet Fixed Gain is **0**, Gain Control Output is **6**, Gain Control Total is **9**, and Digital/Analog Balance is **Disabled**.

Reduce Feedback

The value of the following fields is set to: Analog AGC is **Disabled**, Digital AGC is **Disabled**, SecureNet AGC is **Disabled**, Analog Fixed Gain is **-9**, Digital Fixed Gain is **-9**, SecureNet Fixed Gain is **-9**, Gain Control Output is **0**, Gain Control Total is **6**, and Digital/Analog Balance is **Enabled**.

10.49.2.26

Group Setting (Accessory)

The purpose of this field is to predefine a set of value for Gain Sensitivity Section fields under Microphone/TX Settings Group.

When the Group Setting value is changed other than **Custom**, the value of the fields on that section change accordingly. When the group setting is not set to **Custom**, then all fields will become view-only.

The following lists the selections and definitions for both Gain Sensitivity Group Settings (Radio) and Gain Sensitivity Group Settings (Accessory).

Normal

The value of the following fields is set to: Analog AGC is **Enabled**, Digital AGC is **Enabled**, SecureNet AGC is **Enabled**, Analog Fixed Gain is **0**, Digital Fixed Gain is **0**, SecureNet Fixed Gain is **0**, Gain Control Output is **0**, Gain Control Total is **6**, and Digital/Analog Balance is **Disabled**.

Noise Optimize

The value of the following fields is set to: Analog AGC is **Disabled**, Digital AGC is **Disabled**, SecureNet AGC is **Disabled**, Analog Fixed Gain is **-6**, Digital Fixed Gain is **-6**, SecureNet Fixed Gain is **-6**, Gain Control Output is **0**, Gain Control Total is **6**, and Digital/Analog Balance is **Enabled**.

Loud Output

The value of the following fields is set to: Analog AGC is **Enabled**, Digital AGC is **Enabled**, SecureNet AGC is **Enabled**, Analog Fixed Gain is **0**, Digital Fixed Gain is **0**, SecureNet Fixed Gain is **0**, Gain Control Output is **6**, Gain Control Total is **9**, and Digital/Analog Balance is **Disabled**.

Reduce Feedback

The value of the following fields is set to: Analog AGC is **Disabled**, Digital AGC is **Disabled**, SecureNet AGC is **Disabled**, Analog Fixed Gain is **-9**, Digital Fixed Gain is **-9**, SecureNet Fixed Gain is **-9**, Gain Control Output is **0**, Gain Control Total is **6**, and Digital/Analog Balance is **Enabled**.

Custom

Use the Custom option to individually set unique Speaker Audio Equalization gain settings for the radio that are not supported by the other options in the Group Setting menu. It is highly recommended to avoid Maximum settings for same Frequency Bands between the Microphone and Speaker Equalizations.

10.49.2.27

Analog AGC

This field enables Automatic Gain Control (AGC) to be used for the radio's internal or external microphone.

This selection only applies while the radio is transmitting in analog mode. AGC compensates for differences in voice level and operational style. As a result of AGC, audio is transmitted and then received at the same audio/decibel level. This selection applies to the current Radio Profile.

WARNING:

(If you set the Audio Configuration Level to **Basic**) When enabled, the Radio Wide, Tx Digital/Analog Balance field must not be set to **Radio Wide**, and Tx Digital/Analog Balance in the same Radio Profile record/row must be **Disabled**. Otherwise, this selection is considered invalid.

(If you set the Audio Configuration Level to **Enhanced**) When enabled, the Radio Wide, Tx Digital/Analog Balance field must not be set to **Radio Wide**, and Tx Digital/Analog Balance in the same Radio Profile record/row must be **Disabled** Otherwise, this selection is considered invalid.

IMPORTANT:

The Tx Gain Control Total level (also known as pure gain) is applied before AGC has occurred. For microphone input below the nominal level: actual microphone output = microphone input + Tx Gain Control Total.

The Tx Gain Control Output level is applied after AGC has occurred. Tx Gain Control Output implements an infinity:1 dB ratio when microphone input is above the nominal level. That is, for any input above nominal, the output will never go above the level set via this parameter.

10.49.2.28

Analog AGC (Accessory)

Enables Automatic Gain Control (AGC) to be used for the radio's internal or external microphone. This selection only applies while the radio is transmitting in analog mode.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

AGC compensates for differences in voice level and operational style. As a result of AGC, audio is transmitted and then received at the same audio/decibel level. This selection applies to the current Radio Profile.

WARNING:

(If the user set the Audio Configuration Level to **Basic**) When enabled, the Radio Wide, Tx Digital/Analog Balance field must not be set to **Radio Wide**, and Tx Digital/Analog Balance in the same Radio Profile record/row must be **Disabled**. Otherwise, this selection is considered invalid.

(If the user set the Audio Configuration Level to **Enhanced**) When enabled, the Radio Wide, Tx Digital/Analog Balance field must not be set to **Radio Wide**, and Tx Digital/Analog Balance in the same Radio Profile record/row must be **Disabled**. Otherwise, this selection is considered invalid.

IMPORTANT:

The Tx Gain Control Total level (also known as pure gain) is applied before AGC has occurred. For microphone input below the nominal level: actual microphone output = microphone input + Tx Gain Control Total.

The Tx Gain Control Output level is applied after AGC has occurred. Tx Gain Control Output implements an infinity:1 dB ratio when microphone input is above the nominal level. That is, for any input above nominal, the output will never go above the level set through this parameter.

10.49.2.29

Digital AGC

This field enables Automatic Gain Control (AGC) to be used for the radio's internal or external microphone.

This selection only applies while the radio is transmitting in digital mode. AGC compensates for differences in voice level and operational style. As a result of AGC, audio is transmitted and then received at the same audio/decibel level. This selection applies to the current Radio Profile.

NOTE:

(If the user set the Audio Configuration Level to **Basic**) When enabled, the Radio Wide, Tx Digital/Analog Balance field must not be set to **Radio Wide**, and Tx Digital/Analog Balance in the same Radio Profile record/row must be **Disabled**. Otherwise, this selection is considered invalid.

(If the user set the Audio Configuration Level to **Enhanced**) When enabled, the Radio Wide, Tx Digital/Analog Balance field must not be set to **Radio Wide**, and Tx Digital/Analog Balance in the same Radio Profile record/row must be **Disabled**. Otherwise, this selection is considered invalid.

NOTE:

The Tx Gain Control Total level (also known as pure gain) is applied before AGC has occurred. For microphone input below the nominal level: actual microphone output = microphone input + Tx Gain Control Total.

The Tx Gain Control Output level is applied after AGC has occurred. Tx Gain Control Output implements an infinity:1 dB ratio when microphone input is above the nominal level. That is, for any input above nominal, the output will never go above the level set via this parameter.

10.49.2.30

Digital AGC (Accessory)

Enables Automatic Gain Control (AGC) to be used for the radio's internal or external microphone.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This selection only applies while the radio is transmitting in digital mode. AGC compensates for differences in voice level and operational style. As a result of AGC, audio is transmitted and then received at the same audio/decibel level. This selection applies to the current Radio Profile.

WARNING:

(If the user set the Audio Configuration Level to **Basic**) When enabled, the Radio Wide, Tx Digital/Analog Balance field must not be set to **Radio Wide**, and Tx Digital/Analog Balance in the same Radio Profile record/row must be **Disabled**. Otherwise, this selection is considered invalid.

(If the user set the Audio Configuration Level to **Enhanced**) When enabled, the Radio Wide, Tx Digital/Analog Balance field must not be set to **Radio Wide**, and Tx Digital/Analog Balance in the same Radio Profile record/row must be **Disabled**. Otherwise, this selection is considered invalid.

NOTE:

The Tx Gain Control Total level (also known as pure gain) is applied before AGC has occurred. For microphone input below the nominal level: actual microphone output = microphone input + Tx Gain Control Total.

The Tx Gain Control Output level is applied after AGC has occurred. Tx Gain Control Output implements an infinity:1 dB ratio when microphone input is above the nominal level. That is, for any input above nominal, the output will never go above the level set via this parameter.

10.49.2.31

Securenet AGC

This field allows you to enable Automatic Gain Control (AGC) to be used for the radio internal or external microphone.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This selection only applies while the radio is transmitting in Securenet mode. AGC compensates for differences in voice level and operational style. As a result of AGC, audio is transmitted and then received at the same audio/decibel level. This selection applies to the current Radio Profile.

IMPORTANT:

The Tx Gain Control Total level (also known as pure gain) is applied before AGC has occurred. For microphone input below the nominal level: actual microphone output = microphone input + Tx Gain Control Total.

The Tx Gain Control Output level is applied after AGC has occurred. Tx Gain Control Output implements an infinity:1 dB ratio when microphone input is above the nominal level. That is, for any input above nominal, the output will never go above the level set via this parameter.

Accessed Only: When the radio is model/option capable.

10.49.2.32

Securenet AGC (Accessory)

Enables Automatic Gain Control (AGC) to be used for the radio's internal or external microphone.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This selection only applies while the radio is transmitting in Securenet mode. AGC compensates for differences in voice level and operational style. As a result of AGC, audio is transmitted and then received at the same audio/decibel level. This selection applies to the current Radio Profile.

NOTE:

The Tx Gain Control Total level (also known as pure gain) is applied before AGC has occurred. For microphone input below the nominal level: actual microphone output = microphone input + Tx Gain Control Total.

The Tx Gain Control Output level is applied after AGC has occurred. Tx Gain Control Output implements an infinity:1 dB ratio when microphone input is above the nominal level. That is, for any input above nominal, the output will never go above the level set via this parameter.

Accessed Only: When the radio is model / option capable.

10.49.2.33

AGC Gain Control Output (Radio)

Selects gain for the radio's microphones to either increase (positive values), decrease (negative values), or stay the same (0).

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

The AGC Gain Control Output level is applied after AGC (Automatic Gain Control) has occurred. AGC Gain Control Output implements an infinity:1 dB ratio when microphone input is above the nominal

level. That is, for any input above nominal, the output will never go above the level set via this parameter. This selection applies to the current Radio Profile.

NOTE:

If the user set the Audio Configuration Level is set to **Basic**, then the AGC Gain Control Output (Accessory) field is read-only (except for APX3000 radios only).

For Non-APX3000 radios, the AGC Gain Control Total (Accessory) value is synchronized from the AGC Gain Control Output (Radio).

For APX3000 radios, the AGC Gain Control Total (Accessory) value is synchronized to the AGC Gain Control Output (Radio).

AGC Gain Control Output is applied to any of the RadioCentral-enabled AGC Fields.

Accessed Only:

(If the user set the Audio Configuration Level to **Basic**) When one of the enable AGC field is enabled, then this field is enabled; or

(If the user set the Audio Configuration Level to **Enhanced**) When one of the enable AGC (Radio) field is enabled, then the AGC Gain Control Output (Radio) field is enabled. When any one of the enable AGC (Accessory) field is enabled, then the AGC Gain Control Output (Accessory) field is enabled.

Table 321: Range

Minimum	Maximum	Increments
-12 decibels	12 decibels	3 decibels

10.49.2.34

AGC Gain Control Output (Accessory)

Selects gain for the radio's microphones to either increase (positive values), decrease (negative values), or stay the same ("0").

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

The AGC Gain Control Output level is applied after AGC (Automatic Gain Control) has occurred. AGC Gain Control Output implements an infinity:1 dB ratio when microphone input is above the nominal level. That is, for any input above nominal, the output will never go above the level set via this parameter. This selection applies to the current Radio Profile.

NOTE:

If the user set the Audio Configuration Level is set to **Basic**, then the AGC Gain Control Output (Accessory) field is read-only (except for APX3000 radios only).

For Non-APX3000 radios, the AGC Gain Control Total (Accessory) value is synchronized from the AGC Gain Control Output (Radio).

For APX3000 radios, the AGC Gain Control Total (Accessory) value is synchronized to the AGC Gain Control Output (Radio).

AGC Gain Control Output is applied to any of the RadioCentral-enabled AGC Fields.

Accessed Only:

(If the user sets the Audio Configuration Level to **Basic**) When one of the enable AGC field is enabled, then this field is enabled; or

(If the user sets the Audio Configuration Level to **Enhanced**) When one of the enable AGC (Radio) field is enabled, then the AGC Gain Control Output (Radio) field is enabled. When any one of the enable AGC (Accessory) field is enabled, then the AGC Gain Control Output (Accessory) field is enabled.

Table 322: Range

Minimum	Maximum	Increments
-12 decibels	12 decibels	3 decibels

10.49.2.35

AGC Gain Control Total (Radio)

Selects gain for the radio's microphones to either increase (positive values), decrease (negative values), or stay the same (0), for the current Radio Profile.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

The AGC Gain Control Total level (also known as pure gain) is applied before AGC (Automatic Gain Control) has occurred. For microphone input below the nominal level: actual microphone output = microphone input + AGC Gain Control Total.

NOTE:

If the user set the Audio Configuration Level is set to **Basic**, then the AGC Gain Control Total (Accessory) field is read-only (except for APX3000 radios only).

For Non-APX3000 radios, the AGC Gain Control Total (Accessory) value is synchronized from the AGC Gain Control Total (Radio).

For APX3000 radios, the AGC Gain Control Total (Accessory) value is synchronized to the AGC Gain Control Total (Radio).

There are separate AGC Gain Control Total values for each of the RadioCentral-enabled AGC Fields.

Accessed Only:

(If the user set the Audio Configuration Level to **Basic**) When one of the enable AGC field is enabled, then this field is enabled; or

(If the user set the Audio Configuration Level to **Enhanced**) When one of the enable AGC (Radio) field is enabled, then the AGC Gain Control Total (Radio) field is enabled. When any one of the enable AGC (Accessory) field is enabled, then the AGC Gain Control Total (Accessory) field is enabled.

The following table lists the minimum and maximum values for the AGC Gain Control Output as well as sample audio clips when the user enter specific values.

Table 323: Range

Minimum	Maximum	Increments
-12 decibels	12 decibels	3 decibels

10.49.2.36

AGC Gain Control Total (Accessory)

Selects gain for the radio's microphones to either increase (positive values), decrease (negative values), or stay the same (0), for the current Radio Profile.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

The AGC Gain Control Total level (also known as pure gain) is applied before AGC (Automatic Gain Control) has occurred. For microphone input below the nominal level: actual microphone output = microphone input + AGC Gain Control Total.

NOTE:

If the user sets the Audio Configuration Level is set to **Basic**, then the AGC Gain Control Total (Accessory) field is read-only (except for APX3000 radios only).

For Non-APX3000 radios, the AGC Gain Control Total (Accessory) value is synchronized from the AGC Gain Control Total (Radio).

For APX3000 radios, the AGC Gain Control Total (Accessory) value is synchronized to the AGC Gain Control Total (Radio).

There are separate AGC Gain Control Total values for each of the RadioCentral-enabled AGC Fields.

Accessed Only:

(If the user set the Audio Configuration Level to **Basic**) When one of the enable AGC field is enabled, then this field is enabled; or

(If the user set the Audio Configuration Level to **Enhanced**) When one of the enable AGC (Radio) field is enabled, then the AGC Gain Control Total (Radio) field is enabled. When any one of the enable AGC (Accessory) field is enabled, then the AGC Gain Control Total (Accessory) field is enabled.

The following selections are supported:

Table 324: Range

Minimum	Maximum	Increments
-12 decibels	12 decibels	3 decibels

10.49.2.37

Analog Fixed Gain

This field selects the amount of fixed audio gain (also known as linear) to be used for the radio's internal or external microphone.

This selection only applies while the radio is transmitting in analog mode. Linear is useful for adding pure gain to the signal. This selection applies to the current Radio Profile.

Accessed Only: When the Analog AGC field is disabled.

The following selections are supported:

Table 325: Range

Minimum	Maximum	Increments
-12 decibels	12 decibels	3 decibels

10.49.2.38

Analog Fixed Gain (Accessory)

Selects the amount of fixed audio gain (also known as linear) to be used for the radio's internal or external microphone.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This selection only applies while the radio is transmitting in analog mode. Linear is useful for adding pure gain to the signal. This selection applies to the current Radio Profile.

Accessed Only: When the Analog AGC field is disabled.

The following selections are supported:

Table 326: Range

Minimum	Maximum	Increments
-12 decibels	12 decibels	3 decibels

10.49.2.39

Digital Fixed Gain

This field selects the amount of fixed audio gain (also known as linear) to be used for the radio's internal or external microphone.

This selection only applies while the radio is transmitting in digital mode. Linear is useful for adding pure gain to the signal. This selection applies to the current Radio Profile.

Accessed Only: When the [Digital AGC on page 644](#) field is disabled.

Table 327: Range

Minimum	Maximum	Increments
-12 decibels	12 decibels	3 decibels

10.49.2.40

Digital Fixed Gain (Accessory)

Selects the amount of fixed audio gain (also known as linear) to be used for the radio's internal or external microphone.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This selection only applies while the radio is transmitting in Securenet mode. Linear is useful for adding pure gain to the signal. This selection applies to the current Radio Profile.

Accessed Only: When the [Securenet AGC \(Accessory\) on page 645](#) field is disabled and when the radio is model/option capable.

Table 328: Range

Minimum	Maximum	Increments
-12 decibels	12 decibels	3 decibels

10.49.2.41

Securenet Fixed Gain (Radio)

Selects the amount of fixed audio gain (also known as linear) to be used for the radio's internal or external microphone.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This selection only applies while the radio is transmitting in Securenet mode. Linear is useful for adding pure gain to the signal. This selection applies to the current Radio Profile.

Accessed Only: When the [Securenet AGC on page 645](#) field is disabled and when the radio is model/option capable.

Table 329: Range

Minimum	Maximum	Increments
-12 decibels	12 decibels	3 decibels

10.49.2.42

Securenet Fixed Gain (Accessory)

Selects the amount of fixed audio gain (also known as linear) to be used for the radio's internal or external microphone.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This selection only applies while the radio is transmitting in Securenet mode. Linear is useful for adding pure gain to the signal. This selection applies to the current Radio Profile.

Accessed Only: When the Securenet AGC field is disabled and when the radio is model/option capable.

Table 330: Range

Minimum	Maximum	Increments
-12 decibels	12 decibels	3 decibels

10.49.2.43

Digital/Analog Balance

This field enables the audio transmission level to equalize or balance when switching between analog and digital and back, on a per Radio Profile basis.

The following table lists the selections and the sample audio clip for Digital/Analog Balance.

The selection is either **disabled** or **enabled**.

WARNING:

(If you set the Audio Configuration Level to **Basic**) When this field is enabled, then the Digital AGC (both Radio and Accessory), Analog AGC (both Radio and Accessory) in the same Radio Profile record / row must all be **Disabled**; otherwise, this selection is considered invalid.

(If you set the Audio Configuration Level to **Enhanced**) When Digital/Analog Balance (Radio) field is enabled, then the Digital AGC (Radio), Analog AGC (Radio) in the same Radio Profile record / row must all be **Disabled**; otherwise, this selection is considered invalid.

(If you set the Audio Configuration Level to **Enhanced**) When enabled, Digital/Analog Balance (Accessory) field is enabled, then the Digital AGC (Accessory) and Analog AGC (Accessory) in the same Radio Profile record / row must all be **Disabled**; otherwise, this selection is considered invalid.

NOTE:

If you set the Audio Configuration Level is set to **Basic**, then the Digital/Analog Balance (Accessory) field is read-only (except for APX3000 radios only).

For Non-APX3000 radios, the Digital/Analog Balance (Accessory) value is synchronized from the Digital/Analog Balance (Radio).

For APX3000 radios, the Digital/Analog Balance (Accessory) value is synchronized to the Digital/Analog Balance (Radio).

AGC Gain Control Total is applied to any of the RadioCentral-enabled AGC Fields.

Accessed Only:

(If the Audio Configuration Level is set to **Basic**) When any one of the enable AGC fields is enabled, then the Digital/Analog Balance fields are enabled; or

(If the Audio Configuration Level is set to **Enhanced**) When any one of the enable AGC (Radio) fields is enabled, then the Digital/Analog Balance fields are enabled. When any one of the enable AGC (Accessory) fields is enabled, then the Digital/Analog Balance (Accessory) field is enabled; or

When the Radio Wide, Digital/Analog Balance field is set to **Per Profile**.

10.49.2.44

Digital / Analog Balance (Accessory)

Enables the audio transmission level to equalize or balance when switching between analog and digital and back, on a per Radio Profile basis.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

The selection is either **disabled** or **enabled**.

WARNING:

(If the user set the Audio Configuration Level to **Basic**) When this field is enabled, then the Digital AGC (both Radio and Accessory), Analog AGC (both Radio and Accessory) in the same Radio Profile record / row must all be **Disabled**; otherwise, this selection is considered invalid.

(If the user set the Audio Configuration Level to **Enhanced**) When Digital / Analog Balance (Radio) field is enabled, then the Digital AGC (Radio), Analog AGC (Radio) in the same Radio Profile record / row must all be **Disabled**; otherwise, this selection is considered invalid.

(If the user set the Audio Configuration Level to **Enhanced**) When enabled, Digital / Analog Balance (Accessory) field is enabled, then the Digital AGC (Accessory) and Analog AGC (Accessory) in the same Radio Profile record / row must all be **Disabled**; otherwise, this selection is considered invalid.

NOTE:

If the user set the Audio Configuration Level is set to **Basic**, then the Digital / Analog Balance (Accessory) field is read-only (except for APX3000 radios only).

For Non-APX3000 radios, the Digital / Analog Balance (Accessory) value is synchronized from the Digital / Analog Balance (Radio).

For APX3000 radios, the Digital / Analog Balance (Accessory) value is synchronized to the Digital / Analog Balance (Radio).

AGC Gain Control Total is applied to any of the RadioCentral-enabled AGC Fields.

Accessed Only:

(If the Audio Configuration Level is set to **Basic**) When any one of the enable AGC fields is enabled, then the Digital / Analog Balance fields are enabled; or

(If the Audio Configuration Level is set to **Enhanced**) When any one of the enable AGC (Radio) fields is enabled, then the Digital / Analog Balance fields are enabled. When any one of the enable AGC (Accessory) fields is enabled, then the Digital / Analog Balance (Accessory) field is enabled; or

When the Radio Wide, Digital / Analog Balance field is set to **Per Profile**.

10.49.2.45

Group Settings (Radio)

The purpose of this field is to predefine a set of value for Audio Equalization Section fields under Microphone / TX Settings Group.

When the Group Setting value changes from **Custom**, the value of the fields on that section change accordingly. All fields should become Non-editable, when the group setting is not set to **Custom**.

NOTE: For **Custom** setting, it is highly recommended to avoid Maximum settings for same Frequency Bands between the Microphone and Speaker Equalizations.

The following list the selections and definitions for the Audio Equalization Group Settings (Radio) and Audio Equalization Group Settings (Accessory) under Microphone / TX Settings Group.

Normal

Low Frequency Band is **0**, Mid Frequency Band is **0**, and High Frequency Band is **0**.

Treble Boost

Low Frequency Band is **0**, Mid Frequency Band is **0**, and High Frequency Band is **6**.

Low Cut

Low Frequency Band is **-9**, Mid Frequency Band is **0**, and High Frequency Band is **0**.

XTS

Low Frequency Band is **-3**, Mid Frequency Band is **0**, and High Frequency Band is **6**.

Custom

Use the Custom option to individually set unique Speaker Audio Equalization gain settings for the radio that are not supported by the other options in the Group Setting menu. It is highly recommended to avoid Maximum settings for same Frequency Bands between the Microphone and Speaker Equalizations.

10.49.2.46

Group Setting (Accessory)

The purpose of this field is to predefine a set of value for Audio Equalization Section fields under Microphone / TX Settings Group.

When the Group Setting value changes from **Custom**, the value of the fields on that section change accordingly. All fields should become Non-editable, when the group setting is not set to **Custom**.

NOTE: For **Custom** setting, it is highly recommended to avoid Maximum settings for same Frequency Bands between the Microphone and Speaker Equalizations.

The following list the selections and definitions for the Audio Equalization Group Settings (Radio) and Audio Equalization Group Settings (Accessory) under Microphone / TX Settings Group.

Normal

Low Frequency Band is **0**, Mid Frequency Band is **0**. and High Frequency Band is **0**.

Treble Boost

Low Frequency Band is **0**, Mid Frequency Band is **0**, and High Frequency Band is **6**.

Low Cut

Low Frequency Band is **-9**, Mid Frequency Band is **0**, and High Frequency Band is **0**.

XTS

Low Frequency Band is **-3**, Mid Frequency Band is **0**, and High Frequency Band is **6**.

Custom

Use the Custom option to individually set unique Speaker Audio Equalization gain settings for the radio that are not supported by the other options in the Group Setting menu. It is highly recommended to avoid Maximum settings for same Frequency Bands between the Microphone and Speaker Equalizations.

10.49.2.47

Low Frequency Band

Selects the sound level of calls transmitted in Analog/Digital/SecureNet environment.

This selection applies to the current Radio Profile.

Table 331: Range

Minimum	Maximum
-12	12

10.49.2.48

Low Frequency Band (Accessory)

Selects the sound level of calls transmitted in Analog/Digital/SecureNet environment.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This selection applies to the current Radio Profile.

Table 332: Range

Minimum	Maximum
-12	12

10.49.2.49

Mid Frequency Band

Selects the sound level of calls transmitted in Analog/Digital/Securenet environment.

This selection applies to the current Radio Profile.

Table 333: Range

Minimum	Maximum
-12	12

10.49.2.50

Mid Frequency Band (Accessory)

Selects the sound level of calls transmitted in Analog/Digital/Securenet environment.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This selection applies to the current Radio Profile.

Table 334: Range

Minimum	Maximum
-12	12

10.49.2.51

High Frequency Band (Radio)

Selects the sound level of calls transmitted in Analog/Digital/Securenet environment.

This selection applies to the current Radio Profile.

The following selections are supported:

Table 335: Range

Minimum	Maximum
-12	12

10.49.2.52

High Frequency Band (Accessory)

Selects the sound level of calls transmitted in Analog/Digital/Securenet environment.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This selection applies to the current Radio Profile.

The following selections are supported:

Table 336: Range

Minimum	Maximum
-12	12

10.49.2.53

Volume Control: Maximum Audio Volume

Selects the radio's highest possible receive-voice volume level.

The radio's receive-voice volume level never rises above the selected level.

NOTE: See also the Volume Adjust Tone Offset field setting. This selection applies to the current Radio Profile.

WARNING:

This setting must be higher than the Minimum Audio Volume setting otherwise both fields become invalid.

IMPORTANT INFORMATION FOR MOTORCYCLE HELMET HEADSET CONFIGURATIONS:

CAUTION: If the userr radio is being used with a motorcycle helmet headset, do not set the radio at its highest possible receive-voice volume level. To avoid possible injury to the userr hearing, the user must reduce the receive-voice volume level value to no higher than 130.

IMPORTANT INFORMATION WHEN USING IMPRES SURVEILLANCE AUDIO KITS:

RLN5882, RLN5883, RLN5886, RLN6483, RLN6484, PMLN5111, PMLN5112, PMLN6123, PMLN6124, PMLN6129, PMLN6130, and the LOW NOISE KIT RLN5886: **CAUTION:** If the userr APX radio is being used with the above audio accessories, do not set the radio at its highest possible receive-voice volume level. To avoid possible injury to the userr hearing, the user must reduce the receive-voice volume level value to no higher than 160.

IMPORTANT:

In order to have the radio's Maximum Volume at a constant level higher or lower than the radio's maximum receive voice volume (set in this field) the user must use the Volume Offset (dB) feature.

When the Volume Offset (dB) feature is set to "0" (zero), the radio always uses this Maximum Audio Volume setting for the Maximum Volume, regardless of the Maximum Alert Tone Volume field's setting.

The following selections are supported:

Table 337: Range

Minimum	Maximum
1	255

NOTE: 5=1 decibel (dB)

10.49.2.54

Volume Control: Minimum Audio Volume

Selects the radio's minimum Rx (Receive) audio level.

The radio's volume level never falls below this level, even when the radio-user sets the radio's volume control to **0** (Zero). See also the Volume Adjust Tone Offset field setting. This selection applies to the current Radio Profile.

WARNING: This setting must be lower than the Maximum Audio Volume setting otherwise both fields become invalid.

IMPORTANT:

In order to have the radio's Minimum Volume at a constant level higher or lower than the radio's minimum receive voice volume (set in this field) the user must use the Volume Offset (dB) feature.

When the Volume Offset (dB) feature is set to **0** (zero), the radio always uses this Minimum Audio Volume setting for the Minimum Volume, regardless of the Minimum Volume field's setting.

10.49.2.55

Alert Tone Volume Offset (dB)

Selects the value in decibels (dB) that raises or lowers the volume of an alert tone in comparison to the radio-user selected receive audio volume.

See also the Volume Adjust Tone Offset field setting. This selection applies to the current Radio Profile.

When a higher or lower alert tones volume is desired: Set the Maximum Volume field and the Maximum Audio Volume field to the same value, and set the Minimum Volume field and the Minimum Audio Volume field to the same value, then use this Alert Tone Volume Offset setting to have the radio's alert tones at a constant level higher or lower than the radio's receive voice volume.

IMPORTANT: When this Alert Tone Volume Offset field is set to **0** (zero):

The radio always uses Maximum Audio Volume setting for the Maximum Volume, regardless of the Maximum Alert Tone Volume field's setting.

The radio always uses Minimum Audio Volume setting for the Minimum Volume, regardless of the Minimum Alert Tone Volume field's setting.

Accessed Only: When the Alert Tones field is **Enabled**.

The following selections are supported:

Table 338: Range

Minimum	Maximum	Increments
-26 decibels	25 decibels	1 decibel

10.49.2.56

Minimum Alert Tone Volume

Selects the minimum receive alert tone level, regardless of how low the radio-user may set the volume.

See also the Volume Adjust Tone Offset field setting. This selection applies to the current Radio Profile.

WARNING: This setting must be lower than the Maximum Volume setting otherwise both fields become invalid.

IMPORTANT:

In order to have the radio's Minimum Volume (set in this field) at a constant level higher or lower than the radio's minimum receive voice volume (set in the Minimum Audio Volume field) the user must use the Volume Offset (dB) feature.

When the Volume Offset (dB) feature is set to "0" (zero), the radio always uses the Minimum Audio Volume setting for this Minimum Volume, regardless of this Minimum Volume field's setting.

Accessed Only: When the Alert Tones field is **Enabled**.

The following selections are supported:

Table 339: Range

Minimum	Maximum
0	200

10.49.2.57

Maximum Alert Tone Volume

Selects the radio's highest possible alert tone volume level. The Volume Offset (dB) field setting may override this setting.

See also the Volume Adjust Tone Offset field setting. This selection applies to the current Radio Profile.

WARNING: This setting must be higher than the Minimum Volume setting otherwise both fields become invalid.

NOTE:

In order to have the radio's Maximum Volume (set in this field) at a constant level higher or lower than the radio's receive voice volume (set in the Maximum Audio Volume field) the user must use the Volume Offset (dB) feature.

When the Volume Offset (dB) feature is set to **0** (zero), the radio always uses the Maximum Audio Volume setting for this Maximum Volume, regardless of this Maximum Volume field's setting.

The following selections are supported:

Table 340: Range

Minimum	Maximum
0	255

NOTE: 5 = 1 decibel (dB)

10.49.2.58

Group Settings (Radio)

The purpose of this field is to predefine a set of value for Audio Equalization Section fields under Speaker / RX Settings Group.

When the Group Setting value changes from **Custom**, the value of the fields on that section change accordingly. When the group setting is not set to **Custom**, then all fields should become view-only.

The following selections list the selections and definitions for the Audio Equalization Group Settings (Radio) and Audio Equalization Group Setting (Accessory) under Speaker / RX Settings Group.

Normal

The value of the following fields is set to: [Analog Low Frequency Band \(Accessory\) on page 659](#) is **0**, [Analog Mid Frequency Band \(Accessory\) on page 660](#) is **0**, [Analog High Frequency Band \(Accessory\) on page 661](#) is **0**, Digital Low Frequency Band is **0**, Digital Mid Frequency Band is **0**, Digital High Frequency Band is **0**, Securenet Low Frequency Band is **0**, Securenet Mid Frequency Band is **0**, and Securenet High Frequency Band is **0**.

Treble Boost

The value of the following fields is set to: [Analog Low Frequency Band \(Accessory\) on page 659](#) is **0**, [Analog Mid Frequency Band \(Accessory\) on page 660](#) is **0**, [Analog High Frequency Band \(Accessory\) on page 661](#) is **6**, Digital Low Frequency Band is **0**, Digital Mid Frequency Band is **0**, Digital High Frequency Band is **6**, Securenet Low Frequency Band is **0**, Securenet Mid Frequency Band is **0**, and SecureNet High Frequency Band is **6**.

Low Cut

The value of the following fields is set to: [Analog Low Frequency Band \(Accessory\) on page 659](#) is **-9**, [Analog Mid Frequency Band \(Accessory\) on page 660](#) is **0**, [Analog High Frequency Band \(Accessory\) on page 661](#) is **0**, Digital Low Frequency Band is **-9**, Digital Mid Frequency Band is **0**, Digital High Frequency Band is **0**, Securenet Low Frequency Band **-9**, Securenet Mid Frequency Band **0**, and Securenet High Frequency Band is **0**.

Reduce Feedback

The value of the following fields is set to: [Analog Low Frequency Band \(Accessory\) on page 659](#) is **-6**, [Analog Mid Frequency Band \(Accessory\) on page 660](#) is **0**, [Analog High Frequency Band \(Accessory\) on page 661](#) is **-6**, Digital Low Frequency Band is **-6**, Digital Mid Frequency Band is **0**, Digital High Frequency Band is **-6**, Securenet Low Frequency Band is **-6**, Securenet Mid Frequency Band is **0**, and Securenet High Frequency Band is **-6**.

Custom

Use the Custom option to individually set unique Speaker Audio Equalization gain settings for the radio that are not supported by the other options in the Group Setting menu. It is highly recommended to avoid Maximum settings for same Frequency Bands between the Microphone and Speaker Equalizations.

10.49.2.59

Group Setting (Accessory)

The purpose of this field is to predefine a set of value for Audio Equalization Section fields under Speaker / RX Settings Group.

When the Group Setting value changes from **Custom**, the value of the fields on that section change accordingly. When the group setting is not set to **Custom**, then all fields should become view-only.

The following selections list the selections and definitions for the Audio Equalization Group Settings (Radio) and Audio Equalization Group Setting (Accessory) under Speaker / RX Settings Group.

Normal

The value of the following fields is set to: [Analog Low Frequency Band \(Accessory\) on page 659](#) is **0**, [Analog Mid Frequency Band \(Accessory\) on page 660](#) is **0**, [Analog High Frequency Band \(Accessory\) on page 661](#) is **0**, [Digital Low Frequency Band \(Accessory\) on page 662](#) is **0**, Digital

Mid Frequency Band (Accessory) on page 662 is **0**, Digital High Frequency Band (Accessory) on page 663 is **0**, Securenet Low Frequency Band is **0**, Securenet Mid Frequency Band is **0**, and Securenet High Frequency Band (Radio) on page 664 is **0**.

Treble Boost

The value of the following fields is set to: Analog Low Frequency Band (Accessory) on page 659 is **0**, Analog Mid Frequency Band (Accessory) on page 660 is **0**, Analog High Frequency Band (Accessory) on page 661 is **6**, Digital Low Frequency Band (Accessory) on page 662 is **0**, Digital Mid Frequency Band (Accessory) on page 662 is **0**, Digital High Frequency Band (Accessory) on page 663 is **6**, Securenet Low Frequency Band is **0**, Securenet Mid Frequency Band is **0**, and Securenet High Frequency Band (Radio) on page 664 is **6**.

Low Cut

The value of the following fields is set to: Analog Low Frequency Band (Accessory) on page 659 is **-9**, Analog Mid Frequency Band (Accessory) on page 660 is **0**, Analog High Frequency Band (Accessory) on page 661 is **0**, Digital Low Frequency Band is **-9**, Digital Mid Frequency Band is **0**, Digital High Frequency Band is **0**, Securenet Low Frequency Band **-9**, Securenet Mid Frequency Band **0**, and Securenet High Frequency Band is **0**.

Reduce Feedback

The value of the following fields is set to: Analog Low Frequency Band (Accessory) on page 659 is **-6**, Analog Mid Frequency Band (Accessory) on page 660 is **0**, Analog High Frequency Band (Accessory) on page 661 is **-6**, Digital Low Frequency Band is **-6**, Digital Mid Frequency Band is **0**, Digital High Frequency Band is **-6**, Securenet Low Frequency Band is **-6**, Securenet Mid Frequency Band is **0**, and Securenet High Frequency Band is **-6**.

Custom

Use the Custom option to individually set unique Speaker Audio Equalization gain settings for the radio that are not supported by the other options in the Group Setting menu. It is highly recommended to avoid Maximum settings for same Frequency Bands between the Microphone and Speaker Equalizations.

10.49.2.60

Analog Low Frequency Band (Radio)

Selects the sound level of calls received in an analog environment.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This selection applies to the current Radio Profile.

Table 341: Range

Minimum	Maximum
-12	12

10.49.2.61

Analog Low Frequency Band (Accessory)

Selects the sound level of calls received in an analog environment.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This selection applies to the current Radio Profile.

Table 342: Range

Minimum	Maximum
-12	12

10.49.2.62

Selects the sound level of calls received in an analog environment.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This selection applies to the current Radio Profile.

Table 344: Range

Minimum	Maximum
-12	12

10.49.2.64

Analog High Frequency Band

This field selects the sound level of calls received in an analog environment.

This selection applies to the current Radio Profile.

NOTE:

If you set the Audio Configuration Level is set to **Basic**, then the Analog High Frequency Band (Accessory) field is read-only (except for APX3000 radios only).

For Non-APX3000 radios, the Analog High Frequency Band (Accessory) value is synchronized from the Analog High Frequency Band (Radio).

For APX3000 radios, the Analog High Frequency Band (Accessory) value is synchronized to the Analog High Frequency Band (Radio).

Accessed Only:

(If you set the Audio Configuration Level to **Basic**) When one of the enable AGC field is enabled, then this field is enabled; or

(If you set the Audio Configuration Level to **Enhanced**) When one of the enable AGC (Radio) field is enabled, then the Analog High Frequency Band (Radio) field is enabled. When any one of the enable AGC (Accessory) field is enabled, then the Digital High Frequency Band (Accessory) field is enabled.

The following selections are supported:

Table 345: Range

Minimum	Maximum
-12	12

10.49.2.65

Analog High Frequency Band (Accessory)

Selects the sound level of calls received in an analog environment.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

This selection applies to the current Radio Profile.

NOTE:

If the user set the Audio Configuration Level is set to **Basic**, then the Analog High Frequency Band (Accessory) field is read-only (except for APX3000 radios only).

For Non-APX3000 radios, the Analog High Frequency Band (Accessory) value is synchronized from the Analog High Frequency Band (Radio).

For APX3000 radios, the Analog High Frequency Band (Accessory) value is synchronized to the Analog High Frequency Band (Radio).

Accessed Only:

(If the user sets the Audio Configuration Level to **Basic**) When one of the enable AGC field is enabled, then this field is enabled; or

(If the user sets the Audio Configuration Level to **Enhanced**) When one of the enable AGC (Radio) field is enabled, then the Analog High Frequency Band (Radio) field is enabled. When any one of the enable AGC (Accessory) field is enabled, then the Digital High Frequency Band (Accessory) field is enabled.

The following selections are supported:

Table 346: Range

Minimum	Maximum

Group Settings (Radio)

The purpose of this field is to predefine a set of value for Audio Equalization Section fields under Speaker / RX Settings Group.

When the Group Setting value changes from **Custom**, the value of the fields on that section change accordingly. When the group setting is not set to **Custom**, then all fields should become view-only.

The following selections list the selections and definitions for the Audio Equalization Group Settings (Radio) and Audio Equalization Group Setting (Accessory) under Speaker / RX Settings Group.

Normal

The value of the following fields is set to: [Analog Low Frequency Band \(Accessory\) on page 659](#) is **0**, [Analog Mid Frequency Band \(Accessory\) on page 660](#) is **0**, [Analog High Frequency Band \(Accessory\) on page 661](#) is **0**, Digital Low Frequency Band is **0**, Digital Mid Frequency Band is **0**, Digital High Frequency Band is **0**, Securenet Low Frequency Band is **0**, Securenet Mid Frequency Band is **0**, and Securenet High Frequency Band is **0**.

Treble Boost

The value of the following fields is set to: [Analog Low Frequency Band \(Accessory\) on page 659](#) is **0**, [Analog Mid Frequency Band \(Accessory\) on page 660](#) is **0**, [Analog High Frequency Band \(Accessory\) on page 661](#) is **6**, Digital Low Frequency Band is **0**, Digital Mid Frequency Band is **0**, Digital High Frequency Band is **6**, Securenet Low Frequency Band is **0**, Securenet Mid Frequency Band is **0**, and SecureNet High Frequency Band is **6**.

Low Cut

The value of the following fields is set to: [Analog Low Frequency Band \(Accessory\) on page 659](#) is **-9**, [Analog Mid Frequency Band \(Accessory\) on page 660](#) is **0**, [Analog High Frequency Band \(Accessory\) on page 661](#) is **0**, Digital Low Frequency Band is **-9**, Digital Mid Frequency Band is **0**, Digital High Frequency Band is **0**, Securenet Low Frequency Band **-9**, Securenet Mid Frequency Band **0**, and Securenet High Frequency Band is **0**.

Reduce Feedback

The value of the following fields is set to: [Analog Low Frequency Band \(Accessory\) on page 659](#) is **-6**, [Analog Mid Frequency Band \(Accessory\) on page 660](#) is **0**, [Analog High Frequency Band \(Accessory\) on page 661](#) is **-6**, Digital Low Frequency Band is **-6**, Digital Mid Frequency Band is **0**, Digital High Frequency Band is **-6**, Securenet Low Frequency Band is **-6**, Securenet Mid Frequency Band is **0**, and Securenet High Frequency Band is **-6**.

Custom

Use the Custom option to individually set unique Speaker Audio Equalization gain settings for the radio that are not supported by the other options in the Group Setting menu. It is highly recommended to avoid Maximum settings for same Frequency Bands between the Microphone and Speaker Equalizations.

10.49.2.79

Group Setting (Accessory)

The purpose of this field is to predefine a set of value for Audio Equalization Section fields under Speaker / RX Settings Group.

When the Group Setting value changes from **Custom**, the value of the fields on that section change accordingly. When the group setting is not set to **Custom**, then all fields should become view-only.

The following selections list the selections and definitions for the Audio Equalization Group Settings (Radio) and Audio Equalization Group Setting (Accessory) under Speaker / RX Settings Group.

Normal

The value of the following fields is set to: [Analog Low Frequency Band \(Accessory\) on page 659](#) is **0**, [Analog Mid Frequency Band \(Accessory\) on page 660](#) is **0**, [Analog High Frequency Band \(Accessory\) on page 661](#) is **0**, [Digital Low Frequency Band \(Accessory\) on page 662](#) is **0**, Digital

Mid Frequency Band (Accessory) on page 662 is **0**, Digital High Frequency Band (Accessory) on page 663 is **0**, Securenet Low Frequency Band is **0**, Securenet Mid Frequency Band is **0**, and Securenet High Frequency Band (Radio) on page 664 is **0**.

Treble Boost

The value of the following fields is set to: Analog Low Frequency Band (Accessory) on page 659 is **0**, Analog Mid Frequency Band (Accessory) on page 660 is **0**, Analog High Frequency Band (Accessory) on page 661 is **6**, Digital Low Frequency Band (Accessory) on page 662 is **0**, Digital Mid Frequency Band (Accessory) on page 662 is **0**, Digital High Frequency Band (Accessory) on page 663 is **6**, Securenet Low Frequency Band is **0**, Securenet Mid Frequency Band is **0**, and Securenet High Frequency Band (Radio) on page 664 is **6**.

Low Cut

The value of the following fields is set to: Analog Low Frequency Band (Accessory) on page 659 is **-9**, Analog Mid Frequency Band (Accessory) on page 660 is **0**, Analog High Frequency Band (Accessory) on page 661 is **0**, Digital Low Frequency Band is **-9**, Digital Mid Frequency Band is **0**, Digital High Frequency Band is **0**, Securenet Low Frequency Band **-9**, Securenet Mid Frequency Band **0**, and Securenet High Frequency Band is **0**.

Reduce Feedback

The value of the following fields is set to: Analog Low Frequency Band (Accessory) on page 659 is **-6**, Analog Mid Frequency Band (Accessory) on page 660 is **0**, Analog High Frequency Band (Accessory) on page 661 is **-6**, Digital Low Frequency Band is **-6**, Digital Mid Frequency Band is **0**, Digital High Frequency Band is **-6**, Securenet Low Frequency Band is **-6**, Securenet Mid Frequency Band is **0**, and Securenet High Frequency Band is **-6**.

Custom

Use the Custom option to individually set unique Speaker Audio Equalization gain settings for the radio that are not supported by the other options in the Group Setting menu. It is highly recommended to avoid Maximum settings for same Frequency Bands between the Microphone and Speaker Equalizations.

10.49.2.80

AGC Gain Control Output (Radio)

Selects gain for the radio's microphones to either increase (positive values), decrease (negative values), or stay the same (0).

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

The AGC Gain Control Output level is applied after AGC (Automatic Gain Control) has occurred. AGC Gain Control Output implements an infinity:1 dB ratio when microphone input is above the nominal level. That is, for any input above nominal, the output will never go above the level set via this parameter. This selection applies to the current Radio Profile.

NOTE:

If the user set the Audio Configuration Level is set to **Basic**, then the AGC Gain Control Output (Accessory) field is read-only (except for APX3000 radios only).

For Non-APX3000 radios, the AGC Gain Control Total (Accessory) value is synchronized from the AGC Gain Control Output (Radio).

For APX3000 radios, the AGC Gain Control Total (Accessory) value is synchronized to the AGC Gain Control Output (Radio).

AGC Gain Control Output is applied to any of the RadioCentral-enabled AGC Fields.

Accessed Only:

(If the user set the Audio Configuration Level to **Basic**) When one of the enable AGC field is enabled, then this field is enabled; or

(If the user set the Audio Configuration Level to **Enhanced**) When one of the enable AGC (Radio) field is enabled, then the AGC Gain Control Output (Radio) field is enabled. When any one of the enable AGC (Accessory) field is enabled, then the AGC Gain Control Output (Accessory) field is enabled.

Table 359: Range

Minimum	Maximum	Increments
-12 decibels	12 decibels	3 decibels

10.49.2.81

AGC Gain Control Output (Accessory)

Selects gain for the radio's microphones to either increase (positive values), decrease (negative values), or stay the same ("0").

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

The AGC Gain Control Output level is applied after AGC (Automatic Gain Control) has occurred. AGC Gain Control Output implements an infinity:1 dB ratio when microphone input is above the nominal level. That is, for any input above nominal, the output will never go above the level set via this parameter. This selection applies to the current Radio Profile.

NOTE:

If the user set the Audio Configuration Level is set to **Basic**, then the AGC Gain Control Output (Accessory) field is read-only (except for APX3000 radios only).

For Non-APX3000 radios, the AGC Gain Control Total (Accessory) value is synchronized from the AGC Gain Control Output (Radio).

For APX3000 radios, the AGC Gain Control Total (Accessory) value is synchronized to the AGC Gain Control Output (Radio).

AGC Gain Control Output is applied to any of the RadioCentral-enabled AGC Fields.

Accessed Only:

(If the user sets the Audio Configuration Level to **Basic**) When one of the enable AGC field is enabled, then this field is enabled; or

(If the user sets the Audio Configuration Level to **Enhanced**) When one of the enable AGC (Radio) field is enabled, then the AGC Gain Control Output (Radio) field is enabled. When any one of the enable AGC (Accessory) field is enabled, then the AGC Gain Control Output (Accessory) field is enabled.

Table 360: Range

Minimum	Maximum	Increments
-12 decibels	12 decibels	3 decibels

10.49.2.82

AGC Gain Control Total (Radio)

Selects gain for the radio's microphones to either increase (positive values), decrease (negative values), or stay the same (0), for the current Radio Profile.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

The AGC Gain Control Total level (also known as pure gain) is applied before AGC (Automatic Gain Control) has occurred. For microphone input below the nominal level: actual microphone output = microphone input + AGC Gain Control Total.

NOTE:

If the user set the Audio Configuration Level is set to **Basic**, then the AGC Gain Control Total (Accessory) field is read-only (except for APX3000 radios only).

For Non-APX3000 radios, the AGC Gain Control Total (Accessory) value is synchronized from the AGC Gain Control Total (Radio).

For APX3000 radios, the AGC Gain Control Total (Accessory) value is synchronized to the AGC Gain Control Total (Radio).

There are separate AGC Gain Control Total values for each of the RadioCentral-enabled AGC Fields.

Accessed Only:

(If the user set the Audio Configuration Level to **Basic**) When one of the enable AGC field is enabled, then this field is enabled; or

(If the user set the Audio Configuration Level to **Enhanced**) When one of the enable AGC (Radio) field is enabled, then the AGC Gain Control Total (Radio) field is enabled. When any one of the enable AGC (Accessory) field is enabled, then the AGC Gain Control Total (Accessory) field is enabled.

The following table lists the minimum and maximum values for the AGC Gain Control Output as well as sample audio clips when the user enter specific values.

Table 361: Range

Minimum	Maximum	Increments
-12 decibels	12 decibels	3 decibels

10.49.2.83

AGC Gain Control Total (Accessory)

Selects gain for the radio's microphones to either increase (positive values), decrease (negative values), or stay the same (**0**), for the current Radio Profile.

WARNING: The value in this field must only be modified by Qualified Service Personnel. Improper settings can cause unpredictable results in the radio.

The AGC Gain Control Total level (also known as pure gain) is applied before AGC (Automatic Gain Control) has occurred. For microphone input below the nominal level: actual microphone output = microphone input + AGC Gain Control Total.

NOTE:

If the user sets the Audio Configuration Level is set to **Basic**, then the AGC Gain Control Total (Accessory) field is read-only (except for APX3000 radios only).

For Non-APX3000 radios, the AGC Gain Control Total (Accessory) value is synchronized from the AGC Gain Control Total (Radio).

For APX3000 radios, the AGC Gain Control Total (Accessory) value is synchronized to the AGC Gain Control Total (Radio).

There are separate AGC Gain Control Total values for each of the RadioCentral-enabled AGC Fields.

Accessed Only:

(If the user set the Audio Configuration Level to **Basic**) When one of the enable AGC field is enabled, then this field is enabled; or

(If the user set the Audio Configuration Level to **Enhanced**) When one of the enable AGC (Radio) field is enabled, then the AGC Gain Control Total (Radio) field is enabled. When any one of the enable AGC (Accessory) field is enabled, then the AGC Gain Control Total (Accessory) field is enabled.

The following selections are supported:

Table 362: Range

Minimum	Maximum	Increments
-12 decibels	12 decibels	3 decibels

10.49.2.84

Acoustic Feedback Suppression

When enabled, Acoustic Feedback Suppression suppresses feedback or howling that results from radios being in a call while in close proximity of each other.

This feature is supported in the following accessory models for the following radios:

Table 363: Acoustic Feedback Suppression Supported Accessory Models

Radios	Accessory Models
APX NEXT	XV, XVP850, XVP830, XVE500, XVN500
APX N30	XVP730, XVP750, RM760, RM780
APX N50	
APX N70	

Acoustic Feedback Suppression is not supported for Securenet signaling mode, wireless audio accessories, or both.

For optimal Acoustic Feedback Suppression performance, you are recommended to select **Normal** as the Group Setting for Microphone and Speaker Audio Equalization. Apply the recommended Normal Group Setting to both radio and accessory configurations. Do not select the **Custom Group Setting** for Gain Control under Speaker Settings for the accessory configuration.

Directive sur la mise au rebut des équipements électriques et électroniques (DEEE) de l'Union européenne (UE) et du Royaume-Uni (RU)

La directive DEEE de l'Union européenne et les réglementations DEEE du Royaume-Uni exigent que les produits (ou leur emballage, dans certains cas) vendus dans les pays de l'UE ou au Royaume-Uni portent l'étiquette de la poubelle barrée. Comme le définit la directive DEEE, cette étiquette de poubelle barrée signifie que les clients et les utilisateurs finaux dans les pays de l'UE et du RU ne doivent pas jeter les équipements électriques et électroniques ou leurs accessoires dans les ordures domestiques.

Les clients ou les utilisateurs finaux dans les pays de l'UE et du RU doivent communiquer avec le représentant ou le centre de service local de leur fournisseur d'équipements pour obtenir des renseignements sur le système de collecte des déchets de leur pays.

Avis de non-responsabilité

Veillez noter que certaines fonctionnalités, installations et capacités décrites dans ce document pourraient ne pas s'appliquer ou être accordées sous licence pour l'utilisation sur un système particulier ou pourraient dépendre des caractéristiques d'une unité mobile d'abonné ou d'une configuration de certains paramètres. Veuillez consulter votre personne-ressource chez Motorola Solutions pour en savoir plus.

Communiquer avec nous

Le centre des opérations de soutien centralisé (« Centralized Managed Support Operations » ou CMSO) est le point de contact principal pour le soutien technique compris dans l'entente de service de votre organisation avec Motorola Solutions.

Les clients disposant d'ententes de service doivent s'assurer d'appeler le CMSO dans toutes les situations énumérées dans la section Responsabilités du client de leur entente de service, notamment :

- Pour confirmer les résultats du dépannage et de l'analyse avant de prendre des mesures

Votre entreprise a reçu les numéros de téléphone du soutien et d'autres coordonnées appropriées pour votre région géographique et votre entente de service. Utilisez ces informations pour obtenir la meilleure réponse possible. Cependant, si nécessaire, vous pouvez également trouver les coordonnées du soutien général sur le site Web de Motorola Solutions, en suivant les étapes ci-dessous :

- 1 Entrez motorolasolutions.com dans votre navigateur.
- 2 Vous devez vous assurer que le pays ou la région de votre organisation se trouve sur la page. Cliquez ou appuyez sur le nom de la région pour la changer.
- 3 Sélectionnez « Soutien » à la page motorolasolutions.com.

Commentaires

Envoyez vos questions et commentaires sur la documentation destinée aux utilisateurs à l'adresse documentation@motorolasolutions.com.

Pour signaler une erreur dans la documentation, veuillez fournir les renseignements suivants :

- Le titre du document et le numéro de la pièce
- Le numéro de la page ou le titre de la section contenant l'erreur
- Une description de l'erreur

Motorola offre plusieurs cours conçus pour vous aider à apprendre à utiliser le système. Pour en savoir davantage et consulter la liste des cours actuellement offerts et les parcours technologiques, accédez à <https://learning.motorolasolutions.com>.

10.49.2.84 Suppression du retour acoustique.....	743

Chapitre 1

Introduction à RadioCentral

RadioCentral fournit les capacités logicielles qui permettent aux utilisateurs d'APX NEXT™ et d'APX N70 de gérer les fonctions ci-dessous sur l'appareil :

- Provisionnement de tous les champs associés
- Gestion des mises à jour du micrologiciel
- Activation de nouvelles licences pour la fonction achetée

La base de données de l'agence RadioCentral réside sur un nuage Microsoft Azure. Le client de sécurité publique RadioCentral offre aux utilisateurs la capacité de se connecter, d'ouvrir une session et d'accéder à la base de données de l'agence sélectionnée.

La solution RadioCentral offre aux utilisateurs une option d'ouverture de session sécurisée à partir de toute connexion réseau. L'utilisateur peut utiliser RadioCentral pour passer en revue et modifier les paramètres d'ID de la radio dans une table conviviale sans avoir à ouvrir ou à modifier une archive. L'utilisateur peut appliquer les modifications ou les paramètres individuels par le biais des mises à jour planifiées et effectuées par connexion Wi-Fi et LTE.

Chapitre 2

Aperçu de l'interface utilisateur

Cette section décrit les différentes sections de l'interface utilisateur RadioCentral.

Les fenêtres et les fonctionnalités suivantes sont prises en charge dans l'Aperçu de l'interface utilisateur :

[Icônes de menu et sélecteur d'affichage à la page 45](#)

[Volet de navigation dans le client de configuration RadioCentral à la page 45](#)

[Volet de programmation dans le client de configuration RadioCentral à la page 46](#)

[Fenêtres d'information dans le client de configuration RadioCentral à la page 47](#)

2.1

Icônes de menu et sélecteur d'affichage

L'utilisateur peut accéder aux fonctions du menu principal et aux affichages du client dans le haut de l'écran.

Tableau 1 : Icônes de menu et sélecteur d'affichage

Icône	Fonctionnalité
	Le menu Actions contient toutes les fonctions et opérations prises en charge par RadioCentral dans une liste déroulante pratique.
	Le menu Programmeur menu est activé lorsqu'une ou plusieurs radios sont sélectionnées dans la fenêtre principale. Le programmeur permet de lire, écrire ou basculer des travaux à programmer pour une exécution immédiate ou à un moment prédéfini.
	Le sélecteur d'affichage permet le basculement de l'ensemble de données affiché dans les fenêtres de programmation.

2.2

Volet de navigation dans le client de configuration RadioCentral

Le volet de navigation du client de configuration RadioCentral permet à l'utilisateur de basculer entre les différents éléments contenus dans les affichages suivants :

- Affichage de la configuration
- Affichage d'exploration de données
- Affichage de la licence de radio
- Affichage des ressources

Les différents ensembles peuvent être affichés en sélectionnant **Actions**→**Gérer**.

Masquer automatiquement la navigation

Pour augmenter la taille de la zone de programmation à droite du volet de navigation, l'utilisateur peut sélectionner **Masquer automatiquement** au moyen de l'icône épingle  dans la section d'en-tête. Une fois cette option sélectionnée, le volet de navigation est désépingle et se comprime dans le côté gauche de l'écran. Le nom de l'affichage courant s'affiche alors à la verticale. La sélection du nom affiché à la verticale permet l'expansion du volet de navigation. Pour épingle le volet de navigation à l'application, sélectionnez l'icône épingle **Masquer automatiquement** affichée à l'horizontale.

2.3

Volet de programmation dans le client de configuration RadioCentral

Le volet de programmation du client de configuration RadioCentral est la principale zone de l'application où les utilisateurs sélectionnent et configurent les fonctions et les propriétés de la radio. L'information est présentée sous la forme de table contenant des colonnes à en-tête et des rangées correspondant aux éléments disponibles.

2.3.1

Touches opérationnelles dans RadioCentral

Les touches opérationnelles permettent à l'utilisateur de gérer les données radio dans la base de données du serveur RadioCentral. Ces touches apparaissent dans les principaux affichages, dont celui de la radio, dans les principales fenêtres de configuration et également dans les tableaux Élément de liste d'un jeu.

REMARQUE :

Si une touche opérationnelle n'est pas activée pour la rangée sélectionnée, cela signifie que l'opération demandée n'est pas prise en charge. Certaines zones du volet de programmation permettent d'exécuter une opération unique, par exemple, l'exportation.

Tableau 2 : Touches opérationnelles

Touche	Description
	La touche Modifier permet de modifier les propriétés de la rangée sélectionnée.
	La touche Ajouter permet d'ajouter des éléments dans la table.
	La touche Supprimer permet de supprimer l'élément sélectionné dans la table.
	La touche Grille vers fichiers sert à exporter les données pour les rangées sélectionnées dans un fichier CVS (valeurs séparées par des virgules).
	La touche Fichier vers grille permet d'importer les données d'un fichier CVS délimité par des virgules vers le serveur RadioCentral.

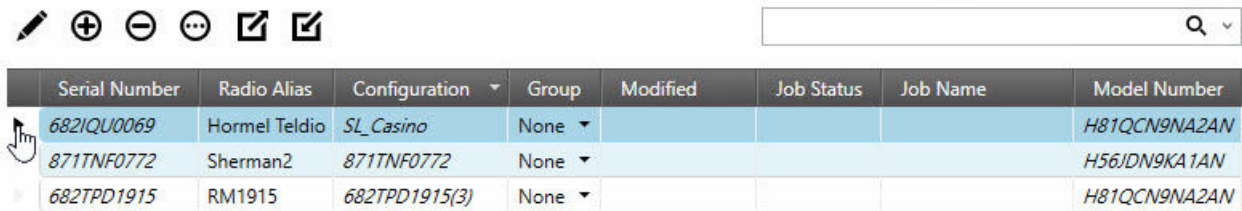

2.3.2

Sélection des rangées dans RadioCentral

La sélection des éléments s'effectue en faisant glisser le curseur à gauche de la rangée désirée et en cliquant sur le bouton gauche de la souris.

Lorsque le curseur est amené au-dessus de la première colonne d'une rangée, il prend la forme d'un pointeur. Les touches SHIFT et CTRL permettent de sélectionner une série de rangées ou des rangées précises. Les rangées sélectionnées sont mises en surbrillance.

Figure 1 : Exemple de rangée sélectionnée

Serial Number	Radio Alias	Configuration	Group	Modified	Job Status	Job Name	Model Number
682IQU0069	Hormel Teldio	SL_Casino	None				H81QCN9NA2AN
871TNF0772	Sherman2	871TNF0772	None				H56JDN9KA1AN
682TPD1915	RM1915	682TPD1915(3)	None				H81QCN9NA2AN

2.3.3

Organiser et masquer des colonnes dans RadioCentral

Les colonnes contenues dans le volet de programmation peuvent être organisées en glissant-tirant toute colonne à partir de la section d'en-tête vers l'emplacement désiré.

Après avoir sélectionné et tiré une colonne donnée, des flèches apparaissent au-dessus et en dessous de la section d'en-tête pour indiquer son nouvel emplacement.

Les colonnes affichées dans le volet de programmation peuvent être masquées de manière à afficher uniquement les colonnes de données pertinentes. Pour masquer des colonnes, cliquez à droite sur tout en-tête de colonne pour ouvrir la fenêtre **Sélecteur de champ**, puis sélectionnez uniquement les champs pertinents qui doivent être visibles à l'écran.

2.4

Fenêtres d'information dans le client de configuration RadioCentral

Le client de configuration RadioCentral affiche des fenêtres d'information dans le bas de l'application. Par défaut, ces fenêtres d'information sont masquées et seuls leurs noms sont visibles dans les onglets.

Ces fenêtres d'information contiennent des détails importants et utiles pour l'utilisateur à propos des opérations effectuées dans l'application.

REMARQUE :

les onglets affichés dépendent de l'affichage courant de l'application.

Les fenêtres suivantes sont prises en charge :

2.4.1

Fenêtre Résultats d'Analyse

La fenêtre **Résultats d'Analyse** affiche les erreurs ou les avertissements qui sont le résultat d'un travail de lecture ou d'écriture. Lorsqu'un travail de lecture ou d'écriture est planifié, la codeplug est compilée et toutes les validations et les dépendances sont cochées. Si une erreur survient, le travail échoue. La correction de la configuration doit être effectuée. L'utilisateur peut vérifier les erreurs avant de programmer un travail en analysant la radio. Voir [Analyse de la configuration de la radio à la page 48](#).

Les colonnes suivantes sont disponibles dans le tableau des Résultats d'Analyse :

Numéro de série

Le Numéro de Série de la radio qui a été choisie dans le cadre du travail.

Configuration

Le nom de la Configuration qui est attribuée à la radio analysée.

Chemin d'Accès

Chemin dans la configuration vers le champ contenant l'erreur. Double-cliquez sur le message d'erreur et RadioCentral navigue automatiquement au champ soit dans la configuration, soit dans l'ensemble.

Description

Description des erreurs (le cas échéant).

Actions

Mesures prises pour corriger les erreurs (le cas échéant).

Pour réinitialiser les radios dans un lot, cliquez sur le bouton **Tout réinitialiser dans une radio**.

REMARQUE :

Tout le texte contenu dans l'onglet Résultats d'Analyse prend en charge plusieurs langues en fonction de la configuration de RadioCentral.

Le résultat de l'Analyse n'est pas actualisé automatiquement, même si l'utilisateur a corrigé les erreurs ou les avertissements. Lancez à nouveau le correcteur pour vérifier si oui ou non les changements ont été faits.

Si une opération est en cours, RadioCentral ne permet pas à l'utilisateur de relancer le correcteur. L'utilisation du correcteur peut comporter plusieurs éléments.

Le lancement d'une nouvelle opération effacera les résultats de l'opération précédente.

Si le jeu visé n'est pas ajouté à la configuration, le chemin de l'élément est identifié par un indicateur spécial. Motorola Solutions recommande d'ajouter le jeu visé à la configuration.

2.4.2

Analyse de la configuration de la radio

Les configurations de la radio peuvent être analysées avant qu'un travail soit programmé.

Procédure :

- 1 À partir de l'**affichage de la radio**, sélectionnez la ou les radios désirées.
- 2 Cliquez avec le bouton droit sur la radio sélectionnée et sélectionnez **Analyser**.

REMARQUE :

La sélection **Analyser** peut également être ouverte en sélectionnant le raccourci **Analyser** situé au-dessus du champ de recherche.

- 3 Développez la fenêtre **Analyser les résultats** en cliquant sur l'onglet **Analyser les résultats** dans le bas de l'onglet.

Une icône « crochet vert » s'affiche vis-à-vis des radios sans erreurs.

REMARQUE :

Toute erreur ou tout avertissement s'affiche sous la touche programmable **Tous**. Pour afficher uniquement les erreurs, sélectionnez la touche programmable **Erreurs**. Pour afficher seulement les avertissements, sélectionnez la touche programmable **Avertissements**.

L'utilisateur peut lancer l'aide pour les éléments comportant une erreur en sélectionnant la rangée contenant l'erreur et en appuyant sur la touche F1.

2.4.3

Fenêtre des tâches

La fenêtre **Tâches** affiche tout processus en arrière-plan effectué dans RadioCentral. Quand un processus d'arrière-plan, comme l'importation de radios ou la suppression d'un lot dans RadioCentral, une tâche est créée dans le serveur RadioCentral et des informations relatives à la tâche apparaissent dans le tableau Tâches.

La touche **Effacer** sert à supprimer toutes les tâches indiquées dans le tableau tâches.

REMARQUE :

Lorsque l'utilisateur double-clique sur une ligne, des détails supplémentaires sont affichés dans la fenêtre **Affichage du travail**.

Le contenu de la fenêtre **Tâches** est effacé lors de la fermeture du client de configuration RadioCentral.

Les colonnes suivantes sont disponibles dans le tableau Tâches :

Nom du travail

Un nom par défaut est donné à tous les travaux. Par exemple, l'action de convertir une radio d'un modèle au mode de configuration crée une `Radio en mode conversion de modèle`. Le client peut préciser le nom de certains travaux, tels que les travaux de programmation.

Heure de création

La date et l'heure du début du travail.

Sommaire

Cette colonne affiche une barre de progression lorsqu'un travail est en cours de traitement. Il contient également des informations concernant le nombre d'éléments dans le travail.

Actions

Lorsque le travail est en traitement, la colonne **Actions** contient une icône **Annuler**. Cliquer sur l'icône **Annuler** annule le travail.

2.4.4

Comparer les configurations

La fonction Comparer les configurations permet à l'utilisateur de comparer les valeurs de codeplug dans deux configurations.

La fonction Comparer les configurations peut être effectuée dans **Affichage de la radio** et dans **Affichage de la configuration**.

Affichage de la radio

Dans **Affichage de la radio**, les opérations suivantes sont prises en charge :

Configuration affectée

Compare les valeurs de codeplug à partir des configurations actuellement affectées.

Dernière programmation

Compare les valeurs de codeplug des dernières configurations programmées dans la radio.

REMARQUE :

La comparaison n'est pas applicable dans les situations suivantes :

- When one of the radios is unread under **Radio View**→**Compare**→**Last Programmed...**
- When one of the radios is not assigned to a configuration under **Radio View**→**Compare**→**Assigned Configuration...**
- When there are failed jobs under **Radio Detail View**→**Job History**→**Compare** for the selected radio.

2.4.4.1

Fenêtre Comparer les résultats

La fenêtre **Comparer les résultats** affiche les différences entre les configurations de la radio, générées par la fonction Comparer les configurations.

REMARQUE :

La fonction Comparer les configurations peut être effectuée dans l'**Affichage de la radio** ou dans l'**Affichage de la configuration**.

Le tableau de comparaison affiche les colonnes suivantes :

Chemin de navigation

Affiche le chemin de navigation vers le champ.

Champ

Affiche le nom du champ.

Valeur source

Affiche la valeur de la configuration source.

Valeur cible

Affiche la valeur de la configuration cible.

REMARQUE :

La sélection de toute valeur liée dans les colonnes Source ou Cible redirige l'utilisateur vers le jeu contenant le champ et met ce champ en valeur. Pour les valeurs non liées, utilisez le chemin de navigation pour rechercher manuellement le champ dans la configuration.

Les boutons de la radio **Afficher par** permettent à l'utilisateur d'afficher les éléments suivants :

Touche radio	Description
Tout	Affiche tous les champs avec les différences, les valeurs manquantes et les modifications de champ MVO.
Différents	Affiche les champs qui contiennent des valeurs différentes.
Manquants	Affiche les champs qui existent dans une configuration, mais pas dans l'autre.
MVO	Affiche les champs des infos MVO (modèle, version, option) dont la valeur MVO par défaut a été modifiée.

2.4.5

Fenêtre Résultats de validation

La fenêtre **Résultats de validation** affiche des conditions d'erreur dans la configuration.

REMARQUE :

La fenêtre **Résultats de validation** s'ouvre uniquement lorsqu'une configuration est en cours de modification.

Les colonnes suivantes sont disponibles dans le tableau des Résultats de validation :

Chemin

Chemin dans la configuration vers le champ contenant l'erreur.

Code d'erreur

Un code d'erreur interne qui identifie l'erreur dans le système.

Description

Une description qui fournit des détails à l'utilisateur sur la cause de l'erreur.

Actions

Quand une icône courbée (valeur de réinitialisation) est affichée dans la colonne **Actions**, l'erreur de validation peut être automatiquement résolue en cliquant sur l'icône. L'utilisateur est amené à l'ensemble associé à l'erreur. Le champ avec l'erreur est indiqué en rouge.

Le bouton **Réinitialiser tout (pour l'ensemble de dessus sélectionné)** permet à l'utilisateur de réinitialiser toutes les erreurs de validation trouvées dans l'ensemble de dessus actuellement sélectionné.

2.4.6

Fenêtre Messages d'Avertissement

La fenêtre **Messages d'Avertissement** affiche les avertissements qui se produisent dans les configurations.

REMARQUE :

La fenêtre **Messages d'Avertissement** s'ouvre uniquement lorsqu'une Configuration est en cours de modification.

2.4.7

Fenêtre Résultats de recherche

La fenêtre **Résultats de recherche** permet à l'utilisateur de chercher des champs ou des valeurs de champ lors de la modification des configurations. Cette fonction de recherche permet à l'utilisateur de localiser rapidement des champs dans une configuration sans avoir à connaître l'ensemble.

Lorsque vous modifiez une configuration, l'utilisateur entre un mot, une phrase ou une valeur dans le champ **Rechercher**. Le **x** à la droite du champ **Rechercher** est utilisé pour effacer l'entrée de recherche et les résultats de recherche. L'icône de recherche (🔍) est utilisée pour lancer la recherche. La flèche déroulante à droite du champ **Rechercher** permet à l'utilisateur de sélectionner à partir des 10 dernières recherches.

Les options suivantes sont utilisées pour affiner la recherche :

Nom

Une fois sélectionné, le texte entré dans le champ **Rechercher** est recherché par rapport au nom de tous les champs.

Valeur

Une fois sélectionné, le nombre ou le texte entré dans le champ **Rechercher** est recherché par rapport au nom de tous les champs.

Nom et valeur

Lorsque sélectionné, le nom et la valeur du champ sont recherchés par rapport à l'entrée dans le champ **Rechercher**.

Correspondre au mot entier

Lorsque cette case est cochée, le mot, la phrase ou la valeur exacts entrés dans le champ **Rechercher** est utilisé pour affiner les résultats de recherche.

Les colonnes suivantes fournissent des détails de la recherche :

Chemin

Le chemin vers le champ dans la configuration dans le format nom d'ensemble\nom de champ.

Valeur

La valeur actuelle du champ.

REMARQUE :

Double-cliquer sur une rangée dans les résultats de recherche ouvre l'ensemble pertinent et met l'accent sur le champ.

2.4.8

Rôles de l'utilisateur

Le rôle des utilisateurs s'affiche dans la barre d'état selon l'option sélectionnée dans la boîte de dialogue **Sélectionner l'agence**.

Rôle	Accès
Administrateur	Tous les privilèges.
Technicien	Tous les privilèges sauf l'enregistrement de licences.
Lecteur	Peut afficher uniquement les champs et les configurations de la radio. Impossible d'ajouter, de modifier ou d'importer des éléments dans le client.

2.4.9

Fenêtre d'aide

La fenêtre **Aide** sert à afficher de l'information d'aide contextuelle à propos des champs utilisés dans les configurations et les ensembles.

REMARQUE :

la fenêtre **Aide** s'affiche uniquement lors de la configuration d'une configuration.

Quand un utilisateur modifie une configuration, le contenu d'aide s'affiche dans la fenêtre **Aide** lors de la sélection d'un champ de l'ensemble. Appuyez sur la touche F1 pour ouvrir le système d'aide intégral à partir du contenu relatif au champ actuellement sélectionné.

Chapitre 3

Menu Actions

Le menu **Actions** permet à l'utilisateur d'accéder rapidement aux fonctions les plus courantes utilisées pour configurer un système RM.

Les sélections disponibles dans le menu **Actions** sont dépendantes de l'affichage actuel.

Les fenêtres et les fonctionnalités suivantes sont prises en charge dans le menu **Actions** :

3.1

Sélections d'importation

Les sélections du menu **Importer** permettent à l'utilisateur d'importer des données archivées pour faciliter la configuration du système RadioCentral.

3.1.1

Importation Fichier vers grille

Cette fonction permet à l'utilisateur d'importer les données des codeplug de la radio à partir d'un fichier à valeurs séparées par des virgules ***.csv** ou d'une feuille de calcul ***.xlsx**.

Les données de codeplug exportées à partir de RadioCentral (voir [Fenêtre Exporter à la page 55](#)) peuvent être modifiées dans un programme de feuille de calcul et enregistrées en tant que fichier **.csv** (en utilisant la commande **Enregistrer sous**).

REMARQUE :

les fichiers à valeurs séparées par des virgules ***.csv** ou les feuilles de calcul ***.xlsx** peuvent être importés uniquement dans l'**Affichage Radio**.

Procédure :

- 1 À partir de **Affichage de la radio**, sélectionnez **Actions**→**Importer**→**Fichier vers grille**.

REMARQUE :

La fenêtre **Importer Fichier vers grille** peut aussi être ouverte en appuyant sur CTRL+H.

- 2 À partir de la fenêtre **Importer Fichier vers grille**, naviguez jusqu'à l'emplacement de stockage contenant les fichiers d'archive de la codeplug, puis exécutez l'une des actions suivantes :
 - Pour les fichiers CSV (valeurs séparées par des virgules), sélectionnez **CSV (délimité) (*.csv)** dans la liste déroulante des types de fichiers.

REMARQUE :

Par défaut, le type de fichier sélectionné est **CSV (délimité par des virgules) (*.csv)**.

- 3 Sélectionnez le ou les fichiers désirés.

REMARQUE :

Utilisez la touche CTRL (sélective) ou la touche SHIFT (plage) pour sélectionner plusieurs fichiers.

- 4 Cliquez sur **Ouvrir**.

3.1.2

Importation de configurations

Cette fonction permet à l'utilisateur d'importer des fichiers de configuration à partir de la **vue Configuration**.

Procédure :

- 1 À partir du menu **Actions**, sélectionnez **Gérer→Configurations** pour ouvrir la fenêtre **Vue Configuration**.
- 2 Sélectionnez **Actions→Importer→Configurations**.

REMARQUE :

La fenêtre **Importer des configurations** peut également être lancée en cliquant sur la touche **Importer**.

- 3 Dans la fenêtre **Importer des configurations**, sélectionnez les fichiers **.dbn** appropriés.
- 4 Cliquez sur **Ouvrir**. La boîte de dialogue **Importer la configuration** s'affiche.
- 5 Entrez un nom approprié dans le champ **Suffixe pour les ensembles**.
- 6 Cliquez sur **OK**.

3.1.3

Importation d'annonces vocales

Cette fonction permet à l'utilisateur d'importer des fichiers d'annonce vocale à partir de la **vue Ressources pour les annonces vocales**.

Procédure :

- 1 À partir du menu **Actions**, sélectionnez **Gérer→Annonces vocales** pour ouvrir la fenêtre **vue Ressources pour les annonces vocales**.
- 2 Sélectionnez **Actions→Importer→Annonces vocales**.

REMARQUE :

La fenêtre **Importer des annonces vocales** peut également être ouverte en cliquant sur la touche **Importer**.

- 3 Dans la fenêtre **Importer des annonces vocales**, sélectionnez les fichiers **.mva** ou **.wav** appropriés.
- 4 Cliquez sur **Ouvrir**.

3.1.4

Importation manuelle des certificats CA

L'option **Importer des fichiers de certificat CA** permet à l'utilisateur d'importer de nouvelles versions des fichiers de certificat CA vers le serveur RadioCentral.

Où et quand utiliser :

Utilisez cette procédure pour importer les fichiers de certificat CA.

Procédure :

- 1 Dans le menu **Actions**, sélectionnez **Gérer→Certificats CA** pour ouvrir la fenêtre **vue des ressources - Certificats CA**.
- 2 Cliquez sur le bouton **Import** (Importer).
- 3 Dans la fenêtre **Importer des certificats CA**, sélectionnez le fichier ***.*** approprié.

Le certificat CA doit avoir une taille maximale de 10 K et utiliser le format PEM (Privacy Enhanced Mail). Les fichiers de certificat CA ne peuvent pas être importés automatiquement ou manuellement lorsque le nom de fichier correspondant existe déjà dans le serveur RadioCentral.

- 4 Cliquez sur **Ouvrir**.

3.2

Fenêtre Exporter

Les sélections du menu **Exporter** permettent à l'utilisateur d'exporter les données de la radio en utilisant différents types de fichiers.

3.2.1

Exportation de la configuration

Cette fonction permet à l'utilisateur d'exporter une ou plusieurs configurations à partir de la **vue Configuration**.

Procédure :

- 1 À partir du menu **Actions**, sélectionnez **Gérer**→**Configurations**.
- 2 Pour exporter une seule configuration, effectuez les actions suivantes :
 - a Sélectionnez la rangée pertinente.
 - b Cliquez avec le bouton droit sur la ligne sélectionnée et sélectionnez **Exporter la configuration**.
 - c Dans la fenêtre **Exporter la configuration**, parcourez les dossiers et sélectionnez-en un.
 - d Entrez un nom pour le fichier de configuration.
 - e Cliquez sur **Enregistrer**.

- 3 Pour exporter plusieurs configurations, effectuez les actions suivantes :
 - a Sélectionnez la première rangée.
 - b Maintenez la touche **CTRL** enfoncée.

REMARQUE :

Pour sélectionner des rangées consécutives, maintenez la touche **MAJ** enfoncée.

- c Sélectionnez un ou plusieurs rangées supplémentaires.
- d Cliquez avec le bouton droit sur les rangées sélectionnées et sélectionnez **Exporter la configuration**.
- e Parcourez les dossiers et sélectionnez un emplacement de dossier.

REMARQUE :

Puisque les fichiers de configuration sélectionnés seront enregistrés à l'emplacement de dossier sélectionné, il est recommandé de créer un nouveau dossier pour faciliter l'organisation des fichiers exportés.

- f Cliquez sur **OK**.

3.2.2

Exportation de Grille vers fichier

La sélection **Grille vers fichier** permet à l'utilisateur d'exporter toutes les radios sélectionnées à partir de la **Vue Radio** dans un format délimité par des virgules (*.csv) affichable dans une application de type tableur. Les données présentées dans le fichier CSV exporté sont les mêmes que celles de la **Vue Radio**.

Procédure :

- 1 Sélectionnez une ou plusieurs radios dans le tableau.
- 2 À partir de la **Vue Radio**, sélectionnez **Actions**→**Exporter**→**Grille vers fichier** pour ouvrir la fenêtre **Exporter grille vers fichier**.
Sinon, entrez `Ctrl+Shift+S`.
- 3 Dans la fenêtre **Exporter grille vers fichier**, parcourez les fichiers pour choisir l'emplacement d'un fichier.
- 4 Entrez un nom pour le fichier **.csv**.
- 5 Cliquez sur **Enregistrer**. La boîte de dialogue **Exporter Grille vers fichier** s'affiche.
Le fichier **.csv** est exporté avec succès.
- 6 Cliquez sur **OK**

3.3

Gérer les configurations

La gestion des configurations permet à l'utilisateur de définir les configurations qui seront créées et stockées dans le serveur RadioCentral.

La **vue Configuration** est lancée à partir du menu **Actions** en sélectionnant **Gérer**→**Configurations**.

REMARQUE :

Les configurations attribuées à un appareil ne peuvent pas être supprimées du serveur RadioCentral. L'utilisateur doit d'abord sélectionner une configuration différente pour l'appareil dans l'affichage de la radio avant de pouvoir la supprimer dans le serveur RadioCentral.

À partir de la **vue Configuration**, l'utilisateur peut effectuer les opérations de base suivantes :

-  **Modifier**

-  **Ajouter**

-  **Suppression**

REMARQUE :

L'icône **Supprimer** supprime les configurations de la base de données du serveur RadioCentral qui ne sont pas attribuées à un appareil.

-  **Importer**

-  **Exportation**

Gestion de la configuration

Tableau 3 : Colonnes du tableau de la vue Configuration

Colonne	Description
Nom	Permet à l'utilisateur d'afficher et de modifier le nom de la configuration. Une configuration doit avoir un nom unique. Un nom de configuration modifié apparaît dans toutes les tables où cette configuration est utilisée.

Colonne	Description
Dernière date de modification	Affiche la date et l'heure actuelles de la dernière modification de la configuration.
Radios	Affiche le nombre de radios attribuées à la configuration.
Commentaires	Permet à l'utilisateur d'ajouter des commentaires pour la configuration.

Option de menu à cliquer à droite

Les sélections de menu à cliquer à droite suivantes sont disponibles lorsqu'une configuration est sélectionnée et que l'utilisateur clique à droite sur la configuration sélectionnée :

Tableau 4 : Sélections à cliquer à droite dans l'affichage de la configuration

Colonne	Description
Modifier	Cette sélection permet à l'utilisateur de modifier tous les ensembles qui sont attribués à la configuration.
Suppression	Cette sélection est disponible uniquement lorsque la configuration sélectionnée n'est pas affectée à une radio.
Copier la configuration	Cette sélection permet à l'utilisateur d'ouvrir la fenêtre Copier la configuration et de dupliquer la configuration sélectionnée. À partir de la fenêtre Copier la configuration , l'utilisateur peut renommer la configuration et ajouter un suffixe à chaque ensemble compris dans la configuration.
Afficher les radios connexes	Cette sélection ouvre la fenêtre Radios associées et affiche toutes les radios stockées dans le serveur RadioCentral qui utilisent actuellement la configuration sélectionnée.  REMARQUE : La fenêtre Radios associées affiche uniquement les radios auxquelles on a attribué l'autorisation Afficher. Pour les utilisateurs ayant le rôle d'administrateur RM, il n'y a aucune restriction.
Exporter les configurations	Cette sélection permet à l'utilisateur d'exporter la configuration dans un lecteur local ou un lecteur réseau sous la forme d'un fichier de données binaires (*.dbn).

3.4

Gérer l'exploration de données

La fonction exploration de données dans RadioCentral permet à l'utilisateur de localiser des champs spécifiques avec des valeurs utilisées dans les configurations et les radios.

L'utilisateur peut créer des requêtes simples ou avancées qui permettent de déterminer où certains champs sont utilisés. L'exploration de données est lancée à partir du menu **Actions** en sélectionnant **Gérer**→**Exploration de données**.

À partir de l'affichage Exploration de données, l'utilisateur peut **ajouter** , **modifier** , **supprimer**  ou **exporter**  des requêtes. Les requêtes sont exportées vers un fichier CSV.

Tableau 5 : Tableau Exploration de données

Colonne	Description
Nom de requête	Affiche les noms des requêtes créées pour l'exploration de données.
Rechercher des	Affiche l'objet qui est le point de la requête de recherche. Les objets disponibles sont configuration, radio et ensemble.
Requête de groupe	Une collection de requêtes uniques. Utile pour trier des requêtes.
Dernières données modifiées	Affiche la date et l'heure de la dernière modification de la requête.
Commentaires	Permet à l'utilisateur d'entrer un commentaire pour aider à identifier le but de la requête.

REMARQUE :

La fonctionnalité exploration de données est uniquement disponible pour les utilisateurs ayant le rôle d'administrateur RM.

3.4.1

Fenêtre Requête d'exploration de données

La fenêtre **Requête** permet aux utilisateurs de créer des requêtes simples et avancées pouvant être exécutées ou partagées dans un système RM. L'utilisateur ajoute de nouvelles demandes dans la fenêtre Exploration de données en cliquant sur le bouton **Ajouter**.

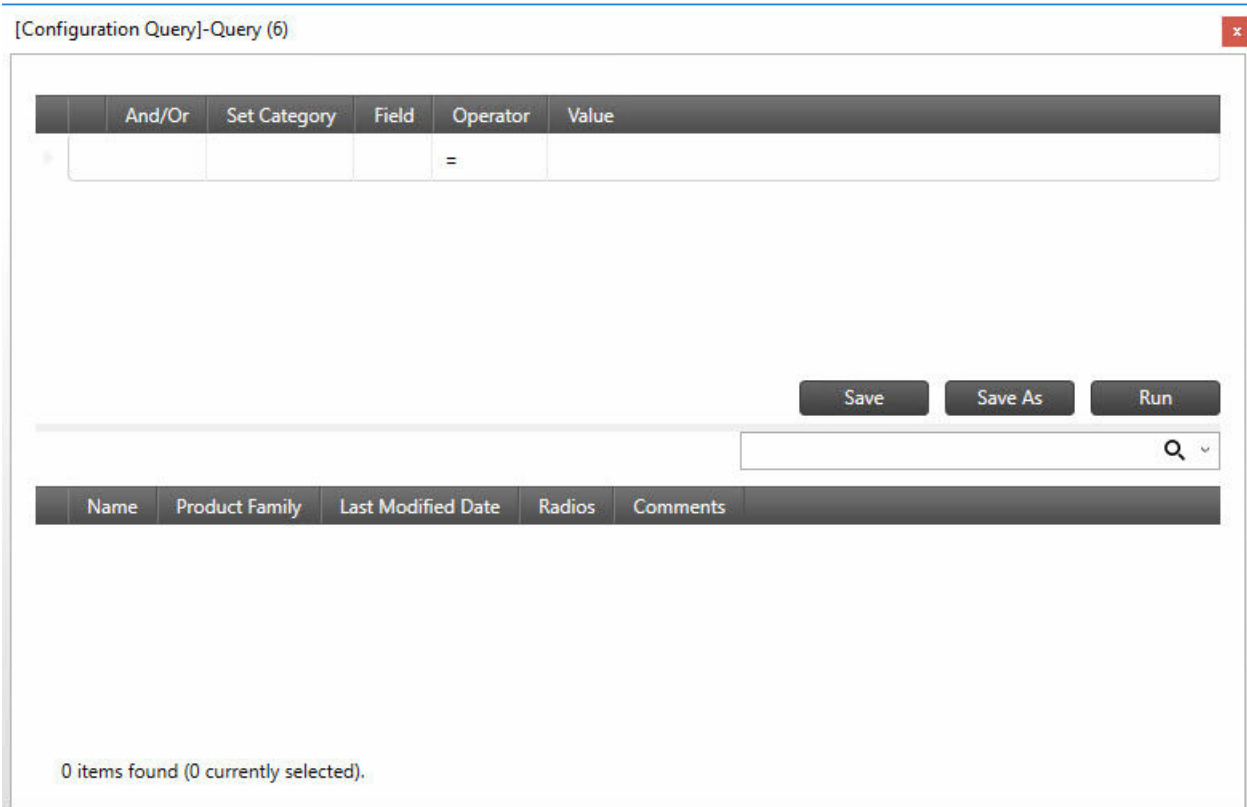

Figure 2 : Fenêtre Nouvelle requête

La fenêtre **Nouvelle requête** permet à l'utilisateur de rechercher des champs (champs) utilisés dans une **configuration**, une **radio** ou un **ensemble**.

Une fois le type de requête **Recherche de** sélectionné, la fenêtre de **requête** principale s'ouvre. Le titre de la fenêtre de requête principale affiche le type de requête sélectionnée.

Figure 3 : Fenêtre Requête principale

Les colonnes de la moitié supérieure de la fenêtre sont utilisées pour établir les clauses de la requête.

Tableau 6 : Colonnes Clause de requête

Colonne	Fonction
Et/ou	Les opérateurs et/ou sont utilisés pour filtrer les résultats à partir d'une ou plusieurs clauses. L'opérateur et affiche le résultat lorsque les conditions de toutes les clauses sont remplies. L'opérateur ou affiche un résultat si au moins une des clauses est vraie. Ces opérateurs sont uniquement valides pour les requêtes utilisant plus d'un article.
Catégorie d'ensemble	Cette liste déroulante est utilisée pour sélectionner une catégorie d'ensemble. Les catégories d'ensemble sont un regroupement de champs.
Extérieur	Cette liste déroulante est utilisée pour sélectionner un champ contenu dans la catégorie d'ensemble sélectionnée.
Opérateur	Cette liste déroulante est utilisée pour sélectionner un opérateur de requête de recherche. Les opérateurs pris en charge sont les suivants : <ul style="list-style-type: none"> • Contient • <= • < • >= • >

Colonne	Fonction
	<ul style="list-style-type: none"> • Ne contient pas • < > <p>La liste des opérateurs disponibles dépend de du champ sélectionné.</p>
Valeur	Ce champ définit la valeur utilisée dans l'expression de requête pour le champ sélectionné. La valeur peut être vraie ou fausse, numérique ou une sélection de la liste déroulante.

Les colonnes de la moitié inférieure de la fenêtre sont utilisées pour afficher les résultats de la requête exécutée. Les colonnes affichées dépendent du type de requête sélectionné. Les résultats peuvent être triés en cliquant sur un titre de colonne.

Tableau 7 : Colonnes Résultats de requête

Type de requête	Colonnes affichées
Configuration	Nom / Famille de produits / Date de dernière modification / Radios / Commentaires
Radio	Numéro de série / Alias radio / Numéro de modèle / Commentaires
Définir	Nom d'ensemble / Date de dernière modification / Commentaires

3.4.2

Ajout d'une requête d'exploration de données

Les requêtes permettent à l'utilisateur d'identifier l'emplacement où un paramètre contenant une valeur spécifique est utilisé. Les requêtes sont créées en ajoutant une ou plusieurs expressions d'article. Des requêtes simples peuvent être créées pour localiser un paramètre unique. Des requêtes plus avancées peuvent être créées pour localiser des paramètres multiples.

Où et quand utiliser :

Utilisez cette procédure pour créer des requêtes de localisation de paramètres dans des configurations, des ensembles ou des radios.

Une fois que les requêtes ont été créées, l'utilisateur peut effectuer les opérations suivantes :

- [Groupement d'articles de requête à la page 61](#)
- [Suppression d'un article de requête à la page 62](#)

Procédure :

- 1 Cliquez sur le menu **Actions** et sélectionnez **Gérer**→**Exploration de données**.
- 2 À partir de la vue **Exploration de données**, cliquez sur la touche **Ajouter**.
- 3 À partir de la fenêtre **Nouvelle requête**, sélectionnez **Configuration**, **Radio** ou **Ensemble** dans la liste déroulante Rechercher.
- 4 Cliquez sur **OK**.
- 5 À partir de la fenêtre **Requête**, créez une fenêtre comme suit :

Si...	Alors...
Si la requête porte sur un article unique,	effectuez les opérations suivantes :

Si...	Alors...
	<ul style="list-style-type: none"> a Cliquez sous la colonne Catégorie de l'ensemble et sélectionnez l'Ensemble approprié. b Cliquez sous la colonne Champ et sélectionnez un paramètre pour la catégorie d'ensemble sélectionnée. c Sélectionnez un Opérateur. Voir Tableau 6 : Colonnes Clause de requête à la page 59 pour obtenir la liste des opérateurs. d Saisissez ou sélectionnez une Valeur pour le champ sélectionné.
Si la requête porte sur des articles multiples,	effectuez les opérations suivantes : <ul style="list-style-type: none"> a Après avoir créé le premier article, cliquez à droite n'importe où dans la moitié supérieure et sélectionnez Ajouter un nouvel article. Par défaut, le nouvel article est relié (Et) à l'article précédent. b À partir de la liste déroulante Et/ou, sélectionnez l'opérateur approprié. c Sélectionnez une Catégorie de l'ensemble. d Sélectionnez un Champ pour la catégorie d'ensemble sélectionnée. e Sélectionnez un Opérateur. f Saisissez ou sélectionnez une Valeur pour le champ sélectionné.

6 Cliquez sur **Enregistrer** ou **Enregistrer sous** pour attribuer un nom à la requête.

7 Cliquez sur **Exécuter** pour lancer la recherche de requête.

Si la requête ne donne pas de résultats, le message *Exploration de données terminée, mais aucune donnée correspondante s'afficher à droite de la touche **Enregistrer***. Sinon, les résultats de la requête s'affichent dans la moitié supérieure de la fenêtre.

3.4.2.1

Groupement d'articles de requête

Le groupement d'articles permet à l'utilisateur de combiner plusieurs articles dans une expression unique. Les expressions d'articles peuvent être groupées dans une requête nouvellement créée ou en modifiant une requête existante.

Où et quand utiliser :

Utilisez cette procédure pour grouper des expressions d'article dans une requête.

REMARQUE :

Les requêtes et les expressions d'articles sont sélectionnées en faisant glisser le curseur vers la gauche de la rangée visée et en cliquant sur le bouton de gauche de la souris.

Procédure :

- 1** Sélectionnez une requête dans l'affichage **Exploration de données** et cliquez sur la touche **Modifier**.
- 2** Sélectionnez le premier article dans la requête à ajouter au groupe.
La rangée de l'article sélectionné est mise en surbrillance.
- 3** Maintenez la touche **CTRL** enfoncée et sélectionnez le deuxième article.
- 4** Cliquez avec le bouton droit sur les articles sélectionnés et sélectionnez **Grouper les articles**.

Une parenthèse verticale apparaît à gauche de l'article groupé.

REMARQUE :

Pour supprimer un groupe, sélectionnez tous les articles contenus dans le groupe, puis sélectionnez **Dissocier les articles**.

3.4.2.2

Suppression d'un article de requête

La suppression de l'expression d'un article dans une requête d'exploration de données peut être effectuée durant la construction de la requête ou la modification d'interrogations existantes.

Où et quand utiliser :

Utilisez cette procédure pour supprimer l'expression d'un article dans une requête.

REMARQUE :

Les requêtes et les expressions d'articles sont sélectionnées en faisant glisser le curseur vers la gauche de la rangée visée et en cliquant sur le bouton de gauche de la souris.

Procédure :

- 1 Cliquez sur le menu **Actions** et sélectionnez **Gérer**→**Exploration de données**.
- 2 Sélectionnez la requête désirée et cliquez sur la touche **Modifier** .
L'utilisateur peut également cliquer avec le bouton droit vis-à-vis de la requête sélectionnée et choisir **Modifier la requête**.
- 3 Sélectionnez l'expression de l'article, puis cliquez avec le bouton droit et sélectionnez **Supprimer des articles**.
- 4 À partir de la vue **Exploration de données**, cliquez sur la touche **Ajouter**.
- 5 Le cas échéant, continuez de modifier la requête, enregistrez-la ou exécutez-la.

3.4.3

Suppression d'une requête d'exploration de données

La suppression des requêtes d'exploration de données permet à l'utilisateur de maintenir et de mettre à jour les requêtes utilisées pour l'exploration de données.

Où et quand utiliser :

Utilisez cette procédure pour supprimer des requêtes d'exploration de données.

REMARQUE :

Les requêtes sont sélectionnées en faisant glisser le curseur à gauche de la rangée visée et en cliquant sur le bouton de gauche de la souris. Lorsque le curseur est placé au-dessus de la première colonne de la table, il prend la forme d'un pointeur.

Procédure :

- 1 Cliquez sur le menu **Actions** et sélectionnez **Gérer**→**Exploration de données**.
- 2 Dans la vue **Exploration de données**, sélectionnez une ou plusieurs requêtes dans le tableau.
 **REMARQUE :** Les touches **Modifier** et **Supprimer** sont grisées jusqu'à ce qu'une requête soit sélectionnée.
- 3 Cliquez sur la touche **Supprimer**.

- 4 Cliquez sur **Oui** pour supprimer la requête ou sur **Non** pour annuler l'opération.

REMARQUE :

Une fois que la commande de suppression a été exécutée, elle ne peut pas être annulée.

3.4.4

Groupement de requêtes pour l'exploration de données

Le groupement des requêtes permet à l'utilisateur d'organiser les requêtes en collections uniques. Des groupes de requêtes doivent d'abord être créés pour pouvoir être attribués à des requêtes.

Où et quand utiliser :

Utilisez cette procédure pour grouper une ou des requêtes dans une collection unique.

REMARQUE :

Les requêtes sont sélectionnées en faisant glisser le curseur à gauche de la rangée visée et en cliquant sur le bouton de gauche de la souris. Lorsque le curseur est placé au-dessus de la première colonne de la table, il prend la forme d'un pointeur.

Procédure :

- 1 Cliquez sur le menu **Actions** et sélectionnez **Gérer**→**Exploration de données**.
- 2 Dans la vue **Exploration de données**, cliquez avec le bouton droit dans le volet de navigation et sélectionnez **Groupes de requêtes**.
- 3 Renommez le nouveau groupe de requêtes. Effectuez les opérations suivantes :
 - a Sélectionnez le groupe de requêtes.
 - b Cliquez avec le bouton droit et sélectionnez **Renommer**.
 - c Entrez un nouveau nom pour le groupe de requêtes et appuyez sur ENTRÉE.

REMARQUE :

Les groupes de requêtes peuvent également être renommés en double-cliquant sur le groupe de requêtes et en entrant un nouveau nom.

- 4 Cliquez sur **Tous les groupes de requêtes** pour afficher toutes les requêtes existantes à droite du volet de navigation.
- 5 Sous la colonne **Groupe de requêtes**, sélectionnez la liste déroulante et choisissez un groupe pour la requête.
- 6 Répétez l'étape 5 jusqu'à ce que toutes les requêtes soient ajoutées au groupe.

REMARQUE :

La sélection de la requête de groupe dans le volet de navigation affiche uniquement les requêtes qui ont été ajoutées au groupe. La sélection **Tous les groupes de requêtes** en tout temps affiche toutes les requêtes dans le système.

3.5

Gestion de licences

La fonction Gestion des licences permet à un utilisateur d'ajouter d'autres radios au système RM.

L'utilisateur peut acheter la fonction RM sur le site Web de Motorola Solutions en ligne (MOL). Si l'achat est réussi, un ID de droit (EID) est fourni. Grâce à cette fonction, l'utilisateur peut spécifier le nombre de radios qu'il désire gérer. Le nombre de radios associé à chaque IED est réparti parmi les multiples instances du serveur RM.

La gestion de licences est lancée à partir du menu **Actions** en sélectionnant **Gérer**→**Licences**.

À partir de la fenêtre Licences, l'utilisateur peut **Ajouter** , **Modifier**  ou **Supprimer**  des radios.

Les types de licence suivants peuvent être gérés dans le module Gestion radio :

3.5.1

Affichage Gérer des licences de radio

La gestion des licences permet à l'utilisateur d'ajouter d'autres radios au système RadioCentral. L'utilisateur peut acheter la fonction RadioCentral sur le site Web Motorola en ligne (MOL). Si l'achat est réussi, un ID de droit (EID) est fourni. Grâce à cette fonction, l'utilisateur peut préciser le nombre de radios qu'il désire gérer. Le nombre de radios associées à chaque EID est divisé entre plusieurs instances du serveur RadioCentral. L'affichage des licences de radio est lancé à partir du menu **Actions** en sélectionnant **Gérer**→**Licences**→**Licences de radio**.

Tableau 8 : Licences de radio

Colonne	Description
Numéro de série	Permet d'afficher en lecture seule le numéro de série de la radio pour toutes les fonctions sous licence. Les numéros de série sont lus à partir des codeplug.
Radio Alias (Alias de radio)	Permet à l'utilisateur d'afficher en lecture seule le nom reconnaissable par l'utilisateur de la radio pour toutes les fonctions sous licence. Ce champ est modifiable uniquement à partir de l' Affichage de la radio .
Numéro de modèle	Permet à l'utilisateur d'afficher en lecture seule le numéro de modèle de la radio pour toutes les fonctions sous licence. Les numéros de modèle sont lus à partir des codeplug.
Région	Permet à l'utilisateur d'afficher en lecture seule la région de la radio pour toutes les fonctions sous licence.
Champ	Permet à l'utilisateur d'afficher en lecture seule le nom de la fonction. Dans ce cas, le nom de la fonction est lu à partir de la licence actuelle.
État	Permet à l'utilisateur d'afficher en lecture seule l'état de toutes les licences de radio.
Commentaires	L'utilisateur peut ajouter une brève description à propos de cette rangée de licence.

Tableau 9 : Licences de radio

Colonne	Descriptions
Numéro de série	Permet d'afficher en lecture seule le numéro de série de la radio pour toutes les fonctions sous licence. Les numéros de série sont lus à partir des codeplug.
Radio Alias (Alias de radio)	Permet à l'utilisateur d'afficher en lecture seule le nom reconnaissable par l'utilisateur de la radio pour toutes les fonctions sous licence. Ce champ est modifiable uniquement à partir de l' Affichage de la radio .
Numéro de modèle	Permet à l'utilisateur d'afficher en lecture seule le numéro de modèle.
Numéro FLASHcode	Permet à l'utilisateur d'afficher en lecture seule le FLASHcode acheté dans la radio actuellement connectée.

Colonne	Descriptions										
Champ	Permet à l'utilisateur d'afficher en lecture seule le nom de la fonction.										
État	Permet à l'utilisateur d'afficher en lecture seule l'état de toutes les licences de radio. Tableau 10 : Colonnes dans l'affichage des licences de radio <table border="1" data-bbox="436 430 1370 926"> <thead> <tr> <th>États possibles</th> <th>Explication de l'état</th> </tr> </thead> <tbody> <tr> <td>Enregistré</td> <td>La fonction est enregistrée pour la radio et les changements déclenchés par l'enregistrement de la fonction sont annulés. L'utilisateur peut utiliser le menu clic droit pour le restaurer à Prêt pour l'activation.</td> </tr> <tr> <td>Disponible pour inscription</td> <td>La fonction n'est pas enregistrée pour l'appareil; l'utilisateur peut enregistrer la fonction dans la radio.</td> </tr> <tr> <td>Prêtes à être activées</td> <td>La fonction est enregistrée pour l'appareil et est en attente d'activation pour la radio.</td> </tr> <tr> <td>Activé - acheté</td> <td>Cette fonction est achetée et activée pour la radio.</td> </tr> </tbody> </table>	États possibles	Explication de l'état	Enregistré	La fonction est enregistrée pour la radio et les changements déclenchés par l'enregistrement de la fonction sont annulés. L'utilisateur peut utiliser le menu clic droit pour le restaurer à Prêt pour l'activation . Prêtes à être activées	La fonction est enregistrée pour l'appareil et est en attente d'activation pour la radio.	Activé - acheté	Cette fonction est achetée et activée pour la radio.
États possibles	Explication de l'état										
Enregistré	La fonction est enregistrée pour la radio et les changements déclenchés par l'enregistrement de la fonction sont annulés. L'utilisateur peut utiliser le menu clic droit pour le restaurer à Prêt pour l'activation .										
Disponible pour inscription	La fonction n'est pas enregistrée pour l'appareil; l'utilisateur peut enregistrer la fonction dans la radio.										
Prêtes à être activées	La fonction est enregistrée pour l'appareil et est en attente d'activation pour la radio.										
Activé - acheté	Cette fonction est achetée et activée pour la radio.										
Commentaires	L'utilisateur peut ajouter une brève description à propos de cette rangée de licence.										

REMARQUE :

Dans toutes les vues qui énumère des radios (fonctions, radios, détails des fonctions), l'utilisateur ne peut voir que les radios auxquelles on a attribué l'autorisation Afficher. La colonne nombre de radios reflète uniquement les radios auxquelles on a attribué l'autorisation Afficher pour l'utilisateur RM actuel.

L'enregistrement de fonctions est uniquement possible pour les appareils dotés des autorisations Afficher et Modifier. Pour les utilisateurs ayant le rôle d'administrateur RM, il n'y a aucune restriction.

3.5.1.1

Restauration des licences enregistrées dans la radio

Cette section traite de la capacité de localiser des licences dans la table des capacités d'appareil qui sont associées à une radio donnée, mais n'apparaissent pas dans la vue Licences de radio. Les licences peuvent avoir cet état lorsque des changements à l'appareil sont rejetés malgré l'état enregistré des licences (avant leur activation dans l'appareil au moyen d'une opération d'écriture).

Procédure :

- 1 Ouvrez la **Vue des licences de radio**.
- 2 Chargez un ou plusieurs appareils radio dans la base de données RadioCentral.
- 3 Sélectionnez une ou plusieurs rangées dans l'affichage Licences de radio.
- 4 Cliquez avec le bouton droit et sélectionnez **Restaurer les licences** ou cliquez sur CTRL+O.

Le client RadioCentral communique avec le serveur RadioCentral pour déterminer si des licences sont associées à l'appareil à partir de l'ID enregistré. Les licences restaurées s'affichent dans la Vue des licences de radio dans l'état *Prêt pour l'activation*.

3.5.1.2

Récupération des licences de radio

Cette fonction permet à l'utilisateur de récupérer les informations de licence perdues en raison de la restauration de l'image de la machine du serveur RadioCentral. Communiquez avec le soutien à la clientèle si l'équipement de la machine a été modifié. L'utilisateur doit rappeler le serveur de licence pour récupérer les licences (sous la forme de réponses de capacité) pour toutes les radios contenues dans RadioCentral.

Procédure :

- 1 Cliquez sur , puis sur **Paramètres**.
- 2 Sélectionnez l'onglet **Licences**.
- 3 Dans la fenêtre **Récupérer les licences**, cliquez sur le bouton **Licences de radio – Récupérer**.
- 4 Cliquez sur **OK**.

Les licences existantes du serveur de licence de Motorola sont restaurées.

3.5.1.3

Tri de la grille dans la vue des licences de radio

Les données du tableau sont triées par ordre croissant selon le numéro de série de la radio.

Procédure :

- Cliquez sur un des en-têtes de colonne dans la grille.
- Permet de trier les données en ordre croissant ou décroissant en fonction de la colonne sélectionnée.

3.5.1.4

Filtrage des radios disponibles par groupes

Procédure :

- L'utilisateur peut trier les données radio par colonne en cliquant sur l'en-tête de colonne.
- L'utilisateur peut filtrer les radios disponibles par groupe.

3.5.2

Fenêtre Enregistrer les licences de radio

Cette fenêtre permet à l'utilisateur de soumettre l'affectation de la licence logicielle. La fenêtre Licences d'appareil présente l'interface utilisateur suivante :

- Champ de texte – champ permettant à l'utilisateur d'entrer l'ID de droits (EID).
- Liste des radios disponibles – liste qui affiche tous les appareils qui répondent aux critères de licence EID.
- Liste des radios sélectionnées – liste permettant de visualiser tous les appareils que l'utilisateur souhaite associer à la licence.

Pour accéder à la fenêtre Licences de radio, cliquez sur le bouton  dans l'**Affichage des licences de radio**.

Le tableau suivant présente les descriptions des colonnes de la table ID de requête.

Tableau 11 : Licences de radio

Colonne et touches	Description
Boîte de texte ID de droit	L'utilisateur saisit le type de l'ID de droits demandé. Voir Exécution d'une requête d'EID à la page 67 .
Demande	Cliquez sur cette touche pour afficher l'information EID dans la table.
Effacer tout	Cliquez sur cette touche pour supprimer les EID précédemment demandés.
ID de droits	Permet à l'utilisateur de visualiser uniquement la rangée d'EID pour chaque licence unique. Voir Sélection d'éléments de rangées multiples dans le tableau EID à la page 68 .
Champ	Permet à l'utilisateur d'afficher en lecture seule le nom de chaque nouvelle fonction.
Disponible	Permet à l'utilisateur d'afficher en lecture seule le nombre restant de licences de fonctions encore disponibles pour être enregistrées dans une radio.
Acheté	Permet à l'utilisateur d'afficher en lecture seule le nombre de licences de fonctions achetées à l'origine.
Numéro de série	Permet à l'utilisateur d'afficher en lecture seule le numéro de série de l'appareil.
Radio Alias (Alias de radio)	Permet à l'utilisateur d'afficher en lecture seule le nom reconnaissable par l'utilisateur de la radio pour toutes les fonctions sous licence. Ce champ est modifiable uniquement à partir de l' Affichage de la radio .
Ajouter tous	Cliquez sur cette touche pour ajouter tous les appareils sélectionnés à partir de la table Radios disponibles dans la table Radios sélectionnées.
Ajouter	Cliquez sur cette touche pour ajouter l'appareil sélectionné à partir de la table Radios disponibles dans la table Radios sélectionnées.
Retirer	Cliquez sur cette touche pour retirer l'appareil sélectionné de la table Radios sélectionnées et le retourner dans la table Radios disponibles.
Supprimer tout	Cliquez sur cette touche pour supprimer tous les appareils de la table Radios sélectionnées et les retourner dans la table Radios disponibles.
Inscription	Cliquez sur cette touche pour enregistrer les fonctions sélectionnées dans la table ID de requête et les ajouter aux appareils dans la table Radios sélectionnées. Voir Soumission de l'attribution de licence logicielle à la page 68 .

3.5.2.1

Exécution d'une requête d'EID

Procédure :

- 1 Entrez l'« ID de droits » dans la boîte de texte ID de droits.
- 2 Cliquez sur le bouton **Requête**.

Pour annuler, cliquez sur le bouton **Effacer tout**.

3.5.2.2

Sélection d'éléments de rangées multiples dans le tableau EID

Procédure :

- 1 Cliquez sur la case à cocher dans la première colonne de la rangée souhaitée.
- 2 Pour sélectionner ou désélectionner tout, cliquez sur la case dans l'en-tête de colonne du tableau EID.

Le client RadioCentral met à jour le tableau EID et applique le filtrage des tableaux Radios disponibles et Radios sélectionnées.

- 3 Cliquez sur **OK** pour supprimer toutes les radios du tableau Radios sélectionnées et ajouter manuellement les radios à partir du tableau Radios disponibles.

L'utilisateur peut sauter cette étape si aucune radio ne doit être supprimée. Pour annuler, cliquez sur le bouton **Effacer tout**.

- 4 Cliquez sur **OK**. Les radios sont filtrées à partir du tableau Radios sélectionnées.

3.5.2.3

Soumission de l'attribution de licence logicielle

Après avoir sélectionné les radios auxquelles assigner les licences, cliquez sur le bouton **Enregistrer** pour valider les associations.

Préalables :

- Ouvrez la fenêtre **Licences de radio**.
- La table EID doit contenir au moins une rangée entièrement remplie et au moins une rangée de la table EID doit être cochée.
- Au moins une rangée est entièrement remplie dans la table Radio sélectionnée.
- Le nombre de radios dans la table Radios sélectionnées ne doit pas dépasser le nombre de licences disponibles dans toute rangée sélectionnée dans la table EID.
- Le client RadioCentral dispose d'une connexion Internet valide.

Procédure :

- 1 Cliquez sur **Enregistrer** après avoir sélectionné les radios auxquelles assigner les licences.
- 2 Cliquez sur **OK**.

3.6

Gestion du micrologiciel

La fonction **Gestion du Micrologiciel** permet à l'utilisateur de visualiser les versions automatiquement importées du micrologiciel stocké dans le serveur RadioCentral.

Chaque fois qu'une radio est ajoutée à RadioCentral, la version de son firmware est automatiquement ajoutée si elle n'est pas actuellement stockée dans RadioCentral. D'autres radios gérées peuvent alors accéder aux radios nouvellement ajoutées.

Gestion du Micrologiciel est lancé à partir du menu **Actions** en sélectionnant **Gestion→du Micrologiciel**.

Tableau 12 : Micrologiciel

Colonne et touches	Description
Nom	Permet à l'utilisateur d'afficher uniquement le nom de toutes les versions de micrologiciels disponibles.
Version	Permet à l'utilisateur d'afficher uniquement le numéro de version de toutes les versions disponibles du micrologiciel.
Taille (ko)	Permet à l'utilisateur d'afficher en lecture seule la taille de fichier de toutes les versions du micrologiciel.
Date d'importation	Permet à l'utilisateur d'afficher en lecture seule la date et l'heure réelles de l'importation de toutes les versions du micrologiciel.
Codeplug	Permet à l'utilisateur d'afficher en lecture seule le nom de la version de la codeplug.
Radios en utilisation	Permet à l'utilisateur d'afficher en lecture seule le nombre de radios utilisant chaque fichier de micrologiciel.
Radios en utilisation (mode Modèle)	Affiche le nombre de modèles utilisant chaque fichier de micrologiciel en mode Modèle.
Radios en utilisation (mode Configuration)	Affiche le nombre de radios utilisant chaque fichier de micrologiciel en mode Configuration.
Commentaires	Permet à l'utilisateur d'ajouter des commentaires pour chaque fichier de micrologiciel.

3.7

Gestion des annonces vocales

La fonction **Gérer les annonces vocales** permet à l'utilisateur d'afficher les fichiers d'annonce vocale importés automatiquement et stockés dans le serveur RM et d'importer manuellement les nouveaux fichiers d'annonce vocale vers le serveur RM.

La fonction **Gérer les annonces vocales** est lancée à partir du menu **Actions** en sélectionnant **Gérer**→**Annonces vocales**.

L'utilisateur peut **Ajouter** , **Modifier**  ou **Supprimer**  des annonces vocales.

REMARQUE :

Les fichiers d'annonce vocale ne peuvent pas être importés automatiquement ou manuellement lorsque le nom de fichier correspondant existe déjà dans le serveur RM. Ceci s'applique même si la durée et le contenu des fichiers diffèrent.

REMARQUE :

La durée du fichier audio `.mva` ne doit pas dépasser 20 secondes.

Il existe deux méthodes de stockage des fichiers d'annonce vocale sur le serveur RM :

Importation automatique

Chaque fois qu'une radio est ajoutée au serveur RM, ses fichiers d'annonce vocale sont automatiquement ajoutés s'ils ne sont pas déjà stockés sur le serveur RM. Les fichiers d'annonce vocale sont alors accessibles pour les autres radios gérées. Voir [Ajout de radios à la Gestion radio](#).

Importation manuelle

Utilisation de l'option d'importation de fichiers vocaux. Voir [Importation manuelle des fichiers d'annonce vocale](#).

Tableau 13 : Gestion des annonces vocales

Colonne et touches	Description
Nom	Permet à l'utilisateur d'afficher en lecture seule le nom de chaque fichier d'annonce vocale.
Taille (Ko)	Permet à l'utilisateur d'afficher en lecture seule la taille de chaque fichier d'annonce vocale.
Date d'importation	Permet à l'utilisateur d'afficher en lecture seule la date et l'heure réelles de l'importation de tous les fichiers d'annonce vocale.
Modèles et radios en utilisation	Permet à l'utilisateur d'afficher en lecture seule le nombre de modèles et de radios utilisant chaque fichier d'annonce vocale.
Modèles en utilisation (mode Modèle)	Permet à l'utilisateur d'afficher en lecture seule le nombre de modèles utilisant chaque fichier d'annonce vocale en mode Modèle.
Radios en utilisation (mode Configuration)	Permet à l'utilisateur d'afficher en lecture seule le nombre de radios utilisant chaque fichier d'annonce vocale.
Commentaires	Permet d'ajouter des commentaires à propos de chaque fichier d'annonce vocale.

3.8

Gérer les Certificats CA

La fonction **Gérer les Certificats CA** permet à l'utilisateur de visualiser les certificats CA importés automatiquement et stockés dans le serveur RadioCentral, et d'importer manuellement de nouveaux Certificats CA dans le Serveur RadioCentral.

Gérer les Certificats CA est lancé à partir du menu **Actions** en sélectionnant **Gérer** → **les certificats CA**.

L'utilisateur peut **Importer** , ou **Supprimer**  des certificats.

REMARQUE :

- Les fichiers de certificat CA ne peuvent pas être importés automatiquement ou manuellement lorsque le nom de fichier correspondant existe déjà dans le serveur RadioCentral.
- Seuls les fichiers de Certificats CA au format PEM (Courrier à Confidentialité Améliorée) et d'une taille inférieure ou égale à 10K peuvent être importés dans le Serveur RadioCentral.

Il existe deux méthodes pour stocker les fichiers de Certificats CA sur le Serveur RadioCentral :

Importation automatique

Chaque fois qu'une radio est ajoutée au Serveur RadioCentral, les fichiers de Certificats CA sont automatiquement ajoutés s'ils ne sont pas actuellement stockés dans le Serveur RadioCentral. Les fichiers de certificats CA sont ensuite disponibles pour les autres radios gérées.

Importation manuelle

En utilisant l'option Importer les fichiers de Certificats CA. Voir [Importation manuelle des certificats CA à la page 54](#).

Tableau 14 : Certificats

Colonnes et touche comprises	Définition
Nom	Permet à l'utilisateur d'afficher uniquement le nom de tous les certificats disponibles.
Taille	Permet à l'utilisateur d'afficher uniquement la taille du fichier de tous les certificats.
Date d'importation	Permet à l'utilisateur d'afficher en lecture seule la date et l'heure réelles de l'importation de tous les certificats.
En utilisation (radios)	Permet à l'utilisateur d'afficher en lecture seule le nombre de radios utilisant chaque fichier de certificat.
Commentaires	Permet à l'utilisateur d'ajouter des commentaires pour chaque fichier de certificats.

3.9

Gérer les clés de système

La fonction **Gérer les clés de système** permet à l'utilisateur d'afficher les clés de systèmes stockées dans le serveur RadioCentral.

La fonction **Clés de système** est lancée à partir du menu **Actions** en sélectionnant **Gérer** → **Gérer les clés de système**.

L'utilisateur peut **Ajouter** , **Modifier**  ou **Supprimer**  des clés de système.

Tableau 15 : Gérer les clés de système

Colonne	Description
ID du système hex	ID du système ADF associé à la clé du système.
Type	Affichez le type de clé du système soit comme Clé de système avancée ou Clé logicielle.
Numéro de série iButton	Le numéro de série du ou des Dispositifs de clé iButton contenant des Clés avancées (matérielles) utilisées pour les activités de programmation antérieures ayant nécessité une Clé avancée.
Niveau d'accès	<p>Accès illimité</p> <p>Ce type d'accès active tous les champs protégés pour toutes les fonctions ADF dans les catégories Système ADF et Personnalité ADF. La clé du système permet l'accès lecture-écriture à toutes les fonctions ADF protégées dans la codeplug.</p> <p>Accès illimité sans protection d'écriture</p> <p>Ce type d'accès active tous les champs protégés pour toutes les fonctions ADF dans les catégories Système ADF et Personnalité ADF. Cette sélection empêche de protéger la radio contre l'écriture.</p>

Colonne	Description
	Limité Ce type d'accès permet à l'administrateur d'activer les champs protégés sélectionnés pour toutes les fonctions ADF dans les catégories Système ADF et Personnalité ADF. L'administrateur peut également limiter la plage de valeurs pour les champs qui utilisent une plage. La clé du système permet d'accéder au champ, mais restreint la plage de valeurs autorisées pour le champ.
Protection en écriture activée	Protège contre la programmation non autorisée de certains champs protégés par clé de Système ADF ASTRO ou de Personnalité ADF.

3.10

Migration de la codeplug

La fonction de migration de la codeplug permet à l'utilisateur de convertir des codeplugins d'APX portable du format `.mc` du logiciel de programmation client au format `.dbn` de votre configuration radio.

3.11

Fenêtre Paramètres

La fenêtre **Paramètres** permet d'afficher ou de modifier les communications entre le client RadioCentral et la base de données du serveur RadioCentral, et elle permet à l'utilisateur de récupérer des licences d'application et de radio.

Sélectionnez **Actions** → **Paramètres** pour lancer la fenêtre **Paramètres**.

3.11.1

Paramètres des licences

La fenêtre **Paramètres des licences** permet à l'utilisateur de récupérer les licences d'application et de radio sur le serveur RadioCentral.

Les **Paramètres des licences** sont lancés à partir du menu **Actions** en sélectionnant **Paramètres**→**Licences**.

Tableau 16 : Paramètres des licences

Colonne	Description
Récupération des licences d'application	Récupération des licences d'application Si l'utilisateur doit imager de nouveau ou reformater le disque dur du serveur RadioCentral, la fonction Récupérer les licences d'application permet à l'utilisateur de récupérer toutes les licences d'application de la radio sur le serveur RadioCentral : <ol style="list-style-type: none">1 Assurez-vous que l'utilisateur dispose d'une connexion Internet.2 Entrez l'ID de droits dans le champ de saisie.3 Cliquez sur la touche Récupération des licences d'application.4 Dans la colonne de transfert vers le champ du serveur, accessible à partir de Actions→Gérer→Licences→Affichage des licences d'application→Disponible, assurez-vous que le nombre approprié

Colonne	Description
Récupération des licences de radio	<p>de licences récupérées à partir de Motorola Solutions Motorola Solutions est correct.</p> <p>Si l'utilisateur doit imager de nouveau ou reformater le disque dur du serveur RadioCentral , la fonction Récupérer les licences de radio permet à l'utilisateur de récupérer toutes les licences de radio sur le serveur RadioCentral :</p> <ol style="list-style-type: none">1 Une fois que la radio est revenue dans RadioCentral, la fonction Récupérer les licences de radio peut être exécutée.2 Une fois que le processus de récupération est achevé, l'utilisateur doit également exécuter la fonction Récupération des licences pour faire passer les licences de radio de l'état Enregistré à l'état Prêt à être activé. <p> REMARQUE :</p> <p>Pour exécuter la fonction Récupération des licences de radio, allez à Actions→Gérer→Licences→Affichage des licences de radio, cliquez à droite sur la radio désirée et sélectionnez Restaurer les licences.</p>

3.11.2

Langue

La fenêtre **Paramètres de langue** vous permet de sélectionner la langue utilisée dans l'application.

L'application prend en charge les langues suivantes :

- Anglais
- Français (Canada)
- Espagnol
- Portugais (Brésil)

REMARQUE :

Lors de la sélection d'une nouvelle langue, RadioCentral doit être redémarré pour que la nouvelle langue prenne effet.

La langue de saisie dépend de la sélection de clavier configurée pour le système d'exploitation de l'ordinateur et non de cette sélection de langue; cependant, les nombres saisis dans un champ de texte sont toujours affichés dans le format 0-9, quelle que soit la langue sélectionnée.

3.12

Afficher les tâches

La fenêtre d'information **Tâches** permet de visualiser les travaux opérationnels.

La fenêtre **Tâches** présente un sommaire de tous les travaux opérationnels. Un travail est une opération qui est effectuée sur un ou plusieurs objets RadioCentral ne comportant pas d'opération de programmation (lecture, d'écriture). Par exemple, si l'utilisateur sélectionne une centaine de radios et sélectionne **Supprimer**, l'utilisateur effectue un travail opérationnel.

Un travail apparaît dans la fenêtre **Tâches** dès que l'utilisateur effectue une opération sur une entité RadioCentral, avec le dernier travail sur le dessus. La fenêtre Tâches montre les travaux qui sont survenus durant la session du client RadioCentral actuelle.

La fenêtre d'information **Tâches** est lancée à partir du menu **Actions** et en sélectionnant **Afficher les tâches**.

Tableau 17 : Tableau Afficher les tâches

Colonne	Description
Nom du travail	Le nom du travail opérationnel qui a été effectué dans RadioCentral.
Heure de création	L'heure du travail opérationnel qui a été effectué dans RadioCentral.
Sommaire	Un résumé du travail effectué dans RadioCentral.
Actions	Le type de travaux opérationnels exécutés par le serveur RadioCentral. Un travail peut être annulé avant d'être achevé en cliquant sur X.

Chapitre 4

Programmeur

Le menu **Programmeur** permet d'ouvrir la fenêtre **Programmer le travail**. La fenêtre **Programmer le travail** permet à l'utilisateur de programmer une radio ou plus pour une opération de Lecture, Écriture ou Réinitialisation des paramètres par défaut. Les travaux peuvent être programmés pour une exécution immédiate ou à un moment prédéfini. Voir [Programmation de travaux dans RadioCentral à la page 98](#).

REMARQUE :

Le menu **Programmeur** est activé dans l' **Affichage de la radio** lorsqu'au moins une est sélectionnée à partir du volet de programmation, a des données radio et une configuration valides et n'est pas en attente d'un traitement de tâche.

La fenêtre **Calendrier de travail** contient des champs qui permettent à l'utilisateur de configurer les paramètres suivants :

Tableau 18 : Paramètres de calendrier de travail

Réglage	Fonction
Type de travail	<p>Les types de travail suivants sont pris en charge :</p> <p>Écriture Les données de configuration pour toutes les radios sélectionnées sont écrites sur les radios. La case à cocher Forcer une mise à jour immédiate est disponible pour permettre l'installation immédiate d'une mise à jour. Cela entraînera le redémarrage de l'appareil cible immédiatement après le téléchargement, sans confirmation de l'utilisateur, et n'est permis que sur une seule radio à la fois.</p> <p> REMARQUE : Cette fonction est disponible pour les tâches sur un seul dispositif provisionné. Si une mise à jour immédiate est requise et que ce texte est grisé, l'utilisateur devra revenir à l'affichage de la radio pour sélectionner une seule radio à mettre à jour.</p> <p>Confirmation protégée contre l'écriture Permet à l'ordonnanceur de programmation POP25 (Programming Over Project 25) par lots de protéger contre l'écriture la radio. Lorsque ce champ est activé, la clé avancée de l'ID du propriétaire (chargée et connectée) doit correspondre pour chaque radio cible.</p> <p>Lu Les radios sélectionnées sont lues et les informations de configuration sont mises à jour sur le serveur. La case à cocher Générer la configuration est disponible pour un travail de lecture et génère une configuration à partir des données sur la radio. Si l'option Appliquer à la radio est sélectionnée, la configuration est affectée à la radio dans la RadioCentral.</p> <p>Réinitialisation aux réglages d'origine La configuration de la radio sélectionnée est supprimée. Les paramètres d'origine de la radio sont restaurés.</p>
Nom du travail	Permet de sélectionner un nom pour le travail courant. Il est recommandé d'entrer un nom significatif, tel que « Écriture câblée pour le poste de pompiers »

Réglage	Fonction
	n° 3 », de sorte que le travail soit facilement identifiable dans Affichage du travail .
Fuseau horaire	Permet de sélectionner le fuseau horaire dans lequel l'événement de travail actuel est exécuté dans un Programmeur d'appareil RadioCentral. Cette sélection s'applique à la radio actuelle ou aux radios sélectionnées pour les travaux dans la fenêtre Programmer un travail .
Commencer après le	Permet de sélectionner la date (en format jour-mois-année) et l'heure (en format 24 heures) du début de l'intervalle du travail. Ce champ est facultatif et s'il n'est pas précisé, le travail est exécuté dès que possible.
Terminer avant le	Permet de sélectionner la date (en format jour-mois-année) et l'heure (en format 24 heures) de la fin de l'intervalle du travail en cours. Si un travail programmé n'a pas commencé à ce moment, le travail expire et ne peut pas être exécuté. Ce champ est facultatif et si rien n'est entré, le travail n'expire jamais.

REMARQUE :

Lorsque le type de travail sélectionné est « **Lecture** », le programmeur d'appareil RadioCentral récupère la codeplug de chaque radio associée au travail. Une fois la codeplug téléversée sur le serveur RadioCentral, l'association de la configuration précédente pour la radio sélectionnée est écrasée.

Chapitre 5

Affichage de la radio

L'**affichage de la radio** fournit de l'information sur les dispositifs qui sont dans le système.

Le numéro de série est inscrit automatiquement. L'agence est créée par Motorola Solutions. La radio inscrite automatiquement utilise la codeplug par défaut et les fonctions achetées personnalisées.

L'**affichage de la radio** prend en charge les opérations suivantes :

- Modifier et sélectionner des configurations
- Planifier et annuler des tâches
- Grouper des radios
- Analyser une configuration de radio

Si une radio est sélectionnée dans la liste, le volet de programmation affiche les raccourcis vers les sélections suivantes : **Afficher les détails**, **Modifier la configuration**, **Analyser** et **Programmer le travail**. Pour en savoir plus, voir [Volet de programmation dans le client de configuration RadioCentral à la page 46](#).

Table Affichage de la radio

Les champs de la radio sont personnalisables. Par défaut, les champs les plus courants s'affichent. Il s'agit notamment des champs **Numéro de série**, **Alias radio**, **Configuration**, **Groupe**, **Modifié**, **État du travail** et ainsi de suite. Voir [Table Affichage de la radio à la page 83](#).

Tableau 19 : Touches opérationnelles de l'Affichage de la radio

Touche	Description
	La touche Modifier n'est pas prise en charge. Les propriétés de la radio sont uniques pour chaque radio et ne sont pas modifiables.
	La touche Grille vers fichier (exporter) est activée lorsque la radio est sélectionnée et permet d'exporter les données de radio contenues dans les rangées sélectionnées dans un fichier CVS (valeurs séparées par des virgules).
	La touche Fichier vers grille (importer) permet d'importer des données de radio à partir d'un fichier CVS (valeurs séparées par des virgules).

Opérations par clic à droite pour les radios

Les opérations suivantes peuvent être effectuées pour une radio sélectionnée :

Tableau 20 : Opérations par clic à droite pour les radios

Utilisation	Description
Afficher les détails	Permet d'afficher l'information radio, l'historique des travaux et les jeux de fonctions pour la radio sélectionnée. Cette opération est également accessible au moyen du raccourci placé au-dessus du champ Rechercher.
Suppression	Permet de supprimer la radio sélectionnée de la base de données du serveur RM.

Utilisation	Description
Sélectionner un groupe	Permet à l'utilisateur d'affecter la radio sélectionnée à un groupe ou à un sous-groupe de radios.
Modifier la configuration	Ouvre l' Affichage Configuration , dans laquelle apparaît l'information sur le terminal, ainsi que tous les ensembles attribués à la configuration. À partir de cet affichage, l'utilisateur peut modifier les champs dans tous les ensembles pertinents.
Sélectionner la configuration	Ouvre la fenêtre Sélectionner la configuration , qui permet à l'utilisateur d'affecter une configuration à la radio sélectionnée.
Comparer	<p>Permet à l'utilisateur de comparer les différences dans les valeurs de codeplug de deux configurations différentes affectées à des radios en utilisant la fonction de configuration de la comparaison.</p> <p>Les opérations suivantes sont prises en charge :</p> <p>Configuration affectée Compare les valeurs de codeplug à partir des configurations actuellement affectées.</p> <p>Dernière programmation Compare les valeurs de codeplug des dernières configurations programmées dans la radio.</p> <p> REMARQUE : Ces sélections sont accessibles lorsque deux radios sont sélectionnées.</p>
Annuler les modifications	<p>Annule toute modification récente apportée à la radio sélectionnée. Cela s'applique à toutes les modifications apportées aux données. Par contre, une modification de groupe n'est pas restaurée (voir Groupes de radios à la page 80).</p> <p> AVERTISSEMENT : Toute fonctionnalité dont l'ajout par le biais de FLASHport est en cours sera définitivement perdue. La FLASHkey a déjà été décrétementée et ne peut pas être annulée. Les fonctionnalités dont l'ajout par le biais de la licence radio est en cours peuvent être récupérées dans Paramètres.</p> <p>Lorsqu'une fonction est ajoutée à la radio par le biais de la licence radio (voir Affichage Gérer des licences de radio à la page 64), plutôt que par FLASHport et que l'option Annuler les modifications est sélectionnée avant ces modifications de FLASHcode en cours d'enregistrement dans la radio, vous pouvez utiliser l'option Restaurer (voir Gérer les licences de radio) afin de remplacer le réglage « État » de la fenêtre Gérer les licences de radio de « Enregistré » par « Prêt pour l'activation ».</p>
Programmer un travail	Ouvre la fenêtre Programmer le travail , qui permet à l'utilisateur un travail de programmation de lecture-écriture pour la ou les radios sélectionnées.
Annuler le travail	Permet à l'utilisateur d'annuler un travail pour la radio actuellement sélectionnée.

Utilisation	Description
Terminer le travail	Permet à l'utilisateur de changer manuellement l'état de la radio sélectionnée de « Transféré » à « Terminé ». Cette action est uniquement disponible lorsque la radio est dans l'état transféré, ce qui indique que le nouveau micrologiciel a été transféré à la radio par liaison radio et qu'il est en attente d'être installé sur la radio par l'utilisateur final. Utilisez uniquement cette action lorsque vous êtes certain que l'utilisateur final a appliqué les changements ou que l'utilisateur souhaite faire une lecture de la radio, en déplaçant manuellement cette radio pour terminer l'action; autrement cela peut faire en sorte que Gestion radio ne soit plus synchronisé avec cette radio.
Sélectionner MVO	Permet à l'utilisateur d'affecter un modèle, une version et une option (MVO) à une nouvelle radio. Voir Modèle, version et options .
Mettre à jour les données radio	Lance la fenêtre Interroger/Mettre à jour les données de la radio, ce qui permet à l'utilisateur de modifier le type de clé avancée du propriétaire d'une radio ou l'ID du propriétaire et(ou) d'activer ou désactiver la protection contre l'écriture d'une radio.
Analyser	Permet à l'utilisateur d'analyser une configuration pour repérer les erreurs et les avertissements avant de créer un travail. Voir Analyse de la configuration de la radio à la page 48 .
Rapports	Ouvre les pages de rapport pour Sommaire canal et Documentation client . Ces rapports peuvent être imprimés ou enregistrés dans un emplacement de fichier local ou sur réseau.
Mettre à niveau le micrologiciel	<p>Permet à l'utilisateur de mettre à niveau le micrologiciel de la radio existante à une version plus récente.</p> <p>La version de codeplug est augmentée automatiquement, selon la version du micrologiciel choisie. De nouvelles fonctions seront disponibles en fonction de la version la plus récente de la codeplug.</p> <p>L'utilisateur peut vérifier les micrologiciels existants dans RadioCentral au moyen de la fonction de gestion du micrologiciel. Voir Gestion du micrologiciel à la page 68.</p> <p>La mise à niveau du micrologiciel est lancée à partir du menu Actions en sélectionnant Mise à jour→Mise à jour du micrologiciel.</p>
Mise à jour du module linguistique	Compare les versions des modules linguistiques actuellement lues par la radio à celles qui sont stockées sur le serveur RM. Si une nouvelle version de module linguistique est détectée, le module linguistique en question est mis à jour et l'indicateur Modules linguistiques modifiés est défini.

Utilisation	Description	
	<p>Un travail d'écriture par fil ou sans fil doit être programmé pour mettre à jour les modules linguistiques sur la radio et supprimer l'indicateur Modules linguistiques modifiés.</p> <p> REMARQUE : L'indicateur Modules linguistiques modifiés est défini uniquement lorsqu'une nouvelle version de module linguistique est détectée sur le serveur RM.</p> <p>En outre, les travaux d'écriture aux fins de modification de codeplug peuvent être programmés par liaison radio, même si l'indicateur Modules linguistiques modifiés est défini. Les modules linguistiques peuvent être programmés sur la radio uniquement par connexion par fil ou sans fil.</p>	
Mise à jour de la version de la codeplug	Permet à l'utilisateur de mettre à jour la version de la codeplug. L'utilisateur peut conserver sa sélection de langue lors de la mise à niveau de la version.	
Exporter la radio	Permet à l'utilisateur d'exporter la ou les radios sélectionnées dans un fichier de multipléts de codeplug (*.xpba). Voir Exportation d'une radio	
Exporter DVRS	Permet à l'utilisateur d'exporter l'enregistrement ou la rangée de la radio actuellement en surbrillance au format de fichier (.XML). Voir Exporter des données DVRS	
Exporter Grille vers fichier	Permet à l'utilisateur d'exporter la radio sélectionnée dans un fichier de valeurs séparées par des virgules (format *.csv). Voir Exportation de Grille vers fichier à la page 55	
Modifier le mot de passe de la radio	Ouvre la fenêtre Modifier le mot de passe de la radio, qui permet à l'utilisateur d'outrepasser le mot de passe de la codeplug courant pour la configuration de la radio.	
Copier l'identité	Permet à l'utilisateur de copier les données d'identité (dont l'ID, l'alias, l'IP, etc.) d'une radio donnée sur une autre radio.	
Coller l'identité	Permet à l'utilisateur de coller les données d'identité copiées (dont l'ID, l'alias, l'IP, etc.) d'une radio donnée sur une autre radio.	<p> REMARQUE : Cette fonction est activée lorsqu'une radio est sélectionnée et que ses données d'identité sont copiées.</p>

5.1

Groupes de radios

Le regroupement des radios dans le client de configuration RadioCentral vous permet d'organiser et de gérer votre radio pour le système RadioCentral dans une structure arborescente. Les groupes sont utilisés avec des jeux et des configurations partagés pour gérer plus efficacement votre système radio.

À partir de l'**affichage de la radio**, le volet de navigation pour les **groupes** permet à l'utilisateur de créer des groupes et des groupes en utilisant un clic droit de la souris.

Les opérations suivantes peuvent être effectuées pour les groupes ou les sous-groupes :

- Créer un groupe ou sous-groupe
- Supprimer un groupe ou sous-groupe
- Renommer un groupe ou sous-groupe
- Glisser-déplacer un groupe ou sous-groupe vers un nouvel emplacement
- Développer ou réduire des nœuds de groupes dans l'arborescence

La sélection du réglage **Tous** permet d'afficher toutes les radios du système RadioCentral sans égard à l'affectation de groupe. L'affectation de radios à un groupe ou à un sous-groupe s'effectue sous la colonne **Groupe** dans ce tableau. Une ou plusieurs radios peuvent être sélectionnées à partir du tableau et affectées à un groupe ou à un sous-groupe. Voir [Création et gestion des groupes de radios](#).

Tableau 21 : Opérations Clic droit pour les groupes de radios

Sélection	Description
Nouveau groupe	Permet à l'utilisateur de créer un groupe ou sous-groupe.
Suppression	Permet à l'utilisateur de supprimer un groupe ou sous-groupe. Quand un groupe contenant des radios ou des sous-groupes est supprimé, une fenêtre de confirmation s'ouvre et avertit l'utilisateur que le groupe sélectionné et tous ses sous-groupes seront supprimés. Toute radio assignée au groupe ou au sous-groupe ne sera plus assignée à un groupe. La colonne Groupe dans le tableau pour toutes les radios supprimées d'un groupe ou sous-groupe affiche <i>Aucun</i> .
Renommer	Permet à l'utilisateur de renommer un groupe ou sous-groupe.

5.1.1

Création et gestion des groupes de radios

Les groupes et sous-groupes de radios sont créés et gérés à partir du volet de navigation **Groupe**. Une fois que des groupes et sous-groupes de radios ont été créés, ils peuvent être renommés, supprimés ou déplacés dans la structure d'affichage en arborescence.

Procédure :

- 1 Cliquez sur l'icône **Vue Radio** pour afficher le tableau de la vue Radio.
- 2 Créez, gérez ou déplacez un groupe ou un sous-groupe. Effectuez l'une des actions suivantes :

Si...	Alors...
Si vous créez un groupe,	effectuez les opérations suivantes : <ol style="list-style-type: none"> a Cliquez avec le bouton droit dans le volet de navigation et sélectionnez Nouveau groupe. b Entrez un <code>name</code> pour le nouveau groupe.
Si vous créez un sous-groupe,	effectuez les opérations suivantes : <ol style="list-style-type: none"> a Cliquez avec le bouton droit sur le groupe ou sous-groupe approprié, puis sélectionnez Nouveau groupe. b Entrez un <code>name</code> pour le nouveau sous-groupe.

Si...	Alors...
Si vous supprimez un groupe ou sous-groupe,	effectuez les opérations suivantes : <ol style="list-style-type: none"> a Sélectionnez le groupe ou sous-groupe approprié. b Cliquez avec le bouton droit et sélectionnez Supprimer.  REMARQUE : Une fenêtre de confirmation s'ouvre et avertit l'utilisateur que le groupe sélectionné et tous les sous-groupes seront supprimés. Toute radio assignée au groupe ou au sous-groupe ne sera plus assignée à un groupe.
Si vous renommez un groupe ou un sous-groupe,	effectuez les opérations suivantes : <ol style="list-style-type: none"> a Sélectionnez le groupe ou sous-groupe approprié. b Cliquez avec le bouton droit et sélectionnez Renommer. c Entrez un nouveau <code>name</code> pour le groupe ou le sous-groupe.
Si vous déplacez un groupe ou un sous-groupe,	effectuez les opérations suivantes : <ol style="list-style-type: none"> a Sélectionnez le groupe ou sous-groupe approprié. b Utilisez la fonction glisser-déposer standard pour déplacer le groupe ou le sous-groupe vers son nouvel emplacement.  REMARQUE : Les groupes ou les sous-groupes peuvent être déplacés et placés sur un groupe existant ou parmi des groupes. Toute radio assignée au groupe ou au sous-groupe sera déplacée avec ce groupe ou sous-groupe vers le nouvel emplacement.

3 Attribuez des radios à un groupe ou à un sous-groupe. Effectuez l'une des actions suivantes :

Si...	Alors...
Si vous attribuez une seule radio,	effectuez les opérations suivantes : <ol style="list-style-type: none"> a a. Dans le volet de navigation, sélectionnez Tous pour afficher toutes les radios contenues dans le système RM. b Dans le tableau, sélectionnez la liste déroulante de la colonne Groupe pour une radio, développez les nœuds si nécessaire et sélectionnez le groupe ou sous-groupe approprié.

Si...	Alors...
	<p>c Répétez l'étape précédente jusqu'à ce que toutes les radios du groupe ou du sous-groupe soient assignées.</p>
Si vous attribuez plusieurs radios,	<p>effectuez les opérations suivantes :</p> <p>a a. Dans le volet de navigation, sélectionnez Tous pour afficher toutes les radios contenues dans le système RM.</p> <p>b Sélectionnez toutes les radios appropriées dans le tableau en utilisant la séquence de touches standard MAJ et CTRL.</p> <p>c Cliquez avec le bouton droit sur toute rangée en surbrillance, puis sélectionnez Sélectionner le groupe.</p> <p>d Dans la fenêtre Sélectionner le groupe, développez les nœuds si nécessaire, puis sélectionnez le groupe ou le sous-groupe.</p> <p>e Cliquez sur OK.</p>

REMARQUE :

Une radio peut être assignée à un seul groupe ou sous-groupe.

Si la valeur **Aucun** est la seule valeur contenue dans la liste déroulante **Groupe**, cela signifie qu'aucun groupe n'existe dans le volet de navigation.

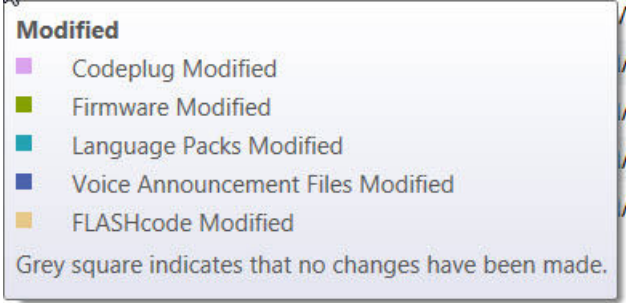

5.2

Table Affichage de la radio

Le tableau suivant définit tous les champs des colonnes qui sont pris en charge dans la fenêtre **Affichage de la radio**.

Tableau 22 :

Colonne	Description	Remarques
Numéro de série	Affiche le numéro de série de la radio stockée dans le serveur RadioCentral.	Lecture seule
Alias de radio	Affiche et permet de modifier directement le nom de la radio.	Ce champ peut être modifié.
Configuration	Un fichier unique qui réside sur le serveur RadioCentral et contient tous les ensembles affectés pour la radio.	
Groupe	Voir Groupes de radios à la page 80 .	
Modifié	Affiche la couleur des indicateurs qui avertissent l'utilisateur de certains états	

Colonne	Description	Remarques
	<p>modifiés pour la radio. L'utilisateur peut faire glisser le curseur sur le terme « Modifié » dans l'en-tête de colonne pour récupérer la légende des couleurs :</p> 	
État du travail	Affiche l'état non modifiable de la radio et tout travail courant pouvant être associé à la radio.	
Nom du travail	Affiche le nom non modifiable donné au travail lors de la création du travail. La valeur n'est pas modifiable une fois qu'un travail a été créé.	
Numéro de modèle	Affiche le numéro de modèle non modifiable de la radio.	
FLASHcode	Le numéro de FLASHcode représente la liste entière des fonctions/options de système qu'une codeplug peut utiliser. Si vous passez le curseur sur un FLASHcode de la radio, le jeu de fonctions complet défini pour cette radio s'affiche. Vous pouvez également le voir dans la fenêtre Affichage Gérer des licences de radio à la page 64 .	
Configurer le mot de passe par appareil	Indique si, oui ou non, un mot de passe a été défini pour la radio. Le mot de passe est nécessaire pour modifier la configuration d'une radio.	
Vérifier le mot de passe	Affiche l'accès configuré (Lecture ou Lecture-écriture) pour les radios prenant en charge la fonction Modifier le mot de passe de la radio . Si aucun mot de passe n'est	Lecture seule

Colonne	Description	Remarques
ID OTAR	<p>attribué à la radio, ce champ affiche Aucun.</p> <p>Affiche l'ID OTAR (changement de clé par onde radio) requis pour la communications radio avec la KMF (fonction de gestion de clés).</p>	
IP fixe OTAR	<p>Affiche l'adresse IP fixe (FIP) OTA (par onde radio Air) pour l'ensemble des rangées et enregistrements de codeplug dans l’Affichage de la radio. Lorsque l'adresse IP de la radio est connue, elle peut servir pour les communications directes entre le programmeur d'appareil - POP25 / OTAP et la radio, ce qui évite d'avoir recours au mode ARS, également appelé mode FIP.</p>	
IP de l'abonné	<p>Affiche l'adresse IP de l'abonné de liaison de série 1 pour la radio-codeplug (enregistrement/rangées) dans la fenêtre Affichage de la radio. Cette adresse IP est affectée à l'appareil de l'abonné associé à l'adresse de liaison série 1.</p>	
IP du pair	<p>Affiche l'adresse IP de pair de liaison de série 1 pour la radio-codeplug (enregistrement/rangées) dans la fenêtre Affichage de la radio. Cette adresse IP est affectée à l'extrémité ordinateur mobile (MC) de la liaison série 1.</p>	
IP DUN Bluetooth de l'abonné	<p>Affiche l'adresse IP d'abonné d'accès réseau à distance (DUN) Bluetooth pour toute la radio-codeplug (enregistrement/rangées) dans la fenêtre Affichage de la radio. Cette adresse IP est affectée à l'appareil de l'abonné associé à l'adresse de liaison Bluetooth (BT).</p>	

Colonne	Description	Remarques
IP DUN Bluetooth du pair	Affiche l'adresse IP DUN de pair DUN Bluetooth pour la toute la radio-codeplug (enregistrement/rangées) dans la fenêtre Affichage de la radio. Cette adresse IP est attribuée à l'extrémité du MC (Ordinateur Mobile) de la liaison Bluetooth (BT) et est également utilisée pour adresser le MC via des données par paquets en direct.	
Nom d'utilisateur Bluetooth	Affiche un nom Bluetooth reconnaissable par l'utilisateur radio pour la radio-codeplug (enregistrement/rangées) dans la fenêtre Affichage de la radio. Ce nom identifie la radio dans un appareil Bluetooth apparié et connecté.	
Nom d'utilisateur	Permet à l'utilisateur d'entrer un nom d'utilisateur par défaut pour le Service d'inscription automatique ou l'authentification d'utilisateur pour toutes les codeplugs radio (enregistrement/rangées) dans l'Affichage de la radio. Ce nom d'utilisateur peut s'appliquer à tous les profils de données compatibles « serveur » ARS. Lorsque la case ID programmable est cochée, ce nom d'utilisateur sert également pour la répartition par système conventionnel de tous les canaux compatibles ASTRO.	
NIP de l'utilisateur	Permet à l'utilisateur de saisir un numéro d'identification personnel (NIP) de connexion au service d'enregistrement automatique par défaut ou un NIP / mot de passe d'authentification de l'utilisateur pour tous les codes radio (enregistrements / rangées) dans Affichage de la Radio Ce NIP/mot de passe peut s'appliquer à	

Colonne	Description	Remarques
	tous les profils de données compatibles « serveur » ARS (voir mode ARS). Les astérisques sont affichés lors de l'entrée du NIP.	
ID d'unité du nom d'utilisateur	Affiche un ID d'unité par défaut pour l'authentification d'utilisateur pour toutes les codeplugs de la radio (enregistrement/rangées) dans l'Affichage de la radio. Cet ID peut servir à désigner toutes les utilisations de la radio dans un véhicule ou une équipe spécifique. Cet ID peut s'appliquer à tous les profils de données compatibles « serveur » ARS.	
Données du groupe	Affiche le groupe qui est utilisé pour la session de données de groupe pour transmettre le micrologiciel (et le module linguistique en option) par liaison radio sur la passerelle de données de groupe. Cette valeur n'est pas modifiable et n'est mise à jour qu'une fois la radio a commencé à télécharger le micrologiciel.	
ASK requis	<p>Affiche le type de clé système propriétaire, l'ID système propriétaire, la protection en écriture et l'état de la Clé Système Avancée (ASK) requise pour tous les codes (enregistrements / rangées) dans Affichage de la radio.</p> <p>L'activation de cette fonction permet de s'assurer que seules les Clés avancées (matérielles) peuvent être chargées dans RC et assignées pour être utilisées dans les Systèmes à commutation automatique de canaux; les Fichiers de clés du système logiciel ne peuvent pas être assignés.</p> <p>Lorsqu'il est désactivé, les clés logicielles et les clés matérielles chargées dans le</p>	

Colonne	Description	Remarques
	RC peuvent être attribuées pour être utilisées dans le champ d'identification du système d'un système à commutation automatique de canaux. De plus, le fait de désactiver cette fonction permet à l'utilisateur de désactiver la protection contre l'écriture d'une radio.	
Type de clé système du propriétaire	Affiche le Type de clé de système du propriétaire de toutes les codeplugs (enregistrement/rangées) dans l'Affichage de la radio.	Le « Type de clé avancée du propriétaire » et l'« ID du système propriétaire » ou l'« ID de WACN du propriétaire » sont déterminés pour la radio et sa codeplug au moment de l'achat de la radio.
ID du système propriétaire (hex)	Affiche l'ID de système propriétaire de toutes les (enregistrement/rangées) dans l'Affichage de la radio.	Le « Type de clé avancée du propriétaire » et l'« ID du système propriétaire » ou l'« ID de WACN du propriétaire » sont déterminés pour la radio et sa codeplug au moment de l'achat de la radio.
Protection contre l'écriture	Affiche la protection d'écriture de toutes les codeplugs (enregistrement/rangées) dans l'Affichage de la radio. L'état « Activé » signifie que la radio est protégée contre l'écriture. L'état « Désactivée » signifie que la radio n'est actuellement pas protégée contre l'écriture.	Si l'ASK requis est désactivé, l'état de protection contre l'écriture dans la radio sera désactivé.
Firmware Version (Version du micrologiciel)	Affiche la version du micrologiciel non modifiable de la radio.	Les versions du micrologiciel déterminent généralement les fonctions qui sont disponibles sur la radio. Généralement, une nouvelle version du micrologiciel prendra en charge les fonctions nouvelles ou améliorées non prises en charge par la version précédente.
Module linguistique	Affiche tout module linguistique actuellement assigné à la radio.	

Colonne	Description	Remarques
Voice Announcements (Annonces vocales)	Affiche le nombre d'annonces vocales actuellement attribuées pour la radio.	
Version de codeplug	Affiche la version de la codeplug non modifiable de la radio.	Les versions de codeplug décrivent le format de l'information de configuration programmée sur une radio et sont généralement reliées à des versions du micrologiciel spécifiques.
Commentaires	Un paramètre modifiable permettant à l'utilisateur de saisir des notes ou des commentaires à propos d'une radio. Par exemple, l'utilisateur peut saisir un nom de client dans ce champ. Puisque les données saisies peuvent être localisées au moyen d'une recherche, l'utilisateur dispose d'une méthode rapide pour la localisation de toutes les radios attribuées à un client donné.	
Provisionné	Affiche l'état de provisionnement non modifiable de la radio.	
Heure du Dernier Contact	Affiche l'heure et la date non modifiables du dernier contact.	

5.3

Détails de la radio

Le tableau suivant définit tous les champs des colonnes qui sont pris en charge dans la fenêtre **Détails de la radio**.

Définition du concept.

Utilisation	Description	Remarques
Numéro de série	Affiche le caractère alphanumérique unique qui identifie l'appareil.	
Identifiant du produit	Affiche le type d'appareil ajouté sur le serveur RM.	
Numéro de modèle	Affiche le numéro de modèle du type d'appareil sélectionné.	
Nom du profil MCIF	Affiche le nom du profil MCIF (Mission Critical Interaction Framework) utilisé par l'appareil.	L'utilisateur doit importer manuellement la trousse MCIF. The MCIF package contains

Utilisation	Description	Remarques
		the mcifconfig.xml, interactions.csv, and manifest.xml files.
Version du profil MCIF	Affiche la version du profil MCIF (Mission Critical Interaction Framework) utilisé par l'appareil.	
Date et heure de la dernière programmation	Affiche la date des derniers travaux programmés.	
Commentaires	Un paramètre modifiable permettant à l'utilisateur de saisir des notes ou des commentaires à propos d'une radio. Par exemple, l'utilisateur peut saisir un nom de client dans ce champ. Puisque les données saisies peuvent être localisées au moyen d'une recherche, l'utilisateur dispose d'une méthode rapide pour la localisation de toutes les radios attribuées à un client donné.	
Nombre de travaux	Affiche le nombre de travaux.	

Chapitre 6

Affichage des systèmes radio

L'**Affichage des systèmes radio** affiche les ID de radio propres au système conventionnel ou ADF pour toutes les radios contenues dans la base de données du serveur RadioCentral.

L'**Affichage des systèmes radio** procure de l'information sur l'état de l'infrastructure radio. Chaque rangée de la table représente un système conventionnel ou ADF.

Les renseignements affichés dans la table peuvent être filtrés en sélectionnant **Tous**, **Radios** ou **Systèmes**.

Les renseignements de système radio ci-dessous sont affichés :

- Numéro de série
- ID de radio
- Configuration
- Radio Alias (Alias de radio)
- Type de communication
- Type de sous-système
- ID système
- Nom du système

Chapitre 7

Affichage du profil de données

L'**Affichage du profil de données** procure de l'information sur la configuration de la radio.

La stratégie de regroupement de radios définie dans l'affichage de la radio détermine les données accessibles dans cet affichage. Voir [Groupes de radios à la page 80](#). Chaque rangée dans cet **Affichage du profil de données** représente un profil de données créé par RadioCentral. Lorsque plus d'un profil de données existe pour une codeplug, plusieurs rangées représentent la même codeplug.

La sélection **Afficher par** permet à l'utilisateur de filtrer tous les profils de données par **Radios** ou **Profils de données**. La sélection **Tout** est la vue par défaut.

Les champs suivants sont pris en charge dans le tableau Affichage du profil de données :

Colonne	Description
Numéro de série	Affiche le numéro de série de la radio stockée dans le serveur RadioCentral.
Configuration	Un fichier unique qui réside sur le serveur RadioCentral et contient tous les ensembles affectés pour la radio.
Radio Alias (Alias de radio)	Affiche et permet de modifier directement le nom de la radio.
Type de communication	Affiche le mode ADF ou conventionnel.
Génère automatiquement les IP	Vrai lorsque le champ Adresse IP générée automatiquement dans Profils de données à la page 375 est activé.
IP de l'abonné	Affiche l'adresse IP de l'appareil d'abonné (SU) à la fin de la liaison série 1.
IP du pair	Permet d'afficher l'adresse IP du pair de liaison série 1 de tous les profils de données conventionnels (enregistrement/rangées) dans cet affichage de Profil de données. Cette adresse IP est attribuée à l'extrémité ordinateur mobile de la liaison série 1 et elle peut également servir à transmettre des paquets de données à l'ordinateur mobile par liaison radio.
IP DUN Bluetooth de l'abonné	Affiche l'adresse IP d'abonné d'accès réseau à distance (DUN) Bluetooth pour toute la radio-codeplug (enregistrement/rangées) dans la fenêtre Affichage de la radio. Cette adresse IP est affectée à l'appareil de l'abonné associé à l'adresse de liaison Bluetooth (BT).
IP DUN Bluetooth du pair	Affiche l'adresse IP DUN de pair DUN Bluetooth pour la toute la radio-codeplug (enregistrement/rangées) dans la fenêtre Affichage de la radio. Cette adresse IP est affectée à l'extrémité ordinateur mobile (MC) de la liaison Bluetooth (BT), et elle peut également servir à transmettre

Colonne	Description
	des paquets de données au MC par liaison radio.
Adresse IP de l'interface radio de l'abonné	Permet d'afficher l'Adresse IP de l'interface radio de l'abonné de tous les profils de données conventionnels (enregistrement/rangées) dans cet affichage de Profil de données. Cette adresse IP est nécessaire pour la communication des paquets de données par liaison radio.
Nom du profil de données	Affiche le nom de l'ensemble du Profil de données sélectionné.

Chapitre 8

Vue des travaux

La **Vue des travaux** affiche les données historiques relatives à tous les travaux traités et stockés dans le serveur RadioCentral.

L'affichage initial montre tous les travaux effectués dans le système. La sélection **Afficher par** permet à l'utilisateur de filtrer tous les travaux par **Travaux de programmation** ou par **Postes opérationnels**.

Travaux de programmation

Cette sélection affiche des travaux traités en tant que travaux d'écriture ou de lecture dans la fenêtre **Programmer le travail**.

Postes opérationnels

Cette sélection affiche les travaux consistant en des opérations effectuées dans RadioCentral, telles que l'importation et l'exportation de radios, la programmation de travaux, la sélection et la suppression de configuration et de nombreux autres travaux.

Le tableau Affichage du travail prend en charge les champs suivants :

Colonne	Description
Nom du travail	Le nom attribué à la tâche lors de sa programmation dans la fenêtre Programmer un travail .
Type	Le type de travail configuré dans la fenêtre Programmer un travail .
Heure de création	La date et l'heure de création du travail dans la fenêtre Programmer un travail .
Start Time (Heure de début)	La date et l'heure de début du travail programmées dans le champ Commencer après le , dans la fenêtre Programmer un travail .
End Time (Heure de fin)	La date et l'heure de fin du travail programmées dans le champ Terminer avant le , dans la fenêtre Programmer un travail .
Total	Affiche le nombre de radios visées par le travail programmé.
Terminé	Affiche le nombre de radios pour lequel le travail programmé a été effectué.

Sélection du nom du travail

La colonne **Nom du travail** affiche tous les travaux sous la forme de liens sélectionnables.

Le lien Nom du travail fournit les renseignements suivants :

Colonne	Description
Composant	Le nom du fichier sélectionné dans le cadre du travail.
État	Les états suivants sont pris en charge : En attente Un travail programmé n'a pas commencé, parce que la radio n'a pas été détectée par le programmeur d'appareil ou que le traitement de tâche est occupé à traiter un autre travail. En cours Le travail a commencé et est en cours.

Colonne	Description
	Annulé Le travail a été annulé par l'utilisateur.
	Terminé Le travail a réussi.
	Échec Le travail a échoué. La raison de la défaillance est décrite dans la colonne Raison de l'échec.
	Expiré La Date de fin est passée et la tâche n'a pas été effectuée ou exécutée.
Date d'exécution	La date et l'heure réelles de l'exécution du travail.
Raison	Ce champ est vierge lorsque les travaux de radio ont été achevés avec succès. Si un travail échoue, une description de la cause de l'échec s'affiche.

Chapitre 9

Tâches courantes dans RadioCentral

RadioCentral prend en charge un large éventail de tâches pouvant être effectuées par les utilisateurs et les administrateurs d'un système RadioCentral. Les tâches courantes permettent aux utilisateurs d'obtenir rapidement l'information nécessaire pour l'exécution de la tâche.

9.1

Configuration de SmartConnect

Procédure :

- 1 À partir des catégories d'ensemble, sélectionnez **Configuration de données**→**Profils de données**.
- 2 Sous **Général**, définissez le champ **Type de profil de données** sur **ADF**.
- 3 Dans l'onglet **Large bande**, faites les réglages suivants :
 - a Réglez le champ **Nom de l'hôte de la passerelle SmartConnect** selon le nom de domaine complet (FQDN)/nom d'hôte de la passerelle nuagique correct. Voir [Nom de l'hôte de la passerelle SmartConnect à la page 389](#).
 - b Réglez le **numéro de port TLS de la passerelle SmartConnect** à la valeur par défaut. Voir [Numéro de port TLS de la passerelle SmartConnect à la page 389](#).
- 4 Dans l'onglet **Large bande**, laissez le champ **Numéro de port de la passerelle SmartConnect** vide.
- 5 Sélectionnez **Configuration ADF**→**Toutes les ADF communes**.
- 6 Réglez le **seuil de redémarrage SmartConnect RSSI** à **52**.

La valeur par défaut pour [Laisser le seuil RSSI LMR à la page 501](#) et [Retour au seuil RSSI LMR à la page 510](#) peut varier d'un utilisateur à l'autre. La valeur dépend de la préférence de durée.
- 7 Sélectionnez **Configuration ADF**→**Système ADF ASTRO 25**.
- 8 Sélectionnez le système qui est utilisé avec SmartConnect, cliquez à droite et sélectionnez **Modifier**.
- 9 Dans le champ **Sélection du profil de données**, sélectionnez le nom de profil de données créé à l'étape 1.
- 10 Sélectionnez **Configuration ADF**→**Personnalité ADF ASTRO 25**.
- 11 Sélectionnez le système créé à l'étape 1, cliquez à droite et sélectionnez **Modifier**.
- 12 Réglez le champ **Fonctionnement SmartConnect** à **LMR seulement** (par défaut) ou à **LMR préféré**.
- 13 Dans le champ [Affectation du canal de zone à la page 668](#), sélectionnez une zone existante ou créez une zone pour y affecter la personnalité ADF créée à l'étape 1 ainsi que les groupes.

9.2

Configuration des radios

Procédure :

- 1 Lance le client RadioCentral et ouvre une session dans la base de données.

Les codeplugs d'usine par défaut pour toutes les radios seront mises à la disposition de l'utilisateur dans une application d'infonuagique sécurisée. Si l'utilisateur veut utiliser une codeplug APX existante, voir [Conversion des codeplugs APX à la page 97](#).

- 2 À partir de l'**affichage de la radio**, configurez les ensembles RadioCentral. Effectuez les opérations suivantes :
 - a Dans le tableau **Affichage de la radio**, sélectionnez la radio appropriée.
 - b Cliquez sur  **Modifier**.
Une fenêtre **Affichage de la configuration** apparaît.
- 3 Configurez les fonctions pour les ensembles RadioCentral.
Pour en savoir plus à ce sujet, consultez la section [RadioCentral version 2.22.135](#).
- 4 Pour enregistrer la configuration, sélectionnez l'icône **Affichage de la radio**.
- 5 Dans la boîte de dialogue **Quitter la configuration**, cliquez sur **Enregistrer cette configuration** et sur **OK** pour enregistrer la configuration.
Si l'utilisateur choisit de ne pas enregistrer les modifications actuelles, cliquez sur **Annuler les modifications à cette configuration** et sur **OK**.
- 6 Dans la boîte de dialogue **Enregistrer en tant que nouvelle configuration**, entrez le nom de la configuration dans le champ **Nom**.
- 7 Si l'utilisateur souhaite supprimer la configuration précédente, sélectionnez la case à cocher **Supprimer la configuration précédente si aucune radio ne l'utilise** et cliquez sur **OK**.
Cette configuration est utilisée par défaut.
- 8 Si l'utilisateur souhaite conserver la configuration précédente, désélectionnez la case à cocher **Supprimer la configuration précédente si aucune radio ne l'utilise** et cliquez sur **OK**.
Si la configuration a été appliquée à des radios, les radios visées s'affichent sous la section **Numéro de série**.
- 9 Programmez un travail d'écriture sur l'appareil pour que la configuration prenne effet.
Voir [Programmation de travaux dans RadioCentral à la page 98](#).

9.3

Conversion des codeplugs APX

Procédure :

- 1 À partir du menu **Actions**, sélectionnez **Migration de la codeplug**.
- 2 Dans la boîte de dialogue **Migration de la codeplug**, cliquez sur **Parcourir** et sélectionnez le fichier `.mc` approprié.
- 3 Sélectionnez la radio cible dans la section **Sélectionner l'appareil cible** et cliquez sur **OK**.
Le processus de conversion commence. Pour surveiller la progression de la conversion, allez à **Vue des travaux** → **Travaux opérationnels**. Les colonnes **État** passent de **En cours** à **Fait**.

9.4

Programmation de travaux dans RadioCentral

La programmation de travaux est effectuée dans la fenêtre **Programmer le travail** de l'**affichage de la radio**. Les travaux peuvent être programmés pour une exécution immédiate ou à un moment prédéfini.

MISE EN GARDE :

Lors de la mise à niveau du micrologiciel de la radio et de la modification de la configuration au moyen de la méthode de connexion **sans fil (LAN)**, il est fortement recommandé d'effectuer deux tâches d'écriture séparées. L'exécution des deux tâches en un travail d'écriture unique peut entraîner une double réinitialisation de la radio.

Pour commencer, mettez à niveau le micrologiciel de la radio en programmant un travail d'écriture. Lorsque le travail d'écriture de mise à niveau du micrologiciel est terminé, enregistrez la nouvelle fonction, configurez les paramètres de la radio pour la nouvelle fonction, puis programmez un second travail d'écriture.

Procédure :

- 1 À partir de l'**affichage de la radio**, sélectionnez la ou les radios désirées.
- 2 Sélectionnez le menu **Programmeur**.

REMARQUE :

La fenêtre **Programmer le travail** peut aussi être ouverte en cliquant avec le bouton droit sur les radios sélectionnées et en sélectionnant **Programmer le travail** dans le menu-éclair ou en sélectionnant le raccourci **Programmer le travail** au-dessus du champ de recherche.

- 3 À partir de la section **Type de travail**, effectuez une des actions suivantes :
 - Sélectionnez **Écriture** pour programmer un travail d'écriture pour une ou plusieurs radios.
 - 1 Sélectionnez **Forcer la mise à jour immédiate** si nécessaire (une seule radio configurée est sélectionnée pour la programmation).
 - 2 Passez en revue l'avertissement de mise à jour immédiate et confirmez si vous souhaitez continuer.
 - Sélectionnez **Lecture** pour programmer un travail de lecture.
 - Sélectionnez **Réinitialisation aux paramètres par défaut** pour restaurer les paramètres d'origine de la radio.
- 4 Dans le champ **Nom du travail**, entrez un nom approprié pour le travail.
- 5 Dans le champ **Fuseau horaire**, sélectionnez le fuseau horaire approprié dans la liste déroulante.
- 6 **Facultatif** : Dans les champs **Commencer après le**, sélectionnez la date de début (en jour-mois-année) et l'heure de début (dans un format 24 heures).

REMARQUE :

Quand l'utilisateur clique dans le champ de date, une flèche déroulante s'affiche et permet à l'utilisateur de sélectionner une date dans un calendrier. L'heure peut être entrée manuellement ou sélectionnée, par incréments d'une minute, au moyen des touches fléchées vers le haut et le bas.

- 7 Dans les champs **Terminer après le**, sélectionnez la date de fin (en jour-mois-année) et l'heure de fin (dans un format 24 heures).
- 8 Cliquez sur **OK**.

Chapitre 10

Ensembles RadioCentral pour la radio

RadioCentral facilite l'établissement d'une configuration de programmation de radio extrêmement efficace. RadioCentral permet de gérer et programmer plusieurs radios à la fois. Les codeplug de radio sont stockées sur un serveur de base de données central permettant la configuration à distance des données et la programmation à distance des radios. Une seule codeplug peut être utilisée en tant que configuration, qu'il est ensuite possible de partager sur plusieurs radios. Les modifications de configuration peuvent alors être appliquées facilement à toutes les radios concernées. Les modifications à apporter à la configuration ou aux paramètres d'une radio individuelle peuvent être programmées en tant que travail de programmation. Les travaux de programmation peuvent être planifiés par connexion LTE.

10.1

Information radio

Cette section vous permet d'afficher l'information d'identité de la radio utilisée lors de la programmation ou du dépannage d'une radio.

REMARQUE :

L'information radio est visible seulement lors de la modification de la configuration d'une radio.

10.1.1

Général

Cette section affiche en lecture seule le modèle, le numéro de série et la version de la radio connectée.

10.1.1.1

Numéro de modèle

L'application récupère et affiche le numéro de modèle de la radio connectée en lecture seule.

Le numéro de modèle désigne le type de radio. Cette information est stockée dans la codeplug de la radio.

10.1.1.2

Nombre maximum de canaux

L'application récupère et affiche le nombre maximal de canaux de communication conventionnels et ADF en lecture seule possible pour la radio actuellement connectée.

Ce nombre maximal s'applique lors de la définition de zones et de canaux dans la fenêtre Affectation du canal de zone.

IMPORTANT :

le nombre maximum de canaux dépend du modèle de la radio et peut être modifié uniquement par l'intermédiaire d'une mise à niveau du FLASHport.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.1.1.3

Numéro de série

L'application récupère et affiche en lecture seule le numéro de série du ou des dispositifs de clé contenant les clés avancées (matériel) utilisées pour les activités de programmation antérieures ayant nécessité une clé avancée

Un seul numéro de série de dispositif de clé est stocké par activité. Le numéro de série stocké est celui du dispositif de clé contenant l'ID du système propriétaire ou celui de la clé avancée d'ID de WACN du propriétaire. La codeplug peut stocker jusqu'à 25 des derniers numéros de série de dispositif de clé.

**REMARQUE :**

Les activités de programmation nécessitant une clé avancée comprennent : protection d'une radio contre l'écriture, l'écriture sur une radio protégée contre l'écriture, et l'activation ou la désactivation du champ ASK requis pour une radio.

Dès lors qu'une activité nécessitant une clé avancée est effectuée sur la radio, le numéro de série du nouveau dispositif de clé est ajouté dans l'historique de programmation de la radio et s'affiche lors de la lecture de la codeplug de la radio dès que l'exécution de l'activité d'écriture ou de clonage est achevée.

10.1.1.4

Activer VHF

Ce champ indique si la bande VHF est activée sur la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.1.1.5

Activer le protocole UHF1

Ce champ indique si la bande UHF1 est activée sur la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.1.1.6

Activer le protocole UHF2

Ce champ indique si la bande UHF2 est activée sur la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.1.1.7

Activer 700 MHz

Ce champ indique si la bande de fréquences 700 MHz est activée sur la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.1.1.8

Activer 800 MHz

Ce champ indique si la bande de fréquences 800 MHz est activée sur la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.1.1.9

Gouvernance régionale

L'application récupère et affiche en lecture seule l'état de conformité de la radio à la réglementation et aux normes.

La radio peut être régie par les règlements et normes de la Federal Communications Commission (FCC)/Telecommunications Industry Association (TIA), la Radio and Telecommunications Terminal Equipment Directive (R&TTE)/Institut européen des normes de télécommunication (ETSI) ou de l'Australian Communications and Media Authority (ACMA).

**REMARQUE :**

Lorsque ce champ est réglé à **ACMA**, la radio/codeplug prend en charge la fonction étendue « Compatible avec la bande UHF R1 étendue » et que le champ utilisé dans la codeplug est réglé à **Activé en permanence**. Dans ce cas, la valeur de fin de la plage UHF 1 s'étend jusqu'à 472 MHz.

10.1.1.10

Version de codeplug

L'application récupère et affiche le numéro de la version de la codeplug actuellement utilisée par la radio connectée en mode lecture seule.

Cette information est stockée dans la Codeplug interne de la radio.

10.1.1.11

Firmware Version (Version du micrologiciel)

L'application récupère et affiche la version du micrologiciel en lecture seule de la radio actuellement connectée.

Le micrologiciel est un logiciel qui gère les composantes matérielles internes de la radio. Le micrologiciel peut être modifié uniquement par l'intermédiaire d'une mise à niveau du FLASHport.

Lorsque l'application lit cette information dans un fichier de codeplug (et non à partir d'une radio), ce champ affiche la valeur **Inconnu**.

10.1.1.12

Version sécurisée

L'application récupère et affiche le numéro de version du matériel sécurisé actuellement utilisé par la radio connectée en mode lecture seule.

10.1.1.13

Type de matériel sécurisé

L'application récupère et affiche le numéro de version du matériel sécurisé actuellement utilisé par la radio connectée en mode lecture seule.

10.1.1.14

Version matérielle sécurisée

L'application récupère et affiche le numéro de version du matériel sécurisé actuellement utilisé par la radio connectée en mode lecture seule.

10.1.1.15

Adresse MAC

L'application récupère et affiche l'adresse MAC (Media Access Control) Ethernet unique à 6 octets. Cette information est en lecture seule.

Cette information est stockée dans le codeplug de la radio, qui identifie la radio mobile sur le réseau.

**REMARQUE :**

Si le champ de l'adresse MAC Ethernet n'est pas affecté, l'adresse MAC Wi-Fi est appliquée. La connexion Ethernet et la connexion Wi-Fi ne peuvent pas être utilisées simultanément sur le même réseau.

S'applique uniquement : lorsque la radio est une radio mobile.

10.1.2

Suivi

Cette section affiche l'information horodatée et la version de la codeplug utiles pour la programmation et le dépannage de la configuration de la radio.

10.1.2.1

Date et heure de la dernière programmation

L'application récupère et vous permet d'afficher la date et l'heure de la dernière programmation (au format jour-mois-année) de la radio connectée.

Ces données sont parfois utilisées pour préparer le processus de clonage. Cette information est stockée dans la codeplug de la radio.

10.1.2.2

Source de la dernière programmation

L'application récupère et affiche l'information relative à la source de la dernière programmation de la radio connectée.

Cette information est stockée dans la codeplug de la radio.

La source suivante s'affiche :

CPS

Programmation par un CPS standard.

Usine

Programmation en usine.

Lab

Programmation à l'aide d'une version de développement spécial.

Clé FTR

Programmation à l'aide d'une clé de système FTR.

10.1.2.3

Date et heure de la programmation d'origine

L'application récupère et vous permet d'afficher la date et l'heure (au format jour-mois-année) de la programmation d'origine de la radio connectée.

Ces données sont parfois utilisées pour préparer le processus de clonage. Cette information est stockée dans la codeplug de la radio.

10.1.2.4

Programmation d'origine de la codeplug

L'application extrait et affiche le numéro de version de la codeplug courante en lecture seule de la radio connectée.

Cette information est stockée dans la codeplug interne de la radio.

10.1.2.5

Source de la programmation d'origine

L'application récupère et vous permet d'afficher la source originale utilisée pour programmer la radio actuellement connectée.

Cette information est stockée dans la codeplug de la radio.

La source suivante s'affiche :

CPS

Programmation par un CPS standard.

Usine

Programmation en usine.

Lab

Programmation à l'aide d'une version de développement spécial.

Clé FTR

Programmation à l'aide d'une clé de système FTR.

Hébergé

Programmé en utilisant le logiciel Hosted Depot.

10.1.3

FLASHport

Cette section affiche de l'information en lecture seule sur le plus récent processus de mise à niveau du FLASHport.

Le processus FLASHport (aussi désigné par le terme « FLASHing ») permet au programmeur de mettre à niveau la trousse du système, les options du système, le micrologiciel et la capacité de chiffrement sécuritaire de la radio connectée.

10.1.3.1

FLASHcode

L'application récupère et affiche le numéro en lecture seule qui identifie le jeu de fonctions du FLASHcode acheté dans la radio actuellement connectée.

Cette information est stockée dans la codeplug de la radio.

IMPORTANT :

Certaines des fonctions ou des options achetables pour les modèles de radios Motorola Solutions APX™ d'entrée ou de milieu de gamme sont comprises dans les modèles haut de gamme. Seules les fonctions achetées s'affichent dans le FLASHcode.

10.1.3.2

Nombre de mises à niveau

L'application récupère et affiche le nombre total de mises à niveau de la radio connectée en mode lecture seule.

Cette information est stockée dans la codeplug de la radio.

10.1.3.3

iButton

L'application récupère et affiche le numéro de série en lecture seule du dispositif de clé - FLASHkey ou de la clé de dépôt qui a été activée la dernière dans la radio actuellement connectée.

Cette information est stockée dans la codeplug de la radio uniquement après la mise à niveau de la radio. Avant de mise à niveau, ce numéro de série contient que des zéros.

10.1.3.4

Source de la dernière mise à niveau

L'application récupère et affiche la plus récente source de la mise à niveau en mode lecture seule pour la radio actuellement connectée.

Cette information est stockée dans la codeplug de la radio.

10.1.3.5

Date et heure de la dernière mise à niveau

L'application récupère et affiche en lecture seule la date et heure (en format jour-mois-année) de la mise à niveau la plus récente de la radio actuellement connectée (également appelé FLASHing).

Cette information est stockée dans la codeplug de la radio.

10.1.4

Information sur la clé de système avancé

Cette section affiche en lecture seule l'historique de programmation de la radio pour les opérations nécessitant une clé avancée.

Les données de l'historique de programmation comprennent : la date de la programmation et le numéro de série du dispositif de clé (de la clé avancée) qui a permis d'effectuer l'activité. Un maximum de 25 dates de programmation est contenu dans l'historique.

IMPORTANT :

Les activités de programmation nécessitant une clé avancée comprennent : protection d'une radio contre l'écriture, l'écriture sur une radio protégée contre l'écriture, et l'activation ou la désactivation du champ ASK requis pour une radio.

Les activités de programmation qui ne nécessitent pas l'utilisation d'une clé avancée ne donnent lieu à aucun enregistrement de données.

Cette fonction est utile pour consulter l'historique de programmation d'une radio ayant été volée puis récupérée. Toutefois, ceci n'est vrai que dans la mesure où les informations concernant le numéro de série et la clé avancée du dispositif de clé utilisé pour programmer la radio ont été préalablement enregistrées à des fins de suivi.

10.1.4.1

Date et heure de la dernière programmation

L'application affiche les heures et les dates de programmation en lecture seule (en format jour-mois-année) de la codeplug courante pour les opérations nécessitant une clé avancée.

La codeplug peut stocker jusqu'à 25 entrées concernant les dates et heures des dernières programmations.

IMPORTANT :

- Les activités de programmation nécessitant une clé avancée comprennent : protection d'une radio contre l'écriture, l'écriture sur une radio protégée contre l'écriture, et l'activation ou la désactivation du champ ASK requis pour une radio.
- Dès lors qu'une activité nécessitant une clé avancée est effectuée sur la radio, les nouvelles données concernant la date et l'heure de cette activité sont ajoutées dans l'historique de programmation de la radio et peuvent être consultées en lisant la codeplug, une fois que l'activité d'écriture ou de clonage est terminée.

10.1.4.2

Numéro de série

L'application récupère et affiche en lecture seule le numéro de série du ou des dispositifs de clé contenant les clés avancées (matériel) utilisées pour les activités de programmation antérieures ayant nécessité une clé avancée

Un seul numéro de série de dispositif de clé est stocké par activité; il s'agit de celui du dispositif de clé contenant la clé avancée de l'ID du système propriétaire ou de l'ID de WACN du propriétaire.

La Codeplug peut stocker jusqu'à 25 des derniers numéros de série de dispositif de clé.

IMPORTANT :

- Les activités de programmation nécessitant une clé avancée comprennent : protection d'une radio contre l'écriture, l'écriture sur une radio protégée contre l'écriture, et l'activation ou la désactivation du champ ASK requis pour une radio.
- Dès lors qu'une activité nécessitant une clé avancée est effectuée sur la radio, le numéro de série du nouveau dispositif de clé est ajouté dans l'historique de programmation de la radio et s'affiche lors de la lecture de la codeplug de la radio dès que l'exécution de l'activité d'écriture ou de clonage est achevée.

10.1.5

Labtool

Cette section affiche des renseignements en lecture seule pour les fonctions achetées.

10.1.5.1

Option-H ATAK

Ce champ indique si la fonction ATAK est achetée.

10.1.5.2

QA08887 – Activation du matériel LTE

Ce champ indique si la fonction matérielle Long Term Evolution (LTE) est achetée.

10.1.5.3

QA08676 – Volume adaptatif du haut-parleur

Ce champ indique si la fonction Volume adaptatif du haut-parleur est achetée.

L'option-H disponible est QA08676 pour la fonction Volume adaptatif du haut-parleur.

10.1.5.4

QA09006 – Suppression du bruit adaptative

Ce champ indique si la fonction Suppression du bruit adaptative est achetée.

10.2

Toute la radio

Cette section vous permet d'afficher ou de définir les fonctions de toute la radio qui s'appliquent à la fois aux modes de communication conventionnel et ADF.

Les fonctions ne s'appliquent pas toutes aux deux modes de communication.

10.2.1

Nom de l'ensemble

Le champ **Nom de l'ensemble** permet à l'utilisateur d'entrer un nom pour identifier de façon unique l'ensemble dans une liste d'ensembles similaires. Un message d'erreur s'affiche lorsque vous tentez d'enregistrer un nom d'ensemble déjà spécifié par l'utilisateur.

10.2.2

Dernière date de modification

Ce champ en lecture seule affiche la date et l'heure du dernier enregistrement de l'ensemble.

10.2.3

Commentaires

Ce champ vous permet d'entrer un commentaire pour l'ensemble qui est actuellement configuré. Le commentaire apparaît dans la liste initiale des ensembles pour une Catégorie d'ensembles donnée.

10.2.4

Général

Cette section permet d'afficher ou de définir les fonctions de base de toute la radio.

10.2.4.1

Alias de codeplug

Ce champ permet de définir des noms reconnaissables pour la codeplug.

De plus, le numéro de série de la radio s'affiche dans le haut de l'arborescence.

L'alias reste associé à sa codeplug même lorsque cette dernière est clonée vers une autre radio.

REMARQUE :

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux. Pour les caractères Unicode non identifiés, comme les émoticônes, l'écran de la radio affiche des « carrés » pour ces caractères.

31 caractères au total sont possibles.

10.2.4.2

Activer la journalisation des appels de répartition

Lorsque ce champ est activé, les identifications reçues lors de la répartition ou du balayage sont consignées dans la liste des appels récents. Lorsque cette fonction est désactivée, seules les identifications reçues dans le cadre d'un appel privé ou d'une alerte d'appel sont consignées.

Cette fonction s'applique à toute la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.2.4.3

Filtre ultraprécis pour fréquences moyennes

Ce champ permet de sélectionner la valeur de bande passante appropriée associée au filtre ultraprécis pour fréquences moyennes à utiliser pour toute la radio.

Les sélections suivantes sont prises en charge :

7,8 kHz

Convient pour les radios utilisant des canaux à bande passante étroite dans des environnements où l'interférence de canaux adjacents ne pose pas de problème majeur.

5,76 kHz

Pour un niveau supérieur de protection contre l'interférence de canaux adjacents dans le cas des radios qui utilisent des canaux à bande passante étroite.

10.2.4.4**Région de réglementation du Wi-Fi**

Ce champ indique la région de réglementation du Wi-Fi utilisée par le contrôleur Wi-Fi de la radio.

Les canaux suivants seront utilisés dans le spectre 2 Ghz :

- FCC (Federal Communications Commission) = Canaux 1 à 11
- Institut européen des normes de télécommunications (ETSI) = Canaux 1 à 13

10.2.4.5**Chemin de connexion**

Ce champ indique que la radio peut être programmée par RadioCentral et CPS, ou CPS seulement.

**REMARQUE :**

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

10.2.5**Alert Tones (Tonalités d'alerte)**

Cette section permet d'afficher ou de définir la fonctionnalité de tonalité d'alerte applicable à toute la radio.

10.2.5.1**Alert Tones (Tonalités d'alerte)**

Ce champ permet d'activer les capacités de tonalité d'alerte de la radio.

Cette fonction s'applique à toute la radio.

10.2.5.2**Compensation de la tonalité de réglage du volume**

Ce champ permet l'échantillonnage du niveau de volume des tonalités d'alerte de la radio.

Lorsque cette case est cochée, la touche Réglage du volume de la tonalité vous permet d'effectuer l'échantillonnage du niveau de volume des tonalités d'alerte de la radio. Le volume de tonalité d'alerte peut différer du volume actuellement sélectionné pour les transmissions entrantes de la radio, selon le réglage du champ Compensation du volume (dB). Ainsi, la fonction Réglage du volume de la tonalité, attribuée à un bouton, produit une tonalité au niveau sonore actuellement sélectionné pour les transmissions entrantes, plus ou moins la valeur du champ Compensation du volume de la tonalité d'alerte.

**REMARQUE :**

Le volume de la tonalité est réglé selon la valeur du champ Compensation du volume de la tonalité d'alerte (dB) seulement si ce volume n'est pas inférieur à la valeur définie dans le champ Volume minimal.

Lorsque cette fonction est désactivée, la fonction Réglage du volume de la tonalité associée à un bouton vous permet d'entendre le volume sonore actuellement sélectionné pour les transmissions entrantes qui désactivent la sourdine du haut-parleur de la radio.

Accès seulement : Lorsque le champ [Alert Tones \(Tonalités d'alerte\) à la page 107](#) est réglé à **Activé**.

10.2.5.3

Tonalité d'alerte de test automatique à la mise sous tension

Ce champ permet l'émission de la tonalité d'alerte de test automatique de la radio lorsque le test automatique est terminé et que la radio est prête à transmettre et à recevoir.

Cette fonction s'applique à toute la radio.

Accès seulement : Lorsque le champ [Alert Tones \(Tonalités d'alerte\) à la page 107](#) est réglé à **Activé** et que le modèle ou l'option de la radio le permet.

10.2.5.4

Activer la tonalité d'alerte de balayage

Ce champ provoque l'émission d'une tonalité d'alerte par la radio chaque fois qu'on active ou désactive le mode de balayage en utilisant la touche Balayage ou le commutateur Balayage.

Cette tonalité d'alerte n'est pas applicable pour une sélection de menu Balayage. Cette fonction s'applique à toute la radio.

Accès seulement : Lorsque le champ [Alert Tones \(Tonalités d'alerte\) à la page 107](#) est réglé à **Activé**.

10.2.5.5

Réinitialisation automatique de la tonalité d'avertissement d'appel

Ce champ fait en sorte que la radio génère une seule séquence de la tonalité d'alerte d'appel.

La tonalité d'alerte d'appel est habituellement un son répété. Cette fonction s'applique à toute la radio.

10.2.5.6

Fonctionnement amélioré des tonalités en sourdine

Ce champ permet de sélectionner les types de tonalités d'alerte, comme les tonalités du clavier, que vous pouvez désactiver (sourdine).

Vous pouvez accéder à la fonction Muet en utilisant le commutateur Muet ou la sélection de menu Muet. Cette fonction s'applique à toute la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Désactivé;

La fonction Muet est désactivée.

Tonalités du clavier

La fonction Muet ne s'applique qu'au clavier et à d'autres tonalités ne transmettant pas de signal.

Tonalités VA

La fonction Muet s'applique uniquement aux annonces vocales.

Toutes les tonalités

La fonction Muet s'applique à toutes les tonalités, qu'elles transmettent ou non des signaux, y compris les tonalités du clavier, des annonces vocales, d'autorisation de parler et d'autres tonalités.

10.2.5.7

Tonalité Hors de portée

Cette touche permet de sélectionner la tonalité d'alerte qui retentit, immédiatement en appuyant sur la touche PTT dès que la radio est à l'extérieur de la zone de couverture du système ADF et ne peut pas se synchroniser sur un canal de contrôle.

La tonalité d'alerte continue de sonner tant que le bouton PTT est gardé enfoncé. Voir aussi Indicateur de zone hors de portée. Cette fonction s'applique à toute la radio pour les communications ADF et P25 conventionnelles activées par le DVRS.

IMPORTANT :

Vous pouvez éviter la confusion en sélectionnant une tonalité convenable différente de la tonalité d'interdiction de parler.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Tonalité hors de portée 1

Le bouton rotatif de la radio n'est associé à aucune tonalité d'alerte.

Tonalité hors de portée 2

Tonalité d'alerte 800 Hz répétée.

10.2.5.8

Tonalité d'interdiction de parler

Ce champ permet de sélectionner la tonalité d'alerte qui retentit chaque fois que les transmissions radio ne sont pas autorisées, soit immédiatement lorsque l'on appuie sur le bouton PTT, soit lorsque la présélection Minuterie de délai d'attente est expirée et que la radio met fin à la transmission en cours.

La tonalité d'alerte continue de sonner tant que le bouton PTT est gardé enfoncé. Cette fonction s'applique à toute la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

IMPORTANT :

Vous pouvez éviter la confusion en sélectionnant une tonalité convenable différente de la tonalité hors de portée.

Les sélections suivantes sont prises en charge :

Tonalité TIP 1

Ancienne tonalité d'alerte 300 Hz continue.

Tonalité TIP 2

Tonalité d'alerte 600 Hz répétée.

10.2.5.9

DEL de batterie faible

Ce champ permet à la radio de vous informer visuellement que la batterie est faible.

Quand la batterie est faible et seulement pendant une transmission en cours, le voyant DEL de transmission clignote en rouge. Cette fonction s'applique à toute la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.2.5.10

Alerte Tx

Ce champ permet à la radio d'émettre un bip dès que la touche PTT est relâchée, et cela, uniquement si l'état de batterie faible a été détecté durant l'émission.

Voir aussi [Alerte veille \(s\) à la page 110](#).

IMPORTANT :

Pour les radios mobiles, voir la sélection « Alerte de batterie faible » pour l'entrée VIP DEK ou l'entrée VIP radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.2.5.11

Alerte veille (s)

Ce champ permet de sélectionner la fréquence utilisée par la radio pour émettre l'alerte de veille de batterie faible (une courte, tonalité aiguë).

Vos entrées directes valides sont également autorisées.

IMPORTANT :

Pour les radios mobiles, voir la sélection **Alerte de batterie faible**, de l'entrée DEK VIP ou de l'entrée VIP radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 23 : Portée

Minimum	Maximum	Incréments
0 seconde	930 seconde	30 secondes

10.2.5.12

Alerte de batterie faible intelligente

Ce champ permet de sélectionner le niveau de charge de la batterie pour lequel une alerte doit être émise.

Cette fonction s'applique à toute la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Standard

10% de charge de la batterie restante

Premier avertissement

15% de charge de la batterie restante

10.2.5.13

Tonalité d'avertissement PTT

Ce champ permet de sélectionner le type de tonalité d'alerte émise lorsque les conditions suivantes sont remplies :

- La Minuterie d'avertissement Push-to-Talk (PTT) vient à échéance.
- La touche PTT est enfoncée pendant que la radio effectue la séquence de données de signal entrant (ISD) ou que la Minuterie de réponse en attente est active.

La tonalité d'alerte commence à retentir à tout moment après que les conditions sont remplies. La tonalité d'alerte s'arrête lorsque l'une des situations suivantes se produit :

- Vous relâchez la touche PTT lorsque la Minuterie d'avertissement PTT vient à échéance.
- La radio reçoit l'autorisation appropriée.
- La radio est occupée lorsque la Minuterie d'avertissement PTT vient à échéance.

Les sélections suivantes sont prises en charge :

Tonalité d'avertissement PTT 1

La radio émet la tonalité d'interdiction de parler héritée.

Tonalité d'avertissement PTT 2

La radio émet une tonalité d'alerte répétitive de 500 Hz avec un temps de pause de 100 ms (marche) et 700 ms (arrêt).

10.2.5.14

Réglage du volume des tonalités RSM

Ce champ vous permet de sélectionner la tonalité d'alerte lorsque vous appuyez sur le bouton ou la bascule de réglage du volume du haut-parleur/microphone à distance (RSM) d'une radio portative.

Cette fonction s'applique à toute la radio.

Tableau 24 : Sélection des types de tonalités

Types de sélection de tonalité	Description
Réglage du volume - Tonalité 1	Prend en charge la tonalité d'alerte de retour de 911 Hz. Comportement hérité.
Réglage du volume - Tonalité 2	Prend en charge la tonalité d'alerte de retour de 410 Hz. Identique à la tonalité de réglage du volume mobile.

REMARQUE :

Vous pouvez sélectionner Réglage du volume - Tonalité 2 pour obtenir une différenciation de la tonalité auxiliaire PTT-ID du MDC. Certains RSM ne sont pas affectés par ce champ et émettent toujours le Réglage du volume - Tonalité 2.

10.2.6

Renseignements sur l'utilisateur et mots de passe

Cette section vous permet d'afficher ou de définir les fonctionnalités à **Renseignements sur l'utilisateur**, **Protection de zone**, **Verrouillage de la radio**, **Inhibition tactique** et **Mot de passe requis**.

10.2.6.1

Activer l'alias radio

Ce champ active le champ Alias radio.

Cette fonction s'applique à toute la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.2.6.2

Lecture et écriture des mots de passe,

Permet à l'utilisateur d'entrer un mot de passe de codeplug pour ainsi accorder l'accès aux permissions de la codeplug actuelle protégée par mot de passe.

Les permissions protégées peuvent comprendre une ou les trois fonctions suivantes :

- lecture à partir de la radio
- écriture dans la radio
- lecture d'un fichier de codeplug

Cette fonction s'applique à toute la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.2.6.3

Activer le mot de passe d'écriture radio

Lorsque cette fonction est activée, l'utilisateur doit entrer le mot de passe de lecture/écriture configuré pour la radio avant de pouvoir écrire des données sur la radio.

Cette fonction s'applique à toute la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.2.6.4

Activer le mot de passe de lecture radio

Lorsque cette fonction est activée, l'utilisateur doit entrer le mot de passe lecture/écriture configuré pour la radio avant de pouvoir lire des données de la radio.

Cette fonction s'applique à toute la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.2.6.5

Activer le mot de passe de lecture d'archive

Lorsque cette fonction est activée, le mot de passe de lecture/écriture de la radio peut être archivé.

Cette fonction s'applique à toute la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.2.7

Fonctions

Cette section permet d'afficher ou de définir les fonctions de base de toute la radio.

10.2.7.1

En attente de bloc CA/PC

Ce champ vous permet de bloquer des appels dans le cas d'un avis d'appel ou appel privé.

Les premières données d'avis d'appel ou d'appel privé reçues par la radio laissée sans surveillance sont sauvegardées. Les données suivantes sont ignorées à moins que leur source ne soit identique à celle des premières données. Cette fonction s'applique à toute la radio.

Lorsque cette fonction est désactivée, ce sont les dernières données d'avis d'appel ou d'appel privé reçues qui sont stockées. Ainsi, les données d'appel préalablement stockées dans la mémoire de la radio sont remplacées.

10.2.7.2

Interrupteur rotatif (Programme de balayage)

Ce champ permet de sélectionner l'élément de mode (**Zones** ou **Canaux**) sélectionné par le commutateur rotatif de la radio ou du haut-parleur/microphone distant (DRSM) en option quand la radio est utilisée en mode de programmation ou de modification de la liste de balayage.

Vous pouvez accéder au mode de programmation ou de modification de la liste de balayage à l'aide d'une longue pression sur la touche Balayage, du commutateur de programmation de la liste de balayage ou de la sélection de menu Liste de balayage. Cette fonction s'applique à toute la radio.

**IMPORTANT :**

Pour les radios dotées d'un bouton multifonction (MFK), cette fonction s'applique uniquement au sélecteur rotatif de l'accessoire DRSM en option.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

- Canal
- Zone

10.2.7.3

Désactiver le branchement à chaud

Ce champ permet de désactiver toute la tension de polarisation des broches GCAI si aucun accessoire GCAI n'est branché à la radio dans la minute suivant la mise sous tension.

**IMPORTANT :**

si cette option est activée et que l'adaptateur véhiculaire APX n'est pas connecté à la radio après la mise sous tension, la fonctionnalité GCAI est désactivée. La radio ne pourra pas détecter la présence d'un adaptateur véhiculaire APX.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.2.7.4

Attribution cyclique des clés

Ce champ permet une accélération ou une décélération de la puissance d'émission afin de satisfaire aux exigences des normes ETS-300 et du FTZ relatives à l'attribution cyclique des clés.

Cette sélection s'applique à toute la radio.

**REMARQUE :**

L'attribution cyclique des clés ne doit être activée que pour les radios utilisées en Europe.

10.2.7.5

Minuterie d'absence de voix

Ce champ permet de sélectionner la période pendant laquelle, durant les transmissions radio, le processeur de signal numérique (DSP) attend avant de détecter l'absence de voix du microphone avant de déclarer un événement Aucune voix.

Ce délai peut ensuite servir à déclencher la fonction Fin de Tx en l'absence de voix. Cette sélection s'applique à toute la radio pour tous les canaux de communication conventionnels et ADF.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 25 : Portée

Minimum	Maximum	Incréments
5 secondes (valeur par défaut)	60 secondes	1 seconde

10.2.7.6

Routage RF externe

Ce champ sert à déterminer la bande RF qui sera transférée à l'antenne externe lorsque la radio est connectée à l'adaptateur véhiculaire (VA) ou au microphone pour sécurité publique (PSM) avec l'antenne.

Cette sélection s'applique aux radios portatives qui prennent en charge plusieurs bandes. Cette fonction est uniquement modifiable pour plusieurs bandes et non modifiables pour une bande simple.

Les sélections suivantes sont prises en charge :

7/800

Valide uniquement si la bande 700/800 MHz est achetée.

UHF

Valide uniquement si la bande UHF1 ou UHF2 est achetée.

VHF

Valide uniquement si la bande VHF est achetée. Le signal VHF sera acheminé à l'extérieur uniquement lorsqu'un adaptateur de véhicule est attaché.

TOUTES LES BANDES

Achemine toutes les bandes achetées en externe. Uniquement valide pour les radios multibandes qui prennent en charge l'adaptateur véhiculaire.

10.2.7.7

Type de certification radio

Cette fonction vous permet de configurer le type de certification radio.

Le type de certification radio est réglé à Aucun par défaut. Si une batterie incorrecte est connectée, l'alerte de batterie incorrecte est déclenchée.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Aucun

La radio prend en charge tout type de batterie.

UL Div 2

La radio prend en charge uniquement une batterie homologuée ULDiv 2.

10.2.7.8

ViQi : Priorité des annonces vocales

Les sélections suivantes sont prises en charge :

Faible

L'audio LMR a priorité. L'audio de réception LMR annule ou bloque la commande vocale lorsque la radio est en cours de réception.

Élevé

La commande vocale a priorité. Lorsque le bouton de commande vocale est maintenu enfoncé (commande vocale activée), l'audio de réception LMR est mis en sourdine.

Désactivé;

La fonction de commande vocale est désactivée.

10.2.7.9

Mise hors tension en mode veille (heures)

Cette fonction permet d'éteindre le modem de radio mobile terrestre (LMR) pendant que le processeur d'applications est en mode faible puissance pour permettre une mise sous tension plus rapide de l'appareil. Cette fonction vous permet également de régler l'heure de mise hors tension en mode veille.

Tableau 26 : Portée

Minimum	Maximum	Incréments
1 (heure)	8 (heures)	1 (heure)

**REMARQUE :**

Si la radio demeure dans ce mode pendant la durée sélectionnée, elle se met hors tension automatiquement. Si la valeur est réglée à 0, la radio est mise hors tension immédiatement. Avec une valeur autre que 0, la radio reste en mode de faible puissance pour la durée sélectionnée. Si le bouton de la radio est actionné pendant qu'elle est en veille, la radio redevient entièrement fonctionnelle en quelques secondes.

La radio nécessite un démarrage à froid dans les scénarios de mise hors tension suivants :

- La batterie est déconnectée.
- La batterie est à plat.
- La fonction de mise hors tension en mode veille est désactivée dans le codeplug.
- La radio a été en mode veille plus longtemps que la plage configurée pour la fonction de mise hors tension en mode veille.

10.2.7.10

ViQi : Mode Partenaire virtuel**REMARQUE :**

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

Les sélections suivantes sont prises en charge :

Désactivé;

Désactive le fonctionnement de la fonction Partenaire virtuel.

Large bande

Toutes les demandes et réponses de la fonction Partenaire virtuel n'utilisent que les connexions LTE ou Wi-Fi.

LMR

Toutes les demandes et réponses de la fonction Partenaire virtuel utilisent uniquement les canaux vocaux de l'infrastructure APCO 25.

10.2.7.11

ViQi : Priorité audio du partenaire virtuel

Configure la manière dont l'audio de retour est priorisé par rapport à l'audio LMR.

**REMARQUE :**

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

Les sélections suivantes sont prises en charge :

ViQi seulement

Lecture de ViQi à 100 % et mise en sourdine de tout audio de réception LMR.

ViQi prioritaire

Lecture en simultané de l'audio de réception LMR et de l'audio ViQi. Le niveau de l'audio de réception LMR sera réduit et inférieur au niveau de l'audio ViQi.

ViQi égal

Lecture en simultané de l'audio de réception LMR et de l'audio ViQi à des niveaux égaux.

LMR prioritaire

Lecture en simultané de l'audio de réception LMR et de l'audio ViQi. Le niveau de l'audio ViQi sera réduit et inférieur au niveau de l'audio de réception LMR.

10.2.7.12

ViQi : Minuterie d'inactivité du Partenaire virtuel (s)

Sélectionne la durée pendant laquelle l'utilisateur restera inactif dans la fonction du partenaire virtuel avant de quitter et de commencer à écouter le canal de répartition sélectionné.

REMARQUE :

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

Accès seulement : Lorsque **Large bande** ou **LMR** est sélectionné dans le champ **ViQi : Mode Partenaire virtuel à la page 115** et que le modèle ou l'option de la radio le permet.

Lorsque la radio reçoit l'audio du partenaire virtuel et l'audio LMR, la radio lit l'audio du partenaire virtuel. Si la radio ne reçoit pas l'audio du partenaire virtuel, l'utilisateur entend l'audio LMR.

Tableau 27 : Portée

Minimum	Maximum	Incréments
5 secondes (valeur par défaut)	255 seconde	1 seconde

REMARQUE :

Quand l'utilisateur se sert de la fonction du partenaire virtuel, tout le trafic vocal de répartition normal sera manqué.

10.2.7.13

Mode Messagerie intelligente

Permet à l'utilisateur de sélectionner le type de routage pour la transmission des messages.

LMR

Les messages sont transmis conformément aux paramètres du canal conventionnel ou ADF.

REMARQUE :

LMR est un réseau à bande étroite qui offre une capacité limitée pour les applications à grand volume de données.

Messagerie intelligente

Les messages sont transmis par l'application de messagerie large bande par défaut.

REMARQUE :

LTE est un réseau à large bande conçu pour les applications à grand volume de données.

10.2.7.14

Taille de la mémoire tampon d'enregistrement de lecture audio

Ce champ indique le dernier nombre de secondes de l'appel entrant courant à enregistrer avec la fonction de rappel instantané

Cette fonction s'applique à toute la radio. La fonction de rappel instantané est activée lorsque ce champ est réglé à toute valeur autre que la valeur **Désactivé** par défaut.

AVERTISSEMENT :

Tous les appels sont enregistrés pour la durée configurée jusqu'au prochain cycle de mise sous tension ou jusqu'à ce qu'ils soient écrasés par une réception audio plus récente.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 28 : Portée

Minimum	Maximum	Incréments
10 s	60 s	1 s

10.2.7.15

Tonalité d'évacuation

Ce champ permet l'émission de la tonalité d'évacuation par la radio émettrice et par toute radio capable de recevoir cette instruction.

La tonalité commence et est transmise lorsque le bouton PTT et le bouton orange sont enfoncés simultanément. À partir du moment où la tonalité se fait entendre, elle continue sur toutes les radios du Groupe même si le bouton orange est relâché, et jusqu'à ce que le bouton PTT soit relâché.

REMARQUE :

Cette instruction de tonalité d'évacuation est transmise à l'ensemble du groupe de la radio (pour le canal courant); le type de groupe dépend du mode de communication courant de la radio. Elle s'applique aux canaux à voix numériques et analogiques, dans des systèmes ADF et conventionnels ainsi que dans des systèmes FDMA et TDMA APCO.

AVERTISSEMENT :

Cette fonctionnalité ne fonctionne que lorsque le canal courant est en mode sans chiffrement sécuritaire.

10.2.7.16

Mise hors tension automatique après allumage

Ce champ vous permet de sélectionner la durée pendant laquelle la radio attend avant de se mettre hors tension automatiquement une fois que la tension au détecteur d'allumage est coupée.

La minuterie se met en marche lorsqu'il n'y a plus de tension dans le détecteur d'allumage et que la radio détecte ensuite qu'aucune action n'est effectuée. Si la minuterie est active, le relâchement de n'importe quelle touche de la radio la réinitialise. Au cours des deux dernières minutes du compte à rebours, la radio émet des avertissements visuels et sonores jusqu'à ce que le délai soit terminé ou que la minuterie soit réinitialisée. Cette sélection s'applique à toute la radio pour tous les canaux de communication conventionnels et ADF.

IMPORTANT :

La fonction de minuterie s'appuie sur l'état de l'interrupteur d'allumage de votre véhicule.

Dans une configuration Radio double, cette fonctionnalité s'applique uniquement à la est uniquement à la **Radio principale**.

Accès seulement : Lorsque le champ **Interrupteur d'allumage** est réglé à **Mise sous tension allumage seulement**, à **Obligatoire** ou à **Mise hors tension normale** et que le modèle ou l'option de la radio le permet.

REMARQUE :

La mise hors tension automatique après inactivité est désactivée lorsque le champ est réglé à **0 - désactivé** (par défaut).

Tableau 29 : Portée

Minimum	Maximum	Incréments
3 minutes	840 minutes	1 minute

10.2.7.17

Désactiver l'alerte de mise hors tension automatique après allumage

Lorsque ce champ est coché, il désactive les avertissements sonores et visuels de la mise hors tension automatique dans les deux dernières minutes de la mise hors tension de la radio en raison de la suppression de la tension au niveau du détecteur d'allumage.

Ce champ peut être modifié lorsque l'option **Mise hors tension automatique après allumage** est accessible et non **désactivée**.

10.2.7.18

Activer l'image de mise sous tension personnalisée

Si ce champ est activé, vous pouvez téléverser une image qui apparaîtra à la fin de la séquence de mise sous tension.

10.2.7.19

Activation de reprise de canal

Ce champ active la fonction de reprise automatique du canal. Cette fonction vous permet d'associer un canal basé sur le système à un canal de reprise. La radio peut passer à un canal de reprise lorsqu'elle n'est pas en mesure de communiquer avec le réseau de la radio mobile terrestre (LMR).

AVERTISSEMENT :

On ne vous recommande **pas** de configurer un canal de reprise comme canal sur le même système. Si la radio ne peut pas communiquer automatiquement avec le système d'un groupe, alors elle ne peut pas non plus communiquer avec un groupe différent.

IMPORTANT :

La fonction de reprise automatique du canal est désactivée par défaut pour tous les canaux. Après avoir activé ce champ, vous devez choisir une zone de reprise et un canal de reprise pour un canal donné dans l'attribution du canal de zone.

La radio peut effectuer des reprises imbriquées. Si le canal de reprise sélectionné n'est pas en mesure de communiquer avec le réseau LMR, la radio peut effectuer une reprise de canal si un canal de reprise lui est attribué.

Une fois que la radio effectue une reprise de canal, la radio attend une courte durée avant d'essayer une autre reprise de canal pour éviter de basculer trop souvent.

Sur un canal à reprise activée, la fonction peut être activée en appuyant sur la touche **Activation/désactivation de la fonction de retour automatique du canal**. Le fait d'appuyer sur cette touche et de la maintenir enfoncée désactive la fonction et ramène la radio au dernier canal sélectionné par l'utilisateur.

En appuyant sur la touche **de retour manuel/annulation du canal**, la radio passe manuellement au canal de reprise assigné, peu importe les conditions du réseau et l'état d'activation actuels. En maintenant cette touche enfoncée, la radio revient au dernier canal sélectionné par l'utilisateur.

Sur les canaux système suivants, la radio est incapable de communiquer avec le réseau LMR et passe automatiquement au canal de reprise. Pour tout autre type de canal, seul la reprise manuelle des canaux est disponible.

- ADF P25
- Partage de ressources de type II
- PSU avec DVRS activé

10.2.8

Localisation

Cette section vous permet d'afficher ou de modifier les paramètres relatifs à la technologie de localisation applicable à toute la radio (ou à un accessoire de la radio).

Par exemple, le système mondial de localisation (GPS) est une technologie qui détermine l'emplacement.

10.2.8.1

Activer l'emplacement

Ce champ permet d'activer le récepteur GPS de la radio pour toutes les fonctions qui concernent l'emplacement, y compris les demandes LRRP (protocole de réponse aux demandes d'emplacement) provenant du FNE (équipement de réseau fixe) et celles associées au menu Emplacement.

Le menu Emplacement vous est accessible en appuyant sur la touche Emplacement ou à l'aide de la sélection de menu Emplacement.

REMARQUE :

Le LRRP est un protocole exclusif à Motorola Solutions qui permet l'échange de données sur l'emplacement (longitude et latitude) entre la radio et un appareil de données comme un ordinateur mobile dans le réseau d'entreprise d'un client (CEN). Cette fonction s'applique à toute la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.2.8.2

Rapports SmartLocate

Ce champ vous permet de sélectionner l'opération des rapports SmartLocate.

Les sélections suivantes sont prises en charge :

LMR seulement

Lorsque l'option [Activer l'emplacement à la page 119](#) est activée, la radio est configurée pour signaler l'emplacement de l'appareil à l'aide du protocole de réponse aux demandes de localisation (LRRP) exclusif à Motorola Solutions par l'entremise du système ASTRO à Command Central Aware.

Large bande uniquement

Lorsque cette option est activée, la radio est configurée pour signaler l'emplacement de l'appareil en tant que messages de télémétrie de l'appareil au nuage à l'aide du service large bande (Wi-Fi ou LTE cellulaire) à Command Central Aware.

Large bande privilégiée

Lorsque l'option [Activer l'emplacement à la page 119](#) est activée et que le service large bande est disponible, la radio est configurée pour signaler l'emplacement de l'appareil en tant que messages

de télémétrie de l'appareil au nuage à l'aide du service large bande à Command Central Aware. Si le service large bande n'est pas disponible, la radio est configurée pour signaler l'emplacement de l'appareil au moyen du protocole de réponse aux demandes de localisation (LRRP) exclusif à Motorola Solutions par l'entremise du système ASTRO à Command Central Aware.

Accès seulement : Lorsque le champ [Activer l'emplacement à la page 119](#) est activé et que le modèle ou l'option de la radio le permet.

10.2.8.3

Activer l'emplacement sélectionnable par l'utilisateur

Ce champ vous permet d'activer ou de désactiver la fonction Emplacement de la radio pour toute la radio.

La fonction Emplacement peut être utilisée conjointement avec une technologie de localisation comme le GPS (système mondial de localisation).

AVERTISSEMENT :

Le menu Emplacement vous est accessible en appuyant sur la touche Emplacement ou à l'aide de la sélection de menu Emplacement. Une de ces commandes doit être programmée, sinon le champ est non valide. Cette fonction s'applique à toute la radio.

Accès seulement : Lorsque le champ [Activer l'emplacement à la page 119](#) est activé et que le modèle ou l'option de la radio le permet.

10.2.8.4

Format de l'écran Emplacement

Ce champ permet de sélectionner le format d'affichage et de modification des coordonnées dans le menu Emplacement et d'afficher les formats d'emplacement.

AVERTISSEMENT :

Le menu Emplacement vous est accessible en appuyant sur la touche Emplacement ou à l'aide de la sélection de menu Emplacement. Cette fonction s'applique à toute la radio.

Accès seulement : Lorsque le modèle ou les options de la radio le permettent, et que le champ [Activer l'emplacement à la page 119](#) ou [Affichage Emplacement entre homologues](#) est activé.

Les sélections suivantes sont prises en charge :

- Latitude/longitude (DMD)
- Latitude/longitude (DMS)
- Latitude/longitude (DD)
- UTM
- MGRS (système de référence de carroyage militaire)

10.2.8.5

Unité de distance

Ce champ permet de sélectionner l'unité de mesure à utiliser pour l'affichage de la distance qui sépare des points de repère dans le menu Emplacement de la radio.

Le menu Emplacement vous est accessible en appuyant sur la touche Emplacement ou à l'aide de la sélection de menu Emplacement. Cette fonction s'applique à toute la radio.

Accès seulement : Lorsque le champ [Activer l'emplacement à la page 119](#) est activé et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

- Kilomètres

- Milles

10.2.8.6

Rapport de localisation P25

Ce champ permet à la radio de traiter les messages de demande de position ou de protocole de réponse (LRRP) à l'aide du format de données du Rapport de localisation P25 (Projet 25), en plus du format de données de l'ancien Rapport de localisation Motorola.

Cela est nécessaire lorsque la radio échange des renseignements de position LRRP avec un serveur de localisation au sein d'une infrastructure de communications conventionnelles ou ADF qui est uniquement compatible avec les spécifications des Services de localisation de niveau 2 P25 (tel que publié par la Telecommunications Industry Association). Cette fonction s'applique à toute la radio.

Si cette fonction est désactivée, la radio prend uniquement en charge les messages LRRP à l'aide de l'ancien format de données de Rapport de localisation de Motorola.

REMARQUE :

Lorsque le serveur de localisation communique avec la radio sur le port spécifié dans le champ Port UDP de rapport de localisation P25, alors la radio interprète les données comme des données de Rapport de localisation P25 (numéro de port P25 spécifié par défaut pour ce port = 49198).

Lorsque le serveur de localisation communique avec la radio sur un port statique 4001, la radio interprète les données comme des données de l'ancien Rapport de localisation Motorola.

Lorsque le serveur de localisation communique avec la radio sur le port spécifié dans le champ Port UDP de Rapport de localisation P25, la radio interprète les données comme des données de Rapport de localisation P25 (numéro de port P25 spécifié par défaut pour ce port = 49198), et la radio chiffre/déchiffre les messages LRRP entre la radio et le serveur de localisation à l'aide du format de données Rapport de localisation P25.

La fonction Inscription de localisation directe permet aux radios d'envoyer la notification de présence pour le serveur de localisation lorsque l'application ARS n'est pas présente, à l'aide du message LRRP « Messagerie de version de protocole » qui est chiffré à l'aide de la méthode du « Rapport de localisation P25 ».

Accès seulement : Lorsque le champ [Activer l'emplacement à la page 119](#) est activé et que le modèle ou l'option de la radio le permet.

10.2.8.7

Géopère géré par le système

Ce champ permet à la radio de prendre en charge le géopère de l'UNS.

Lorsque l'unité d'abonné exécute la connexion utilisateur de l'ARS avec le serveur de présence, les informations pour indiquer si l'unité est en mesure de prendre en charge les transmissions de géopère géré par le système avec l'ARS.

AVERTISSEMENT :

Lors de l'activation du géopère géré par le système, le [Mode ARS à la page 382](#) doit être réglé sur **Serveur amélioré** dans le dossier du profil de données afin d'empêcher d'avoir des Rapport sur les champs non valides.

Accès seulement : Lorsque le modèle ou les options de la radio le permettent, et lorsque le Mode ARS est Serveur amélioré dans au moins un Profils de données, et lorsque le champ [Activer l'emplacement à la page 119](#) est activé.

10.2.8.8

Mode Cartographie

Le mode Cartographie permet à l'utilisateur d'afficher son emplacement ou celui d'autres personnes sur la carte.

Accès seulement : Lorsque le champ [Activer l'emplacement à la page 119](#) est réglé à Activé.

Les sélections suivantes sont prises en charge :

- Aucun
- Cartographie intelligente (SmartMapping)

10.2.8.9

Localisation assistée par serveur

Lorsque cette option est activée, la radio utilise une connexion Internet à large bande pour indiquer son emplacement. Lorsque le système mondial de navigation par satellite (GNSS) est indisponible, les données de télémétrie sont envoyées au serveur de localisation pour approximer l'emplacement de la radio. Les emplacements sont envoyés au serveur de localisation aux fins de géocodage inversé.

Accès seulement : Lorsque le champ [Activer l'emplacement à la page 119](#) est réglé à Activé.

10.2.8.10

Format d'emplacement géocodé

Le format d'emplacement géocodé permet à l'utilisateur de choisir le format de géocodage inversé.

Accès seulement : Lorsque le champ [Activer l'emplacement à la page 119](#) est réglé à Activé.

Les sélections suivantes sont prises en charge :

- Désactivé;
- Adresse municipale
- Intersection

10.2.9

Options audio

Cette section permet d'afficher ou de définir les paramètres de contrôle audio relatifs à la réception et à la transmission pour toute la radio.

10.2.9.1

Activer Rx concomitant

Ce champ permet de laisser la sourdine de la radio désactivée, même lorsque plusieurs transmissions se déroulent en même temps et sur le même canal.

Cela ne s'applique que si des canaux analogiques Direct/Talkaround sont utilisés. Ces transmissions simultanées ne sont audibles que si les signaux reçus sont d'une intensité assez forte et similaire. Cette fonction s'applique à toute la radio.

IMPORTANT :

L'activation de cette fonction fait en sorte que certains signaux faibles qui seraient normalement transmis ne le sont pas; il est donc recommandé d'activer cette fonction seulement si la réception de transmissions simultanées est considérée comme nécessaire.

Pour les modèles de radio contenant un micrologiciel antérieur à la version R12.00.00, cette caractéristique est applicable uniquement aux canaux 25 kHz (voir aussi le champ Écart Tx/ Séparation des canaux). Pour les modèles de radio ayant la version R12.00.00 ou ultérieure, ce champ s'applique aux canaux de 12,5 kHz et 25 kHz.

REMARQUE :

Le son de ces transmissions simultanées est en grande partie inintelligible. La réception de transmissions simultanées est parfois nécessaire lors de la gestion d'un incident sur place, où il peut être très important de recevoir toutes les communications. Par exemple, l'activation de cette fonction peut être essentielle à la gestion d'un incident lorsque toutes les communications sont en mode analogique seulement, qu'on s'attend à des conditions chaotiques et que toute transmission reçue vaut mieux que rien.

10.2.9.2

Équilibre Tx numérique/analogique

Ce champ permet d'égaliser ou d'équilibrer le volume d'émission en alternant entre les modes analogique et numérique.

Cette fonction peut être appliquée à l'ensemble de la radio ou par profil.

AVERTISSEMENT :

Lorsque **Toute la radio** est sélectionné, les champs AGC numérique (radio), AGC analogique (radio), AGC numérique (accessoire) et AGC analogique (accessoire) doivent être désactivés pour chaque enregistrement de profil radio; sinon, cette sélection sera considérée comme non valide.

Les sélections suivantes sont prises en charge :

Désactivée

La fonction est désactivée.

Toute la radio

L'équilibrage du volume des transmissions s'applique à l'ensemble de la radio.

Par profil

Cette sélection permet l'activation ou la désactivation du champ Équilibre numérique/analogique pour chaque enregistrement de profil radio existant.

10.2.9.3

Niveau de configuration audio

Ce champ permet de configurer le niveau audio de la radio.

Accès seulement : Ce paramètre est disponible uniquement dans l'affichage intégral (voir Vue Codeplug).

Les sélections suivantes sont prises en charge :

Amélioré

Active la fonction d'amélioration audio.

Si vous remplacez la sélection **Amélioré** par **De base**, les valeurs des paramètres de groupe de sensibilité de gain et les valeurs des paramètres de groupe d'égalisation audio (haut-parleur) sont synchronisées de la colonne Radio à la colonne Accessoire.

De base

La sélection du réglage **De base** désactive la fonction d'amélioration audio et les champs suivants ne s'appliquent pas :

Les champs suivants ne s'appliquent pas :

- **Bande basse fréquence numérique pour la radio et les accessoires**
- **Bande fréquence moyenne numérique pour la radio et les accessoires**
- **Bande basse fréquence pour la radio et les accessoires**
- **Bande haute fréquence numérique pour les accessoires**
- **Bande fréquence moyenne pour la radio et les accessoires**
- **Bande basse fréquence SecureNet pour la radio et les accessoires**
- **Bande haute fréquence pour la radio et les accessoires**
- **Bande fréquence moyenne SecureNet pour la radio et les accessoires**
- **Réglages du groupe égalisation audio (microphone)**
- **Bande basse fréquence analogique pour la radio et les accessoires**
- **Réglages du groupe égalisation audio (haut-parleur)**
- **Bande fréquence moyenne analogique pour la radio et les accessoires**

Les champs suivants ne sont pas modifiables :

- **Sortie de commande du gain AGC pour les accessoires**
- **Total de commande du gain AGC pour les accessoires**
- **Équilibre numérique/analogique pour les accessoires**
- **Bande haute fréquence analogique pour les accessoires**
- **Bande haute fréquence SecureNet pour les accessoires**
- **Bande haute fréquence numérique pour les accessoires**

10.2.10

Niveaux de puissance de transmission

Cette section permet d'afficher ou de définir les réglages de haute et de faible puissance Tx (transmission), dans les limites prédéfinies.

**IMPORTANT :**

Il existe des configurations de niveau de puissance de transmission (enregistrements/rangées) propres à chaque plage de fréquences possible dans une bande de fréquences donnée. Toutefois, seules les configurations de niveau de puissance de transmission de la bande de fréquences (ou bandes) prises en charge par le codeplug courant s'appliquent et, dans certains cas, peuvent être modifiées. Voir aussi les rubriques Bande de fréquences primaire et Bande de fréquences secondaire pour les bandes de fréquences prises en charge par la radio.

**REMARQUE :**

Pour se conformer entièrement aux exigences réglementaires en matière de niveau de puissance de sortie, les utilisateurs de fréquences marines section 80 utilisant les fréquences entre 154 et 162,025 MHz (bande VHF) et 454 et 470 MHz (bande UHF) doivent programmer la puissance de transmission à partir des valeurs par défaut à un niveau ne dépassant pas les valeurs indiquées dans le tableau ci-dessous.

Notez que cette restriction de puissance réduite ne s'applique qu'à certains modèles de radio et strictement pour les fréquences marine section 80. Vérifiez également votre licence pour toute restriction supplémentaire sur la puissance de sortie.

Description de la famille de produits	FCC/IC	Plage de fréquences/ Puissance de sortie
APX Suivant	AZ489FT7147/109U-89FT7 147	156 – 162,025 MHz/5 W 454 – 470 MHz/2 W

10.2.10.1

Sélection du plan de bande

Ce champ permet de sélectionner la bande de fréquences 7/800 MHz ou le plan de bande que la radio est autorisée à utiliser, ce qui détermine laquelle des deux tables de configuration du niveau de puissance de transmission peut être utilisée par la codeplug de la radio.

Cette information s'applique à toute la radio.

**AVERTISSEMENT :**

En 2007, la FCC (Federal Communications Commission) a remplacé la bande de fréquences 700 MHz par la bande de fréquences 7/800 MHz dans le but, notamment, d'attribuer les fréquences de large bande du « bloc D » pour l'utilisation par la sécurité publique; toutefois, certains organismes américains et canadiens peuvent détenir des licences ou des exonérations leur permettant d'utiliser le plan de bande 700 MHz d'origine.

**IMPORTANT :**

Il existe des configurations de niveau de puissance de transmission (enregistrements/rangées) pour chacune des plages de fréquences possibles dans une bande de fréquences particulière; toutefois, seules les configurations de niveau de puissance de transmission associées à la/aux bande(s) de fréquences prises en charge par la codeplug s'appliqueront et, dans certains cas, pourront être modifiées. Voir aussi les rubriques Bande de fréquences primaire et Bande de fréquences secondaire pour la ou les bandes de fréquences prises en charge par la radio.

Les sélections suivantes sont prises en charge :

Ancien

Le plan de bande 7/800 MHz d'origine (voir l'avertissement), et donc les configurations de niveau de puissance de transmission d'origine, s'appliquent à la codeplug de la radio.

Nouvelle

Le dernier plan de bande 7/800 MHz (voir l'avertissement), et donc les configurations de niveau de puissance de transmission (nouveau plan de bande), s'appliquent à la codeplug de la radio.

Accès seulement :

- Lorsque la valeur de la bande de fréquences primaire ou de la bande de fréquences secondaire est 7/800 MHz.
- Lorsque **Permettre les fréquences non valides** est activé et que 7/800 MHz dans la codeplug est activé.
- Lorsque **Activer 700 MHz ou Activer 800 MHz** est coché).
- Lorsque **Permettre les fréquences non valides** est activé.
- Lorsque **700 MHz est utilisé dans la codeplug ou que 800 MHz est utilisé dans la codeplug** est activé.
- Lorsque le modèle ou l'option de la radio le permet.

10.2.10.2**Bande de fréquences**

L'application récupère et affiche en lecture seule la bande de fréquences, où chaque rangée est associée à une configuration (enregistrement/rangée) de niveau de puissance de transmission unique.

La plage de fréquences courante est définie par [Début de la bande de fréquences \(MHz\) à la page 126](#) et [Fin de la plage de fréquences \(MHz\) à la page 127](#). Les radios à double bande prennent en charge plus d'une bande de fréquences (voir aussi Bande de fréquences primaire et Bande de fréquences secondaire pour des détails sur la ou les bandes de fréquences prises en charge par la radio). Cette information s'applique à toute la radio.

**IMPORTANT :**

Il existe des configurations de niveau de puissance de transmission (enregistrements/rangées) propres à chaque plage de fréquences possible dans une bande de fréquences donnée. Toutefois, seules les configurations de niveau de puissance de transmission de la bande de fréquences (ou bandes) prises en charge par la codeplug courante s'appliquent et, dans certains cas, peuvent être modifiées.

10.2.10.3**Début de la bande de fréquences (MHz)**

L'application radio récupère et affiche en lecture seule la valeur de début de la plage de fréquences pour la bande de fréquences de l'enregistrement courant ou de la rangée courante.

Cette valeur est déterminée pour ce modèle de radio. Cette information s'applique à toute la radio.

**IMPORTANT :**

Il existe des configurations de niveau de puissance de transmission (enregistrements/rangées) propres à chaque plage de fréquences possible dans une bande de fréquences donnée. Toutefois, seules les configurations de niveau de puissance de transmission de la bande de fréquences (ou bandes) prises en charge par la codeplug courante s'appliquent et, dans certains cas, peuvent être modifiées. Voir aussi les rubriques Bande de fréquences primaire et Bande de fréquences secondaire pour la ou les bandes de fréquences prises en charge par la radio.

10.2.10.4

Fin de la plage de fréquences (MHz)

L'application récupère et affiche en lecture seule la valeur de fin de la plage de fréquences pour la bande de fréquences de l'enregistrement courant ou de la rangée courante.

Cette valeur est déterminée pour ce modèle de radio. Cette information s'applique à toute la radio.

**IMPORTANT :**

Il existe des configurations de niveau de puissance de transmission (enregistrements/rangées) propres à chaque plage de fréquences possible dans une bande de fréquences donnée. Toutefois, seules les configurations de niveau de puissance de transmission de la bande de fréquences (ou bandes) prises en charge par la codeplug courante s'appliquent et, dans certains cas, peuvent être modifiées. Voir aussi les rubriques Bande de fréquences primaire et Bande de fréquences secondaire pour la ou les bandes de fréquences prises en charge par la radio.

10.2.10.5

Niveau de puissance de Tx minimal (W)

L'application récupère et affiche en lecture seule la valeur Niveau de puissance de Tx maximal.

Cette valeur s'applique uniquement aux canaux dans la bande de fréquence de l'enregistrement ou la rangée en place.

**IMPORTANT :**

Il existe des configurations de niveau de puissance de transmission (enregistrements/rangées) propres à chaque plage de fréquences possible dans une bande de fréquences donnée. Toutefois, seules les configurations de niveau de puissance de transmission de la bande de fréquences (ou bandes) prises en charge par la codeplug courante s'appliquent et, dans certains cas, peuvent être modifiées. Voir aussi les rubriques Bande de fréquences primaire et Bande de fréquences secondaire pour la ou les bandes de fréquences prises en charge par la radio.

10.2.10.6

Niveau de puissance de Tx faible (W)

Ce champ permet d'entrer le niveau de puissance de Tx (transmission) faible.

Cette valeur s'applique uniquement aux canaux dans la bande de fréquence de l'enregistrement ou la rangée en place.

**AVERTISSEMENT :**

Pour être considéré comme valide, le niveau de puissance Tx faible doit être supérieur ou égal à [Niveau de puissance de Tx minimal \(W\) à la page 127](#) et inférieur ou égal à [Niveau de puissance de Tx élevé \(W\) à la page 128](#) et [Niveau de puissance de Tx maximal \(W\) à la page 128](#).

**IMPORTANT :**

Il existe des configurations de niveau de puissance de transmission (enregistrements/rangées) propres à chaque plage de fréquences possible dans une bande de fréquences donnée. Toutefois, seules les configurations de niveau de puissance de transmission de la bande de fréquences (ou bandes) prises en charge par la codeplug courante s'appliquent et, dans certains cas, peuvent être modifiées. Voir aussi les rubriques Bande de fréquences primaire et Bande de fréquences secondaire pour la ou les bandes de fréquences prises en charge par la radio.

10.2.10.7

Niveau de puissance de Tx élevé (W)

Ce champ permet d'entrer le niveau de puissance de Tx (transmission) élevé.

Cette valeur s'applique uniquement aux canaux dans la bande de fréquence de l'enregistrement ou la rangée en place.

IMPORTANT :

Il existe des configurations de niveau de puissance de transmission (enregistrements/rangées) propres à chaque plage de fréquences possible dans une bande de fréquences donnée. Toutefois, seules les configurations de niveau de puissance de transmission de la bande de fréquences (ou bandes) prises en charge par la codeplug courante s'appliquent et, dans certains cas, peuvent être modifiées. Voir aussi les rubriques Bande de fréquences primaire et Bande de fréquences secondaire pour la ou les bandes de fréquences prises en charge par la radio.

Si la puissance élevée est augmentée, les limites courantes doivent être réglées de nouveau à l'aide de l'application du syntoniseur afin que le niveau de puissance voulu puisse être atteint.

Si le réglage de la puissance élevée de Tx est abaissé, les limites de courant peuvent être réglées de nouveau afin d'accroître la protection.

10.2.10.8

Niveau de puissance de Tx maximal (W)

L'application récupère et affiche en lecture seule la valeur Niveau de puissance de Tx maximal.

Cette valeur s'applique uniquement aux canaux dans la bande de fréquence de l'enregistrement ou la rangée en place.

REMARQUE :

Il existe des configurations de niveau de puissance de transmission (enregistrements/rangées) propres à chaque plage de fréquences possible dans une bande de fréquences donnée. Toutefois, seules les configurations de niveau de puissance de transmission de la bande de fréquences (ou bandes) prises en charge par la codeplug courante s'appliquent et, dans certains cas, peuvent être modifiées. Voir aussi les rubriques Bande de fréquences primaire et Bande de fréquences secondaire pour la ou les bandes de fréquences prises en charge par la radio.

10.2.11

Spectres de fréquences

Cette section vous permet de régler dans la codeplug des fréquences qui ne sont pas comprises dans la bande de fréquences d'une radio donnée.

REMARQUE :

Cette fonction est utile lorsqu'un système à ressources ADF ou conventionnel permet la prise en charge de doubles bandes de fréquences, mais que certaines radios de ce système sont monobande. Dans un tel cas, vous demeurez capable de lire et d'écrire des codeplugs et de faire des clonages entre les radios, même si certaines fréquences dans la codeplug sont « non valides ».

AVERTISSEMENT :

Si le champ Permettre les fréquences non valides est activé, aucun avertissement n'est émis si vous essayez d'écrire dans la codeplug (écriture, clonage ou utilisation d'un FLASHport) et certains canaux programmés de la radio ne fonctionneront pas.

10.2.11.1

VHF utilisé dans la codeplug

Cette case à cocher vous permet d'entrer des fréquences dans les bandes de fréquence VHF dans la codeplug, peu importe les capacités de la radio.

**AVERTISSEMENT :**

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

**IMPORTANT :**

L'activation de ce champ et la programmation des fréquences VHF dans la radio ne permettent pas à la radio de fonctionner dans la plage de fréquences VHF. La radio doit avoir le matériel nécessaire et prendre en charge FLASHcode pour prendre en charge cette bande.

**REMARQUE :**

Si la bande de fréquence a déjà été achetée pour la radio comme représentée dans le FLASHcode, ce champ sera activé et non modifiable.

Accès seulement : Lorsque le champ Permettre les fréquences non valides est réglé à **Activé** et que le modèle de la radio ou l'option le permet.

10.2.11.2

UHF1 utilisé dans la codeplug

Cette case à cocher vous permet d'entrer des fréquences dans les bandes de fréquence UHF1 dans la codeplug, peu importe les capacités de la radio.

**AVERTISSEMENT :**

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

**IMPORTANT :**

L'activation de ce champ et la programmation des fréquences UHF1 dans la radio ne permettent pas à la radio de fonctionner dans la plage de fréquences UHF1. La radio doit avoir le matériel nécessaire et prendre en charge FLASHcode pour prendre en charge cette bande.

**REMARQUE :**

Si la bande de fréquence a déjà été achetée pour la radio comme représentée dans le FLASHcode, ce champ sera activé et non modifiable.

Accès seulement : Lorsque le champ Permettre les fréquences non valides est réglé à **Activé** et que le modèle de la radio ou l'option le permet.

10.2.11.3

UHF2 utilisé dans la codeplug

Cette case à cocher vous permet d'entrer des fréquences dans les bandes de fréquence UHF2 dans la codeplug, peu importe les capacités de la radio.

**AVERTISSEMENT :**

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

**IMPORTANT :**

L'activation de ce champ et la programmation des fréquences UHF2 dans la radio ne permettent pas à la radio de fonctionner dans la plage de fréquences UHF2. La radio doit avoir le matériel nécessaire et prendre en charge FLASHcode pour prendre en charge cette bande.

**REMARQUE :**

Si la bande de fréquence a déjà été achetée pour la radio comme représentée dans le FLASHcode, ce champ sera activé et non modifiable.

Accès seulement : Lorsque le champ Permettre les fréquences non valides est réglé à **Activé** et que le modèle de la radio ou l'option le permet.

10.2.11.4

700 MHz utilisé dans la codeplug

Cette case à cocher vous permet d'entrer des fréquences dans les bandes de fréquence 700 MHz dans la codeplug, peu importe les capacités de la radio.

**IMPORTANT :**

L'activation de ce champ et la programmation des fréquences 700 MHz dans la radio ne permettent pas à la radio de fonctionner dans la plage de fréquences 700 MHz. La radio doit avoir le matériel nécessaire et prendre en charge FLASHcode pour prendre en charge cette bande.

**REMARQUE :**

Actuellement, il n'y a qu'une seule Option-H QA00569 disponible pour la bande de fréquences 7/800 MHz. Par conséquent, il est recommandé d'activer ou de désactiver en même temps les deux bandes de fréquences 700 MHz et 800 MHz utilisées dans la codeplug.

Si la bande de fréquence a déjà été achetée pour la radio comme représentée dans le FLASHcode, ce champ sera activé et non modifiable.

Accès seulement : Lorsque le champ Permettre les fréquences non valides est réglé à **Activé** et que le modèle de la radio ou l'option le permet.

10.2.11.5

800 MHz utilisé dans la codeplug

Cette case à cocher vous permet d'entrer des fréquences dans les bandes de fréquence 800 MHz dans la codeplug, peu importe les capacités de la radio.

**IMPORTANT :**

L'activation de ce champ et la programmation des fréquences 800 MHz dans la radio ne permettent pas à la radio de fonctionner dans la plage de fréquences 800 MHz. La radio doit avoir le matériel nécessaire et prendre en charge FLASHcode pour prendre en charge cette bande.

**REMARQUE :**

Actuellement, il n'y a qu'une seule Option-H QA00569 disponible pour la bande de fréquences 7/800 MHz. Par conséquent, il est recommandé d'activer ou de désactiver en même temps les deux bandes de fréquences 700 MHz et 800 MHz utilisées dans la codeplug.

Si la bande de fréquence a déjà été achetée pour la radio comme représentée dans le FLASHcode, ce champ sera activé et non modifiable.

Accès seulement : Lorsque le champ Permettre les fréquences non valides est réglé à **Activé** et que le modèle de la radio ou l'option le permet.

10.2.11.6

Portée étendue de 700 MHz

Cette case à cocher vous permet d'entrer des fréquences dans les bandes de fréquence de 762 à 763 MHz et de 792 à 793 MHz dans la codeplug, peu importe les capacités de la radio.

**REMARQUE :**

Actuellement, une option PCI QA07468 est disponible pour la portée étendue de 700 MHz.

Si la bande de fréquence a déjà été achetée pour la radio comme représentée dans le FLASHcode, ce champ sera activé et non modifiable.

10.2.12

Sécurité publique tactique

Cette section vous permet de visualiser ou de modifier les paramètres de sécurité publique tactique (TPS).

**REMARQUE :**

Les paramètres TPS doivent alors être définis pour chaque personnalité conventionnelle. Voir les champs Personnalité conventionnelle, Type de signalement d'incident et Activer UI de la Sécurité publique tactique.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.2.12.1

Tonalité de fin de Tx vocale

Ce champ permet à la radio d'émettre une tonalité d'alerte à la fin d'une transmission vocale.

Cette tonalité retentit lorsque la touche PTT est relâchée dans les modes conventionnels analogique et numérique (voir le champ Type voix/signal Tx), quel que soit le réglage du type de signalement d'incident, y compris le réglage « Désactivé ». Cette fonction s'applique à toute la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.2.12.2

Balise de détresse sonore

Ce champ vous permet de créer des tonalités d'alerte d'urgence lors d'une transmission en mode d'urgence; et vous permet de choisir l'intervalle entre chacune de ces tonalités répétées uniques.

Ces tonalités d'alerte sont toujours diffusées par le haut-parleur de la radio afin de fournir un mécanisme audible de recherche et secours qui continue jusqu'à ce que vous annuliez l'urgence : voir aussi Acheminement audible de phare d'urgence. Cette sélection s'applique à toute la radio. La durée est exprimée en secondes.

IMPORTANT :

pour les radios mobiles, la balise de détresse se fait entendre selon le niveau sonore actuellement sélectionné.

Pour les radios portables, la balise d'urgence se fait entendre au paramètre de niveau de volume maximum.

Applicable seulement :

- lorsque la radio fonctionne en mode d'urgence, uniquement avec une personnalité conventionnelle et si le champ Activer UTI de la Sécurité publique tactique est activé.
- (Pour les radios mobiles uniquement) lorsque la fonction étendue « Balise d'urgence audible » s'affiche dans le champ Nom de la fonction étendue.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

La balise d'urgence audible est désactivée lorsque le champ est réglé à **0 - Désactivé** (par défaut).

Tableau 30 : Portée

Minimum	Maximum	Incréments
1 seconde	255 secondes	1 seconde

10.2.12.3

Acheminement audible de phare d'urgence

Ce champ permet de sélectionner l'acheminement de tonalités d'alerte « Balise d'urgence audible » et l'audio entrant vers un haut-parleur précis lorsqu'une transmission en mode d'urgence est active.

Cette sélection s'applique à toute la radio.

Applicable seulement : lorsque la radio fonctionne en mode d'urgence, uniquement avec une personnalité conventionnelle et si le champ Activer UTI de la Sécurité publique tactique est activé.

Accès seulement :

- lorsque la fonction étendue « Acheminement audible de phare d'urgence » apparaît dans le champ Nom de la fonction étendue,
- lorsque le champ [Balise de détresse sonore à la page 132](#) n'est pas réglé à **Désactivé**.
- Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Haut-parleur externe

Les tonalités d'alerte de phare d'urgence sont acheminées à un haut-parleur externe (le haut-parleur interne est utilisé si aucun haut-parleur externe n'est branché)

Haut-parleur interne seulement

Les tonalités d'alerte de phare d'urgence sont diffusées par le haut-parleur interne seulement (qu'un haut-parleur externe soit disponible ou non).

10.2.12.4

Fréquence de nouvelle tentative d'alarme d'urgence

Ce champ permet de sélectionner le temps pendant lequel la radio attend entre les tentatives de transmission d'alarme d'urgence. Cette sélection s'applique à toute la radio.

**REMARQUE :**

Une fois que le mode d'urgence est activé sur une personnalité conventionnelle, ce temps d'attente s'applique à la fois aux nouvelles tentatives de transmission d'urgence polies et impolies définies dans le profil d'urgence conventionnel référencé pour le système conventionnel référencé de la personnalité.

Les tentatives d'alarme d'urgence se poursuivent jusqu'à ce qu'un accusé de réception (ACK) d'une transmission d'urgence réussie soit renvoyé à radio ou que le nombre de tentatives d'urgence Polies et Impolies soit épuisé.

Applicable seulement : lorsque la radio fonctionne en mode d'urgence, uniquement avec une personnalité conventionnelle et si le champ Activer UTI de la Sécurité publique tactique est activé.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

**REMARQUE :**

Le champ Délai entre les tentatives d'alarme d'urgence est désactivé lorsqu'il est réglé à **4 - Désactivé** (valeur par défaut).

Tableau 31 : Portée

Minimum	Maximum	Incréments
5 seconde	64 seconde	1 seconde

10.2.12.5

Tonalité auxiliaire de touche de relâchement d'appel d'urgence

Ce champ permet à la radio de faire retentir une tonalité d'alerte unique vous rappelant que le mode d'urgence est toujours actif.

Cette tonalité d'alerte retentit lorsque vous relâchez la touche PTT lors d'un appel d'urgence.

**IMPORTANT :**

Pour les radios mobiles, la tonalité auxiliaire d'urgence se fait entendre au niveau sonore actuellement sélectionné.

Pour les radios portatives, cette tonalité auxiliaire d'urgence se fait entendre au niveau de volume maximal de la radio (voir aussi Compensation du volume [dB]).

Applicable seulement : lorsque la radio fonctionne en mode d'urgence, uniquement avec une personnalité conventionnelle et si le champ Activer UTI de la Sécurité publique tactique est activé.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.2.12.6

Transmission PTT TPS

Ce champ permet de déterminer à quel moment un paquet TPS (sécurité publique tactique) est transmis en relation avec une transmission d'appel (vocal) non urgente.

Cette fonction s'applique à toute la radio pour les canaux de communication TPS.

Applicable seulement : Lorsque la radio fonctionne au moyen d'une personnalité conventionnelle dont le champ Type de signalement d'incident est réglé à **Sécurité publique tactique**.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Aucun

Aucun paquet TPS n'est transmis.

Front montant

Le paquet TPS est transmis lorsque la touche PTT est enfoncée, juste avant toute transmission d'appel vocal.

Front descendant

Le paquet TPS est transmis juste après le relâchement du bouton PTT.

Les deux

Le paquet TPS est transmis lorsque la touche PTT est enfoncée, juste avant toute transmission d'appel vocal, puis après le relâchement de la touche PTT.

10.2.12.7

Transmission PTT d'urgence TPS

Ce champ permet de déterminer à quel moment un paquet Sécurité publique tactique (TPSI) est transmis en relation avec une transmission « d'appel » (vocal) d'urgence (voir également Type d'urgence).

Cette fonctionnalité s'applique à toute la radio pour les transmissions d'appel d'urgence sur les canaux activés par TPS.

Applicable seulement : lorsque la radio fonctionne en mode d'urgence et seulement lorsqu'elle fonctionne sur une personnalité conventionnelle où le champ Type de signalement d'incident est réglé à **Sécurité publique tactique**.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Aucun

Aucun paquet TPS n'est transmis.

Front montant

Le paquet TPS est transmis lorsque la touche PTT est enfoncée et juste avant toute transmission d'appel (vocal) d'urgence.

Front descendant

Le paquet TPS est transmis lorsque la touche PTT est relâchée durant toute transmission d'appel (vocal) d'urgence.

Les deux

Le paquet TPS est transmis lorsque la touche PTT est enfoncée, juste avant toute transmission d'appel (vocal) d'urgence, puis à nouveau juste après le relâchement de la touche PTT.

10.2.13

Localisation du personnel

La section **Localisation du personnel** de l'ensemble **Toute la radio** permet à l'utilisateur d'afficher ou de modifier les paramètres de localisation du personnel.

REMARQUE :

Lorsque la radio fonctionne en mode Talkaround (En direct)/Direct et à proximité des autres radios, il est recommandé de configurer un préambule supplémentaire de 160 sur le système ASTRO configuré avec canaux activés pour la localisation du personnel.

10.2.13.1

Minuterie de mise à jour périodique

Ce champ permet de sélectionner la durée qui détermine à quel intervalle (en minutes) la radio envoie un paquet Localisation du personnel (PA) non sollicité et sans confirmation requise au Terminal de commandes d'incident (ICT).

Cela est vrai seulement si une inscription PA réussie a déjà été effectuée. Si la tentative d'inscription PA a échoué, cette minuterie est ensuite utilisée pour déterminer à quel intervalle (en minutes) la radio effectuera une nouvelle tentative d'inscription PA. Cette fonction s'applique à toute la radio pour les canaux de communication de localisation du personnel.

Applicable seulement : lorsque la radio fonctionne sur une personnalité conventionnelle dont le champ Type de signalement d'incident est réglé à **Localisation du personnel** et que le champ Inscription d'imputabilité du personnel est activé.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

**REMARQUE :**

la minuterie de mise à jour périodique est désactivée lorsque ce champ est réglé à **0 - Désactivé** (valeur par défaut). La radio n'envoie pas de paquets d'imputabilité du personnel (PA) non sollicités et de paquets d'imputabilité du personnel (PA) sans demande de confirmation, et n'effectue pas d'autres tentatives d'inscription PA.

Tableau 32 : Portée

Minimum	Maximum	Incréments
1 minute	20 minutes	1 minute

10.2.13.2

Répondre aux invitations à émettre

Ce champ permet à la radio de renvoyer une réponse immédiatement après avoir reçu un sondage Localisation du personnel.

Le sondage de localisation du personnel est initialement émis par le chef des incidents (IC) et sert à interroger les radios afin de confirmer leur capacité à communiquer. Cette fonction s'applique à toute la radio pour les canaux de communication de localisation du personnel.

Applicable seulement : Lorsque la radio fonctionne avec une personnalité conventionnelle où le champ Type d'émission de signaux est réglé à **Localisation du personnel**.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.2.13.3

Accusé réception de l'évacuation

Ce champ permet de sélectionner la façon dont la radio répond aux messages d'évacuation Localisation du personnel.

Les messages d'évacuation lors de la localisation du personnel sont envoyés par le chef des incidents (IC). Cette fonction s'applique à toute la radio pour les canaux de communication de localisation du personnel.

Applicable seulement : Lorsque la radio fonctionne avec une personnalité conventionnelle où le champ Type d'émission de signaux est réglé à **Localisation du personnel**.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Désactivé;

La radio ne répond pas à un message d'évacuation.

Manuelle

La radio répond à un message d'évacuation lorsque vous intervenez en appuyant sur la touche PTT.

10.2.13.4

Transmission PTT de Localisation du personnel

Ce champ permet de sélectionner à quel moment un paquet de localisation du personnel (PA) non confirmé (aucune confirmation attendue) est transmis par rapport à une transmission d'appel vocal non urgente.

Cette fonction s'applique à toute la radio pour les canaux de communication de localisation du personnel.

Applicable seulement : Lorsque la radio fonctionne avec une personnalité conventionnelle où le champ Type d'émission de signaux est réglé à **Localisation du personnel**.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Aucun

Aucun paquet PA n'est transmis.

Front montant

Le paquet PA est transmis lorsque le bouton PTT est enfoncé et juste avant toute transmission d'appel (vocal) non urgente.

Front descendant

Le paquet PA est transmis juste après le relâchement du bouton PTT.

Les deux

Le paquet PA est transmis lorsque le bouton PTT est enfoncé et juste avant toute transmission d'appel vocal non urgente, puis à nouveau juste après le relâchement du bouton PTT.

10.2.13.5

Transmission PTT d'urgence de Localisation du personnel

Ce champ permet de déterminer à quel moment un paquet de localisation du personnel (PA) non confirmé (aucune confirmation attendue) est transmis en relation avec une urgence.

Cette fonctionnalité s'applique à toute la radio pour les émissions d'appel d'urgence sur les canaux activés pour la localisation du personnel.

Applicable seulement : lorsque la radio fonctionne en mode d'urgence sur une personnalité conventionnelle et que le champ Type de signalement d'incident est réglé à **Localisation du personnel**.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Aucun

Aucun paquet PA n'est transmis.

Front montant

Le paquet PA est transmis lorsque la touche PTT est enfoncée et juste avant toute émission d'appel d'urgence.

Front descendant

Le paquet PA est transmis juste après le relâchement du bouton PTT.

Les deux

Le paquet PA est transmis lorsque la touche PTT est enfoncée et juste avant toute émission d'appel d'urgence, puis de nouveau juste après le relâchement de la touche PTT.

10.2.13.6

Accuser réception des alertes sur PTT

Ce champ vous permet de configurer la touche PTT pour accuser réception des alertes Fireground.

Lorsque ce champ est activé, le bouton PTT latéral supérieur (mauve) de la radio portative ou des accessoires et le bouton programmable 1 point sur le RSM peuvent être utilisés pour accuser réception de ces alertes.

Seize alertes programmables peuvent être envoyées par le client et reçues par les radios. Les alertes peuvent être signalées par tonalité, rétroéclairage, vibration, annonce vocale, texte, DEL, etc.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.2.14

Bluetooth

Cette section permet d'afficher et de modifier des réglages reliés à Bluetooth.

IMPORTANT :

Reportez-vous au Guide de l'utilisateur radio pour voir la liste des appareils commerciaux prêts à l'emploi approuvés et des nouveaux profils pris en charge.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.2.14.1

Activer Bluetooth

Ce champ vous permet d'activer la fonction Bluetooth dans la radio.

Activer Bluetooth permet l'appariement et la communication de la radio avec un accessoire Bluetooth, par exemple, un écouteur. Cette fonction s'applique à toute la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.2.14.2

Tonalités Bluetooth

Ce champ vous permet d'activer les tonalités Bluetooth.

Cette fonction s'applique à toute la radio.

Accès seulement : Lorsque le champ [Activer Bluetooth à la page 137](#) est réglé à **Activé** et que le modèle ou l'option de la radio le permet.

10.2.14.3

Nom d'utilisateur Bluetooth modifiable

Ce champ vous permet de modifier le contenu du champ Nom d'utilisateur Bluetooth à partir du menu ou du clavier de la radio.

Cette fonction s'applique à toute la radio.

Accès seulement : Lorsque le champ [Activer Bluetooth à la page 137](#) est réglé à **Activé** et que le modèle ou l'option de la radio le permet.

10.2.14.4

Voyant DEL Bluetooth du haut-parleur/microphone distant

Le voyant DEL Bluetooth du haut-parleur/microphone distant s'allume lorsqu'il y a une connexion Bluetooth radio.

10.2.14.5

Appariement hérité du code NIP Bluetooth

Ce champ vous permet d'activer l'appariement de NIP Bluetooth hérité.

Vous pouvez appairer la radio avec un accessoire compatible Bluetooth qui utilise la spécification Bluetooth Core 2.0 ou une version antérieure.

Cette fonction s'applique à toute la radio.

10.2.15

Capteur

Cette section vous permet d'afficher ou de définir la fonctionnalité du capteur.

10.2.15.1

Délai de désactivation d'événement du capteur

Ce champ vous permet de spécifier la période d'attente avant qu'un événement donné se produise en mode de désactivation temporaire.

Si l'événement n'a pas lieu, la désactivation temporaire est annulée. La valeur par défaut est 30.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 33 : Portée

Minimum	Maximum	Incréments
5 secondes	300 seconde	5 secondes

10.2.15.2

Activation de la notification d'événements de capteur

Ce champ vous permet d'activer la notification locale si quelque événement contextuel se produit au niveau des dispositifs de détection connectés.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.2.16

Plage de fréquence Rx

Ce champ affiche la fréquence de début et de fin de la plage de fréquence de réception. Chaque rangée s'applique à la bande de fréquences spécifiée.

Ces valeurs sont déterminées pour le modèle de radio à toute la radio.

10.2.17

Plage de fréquence Tx

Ce champ affiche la fréquence de début et de fin de la plage de fréquence de transmission. Chaque rangée s'applique à la bande de fréquences spécifiée.

Ces valeurs sont déterminées pour le modèle de radio à toute la radio.

10.3

Priorité des données d'usine

La fenêtre **Priorité des données d'usine** permet de saisir les données d'usine qui doivent être utilisées en priorité pour certains algorithmes de signal radio, cela s'appliquant pour toute la radio.

**AVERTISSEMENT :**

Les données par défaut ne doivent pas être remplacées à moins que cela ne soit nécessaire. Seul le personnel qualifié devrait procéder à la saisie de ces données. Une mauvaise exécution des procédures peut sérieusement nuire à la performance de la radio ou du système.

10.3.1

Général

Cette section vous permet d'entrer l'information de priorité des données d'usine.

10.3.1.1

Activer le remplacement des données d'usine

Ce champ vous permet d'entrer l'information sur la priorité des données d'usine dans les listes Priorité des données d'usine.

Cette sélection s'applique à toute la radio. Si cette fonction est désactivée, tous les réglages relatifs à la priorité des données d'usine ne sont pas pris en compte.

**AVERTISSEMENT :**

Ce champ ne doit pas être activé à moins que cela ne soit nécessaire. Seul le personnel qualifié doit exécuter les procédures de saisie de l'information sur la priorité des données d'usine à partir du menu Priorité des données d'usine. Une mauvaise exécution des procédures peut sérieusement nuire à la performance de la radio ou du système.

Accès seulement : ce paramètre avancé est disponible uniquement dans l'Affichage expert.

10.3.2

Liste de fréquences d'horloge SSI Tx

Cette section vous permet de saisir les fréquences de transmission sur lesquelles se produit un phénomène de diaphonie, ainsi que leurs valeurs de division de référence respectives.

La diaphonie a lieu lorsqu'un signal transmis sur un canal crée des interférences sur un autre canal. Ces champs s'appliquent à toute la radio.

**AVERTISSEMENT :**

Les données par défaut ne doivent pas être remplacées à moins que cela ne soit nécessaire. Seul le personnel qualifié devrait procéder à la saisie de ces données. Une mauvaise exécution des procédures peut sérieusement nuire à la performance de la radio ou du système.

10.3.2.1

Fréquence Tx

Ce champ vous permet de saisir une fréquence Tx (émission) (en MHz) sur laquelle se produit un phénomène de diaphonie, associée à la valeur de fréquences d'horloge SSI Tx sélectionnée.

Cette sélection s'applique à la rangée ou l'enregistrement courant pour toute la radio.

**AVERTISSEMENT :**

Ce champ ne doit pas être activé à moins que cela ne soit nécessaire. Seul le personnel qualifié doit exécuter les procédures de saisie de l'information sur la priorité des données d'usine à partir du menu Priorité des données d'usine. Une mauvaise exécution des procédures peut sérieusement nuire à la performance de la radio ou du système.

Incrément de 6,25 KHz pour la bande de fréquence 800 MHz :

Depuis la version R09.01.00, l'application permet un incrément de 6,25 kHz pour une fréquence conventionnelle de bande de fréquence de 800 MHz afin de se conformer aux réglementations de certains pays (non-FCC); cependant, n'oubliez pas que deux radios fonctionnant sur des canaux adjacents séparés par un incrément de 6,25 kHz uniquement peuvent rencontrer un phénomène de diaphonie.

**IMPORTANT :**

Il n'est pas possible d'entrer des fréquences en double. Ainsi, la sélection d'une fréquence qui a déjà été entrée dans la liste ne constitue pas un choix valide pour le champ actif.

Reportez-vous aux fiches du catalogue de Motorola Solutions, à la section portant sur les prix ou au manuel pour obtenir la liste des fréquences valides pour le modèle.

Pour un fonctionnement optimal, les fréquences doivent être entrées en ordre croissant.

Accès seulement : Lorsque le champ [Activer le remplacement des données d'usine à la page 139](#) est réglé à **Activé** et que le modèle ou l'option de la radio le permet. Il s'agit d'un paramètre avancé qui est disponible uniquement dans l'Affichage Expert (voir Affichage Codeplug).

10.3.2.2

Fréquence d'horloge SSI Tx

Ce champ permet de sélectionner la fréquence d'horloge SSI du synthétiseur d'émission (Tx) (en MHz) associée à la fréquence Tx sur laquelle se produit le phénomène de diaphonie.

Cette sélection s'applique à la rangée ou l'enregistrement courant pour toute la radio.

**AVERTISSEMENT :**

Ce champ ne doit pas être activé à moins que cela ne soit nécessaire. Seul le personnel qualifié doit exécuter les procédures de saisie de l'information sur la priorité des données d'usine à partir du menu Priorité des données d'usine. Une mauvaise exécution des procédures peut sérieusement nuire à la performance de la radio ou du système.

Accès seulement : Lorsque le champ [Activer le remplacement des données d'usine à la page 139](#) est réglé à **Activé** et que le modèle ou l'option de la radio le permet. Il s'agit d'un paramètre avancé qui est disponible uniquement dans l'Affichage Expert (voir Affichage Codeplug).

Les sélections suivantes sont prises en charge :

- 2,40 MHz
- 3,36 MHz
- 8,40 MHz
- 1,92 MHz

10.3.3

Liste de fréquences d'horloge SSI Rx

Cette section vous permet de saisir les fréquences de transmission sur lesquelles se produit un phénomène de diaphonie, ainsi que leurs valeurs de division de référence respectives.

La diaphonie a lieu lorsqu'un signal transmis sur un canal crée des interférences sur un autre canal. Ces champs s'appliquent à toute la radio.

AVERTISSEMENT :

Les données par défaut ne doivent pas être remplacées à moins que cela ne soit nécessaire. Seul le personnel qualifié devrait procéder à la saisie de ces données. Une mauvaise exécution des procédures peut sérieusement nuire à la performance de la radio ou du système.

10.3.3.1

Fréquence Rx

Ce champ vous permet de saisir une fréquence de réception (Rx) ((en MHz) sur laquelle se produit un phénomène de diaphonie, associée à la valeur de fréquences d'horloge SSI Rx sélectionnée.

Cette sélection s'applique à la rangée ou l'enregistrement courant pour toute la radio.

AVERTISSEMENT :

Ce champ ne doit pas être activé à moins que cela ne soit nécessaire. Seul le personnel qualifié doit exécuter les procédures de saisie de l'information sur la priorité des données d'usine à partir du menu Priorité des données d'usine. Une mauvaise exécution des procédures peut sérieusement nuire à la performance de la radio ou du système.

À partir de R09.01.00, un incrément de 6,25 kHz sur les fréquences conventionnelles de la bande de fréquence de 800 MHz est autorisé pour être conforme aux réglementations dans certains pays (non FCC). Deux radios utilisant les canaux adjacents séparés par un incrément de 6,25 kHz uniquement peuvent rencontrer un phénomène de diaphonie indésirable.

IMPORTANT :

Il n'est pas possible d'entrer des fréquences en double. Ainsi, la sélection d'une fréquence qui a déjà été entrée dans la liste ne constitue pas un choix valide pour le champ actif.

Reportez-vous aux fiches du catalogue de Motorola Solutions, à la section portant sur les prix ou au manuel pour obtenir la liste des fréquences valides pour le modèle.

Pour un fonctionnement optimal, les fréquences doivent être entrées en ordre croissant.

Accès seulement lorsque le champ [Activer le remplacement des données d'usine à la page 139](#) est réglé à **Activé** et que le modèle ou l'option de la radio le permet.

10.3.3.2

fréquences d'horloge SSI Rx

Ce champ permet de sélectionner la fréquence d'horloge SSI du synthétiseur de réception (Rx) (en MHz) associée à la fréquence Rx sur laquelle se produit le phénomène de diaphonie.

Cette sélection s'applique à la rangée ou l'enregistrement courant pour toute la radio.

AVERTISSEMENT :

Ce champ ne doit pas être activé à moins que cela ne soit nécessaire. Seul le personnel qualifié doit exécuter les procédures de saisie de l'information sur la priorité des données d'usine à partir du menu Priorité des données d'usine. Une mauvaise exécution des procédures peut sérieusement nuire à la performance de la radio ou du système.

Accès seulement : lorsque le champ [Activer le remplacement des données d'usine à la page 139](#) est activé et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

- 1,2 MHz
- 1,5 MHz
- 1,8 MHz
- 6,4 MHz

- 9,6 MHz

10.3.4

Liste de fréquences d'horloge SSI Rx Mode Tx

Cette section vous permet de saisir les fréquences de transmission sur lesquelles se produit un phénomène de diaphonie, ainsi que leurs valeurs de division de référence respectives.

La diaphonie a lieu lorsqu'un signal transmis sur un canal crée des interférences sur un autre canal. Ces champs s'appliquent à toute la radio.

**AVERTISSEMENT :**

Les données par défaut ne doivent pas être remplacées à moins que cela ne soit nécessaire. Seul le personnel qualifié devrait procéder à la saisie de ces données. Une mauvaise exécution des procédures peut sérieusement nuire à la performance de la radio ou du système.

10.3.4.1

Fréquence Tx

Ce champ vous permet de saisir une fréquence Tx (émission) (en MHz) sur laquelle se produit un phénomène de diaphonie, associée à la valeur de fréquences d'horloge SSI Tx sélectionnée.

Cette sélection s'applique à la rangée ou l'enregistrement courant pour toute la radio.

**AVERTISSEMENT :**

Ce champ ne doit pas être activé à moins que cela ne soit nécessaire. Seul le personnel qualifié doit exécuter les procédures de saisie de l'information sur la priorité des données d'usine à partir du menu Priorité des données d'usine. Une mauvaise exécution des procédures peut sérieusement nuire à la performance de la radio ou du système.

À partir de R09.01.00, un incrément de 6,25 kHz sur les fréquences conventionnelles de la bande de fréquence de 800 MHz est autorisé pour être conforme aux réglementations dans certains pays (non FCC). Deux radios utilisant les canaux adjacents séparés par un incrément de 6,25 kHz uniquement peuvent rencontrer un phénomène de diaphonie indésirable.

**IMPORTANT :**

Il n'est pas possible d'entrer des fréquences en double. Ainsi, la sélection d'une fréquence qui a déjà été entrée dans la liste ne constitue pas un choix valide pour le champ actif.

Reportez-vous aux fiches du catalogue de Motorola Solutions, à la section portant sur les prix ou au manuel pour obtenir la liste des fréquences valides pour le modèle.

Pour un fonctionnement optimal, les fréquences doivent être entrées en ordre croissant.

Accès seulement : Lorsque le champ [Activer le remplacement des données d'usine à la page 139](#) est réglé à **Activé** et que le modèle ou l'option de la radio le permet. Il s'agit d'un paramètre avancé qui est disponible uniquement dans l'Affichage Expert (voir Affichage Codeplug).

10.3.4.2

fréquences d'horloge SSI Rx

Ce champ permet de sélectionner la fréquence d'horloge SSI du synthétiseur de réception (Rx) (en MHz) associée à la fréquence Rx sur laquelle se produit le phénomène de diaphonie.

Cette sélection s'applique à la rangée ou l'enregistrement courant pour toute la radio.

**AVERTISSEMENT :**

Ce champ ne doit pas être activé à moins que cela ne soit nécessaire. Seul le personnel qualifié doit exécuter les procédures de saisie de l'information sur la priorité des données d'usine à partir du menu Priorité des données d'usine. Une mauvaise exécution des procédures peut sérieusement nuire à la performance de la radio ou du système.

Accès seulement : Lorsque le champ [Activer le remplacement des données d'usine à la page 139](#) est réglé à **Activé** et que le modèle ou les options de la radio le permettent.

Les sélections suivantes sont prises en charge :

- 6,4 MHz
- 9,6 MHz

10.3.5

Liste de deuxième fréquences d'injection LO

Cette section permet d'afficher ou de modifier une fréquence Rx (en MHz) individuelle pour laquelle une deuxième fréquence d'injection LO opposée sera utilisée au lieu de celle par défaut.

Cette fonction s'applique à toute la radio.

AVERTISSEMENT :

Les données par défaut ne doivent pas être remplacées à moins que cela ne soit nécessaire. Seul le personnel qualifié devrait procéder à la saisie de ces données. Une mauvaise exécution des procédures peut sérieusement nuire à la performance de la radio ou du système.

10.3.5.1

Deuxième fréquences d'injection LO

Ce champ permet de saisir une fréquence de réception (Rx) individuelle (en MHz) pour laquelle une deuxième fréquence d'injection LO opposée sera utilisée au lieu de celle par défaut.

Cette sélection s'applique à la rangée ou l'enregistrement courant pour toute la radio.

AVERTISSEMENT :

Ce champ ne doit pas être activé à moins que cela ne soit nécessaire. Seul le personnel qualifié doit exécuter les procédures de saisie de l'information sur la priorité des données d'usine à partir du menu **Priorité des données d'usine**. Une mauvaise exécution des procédures peut sérieusement nuire à la performance de la radio ou du système.

À partir de R09.01.00, un incrément de 6,25 kHz sur les fréquences conventionnelles de la bande de fréquence de 800 MHz est autorisé pour être conforme aux réglementations dans certains pays (non FCC). Deux radios utilisant les canaux adjacents séparés par un incrément de 6,25 kHz uniquement peuvent rencontrer un phénomène de diaphonie indésirable.

Accès seulement : Lorsque le champ [Activer le remplacement des données d'usine à la page 139](#) est réglé à **Activé** et que le modèle ou l'option de la radio le permet.

10.3.6

Liste de rejets hors bande

Le rejet hors bande spécifie une valeur de rejet centrée autour de dB. Il est défini en fonction de l'efficacité maximale d'un filtre.

10.3.6.1

Fréquence Rx (MHz)

Permet à l'utilisateur de saisir une fréquence Rx (réception) (en MHz) sur laquelle se produit un phénomène de diaphonie, associée à la valeur de fréquences de liste de rejets hors bande respective.

Cette sélection s'applique à la rangée ou l'enregistrement courant pour toute la radio.

AVERTISSEMENT :

Ce champ ne doit pas être activé à moins que cela ne soit nécessaire. Seul le personnel qualifié doit exécuter les procédures de saisie de l'information sur la priorité des données d'usine à partir du menu Priorité des données d'usine. Une mauvaise exécution des procédures peut sérieusement nuire à la performance de la radio ou du système.

Incrément de 6,25 KHz pour la bande de fréquence 800 MHz :

Depuis la version R09.01.00, RadioCentral permet un incrément de 6,25 kHz pour une fréquence conventionnelle de bande de fréquence de 800 MHz afin de se conformer aux réglementations de certains pays (non-FCC); cependant, n'oubliez pas que deux radios fonctionnant sur des canaux adjacents séparés par un incrément de 6,25 kHz uniquement peuvent rencontrer un phénomène de diaphonie.

IMPORTANT :

Il n'est pas possible d'entrer des fréquences en double. Ainsi, la sélection d'une fréquence qui a déjà été entrée dans la liste ne constitue pas un choix valide pour le champ actif.

Reportez-vous aux fiches du catalogue de Motorola Solutions, à la section portant sur les prix ou au manuel pour obtenir la liste des fréquences valides pour le modèle.

Pour un fonctionnement optimal, les fréquences doivent être entrées en ordre croissant.

Accès seulement lorsque le champ [Activer le remplacement des données d'usine à la page 139](#) est réglé à **Activé** et que le modèle ou l'option de la radio le permet.

10.4

Tête multicontrôle

Cette section vous permet d'afficher ou de définir les fonctions de toute la radio qui s'appliquent à la fois aux modes de communication conventionnel et ADF.

10.4.1

Mode accueil

Cette section vous permet de sélectionner une zone et un canal spécifiques qui seront considérés comme formant le mode Accueil de la radio.

Le « mode » correspond à la combinaison d'une zone et d'un canal. Les zones et les canaux doivent d'abord avoir été définis dans la fenêtre Affectation du canal de zone. Cette fonction s'applique à toute la radio.

REMARQUE :

Vous pouvez accéder au mode Accueil programmé au moyen d'une longue pression sur la touche Accueil de la radio. Une courte pression sur la touche Accueil sert quant à elle à vérifier une sélection courante propre à une fonction telle que le changement de canal, le changement de zone ou le choix des canaux ou des membres prioritaires d'une liste de balayage.

10.4.1.1

Sélection du mode Accueil

Ce champ permet d'activer le mode Accueil pour que la radio puisse facilement syntoniser la zone du mode Accueil et le canal du mode Accueil programmé.

Le « mode » correspond à la combinaison d'une zone et d'un canal. Cette sélection s'applique à toute la radio.

REMARQUE :

Vous pouvez accéder facilement à ce mode Accueil prédéfini au moyen d'une longue pression sur la touche Accueil de la radio. Une courte pression sur la touche Accueil sert quant à elle à vérifier une sélection courante propre à une fonction telle que le changement de canal, le changement de zone ou le choix des canaux ou des membres prioritaires d'une liste de balayage.

Si la radio fait partie des plus récents modèles des normes du service d'incendie, le mode Accueil est coché et grisé par défaut. **Zone et canal** du mode Accueil doit être réglé sur un canal lié à une personnalité du mode Zone de danger (le champ Personnalité du mode Zone de danger est coché).

Le plus récent modèle de radio des normes du service d'incendie se met sous tension avec le canal du mode Zone de danger. **Zones et canal** du mode Accueil est sélectionné si le canal précédent n'est pas un canal du mode Zone de danger.

Accès seulement : Lorsque le modèle ou les options de la radio le permettent.

10.4.1.2

Zone du mode Accueil

Ce champ vous permet de sélectionner une zone du Mode Accueil de la radio.

Une fois la zone choisie, il est possible de sélectionner le canal du mode Accueil. Le « mode » correspond à la combinaison d'une zone et d'un canal. Cette sélection s'applique à toute la radio.

REMARQUE :

Vous pouvez accéder facilement à ce mode Accueil prédéfini au moyen d'une longue pression sur la touche Accueil de la radio. Une courte pression sur la touche Accueil sert quant à elle à vérifier une sélection courante propre à une fonction telle que le changement de canal, le changement de zone ou le choix des canaux ou des membres prioritaires d'une liste de balayage.

AVERTISSEMENT :

Les zones dynamiques ne sont pas valides et ne peuvent pas être sélectionnées (zones pour lesquelles Activation zone dynamique est activé).

Les zones d'interface de site à distance (RSI) ne sont pas valides et ne peuvent pas être sélectionnées (zones pour lesquelles le mode RSI est activé).

Accès seulement : Lorsque le champ Sélection du mode Accueil est activé, et lorsque le modèle et les options de la radio le permettent.

10.4.1.3

Canal du mode Accueil

Ce champ permet de sélectionner le canal du mode Accueil de la radio.

La zone du mode Accueil doit avoir été sélectionnée au préalable. Le « mode » correspond à la combinaison d'une zone et d'un canal. Cette sélection s'applique à toute la radio.

REMARQUE :

Vous pouvez accéder facilement à ce mode Accueil prédéfini au moyen d'une longue pression sur la touche Accueil de la radio. Une courte pression sur la touche Accueil sert quant à elle à vérifier une sélection courante propre à une fonction telle que le changement de canal, le changement de zone ou le choix des canaux ou des membres prioritaires d'une liste de balayage.

Accès seulement : Lorsque le champ [Sélection du mode Accueil à la page 144](#) est **activé**, et lorsque le champ [Zone du mode Accueil à la page 145](#) n'est pas réglé à **Zone dynamique**, et lorsque le modèle et les options de la radio le permettent.

10.4.2

Avancé

Cette section vous permet d'afficher ou de définir diverses fonctions qui s'appliquent à toute la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.4.2.1

Durée courte pression de touche

Ce champ permet de sélectionner la durée pendant laquelle vous devez maintenir un bouton enfoncé pour que la radio considère l'action comme une courte pression de touche.

La durée est exprimée en millisecondes (ms). Cette sélection s'applique à toute la radio.

IMPORTANT :

La durée de la courte pression de touche doit toujours être inférieure à la valeur du champ Durée longue pression de touche.

Les sélections suivantes sont prises en charge :

Tableau 34 : Portée

Minimum	Maximum	Incréments
0 (ms)	6200 (ms)	50 (ms)

10.4.2.2

Durée courte pression de touche pour urgence

Ce champ permet de sélectionner la durée pendant laquelle vous devez maintenir enfoncé le bouton d'urgence pour que la radio active son mode d'urgence.

Une longue pression de la touche d'urgence désactive le mode d'urgence de la radio. La durée est exprimée en millisecondes (ms). Cette fonction s'applique à toute la radio.

REMARQUE :

Soit la durée de la courte pression de touche doit toujours être inférieure à la valeur du champ Durée longue pression de touche pour le MFK, OU ce champ doit être désactivé (est réglé à **0**).

Les sélections suivantes sont prises en charge :

Tableau 35 : Portée

Minimum	Maximum	Incréments
50 (ms)	6200 (ms)	50 (ms)

10.4.2.3

Durée longue pression de touche

Ce champ permet de sélectionner la durée pendant laquelle vous devez maintenir enfoncé un bouton programmable multifonction (MFK) pour que la radio portative considère l'action comme une longue pression de touche.

Parmi les boutons qui utilisent la longue pression, mentionnons la touche Accueil préprogrammée de la radio. La durée est exprimée en millisecondes (ms). Cette fonction s'applique à toute la radio.

IMPORTANT :

La durée de la longue pression de touche doit toujours être supérieure à la valeur du champ [Durée courte pression de touche à la page 146](#).

Les sélections suivantes sont prises en charge :

Tableau 36 : Portée

Minimum	Maximum	Incréments
250 (ms)	6350 (ms)	250 (ms)

10.4.2.4

Durée longue pression de touche pour urgence

Ce champ permet de sélectionner la durée pendant laquelle vous devez maintenir enfoncé le bouton d'urgence pour que la radio désactive son mode d'urgence.

Une courte pression de la touche d'urgence active le mode d'urgence de la radio. Cette fonction s'applique à toute la radio. La durée est exprimée en millisecondes (ms).

IMPORTANT :

Quand elle n'est pas réglé à **0**, la durée de cette longue pression doit être supérieure à celle indiquée dans le champ [Durée courte pression de touche pour urgence](#).

La sélection **0** a pour effet de désactiver l'interruption du mode d'urgence par une longue pression de touche. Il est toujours possible d'interrompre le mode d'urgence en mettant la radio hors tension.

Les sélections suivantes sont prises en charge :

Tableau 37 : Portée

Minimum	Maximum	Incréments
0 (ms)	63750 (ms)	250 (ms)

10.4.2.5

Mise hors tension normale

Ce champ permet de sélectionner une touche particulière de la radio sur lequel vous devez appuyer (après avoir placé l'interrupteur d'alimentation en position « Arrêt ») pour mettre la radio hors tension.

Cette sélection s'applique à toute la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Désactivé;

Pour mettre la radio hors tension, il suffit de placer l'interrupteur d'alimentation en position « Arrêt ».

Touche latérale 1

Pour mettre la radio hors tension, il faut appuyer sur le bouton latéral supérieur après avoir placé l'interrupteur d'alimentation en position « Arrêt ». Dans le guide d'utilisation, ce bouton est appelé bouton supérieur latéral (de sélection).

Touche latérale 2

Pour mettre la radio hors tension, il faut appuyer sur le bouton latéral du milieu après avoir placé l'interrupteur d'alimentation en position « Arrêt ». Dans le guide d'utilisation, ce bouton est appelé bouton latéral 1.

Touche latérale 3

Pour mettre la radio hors tension, il faut appuyer sur le bouton latéral inférieur après avoir placé l'interrupteur d'alimentation en position « Arrêt ». Dans le guide d'utilisation, ce bouton est appelé bouton latéral 2.

10.4.2.6

Activation du dernier canal sélectionné par zone

Ce champ permet de faire afficher automatiquement sur la radio votre plus récent canal sélectionné pour chaque zone.

Lorsque vous faites défiler les zones de la radio, la radio garde en mémoire le dernier canal sélectionné pour chaque zone, qui devient immédiatement disponible. Vous pouvez ensuite sélectionner n'importe quel autre canal désiré dans une zone. Cette fonction s'applique à votre radio.

Si la case n'est pas cochée, la radio demeure sur le canal présentement sélectionné quand on passe dans une nouvelle zone. Exemple : la radio est sur le canal 14 dans la zone 3; si la zone change pour la 15, le canal est maintenant le canal 14 de la zone 15. Veuillez noter que si la zone 15 ne comprend pas de canal 14, et que **NON PROGRAMMÉ** est affiché sur l'écran de la radio, vous devez choisir un canal qui fait partie de la nouvelle zone.

REMARQUE :

Lorsque cette fonction est activée, les champs [Dernière zone et dernier canal sélectionnés à la mise sous tension](#) à la page 148 et [Canal du mode Accueil](#) à la page 145 deviennent également activés et en lecture seule (non modifiable).

10.4.2.7

Dernière zone et dernier canal sélectionnés à la mise sous tension

Lorsque ce champ est activé, la zone courante et les positions d'interrupteur de canal sont ignorées durant la mise sous tension.

Ce champ entraîne également la mise sous tension de la radio sur la dernière zone et les dernières positions d'interrupteur de canal sélectionnées juste avant la mise hors tension. Si la case n'est pas cochée, la radio est mise sous tension en fonction de la zone et du canal présentement sélectionnés. Cette fonction s'applique à toute la radio.

AVERTISSEMENT :

Les sélections du commutateur rotatif ou des commutateurs Sélection de zone et Sélection de canal doivent être programmées.

Accès seulement : Lorsque l'Activation du dernier canal sélectionné par zone est **désactivée** et lorsque le modèle et les options de la radio le permettent.

REMARQUE :

Lorsque l'Activation du dernier canal sélectionné par zone est **activée**, ce champ l'est également en lecture seule/non modifiable.

10.4.2.8

Verrouillage du contrôle de volume avec RSM

Ce champ permet de sélectionner la ou les commandes de volume qui peuvent régler le volume de la radio lorsqu'un accessoire est branché sur la radio.

Cette fonction s'applique à toute la radio.

Accès seulement : cette option est uniquement offerte lorsque le modèle ou les options du microphone le permettent.

Les sélections suivantes sont prises en charge :

Aucun

Le contrôle du volume de la radio et celui de l'accessoire peuvent tous deux sélectionner le volume de la radio.

Verrouiller radio seulement

Lorsqu'un accessoire doté d'une fonction de contrôle de volume est branché, le contrôle de volume de la radio devient inutilisable, et c'est celui de l'accessoire qui sélectionne le volume de la radio.

10.4.2.9

Verrouillage du contrôle de canaux avec accessoire

Ce champ permet au canal de contrôle d'un accessoire radio de contourner et de verrouiller le contrôle des canaux de la radio.

Cette fonction s'applique à toute la radio.

REMARQUE :

Ce champ ne doit pas être activé si le microphone RMN5067 est utilisé, car ce microphone ne comporte pas de bouton de contrôle de canaux.

Accès seulement : lorsque le modèle ou les options du microphone le permettent.

Les sélections suivantes sont prises en charge :

Aucun

Le contrôle des canaux de la radio et celui de l'accessoire peuvent tous deux sélectionner les canaux radio.

Verrouiller radio seulement

Lorsqu'un accessoire doté d'une fonction de contrôle de canaux est branché, le contrôle de canaux de la radio devient inutilisable, et c'est celui de l'accessoire qui sélectionne les canaux radio.

10.4.2.10

Microphone actif pour bouton PTT

Ce champ permet de sélectionner le microphone qui devient activé lorsque vous appuyez sur la touche PTT.

Cette fonction s'applique à toute la radio.

IMPORTANT :

Le paramètre de ce champ n'est pas pris en charge pour les accessoires tiers. Tout changement aux paramètres doit être apporté le concepteur de votre accessoire.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Microphone de la radio

Le microphone interne de la radio sera activé.

Haut-parleur microphone à distance (RSM)

Le microphone à distance pour haut-parleur (RSM) sera activé.

Le microphone interne de la radio assure le fonctionnement si un RSM n'est pas disponible lorsque vous appuyez sur la touche PTT.

Lorsque la radio est connectée à un adaptateur véhiculaire (VA) doté d'un microphone fixé à son port de microphone mobile (MMP), ce microphone sera activé.

Microphone sans fil

Le microphone sans fil sera activé.

Le microphone interne de la radio assure le fonctionnement si un microphone sans fil n'est pas disponible lorsque vous appuyez sur la touche PTT.

10.4.2.11

Microphone actif pour le PTT du RSM

Ce champ permet de sélectionner le microphone qui devient activé lorsque vous appuyez sur la touche PTT du microphone haut-parleur distant (RSM).

Cette fonction s'applique à toute la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Microphone de la radio

Le microphone interne de la radio sera activé.

Haut-parleur microphone à distance (RSM)

Le RSM devient activé.

Le microphone interne de la radio assure le fonctionnement si un RSM n'est pas disponible lorsque vous appuyez sur la touche PTT.

Lorsque la radio est connectée à un adaptateur de véhicule (VA) doté d'un microphone fixé à son MMP (port de microphone mobile), ce microphone sera activé.

Microphone sans fil

Le microphone sans fil sera activé.

Le microphone interne de la radio assure le fonctionnement si un microphone sans fil n'est pas disponible lorsque vous appuyez sur la touche PTT.

10.4.2.12

Verrouillage de l'écran tactile activé

Ce champ vous permet d'activer l'option de déverrouiller et verrouiller de l'écran tactile.

10.4.2.13

Verrouiller des boutons latéraux et de la grille du haut-parleur activé

Ce champ active la fonction de verrouillage des boutons supérieur latéral, milieu latéral, bas latéral et de la grille du haut-parleur.

REMARQUE :

Les boutons qui sont programmés avec les fonctions de commande vocale ViQi et de partenaire virtuel ViQi restent déverrouillés.

Vous pouvez activer ou désactiver cette fonction en appuyant sur la touche de verrouillage du clavier ou des commandes, ou en appuyant sur le commutateur de verrouillage du clavier ou des commandes. Cette fonction s'applique à toute la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.4.3

Tête de commande

Cette section permet d'afficher ou de modifier les paramètres d'un environnement à têtes de commande multiples reliées à un émetteur-récepteur.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.4.3.1

Luminosité de la mise sous tension de la tête de commande

Cette fonction permet à chaque tête de commande de se mettre sous tension avec la luminosité sélectionnée précédemment ou avec la luminosité minimale.

Si l'utilisateur précédent a sélectionné la luminosité minimale ou une luminosité supérieure, la tête de commande se met sous tension avec la même luminosité.

Chaque tête de commande se met au minimum sous tension avec la luminosité minimale. Si la luminosité sélectionnée par l'utilisateur précédent d'une tête de commande est égale au minimum, alors cette tête de commande doit être mise sous tension avec la luminosité minimale. Si la luminosité sélectionnée par l'utilisateur précédent d'une tête de commande est supérieure au minimum, alors cette tête de commande doit être mise sous tension avec la luminosité minimale sélectionnée par l'utilisateur précédent.

**REMARQUE :**

Ce champ n'est pas disponible si **Radio secondaire** est sélectionné dans le champ **Radio double – Sélection de radio**.

Dernier mode (par défaut)

La tête de commande s'allume et maintient la dernière luminosité sélectionnée.

Minimum

La tête de commande s'allume avec la luminosité minimale si elle était en **mode Obscurité** ou maintient le niveau qu'elle avait auparavant.

10.5

Localisation du personnel

La **Localisation du personnel** permet à l'utilisateur de visualiser ou de définir la fonctionnalité ayant trait à la fonction de localisation du personnel. Ces paramètres s'appliquent à toute la radio pour les canaux de communication activés pour la localisation du personnel.

Lorsque l'abonné reçoit une commande Évacuation (EVAC) ou Rapport de localisation du personnel (PAR) sur un canal vocal ou un canal de données, le premier répondant verra cette information affichée à l'écran et entendra une tonalité. Lorsque le premier répondant appuie sur le bouton PTT, la radio transmet un accusé de réception pour informer le commandant en cas d'incident que la commande a été reçue.

**REMARQUE :**

Les paramètres de localisation du personnel doivent être définis pour chaque personnalité conventionnelle. Voir les champs Type de signalement d'incident, Inscription d'imputabilité du personnel et Type de voix Tx de la fenêtre Personnalité conventionnelle.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.5.1

Sélection de la liste AC

Ce champ permet de sélectionner une consolidation de l'action de 0 à 16 pour la liste de localisation du personnel.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

**AVERTISSEMENT :**

ce champ doit renvoyer à une consolidation de l'action où **Type d'action** est réglé à **Localisation du personnel**.

10.5.2

Nom de liste de localisation du personnel

Ce champ vous permet de créer un nom reconnaissable pour la liste de localisation du personnel courante.

La liste d'alerte de localisation du personnel est sélectionnée à partir du champ Sélection de la liste de localisation du personnel d'un système conventionnel ou ADF.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.6

Consolidation de l'action

La **Consolidation de l'action** permet d'afficher et de définir des séquences particulières d'actions radio, que l'on appelle actions consolidées. Dans une action consolidée, les actions sous-jacentes peuvent être conçues de manière à s'exécuter (dans la radio) une à la fois, dans un ordre précis. Il est possible de créer des actions consolidées multiples. Ces actions consolidées peuvent ainsi être exécutées facilement par l'utilisateur de la radio.

IMPORTANT :

Lorsque la radio est sous tension, toute action consolidée associée à la position courante du sélecteur de réponse est exécutée.

Si l'action consolidée comporte un changement de canal ou de mode, la radio retourne toujours à son canal ou à son mode initial après l'exécution totale ou partielle de l'action.

Même si les actions consolidées peuvent être annulées, leur déroulement est si rapide que leur interruption est peu probable.

- Pour interrompre une action consolidée, il faut appuyer sur le bouton associé à la fonction Accueil, sélectionner l'option de menu QUITTER, sélectionner le bouton PTT (à condition que le mode Diffusion publique ne soit pas activé) ou activer le mode d'urgence.
- Les fonctions Schéma de relais, Type de sirène ou Rapport sur le message GPS sont les premières à s'exécuter; leur action est donc quasi immédiate.

REMARQUE :

L'utilisateur de la radio peut lancer la fonction Consolidation de l'action à l'aide du sélecteur de réponse ou en appuyant sur un bouton-poussoir.

Il est fortement recommandé d'assigner la position « 0 » du sélecteur de réponse à une action consolidée qui attribue l'état « Non assigné » ou ALL OFF à l'ensemble des schémas de relais, des tonalités de sirène, des rapports sur les messages GPS et des changements de modes, de même qu'à l'état direct. Il peut aussi être souhaitable d'assigner cette action à un bouton.

10.6.1

Général (Consolidation de l'action)

La section **Général** de l'ensemble **Consolidation de l'action** contient les champs suivants :

10.6.1.1

Type d'action

Ce champ détermine le type de Consolidation de l'action courante qui sera utilisé.

Les sélections suivantes sont disponibles :

Général

La Consolidation de l'action est appliquée pour l'action d'entrée dans un géopère essentiel.

Quitter le géorepère

La Consolidation de l'action est appliquée pour l'action de sortie ou d'entrée dans un géorepère essentiel.

Localisation du personnel

La Consolidation de l'action est appliquée en tant que Sélection de la liste AC pour la Localisation du personnel ou action d'entrée dans un géorepère essentiel.

Partenaire virtuel

La consolidation de l'action est appliquée lorsque la radio reçoit une alerte de partenaire virtuel à partir du système.

ViQi : Partenaire virtuel

La consolidation de l'action est appliquée lorsque la radio reçoit une alerte de partenaire virtuel à partir du système.

10.6.1.2

Action permise sur sélecteur de réponse

L'application permet de voir l'action consolidée courante en lecture seule et de connaître sa disponibilité aux fins de configuration du sélecteur de réponse.

Si un ID d'action (enregistrement ou rangée) est réglé à **Mode** pour l'action consolidée courante, ce champ est alors décoché, ce qui indique que le sélecteur de réponse n'est pas disponible pour l'action consolidée courante. Si le champ est coché, le sélecteur de réponse est disponible pour l'action consolidée courante.

Accès seulement : Lorsque le modèle ou les options de la radio le permettent et que le champ [Type d'action à la page 152](#) est réglé à **Commande**.

10.6.1.3

Couleur de rétroéclairage

Ce champ vous permet de sélectionner un rétroéclairage lorsque l'action consolidée est déclenchée.

Les options suivantes sont prises en charge :

- Désactivé;
- Rouge
- Orange
- Vert

10.6.1.4

Nom d'action consolidée

Ce champ permet de définir des noms reconnaissables pour la l'action consolidée courante.

Ce champ est également utilisé comme alias d'alerte de localisation du personnel pour mettre le texte en surbrillance lorsque la consolidation de l'action correspond au type d'action Localisation du personnel.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Vous pouvez utiliser jusqu'à 14 caractères.

Exemples : Arrêt circulation, En poursuite, n° 510

10.6.2

Liste des actions de consolidation (Consolidation des actions)

La section **Liste des Actions de Consolidation**.

10.6.2.1

ID d'action

Ce champ permet de sélectionner le type d'ID d'action (enregistrement/rangée) courant de l'action consolidée courante.

Une seule action consolidée peut comporter plusieurs ID d'action (changements de mode et d'état direct), Cela permet à la radio de transmettre automatiquement un état direct en utilisant le mode radio approprié. Lors de la définition de multiples ID d'action, les actions s'exécutent dans l'ordre descendant. Vous pouvez lancer la fonction Consolidation de l'action à l'aide du sélecteur de réponse ou en appuyant sur un bouton-poussoir.

Exemple : L'exemple suivant présente une action consolidée comportant plusieurs ID d'action. Dans ce cas, la radio compte trois canaux (800 MHz ADF, VHF ADF et ASTRO conventionnel), et le but est de diffuser automatiquement l'état **Sur les lieux** sur ces trois canaux à la fois à partir de l'action consolidée.

Tableau 38 : Exemples

Paramètres des ID d'action	Détails des paramètres	Action de la radio
Rangée 1 = "Mode"	Mode pour le canal 800 MHz ADF désiré	La radio passe au canal désiré
Rangée 2 = "État direct"	État direct à « Sur place »	La radio transmet l'état sur le canal désiré
Rangée 3 = "Mode"	Mode vers le canal VHF ADF désiré	La radio passe au canal désiré
Rangée 4 = "État direct"	État direct à « Sur place »	La radio transmet l'état sur le canal désiré
Rangée 5 = "Mode"	Mode vers le canal ASTRO conventionnel désiré	La radio passe au canal désiré
Rangée 6 = "État direct"	État direct à « Sur place »	La radio transmet l'état sur le canal désiré
Rangée 7 = "Mode"	Mode pour le canal 800 MHz ADF désiré	La radio passe au canal désiré

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

État direct

Permet de sélectionner l'état pour l'action consolidée courante. La sélection de l'index pour l'action consolidée courante (enregistrement/rangée) détermine l'état direct à transmettre.

- Lors de l'utilisation de la radio en mode conventionnel, la sélection du numéro d'index correspond au numéro d'état contenu dans la Liste d'alias état pour les communications conventionnelles. Il existe une seule liste d'alias état pour les communications conventionnelles; par conséquent, les numéros d'état de la liste d'alias état s'appliquent à toutes les personnalités conventionnelles.
- Lors de l'utilisation de la radio en mode ADF, la sélection du numéro d'index correspond au numéro d'état contenu dans la liste d'alias état pour le mode ADF. Le mode ADF autorise une

seule liste d'alias état par système ADF; par conséquent, le texte d'état utilisé pour un même numéro d'état peut varier selon le système ADF.

Mode

Entraîne la modification par la radio du canal/mode dans le cadre de l'action consolidée courante. Les sélections Zone et Canal déterminent les modes actuellement disponibles. Une fois l'action consolidée terminée, la radio retourne au mode (zone et canal) sur lequel elle transmettait ou recevait des communications avant l'exécution de l'action consolidée.

REMARQUE :

Une fois l'action consolidée terminée, la radio retourne au mode (zone et canal) sur lequel elle transmettait ou recevait des communications avant l'exécution de l'action consolidée.

Message direct

Entraîne la transmission par la radio du message défini dans la liste d'alias message conventionnel ou ADF dans le cadre de l'action consolidée courante.

Annonce vocale

Entraîne la lecture par la radio de l'annonce vocale désignée dans le cadre de l'action consolidée courante.

Message texte

Permet de définir un message texte, qui s'affiche lors du déclenchement de l'action consolidée courante.

Niveau de puissance de transmission

Entraîne la modification par la radio du niveau de puissance de transmission dans le cadre de l'action consolidée courante.

Alerte sélectionnable par site muet

Entraîne l'activation par la radio de l'alerte sélectionnable par site muet dans le cadre de l'action consolidée courante.

10.6.2.2

Index

Ce champ permet de sélectionner l'état ou le message qui sera transmis automatiquement pour l'ID d'action courante (enregistrement/rangée) de l'action consolidée courante.

Vous pouvez exécuter une action consolidée en sélectionnant l'option Consolidation de l'action définie dans le Sélecteur de réponse ou en appuyant sur un bouton ou sur le déclencheur de l'entrée/sortie de Géopère essentiel de l'unité d'abonné ou avec une commande de Localisation du personnel EVAC/PAR.

IMPORTANT :

- Lors de l'utilisation de la radio en mode conventionnel, la sélection de ce numéro d'index correspond au numéro défini pour cet état dans la liste d'alias état conventionnel. Il existe une seule liste d'alias état pour les communications conventionnelles; par conséquent, les numéros d'état de la liste d'alias état s'appliquent à toutes les personnalités conventionnelles.
- Lors de l'utilisation de la radio en mode ADF, la sélection de ce numéro d'index correspond au numéro défini pour cet état dans la liste d'alias état du mode ADF. Comme le mode ADF ne permet qu'une seule liste d'alias état par système ADF, le texte d'état avec le même numéro d'état peut varier en fonction du système ADF.

Exemple : L'exemple suivant présente une action consolidée comportant plusieurs ID d'action. Dans ce cas, la radio compte trois canaux (800 MHz ADF, VHF ADF et ASTRO conventionnel), et le but est de diffuser automatiquement l'état **Sur les lieux** sur ces trois canaux à la fois à partir de l'action consolidée.

Tableau 39 : Exemples

Paramètres des ID d'action	Détails des paramètres	Action de la radio
Rangée 1 = "Mode"	Mode vers le canal 800 MHz ADF désiré	La radio passe au canal désiré
Rangée 2 = "État direct"	État direct à « Sur place »	La radio transmet l'état sur le canal désiré
Rangée 3 = "Mode"	Mode vers le canal VHF ADF désiré	La radio passe au canal désiré
Rangée 4 = "État direct"	État direct à « Sur place »	La radio transmet l'état sur le canal désiré
Rangée 5 = "Mode"	Mode vers le canal ASTRO conventionnel désiré	La radio passe au canal désiré
Rangée 6 = "État direct"	État direct à « Sur place »	La radio transmet l'état sur le canal désiré
Rangée 7 = "Mode"	Mode vers le canal 800 MHz ADF désiré	La radio passe au canal désiré

REMARQUE :

Une fois l'action consolidée terminée, la radio retourne au mode (zone et canal) sur lequel elle transmettait ou recevait des communications avant l'exécution de l'action consolidée.

Accès seulement : Lorsque la valeur d'ID d'action pour l'enregistrement/rangée courant est réglée à **État direct**,

et lorsque le champ Type d'action est réglé à **Général**,

et la valeur du champ ID d'action pour la l'enregistrement/rangée courant est réglée à **État direct** ou à **Message direct**,

et lorsque le champ Type d'action est réglé à **Général**,

lorsque le modèle ou l'option de la radio le permet.

10.6.2.3

Zone

Ce champ permet de sélectionner le changement de zone pour l'ID d'action courante (enregistrement/rangée) de l'action consolidée courante.

Une fois la zone sélectionnée, le canal doit être celui de l'enregistrement/rangée courant. Vous pouvez exécuter une action consolidée en sélectionnant l'option Consolidation de l'action définie dans le sélecteur de réponse ou en appuyant sur un bouton ou sur le déclencheur de l'entrée Géopère essentiel de l'unité d'abonné.

AVERTISSEMENT :

Les zones d'interface de site à distance (RSI) ne sont pas valides et ne peuvent pas être sélectionnées (zones pour lesquelles le mode RSI est activé).

Accès seulement : Lorsque le champ **ID d'action à la page 154** de l'enregistrement/rangée courant est réglé à **Mode**, et que le champ **Type d'action à la page 152** est réglé à **Général** ou à **Contrôle**, et que le modèle ou les options de la radio le permettent.

10.6.2.4

Canal

Ce champ permet de sélectionner le changement de canal pour l'ID d'action courant (enregistrement/rangée) de l'action consolidée courante.

La Zone associée à la rangée ou à l'enregistrement courant doit être sélectionnée avant que le canal ne soit défini.

Accès seulement : Lorsque le champ ID d'action pour l'enregistrement/rangée en cours est réglé à **Mode**, et lorsque le champ Zone n'est pas attribué et lorsque le champ Type d'action est sur **Général** ou **Contrôler** et lorsque le modèle ou les options de la radio le permettent.

10.6.2.5

Fichier audio d'alerte

Ce champ permet à l'utilisateur de la radio de sélectionner le fichier d'annonce vocale Motorola (*.MVA) à utiliser en tant qu'alerte de localisation du personnel courante (rangée/enregistrement) dans la liste de localisation du personnel.

L'invite d'alerte est émise lorsque la radio reçoit la commande Évacuation (EVAC) ou Rapport d'imputabilité du personnel (PAR) du chef des incidents.

Accès seulement : lorsque le champ [Type d'action à la page 152](#) est réglé à **Général**, à **Quitter le géorepère** ou à **Localisation du personnel** et que le champ [ID d'action à la page 154](#) pour l'enregistrement courant ou la rangée courante est réglé à **Annonce vocale**, et que le modèle ou l'option de la radio le permet.

10.6.2.6

Intervalle d'alerte

Ce champ permet de sélectionner l'intervalle entre les alertes de localisation de personnel répétitives.

Accès seulement : lorsque le champ [Type d'action à la page 152](#) est réglé à **Général**, à **Quitter le géorepère** ou à **Localisation du personnel** et que le champ [ID d'action à la page 154](#) pour l'enregistrement/rangée courante est réglé à **Annonce vocale**, et que le modèle ou l'option de la radio le permet.

**AVERTISSEMENT :**

Dans la consolidation de l'action courante, une seule action est permise, ce qui consiste en une plage de 1 à 254 ou « Continu ».

Les sélections suivantes sont prises en charge :

255

Momentané

0

Continu

Tableau 40 : Portée

Minimum	Maximum	Incréments
1 seconde	254 seconde	1 seconde

10.6.2.7

Message texte

Ce champ vous permet d'afficher ou de définir le message texte pour l'ID d'action actuel (enregistrement ou rangée) de l'action consolidée en cours.

10.6.2.8

Niveau de puissance de transmission

Si un Niveau de puissance de transmission est sélectionné lors de la saisie du géopère, le niveau de puissance passe au niveau spécifié (élevé ou faible).

Lorsque la radio quitte le géopère, si le Niveau de puissance de transmission de l'unité d'abonné a été changé à l'entrée, il retourne au dernier niveau sélectionné par l'utilisateur.

Accès seulement : Lorsque le champ [ID d'action à la page 154](#) de l'enregistrement/rangée est réglé sur **Niveau de puissance de transmission** et que le [Type d'action à la page 152](#) est réglé sur **Général** et que le modèle ou les options de la radio le permettent.

Les sélections suivantes sont prises en charge :

Basculer à Faible

Basculer le niveau de puissance de transmission à faible.

Basculer à Élevé

Basculer le niveau de puissance de transmission à élevé.

10.6.2.9

Alerte sélectionnable par site muet

Si l'Alerte sélectionnable par site muet est sélectionnée dans le champ ID d'action lors de la saisie du géopère, l'unité de l'abonné (UA) met en sourdine l'alerte sélectionnable par site actuelle.

Lorsqu'une sortie de géopère est détectée, si l'unité de l'abonné a déjà coupé une alerte sélectionnable par site en raison des actions d'entrée, l'unité d'abonné doit activer l'alerte sélectionnable par site.

Accès seulement : lorsque le champ [ID d'action à la page 154](#) pour l'enregistrement/rangée courant est réglé à **Alerte sélectionnable par site muet** et lorsque le champ [Type d'action à la page 152](#) est réglé à **Général**, et lorsque le modèle ou les options de la radio le permettent.

10.6.2.10

Stratégie d'erreur

Ce champ permet de sélectionner la stratégie d'erreur désirée pour l'ID d'action courant (enregistrement/rangée) de l'action consolidée courante.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Quitter en cas d'erreur

En cas d'erreur, la radio quitte immédiatement l'action consolidée courante sans en terminer l'exécution.

Continuer en cas d'erreur

En cas d'erreur, la radio ne quitte pas l'action consolidée courante et en termine l'exécution.

10.7

Géopère essentiel

Le **géopère essentiel** vous permet d'afficher et de définir des profils de géopère essentiel, notamment le nom d'alias de géopère, la priorité, le rayon (mètres), l'action d'entrée, l'action de sortie, la longitude et la latitude.

La fonction Géopère essentiel définit un périmètre virtuel pour une zone géographique réelle.

Les coordonnées de géopère (latitude/longitude) et les actions d'entrée et de sorties associées sont programmées directement dans la radio.

Une fois configurés, la radio effectue à l'interne des vérifications de géopère et des actions chaque fois qu'elle reçoit une nouvelle position GPS, soit chaque seconde.

Le géopère essentiel prend deux formes dans une zone géographique : **Cercle** et **Polygone**. S'il y a seulement une coordonnée dans la table Coordonnées, celle-ci est alors considérée comme étant le cercle du géopère et vous pouvez entrer manuellement le rayon.

S'il y a seulement deux coordonnées dans la table Coordonnées, alors la première coordonnée est considérée comme étant le centre du cercle du géopère et la distance entre la première et la deuxième coordonnée est calculée automatiquement et considérée comme étant le rayon.

S'il y a de trois à 100 coordonnées dans la table Coordonnées, alors ces coordonnées sont considérées comme étant le géopère polygone et ce géopère polygone est relié par les coordonnées considérées une par une.

REMARQUE :

Vous pouvez modifier manuellement les profils de géopère essentiel.

Vous pouvez cliquer sur **Importer le fichier de carte**  pour importer le fichier Google Earth au format Keyhole Markup Language (KML) ou Keyhole Markup Language Zipped (KMZ) du disque local dans le géopère essentiel.

Vous pouvez cliquer sur **Exporter le fichier de carte**  pour exporter le profil de géopère essentiel courant vers le disque local au format KML.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet , et que le champ Activer l'emplacement est réglé à **Activé**.

Voir [Fonctions Géopère essentiel](#) :

10.7.1

Nom d'alias de géopère

Ce champ vous permet d'afficher ou de définir des noms reconnaissables pour le géopère essentiel courant.

Accès seulement : lorsque le modèle ou les options de la radio le permettent et que le champ Activer l'emplacement est réglé à Activé.

10.7.2

Priorité de

Ce champ vous permet de déterminer le géopère qui est exécuté lorsqu'il y a plus d'une zone de géopère qui se chevauchent.

IMPORTANT :

- La priorité pour chaque profil de géopère doit être mutuellement exclusive.

Tableau 41 : Portée

Minimum	Maximum	Incréments
1 (priorité la plus basse)	100 (priorité la plus élevée)	1

Accès seulement : lorsque le modèle ou les options de la radio le permettent et que le champ Activer l'emplacement est réglé à Activé.

10.7.3

Rayon de (mètres)

Ce champ vous permet de déterminer le rayon du cercle de géorepère.

IMPORTANT :

- **Cercle de géorepère** : seulement une ou deux coordonnées sont répertoriées dans le tableau des coordonnées.
Cercle de géorepère à une seule coordonnée : la coordonnée est considérée comme étant le cercle du géorepère et vous entrer manuellement le rayon.
Cercle de géorepère avec seulement deux coordonnées : la première est considérée comme le centre du cercle de géorepère. La distance entre la première et la seconde coordonnée est automatiquement calculée et considérée comme le rayon du cercle de géorepère.
- **Polygone de géorepère** : Trois coordonnées ou plus sont répertoriées dans le tableau des coordonnées.
Le rayon est réglé à **Désactivé** automatiquement par la RM lorsque le géorepère est en forme de polygone.

Tableau 42 : Portée

Portée	Incréments	Désactivé;
10 - 500 000 (mètres)	1 (mètre)	Aucun rayon utilisé pour le cercle de géorepère

Accès seulement : lorsque le modèle ou les options de la radio le permettent et que le champ Activer l'emplacement est réglé à Activé.

10.7.4

Action d'entrée de

Ce champ permet de sélectionner la consolidation d'action à utiliser avec le géorepère essentiel courant pour l'événement déclenché lorsque SU atteint un géorepère.

Les sélections suivantes sont prises en charge :

Non affecté

Aucune action d'entrée ne sera déclenchée.

Consolidations de l'action disponibles

Toutes les consolidations de l'action dont le Type d'action n'est PAS réglé sur **Commande**.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet et que le champ Activer l'emplacement est réglé à Activé.

10.7.5

Action de sortie de

Ce champ permet de sélectionner la consolidation d'action à utiliser avec le géorepère essentiel courant pour l'événement déclenché lorsque SU atteint un géorepère.

Les sélections suivantes sont prises en charge :

Non affecté

Aucune action de sortie ne sera déclenchée.

Consolidations de l'action disponibles

Toutes les consolidations de l'action dont le Type d'action est réglé sur **Quitter le géorepère**.

Accès seulement : lorsque le modèle ou les options de la radio le permettent et que le champ Activer l'emplacement est réglé à Activé.

10.7.6

Longitude

Ce champ vous permet de saisir une valeur de longitude pour une coordonnée.

Les sélections suivantes sont prises en charge :

Minimum

-180,0000000.

Maximum

180,0000000.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet et que le champ Activer l'emplacement est réglé à Activé.

10.7.7

Latitude

Ce champ vous permet de saisir une valeur de latitude pour une coordonnée.

Les sélections suivantes sont prises en charge :

Minimum

-90,0000000.

Maximum

90,0000000.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet et que le champ Activer l'emplacement est réglé à Activé.

10.8

Commande portative

Les sections **Boutons**, **Commuté**, **Éléments de menu**, **Clavier**, **Boutons FOB de touche intelligente**, et **Touches de l'accessoire** sont utilisées pour afficher ou sélectionner des fonctions de touche programmable pour toute la radio applicables aux modes de communications conventionnel et ADF.

IMPORTANT :

Pour les sections **Boutons**, **Boutons FOB de touche intelligente** et **Touches de l'accessoire**, la fonction de la touche est sélectionnée et s'applique séparément pour chacun des deux modes de communication radio. Cela signifie que lorsque la radio utilise un canal conventionnel, seules les fonctions conventionnelles sélectionnées sont disponibles pour l'utilisateur radio. De même, lorsque la radio utilise un canal ADF, seules les fonctions ADF sélectionnées sont disponibles pour l'utilisateur radio. Pour la section **Clavier**, la fonction de la touche est sélectionnée une seule fois et s'applique aux deux modes de communication radio.

REMARQUE :

Certaines fonctions dépendent du modèle de radio ou des options choisies.

10.8.1

Touches (Commande portative)

La section **Touches** permet à l'utilisateur d'afficher ou de sélectionner la fonctionnalité de touche programmable à l'échelle de la radio pour des modes de communication conventionnelle ou ADF. La fonctionnalité de touche est sélectionnée et fonctionne différemment selon le mode choisi. Cela

signifie que lorsque la radio utilise un canal conventionnel, seules les fonctions conventionnelles sélectionnées sont disponibles. De même, lorsque la radio utilise un canal ADF, seules les fonctions ADF sélectionnées sont disponibles.

REMARQUE :

Certaines fonctions dépendent du modèle de radio ou des options choisies.

Les champs suivants sont pris en charge :

10.8.1.1

Bouton du haut (Conventionnel)

Permet de sélectionner la fonction du bouton du haut.

Ces sélections s'appliquent lors de l'utilisation en mode de communication Conventionnel ou ADF, comme le décrit le tableau suivant.

AVERTISSEMENT :

L'utilisateur ne doit pas affecter une même fonction à plus d'une commande utilisateur, c'est-à-dire à plus d'un bouton, à plus d'un commutateur, ou à un bouton et à un commutateur. Le fonctionnement de la radio pourrait en être perturbé.

Voir [Sélections des touches \(supérieures et latérales\) à la page 164](#) pour une liste des sélections prises en charge :

10.8.1.2

Bouton du haut (ADF)

Permet de sélectionner la fonction du bouton du haut.

Voir [Bouton du haut \(Conventionnel\) à la page 162](#) pour les notes et les avertissements.

Voir [Sélections des touches \(supérieures et latérales\) à la page 164](#) pour une liste des sélections prises en charge :

10.8.1.3

Bouton du haut latéral (Conventionnel)

Permet de sélectionner la fonction du bouton du haut latéral.

Voir [Bouton du haut \(Conventionnel\) à la page 162](#) pour les notes et les avertissements.

Voir [Sélections des touches \(supérieures et latérales\) à la page 164](#) pour une liste des sélections prises en charge :

10.8.1.4

Bouton du haut latéral (ADF)

Permet de sélectionner la fonction du bouton du haut latéral.

Voir [Bouton du haut \(Conventionnel\) à la page 162](#) pour les notes et les avertissements.

Voir [Sélections des touches \(supérieures et latérales\) à la page 164](#) pour une liste des sélections prises en charge :

10.8.1.5

Bouton du milieu latéral (Conventionnel)

Permet de sélectionner la fonction du bouton latéral du milieu.

Voir [Bouton du haut \(Conventionnel\) à la page 162](#) pour les notes et les avertissements.

Voir [Sélections des touches \(supérieures et latérales\) à la page 164](#) pour une liste des sélections prises en charge :

10.8.1.6

Bouton latéral du milieu (ADF)

Permet de sélectionner la fonction du bouton latéral du milieu.

Voir [Bouton du haut \(Conventionnel\) à la page 162](#) pour les notes et les avertissements.

Voir [Sélections des touches \(supérieures et latérales\) à la page 164](#) pour une liste des sélections prises en charge :

10.8.1.7

Bouton du bas latéral (Conventionnel)

Permet de sélectionner la fonction du bouton latéral du bas.

Voir [Bouton du haut \(Conventionnel\) à la page 162](#) pour les notes et les avertissements.

Voir [Sélections des touches \(supérieures et latérales\) à la page 164](#) pour une liste des sélections prises en charge :

10.8.1.8

Bouton latéral du bas (ADF)

Permet de sélectionner la fonction du bouton latéral du bas.

Voir [Bouton du haut \(Conventionnel\) à la page 162](#) pour les notes et les avertissements.

Voir [Sélections des touches \(supérieures et latérales\) à la page 164](#) pour une liste des sélections prises en charge :

10.8.1.9

Bouton de la grille du haut-parleur (conventionnel)

Permet de sélectionner la fonction du bouton de la grille du haut-parleur.

Voir [Bouton du haut \(Conventionnel\) à la page 162](#) pour les notes et les avertissements.

Voir [Sélections des touches \(supérieures et latérales\) à la page 164](#) pour une liste des sélections prises en charge :

10.8.1.10

Bouton de la grille du haut-parleur (ADF)

Permet de sélectionner la fonction du bouton de la grille du haut-parleur.

Voir [Bouton du haut \(ADF\) à la page 162](#) pour les notes et les avertissements.

Voir [Sélections des touches \(supérieures et latérales\) à la page 164](#) pour une liste des sélections prises en charge :

10.8.1.11

Nom de la touche

Ce champ indique le nom du bouton programmable.

10.8.1.12

Touches (conventionnel)

Ce champ détermine la fonction sélectionnée pour la touche programmable correspondant en mode conventionnel.

Voir [Sélections des touches](#) pour une liste des sélections prises en charge.

10.8.1.13

Touches (ADF)

Ce champ détermine la fonction sélectionnée pour la touche programmable correspondante en mode ADF.

Voir [Sélections des touches](#) pour une liste des sélections prises en charge.

10.8.1.14

Sélections des touches (supérieures et latérales)

La section Commande portable permet à l'utilisateur de sélectionner la fonction pour les touches supérieures et latérales de radio portable.

Tableau 43 : Fonctions des touches supérieures et latérales de radio portable

Sélections des touches :	Cette sélection est valide seulement dans RadioCentral, et accessible à l'utilisateur :	Les sélections sont offertes dans RadioCentral selon les caractéristiques du matériel utilisé :
Lecture audio à la page 182	Lorsque cette option est sélectionnée, l'utilisateur y a toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection de RadioCentral.	<ul style="list-style-type: none"> • Clavier/Écran double • Écran supérieur • Écran avant et touches de menu/navigation • Écran avant et touches de menu • Prise • Touches du porte-clés Smart Key
Activation/désactivation de la fonction de retour automatique du canal	Lorsque le champ Activer le retour de canal est activé.	<ul style="list-style-type: none"> • Clavier/Écran double • Écran supérieur • Écran avant et touches de menu/navigation • Écran avant et touches de menu • Prise • Touches du porte-clés Smart Key
Balise à la page 182	Lorsque le modèle ou les options de la radio le permettent.	<ul style="list-style-type: none"> • Clavier/Écran double • Écran supérieur • Écran avant et touches de menu/navigation

Sélections des touches :	Cette sélection est valide seulement dans RadioCentral, et accessible à l'utilisateur :	Les sélections sont offertes dans RadioCentral selon les caractéristiques du matériel utilisé :
		<ul style="list-style-type: none"> • Écran avant et touches de menu • Prise • Touches du porte-clés Smart Key
Vierge à la page 182	(Pour les commandes non utilisées.)	<ul style="list-style-type: none"> • Clavier/Écran double • Écran supérieur • Écran avant et touches de menu/navigation • Écran avant et touches de menu • Prise • Touches du porte-clés Smart Key
Réacheminement audio Bluetooth à la page 182	<p>Lorsque le champ Activer Bluetooth à la page 137 est réglé à Activé.</p> <p> IMPORTANT : Cette sélection doit être réglée pour Conventionnel et ADF sur la même touche; par conséquent, lorsque la sélection est réglée pour le mode Conventionnel, RadioCentral règle automatiquement la sélection de la touche ADF correspondante.</p>	<ul style="list-style-type: none"> • Clavier/Écran double • Écran supérieur • Écran avant et touches de menu/navigation • Prise • Touches du porte-clés Smart Key
Configuration Bluetooth à la page 183	<p>Lorsque le champ Activer Bluetooth à la page 137 est réglé à Activé.</p> <p> IMPORTANT : Cette sélection doit être réglée pour Conventionnel et ADF sur la même touche; par conséquent, lorsque la sélection est réglée pour le mode Conventionnel, RadioCentral règle automatiquement la sélection de la touche ADF correspondante.</p>	<ul style="list-style-type: none"> • Clavier/Écran double • Écran avant et touches de menu/navigation • Prise

Sélections des touches :	Cette sélection est valide seulement dans RadioCentral, et accessible à l'utilisateur :	Les sélections sont offertes dans RadioCentral selon les caractéristiques du matériel utilisé :
Casque Bluetooth PTT à la page 183	<p>Lorsque le champ Activer Bluetooth à la page 137 est réglé à Activé.</p> <p> IMPORTANT : Cette sélection doit être réglée pour Conventionnel et ADF sur la même touche; par conséquent, lorsque la sélection est réglée pour le mode Conventionnel, RadioCentral règle automatiquement la sélection de la touche ADF correspondante.</p>	<ul style="list-style-type: none"> • Clavier/Écran double • Écran supérieur • Écran avant et touches de menu/navigation • Prise • Touches du porte-clés Smart Key
Activer ou désactiver Bluetooth à la page 183	<p>Lorsque le champ Activer Bluetooth à la page 137 est réglé à Activé.</p> <p> IMPORTANT : Cette sélection doit être réglée pour Conventionnel et ADF sur la même touche; par conséquent, lorsque la sélection est réglée pour le mode Conventionnel, RadioCentral règle automatiquement la sélection de la touche ADF correspondante.</p>	<ul style="list-style-type: none"> • Clavier/Écran double • Écran supérieur • Écran avant et touches de menu/navigation
Alerte d'appel à la page 183	<p>Pour le mode Conventionnel, lorsque le champ Rx/Tx d'avis d'appel à la page 471 de personnalité conventionnelle ASTRO est réglé à Encoder ou à Décoder et encoder ou lorsque le champ Rx/Tx d'avis d'appel à la page 466 est réglé à Encoder ou à Décoder et encoder pour le canal actuel de la radio.</p> <p>Pour le mode ADF, lorsque le champ Alerte d'appel/Notification à la page 570 de personnalité ADF est réglé à Liste seulement ou Illimité pour le canal actuel de la radio.</p>	<ul style="list-style-type: none"> • Clavier/Écran double • Écran avant et touches de menu/navigation • Prise • Touches du porte-clés Smart Key
Réponse à l'appel à la page 183	<p>Pour le mode Conventionnel, lorsque le champ Fonctionnement du téléphone n'est pas réglé à Aucun pour le canal actuel de la radio.</p> <p>Pour le mode ADF, lorsque le champ Fonctionnement du téléphone à la page 573 de la personnalité ADF n'est pas réglé à Désactivé, ou lorsque le champ Type d'appel privé à la page 569 n'est pas réglé à Désactivé pour le canal actuel de la radio.</p>	<ul style="list-style-type: none"> • Clavier/Écran double • Écran supérieur • Écran avant et touches de menu/navigation • Écran avant et touches de menu • Prise • Touches du porte-clés Smart Key

Sélections des touches :	Cette sélection est valide seulement dans RadioCentral, et accessible à l'utilisateur :	Les sélections sont offertes dans RadioCentral selon les caractéristiques du matériel utilisé :
Annonce du canal à la page 184	Lorsqu'un fichier d'annonce vocale a été sélectionné dans le champ Affectation du canal de zone, Annonce du canal à la page 674 du canal courant de la radio.	<ul style="list-style-type: none"> • Clavier/Écran double • Écran supérieur • Écran avant et touches de menu/navigation • Écran avant et touches de menu • Prise • Touches du porte-clés Smart Key
Canal suivant à la page 184	 <p>AVERTISSEMENT : Cette fonction doit être attribuée simultanément aux fonctions conventionnelles et ADF. Si l'utilisateur l'attribue à une touche pour le mode Conventionnel, elle est attribuée automatiquement à la même touche pour le mode ADF. La disponibilité dépend du modèle et des options de la radio.</p>	<ul style="list-style-type: none"> • Clavier/Écran double • Écran supérieur • Écran avant et touches de menu/navigation • Écran avant et touches de menu • Prise • Touches du porte-clés Smart Key

10.8.1.14.1

Activation/désactivation de la fonction de retour automatique du canal

Sur un canal avec fonction de reprise, appuyez sur cette touche pour activer la fonction de reprise automatique du canal. Le fait d'appuyer sur cette touche et de la maintenir enfoncée désactive la fonction et ramène la radio au dernier canal sélectionné par l'utilisateur.

10.8.1.14.2

Lecture audio

La lecture audio fait entendre le son sélectionné.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

10.8.1.14.3

Balise

Cette touche vous permet de vérifier les détails des balises d'urgence récemment reçues.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

10.8.1.14.4

Vierge

Sélectionnez cette option pour un bouton non utilisé.

Vous entendez une courte tonalité lorsque vous appuyez sur cette touche. Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

10.8.1.14.5

Réacheminement audio Bluetooth

Cette fonction vous permet de choisir l'option de routage audio des haut-parleurs, entre le haut-parleur interne ou externe (RSM/DRSM) d'une radio portative et les haut-parleurs sans fil d'un accessoire Bluetooth.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

10.8.1.14.6

Configuration Bluetooth

Cette touche permet d'afficher des informations sur l'état Bluetooth ainsi que sur les options Bluetooth.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

Les fonctions suivantes sont incluses :

État Bluetooth

Vous permet d'activer ou de désactiver la fonction Bluetooth de la radio.

Appareil actif

Vous permet d'afficher la liste de tous les appareils Bluetooth (appariés) actuellement actifs.

Haut-parleur Bluetooth

Vous permet d'activer ou de désactiver le haut-parleur d'un appareil Bluetooth.

10.8.1.14.7

Casque Bluetooth PTT

Cette touche sert de bouton PTT principal, ou supplémentaire, pour un casque sans fil Bluetooth; elle vous permet d'activer la radio quand vous utilisez le microphone du casque Bluetooth comme source audio.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

10.8.1.14.8

Activer ou désactiver Bluetooth

Cette fonction permet d'activer et de désactiver les fonctions Bluetooth de la radio.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

10.8.1.14.9

Alerte d'appel

Cette fonction vous permet de transmettre une alerte d'appel en mode conventionnel ou une alerte d'appel/notification en mode ADF.

**REMARQUE :**

Les alertes d'appel et les notifications permettent au répartiteur ou à l'appelant radio d'informer l'utilisateur de la radio cible (ou un groupe d'utilisateurs radio) qu'un appel a été manqué.

Les radios réceptrices sont ciblées d'après les renseignements sur la radio et le système qui ont été définis dans les champs Contact et Identification de l'appel des listes d'appel privilégiées de la radio. Vous pouvez entrer directement ou sélectionner les ID d'appel dans la liste courte du canal.

La radio réceptrice vous envoie des tonalités d'alerte et des alertes visuelles. L'alerte visuelle (clignotement de l'indicateur à DEL) persiste jusqu'à ce que vous appuyiez sur une touche.

10.8.1.14.10

Réponse à l'appel

Ce bouton vous permet de répondre à un appel téléphonique (conventionnel ou ADF) ou à un appel privé, et de raccrocher. (Mode de communication ADF seulement)

10.8.1.14.11

Annnonce du canal

Cette touche vous permet d'entendre le fichier audio d'annonce vocale associé au canal/mode de communication courant de la radio.

**IMPORTANT :**

Les fichiers vocaux sont affectés aux canaux définis dans le champ Annonce vocale [Annonce du canal à la page 674](#) de l'Affectation du canal de zone.

10.8.1.14.12

Canal suivant

Ce bouton de la radio portative APX™ 3000 vous permet de faire défiler vers le bas la liste des canaux de la radio.

Il est possible d'accélérer le défilement par une [Durée longue pression de touche à la page 146](#) de touche. La liste défile en boucle; après que le dernier canal a été atteint, la liste recommence au premier canal. Les canaux sont définis dans la page Canaux de la fenêtre Affectation du canal de zone.

10.8.1.14.13

Retour de canal manuel/rétablir

Sur un canal avec fonction de reprise, appuyez sur cette touche permet de faire passer la radio au canal de reprise attribué, peu importe les conditions du réseau et l'état d'activation actuels. En maintenant cette touche enfoncée, la radio revient au dernier canal sélectionné par l'utilisateur.

10.8.1.14.14

Canal supérieur

Cette touche sur la radio portative APX™ 3000 vous permet de faire défiler vers le bas la liste des canaux de la radio.

Il est possible d'accélérer le défilement par une [Durée longue pression de touche à la page 146](#) de touche. La liste défile en boucle; après que le dernier canal a été atteint, la liste recommence au premier canal. Les canaux sont définis dans la page Canaux de la fenêtre Affectation du canal de zone.

10.8.1.14.15

Contacts

Cette touche vous permet d'afficher ou de modifier les contacts pour le canal courant de la radio.

Ces contacts doivent être programmés dans la Liste d'appel unifiée. Les contacts sont les éléments constitutifs des listes d'appel privilégiées. Vous pouvez sélectionner les éléments de la liste courte/contacts pour différents types d'appels, comme les appels téléphoniques, les appels sélectifs, les alertes d'appel, les appels privés et les notifications vers une radio unique ou un groupe de radios.

**IMPORTANT :**

Cette fonction ne s'applique pas aux radios portatives qui ont seulement un écran sur le dessus de l'appareil.

10.8.1.14.16

Tonalité DTMF

Cette touche vous permet de transmettre un code DTMF de la valeur DTMF assignée.

Il existe 12 tonalités DTMF : les tonalités DTMF 0 à 9, la tonalité DTMF * et la tonalité DTMF #. Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

10.8.1.14.17

ID dynamique

Cette touche permet d'entrer en mode de modification ID dynamique, qui vous permet d'afficher ou de modifier l'ID individuel et/ou l'ID principal MDC de la radio pour le système ASTRO et/ou MDC courant.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnel.

10.8.1.14.18

Priorité dynamique

Cette touche vous permet de sélectionner l'affectation de balayage en priorité dynamique.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnel.

10.8.1.14.19

Effacement de l'urgence par le superviseur

Cette fonction activée par bouton à enfoncer est sélectionnée pour le bouton latéral du centre ou Acc. 1 point. Le contrôle de sortie d'urgence est réglé à Superviseur.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication ADF.

10.8.1.14.20

Urgence

Cette touche vous permet d'entrer et aussi de quitter le fonctionnement en mode d'urgence.

Voir aussi les fonctions [Durée courte pression de touche pour urgence à la page 146](#) et [Durée longue pression de touche pour urgence à la page 147](#). Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

AVERTISSEMENT :

Lorsque le champ Double radio - Sélection de radio est réglé à **Radio principale** ou à **Radio secondaire**, cette sélection est non valide pour la touche mauve (latérale supérieure) d'une

10.8.1.14.21

Information

Cette sélection de menu vous permet de récupérer et d'afficher des informations de base, comme des informations sur l'IP et sur le mappage des touches/commutateurs, et d'afficher ou de modifier l'ID programmable.

Cette fonction s'applique seulement au système conventionnel - ASTRO courant. Ceci est une fonction pour radio portative seulement.

IMPORTANT :

Le fait de modifier l'ID programmable modifie aussi le nom d'utilisateur de la radio pour le serveur du Service d'inscription automatique ou pour l'ouverture de session du serveur UNS (Unified Network Services) d'authentification utilisateur. Lors de la modification du nom d'utilisateur à l'aide de cette fonction, le NIP/mot de passe et l'ID d'unité sont vierges. Par conséquent, cette fonction peut uniquement être utilisée lorsque le serveur s'attend à recevoir un NIP/mot de passe vide, lorsque vous ne souhaitez pas utiliser l'ID d'unité.

Cette fonction ne s'applique pas aux radios portatives qui ont seulement un écran sur le dessus de l'appareil.

10.8.1.14.22

Adresse de protocole Internet (IP)

Cette sélection de menu vous permet d'extraire et de consulter (à l'écran de la radio) l'adresse IP courante, le nom et l'état de l'appareil.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

10.8.1.14.23

Verrouillage du clavier ou des commandes

Cette touche vous permet de verrouiller ou de déverrouiller le clavier de la radio (si disponible).

D'autres fonctions de verrouillage de commandes sont offertes (pour tous les modèles) lorsque le champ [Activer verrou interrupteur rotatif](#) ou [Verrouiller des boutons latéraux et de la grille du haut-parleur activé à la page 150](#) est **activé**.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

IMPORTANT :

Lorsque l'option Activer verrou interrupteur rotatif est **activée** dans les radios munies d'un interrupteur rotatif, cette fonction a aussi pour effet de verrouiller la [Sélections pour l'interrupteur rotatif à la page 198](#) (zone ou canal) en fonction, même lorsque l'interrupteur rotatif est déplacé vers une autre position.

Lorsque l'option Activer le verrouillage des boutons latéraux est réglée à **Activé**, cette fonction verrouille également les trois boutons latéraux (supérieur, du milieu et inférieur).

10.8.1.14.24

Rétroéclairage/rotation (affichage)

Une courte pression sur cette touche permet d'activer ou de désactiver la fonction d'éclairage du commutateur rotatif, de l'écran, de l'écran du dessus et du clavier.

La fonction Rotation (Affichage) de la touche [Durée longue pression de touche à la page 146](#) vous permet de basculer changer l'affichage de l'écran du haut sur 180 degrés. Cette fonction est particulièrement utile pour voir l'écran du dessus lorsque la radio se trouve dans son étui.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

IMPORTANT :

Le [Temps de lumière d'affichage à la page 236](#) détermine la durée pendant laquelle les lumières restent allumées; lorsque ce temps est réglé à **Infini**, appuyer à nouveau sur cette touche désactive l'éclairage.

Pour tous les modèles portatifs, les fonctions « Lumière » et « Rotation d'écran » s'appliquent aussi à tout accessoire portatif doté d'un écran, par exemple le microphone haut-parleur à distance (DRSM).

10.8.1.14.25

Localisation

Cette touche vous permet de connaître son emplacement courant (latitude et longitude, heure et date), sa position par rapport à un autre emplacement, de même que la distance qui l'en sépare.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

IMPORTANT :

Si le champ [Activer l'emplacement sélectionnable par l'utilisateur à la page 120](#) de la fenêtre Toute la radio est **Activé**, vous pouvez également activer ou désactiver la fonction d'emplacement extérieur/GPS pour tous les canaux des modes conventionnels et ADF pour lesquels cette fonction a été activée.

10.8.1.14.26

LTE

Cette fonction attribuée à un bouton permet d'activer et de désactiver les fonctions de données LTE à large bande de la radio.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

IMPORTANT :

Cette touche de menu est uniquement opérationnelle quand un canal configuré pour fonctionner en LTE à large bande est sélectionné. Lorsqu'un canal non LTE est sélectionné, ce menu est masqué.

Un canal prends en charge le protocole LTE lorsque son champ [Type de profil de données à la page 376](#) Profil de données est réglé à **Conventionnel et large bande, ADF et large bande** ou **Large bande seulement**

10.8.1.14.27

Suppression de l'avertissement de situation de détresse

Cette fonction vous permet de désactiver la fonction Avertissement en situation de détresse.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

10.8.1.14.28

Message

Cette touche vous permet de faire une sélection dans la liste d'alias de message du canal/mode courant.

IMPORTANT :

Lorsque la radio est utilisée en mode de communication conventionnel avec le type d'émission de signaux MDC / ASTRO / DVRS, la liste d'alias message conventionnelle est utilisée.

Lorsque la radio est utilisée en mode de communication ADF, la liste d'alias message du système ADF sélectionné pour la personnalité ADF courante est utilisée.

10.8.1.14.29

Moniteur

Cette touche vous permet d'entendre, sur le canal courant de la radio, la plupart, sinon toutes les conversations transmises par une onde porteuse.

La sélection du champ [Type de moniteur à la page 402](#) détermine si seule l'exigence en matière de réception d'un canal pour une transmission encodée de ligne privée (PL) est temporairement ignorée, ou si c'est l'exigence relative à la ligne privée et au silencieux de l'onde porteuse qui

est temporairement ignorée. Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnel.

**IMPORTANT :**

Lorsque l'utilisateur maintient le bouton Moniteur enfoncé pendant le délai précisé dans le champ [Temps d'activation du loquet à la page 403](#), la radio se verrouille en mode d'écoute. Il en demeure ainsi jusqu'à ce que l'utilisateur radio appuie de nouveau brièvement sur ce bouton. L'activation des fonctions Urgence, Téléphone, Rechercher, Appel sélectif ou la réception d'un Avis d'appel désactive également le verrouillage. Voir aussi le champ [Tonalité d'activation du loquet à la page 402](#).

10.8.1.14.30

MS01–MS13

Ces affectations de touche vous permettent de programmer des touches avec une combinaison de zones et de canaux utilisés fréquemment ou au choix.

La programmation de ces touches par l'utilisateur est très similaire à la programmation et à l'utilisation des stations de radio préétablies. Autrement dit, en appuyant longuement sur une touche, la zone et le canal courant sont programmés dans cette touche; ensuite, en appuyant brièvement sur cette touche, la radio passe à la zone et au canal programmés. Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

**IMPORTANT :**

La [Durée courte pression de touche à la page 146](#) et la [Durée longue pression de touche à la page 146](#) sont toutes deux programmées.

La radio Portable APX™ 3000 prend seulement en charge MS01 et MS02.

10.8.1.14.31

Ligne privée multiple (MPL)

Cette touche vous permet d'accéder à une liste de toutes les listes MPL.

**IMPORTANT :**

Chaque liste porte un nom reconnaissable . Vous pouvez alors sélectionner les réglages voulus pour l'alias et la ligne privée. Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnel.

10.8.1.14.32

Suppression des nuisances

Pendant un balayage actif, cette touche vous permet de supprimer un canal dont l'onde porteuse génère continuellement du bruit.

Pour activer cette fonction, il suffit d'appuyer sur le bouton Suppression des nuisances lorsque, en mode de balayage réussi, la radio syntonise l'élément à supprimer de la liste de balayage. Cette

fonction s'applique pour la liste de balayage courante lorsque la radio est utilisée en mode de communication conventionnel ou ADF.

IMPORTANT :

Le fait de sélectionner un autre canal au moyen du sélecteur de canal de la radio, de désactiver puis de réactiver le mode de balayage, ou de mettre la radio hors tension puis de nouveau sous tension remet dans la liste de balayage actif le canal qui en avait été temporairement supprimé.

On ne peut utiliser la fonction Suppression des nuisances :

- Pour un membre prioritaire 1 ou un membre prioritaire 2 de la liste de balayage.
- Lorsque la valeur du champ [Type de membre de Tx vocale désigné à la page 689](#) est réglée à **Canal sélectionné** et que la fréquence Tx du canal trouvé au moyen d'un balayage est identique à celle du canal actuellement sélectionné.
- Si la liste de balayage ne contient pas au moins deux éléments.

10.8.1.14.33

Une touche 1 à 4

Ces quatre touches, qui sont programmées séparément, vous permettent de lancer une fonction particulière à l'aide d'une seule touche.

Vous pouvez associer à chaque bouton une fonction Une touche comme État, Message, Appel sélectif/ privé, Avis d'appel/notification, Téléphone, Accès au répéteur (RAC) et Accès du bouton RTT en mode MDC, auxquelles vous pourrez par la suite accéder en appuyant simplement sur le bouton correspondant. Jusqu'à quatre fonctions peuvent ainsi être programmées pour chaque personnalité conventionnelle et pour chaque système ADF.

IMPORTANT :

Le fait d'appuyer sur la touche associée à la fonction actuellement sélectionnée a pour effet d'interrompre cette fonction.

10.8.1.14.34

Téléphone

Cette touche vous permet de passer en mode Téléphone lors du fonctionnement en mode de communications conventionnel ou ADF.

10.8.1.14.35

Canal prioritaire PTT

Si la radio fonctionne en mode balayage, et qu'il y a un Membre de la liste de balayage Membre priorité 1 sur le canal actuel de la Liste de balayage, alors appuyer sur cette touche fait en sorte que la radio amorce sur le canal du Membre de la liste de balayage priorité 1. Par conséquent, cela permet la transmission de communications vocales; autrement, la radio bloque la transmission et les sons de la tonalité d'interdiction de parler.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnel.

**IMPORTANT :**

Le fonctionnement du canal prioritaire PTT est mutuellement exclusif aux fonctions d'interphone, de et de sirène et de diffusion publique (PA).

Pour toutes les radios APX, le fonctionnement du canal prioritaire PTT n'effectuera pas d'envoi/d'appel lorsque l'une des fonctions ci-dessous est active :

- Urgence
- Alerte d'appel
- Appel sélectif
- Derniers appels
- Téléphone
- Interrompre/Arrêter
- TMS
- État/Message
- Sirène
- Diffusion publique (PA)
- Liste d'appel unifiée
- Demande de nouvelle attribution de clé
- Tonalité d'évacuation

Pour ce qui est de la tête de commande O3 pour radio mobile, le Canal prioritaire PTT n'effectuera pas d'envoi en mode clavier activé. La raison étant que la tête de commande O3 ne prend pas en charge l'appui simultané entre la touche latérale, la touche programmable menu, la touche fléchée ou les touches du clavier numérique. Cette limitation a aussi un impact sur d'autres fonctions où il est nécessaire d'appuyer simultanément sur deux ou plusieurs boutons.

La radio traite le premier enfoncement de la touche PTT, et elle ignore le deuxième lorsque les deux actions PTT sont de types différents; en d'autres mots :

- lorsque la radio transmet déjà en raison de l'appui sur une touche PTT principale, elle ignore l'appui sur le canal prioritaire PTT.
- inversement, lorsque la radio transmet déjà sur le canal Membre de liste de balayage Priorité 1, elle ignore l'appui sur une touche PTT principale.

La touche Canal prioritaire PTT ne doit pas être utilisée dans le canal DVRS.

10.8.1.14.36**Profils de radio**

Cette touche vous permet de sélectionner l'un des profils radio programmés.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

10.8.1.14.37**Derniers appels**

Cette touche vous permet de consulter les détails des derniers appels entrants et sortants de types suivants : Avis d'appel, Appels sélectifs, Appels privés et Appels téléphoniques (sortants seulement).

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

10.8.1.14.38

Demande de nouvelle attribution de clé

Cette fonction vous permet de transmettre une demande de nouvelle attribution de clé (OTAR) à la console (KMF ou KMC) du répartiteur lorsque la radio est utilisée en mode de communication conventionnel ou ADF.

IMPORTANT :

Le protocole des demandes MDC OTAR (mode de communication conventionnel) est déterminé par la valeur du champ [Demande de réattribution de touche\Mode à la page 308](#).

Pour ASTRO OTAR (mode de communication conventionnelle ou ADF), le champ [Demande de nouvelle attribution de clé sélectionnable par l'utilisateur à la page 327](#) doit d'abord être **activé**, et le champ [Niveau de sécurité Tx OTAR à la page 326](#) détermine le protocole de demande.

10.8.1.14.39

Urgence à distance

Ce bouton active la fonction Activation d'urgence à distance afin qu'un utilisateur autorisé à encoder cette commande puisse faire en sorte qu'une radio cible lance la fonction d'urgence sans intervention de l'utilisateur cible.

REMARQUE :

L'urgence à distance n'est prise en charge que par les canaux ASTRO conventionnels et par les canaux ADF ASTRO 25.

10.8.1.14.40

Bouton d'accès au répéteur 1 (RAB1)

Cette touche vous permet de transmettre manuellement un mot codé pour accéder au répéteur. Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnel.

10.8.1.14.41

Bouton d'accès au répéteur 2 (RAB2)

Cette touche vous permet de transmettre manuellement un mot codé pour accéder au répéteur. Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnel.

10.8.1.14.42

Demande de reprogrammation

Cette touche vous permet de transmettre une demande au répartiteur pour que le Regroupement dynamique soit réaffecté.

Les fonctions et les paramètres du groupe d'un regroupement dynamique sont définis et retransmis par le répartiteur ou la console. La radio passe alors automatiquement à la zone et au canal de regroupement dynamique définis dans les champs Zone et Canal. Cette fonction s'applique lorsque la radio est utilisée en mode de communication ADF.

IMPORTANT :

Dans le cas d'un système ADF, cette zone et de canal sont définis en réglant le champ [Groupe de conversation ADF à la page 673](#) de l'Affectation du canal de zone à **DYN**. La personnalité ADF considérée dans ce scénario doit avoir son même réglage [Système à la page 555](#) ADF sélectionné dans son champ Système. Ainsi, on ne peut définir qu'un seul canal de regroupement dynamique par système ADF.

10.8.1.14.43

Demande de conversation (RTT)

Cette touche vous permet de transmettre au répartiteur ou à la console une demande de conversation (Request-To-Talk, ou RTT) sous forme de paquet de signaux

Cette sélection ne s'applique que lorsque la radio est utilisée dans un système MDC en mode conventionnel.

10.8.1.14.44

Balayage

Une courte pression sur ce bouton vous permet d'activer ou de désactiver le mode balayage pour le canal courant.

Une longue pression permet d'accéder au mode de modification de la liste de balayage pour la liste de balayage du canal courant de la radio, ce qui vous permet d'ajouter ou de supprimer des canaux membres de la liste de balayage individuels, et de modifier la priorité de balayage.

10.8.1.14.45

Sélectionner un appel

Cette fonction permet à l'utilisateur de la radio de transmettre un appel conventionnel.

10.8.1.14.46

Aff. /Rech. site

Une courte pression sur cette touche permet d'activer l'**affichage du site** pour voir temporairement l'ID de site courant et l'indicateur d'intensité du signal reçu (RSSI) correspondant à l'écran de la radio.

Une longue pression sur cette touche permet d'activer la **recherche de site**, ce qui lance une recherche de site pour le fonctionnement SmartZone. Cette fonction s'applique lorsque la radio est utilisée en mode de communication ADF.

10.8.1.14.47

Verr./Déverr. site

Une courte pression sur cette touche **Site** permet d'afficher l'état de verrouillage du site ADF courant.

Une longue pression sur cette touche **Verr./Déverr. site** active la fonction d'activer ou de désactiver le verrouillage lors de l'utilisation de l'option SmartZone.

IMPORTANT :

Le verrouillage d'un site désactive l'itinérance sur un site différent dans un système étendu. Cette fonction s'applique lorsque la radio est utilisée en mode de communication ADF.

10.8.1.14.48

État

Cette touche vous permet de faire une sélection dans la liste d'alias d'état du canal/mode courant.

**REMARQUE :**

Pour vous aider, avec cette fonction, l'écran affiche tout d'abord le dernier état confirmé ou le premier état de la liste. Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

**IMPORTANT :**

Lorsque la radio est utilisée en mode de communication conventionnel avec le type d'émission de signaux MDC / ASTRO / DVRS, la liste d'alias d'état conventionnel est utilisée.

Lorsque la radio est utilisée en mode de communication ADF, la liste d'alias d'état du système ADF sélectionnée pour la personnalité ADF courante est utilisée.

10.8.1.14.49

Talkaround/Direct

Cette touche vous permet d'activer ou de désactiver le mode Direct / Talkaround (En direct) pour le profil d'options du canal courant.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnel.

10.8.1.14.50

Groupe

Cette touche vous permet de passer du groupe prédéfini à un autre groupe faisant partie de la liste de groupes de la personnalité conventionnelle courante.

Toutes les personnalités conventionnelles qui utilisent la même liste de groupes de conversation sont automatiquement intégrées au groupe de conversation sélectionné.

10.8.1.14.51

Service de messagerie texte (TMS)

Cette touche à courte pression **TMS** vous permet d'accéder au mode TMS de la radio, montré dans l'affichage de la radio.

Cette touche à pression longue vous permet d'accéder directement à la **boîte de réception TMS** pour y voir vos messages texte reçus et accéder aux entrées [Message texte rapide à la page 375](#) programmées (montré dans l'affichage de la radio). Voir aussi la fonction Service de messagerie texte pour les systèmes ADF ou les systèmes conventionnels.

10.8.1.14.52

Tierce partie

Cette fonction attribuée à un bouton vous permet de lancer la fonctionnalité dans des accessoires de tierce partie, par exemple les sirènes Whelen®.

**AVERTISSEMENT :**

Lorsque le champ Radio double [Sélection de radio](#) est réglé à **Radio principale** ou à **Radio secondaire**, cette sélection doit être effectuée à la fois pour les modes conventionnel et ADF, s'il y a lieu, pour être considérée comme étant valide.

10.8.1.14.53

Requête TMS

Cette fonction vous permet de passer directement aux messages de requête rapides programmés pour la fonction Service de message texte.

Vous pouvez alors sélectionner un message dans la liste d'entrées prédéfinies et transmettre une requête facilement.

**REMARQUE :**

Une requête TMS vous permet de demander des informations à l'aide d'un modèle de requête préformaté et l'envoi comme message au serveur de requête; ce serveur répond alors par un message texte contenant l'information demandée.

Pour un système ADF ou conventionnel, la fonction Service de messagerie texte est activée sur le canal courant de la radio, et lorsque le Service de requête TMS est actuellement disponible pour la radio .

10.8.1.14.54**Texte rapide TMS**

Cette touche vous permet de passer directement aux messages texte rapide pour la fonction Service de message texte.

Vous pouvez alors sélectionner un message dans la liste d'entrées prédéfinies et transmettre facilement un message texte rapide.

Lorsque le Système ADF ou le Système conventionnel est utilisé, la fonction Service de messagerie texte est activée sur le canal courant de la radio.

10.8.1.14.55**Non programmé**

Sélectionnez cette option pour un bouton non utilisé.

Vous entendez une courte tonalité lorsque vous appuyez sur cette touche. Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

10.8.1.14.56**ViQi : Partenaire virtuel**

Ce bouton permet d'accéder à la fonction Partenaire virtuel.

Cette fonction est disponible uniquement en mode ADF lorsqu'elle est réglée au fonctionnement **LMR** dans [ViQi : Mode Partenaire virtuel à la page 115](#). Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF lorsqu'elle est réglée à **Désactivé** et sur « Large bande » dans [ViQi : Mode Partenaire virtuel à la page 115](#).

10.8.1.14.57**ViQi : Commande vocale**

Ce bouton permet d'accéder à la commande vocale et à la fonction Partenaire virtuel.

Lorsque la fonction Partenaire virtuel de la radio n'est pas activée, les pressions de cette touche activent la fonction de commande vocale. Lorsque l'utilisateur active la fonction Partenaire virtuel à l'aide d'une fonction de commande vocale, les pressions du bouton suivantes s'appliquent uniquement à la fonction Partenaire virtuel. Une fois la session avec le partenaire virtuel terminée, ce bouton s'applique à la commande vocale.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.8.1.14.58

Utilisateur

Cette touche vous permet de vous connecter au serveur d'un service d'inscription automatique ou à l'authentification d'utilisateur d'un serveur UNS (Unified Network Services) en utilisant une combinaison appropriée de nom d'utilisateur, de NIP/mot de passe et d'ID d'unité de nom d'utilisateur.

Vous pouvez sélectionner les noms d'utilisateur et les ID d'unité dans les entrées de la liste d'utilisateurs de données programmées, ou les noms d'utilisateur, les NIP/mot de passe et les ID d'unité peuvent être entrés manuellement à partir du clavier de la radio.

AVERTISSEMENT :

Cette fonction n'est active que lorsque le canal courant de la radio (mode conventionnel ou ADF) possède, dans son profil de données référencé, le champ [Mode ARS à la page 382](#) réglé à **Serveur**.

10.8.1.14.59

Mettre la voix en sourdine

Cette touche vous permet d'activer ou de désactiver la mise en sourdine de la voix pour les canaux dont la fonction d'alerte utilisateur en appel est activée.

Lorsque la sourdine est activée, la radio demeure en sourdine pour toutes les communications en mode conventionnel et pour tous les appels des groupes de conversation ADF associés. La mise en sourdine de la voix est désactivée lors de la réception d'alertes d'appel et de notifications, et lors d'appels de radio à radio comme les appels sélectifs ou privés et les appels téléphoniques d'interconnexion.

10.8.1.14.60

Réglage du volume de la tonalité

L'enfoncement de ce bouton peut amener la radio à se comporter de l'une des façons suivantes :

Lorsque le champ [Compensation de la tonalité de réglage du volume à la page 107](#) est réglé à **Désactivé**, cette touche vous permet d'entendre un exemple du niveau sonore des communications entrantes transmises par les haut-parleurs lorsque le mode de mise en sourdine est interrompu. Quand vous appuyez sur cette touche, la tonalité (initialement émise selon le niveau sonore sélectionné pour la radio) se fait entendre, ce qui vous permet d'ajuster le niveau sonore.

10.8.1.14.61

Activer/désactiver Wi-Fi

Cette touche vous permet d'activer et de désactiver la capacité Wi-Fi.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

10.8.1.14.62

Bloc de zones bas

Cette touche permet à l'utilisateur de faire défiler la liste des blocs de zone de la radio vers le bas (en ordre décroissant).

Lorsque la valeur du champ Fonctionnement du bloc de zones est réglée à **Amélioré**, on peut accélérer le défilement de la liste (en ordre décroissant) par une [Durée longue pression de touche à la page 146](#) du bouton.

**REMARQUE :**

La touche programmable [Bloc de zones haut à la page 196](#) vous permet de faire défiler la liste des blocs de zones de la radio vers le haut (en ordre ascendant). Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

**IMPORTANT :**

Lorsque la fonction Bloc de zones haut ou Bloc de zones bas est attribuée à un bouton programmable, la fonction [Sélection de zone à la page 207](#) est automatiquement attribuée à la touche à bascule à trois positions.

Le sélecteur rotatif peut alors être réglé uniquement sur la sélection [Sélection de canal à la page 204](#). Chaque zone ne peut contenir que 16 canaux en utilisant le bouton rotatif pour sélectionner les canaux.

10.8.1.14.63

Bloc de zones haut

Cette touche vous permet de faire défiler la liste des blocs de zone de la radio vers le bas (en ordre décroissant).

Lorsque la valeur du champ Fonctionnement du bloc de zones est réglée à **Amélioré**, on peut accélérer le défilement de la liste (en ordre décroissant) par une [Durée longue pression de touche à la page 146](#) du bouton.

**REMARQUE :**

La touche programmable [Bloc de zones bas à la page 195](#) vous permet de faire défiler la liste des blocs de zones de la radio vers le bas (en ordre descendant). Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

**IMPORTANT :**

Lorsque la fonction Bloc de zones haut ou Bloc de zones bas est attribuée à un bouton programmable, la fonction [Sélection de zone à la page 207](#) est automatiquement attribuée à la touche à bascule à trois positions.

Le sélecteur rotatif peut alors être réglé uniquement sur la sélection [Sélection de canal à la page 204](#). Chaque zone ne peut contenir que 16 canaux en utilisant le bouton rotatif pour sélectionner les canaux.

10.8.1.14.64

Zone -

Cette touche vous permet de faire défiler vers le bas la liste des zones de la radio.

Il est possible d'accélérer le défilement par une [Durée longue pression de touche à la page 146](#) de touche. La liste défile en boucle; après que la première zone a été atteinte, la liste recommence à la dernière zone. Les zones sont définies dans la fenêtre Attribution du canal de zone.

**REMARQUE :**

Dans certaines radios portatives, les zones peuvent également être groupées par blocs de zones; il est alors possible de sélectionner un bloc individuel en appuyant sur le bouton [Bloc de zones haut à la page 196](#) ou [Bloc de zones bas à la page 195](#).

10.8.1.14.65

Zone +

Cette touche vous permet de faire défiler vers le haut la liste des zones de la radio.

Il est possible d'accélérer le défilement par une [Durée longue pression de touche à la page 146](#) de touche. La liste défile en boucle; après que la dernière zone a été atteinte, la liste recommence à la première zone. Les zones sont définies dans la page Zone de la fenêtre Attribution du canal de zone. Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

**REMARQUE :**

Dans certaines radios portatives, les zones peuvent également être groupées par blocs de zones; il est alors possible de sélectionner un bloc individuel en appuyant sur le bouton [Bloc de zones haut à la page 196](#) ou [Bloc de zones bas à la page 195](#).

10.8.1.15

Touches du porte-clés Smart Key (Conventionnel)

Ce champ permet de sélectionner la fonction des touches du porte-clés intelligent (SKF) programmables.

**AVERTISSEMENT :**

Vous ne devez pas attribuer une même fonction à plus d'une commande utilisateur, c'est-à-dire à plus d'une touche, à plus d'un commutateur, ou à une touche et à un commutateur. Le fonctionnement de la radio pourrait en être perturbé.

Voir [Sélections des touches](#) pour une liste des sélections prises en charge.

10.8.1.16

Touches du porte-clés Smart Key (ADF)

Ce champ permet de sélectionner la fonction des touches du porte-clés intelligent (SKF) programmables.

**AVERTISSEMENT :**

Vous ne devez pas attribuer une même fonction à plus d'une commande utilisateur, c'est-à-dire à plus d'une touche, à plus d'un commutateur, ou à une touche et à un commutateur. Le fonctionnement de la radio pourrait en être perturbé.

Voir [Sélections des touches](#) pour une liste des sélections prises en charge.

10.8.2

Commutateurs

Cette section permet d'associer des fonctions au commutateur rotatif, au bouton multifonction et aux commutateurs concentriques.

L'association d'une fonction au sélecteur rotatif et au bouton multifonction (MFK) s'applique lorsque la radio est utilisée en mode de communication conventionnel ou ADF. Pour ce qui est de la touche à bascule et du commutateur concentrique, les sélections pour les modes conventionnel et ADF diffèrent.

**REMARQUE :**

Ces sélections dépendent du modèle ou des options de la radio.

10.8.2.1

Sélections pour l'interrupteur rotatif

Permet de sélectionner la fonction à attribuer au sélecteur rotatif pour le mode de communication conventionnel ou ADF.

AVERTISSEMENT :

Vous ne devez pas assigner une même fonction à plus d'une commande utilisateur, c'est-à-dire à plus d'un bouton, à plus d'un commutateur, ou à un bouton et à un commutateur. Le fonctionnement de la radio pourrait en être perturbé.

Les sélections suivantes sont prises en charge :

Vierge à la page 204

(Pour les commandes non utilisées.)

Sélection Can./Sous. (Sélection de canal à la page 204)

Lorsque le modèle ou l'option de la radio le permet.

AVERTISSEMENT :

Cette sélection ne peut pas être attribuée à la fois au sélecteur rotatif, aux commutateurs concentriques et à l'interrupteur à bascule.

Sélection Zone/Sys. (Sélection de zone à la page 207)

Lorsque le modèle ou l'option de la radio le permet.

AVERTISSEMENT :

Cette sélection ne peut pas être attribuée à la fois au sélecteur rotatif, aux commutateurs concentriques et à l'interrupteur à bascule.

Ce n'est pas une sélection valide lorsque [Bloc de zones haut à la page 196](#) ou [Bloc de zones bas à la page 195](#) est réglé à un bouton programmable.

REMARQUE :

Ces sélections s'appliquent à la fois aux modes de communication conventionnel et ADF, et dépendent du modèle et des options de la radio.

10.8.2.2

Position A du commutateur concentrique (conventionnel)

Permet de sélectionner la fonction pour la position A du commutateur concentrique de la radio portable.

Ces attributions s'appliquent lors de l'utilisation en mode de communication Conventionnel ou ADF.

AVERTISSEMENT :

Vous ne devez pas attribuer une même fonction à plus d'une commande utilisateur, c'est-à-dire à plus d'une touche, à plus d'un commutateur, ou à une touche et à un commutateur. Cela risque de perturber le fonctionnement de la radio.

Voir [Sélections pour les commutateurs à la page 201](#) pour une liste des sélections prises en charge.

REMARQUE :

Ces sélections dépendent du modèle et des options de la radio et s'appliquent à la fois aux modes de communication Conventionnel et ADF (sauf avis contraire).

10.8.2.3

Position A du commutateur concentrique (ADF)

Permet de sélectionner la fonction pour la position A du commutateur concentrique de la radio portable.

AVERTISSEMENT :

Vous ne devez pas attribuer une même fonction à plus d'une commande utilisateur, c'est-à-dire à plus d'une touche, à plus d'un commutateur, ou à une touche et à un commutateur. Cela risque de perturber le fonctionnement de la radio.

Voir [Position A du commutateur concentrique \(conventionnel\) à la page 198](#) pour les notes et les avertissements.

Voir [Sélections pour les commutateurs à la page 201](#) pour une liste des sélections prises en charge.

10.8.2.4

Position B de l'interrupteur concentrique (conventionnel)

Permet de sélectionner la fonction pour la position B de l'interrupteur concentrique de la radio portable.

AVERTISSEMENT :

Vous ne devez pas attribuer une même fonction à plus d'une commande utilisateur, c'est-à-dire à plus d'une touche, à plus d'un commutateur, ou à une touche et à un commutateur. Cela risque de perturber le fonctionnement de la radio.

Voir [Position A du commutateur concentrique \(conventionnel\) à la page 198](#) pour les notes et les avertissements.

Voir [Sélections pour les commutateurs à la page 201](#) pour une liste des sélections prises en charge.

10.8.2.5

Position B du commutateur concentrique (ADF)

Permet de sélectionner la fonction pour la position A du commutateur concentrique de la radio portable.

AVERTISSEMENT :

Vous ne devez pas attribuer une même fonction à plus d'une commande utilisateur, c'est-à-dire à plus d'une touche, à plus d'un commutateur, ou à une touche et à un commutateur. Cela risque de perturber le fonctionnement de la radio.

Voir [Position A du commutateur concentrique \(conventionnel\) à la page 198](#) pour les notes et les avertissements.

Voir [Sélections pour les commutateurs à la page 201](#) pour une liste des sélections prises en charge.

10.8.2.6

Position A de l'interrupteur à bascule (conventionnel)

Permet de sélectionner la fonction pour la position A du commutateur à bascule de la radio portable.

AVERTISSEMENT :

Vous ne devez pas attribuer une même fonction à plus d'une commande utilisateur, c'est-à-dire à plus d'une touche, à plus d'un commutateur, ou à une touche et à un commutateur. Cela risque de perturber le fonctionnement de la radio.

Voir [Position A du commutateur concentrique \(conventionnel\) à la page 198](#) pour les notes et les avertissements.

Voir [Sélections pour les commutateurs à la page 201](#) pour une liste des sélections prises en charge.

10.8.2.7

Position A de l'interrupteur à bascule (ADF)

Permet de sélectionner la fonction pour la position A du commutateur à bascule de la radio portative.

AVERTISSEMENT :

Vous ne devez pas attribuer une même fonction à plus d'une commande utilisateur, c'est-à-dire à plus d'une touche, à plus d'un commutateur, ou à une touche et à un commutateur. Cela risque de perturber le fonctionnement de la radio.

Voir [Position A du commutateur concentrique \(conventionnel\) à la page 198](#) pour les notes et les avertissements.

Voir [Sélections pour les commutateurs à la page 201](#) pour une liste des sélections prises en charge.

10.8.2.8

Position B de l'interrupteur à bascule (conventionnel)

Permet de sélectionner la fonction pour la position B du commutateur à bascule de la radio portative.

AVERTISSEMENT :

Vous ne devez pas attribuer une même fonction à plus d'une commande utilisateur, c'est-à-dire à plus d'une touche, à plus d'un commutateur, ou à une touche et à un commutateur. Cela risque de perturber le fonctionnement de la radio.

Voir [Position A du commutateur concentrique \(conventionnel\) à la page 198](#) pour les notes et les avertissements.

Voir [Sélections pour les commutateurs à la page 201](#) pour une liste des sélections prises en charge.

10.8.2.9

Position B de l'interrupteur à bascule (ADF)

Permet de sélectionner la fonction pour la position B du commutateur à bascule de la radio portative.

AVERTISSEMENT :

Vous ne devez pas attribuer une même fonction à plus d'une commande utilisateur, c'est-à-dire à plus d'une touche, à plus d'un commutateur, ou à une touche et à un commutateur. Cela risque de perturber le fonctionnement de la radio.

Voir [Position A du commutateur concentrique \(conventionnel\) à la page 198](#) pour les notes et les avertissements.

Voir [Sélections pour les commutateurs à la page 201](#) pour une liste des sélections prises en charge :

10.8.2.10

Position C de l'interrupteur à bascule (conventionnel)

Permet de sélectionner la fonction pour la position C du commutateur à bascule de la radio portative.

AVERTISSEMENT :

Vous ne devez pas attribuer une même fonction à plus d'une commande utilisateur, c'est-à-dire à plus d'une touche, à plus d'un commutateur, ou à une touche et à un commutateur. Cela risque de perturber le fonctionnement de la radio.

Voir [Position A du commutateur concentrique \(conventionnel\) à la page 198](#) pour les notes et les avertissements.

Voir [Sélections pour les commutateurs à la page 201](#) pour une liste des sélections prises en charge.

10.8.2.11

Position C de l'interrupteur à bascule (ADF)

Permet de sélectionner la fonction pour la position C du commutateur à bascule de la radio portative.

**AVERTISSEMENT :**

Vous ne devez pas attribuer une même fonction à plus d'une commande utilisateur, c'est-à-dire à plus d'une touche, à plus d'un commutateur, ou à une touche et à un commutateur. Cela risque de perturber le fonctionnement de la radio.

Voir [Position A du commutateur concentrique \(conventionnel\) à la page 198](#) pour les notes et les avertissements.

Voir [Sélections pour les commutateurs à la page 201](#) pour une liste des sélections prises en charge.

10.8.2.12

Sélections pour les commutateurs

Cette rubrique répertorie les sélections de commutateur et indique quand celles-ci sont offertes aux utilisateurs.

Sélections pour les commutateurs :	Cette sélection est valide seulement dans RadioCentral, et accessible à l'utilisateur :
Vierge à la page 204	(Pour les commandes non utilisées.)

Sélections pour les commutateurs :	Cette sélection est valide seulement dans RadioCentral, et accessible à l'utilisateur :
<p>Sélection de canal à la page 204</p>	<p>Lorsque cette option est sélectionnée, l'utilisateur y a toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection de RadioCentral.</p> <p> AVERTISSEMENT : Cette sélection ne peut pas être attribuée à la fois à l'interrupteur rotatif, au commutateur concentrique et à la touche à bascule.</p> <p>Cette sélection doit être attribuée à toutes les positions du commutateur choisi, tant en mode de communications conventionnel qu'ADF.</p> <p>Lorsque la sélection Bloc de zones haut à la page 196 ou Bloc de zones bas à la page 195 a été attribuée à une touche programmable, cette sélection n'est pas valide pour la touche à bascule à deux ou à trois positions, ou pour le commutateur concentrique.</p> <p> IMPORTANT : Lorsque, en mode conventionnel, la fonction Sélection de canal est attribuée à la position A du commutateur concentrique, elle est automatiquement attribuée à la position B du commutateur concentrique en mode conventionnel et aux positions A et B du commutateur concentrique en mode ADF, et les champs correspondants ne sont accessibles qu'en lecture seule. Par conséquent, seule la fonction attribuée à la position A du commutateur concentrique en mode conventionnel peut être modifiée.</p> <p>Lorsque, en mode conventionnel, la fonction Sélection de canal est attribuée à la position A de la touche à bascule, elle est automatiquement attribuée aux positions B et C de la touche à bascule en mode conventionnel et aux positions A, B et C en mode ADF, et les champs correspondants ne sont accessibles qu'en lecture seule. Par conséquent, seule la fonction attribuée à la position A de la touche à bascule en mode conventionnel peut être modifiée.</p>
<p>Verrouillage du clavier ou des commandes à la page 205</p>	<p>Dans Toute l'ergonomie de la radio, lorsque le champ Activer verrou interrupteur rotatif est réglé à Activé (tous les modèles), ou lorsque le champ Activer le verrouillage des touches latérales est réglé à Activé (tous les modèles), ou lorsque la radio est dotée d'un clavier (certains modèles seulement).</p> <p> AVERTISSEMENT : Cette sélection ne doit pas être attribuée à la fois à la « Position A » et à la « Position B » de l'interrupteur rotatif, ou à toutes les positions de l'interrupteur à bascule; par conséquent, les boutons, éléments de menu et bouton rotatif sont inutilisables par l'utilisateur radio.</p>
<p>Désact. PL à la page 206</p>	<p>Pendant le fonctionnement en mode de communication conventionnel. Disponible uniquement pour le mode Conventionnel.</p>
<p>Balayage à la page 206</p>	<p>Pour le mode Conventionnel, lorsque le champ Type de balayage à la page 682 n'est pas réglé à Balayage de vote, lorsque le champ de Sélection de</p>

<p>Sélections pour les commutateurs :</p>	<p>Cette sélection est valide seulement dans RadioCentral, et accessible à l'utilisateur :</p>
	<p>la liste de balayage à la page 476 de la personnalité conventionnelle n'est pas réglé à Aucun et lorsque le champ Balayage automatique à la page 478 de la personnalité conventionnelle est réglé à Désactivé pour le canal courant de la radio.</p> <p>Pour le mode ADF, lorsque le champ de Sélection de la liste de balayage à la page 573 de la personnalité ADF n'est pas réglé à Aucun et que le champ Balayage automatique à la page 574 de la personnalité ADF est réglé à Désactivé pour le canal courant de la radio.</p> <p> AVERTISSEMENT : Cette sélection ne peut pas être programmée simultanément sur des boutons, sur des commutateurs et sur des éléments de menu, mais elle peut être attribuée simultanément à des boutons de radio portative et à des boutons d'accessoire.</p> <p> IMPORTANT : On peut attribuer cette fonction au commutateur concentrique en mode conventionnel (une seule position) ou à la touche à bascule en mode conventionnel (deux positions maximum), mais pas aux deux. Cette contrainte vaut également pour les commutateurs ADF.</p> <p>On peut attribuer cette fonction à la fois au commutateur concentrique ou à la touche à bascule en mode de communication conventionnel et ADF tout en respectant la contrainte précédente.</p>
<p>Programmation de la liste de balayage à la page 206</p>	<p>Pour le mode Conventionnel, lorsque le champ de Sélection de la liste de balayage à la page 476 de la personnalité conventionnelle n'est pas réglé à Aucun pour le canal courant de la radio.</p> <p>Pour le mode ADF, lorsque le champ de Sélection de la liste de balayage à la page 573 de la personnalité ADF n'est pas réglé à Aucun pour le canal courant de la radio.</p>
<p>Talkaround/Direct à la page 206</p>	<p>Lors du fonctionnement en mode de communication conventionnel et lorsque le champ Direct/Talkaround (En direct) à la page 439 de la personnalité conventionnelle est réglé à Activé pour le canal courant de la radio. Disponible uniquement pour le mode Conventionnel.</p> <p> AVERTISSEMENT : Cette sélection ne peut pas être attribuée simultanément à des touches, à des commutateurs et à des éléments de menu, mais elle peut être attribuée simultanément à des touches de radio portative et à des touches d'accessoire.</p> <p>Cette sélection ne peut être attribuée qu'à un seul commutateur.</p>
<p>Tx à faible tension à la page 207</p>	<p>Lorsque cette option est sélectionnée, l'utilisateur y a toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection de RadioCentral.</p>
<p>Non programmé à la page 207</p>	<p>(Pour les commandes non utilisées.)</p>

Sélections pour les commutateurs :	Cette sélection est valide seulement dans RadioCentral, et accessible à l'utilisateur :
Sélection de zone à la page 207	<p>Lorsque cette option est sélectionnée, l'utilisateur y a toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection de RadioCentral.</p> <p> AVERTISSEMENT : Cette sélection doit être attribuée à toutes les positions du commutateur choisi, tant pour le mode de communication conventionnel que pour le mode de communication ADF.</p> <p>Cette sélection ne peut pas être attribuée à la fois à l'interrupteur rotatif, au commutateur concentrique et à la touche à bascule.</p> <p>Lorsque la sélection Bloc de zones haut à la page 196 ou Bloc de zones bas à la page 195 a été attribuée à une touche, cette sélection n'est pas valide pour le commutateur concentrique.</p> <p> IMPORTANT : Lorsque la fonction Blocs de zone croissants ou Blocs de zone décroissants est attribuée à une touche programmable, la fonction Sélection de zone est automatiquement attribuée à la touche à bascule à trois positions.</p> <p>Lorsque la fonction Sélection de zone est attribuée à la position A du commutateur concentrique en mode de communication conventionnel, elle est automatiquement attribuée aux positions A et B du commutateur concentrique en mode ADF et à la position B du commutateur concentrique en mode conventionnel, et les champs correspondants ne sont accessibles qu'en lecture seule. Par conséquent, seule la fonction attribuée à la position A du commutateur concentrique en mode conventionnel peut être modifiée.</p> <p>Lorsque la fonction Sélection de zone est attribuée à la position A de la touche à bascule en mode de communication conventionnel, elle est automatiquement attribuée aux positions A, B et C de la touche à bascule en mode de communication ADF et aux positions B et C de la touche à bascule en mode conventionnel, et les champs correspondants ne sont accessibles qu'en lecture seule. Par conséquent, seule la fonction attribuée à la position A de la touche à bascule en mode conventionnel peut être modifiée.</p>

10.8.2.12.1

Vierge

Sélectionnez cette fonction pour un sélecteur rotatif, une touche à bascule, un commutateur concentrique ou un bouton multifonction (MFK), qui n'est pas utilisé.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

10.8.2.12.2

Sélection de canal

Cette sélection du commutateur rotatif ou du bouton multifonction (MFK) vous permet de changer le canal de la radio.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

IMPORTANT :

Le sélecteur rotatif ne permet de sélectionner que les 16 premiers canaux (voir la page Canaux) définis pour chaque zone.

Les commutateurs à deux ou à trois positions ne permettent de sélectionner que les deux ou trois premiers canaux (voir la page Canaux) définis pour chaque zone.

Dans le cas d'un commutateur à deux ou à trois positions, les canaux doivent être sélectionnés à la fois pour le mode de communication conventionnel et pour le mode de communication ADF, et pour toutes les positions du commutateur.

Cette sélection n'est possible pour le sélecteur rotatif que si la fonction **Bloc de zones haut** ou **Bloc de zones bas** est associée à un bouton programmable. Seulement 16 canaux par zone peuvent être associés au sélecteur rotatif lorsque ce dernier est utilisé pour sélectionner les canaux.

Lorsque sélectionné comme la fonction principale pour un bouton multifonction (MFK), **Sélection volume** doit être sélectionnée comme la fonction secondaire afin d'être considérée valide.

10.8.2.12.3

Sélection de Tx non chiffrée

Ce commutateur vous permet de désactiver les transmissions sécurisées.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

10.8.2.12.4

Verrouillage du clavier ou des commandes

Ce commutateur vous permet de verrouiller (ou de déverrouiller) le clavier de la radio (si disponible).

D'autres fonctions de verrouillage de commandes sont offertes (pour tous les modèles) lorsque le champ Activer le verrouillage du sélecteur rotatif ou le champ Activer le verrouillage des boutons latéraux est réglé à **Activé** (voir la note importante). Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

IMPORTANT :

Lorsque le champ Activer le verrouillage du sélecteur rotatif est réglé à **Activé**, cette fonction verrouille également le canal actuellement utilisé par la radio, même lorsqu'une autre position du sélecteur rotatif est sélectionnée.

Lorsque l'option Activer le verrouillage des boutons latéraux est réglée à **Activé**, cette fonction verrouille également les trois boutons latéraux (supérieur, du milieu et inférieur).

10.8.2.12.5

Muet

Ce commutateur vous permet d'activer ou de désactiver certaines tonalités de la radio (par exemple, les tonalités du clavier) configurées par la commande Fonctionnement amélioré des tonalités en sourdine.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

10.8.2.12.6

Désact. PL

Ce commutateur vous permet de désactiver le silencieux de porteuse PL/DPL.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnel.

10.8.2.12.7

Balayage

Ce commutateur vous permet de sélectionner des listes de balayage et d'activer ou de désactiver le mode balayage lorsque la radio est utilisée en mode conventionnel ou ADF.

10.8.2.12.8

Programmation de la liste de balayage

Ce commutateur fait passer la radio en mode **Modification de la liste de balayage**.

Dans ce mode de modification, vous pouvez ajouter des membres à la liste de balayage ou en supprimer, et modifier la priorité de balayage de tout membre. Les communications par liaison radio ne sont pas disponibles en mode de modification de la liste de balayage. Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

IMPORTANT :

Le bouton latéral du haut devient automatiquement le bouton de sélection désigné pendant la modification d'un canal de liste de balayage. Le bouton latéral supérieur devient automatiquement le bouton de sélection désigné pour modifier les canaux de la liste de balayage, seulement lorsque la radio est utilisée en mode de programmation de la liste de balayage.

10.8.2.12.9

Sélection de Tx sécurisée

Ce commutateur vous permet de sélectionner (ou d'effacer) les transmissions chiffrées (ou non chiffrées).

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

10.8.2.12.10

Talkaround/Direct

Ce commutateur vous permet d'activer ou de désactiver le mode Direct / Talkaround (En direct) pour le profil d'options du canal courant.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnel.

10.8.2.12.11

Blocage de Tx

Ce commutateur vous permet de désactiver toutes les transmissions radio lorsque la radio est utilisée en mode de communications conventionnelles ou ADF.

**IMPORTANT :**

Cette action peut être nécessaire dans les zones dangereuses avec haute sensibilité aux fréquences radio, où des transmissions radio peuvent provoquer une explosion ou une autre réaction dangereuse.

**REMARQUE :**

Si vous tentez d'amorcer la radio lorsque le Blocage Tx est **activé**, la radio émet une longue tonalité grave « Interdiction de parler », indiquant que les transmissions ne sont actuellement pas autorisées.

10.8.2.12.12

Blocage de Tx désactivé

Ce commutateur vous permet de désactiver toutes les transmissions radio lorsque la radio est utilisée en mode de communications conventionnelles ou ADF.

10.8.2.12.13

Tx à faible tension

Ce commutateur vous permet d'alterner entre une puissance d'émission faible et une puissance d'émission élevée pour toute la radio.

Une fois activé, ce réglage de faible puissance a préséance sur tous les réglages [Niveau de puissance de transmission à la page 435](#) de la personnalité conventionnelle et réglages [Niveau de puissance Tx à la page 526](#) du système ADF. Le réglage de puissance de la radio passe également à la puissance élevée pour toute la radio lorsque le commutateur est amené sur une autre sélection programmée. La mise hors tension de la radio suivie de sa remise sous tension réinitialise tous les canaux de la radio à leurs niveaux de puissance programmés.

10.8.2.12.14

Non programmé

Sélectionnez cette fonction pour une touche à bascule non utilisée.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

10.8.2.12.15

Sélection de zone

Cette sélection du commutateur rotatif ou du bouton multifonction (MFK) vous permet de sélectionner une zone.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

IMPORTANT :

Les commutateurs ne permettent de sélectionner que les deux ou trois premières zones définies dans la fenêtre Attribution du canal de zone. Voir aussi Bloc de zones, Bloc de zones haut et Bloc de zones bas.

Dans le cas d'un commutateur à deux ou à trois positions, les canaux doivent être sélectionnés à la fois pour le mode de communication conventionnel et pour le mode de communication ADF, et pour toutes les positions du commutateur.

Cette fonction est automatiquement associée à la touche à bascule à trois positions de la radio lorsque la fonction **Bloc de zones haut** ou **Bloc de zones bas** est associée à un bouton programmable. Voir aussi le concept Keystone Blocs de zone.

Lorsque sélectionné comme la fonction principale pour un bouton multifonction (MFK), **Sélection volume** doit être sélectionnée comme la fonction secondaire afin d'être considérée valide.

10.8.2.12.16

Sélec. volume

Cette sélection du bouton multifonction (MFK) vous permet de changer le volume de la radio.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

AVERTISSEMENT :

Pour le fonctionnement à double fonction :

- Si la fonction principale du bouton multifonction (MFK) est **Sélection de zone** ou **Sélection de canal**, alors la fonction secondaire doit être **Sélection du volume** pour que la sélection soit reconnue comme valide.
- Si la fonction principale du bouton multifonction (MFK) est **Sélection du volume**, alors la fonction secondaire doit être **Sélection de zone** ou **Sélection de zone** pour que la sélection soit reconnue comme valide.

Pour une utilisation à une seule fonction : Vous devez sélectionner **Sélection du volume** en tant que fonction principale et **Vierge** en tant que fonction secondaire pour que cela soit reconnu comme étant valide.

10.8.3

Éléments de menu

La fenêtre **Éléments de menu** permet d'afficher ou de sélectionner les fonctions qui s'afficheront à l'écran de la radio et auxquelles l'utilisateur aura accès.

Les fonctions de la radio ne sont pas les mêmes pour les deux modes de communication, c'est-à-dire les modes conventionnel et ADF. Cela signifie que lorsque la radio utilise un canal conventionnel,

seules les fonctions conventionnelles sélectionnées sont disponibles. De même, lorsque la radio utilise un canal ADF, seules les fonctions ADF sélectionnées sont disponibles.

IMPORTANT :

Certains éléments de menu sont automatiquement retirés de la colonne des éléments **sélectionnés** si les fonctions correspondantes sont accessibles par l'intermédiaire des boutons ou des commutateurs; certains éléments de menu peuvent cependant être maintenus pour des raisons pratiques.

Les modèles de radio portative APX™ 1000 1.5, APX™ 2000 1.5 et APX™ 4000Li 1.5 prennent en charge un maximum de trois (3) sélections de touche programmable de menu (la limite normale est 24). Lors de la modification des codeplugs de ces modèles dans l'application, si vous tentez de sélectionner plus de trois éléments de menu, le champ **Sélectionné** deviendra non valide.

REMARQUE :

Certaines fonctions dépendent du modèle de radio ou des options choisies.

10.8.3.1

Disponible/sélectionné (Conventionnel)

Ce champ vous permet d'ajouter ou de supprimer l'élément de menu des fonctions conventionnelles.

À partir de la colonne **Éléments disponibles**, vous pouvez sélectionner les fonctions à afficher à l'écran de la radio (disponibles pour votre usage) lors du fonctionnement en mode de communications conventionnelles.

REMARQUE :

Cliquez sur le bouton **Ajouter** ou **Retirer** pour ajouter ou retirer des éléments de menu sélectionnés dans la colonne **Sélectionnés**.

Il doit y avoir au moins un élément de menu dans la colonne **Sélectionné**.

Voir [Sélections de menu à la page 210](#) pour une liste des sélections prises en charge :

10.8.3.2

Disponible/sélectionné (ADF)

Ce champ vous permet d'ajouter ou de supprimer l'élément de menu des fonctions ADF.

À partir de la colonne **Éléments disponibles**, vous pouvez sélectionner les fonctions qui s'afficheront à l'écran de la radio (disponibles pour votre usage) lors du fonctionnement en mode de communications ADF.

REMARQUE :

Cliquez sur le bouton **Ajouter** ou **Retirer** pour ajouter ou retirer des éléments de menu sélectionnés dans la colonne **Sélectionnés**.

Il doit y avoir au moins un élément de menu dans la colonne **Sélectionné**.

Voir [Sélections de menu à la page 210](#) pour une liste des sélections prises en charge :

10.8.3.3

Sélections de menu

Cette rubrique répertorie les éléments de menu et indique quand ceux-ci sont offerts aux utilisateurs.

Sélections d'éléments de menu :	Cette sélection est valide seulement dans RadioCentral, et accessible à l'utilisateur :
Batterie à la page 215 (BATT)	Lorsque cette option est sélectionnée, l'utilisateur y a toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection.
Bluetooth à la page 215 (BT)	Lorsque le champ Activer Bluetooth à la page 137 est réglé à Activé .
Balise à la page 215 (BCON)	Lorsque le modèle ou les options de la radio le permettent.
Appel sélectif/privé à la page 216 (CALL)	<p>Pour le mode Conventionnel, lorsque le champ Rx/Tx d'appel sélectif à la page 470 de la personnalité conventionnelle (ASTRO) est réglé à Encoder ou à Décoder et encoder ou lorsque le champ Rx/Tx d'appel sélectif à la page 465 (Non ASTRO) de la personnalité conventionnelle est réglé à Encoder ou à Décoder et encoder pour le canal actuel de la radio.</p> <p>Pour le mode ADF, lorsque le champ Type d'appel privé à la page 569 de la personnalité ADF n'est pas réglé à Désactivé pour le canal actuel de la radio.</p>
Canal suivant à la page 216 (CHDN)	Lorsque cette option est sélectionnée, l'utilisateur y a toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection.
Recherche de canal à la page 216 (CHSR)	Lorsque cette option est sélectionnée, l'utilisateur y a toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection.
Sélection de canal à la page 216 (CHAN)	Lorsque cette option est sélectionnée, l'utilisateur y a toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection.
Canal supérieur à la page 216 (CHUP)	Lorsque cette option est sélectionnée, l'utilisateur y a toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection.
Horloge à la page 217 (CLCK)	Lorsque le champ Format d'heure de la fenêtre Toute la radio n'est pas réglé à Désactivé .
Contacts à la page 217 (CNTS)	Lorsque cette option est sélectionnée, l'utilisateur y a toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection.
Composition	Lorsque le modèle ou les options de la radio le permettent.
Direct/Talkaround (En direct) à la page 217 (DIR)	Lors du fonctionnement en mode de communication conventionnel et lorsque le champ Direct/Talkaround (En

Sélections d'éléments de menu :	Cette sélection est valide seulement dans RadioCentral, et accessible à l'utilisateur :
	<p>direct) à la page 439 de la personnalité conventionnelle est réglé à Activé pour le canal courant de la radio.</p> <p> IMPORTANT : Cette sélection ne peut pas être attribuée simultanément à des boutons, à des commutateurs et à des éléments de menu.</p>
ID dynamique à la page 217 (IDDY)	En mode de communications conventionnelles, et lorsque la case Activer l'ID dynamique du système conventionnel est réglé à Activé pour le canal actuel de la radio.
Priorité dynamique à la page 217 (PDYN) 	Lorsque le mode Balayage est activé, lorsque le champ Type de balayage à la page 682 est réglé à Conventionnel et lorsque le champ Priorité dynamique à la page 686 est réglé à activé pour le canal de balayage établi actuel de la radio.
Effacer à la page 217 (ERAS)	Lorsque le champ Fonctionnement sécurisé à la page 301 de Toute la sécurité est réglé à Matériel ou à Logiciel , et lorsque le champ Norme de chiffrement avancée (AES256) à la page 302 est activé.
Information à la page 218 (INFO)	Lorsque cette option est sélectionnée, l'utilisateur y a toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection.
Adresse de protocole Internet à la page 218 (IP)	Lorsque cette option est sélectionnée, l'utilisateur y a toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection.
Touche à la page 218 (KEY)	Lorsque le champ Voix\Connexion de touche à la page 486 (Voix) de la personnalité conventionnelle est réglé à Sélectionner pour le canal courant de la radio.
Jeu de clés à la page 218 (KSET)	Lorsque le champ Fonctionnement sécurisé à la page 301 de Toute la sécurité est réglé à Matériel ou à Logiciel , et lorsque les paramètres Norme de chiffrement avancée (AES256) à la page 302 et Sélectionnable par l'utilisateur (Jeu de clés) sont activés.
Localisation à la page 219 (LOC)	Lorsque le champ Activer l'emplacement à la page 119 la fenêtre Toute la radio est Activé .
LTE à la page 219 (LTE)	<p>Pour le mode Conventionnel, lorsque le champ Type de profil de données à la page 376 du profil de données référencé du système conventionnel est réglé à Conventionnel et large bande ou Large bande seulement.</p> <p>Pour le mode ADF, lorsque le type de profil de données du profil de données référencé du système ADF est Conventionnel et large bande ou Large bande seulement.</p>
Message à la page 219 (MSG)	Pour le mode Conventionnel, lorsque le champ Message du système conventionnel est réglé à activé pour le canal actuel de la radio.

Sélections d'éléments de menu :	Cette sélection est valide seulement dans RadioCentral, et accessible à l'utilisateur :
	Pour le mode ADF, lorsque le champ Activer le message à la page 575 de la personnalité ADF est réglé à activé pour le canal actuel de la radio.
Mode Sélection à la page 219 (MS01–MS05)	Lorsque cette option est sélectionnée, l'utilisateur y a toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection.
Ligne privée multiple à la page 220 (MPL)	Lorsque le champ Rx (type voix/signal) à la page 430 de la personnalité conventionnelle est réglé à Non ASTRO ou Mode mixte et que le champ PM Sélectionnable par l'utilisateur [MPL] de la personnalité conventionnelle est réglé à Activé pour le canal actuel de la radio. Disponible uniquement pour le mode Conventionnel.
Muet à la page 220 (MUTE)	Lorsque le champ Fonctionnement amélioré des tonalités en sourdine à la page 108 de la fenêtre Toute la radio est désactivé .
Mon identification radio (MYID) à la page 220 (MYID)	Lorsqu'un nom a été défini dans le champ Alias radio de la fenêtre Toute la radio.
Suppression des nuisances à la page 220 (NUIS)	Lorsque le mode de balayage est activé .
Avis à la page 221 (PAGE)	Pour le mode Conventionnel, lorsque le champ Rx/Tx d'avis d'appel à la page 471 de la personnalité conventionnelle (ASTRO) est réglé à Encoder ou à Décoder et encoder ou lorsque le champ Rx/Tx d'avis d'appel à la page 466 (Non ASTRO) de la personnalité conventionnelle est réglé à Encoder ou à Décoder et encoder pour le canal actuel de la radio. Pour le mode ADF, lorsque le champ Alerte d'appel/Notification à la page 570 de personnalité ADF est réglé à Liste seulement ou Illimité pour le canal actuel de la radio.
Mot de passe à la page 221 (PSWD)	Lorsque le champ Activer (Verrouillage radio) de la fenêtre Toute la radio est réglé à Activé .
Téléphone à la page 221 (PHON)	Pour le mode Conventionnel, lorsque le champ Fonctionnement du téléphone à la page 573 de la personnalité conventionnelle n'est pas réglé à Aucun pour le canal actuel de la radio. Pour le mode ADF, lorsque le champ Fonctionnement du téléphone à la page 573 de la personnalité ADF n'est pas réglé à Désactivé pour le canal actuel de la radio.
Alimentation à la page 222 (PWR)	Lorsque cette option est sélectionnée, l'utilisateur y a toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection.
Quik Call II à la page 222 (QCII)	Pour activer la fonction QCII sélectionnée, l'utilisateur n'a qu'à maintenir le bouton PTT enfoncé, qui transmet les tonalités sur le réseau de la radio.

Sélections d'éléments de menu :	Cette sélection est valide seulement dans RadioCentral, et accessible à l'utilisateur :
	<p>Pour le mode Conventionnel, lorsque le champ Liste de composition de tonalité à la page 645 de la personnalité conventionnelle est réglé à une liste de composition de tonalité spécifique, et lorsque le modèle ou les options de la radio le permettent.</p> <p>Pour le mode ADF, lorsque le champ Liste de composition de tonalité à la page 645 de la personnalité ADF est réglé à une liste de composition de tonalité spécifique, et lorsque le modèle ou les options de la radio le permettent.</p>
Profils de radio à la page 222 (PRFL)	Lorsque cette option est sélectionnée, l'utilisateur y a toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection.
Derniers appels à la page 222 (RCNT)	Lorsque cette option est sélectionnée, l'utilisateur y a toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection.
Demande de nouvelle attribution de clé à la page 223 (REKY)	Lorsque le champ Demande de nouvelle attribution de clé sélectionnable par l'utilisateur à la page 327 de la fenêtre Information ASTRO OTAR n'est pas Désactivé , lorsque le champ Demande de réattribution de touche/Mode à la page 308 de MDC OTAR n'est pas réglé à Désactivé .
Urgence à distance à la page 191 (REMG)	Lorsque cette option est sélectionnée, vous y avez toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection.
Balayage à la page 223 (SCAN)	<p>Pour le mode Conventionnel, lorsque le champ Type de balayage à la page 682 n'est pas réglé à Balayage de vote, lorsque le champ de Sélection de la liste de balayage à la page 476 de la personnalité conventionnelle n'est pas réglé à Aucun et lorsque le champ Balayage automatique à la page 478 de la personnalité conventionnelle est réglé à Désactivé pour le canal courant de la radio.</p> <p>Pour le mode ADF, lorsque le champ de Sélection de la liste de balayage à la page 573 de la personnalité ADF n'est pas réglé à Aucun et que le champ Balayage automatique à la page 574 de la personnalité ADF est réglé à Désactivé pour le canal courant de la radio.</p> <p> IMPORTANT : Cette sélection ne peut pas être attribuée simultanément à des touches, à des commutateurs et à des éléments de menu, mais elle peut être attribuée simultanément à des touches de radio portative et à des touches d'accessoire.</p>
Liste de balayage à la page 223 (SCNL)	Pour le mode Conventionnel, lorsque le champ de Sélection de la liste de balayage à la page 476 de la personnalité conventionnelle n'est pas réglé à Aucun pour le canal courant de la radio.

Sélections d'éléments de menu :	Cette sélection est valide seulement dans RadioCentral, et accessible à l'utilisateur :
	Pour le mode ADF, lorsque le champ de Sélection de la liste de balayage à la page 573 de la personnalité ADF n'est pas réglé à Aucun pour le canal courant de la radio.
Capteur à la page 223 (SNSR)	Lorsque le modèle ou l'option de la radio le permet.
État à la page 224 (STS)	Pour le mode Conventionnel, lorsque le champ État à la page 419 du système conventionnel est réglé à Activé pour le canal actuel de la radio. Pour le mode ADF, lorsque le champ Activer l'état à la page 575 de la personnalité ADF est réglé à Activé pour le canal actuel de la radio.
Groupe à la page 224 (TGRP)	Lorsque le champ Type de sélection à la page 474 groupe ASTRO de la personnalité conventionnelle est réglé à Sélectionnable pour le canal courant de la radio. Disponible uniquement pour le mode Conventionnel.
Service de messagerie texte à la page 224 (TMS)	Pour le mode Conventionnel, lorsque le champ Service de messagerie texte à la page 422 du système conventionnel est réglé à Liste seulement ou Illimité , et lorsque le champ Sélection du profil de données à la page 418 de ce système n'est pas réglé à Données désactivées pour le canal actuel de la radio. Pour le mode ADF, lorsque le champ Service de messagerie texte à la page 532 du système ADF est réglé à Liste seulement ou Illimité , et lorsque le champ Sélection du profil de données à la page 585 de ce système n'est pas réglé à Données désactivées pour le canal actuel de la radio.
Blocage de Tx à la page 225 (TxIN)	Pour une codeplug de radio mobile : lorsque le champ Sélection de radio n'est pas réglé à Radio secondaire , ou lorsque le champ Activer la transmission sur radio secondaire est réglé à Activé .  IMPORTANT : Pour une codeplug de radio portative : cette sélection ne peut pas être réglée simultanément à une sélection de commutateur Blocage de Tx à la page 207 .
Utilisateur à la page 225 (USER)	Lorsque cette option est sélectionnée, l'utilisateur y a toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection.
Mettre la voix en sourdine à la page 225 (VMUT) 	Pour le mode Conventionnel, lorsque le champ Activer l'alerte utilisateur en appel (Appel ASTRO) de la personnalité conventionnelle est réglé à Activé pour le canal actuel de la radio, ou lorsque le champ Activer l'alerte utilisateur en appel (Appel autre que ASTRO) de la personnalité conventionnelle est réglé à Activé pour le canal actuel de la radio.

Sélections d'éléments de menu :	Cette sélection est valide seulement dans RadioCentral, et accessible à l'utilisateur :
	Lorsque le champ Activer l'alerte utilisateur en appel à la page 571 de la personnalité ADF est réglé à Activé pour le canal actuel de la radio.
Activer/désactiver Wi-Fi à la page 195 (WIFI)	Cette commande de menu offre à l'utilisateur des renseignements et des options WiFi. Il est possible d'activer ce champ seulement si le champ Activer Wi-Fi à la page 364 est Activé .
Zone - à la page 225 (ZNDN)	Lorsque cette option est sélectionnée, l'utilisateur y a toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection.
Programmation d'une zone dynamique à la page 225 (ZNPR)	Lorsque le champ Activation zone dynamique de la fenêtre Affectation du canal de zone est activé pour une ou plusieurs zones.
Sélection de zone à la page 226 (ZONE)	Lorsque cette option est sélectionnée, l'utilisateur y a toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection.
Zone + à la page 226 (ZNUP)	Lorsque cette option est sélectionnée, l'utilisateur y a toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection.

10.8.3.3.1

Batterie

Cette sélection de menu vous permet de vérifier le niveau de charge de la batterie lorsque la radio est utilisée en mode conventionnel ou ADF.

10.8.3.3.2

Bluetooth

Cette sélection de menu permet d'afficher des informations sur l'état et les options Bluetooth.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

Fonctions de Configuration Bluetooth comprises :

État Bluetooth

Permet à l'utilisateur d'activer ou de désactiver la fonction Bluetooth de la radio.

Appareil actif

Vous permet d'afficher la liste de tous les appareils Bluetooth (appariés) actuellement actifs.

Haut-parleur Bluetooth

Permet à l'utilisateur d'activer ou de désactiver le haut-parleur d'un appareil Bluetooth.

10.8.3.3.3

Balise

Cette sélection de menu vous permet de vérifier les détails des balises d'urgence récemment reçues.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

10.8.3.3.4

Appel sélectif/privé

Cette sélection de menu vous permet de transmettre un appel sélectif conventionnel ou un appel privé ADF.

Pour effectuer l'appel, vous devez d'abord sélectionner le contact ou l'ID d'appel désiré, puis appuyer sur la touche PTT.

La fonction Appel sélectif/privé est habituellement utilisée lorsque la plupart des communications sont acheminées entre vous-même et un répartiteur ou un groupe d'utilisateurs.

Vous pouvez entrer directement ou sélectionner les appels ciblés selon l'ID d'appel dans la Liste courte d'appel du canal. La fonction d'appel sélectif/privé ne vise pas tant à garantir une certaine confidentialité à l'utilisateur de la radio qu'à éliminer la réception de transmissions qui ne sont pas pertinentes pour lui. Voir aussi Conventionnel - Rx/Tx d'appel sélectif et ADF - Appel privé.

10.8.3.3.5

Canal suivant

Cette sélection de menu vous permet d'accéder par défilement aux autres canaux à l'intérieur de la zone courante de la radio.

Les canaux sont définis dans la fenêtre Attribution du canal de zone. Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

10.8.3.3.6

Recherche de canal

Cette sélection de menu vous permet de rechercher un canal / mode en fonction de son nom de canal programmé, et de passer directement au canal trouvé.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

REMARQUE :

Les champs [Nom du canal à la page 671](#) peuvent être affichés par zone dans la page Canaux de la fenêtre Affectation du canal de zone.

10.8.3.3.7

Sélection de canal

Cette sélection de menu vous permet d'entrer au clavier le numéro d'un canal particulier afin d'y accéder directement.

Cette fonction s'applique lors de l'utilisation de la radio en mode de communication conventionnel ou ADF.

REMARQUE :

Ces numéros de canal doivent être programmés et peuvent être affichés par zone dans la page Canaux de la fenêtre Affectation du canal de zone.

10.8.3.3.8

Canal supérieur

Cette sélection de menu vous permet d'accéder par défilement aux autres canaux à l'intérieur de la zone courante de la radio.

Les canaux sont définis dans la fenêtre Attribution du canal de zone. Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

10.8.3.3.9

Horloge

Cette sélection de menu vous permet de consulter et de modifier les réglages de l'horloge.

Le champ Format d'heure permet de définir le mode d'affichage du temps par défaut pour toute la radio (12 h ou 24 h). Cette fonction s'applique lors de l'utilisation de la radio en mode de communication conventionnel ou ADF.

IMPORTANT :

La fonction Horloge n'apparaît à l'écran de la radio que si la valeur du champ Toute la radio, Format d'heure n'est pas réglée à **Désactivé**.

10.8.3.3.10

Contacts

Cette sélection de menu vous permet d'afficher/modifier les contacts pour le canal courant de la radio.

Ces contacts sont programmés dans la fenêtre Liste d'appel unifiée. Les contacts sont les éléments constitutifs des listes d'appel privilégiées.

Vous pouvez sélectionner les membres de la liste courte/contacts pour différents types d'appels, comme les appels téléphoniques, les appels sélectifs ou privés et les alertes d'appel ou notifications, vers une radio unique ou un groupe de radios. Cette fonction s'applique lors de l'utilisation de la radio en mode de communication conventionnel ou ADF.

IMPORTANT :

Cette fonction ne s'applique pas aux radios portatives qui ont seulement un écran sur le dessus de l'appareil.

10.8.3.3.11

Direct/Talkaround (En direct)

Cette sélection de menu vous permet d'activer ou de désactiver le mode Direct / Talkaround (En direct) pour le profil d'options du canal courant.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnel.

10.8.3.3.12

ID dynamique

Cette sélection de menu permet d'entrer en mode de modification ID dynamique, qui vous permet d'afficher ou de modifier l'ID individuel et/ou l'ID principal MDC de la radio pour le système ASTRO et/ou MDC courant.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnel.

10.8.3.3.13

Priorité dynamique

Cette sélection de menu vous permet de sélectionner l'affectation de balayage en priorité dynamique.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnel.

10.8.3.3.14

Effacer

Cette sélection de menu vous permet de retirer la clé de chiffrement sécurisée utilisée par la radio ou toutes les clés de chiffrement courantes de la radio.

Cette sélection s'applique lors de l'utilisation de la radio en mode de communication conventionnel ou ADF.

10.8.3.3.15

Information

Cette sélection de menu vous permet de récupérer et d'afficher des informations de base, comme des informations sur l'IP et sur le mappage des touches/commutateurs, et d'afficher ou de modifier l'ID programmable.

Cette fonction s'applique seulement au système conventionnel - ASTRO courant. Ceci est une fonction pour radio portative seulement.

IMPORTANT :

Le fait de modifier l'ID programmable modifie aussi le nom d'utilisateur de la radio pour le serveur du Service d'inscription automatique ou pour l'ouverture de session du serveur UNS (Unified Network Services) d'authentification utilisateur. Lors de la modification du nom d'utilisateur à l'aide de cette fonction, le NIP/mot de passe et l'ID d'unité sont vierges. Par conséquent, cette fonction peut uniquement être utilisée lorsque le serveur s'attend à recevoir un NIP/mot de passe vide, lorsque vous ne souhaitez pas utiliser l'ID d'unité.

Cette fonction ne s'applique pas aux radios portatives qui ont seulement un écran sur le dessus de l'appareil.

10.8.3.3.16

Adresse de protocole Internet

Cette sélection de menu vous permet d'extraire et de consulter (à l'écran de la radio) l'adresse IP courante, le nom et l'état de l'appareil.

Cette fonction s'applique lors de l'utilisation de la radio en mode de communication conventionnel ou ADF.

10.8.3.3.17

Touche

Cette sélection de menu vous permet de modifier la clé de chiffrement sécurisée pour le canal de communication conventionnel courant.

IMPORTANT :

Ces clés sélectionnables sont définies de façon unique dans le champ [Numéro CKR à la page 317](#).

Lorsque l'utilisateur sélectionne une nouvelle clé, tous les canaux du mode de communication conventionnel pour lesquels la valeur du champ [Voix\Connexion de touche à la page 486](#) a été réglée à **Sélection** se font automatiquement réattribuer la clé que vous avez sélectionnée.

La modification des clés peut s'avérer utile lorsqu'une clé de chiffrement est compromise.

10.8.3.3.18

Jeu de clés

Cette sélection de menu vous permet d'utiliser un autre jeu de clés de chiffrement sécurisées lorsque la radio est utilisée en mode conventionnel ou ADF.

Le jeu de clés sélectionné s'applique alors à toute la radio pour les modes de communication conventionnel et ADF.

IMPORTANT :

La sélection d'un autre jeu de clés est possible en raison de la compatibilité de la gestion de clés PID [Gestion de clés PID pour mode ASN à la page 315](#) ou du changement de clé par liaison radio (OTAR).

La modification des jeux de clés peut s'avérer utile lorsqu'une clé de chiffrement est compromise.

10.8.3.3.19

Localisation

Cette sélection de menu vous permet de connaître son emplacement courant (latitude et longitude, heure et date), sa position par rapport à un autre emplacement, de même que la distance qui l'en sépare (« point de repère »).

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

**IMPORTANT :**

Si le champ [Activer l'emplacement sélectionnable par l'utilisateur à la page 120](#) de la fenêtre Toute la radio est **Activé**, vous pouvez également activer ou désactiver la fonction d'emplacement extérieur/GPS pour tous les canaux des modes conventionnels et ADF pour lesquels cette fonction a été activée.

10.8.3.3.20

LTE

Cette fonction attribuée à une sélection de menu permet d'activer et de désactiver les fonctions de données LTE à large bande de la radio.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

**IMPORTANT :**

Cette commande de menu est uniquement opérationnelle quand un canal configuré pour fonctionner en LTE large bande est sélectionné. Lorsqu'un canal non LTE est sélectionné, ce menu est masqué.

LTE est activé sur un canal lorsque le champ [Type de profil de données à la page 376](#) du Profil de données et réglé sur **Conventionnel et large bande**, ou sur **ADF et large bande** ou **Large bande seulement**, et que le champ [Source large bande](#) est sur **Modem LTE interne**.

10.8.3.3.21

Message

Cette sélection de menu vous permet d'afficher le dernier message transmis par la radio et reçu par la station de base lorsque la radio est utilisée en mode conventionnel ou ADF.

10.8.3.3.22

Mode Sélection

Ces cinq sélections de menu (MS01–MS05) vous permettent de programmer des combinaisons de zone et de canal utilisées fréquemment ou au choix. Si l'option MSPR est sélectionnée, vous pouvez pré-régler la configuration correspondant à MS01-MS05 sur la radio.

Chaque sélection de menu peut être programmée en combinant une zone et un canal distincts, pour une utilisation ultérieure. La programmation et l'utilisation de ces sélections de menu sont très similaires à la programmation et à l'utilisation des stations de radio préétablies dans une radio d'auto. Autrement dit, lorsque vous accédez à une option MSx dans le menu, si vous appuyez longuement sur le bouton de sélection, la zone et le canal courants de la radio sont programmés dans cette option de menu MSx; ultérieurement, si vous appuyez brièvement sur le bouton de sélection, la radio passe à la combinaison de zone et de canal mémorisée.

Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

**IMPORTANT :**

Les paramètres [Durée courte pression de touche à la page 146](#) et [Durée longue pression de touche à la page 146](#) sont tous deux définis par RadioCentral.

10.8.3.3.23

Ligne privée multiple

Cette sélection de menu vous permet d'accéder à une liste de toutes les listes MPL.

REMARQUE :

Chaque liste porte un nom reconnaissable . Vous pouvez alors sélectionner les réglages voulus pour l'alias et la ligne privée. Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnel.

10.8.3.3.24

Muet

Cette sélection de menu vous permet d'activer ou de désactiver certaines tonalités de la radio (par exemple, les tonalités du clavier) configurées par la commande Fonctionnement amélioré des tonalités en sourdine.

Cette fonction s'applique lorsque la radio est utilisée en modes de communication conventionnelle et ADF.

10.8.3.3.25

Mon identification radio (MYID)

Cette sélection de menu vous permet d'afficher son alias d'identification à l'écran de la radio.

Cette fonction s'applique lors de l'utilisation de la radio en mode de communication conventionnel ou ADF.

10.8.3.3.26

Suppression des nuisances

Pendant un balayage actif, cette sélection de menu vous permet de supprimer temporairement de la liste de balayage un canal dont l'onde porteuse génère continuellement du bruit.

Cette fonction s'applique lors de l'utilisation de la radio en mode de communication conventionnel ou ADF.

IMPORTANT :

Le fait de sélectionner un autre canal au moyen du sélecteur de canal de la radio, de désactiver puis de le réactiver, ou de mettre la radio hors tension puis de nouveau sous tension remet dans la liste de balayage actif le canal qui en avait été temporairement supprimé.

On ne peut utiliser la fonction Suppression des nuisances :

- Pour un membre prioritaire 1 ou un membre prioritaire 2 de la liste de balayage.
- Lorsque la valeur du champ [Type de membre de Tx vocale désigné à la page 689](#) est réglée à **Canal sélectionné** et que la fréquence Tx du canal trouvé au moyen d'un balayage est identique à celle du canal actuellement sélectionné.
- Si la liste de balayage ne contient pas au moins deux éléments.

10.8.3.3.27

Avis

Cette sélection de menu permet à l'utilisateur de transmettre une alerte d'appel en mode conventionnel ou une alerte d'appel/notification en mode ADF.

REMARQUE :

Les alertes d'appel et les notifications permettent au répartiteur ou à l'appelant radio de vous informer (ou d'informer un groupe d'utilisateurs radio) qu'un appel a été manqué. Les radios réceptrices sont ciblées d'après les renseignements sur la radio et le système qui ont été définis dans les champs Contact et Identification de l'appel des listes d'appel privilégiées de la radio. Vous pouvez entrer directement ou sélectionner les ID d'appel dans la liste courte du canal. La radio réceptrice répond par des tonalités d'alerte et des alertes visuelles. L'alerte visuelle (clignotement de l'indicateur à DEL) persiste jusqu'à ce que vous appuyiez sur une touche.

10.8.3.3.28

Mot de passe

Cette sélection de menu vous permet de modifier les paramètres Verrouillage radio/Interruption de l'inhibition tactique, Mot de passe de déverrouillage et de modifier le mot de passe encodé de blocage de transmission.

Cette fonction s'applique lors de l'utilisation de la radio en mode de communication conventionnel ou ADF.

IMPORTANT :

Le mot de passe doit être composé uniquement de chiffres faciles à saisir à l'aide du clavier. La longueur maximale du mot de passe est déterminée par la valeur du champ Longueur maximale du mot de passe.

Dans la version de chiffrement sécurisé de la fonction Verrouillage radio (voir la note importante dans la rubrique Activation du verrouillage radio), le mot de passe doit être défini manuellement dans le module de chiffrement du matériel au moyen du clavier de la radio et de cette sélection de menu Mot de passe.

Dans la version libre/inhibition tactique de la fonction Verrouillage radio, le mot de passe initial est programmé dans le champ Mot de passe de déverrouillage.

10.8.3.3.29

Téléphone

Cette sélection de menu vous permet de passer en mode Téléphone lors du fonctionnement en mode de communications conventionnel ou ADF.

10.8.3.3.30

Alimentation

Cette sélection de menu vous permet d'alterner entre les niveaux de puissance d'émission faible et élevé pour toutes les personnalités conventionnelles ou les systèmes ADF définis pour toute la radio.

IMPORTANT :

Une fois que les réglages dans l'affichage de la radio ont été modifiés, ce réglage de puissance élevée ou faible a préséance sur tous les réglages [Niveau de puissance de transmission à la page 435](#) conventionnels ou [Niveau de puissance Tx à la page 526](#) ADF individuels. Ainsi, après avoir choisi la sélection de menu Puissance (**PWR**), la radio affiche *Puissance élevée* ou *Puissance faible*, selon l'état du canal courant de la radio. Vous pouvez alors choisir de transmettre selon un niveau de puissance élevé ou faible en sélectionnant l'option appropriée à l'écran.

La mise hors tension de la radio suivie de sa remise sous tension réinitialise tous les canaux de la radio à leurs niveaux de puissance programmés.

10.8.3.3.31

Quik Call II

Cette option permet de lancer l'application QCII et vous permet également de choisir la tonalité à transmettre.

Cette fonction s'applique lors de l'utilisation de la radio en mode de communication conventionnel ou ADF.

10.8.3.3.32

Profils de radio

Cette sélection de menu vous permet de sélectionner un des profils de radio programmés dans la fenêtre Affectation de zone-canal, lorsque le champ « Sélection de profil radio » est réglé à la dernière sélection.

Cette fonction s'applique lors de l'utilisation de la radio en mode de communication conventionnel ou ADF.

10.8.3.3.33

Échange de radio

Cette sélection de menu vous permet de basculer entre deux radios (changer de module) reliées à la même tête de commande d'une configuration à double radio.

Cette fonction s'applique lors de l'utilisation de la radio en mode de communication conventionnel ou ADF.

IMPORTANT :

Si le champ Menu d'échange fixe est réglé à **Activé**, une sélection de menu **Échange de radio** apparaît toujours à la position du menu la plus à gauche, même lorsque vous faites défiler les touches de menu programmables et que cette fonction soit programmée ou non; cependant, si le champ Menu d'échange fixe est réglé à **est Désactivé**, cette sélection de menu est accessible à partir du menu défilant standard.

10.8.3.3.34

Derniers appels

Cette sélection de menu vous permet de consulter les détails des derniers appels entrants et sortants de types suivants : Avis d'appel, Appels sélectifs, Appels privés et Appels téléphoniques (sortants seulement).

Cette fonction s'applique lors de l'utilisation de la radio en mode de communication conventionnel ou ADF.

10.8.3.3.35

Demande de nouvelle attribution de clé

Cette fonction vous permet de transmettre une demande de changement de clé par onde radio (OTAR) à la console (KMF ou KMC) du répartiteur lorsque la radio est utilisée en mode de communication conventionnel ou ADF.

IMPORTANT :

Le protocole des demandes MDC OTAR (mode de communication conventionnel) est déterminé par la valeur du champ [Demande de réattribution de touche\Mode à la page 308](#).

Pour ASTRO OTAR (mode de communication conventionnelle ou ADF), le champ [Demande de nouvelle attribution de clé sélectionnable par l'utilisateur à la page 327](#) doit d'abord être **activé**, et le champ [Niveau de sécurité Tx OTAR à la page 326](#) détermine le protocole de demande.

10.8.3.3.36

Urgence à distance

Ce bouton active la fonction Activation d'urgence à distance afin qu'un utilisateur autorisé à encoder cette commande puisse faire en sorte qu'une radio cible lance la fonction d'urgence sans intervention de l'utilisateur cible.

REMARQUE :

L'urgence à distance n'est prise en charge que par les canaux ASTRO conventionnels et par les canaux ADF ASTRO 25.

10.8.3.3.37

Balayage

Cette sélection de menu vous permet de sélectionner des listes de balayage et d'activer ou de désactiver le mode Balayage lorsque la radio est utilisée en mode conventionnel ou ADF.

10.8.3.3.38

Liste de balayage

Cette sélection de menu vous permet d'afficher individuellement les membres de la liste de balayage et également de placer la radio en mode de modification de la liste de balayage.

Dans ce mode de modification, vous pouvez ajouter des membres à la liste de balayage ou en supprimer, et modifier la priorité de balayage de n'importe quel membre. Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

IMPORTANT :

Le bouton latéral du haut devient automatiquement le bouton de sélection désigné pendant la modification d'un canal de liste de balayage. Le bouton latéral supérieur devient automatiquement le bouton de sélection désigné pour modifier les canaux de la liste de balayage, seulement lorsque la radio est utilisée en mode de programmation de la liste de balayage.

10.8.3.3.39

Capteur

Cette touche vous permet de sélectionner le délai de désactivation d'événement du capteur.

Le champ [Délai de désactivation d'événement du capteur à la page 138](#) s'applique à l'ensemble de la radio. Cette fonction s'applique lors de l'utilisation de la radio en mode de communication conventionnel ou ADF.

10.8.3.3.40

État

Cette sélection de menu vous permet de sélectionner un état dans la liste d'alias état du mode de communication courant.

**REMARQUE :**

Pour vous aider, avec cette fonction, l'écran affiche tout d'abord le dernier état confirmé ou le premier état de la liste. Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF.

**IMPORTANT :**

Lorsque la radio est utilisée en mode de communication conventionnel avec le type d'émission de signaux MDC / ASTRO / DVRS, la liste d'alias d'état conventionnel est utilisée.

Lorsque la radio est utilisée en mode de communication ADF, la liste d'alias d'état du système ADF sélectionnée pour la personnalité ADF courante est utilisée.

10.8.3.3.41

Désactiver temporairement

Cette option de menu permet à l'utilisateur de transmettre une commande d'interruption de l'inhibition tactique à une radio particulière ou à un groupe de radios.

**IMPORTANT :**

Cette opération est possible uniquement lorsque le champ Personnalité conventionnelle, Opération d'interruption du blocage tactique dans l'application est réglé à **Encoder** ou à **Décoder et encoder**. La commande d'interruption de l'inhibition tactique est définie pour chaque personnalité conventionnelle.

10.8.3.3.42

Groupe

Cette sélection de menu vous permet de passer du groupe prédéfini à un autre groupe faisant partie de la liste de groupes de la personnalité conventionnelle courante.

Toutes les personnalités conventionnelles qui utilisent la même liste de groupes de conversation sont automatiquement intégrées au groupe de conversation sélectionné.

10.8.3.3.43

Service de messagerie texte

Cette sélection de menu vous permet d'accéder au service de messagerie texte (TMS) à l'écran de la radio.

Voir aussi la fonction Service de messagerie texte pour les systèmes ADF ou les systèmes conventionnels.

10.8.3.3.44

Blocage de Tx

Cette sélection de menu vous permet de désactiver toutes les transmissions radio lorsque la radio est utilisée en mode de communications conventionnelles ou ADF.

**IMPORTANT :**

Cette action peut être nécessaire dans les zones dangereuses avec haute sensibilité aux fréquences radio, où des transmissions radio peuvent provoquer une explosion ou une autre réaction dangereuse.

**REMARQUE :**

Si vous tentez d'amorcer la radio lorsque le Blocage Tx est **activé**, la radio émet une longue tonalité grave « Interdiction de parler », indiquant que les transmissions ne sont actuellement pas autorisées.

10.8.3.3.45

Utilisateur

Cette sélection de menu vous permet de vous connecter à différents serveurs ARS (service d'inscription automatique) à l'aide de la combinaison appropriée de nom d'utilisateur et de mot de passe (NIP).

On peut soit entrer manuellement les noms d'utilisateur et les NIP au clavier de la radio, soit sélectionner les noms d'utilisateurs dans la [Liste d'utilisateurs de données à la page 373](#) définie dans (le NIP doit cependant être entré manuellement). Cette fonction s'applique lorsque la radio est utilisée en mode de communication conventionnelle ou ADF. Voir aussi le champ ID/Nom d'utilisateur programmable.

**AVERTISSEMENT :**

Cette fonction peut être activée seulement si la valeur du champ [Mode ARS à la page 382](#) de la fenêtre Profils de données n'est pas réglée à **Désactivé**.

10.8.3.3.46

Mettre la voix en sourdine

Cette touche vous permet d'activer ou de désactiver la mise en sourdine de la voix pour les canaux dont la fonction d'alerte utilisateur en appel est activée.

Lorsque la sourdine est activée, la radio demeure en sourdine pour toutes les communications en mode conventionnel et pour tous les appels des groupes de conversation ADF associés. La mise en sourdine de la voix est désactivée lors de la réception d'alertes d'appel et de notifications, et lors d'appels de radio à radio comme les appels sélectifs ou privés et les appels téléphoniques d'interconnexion.

10.8.3.3.47

Zone -

Cette sélection de menu vous permet de faire défiler vers le bas la liste des zones de la radio.

La liste défile en boucle; après que la première zone a été atteinte, la liste recommence à la dernière zone. Les zones sont définies dans la fenêtre Attribution du canal de zone.

10.8.3.3.48

Programmation d'une zone dynamique

Cette sélection de menu vous permet d'afficher ou de modifier les canaux dans les Zones dynamiques de la radio.

Les zones dynamiques sont définies dans la page Zone de la fenêtre Attribution du canal de zone.

10.8.3.3.49

Sélection de zone

Cette sélection de menu vous permet de sélectionner une zone lorsque la radio est utilisée en mode de communication conventionnel ou ADF.

Les zones sont définies dans la fenêtre Attribution du canal de zone.

10.8.3.3.50

Zone +

Cette sélection de menu vous permet de faire défiler vers le haut la liste des zones de la radio.

La liste défile en boucle; après que la dernière zone a été atteinte, la liste recommence à la première zone. Les zones sont définies dans la fenêtre Attribution du canal de zone.

10.8.4

Clavier (Commande portative)

La section **Clavier** permet à l'utilisateur d'afficher ou de sélectionner la fonctionnalité de touche programmable à l'échelle de la radio pour des modes de communication conventionnelle ou ADF. La fonction de la touche est sélectionnée une seule fois et s'applique aux deux modes de communication radio.

REMARQUE :

Certaines fonctions dépendent du modèle de radio ou des options choisies.

10.8.4.1

Un (1)

Sélectionne la fonction pour une touche un (1) de clavier alphanumérique sur une radio portative, une tête de commande ou un microphone à clavier (KPM).

Voir [Zéro \(0\) à la page 228](#) pour les notes et les avertissements.

Voir [Sélections de touche de clavier à la page 228](#) pour une liste des sélections prises en charge :

10.8.4.2

Deux (2)

Sélectionne la fonction pour une touche deux (2) de clavier alphanumérique sur une radio portative, une tête de commande ou un microphone à clavier (KPM).

Voir [Zéro \(0\) à la page 228](#) pour les notes et les avertissements.

Voir [Sélections de touche de clavier à la page 228](#) pour une liste des sélections prises en charge :

10.8.4.3

Trois (3)

Sélectionne la fonction pour une touche trois (3) de clavier alphanumérique sur une radio portative, une tête de commande ou un microphone à clavier (KPM).

Voir [Zéro \(0\) à la page 228](#) pour les notes et les avertissements.

Voir [Sélections de touche de clavier à la page 228](#) pour une liste des sélections prises en charge :

10.8.4.4

Quatre (4)

Sélectionne la fonction pour une touche quatre (4) de clavier alphanumérique sur une radio portative, une tête de commande ou un microphone à clavier (KPM).

Voir [Zéro \(0\) à la page 228](#) pour les notes et les avertissements.

Voir [Sélections de touche de clavier à la page 228](#) pour une liste des sélections prises en charge :

10.8.4.5

Cinq (5)

Sélectionne la fonction pour une touche cinq (5) de clavier alphanumérique sur une radio portative, une tête de commande ou un microphone à clavier (KPM).

Voir [Zéro \(0\) à la page 228](#) pour les notes et les avertissements.

Voir [Sélections de touche de clavier à la page 228](#) pour une liste des sélections prises en charge :

10.8.4.6

Six (6)

Sélectionne la fonction pour une touche six (6) de clavier alphanumérique sur une radio portative, une tête de commande ou un microphone à clavier (KPM).

Voir [Zéro \(0\) à la page 228](#) pour les notes et les avertissements.

Voir [Sélections de touche de clavier à la page 228](#) pour une liste des sélections prises en charge :

10.8.4.7

Sept (7)

Sélectionne la fonction pour une touche sept (7) de clavier alphanumérique sur une radio portative, une tête de commande ou un microphone à clavier (KPM).

Voir [Zéro \(0\) à la page 228](#) pour les notes et les avertissements.

Voir [Sélections de touche de clavier à la page 228](#) pour une liste des sélections prises en charge :

10.8.4.8

Huit (8)

Sélectionne la fonction pour une touche huit (8) de clavier alphanumérique sur une radio portative, une tête de commande ou un microphone à clavier (KPM).

Voir [Zéro \(0\) à la page 228](#) pour les notes et les avertissements.

Voir [Sélections de touche de clavier à la page 228](#) pour une liste des sélections prises en charge :

10.8.4.9

Neuf (9)

Sélectionne la fonction pour une touche neuf (9) de clavier alphanumérique sur une radio portative, une tête de commande ou un microphone à clavier (KPM).

Voir [Zéro \(0\) à la page 228](#) pour les notes et les avertissements.

Voir [Sélections de touche de clavier à la page 228](#) pour une liste des sélections prises en charge :

10.8.4.10

Étoile (*)

Sélectionne la fonction pour une touche étoile (*) de clavier alphanumérique sur une radio Portable, une Tête de commande ou un microphone à clavier (KPM).

Voir [Zéro \(0\) à la page 228](#) pour les notes et les avertissements.

Voir [Sélections de touche de clavier à la page 228](#) pour une liste des sélections prises en charge :

10.8.4.11

Zéro (0)

Sélectionne la fonction pour une touche zéro (0) de clavier alphanumérique sur une radio Portable, une Tête de commande ou un microphone à clavier (KPM).

Ces sélections s'appliquent lors de l'utilisation en mode de communication conventionnel ou ADF.

IMPORTANT :

Si une radio est équipée par défaut d'une tête de commande O7 avec un clavier à sirène et lumières optionnel, les touches du clavier sont préconfigurées pour correspondre aux graphiques du clavier.

AVERTISSEMENT :

Pour une configuration à double radio :

Les fonctions des touches de la radio (touches de sirène, commande aux. (1 à 3), Dim, Sûreté (1, 2, 3 ou Tout), Schéma de relais, Échange de radio et Tiers) doivent être configurées de la même manière sur la radio principale et la radio secondaire; de plus, il est fortement recommandé de configurer toutes les fonctions des touches de la même manière pour les deux radios, afin d'éviter toute confusion.

Voir [Sélections de touche de clavier à la page 228](#) pour une liste des sélections prises en charge :

10.8.4.12

Carré/dièse (#)

Sélectionne la fonction pour une touche carré/dièse (#) de clavier alphanumérique sur une radio portable, une tête de commande ou un microphone à clavier (KPM).

Voir [Zéro \(0\) à la page 228](#) pour les notes et les avertissements.

Voir [Sélections de touche de clavier](#) pour une liste des sélections prises en charge :

10.8.4.13

Sélections de touche de clavier

Cette rubrique répertorie les sélections de bouton et indique quand celles-ci sont offertes aux utilisateurs.

Sélections des touches :	Cette sélection est valide seulement dans RadioCentral, et accessible à l'utilisateur :
Touche numérique du clavier à la page 229	Lorsque cette option est sélectionnée, l'utilisateur y a toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection.
MS01–MS13 à la page 188	Lorsque cette option est sélectionnée, l'utilisateur y a toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection.

Sélections des touches :	Cette sélection est valide seulement dans RadioCentral, et accessible à l'utilisateur :
(sélection de mode)	
Tierce partie à la page 193	Lorsque cette option est sélectionnée, l'utilisateur y a toujours accès, c'est-à-dire qu'elle ne dépend d'aucune fonction ou sélection.

10.8.4.13.1

Touche numérique du clavier

Sélectionnez cette fonction pour conserver le fonctionnement standard de la touche du clavier associée.

IMPORTANT :

Sur une radio portable, il s'agit de la seule fonction disponible pour les touches Étoile (*) et Carré (#).

10.8.5

Touches d'accessoire (Commande portable)

La section **Touches d'accessoire** permet à l'utilisateur d'afficher ou de sélectionner la fonctionnalité de touche programmable à l'échelle de la radio pour des modes de communication conventionnelle ou ADF. La fonctionnalité de touche est sélectionnée et fonctionne différemment selon le mode choisi. Cela signifie que lorsque la radio utilise un canal conventionnel, seules les fonctions conventionnelles sélectionnées sont disponibles. De même, lorsque la radio utilise un canal ADF, seules les fonctions ADF sélectionnées sont disponibles.

REMARQUE :

Certaines fonctions dépendent du modèle de radio ou des options choisies.

10.8.5.1

Acc. orange (conventionnel)

Permet de sélectionner la fonction du bouton Acc. orange d'accessoire.

IMPORTANT :

La sélection de la touche de l'accessoire « Acc. orange » suit immédiatement celle du « bouton supérieur ».

Voir [Sélections des touches \(supérieures et latérales\) à la page 164](#) pour une liste des sélections prises en charge :

10.8.5.2

Acc. orange (ADF)

Permet de sélectionner la fonction du bouton Acc. orange d'accessoire.

IMPORTANT :

La sélection de la touche de l'accessoire « Acc. orange » suit immédiatement celle du « bouton supérieur ».

Voir [Sélections des touches \(supérieures et latérales\) à la page 164](#) pour une liste des sélections prises en charge :

10.8.5.3

Acc. 0 point (Conventionnel)

Permet de sélectionner la fonction du bouton Acc. 0 point d'accessoire.

Ces sélections s'appliquent lors de l'utilisation en mode de communication Conventionnel ou ADF, comme le décrit le tableau suivant.

AVERTISSEMENT :

L'utilisateur ne doit pas assigner une même fonction à plus d'une commande utilisateur, c'est-à-dire à plus d'un bouton, à plus d'un commutateur, ou à un bouton et à un commutateur. Le fonctionnement de la radio pourrait en être perturbé.

IMPORTANT :

Lors de la sélection d'une fonction conventionnelle Haut ou Bas, la fonction ADF est automatiquement réglée à la fonction opposée en mode affichage seulement. La sélection de toute autre fonction conventionnelle active la fonction ADF pour cette sélection.

Voir [Sélections des touches \(supérieures et latérales\) à la page 164](#) pour une liste des sélections prises en charge :

10.8.5.4

Acc. 0 point (ADF)

Permet de sélectionner la fonction du bouton Acc. 0 point d'accessoire.

Voir [Acc. 0 point \(Conventionnel\) à la page 230](#) pour les notes et les avertissements.

Voir [Sélections des touches \(supérieures et latérales\) à la page 164](#) pour une liste des sélections prises en charge :

10.8.5.5

Acc. 1 point (Conventionnel)

Permet de sélectionner la fonction du bouton Acc. 1 point d'accessoire.

Voir [Acc. 0 point \(Conventionnel\) à la page 230](#) pour les notes et les avertissements.

Voir [Sélections des touches \(supérieures et latérales\) à la page 164](#) pour une liste des sélections prises en charge :

10.8.5.6

Acc. 1 point (ADF)

Permet de sélectionner la fonction du bouton Acc. 1 point d'accessoire.

Voir [Acc. 0 point \(Conventionnel\) à la page 230](#) pour les notes et les avertissements.

Voir [Sélections des touches \(supérieures et latérales\) à la page 164](#) pour une liste des sélections prises en charge :

10.8.5.7

Acc. 2 point (Conventionnel)

Permet de sélectionner la fonction du bouton Acc. 2 point d'accessoire.

Voir [Acc. 0 point \(Conventionnel\) à la page 230](#) pour les notes et les avertissements.

Voir [Sélections des touches \(supérieures et latérales\) à la page 164](#) pour une liste des sélections prises en charge :

10.8.5.8

Acc. 2 point (ADF)

Permet de sélectionner la fonction du bouton Acc. 2 point d'accessoire.

Voir [Acc. 0 point \(Conventionnel\) à la page 230](#) pour les notes et les avertissements.

Voir [Sélections des touches \(supérieures et latérales\) à la page 164](#) pour une liste des sélections prises en charge :

10.8.5.9

Acc. 3 point (Conventionnel)

Permet de sélectionner la fonction du bouton Acc. 3 point d'accessoire.

Voir [Acc. 0 point \(Conventionnel\) à la page 230](#) pour les notes et les avertissements.

Voir [Sélections des touches \(supérieures et latérales\) à la page 164](#) pour une liste des sélections prises en charge :

10.8.5.10

Acc. 3 point (ADF)

Permet de sélectionner la fonction du bouton Acc. 3 point d'accessoire.

Voir [Acc. 0 point \(Conventionnel\) à la page 230](#) pour les notes et les avertissements.

Voir [Sélections des touches \(supérieures et latérales\) à la page 164](#) pour une liste des sélections prises en charge :

10.9

Écran

La fenêtre **Affichage** vous permet d'afficher ou de modifier les paramètres d'affichage et d'options de menu pour toute la radio.

10.9.1

Général

Cette section vous permet de consulter ou de définir les paramètres de base applicables à toute la radio reliés à l'aspect et à la fonctionnalité de l'écran de la radio.

10.9.1.1

Taille du texte de la zone

Ce champ permet de sélectionner le nombre de caractères maximum permis pour le nom des zones dans l'écran avant de la radio.

Cette sélection s'applique à toute la radio.

REMARQUE :

Les noms et descriptions de zone sont définis dans le champ Attribution du canal de zone [Noms de zone à la page 669](#).

Vous pouvez sélectionner des zones à l'aide d'un commutateur [Sélection de zone à la page 207](#) ou d'une sélection de menu Sélectionner la zone.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les nombres entiers de 0 à 14 sont pris en charge.

10.9.1.2

Taille du texte du canal

Ce champ permet de sélectionner le nombre de caractères maximum permis pour le nom des canaux dans l'écran avant de la radio.

Cette sélection s'applique à toute la radio.

REMARQUE :

Les noms et descriptions des canaux sont définis dans le champ Nom du canal de la fenêtre Affectation du canal de zone. Vous pouvez sélectionner les canaux à l'aide d'une touche de sélection de canal, d'un commutateur de sélection de canal ou de la sélection de menu Sélection de canal.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Portée

Nombres entiers entre 1 et 14

10.9.1.3

Orientation de l'affichage du haut

Ce champ permet de sélectionner l'orientation par défaut pour l'écran du dessus de la radio, pour qu'il soit possible de faire pivoter l'affichage sur 180 degrés, selon votre préférence.

La sélection de la touche programmable Rétroéclairage/Rotation (Affichage) vous permet de modifier cette orientation, au besoin. Cette sélection s'applique à toute la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

- Normal
- Inversé

10.9.1.4

Vitesse de défilement lent

Ce champ permet de sélectionner la vitesse du défilement lent des listes à l'écran.

La radio utilise d'abord la vitesse de défilement lent et passe à la vitesse de défilement rapide une fois que la valeur définie dans le champ Nombre de défilements lents est atteinte. Cette fonction s'applique à toute la radio pour les modes de communication conventionnel et ADF.

Tableau 44 : Portée

Minimum	Maximum	Incréments
250 (ms)	6250 (ms)	250 (ms)

REMARQUE :

La vitesse de défilement lent doit être supérieure ou égale à la vitesse de défilement rapide.

10.9.1.5

Vitesse de défilement rapide

Ce champ permet de sélectionner la vitesse du défilement rapide des listes à l'écran.

La radio utilise d'abord la vitesse de défilement lent et passe à la vitesse de défilement rapide une fois que la valeur définie dans le champ Nombre de défilements lents est atteinte. Cette fonction s'applique à toute la radio pour les modes de communication conventionnel et ADF.

Tableau 45 : Portée

Minimum	Maximum	Incréments
250 (ms)	6250 (ms)	250 (ms)

**REMARQUE :**

la vitesse de défilement rapide doit être inférieure ou égale à la vitesse de défilement lent.

10.9.1.6

Nombre de défilements lents

Ce champ permet de sélectionner le nombre d'éléments parcourus à l'écran avant que la radio passe à la vitesse de défilement rapide.

Cette fonction s'applique à toute la radio pour les modes de communication conventionnel et ADF.

Tableau 46 : Portée

Minimum	Maximum
0 menu	255 menu

10.9.1.7

Indicateur de zone hors de portée

Ce champ permet de sélectionner le type d'alerte utilisé par la radio pour indiquer lorsqu'elle a quitté la zone de couverture du système ADF.

Cette fonction s'applique aux communications conventionnelles P25 ADF et DVRS activé.

Les sélections suivantes sont prises en charge :

Aucune indication

Fonctionnalité désactivée (en d'autres mots, aucune indication ne vous est fournie à l'utilisateur radio lorsque la radio est dans une condition hors portée).

Alerte seulement

Indicateur sonore seulement. Voir aussi Tonalité hors de portée.

Affichage seulement

L'écran de la radio affiche, en alternance, le message **NO SYS** (aucun système) et la zone et le canal courants de la radio.

Alerte et affichage

Indicateurs sonore et visuel (voir « Alerte seulement » et « Affichage seulement » ci-dessus).

10.9.1.8

Indicateur Recherche de site en cours

Ce champ vous permet de sélectionner les types d'alerte émis lorsque la radio se connecte à SmartConnect.

Tableau 47 : Sélection des types d'alerte

Types de sélection d'alerte	Description
Aucune indication	La fonction est désactivée et aucune indication ne s'affiche lorsque la radio se connecte à SmartConnect.
Affichage seulement	L'écran affiche Recherche de site en cours.

10.9.1.9

Détection précoce de zone hors de portée

Si ce champ est coché, la radio effectue une détection plus rapide d'une condition de zone hors de portée en moins d'une minute.

Si cette case n'est pas cochée, la radio effectue la détection classique d'une condition de zone hors de portée.

10.9.1.10

Minuterie de mise en attente hors de portée

Permet de sélectionner la durée de mise en attente pour que les indicateurs de zone hors de portée s'affichent.

10.9.1.11

Indicateur de couverture déséquilibrée

Ce champ permet de sélectionner le type d'alerte utilisée par la radio pour indiquer que les communications entrantes ne sont pas toutes reçues en raison de l'état non reconnu de la radio.

Cet état se produit lorsque la radio se trouve dans une zone de couverture déséquilibrée. Il est détecté lors de l'échec d'une seconde tentative de réception d'une communication entrante. Une couverture déséquilibrée peut prendre quelques minutes à se rétablir. Cette fonction s'applique aux communications conventionnelles P25 ADF et DVRS activé.

REMARQUE :

lorsque cette fonction est utilisée, la fonction Indicateur de zone hors de portée devrait également être activée afin de vous indiquer que la fin de l'alerte de couverture déséquilibrée est due à l'entrée de la radio dans une zone hors de portée.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Aucune indication

Fonctionnalité désactivée, Aucune indication : ne vous est fournie que lorsque la radio est dans une condition de couverture déséquilibrée.

Alerte seulement

Indicateur sonore seulement.

Affichage seulement

L'écran de la radio affiche, en alternance, un message d'absence de communications **NO COMMS** ainsi que la zone et le canal courants de la radio.

Alerte et affichage

Indicateurs Sonore et Visuel (voir « Alerte seulement » et « Affichage seulement » ci-dessus).

10.9.1.12

Indicateur ADF du site

Ce champ permet de sélectionner le type d'indicateur ADF de site. Le mode ADF du site est un mode ADF unique qui est considéré comme un mode intermédiaire entre le mode SmartZone et le mode dégradé.

Dans un système SmartZone, si le contrôleur de zone perd la communication, le site courant transmet un message indiquant qu'il est maintenant en mode ADF de site. Il continuera de transmettre ce message jusqu'à ce que la communication avec le contrôleur de zone soit rétablie. Cette sélection s'applique lorsque la radio est utilisée en mode SmartZone pour tous les systèmes ADF et les personnalités ADF.

**IMPORTANT :**

En cas de défaillance du mode ADF du site, la radio passe au mode dégradé.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Aucune indication

La fonction est désactivée.

Alerte seulement

Indicateur sonore seulement.

Affichage seulement

Affichage du message « ADF de site » à l'écran de la radio.

Alerte et affichage

Indicateurs Sonore et Visuel (voir « Alerte seulement » et « Affichage seulement » ci-dessus).

10.9.1.13

Indicateur d'inscription du système

Ce champ permet de sélectionner le type d'alerte utilisé par la radio pour indiquer l'état du processus d'inscription du système dans l'éventualité où l'abonné n'a pas réussi à s'inscrire dans le système.

Cette fonction s'applique aux communications ADF APCO P25 (ASTRO 25).

Les sélections suivantes sont prises en charge :

Aucune indication

La fonction est désactivée.

Alerte seulement

Indicateur sonore seulement.

Affichage seulement

L'écran de la radio affiche l'un des deux messages suivants : « Enreg. sys. refusé » (enregistrement système refusé) ou « Échec aut. » (échec de l'authentification).

Alerte et affichage

Indicateurs sonore et visuel (voir « Alerte seulement » et « Affichage seulement » ci-dessus).

10.9.1.14

Indicateur DVRS local seulement

Ce champ permet de sélectionner le type d'alerte utilisée par la radio pour indiquer une condition **Mode local** du système de répéteur véhiculaire numérique (DVRS).

Cette fonction s'applique aux communications conventionnelles DVRS.

Sélections

Aucune indication

La fonction est désactivée.

Alerte seulement

Indicateur sonore seulement.

Affichage seulement

L'écran de la radio affiche l'un des deux messages suivants :

Alerte et affichage

Indicateurs sonore et visuel (voir « Alerte seulement » et « Affichage seulement » ci-dessus).

10.9.2

Avancé

Cette section permet d'afficher ou de définir de multiples paramètres complexes d'affichage pour toute la radio.

10.9.2.1

Lumière automatique

Ce champ permet d'activer l'éclairage de l'écran avant, du clavier, de l'interrupteur rotatif et de l'écran du haut de la radio chaque fois qu'on appuie sur une touche, un interrupteur ou une touche du clavier (sauf les touches PTT, Urgence et Moniteur).

La durée du rétroéclairage dépend de la durée précisée dans le champ [Temps de lumière d'affichage à la page 236](#). Lorsque cette fonction est désactivée, la sélection de Rétroéclairage/Rotation active et désactive l'éclairage de l'écran et du clavier.

Cette sélection s'applique également à un accessoire de la radio portative qui a un écran, tel que le microphone haut parleur à distance (DRSM). Cette sélection s'applique à toute la radio.

Accès seulement : Lorsque le champ [Temps de lumière d'affichage à la page 236](#) n'est pas réglé à **Infini** et que le modèle ou l'option de la radio le permet.

10.9.2.2

Temps de lumière d'affichage

Ce champ permet de sélectionner la durée d'éclairage du commutateur rotatif, de l'affichage et du clavier une fois que vous avez appuyé sur la touche Rétroéclairage/Rotation (Affichage).

REMARQUE :

Cette fonction s'applique également à l'éclairage de l'écran sur l'accessoire haut-parleur/microphone à distance avec écran (DRSM). La durée est exprimée en secondes. Cette sélection s'applique à toute la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

Lorsque réglé à **Infini**, l'éclairage de l'écran et du clavier demeure activé jusqu'à ce que le bouton [Rétroéclairage/rotation \(affichage\) à la page 186](#) soit enfoncé.

Tableau 48 : Portée

Minimum	Maximum	Incréments
0 s	60 s	5 s

10.9.2.3

Temps d'affichage alternatif

Ce champ permet de définir la durée de l'affichage des messages en alternance à l'écran de la radio.

Le champ Type d'indicateur de réception d'alarme d'urgence, notamment, utilise la fonction Temps d'affichage alternatif, mais uniquement lorsqu'il est réglé à **Affichage seulement** ou à **Alerte et affichage**. Cette sélection s'applique à toute la radio.

Tableau 49 : Sélections

Minimum	Maximum	Incréments
250 (ms)	6250 (ms)	250 (ms)

**REMARQUE :**

ms = millisecondes

10.9.2.4

Temps d'affichage du message temporaire

Ce champ permet de définir la durée de l'affichage d'un message temporaire à l'écran de la radio.

Cette sélection s'applique à toute la radio.

Tableau 50 : Portée

Minimum	Maximum	Incréments
250 (ms)	6250 (ms)	250 (ms)

10.9.2.5

Tonalité d'alerte d'inactivité de la fonction

Ce champ permet de sélectionner le type de tonalité d'alerte en cas d'inactivité pour les menus de configuration des fonctions.

Cette sélection s'applique à toute la radio.

**IMPORTANT :**

Actuellement, la **tonalité d'alerte d'inactivité périodique** est sélectionnée pour les menus de configuration Avis d'appel/Notification, Appel sélectif/Privé, Téléphone, État, Message et TMS. Actuellement, la **tonalité de sortie de fonction inactive** est sélectionnée pour les menus de configuration Avis d'appel/Notification, Appel sélectif/Privé, Téléphone, État, Message, TMS, Sélection de zone, Sélection de canal, Emplacement, Information, Profils radio, Derniers appels et Contacts.

Les sélections suivantes sont prises en charge :

Désactivé;

Les tonalités d'alerte des fonctions sont désactivées. Cette sélection est valide seulement si la valeur du champ Délai d'inactivité de la fonction n'est pas réglée à **Infini**.

Sortie seulement

Active la tonalité de sortie de fonction inactive, qui vous avise de la sortie du menu lorsque le menu demeure inactif pendant la durée précisée dans le champ Délai d'inactivité de la fonction. Cette sélection est valide seulement si la valeur du champ Délai d'inactivité de la fonction n'est pas réglée à **Infini**.

Inactivité seulement (Origine par défaut)

Active la tonalité de fonction inactive qui vous avise que le menu de la fonction est en attente.

Inactivité et sortie

Active la tonalité de fonction inactive et la tonalité de sortie d'une fonction inactive. Cette sélection est valide seulement si la valeur du champ Délai d'inactivité de la fonction n'est pas réglée à **Infini**.

10.9.2.6

Sortie automatique de l'état

Ce champ permet de sélectionner la méthode utilisée par la radio pour quitter le menu de configuration; l'état a été transmis au répartiteur.

Cette sélection s'applique à toute la radio.

Les sélections suivantes sont prises en charge :

Sur confirmation réussie

Le menu État se ferme et la radio revient à son état de répartition normale uniquement après la confirmation provenant de l'équipement de réseau fixe (FNE)/répartiteur; le menu État reste actif si aucune confirmation n'est pas reçue ou si l'état est refusé.

Toujours

Le menu d'état se ferme automatiquement après confirmation ou (dans le cas de répartition conventionnelle) une fois que le nombre total de tentatives d'état est atteint.

10.9.3

Affichage ID

Cette section permet d'afficher ou de modifier l'ID de PTT et la fonction Groupe à l'écran de la radio.

Un ID de PTT est transmis lorsque l'utilisateur appuie sur le bouton PTT pour un système conventionnel de type MDC ou ASTRO; par conséquent, ces fonctions liées à l'ID de PTT s'appliquent seulement aux canaux du mode de communication conventionnel.

10.9.3.1

Affichage de l'ID PTT

Ce champ permet de sélectionner le type de transmission entrante pour l'affichage de l'ID de PTT.

La fonction Affichage de l'ID PTT permet d'afficher l'identification de l'appelant correspondant au nom du contact dans la liste d'appel à l'écran de la radio; en l'absence d'un nom de contact dans la liste d'appel, l'ID PPT actuel de l'appelant s'affiche. Cette fonction s'applique à toute la radio pour les canaux de communication conventionnels.

Les sélections suivantes sont prises en charge :

- Désactivé;
- Répartition
- Répartir et balayer

10.9.3.2

Minuterie fin de voix

Ce champ permet de sélectionner la durée d'affichage de l'ID de PTT d'une autre radio après la fin de la transmission.

Cette fonction s'applique à toute la radio pour les canaux de communication conventionnels.

IMPORTANT :

Lorsque la valeur de ce champ est réglée à **0** seconde, le réglage **Front descendant** de l'ID de PTT transmis par d'autres radios n'a pas le temps de s'afficher.

Accès seulement : Lorsque le champ [Affichage de l'ID PTT à la page 238](#) est réglé à **Répartition** ou à **Répartition et balayage** ou que le champ Afficher la localisation du pair est activé.

Tableau 51 : Portée

Minimum	Maximum	Incréments
0 seconde	7 secondes	1 seconde

10.9.3.3

Taille du texte ID préfixe

Ce champ permet de sélectionner le nombre de caractères à utiliser pour les ID des radios, des avis d'appel et des alarmes d'urgences.

Cette fonction s'applique à toute la radio pour les canaux de communication conventionnels.

Accès seulement : lorsque que le champ Affichage ID PTT est réglé à **Répartir** ou à **Répartir et balayer**

Les nombres entiers de 1 à 6 sont pris en charge.

10.9.3.4

Groupe\Afficher lorsque PTT

Ce champ permet l'affichage de la liste de groupe ASTRO, du texte de l'alias des groupes ou de l'ID de groupe lorsque la touche PTT est enfoncée.

Si la fonction Alias des groupes est activée, le texte de l'alias des groupes s'affiche. Autrement, c'est l'ID de groupe qui s'affiche. Une fois que ce champ est activé, son réglage a préséance sur celui du champ Afficher lorsque PTT. Cette fonction s'applique à toute la radio pour les canaux de communication conventionnels.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.9.3.5

Affichage du groupe lors d'un changement de mode

Ce champ permet l'affichage de la liste de groupe ASTRO, du texte de l'alias des groupes ou de l'ID de groupe lors d'un changement de canal.

Si la fonction Alias des groupes est activée, le texte de l'alias des groupes s'affiche. Autrement, c'est l'ID de groupe qui s'affiche. Une fois que ce champ est activé, son réglage a préséance sur celui du champ Afficher lorsque changement de mode. Cette fonction s'applique à toute la radio pour les canaux de communication conventionnels.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.9.3.6

Groupe\Afficher sur réception

Ce champ permet l'affichage de la liste de groupe ASTRO, du texte de l'alias des groupes ou de l'ID de groupe lors de la désactivation de la sourdine au moment d'un appel.

Si la fonction Alias des groupes est activée, le texte de l'alias des groupes s'affiche. Autrement, c'est l'ID de groupe qui s'affiche. Cette fonction s'applique à toute la radio pour les canaux de communication conventionnels.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.9.3.7

Tableau d'affichage ID (Affichage)

La section **Tableau d'affichage ID** de l'ensemble **Affichage** contient les champs suivants :

10.9.3.7.1

Champ

Affiche le nom en lecture seule pour la fonction énumérée dans le tableau Affichage ID pour l'ID PTT, l'ID d'urgence ou l'ID d'Avis d'appel.

Accès seulement : Lorsque la valeur du champ [Affichage de l'ID PTT à la page 238](#) est réglée à **Répartir** ou à **Répartir et balayer**.

10.9.3.7.2

Écran

Ce champ vous permet de définir le texte reconnaissable affiché devant l'ID de PTT, l'ID d'alarme d'urgence ou l'ID d'avis d'appel dans l'enregistrement ou la rangée courante, dans la table Affichage ID.

La longueur de ce champ est déterminée par la valeur du champ Taille du texte ID préfixe. Cette fonction s'applique à toute la radio pour les canaux de communication conventionnels.

Accès seulement : Lorsque la valeur du champ Affichage de l'ID PTT est réglée à **Répartir** ou à **Répartir et balayer**.

REMARQUE :

Ce préfixe peut contenir jusqu'à six (6) caractères (valeur définie dans le champ Taille du texte ID préfixe) et comprendre des nombres, des lettres et des caractères spéciaux.

Exemples : ID, URG, Élec01, APPEL

10.10

Réglage du Profil de Réduction du Bruit du Micro Interne

L'ensemble **Réglage du Profil de Réduction du Bruit du Micro Interne** permet à l'utilisateur de visualiser ou de définir des paramètres de réduction du bruit de transmission pour les microphones internes qui ciblent des conditions de bruit spécifiques.

Ces paramètres s'appliquent à toute la radio.

REMARQUE :

La réduction du bruit atténue les bruits de fond, ce qui améliore la qualité de la voix. La réduction du bruit s'effectue dans la radio émettrice avant la transmission (en mode analogique) et avant l'encodage de la voix (en mode numérique). La réduction de bruit de fond améliore également la clarté de la voix lors d'une transmission en mode analogique. En mode numérique, l'entrée d'un signal vocal plus clair dans l'encodeur de voix (vocodateur) contribue à améliorer la clarté de la voix reçue et décodée par le récepteur.

AVERTISSEMENT :

Ces paramètres personnalisés s'appliquent uniquement si le champ Réduction du bruit personnalisée (Radio) est sélectionné dans le profil radio référencé.

À moins d'être un membre du personnel qualifié, l'utilisateur ne doit pas modifier les paramètres de réduction du bruit. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

Les champs suivants sont pris en charge :

10.10.1

Nom du profil de réduction du bruit de la radio

Ce champ vous permet d'afficher ou de définir des noms reconnaissables pour le profil de réduction du bruit de la radio courant.

**IMPORTANT :**

Les [Profils de radio à la page 695](#) - paramètres de réduction du bruit du microphone interne conviennent à la plupart des environnements.

**AVERTISSEMENT :**

Ces paramètres personnalisés s'appliquent uniquement si le champ Réduction du bruit personnalisée (Radio) est sélectionné dans le profil radio référencé.

Ne modifiez pas les paramètres de la réduction du bruit, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

**REMARQUE :**

Exemples : PER-001, #500, Ext Mic NR 3, # A5

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Vous pouvez utiliser jusqu'à 14 caractères.

10.10.1.1

QA09006 – Suppression du bruit adaptative

Ce champ indique si la fonction Suppression du bruit adaptative est achetée.

10.10.2

E Wind/VECTEUR MAXS

Ces réglages permettent d'ajuster les paramètres de réduction du bruit pour certains environnements où le niveau de bruit est élevé.

**IMPORTANT :**

Les paramètres [Profils de radio à la page 695](#) - réduction du bruit de la radio sont recommandés pour la plupart des environnements bruyants.

Ce paramètre a une portée effective de 31 coefficients de 16 bits chacun, ce qui correspond à 124 caractères de 4 bits. Cependant, ceci nécessite la saisie de 32 valeurs de coefficient.

Lorsque vous entrez les coefficients pour ce vecteur, la 32e valeur est la valeur située à l'extrême droite (soit la moins importante); autrement dit, les quatre derniers caractères.

Assurez-vous que cette 32e valeur est identique à la 31e. Le processeur de signal numérique (DSP) de la radio ne tient pas compte de la 32e valeur.

**AVERTISSEMENT :**

Ces paramètres personnalisés s'appliquent uniquement si le champ Réduction du bruit personnalisée (Radio) est sélectionné dans le profil radio référencé.

Ne modifiez pas les paramètres de la réduction du bruit, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

10.10.3

E Wind/NBANDS

Ces réglages permettent d'ajuster les paramètres de réduction du bruit pour certains environnements où le niveau de bruit est élevé.

IMPORTANT :

Les paramètres [Profils de radio à la page 695](#) - réduction du bruit de la radio sont recommandés pour la plupart des environnements bruyants.

AVERTISSEMENT :

Ces paramètres personnalisés s'appliquent uniquement si le champ Réduction du bruit personnalisée (Radio) est sélectionné dans le profil radio référencé.

Ne modifiez pas les paramètres de la réduction du bruit, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

Deux valeurs distinctes déterminent la plage.
