Ces paramètres personnalisés s'appliquent uniquement si le champ Réduction du bruit personnalisée (Radio) est sélectionné dans le profil radio référencé.

Ne modifiez pas les paramètres de la réduction du bruit, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

**IMPORTANT :**

Les paramètres [Profils de radio à la page 695](#) - réduction du bruit de la radio sont recommandés pour la plupart des environnements bruyants.

Même si la valeur hexadécimale de ce champ est présentée comme étant une valeur non signée, le micrologiciel de la radio l'interprète comme une valeur signée. Vous devez donc entrer la valeur signée souhaitée dans le champ Hexadécimal (champ de droite), et non dans le champ Décimal. Par exemple, si vous souhaitez entrer $-1E00$ (-7680), vous devez entrer $E200$ (le complément du 2) dans le champ Hexadécimal. Le champ Décimal contient toujours la valeur 57856, mais le micrologiciel interprète $E200$ comme un nombre négatif dans la radio.

Deux valeurs distinctes déterminent la plage.

10.10.14

VECTEUR DINC EQ SORTIE

Ce réglage permet de modifier le paramètre VECTEUR DINC (Dual Input Noise Canceller) EQ SORTIE pour le microphone interne.

AVERTISSEMENT :

Ce paramètre personnalisé s'applique uniquement si le champ Réduction du bruit personnalisée (Radio) est sélectionné dans le profil radio référencé.

Ne modifiez pas les paramètres de la réduction du bruit, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications. Accédez à la fenêtre Réduction du bruit de la radio.

10.10.15

VECTEUR DINC EP

Ce réglage permet de modifier le paramètre VECTEUR DINC (Dual Input Noise Canceller) EP pour le microphone interne.

AVERTISSEMENT :

Ce paramètre personnalisé s'applique uniquement si le champ Réduction du bruit personnalisée (Radio) est sélectionné dans le profil radio référencé.

Ne modifiez pas les paramètres de la réduction du bruit, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications. Accédez à la fenêtre Réduction du bruit de la radio.

10.10.16

SEUILS DE BRUIT AUTO DBQ8 DE LA RADIO

Cette paire de nombres définit la limite inférieure et supérieure de bruit (en dB par rapport à la pleine échelle) pour le contrôle automatique des niveaux de réduction du bruit.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Les sélections suivantes sont prises en charge :

- La longueur des LIMITES DE BRUIT AUTO DE LA RADIO DBQ8 doit être égale à 8;
- la valeur [X] des LIMITES DE BRUIT AUTO DE LA RADIO DBQ8 doit être DE « -23040 » à « 0 » ,
- la valeur [Y] des LIMITES DE BRUIT AUTO DE LA RADIO DBQ8 doit être de « -23040 » à « 0 » et
- [X] n'est PAS supérieur à [Y].

REMARQUE :

LES LIMITES DE BRUIT AUTO DE LA RADIO DBQ8 représentent le vecteur de deux nombres entiers de 16 bits.

Chaque jeu de quatre nombres hexadécimaux représente un nombre entier signé de 16 bits. La plage de chacun des deux nombres ([X] et [Y]) est de -23040 à 0, inclusivement.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.10.17

VECTEUR DE GAIN MIN AUTO DE LA RADIO

Ce vecteur définit les limites du gain minimal pour le mode automatique de suppression de bruit.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Les sélections suivantes sont prises en charge :

- La longueur de la valeur VECTEUR DE GAIN MIN AUTO DE RADIO doit être égale à 8;
- la valeur [X] du VECTEUR DE GAIN MIN AUTO DE RADIO doit être de « 0 » à « 32767 » ,
- la valeur [Y] de VECTEUR DE GAIN MIN AUTO DE RADIO doit être de « 0 » à « 32767 » et

- [Y] n'est PAS supérieure à [X].

**REMARQUE :**

le VECTEUR DE GAIN MIN AUTO DE RADIO correspond au vecteur de deux nombres entiers de 16 bits :

Chaque jeu de quatre nombres hexadécimaux représente un nombre entier signé de 16 bits. La plage réservée à chacun des deux nombres ([X] et [Y]) va de 0 à 32767 en décimal.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.10.18

SEUILS DE RELAXATION AUTO DE LA RADIO

Ce vecteur définit les limites de relaxation avec la fréquence pour me mode automatique de suppression de bruit.

**AVERTISSEMENT :**

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Les sélections suivantes sont prises en charge :

- La longueur des valeurs de LIMITES DE RELAXATION AUTO DE LA RADIO doit être égale à 4;
- la valeur [X] des LIMITES DE RELAXATION AUTO DE LA RADIO doit être de « 0 » à « 10 »,
- la valeur [Y] des LIMITES DE RELAXATION AUTO DE LA RADIO doit être de « 0 » à « 10 » et
- [X] n'est PAS supérieur à [Y].

**REMARQUE :**

les LIMITES DE RELAXATION AUTO DE LA RADIO représentent le vecteur à deux nombres de 8 bits.

Chaque paire de nombres hexadécimaux est un nombre entier signé à 8 bits. La plage de chacun des deux nombres ([X] et [Y]) est de 0 à 10, inclusivement.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.10.19

DÉMARRAGE DU FILTRE PASS DE LA RADIO

Ce champ définit la fréquence qui est appliquée par le filtre PASS automatique.

**AVERTISSEMENT :**

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 74 : Portée

Minimum	Maximum	Incréments
1	3999	1

10.10.20

MODE MÉL SAM DE LA RADIO

Ce paramètre contrôle la façon dont le signal d'entrée audio du haut-parleur-comme-microphone est formé.

**AVERTISSEMENT :**

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 75 : Portée

Minimum	Maximum	Incréments
0	2	1

10.10.21

FRÉQUENCE DE TRANSFERT SAM DE LA RADIO

Ce champ définit la fréquence utilisée par l'entrée haut-parleur-comme.

**AVERTISSEMENT :**

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 76 : Portée

Minimum	Maximum	Incréments

10.10.22

DÉBIT MÉL DU FAISCEAU CHAUD DE LA RADIO

Ce champ contrôle la détection automatique du faisceau chaud. Le plus grand nombre passe lentement.

**AVERTISSEMENT :**

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 77 : Portée

Minimum	Maximum	Incréments
1	250	1

10.10.23

ATTÉNUATION MAX DU FAISCEAU CHAUD DBQ8 DE LA RADIO

Ce champ définit le niveau d'atténuation maximal qui peut être appliqué à l'un ou l'autre des faisceaux.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 78 : Portée

Minimum	Maximum	Incréments
1	7680	1

10.11

Profil de réduction du bruit du microphone externe

L'ensemble **Profil de réduction du bruit du microphone externe** permet à l'utilisateur de visualiser ou de définir des paramètres de réduction du bruit de transmission pour les microphones externes qui ciblent des conditions de bruit spécifiques.

Ces paramètres s'appliquent à toute la radio.

REMARQUE :

La réduction du bruit atténue les bruits de fond, ce qui améliore la qualité de la voix. La réduction du bruit s'effectue dans la radio émettrice avant la transmission (en mode analogique) et avant l'encodage de la voix (en mode numérique). La réduction de bruit de fond améliore également la clarté de la voix lors d'une transmission en mode analogique. En mode numérique, l'entrée d'un signal vocal plus clair dans l'encodeur de voix (vocodeur) contribue à améliorer la clarté de la voix reçue et décodée par le récepteur.

AVERTISSEMENT :

Ces paramètres personnalisés ne s'appliquent que si le champ Réduction du bruit personnalisée (accessoire) est sélectionné dans le profil radio indiqué.

À moins d'être un membre du personnel qualifié, l'utilisateur ne doit pas modifier les paramètres de réduction du bruit. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

Les champs suivants sont pris en charge :

10.11.1

Nom du profil de réduction du bruit de l'accessoire

Ce champ vous permet d'afficher ou de définir des noms reconnaissables pour le profil de réduction du bruit de la radio courant.

**AVERTISSEMENT :**

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

**IMPORTANT :**

Les paramètres de réduction du bruit du microphone externe de la fenêtre Profils radio sont recommandés pour la plupart des environnements.

**AVERTISSEMENT :**

Ces paramètres personnalisés ne s'appliquent que si le champ Réduction du bruit personnalisée (accessoire) est sélectionné dans le profil radio indiqué.

Ne modifiez pas les paramètres de la réduction du bruit, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

**REMARQUE :**

Exemples : NRP-001, #500, Ext Mic NR 3, # A5

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Vous pouvez utiliser jusqu'à 14 caractères.

10.11.2

E Wind/DINC EWIND NBANDS

Ces réglages permettent d'ajuster les paramètres de réduction du bruit pour certains environnements où le niveau de bruit est élevé. Les paramètres Profils radio – Paramètres de réduction du bruit (accessoire) sont recommandés pour la plupart des environnements bruyants.

**AVERTISSEMENT :**

Ce paramètre personnalisé s'applique uniquement si le champ Réduction du bruit personnalisée (accessoire) est sélectionné dans le profil radio référencé.

Ne modifiez pas les paramètres de la réduction du bruit, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

Deux valeurs distinctes déterminent la plage.

Tableau 79 : Première valeur

0	65535	1

Tableau 80 : Seconde valeur

Minimum	Maximum	Incréments
0	FFFF (hex)	1

10.11.3

E Wind/VECTEUR MAXS

Ces réglages permettent d'ajuster les paramètres de réduction du bruit pour certains environnements où le niveau de bruit est élevé.

IMPORTANT :

Les paramètres Profils radio – Paramètres de réduction du bruit d'accessoire sont recommandés pour la plupart des environnements bruyants.

Ce paramètre a une portée effective de 31 coefficients de 16 bits chacun, ce qui correspond à 124 caractères de 4 bits. Cependant, ceci nécessite la saisie de 32 valeurs de coefficient.

Lorsque vous entrez les coefficients pour ce vecteur, la 32e valeur est la valeur située à l'extrême droite (soit la moins importante); autrement dit, les quatre derniers caractères. Assurez-vous que cette 32e valeur est identique à la 31e. Le processeur de signal numérique (DSP) de la radio ne tient pas compte de la 32e valeur.

AVERTISSEMENT :

Ce paramètre personnalisé s'applique uniquement si le champ Réduction du bruit personnalisée (accessoire) est sélectionné dans le profil radio référencé.

Ne modifiez pas les paramètres de la réduction du bruit, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

10.11.4

DINC ABF SS

Ces réglages permettent d'ajuster les paramètres de réduction du bruit pour certains environnements où le niveau de bruit est élevé. Les paramètres Profils radio – Paramètres de réduction du bruit d'accessoire sont recommandés pour la plupart des environnements bruyants.

AVERTISSEMENT :

Ce paramètre personnalisé s'applique uniquement si le champ Réduction du bruit personnalisée (accessoire) est sélectionné dans le profil radio référencé.

Ne modifiez pas les paramètres de la réduction du bruit, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

- la valeur [Y] des LIMITES DE BRUIT AUTO DE L'ACCESSOIRE DBQ8 doit être de « -23040 » et « 0 » et
- [X] n'est PAS supérieur à [Y].

**REMARQUE :**

LES LIMITES DE BRUIT AUTO DE L'ACCESSOIRE DBQ8 représentent le vecteur de deux nombres entiers de 16 bits.

Chaque jeu de quatre nombres hexadécimaux représente un nombre entier signé de 16 bits. La plage réservée à chacune des deux nombres ([X] et [Y]) est -23040 à 0 inclus.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.11.17

VECTEUR DE GAIN MIN AUTO D'ACCESSOIRE

Ce vecteur définit les limites du gain minimal pour le mode automatique de suppression de bruit.

**AVERTISSEMENT :**

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Les sélections suivantes sont prises en charge :

- La longueur du VECTEUR DE GAIN MIN AUTO D'ACCESSOIRE doit être égale à 8;
- la valeur [X] du VECTEUR DE GAIN MIN AUTO D'ACCESSOIRE doit être de « 0 » à « 32767 » ,
- la valeur [Y] de VECTEUR DE GAIN MIN AUTO D'ACCESSOIRE doit être de à « 0 » à « 32767 » , et

- [Y] n'est PAS supérieure à [X].

**REMARQUE :**

Le VECTEUR DE GAIN MIN AUTO D'ACCESSOIRE représente le vecteur de deux nombres entiers de 16 bits :

Chaque jeu de quatre nombres hexadécimaux représente un nombre entier signé de 16 bits. La plage réservée à chacun des deux nombres ([X] et [Y]) va de 0 à 32767 en décimal.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.11.18

SEUILS DE RELAXATION AUTO D'ACCESSOIRE

Ce vecteur définit les limites de relaxation avec la fréquence pour le mode automatique de suppression de bruit.

**AVERTISSEMENT :**

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Les sélections suivantes sont prises en charge :

- la longueur des valeurs de LIMITES DE RELAXATION AUTO DE L'ACCESSOIRE doit être égale à 4;
- la valeur [X] des SEUILS DE RELAXATION AUTO DE L'ACCESSOIRE doit être de « 0 » à « 10 »,
- la valeur [Y] des LIMITES DE RELAXATION AUTO DE L'ACCESSOIRE doit être de « 0 » à « 10 » et
- [X] n'est PAS supérieur à [Y].

**REMARQUE :**

les LIMITES DE RELAXATION AUTO DE L'ACCESSOIRE représentent le vecteur à deux nombres de 8 bits.

Chaque paire de nombres hexadécimaux est un nombre entier signé à 8 bits. La plage de chacun des deux nombres ([X] et [Y]) est de 0 à 10, inclusivement.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.11.19

DÉMARRAGE DU FILTRE PASS D'ACCESSOIRE

Ce champ définit la fréquence qui est appliquée par le filtre PASS automatique.

**AVERTISSEMENT :**

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Tableau 101 : Portée

Minimum	Maximum	Incréments
1	3999	1

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.12

Liste globale de réduction du bruit

La **Liste globale de réduction du bruit** permet à l'utilisateur d'afficher ou de définir les paramètres DINC (Dual Input Noise Canceller) personnalisés.

Ces paramètres s'appliquent à toute la radio.

REMARQUE :

La réduction du bruit atténue les bruits de fond, ce qui améliore la qualité de la voix. La réduction du bruit s'effectue dans la radio émettrice avant la transmission (en mode analogique) et avant l'encodage de la voix (en mode numérique). La réduction de bruit de fond améliore également la clarté de la voix lors d'une transmission en mode analogique. En mode numérique, l'entrée d'un signal vocal plus clair dans l'encodeur de voix (vocodateur) contribue à améliorer la clarté de la voix reçue et décodée par le récepteur.

AVERTISSEMENT :

Ce paramètre personnalisé ne s'applique que si le champ Activer la réduction du bruit générale personnalisée est sélectionné dans le profil radio indiqué.

À moins d'être un membre du personnel qualifié, l'utilisateur ne doit pas modifier les paramètres de réduction du bruit. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

Les champs suivants sont pris en charge :

10.12.1

VECTEUR DINC SPATIAL EQ1

Ce réglage permet de modifier le paramètre interne VECTEUR DINC (Dual Input Noise Canceller) SPATIAL EQ1.

AVERTISSEMENT :

Ce paramètre personnalisé s'applique uniquement lorsque le champ Activer la réduction du bruit générale personnalisée est sélectionné dans [Profils de radio à la page 695](#) de référence.

Ne modifiez pas les paramètres de la réduction du bruit, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

10.12.2

VECTEUR DINC SPATIAL EQ1 CONT

Ce réglage permet de modifier le paramètre interne VECTEUR DINC (Dual Input Noise Canceller) SPATIAL EQ1.

La valeur de ce champ sera ajoutée à la valeur du paramètre [VECTEUR DINC SPATIAL EQ1 à la page 262](#) pour compléter les soixante-six coefficients du vecteur spatial.

AVERTISSEMENT :

Ce paramètre personnalisé s'applique uniquement lorsque le champ Activer la réduction du bruit générale personnalisée est sélectionné dans [Profils de radio à la page 695](#) de référence.

Ne modifiez pas les paramètres de la réduction du bruit, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

10.12.3

VECTEUR DINC SPATIAL EQ2

Ce réglage permet de modifier le paramètre interne VECTEUR DINC (Dual Input Noise Canceller) SPATIAL EQ2.

**AVERTISSEMENT :**

Ce paramètre personnalisé s'applique uniquement lorsque le champ Activer la réduction du bruit générale personnalisée est sélectionné dans [Profils de radio à la page 695](#) de référence.

Ne modifiez pas les paramètres de la réduction du bruit, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

10.12.4

VECTEUR DINC SPATIAL EQ2 CONT

Ce réglage permet de modifier le paramètre interne VECTEUR DINC (Dual Input Noise Canceller) SPATIAL EQ2.

La valeur de ce champ sera ajoutée à la valeur du paramètre [VECTEUR DINC SPATIAL EQ2 à la page 263](#) pour compléter les soixante-six coefficients du vecteur spatial.

**AVERTISSEMENT :**

Ce paramètre personnalisé s'applique uniquement lorsque le champ Activer la réduction du bruit générale personnalisée est sélectionné dans [Profils de radio à la page 695](#) de référence.

Ne modifiez pas les paramètres de la réduction du bruit, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

10.12.5

VECTEUR DINC EQ BF

Ce réglage permet de modifier le paramètre interne VECTEUR DINC (Dual Input Noise Canceller) EQ BF.

**AVERTISSEMENT :**

Ce paramètre personnalisé s'applique uniquement lorsque le champ Activer la réduction du bruit générale personnalisée est sélectionné dans [Profils de radio à la page 695](#) de référence.

Ne modifiez pas les paramètres de la réduction du bruit, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

10.12.6

HYSTÉRÉSIS HOTBEAM DINC

Ce réglage permet de modifier le paramètre interne HYSTÉRÉSIS HOTBEAM DINC (Dual Input Noise Canceller).

**AVERTISSEMENT :**

Ce paramètre personnalisé s'applique uniquement lorsque le champ Activer la réduction du bruit générale personnalisée est sélectionné dans [Profils de radio à la page 695](#) de référence.

Ne modifiez pas les paramètres de la réduction du bruit, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

Deux valeurs distinctes déterminent la plage.

Tableau 102 : Première valeur

10.13

Liste de composition de tonalité

Cette section vous permet de définir des listes d'émission de signaux de tonalités individuelles. Au maximum, 1000 enregistrements peuvent être ajoutés dans toutes les listes de composition de tonalité.

REMARQUE :

Lorsque le champ Type de liste de tonalités est réglé à **Appel rapide II**, dix listes de composition de tonalité sont possibles, avec un maximum de 100 enregistrements chacune.

Vous pouvez sélectionner une liste de composition de tonalité distincte pour les personnalités conventionnelles et ADF à partir du champ Liste de composition de tonalité de chaque personnalité.

Pour les communications ADF, la composition de tonalité s'applique uniquement aux personnalités ADF associées à un système ADF et dont le champ Type de système est réglé à **ASTRO 25**.

Lorsque le champ Type de liste de tonalités est réglé à **Tonalité unique**, un maximum de 100 entrées est autorisé dans une liste de composition de tonalité. Les listes de composition de tonalité unique et les enregistrements Alias ton. peuvent ensuite être sélectionnés pour les personnalités conventionnelles dans leurs champs de sélection de composition de tonalité respectifs.

REMARQUE :

La radio peut décoder de 1 à 10 tonalités dans chaque liste et peut encoder toutes les tonalités lorsque le champ Type de liste de tonalités est réglé à **Appel rapide II**.

10.13.1

Alias de la liste de tonalités

Ce champ vous permet de définir des noms reconnaissables pour la liste de composition de tonalité courante.

Une fois définies, les listes de composition de tonalité peuvent être sélectionnées pour les personnalités conventionnelles ASTRO et ADF ASTRO 25 à partir de leurs champs **Liste de composition de tonalité** respectifs.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

REMARQUE :

EMT-001, no 500, Électrique1, # A5.

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Vous pouvez utiliser jusqu'à 14 caractères.

10.13.2

Type de tonalités

Ce champ permet de sélectionner le type de composition de tonalité dans la Liste de composition de tonalité courante.

La Liste de composition de tonalité est sélectionnée dans les listes de composition de tonalité des personnalités conventionnelles/ADF ou dans la Sélection de liste de tonalité unique des personnalités conventionnelles.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Tonalité unique

L'une des compositions de tonalité qui vous permet d'accéder de manière sélective aux répéteurs dans toutes les compositions analogiques conventionnelles.

Appel rapide II

Une de la Composition de tonalité individuelle

10.13.3

Alias de tonalité

Ce champ vous permet de définir le texte de la tonalité pour une tonalité unique dans le tableau de composition de tonalité.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.13.4

Fréq. tonalité 1

Ce champ permet de sélectionner la fréquence de réception de la Tonalité 1 pour la Liste de composition de tonalité courante (rangée ou enregistrement).

Lorsque cette fonction est sélectionnée, une séquence de deux tonalités nécessite la sélection de la Fréq. de tonalité2.

Cette sélection s'applique uniquement pour les communications ASTRO conventionnelles et ASTRO 25 ADF.

AVERTISSEMENT :

La technologie de codeur AMBE numérique utilisée par la console de répartition et la radio ne chiffre ou ne déchiffre pas précisément les fréquences Appel rapide II (analogiques) correspondantes; plutôt, à l'intérieur de la plage de fréquences pertinentes disponibles pour la Fréq. tonalité1 et la Fréq. tonalité2 (265,625 à 3109,375 Hz), le coder transforme des groupes de fréquences homogènes en ensemble de « fréquences standards », dans lequel chaque groupe a une plage de fréquences permises, et une fréquence standard est définie au centre de chaque groupe.

Par conséquent, lorsqu'une fréquence de tonalité programmée se situe dans la plage autorisée de l'une de ces fréquences standards, elle est décodée par la radio en tant que fréquence.

Idéalement, les fréquences de tonalité programmées de la radio doivent correspondre à celles de tonalité programmées dans la console de répartition afin d'éviter le risque de manquer un appel.

Les définitions de groupe de fréquences de tonalité spécifique dépendent du Type de canal et, par conséquent, des canaux TDMA (accès multiple par répartition dans le temps) par rapport à ceux FDMA (accès multiple par répartition en fréquence).

- Pour les canaux TDMA, il existe 91 groupes et chaque groupe couvre une plage de 31,25 Hz.
- Pour les canaux FDMA, il existe 72 groupes; certains groupes couvrent une plage de 31,25 Hz et d'autres groupes, une plage de 62,5 Hz.

Lors de la configuration des fréquences de tonalité :

- Pour un enregistrement de fréquence à deux tonalités unique, il faut éviter une combinaison où les deux fréquences, Fréq tonalité1 et Fréq. tonalité2, sont configurées comme une même tonalité, car cette entrée à deux tonalités ne peut pas être décodée par la radio.
- Pour un enregistrement de fréquence à deux tonalités unique, il faut éviter une combinaison où les deux fréquences, Fréq tonalité1 et Fréq. tonalité2, tombent dans le même groupe de fréquences, car les deux sont décodés comme la même tonalité. Par exemple, un enregistrement de fréquence à deux tonalités sur les fréquences 927 Hz et 940 Hz fait en sorte que les deux sont décodées comme une fréquence de 937,5 Hz.
- Pour deux enregistrements de fréquence de tonalité différents, il faut éviter une combinaison où les deux fréquences, Fréq. tonalité1 et Fréq. de tonalité2, tombent dans le même groupe de fréquences, car les deux sont décodés comme la même tonalité. Par exemple, si la fréquence du premier enregistrement est 927 Hz et 1240 Hz, et celle du second enregistrement est 940 Hz et 1260 Hz, les deux enregistrements sont décodés comme 937,5 Hz et 1250 Hz.
- Dans certains cas, une fréquence de tonalité numérique ne peut pas être toujours décodée pour une valeur de fréquence spécifique, elle est plutôt décodée de façon aléatoire sur l'une des deux valeurs différentes. Le tableau montre les fréquences de tonalité à éviter absolument pour les deux canaux FDMA et TDMA canaux :

Voir [Liste de fréquences de tonalité non prises en charge à la page 268](#).

Accès seulement : Lorsque [Type de tonalités à la page 265](#) est réglé à **Appel rapide II** et que le modèle ou l'option de la radio le permet.

Tableau 106 : Portée

Minimum	Maximum	Incréments
288,5 Hz	3086,0 Hz	0,1 Hz

Voir [Plages de groupe et fréquences standard et applicables pour TDMA à la page 268](#).

Voir [Plages de groupe et fréquences standard et applicables pour FDMA à la page 271](#).

30	1 171,9 - 1 203,1	1187,5	61	2 140,7 - 2 171,8	2156,25			
31	1 203,2 - 1 234,3	1218,75	62	2 171,9 - 2 203,1	2187,5			

**IMPORTANT :**

Lorsqu'une fréquence est reçue par une radio, n'importe quelle fréquence de tonalité à l'intérieur d'un groupe spécifique (plage) est décodée comme la fréquence standard de ce groupe. Par exemple, la fréquence de tonalité 937,5 Hz est une fréquence standard prise en charge par un codeur numérique (pour les canaux TDMA); ainsi, toute fréquence de tonalité reçue entre 921,875 et 953,125 Hz est décodée comme une tonalité de 937,5 Hz.

La plage de fréquences de la tonalité Appel rapide II est de 288,5 Hz à 3086 Hz. Selon le tableau ci-dessus, une fréquence entre 288,5 et 296,875 Hz est décodée par une radio comme une fréquence de 281,25 Hz, tandis qu'une fréquence entre 3046,875 et 3086 Hz est décodée par la radio comme une fréquence de 3093,75 Hz.

10.13.4.3

Plages de groupe et fréquences standard et applicables pour FDMA

Pour les canaux FDMA, il existe 72 groupes de fréquences, où certains groupes couvrent une plage de 31,25 Hz, et certains une plage de 62,5 Hz (en texte gras ci-dessous). Le tableau répertorie les fréquences standard et les fréquences minimales et maximales pour chaque groupe :

Tableau 108 : Fréquences

Index	Plage de fréq. (Hz)	Fréq. décodée (Hz)	Index	Plage de fréq. (Hz)	Fréq. décodée (Hz)	Index	Plage de fréq. (Hz)	Fréq. décodée (Hz)
1	265,7 - 296,8	283	25	1 015,7 - 1 046,8	1 032,5	49	1 828,2 - 1 859,3	1 838,25

IMPORTANT :

Lorsqu'une fréquence est reçue par une radio, n'importe quelle fréquence de tonalité à l'intérieur d'un groupe spécifique (plage) sera décodée comme la fréquence standard de ce groupe. Par exemple, la fréquence de tonalité 932 Hz est une fréquence standard prise en charge par un codeur numérique (pour les canaux FDMA); ainsi, toute fréquence de tonalité reçue entre 921,875 et 953,125 Hz sera décodée comme une tonalité de 932 Hz.

La plage de fréquences de la tonalité Appel rapide II est de 288,5 Hz à 3086 Hz. Selon le tableau ci-dessus, une fréquence entre 288,5 et 296,875 Hz est décodée par une radio comme une fréquence de 283 Hz, tandis qu'une fréquence entre 3046,875 Hz et 3086 Hz est décodée par la radio comme une fréquence de 3082,25 Hz.

10.13.5

Fréq. tonalité 2

Ce champ permet de sélectionner la fréquence de réception de la Tonalité 2 pour la Liste de composition de tonalité courante (rangée ou enregistrement).

Cela est uniquement requis quand une séquence de deux tonalités est requise, où la Fréq. de tonalité1 et la Fréq. de tonalité2 définissent collectivement la séquence de tonalités désirée dans la Liste de composition de tonalité courante.

Cette sélection s'applique uniquement pour les communications ASTRO conventionnelles et ASTRO 25 ADF.

AVERTISSEMENT :

La technologie de codeur AMBE numérique utilisée par la console de répartition et la radio ne chiffre ou ne déchiffre pas précisément les fréquences Appel rapide II (analogiques) correspondantes; plutôt, à l'intérieur de la plage de fréquences pertinentes disponibles pour la Fréq. tonalité1 et la Fréq. tonalité2 (265,625 à 3109,375 Hz), le coder transforme des groupes de fréquences homogènes en ensemble de « fréquences standards », dans lequel chaque groupe a une plage de fréquences permises, et une fréquence standard est définie au centre de chaque groupe.

Par conséquent, lorsqu'une fréquence de tonalité programmée se situe dans la plage autorisée de l'une de ces fréquences standards, elle est décodée par la radio en tant que fréquence.

Idéalement, les fréquences de tonalité programmées de la radio doivent correspondre à celles de tonalité programmées dans la console de répartition afin d'éviter le risque de manquer un appel.

Les définitions de groupe de fréquences de tonalité spécifique dépendent du Type de canal et, par conséquent, des canaux TDMA (accès multiple par répartition dans le temps) par rapport à ceux FDMA (accès multiple par répartition en fréquence).

- Pour les canaux TDMA, il existe 91 groupes et chaque groupe couvre une plage de 31,25 Hz.
- Pour les canaux FDMA, il existe 72 groupes; certains groupes couvrent une plage de 31,25 Hz et d'autres groupes, une plage de 62,5 Hz.

Lors de la configuration des fréquences de tonalité :

- Pour un enregistrement de fréquence à deux tonalités unique, il faut éviter une combinaison où les deux fréquences, Fréq tonalité1 et Fréq. tonalité2, sont configurées comme une même tonalité, car cette entrée à deux tonalités ne peut pas être décodée par la radio.
- Pour un enregistrement de fréquence à deux tonalités unique, il faut éviter une combinaison où les deux fréquences, Fréq tonalité1 et Fréq. tonalité2, tombent dans le même groupe de fréquences, car les deux sont décodés comme la même tonalité. Par exemple, un enregistrement de fréquence à deux tonalités sur les fréquences 927 Hz et 940 Hz fait en sorte que les deux sont décodées comme une fréquence de 937,5 Hz.
- Pour deux enregistrements de fréquence de tonalité différents, il faut éviter une combinaison où les deux fréquences, Fréq. tonalité1 et Fréq. de tonalité2, tombent dans le même groupe de fréquences, car les deux sont décodés comme la même tonalité. Par exemple, si la fréquence du premier enregistrement est 927 Hz et 1240 Hz, et celle du second enregistrement est 940 Hz et 1260 Hz, les deux enregistrements sont décodés comme 937,5 Hz et 1250 Hz.
- Dans certains cas, une fréquence de tonalité numérique ne peut pas être toujours décodée pour une valeur de fréquence spécifique, elle est plutôt décodée de façon aléatoire sur l'une des deux valeurs différentes. Le tableau montre les fréquences de tonalité à éviter absolument pour les deux canaux FDMA et TDMA canaux :

Voir [Liste de fréquences de tonalité non prises en charge à la page 268](#).

Accès seulement : Lorsque [Type de tonalités à la page 265](#) est réglé à **Appel rapide II** et que le modèle ou l'option de la radio le permet.

REMARQUE :

Lorsque réglée à **Désactivé**, seule une tonalité unique (Fréq. de tonalité1) s'applique au membre de la Liste de composition de tonalité courante.

Tableau 109 : Portée

Minimum	Maximum	Incréments
288,5 Hz	3086,0 Hz	0,1 Hz

Voir [Plages de groupe et fréquences standard et applicables pour TDMA à la page 268](#).

Voir [Plages de groupe et fréquences standard et applicables pour FDMA à la page 271](#).

10.13.6

Activer la sourdine

Ce champ permet à la radio de demeurer en sourdine pour tous les appels de répartition conventionnels reçus et les appels de groupe affiliés ADF jusqu'à ce que la radio décode les tonalités Composition de tonalité définies dans la rangée ou l'enregistrement courant.

Cette sélection s'applique uniquement pour les communications ASTRO conventionnelles et ASTRO 25 ADF.

REMARQUE :

- Dans les cas où la répartition doit séquentiellement transmettre plusieurs tonalités de composition (par exemple, au cours d'un appel à tous), la première tonalité unique qualifiée (ou paire de tonalités) correspondant aux tonalités définies réactive le son de la radio et vous pouvez entendre toutes les tonalités subséquentes avant le message vocal.
- Cette fonction peut être utilisée uniquement sur des canaux avec l'Alerte utilisateur en appel activée où la sourdine vocale est activée.
- La touche Mettre la voix en sourdine et la sélection de menu Mettre la voix en sourdine vous permettent d'activer et de désactiver la mise en sourdine de la voix pour les canaux dont la fonction Alerte utilisateur en appel est activée.
- La radio peut décoder de 1 à 10 tonalités et peut encoder toutes les tonalités.

Accès seulement : Lorsque [Type de tonalités à la page 265](#) est réglé à **Appel rapide II** et que le modèle ou l'option de la radio le permet.

10.13.7

Alert Tone (Tonalité d'alerte)

Ce champ permet de sélectionner une tonalité d'alerte spécifique à émettre lors de la réception de la ou des compositions de tonalité définies dans l'enregistrement/rangée courant.

Lorsque la radio décode les tonalités, elle désactive la sourdine du haut-parleur et joue la tonalité d'alerte associée, suivie par la voix restante.

Cette sélection s'applique uniquement pour les communications ASTRO conventionnelles et ASTRO 25 ADF.

Accès seulement : Lorsque [Type de tonalités à la page 265](#) est réglé à **Appel rapide II** et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

- Désactivé;
- Standard
- Continu
- Tonalité 1 à Tonalité 8

REMARQUE :

La radio peut décoder de 1 à 10 tonalités et peut encoder toutes les tonalités.

10.13.8

Fréq. tonalité

Ce champ vous permet de définir la fréquence à tonalité unique pour la liste de composition de tonalité.

Accès seulement : lorsque le champ [Type de tonalités à la page 265](#) est réglé à **Tonalité unique** et que le modèle ou les options de la radio le permettent.

Tableau 110 : Portée

Minimum	Maximum	Incréments
288,5 Hz	3086,0 Hz	0,1 Hz

10.13.9

Durée de tonalité

Ce champ vous permet de définir la durée de transmission d'une tonalité de fréquence à tonalité unique de la radio.

Accès seulement : lorsque le champ [Type de tonalités à la page 265](#) est réglé à **Tonalité unique** et que le modèle ou les options de la radio le permettent.

Tableau 111 : Portée

Minimum	Maximum	Incréments
25 ms	6 375 ms	25 ms

10.13.10

Préminutage de tonalité

Ce champ vous permet de définir la durée d'attente de la radio avant d'envoyer une tonalité de fréquence à tonalité unique.

Accès seulement : lorsque le champ [Type de tonalités à la page 265](#) est réglé à **Tonalité unique** et que le modèle ou les options de la radio le permettent.

Tableau 112 : Portée

Minimum	Maximum	Incréments
25 ms	6 375 ms	25 ms

10.14

langue Définie

La **Langue** définie permet à l'utilisateur de définir une liste de langues pour la radio.

10.14.1

Sélection de la langue

Ce champ vous permet de sélectionner la langue d'affichage de la radio. Cette sélection s'applique à toute la radio.

L'application prend en charge les langues suivantes : Les radios prennent en charge les langues suivantes :

- Anglais (Australie)
- Anglais (États-Unis)
- Français (Canada)
- Portugais (Brésil)
- Espagnol (Argentine)
- Espagnol (Chili)
- Espagnol (Colombie)
- Espagnol (Mexique)

**REMARQUE :**

Lorsque la langue d'affichage de la radio est réglée à une langue autre que l'anglais pour la première fois, les opérations d'écriture, de clonage ou de mise à jour demandent plus de temps.

Selon le réglage utilisé pour Mettre à jour la langue de la radio, les mises à jour subséquentes peuvent être plus rapides.

10.15

ViQi : Alerte de partenaire virtuel

L'ensemble **ViQi : Alerte de partenaire virtuel** permet aux utilisateurs de créer une liste d'alertes de partenaires virtuels ViQi avec les actions d'alerte correspondantes qui sont définies sous la rubrique **Consolidation des actions**. Le partenaire virtuel ViQi traite le lancement d'un appel de partenaire virtuel ViQi par un utilisateur et demeure actif jusqu'à la fin de l'appel.

**REMARQUE :**

La liste d'alertes est un ensemble fixe de 16 alertes qui correspondent à des alertes de partenaire virtuel ViQi provenant du système.

Chaque alerte a une action d'alerte associée qui est une alerte de partenaire virtuel ViQi dans le tableau de consolidation d'action et qui est effectuée sur la radio lorsque l'alerte de partenaire virtuel ViQi correspondante est émise par le système.

10.15.1

Nom de liste d'alertes de partenaire virtuel

Ce champ vous permet d'afficher ou de définir un nom reconnaissable par l'utilisateur pour la liste d'alertes actuelle du partenaire virtuel.

**REMARQUE :**

La valeur par défaut est « Liste de partenaire virtuel 1 ».

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Vous pouvez utiliser jusqu'à 14 caractères.

10.15.1.1

Alias d'alerte

Ce champ vous permet de définir le nom reconnaissable par l'utilisateur de la radio lorsqu'une alerte de partenaire virtuel est émise par le système.

**REMARQUE :**

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Vous pouvez utiliser jusqu'à 14 caractères.

10.15.1.2

Action d'alerte

Ce champ vous permet de spécifier l'action à exécuter sur la radio lorsqu'une alerte de partenaire virtuel est émise par le système.

**IMPORTANT :**

Ce champ est une référence à un enregistrement d'action de partenaire virtuel action dans le tableau de consolidation d'action. La valeur par défaut est **Non assigné**.

10.16

Toutes les annonces vocales

Cette section permet d'afficher ou d'affecter des fichiers d'annonce vocale de Motorola (*.MVA) à certaines fonctions de la radio.

Vous pouvez entendre ces messages-guide dès qu'une des fonctions affectées est sélectionnée. Les sélections s'appliquent à toute la radio.

**REMARQUE :**

La Liste d'annonces vocales vous permet de charger les fichiers d'annonce vocale de Motorola (*.MVA) dans la codeplug courante.

10.16.1

Général (Toutes les annonces vocales)

La section **Général** de l'ensemble Toutes les annonces vocales permet d'assigner des fichiers d'annonce vocale de Motorola (*.MVA) à certaines fonctions de la radio. L'utilisateur radio peut ensuite entendre les messages-guide dès qu'une des fonctions assignées est sélectionnée. Les sélections s'appliquent à toute la radio.

10.16.1.1

Priorité des annonces vocales

Ce champ permet d'indiquer si la lecture audio des annonces vocales a priorité sur l'audio de réception (Rx) normal de la radio.

Cette sélection s'applique à toute la radio.

**IMPORTANT :**

Ce réglage n'a aucune incidence sur les interactions entre les annonces vocales et les tonalités d'alerte. Les tonalités d'alerte momentanées ont priorité sur les annonces vocales qui, elles, ont priorité sur les tonalités d'alerte continues.

Les sélections suivantes sont prises en charge :

Faible

Les sons de réception normaux de la radio ont priorité.

Ces transmissions sont aussi appelées « urgences tactiques ».

Élevé

Les annonces vocales ont priorité.

10.16.1.2

Balayage activé

Ce champ permet de sélectionner, s'il y a lieu, le fichier d'annonce vocale de Motorola (.MVA) affecté au fonctionnement Mode de balayage activé.

Lorsque vous activez le mode de balayage, un message-guide vocal se fait entendre.

Vous pouvez activer le mode Balayage en appuyant sur une touche Balayer ou un commutateur Balayer, ou en utilisant la sélection de menu Balayer. Si l'option de synthèse texte-paroles (TTS) est sélectionnée, le texte dans le champ de commande vocale correspondant est converti en parole et lu en tant que contenu audio. Cette fonction ne peut pas être utilisée lorsque le mode Balayage automatique est activé sur le canal de fonctionnement de la radio.

Cette sélection s'applique à toute la radio.

REMARQUE :

La page Liste d'annonces vocales permet de charger les fichiers d'annonce vocale de Motorola (*.MVA) dans la codeplug courante de l'application.

Les sélections suivantes sont prises en charge :

Aucun

Cette fonction de la radio ne nécessite aucun message-guide vocal.

TTS

Lorsque la fonction Commande vocale est activée, le texte qui apparaît dans le champ Commande vocale pour le mode Balayage activé est lu comme un contenu audio.

Fichier d'annonce vocale de Motorola (*.MVA)

Énumère tous les fichiers vocaux possibles définis dans la page Liste de fichiers d'annonce vocale.

10.16.1.3

Balayage activé – Annonce TTS

Un mot couramment prononcé pour la référence au champ « Balayage activé » aux fins d'annonce de synthèse texte-parole (TTS).

REMARQUE :

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

Lorsqu'on appuie sur la touche **Lecture** , l'application convertit le texte affiché dans le champ Commande vocale en parole et le transmet dans le haut-parleur.

Accès seulement :

- [ViQi : Priorité des annonces vocales à la page 114](#) n'est pas réglé à **Désactivé**.
- [Balayage activé à la page 278](#) est réglé à **TTS**.
- Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.4

Balayage désactivé

Ce champ permet de sélectionner, s'il y a lieu, le fichier d'annonce vocale de Motorola (.MVA) affecté au fonctionnement Mode de balayage désactivé.

Lorsque vous désactivez le mode de balayage, un message-guide vocal se fait entendre.

Vous pouvez désactiver le mode Balayage en appuyant sur une touche Balayer ou un commutateur Balayer, ou en utilisant la sélection de menu Balayer. Si l'option de synthèse texte-paroles (TTS) est sélectionnée, le texte dans le champ de commande vocale correspondant est converti en parole et lu en tant que contenu audio. Cette fonction ne peut pas être utilisée lorsque le mode Balayage automatique est activé sur le canal de fonctionnement de la radio.

Cette sélection s'applique à toute la radio.

REMARQUE :

La page Liste d'annonces vocales permet de charger les fichiers d'annonce vocale de Motorola (.MVA) dans la codeplug courante de l'application.

Les sélections suivantes sont prises en charge :

Aucun

Cette fonction de la radio ne nécessite aucun message-guide vocal.

TTS

Lorsque la fonction Commande vocale est activée, le texte qui apparaît dans le champ Commande vocale pour le mode Balayage désactivé est lu comme un contenu audio.

Fichier d'annonce vocale de Motorola (.MVA)

Énumère tous les fichiers vocaux possibles définis dans la page Liste de fichiers d'annonce vocale.

10.16.1.5

Balayage désactivé – Annonce TTS

Un mot couramment prononcé pour la référence au champ « Balayage désactivé » aux fins d'annonce de synthèse texte-parole (TTS).

REMARQUE :

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

Lorsqu'on appuie sur la touche **Lecture** , l'application convertit le texte affiché dans le champ Commande vocale en parole et le transmet dans le haut-parleur.

Accès seulement :

- [ViQi : Priorité des annonces vocales à la page 114](#) n'est pas réglé à **Désactivé**.
- [Balayage désactivé à la page 279](#) est réglé à **TTS**.
- Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.6

Moniteur activé

Ce champ permet de sélectionner, s'il y a lieu, le fichier d'annonce vocale de Motorola (.MVA) affecté à l'activation du mode Moniteur.

Si l'option de synthèse texte-paroles (TTS) est sélectionnée, le texte dans le champ de commande vocale correspondant est converti en parole et lu en tant que contenu audio. Ce mode est aussi appelé « échec de la ligne privée ». Le mode Moniteur vous permet de surveiller toutes les activités du silencieux de porteuse sur le canal courant de la radio.

Lorsque vous activez le mode Moniteur (échec de la ligne privée), le message-guide vocal se fait entendre. Cette sélection s'applique seulement aux communications conventionnelles.

AVERTISSEMENT :

- L'utilisateur d'une radio mobile peut exécuter le fichier d'annonce vocale seulement en appuyant sur le bouton associé à la fonction Moniteur ou en sélectionnant la commande de menu Moniteur.
- L'utilisateur d'une radio portative peut exécuter le fichier d'annonce vocale seulement à l'aide de la fonction Désact.

REMARQUE :

- La page Liste d'annonces vocales permet de charger les fichiers d'annonce vocale de Motorola (.MVA) dans la codeplug courante de l'application.
- Avec les radios mobiles, vous pouvez désactiver le mode Moniteur en utilisant une touche Moniteur ou une sélection de menu Moniteur.
- Avec les radios portatives, vous pouvez désactiver le mode Échec de la ligne privée (PL) au moyen du commutateur Désact PL.

Les sélections suivantes sont prises en charge :

Aucun

Cette fonction de la radio ne nécessite aucun message-guide vocal.

TTS

Lorsque la fonction Commande vocale est activée, le texte qui apparaît dans le champ Commande vocale pour le mode Moniteur activé est lu comme un contenu audio.

Fichier d'annonce vocale de Motorola (.MVA)

Énumère tous les fichiers vocaux possibles définis dans la page Liste de fichiers d'annonce vocale.

10.16.1.7

Moniteur activé – Annonce TTS

Un mot couramment prononcé pour la référence au champ « Moniteur activé » aux fins d'annonce de synthèse texte-parole (TTS).

REMARQUE :

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

Lorsqu'on appuie sur la touche **Lecture** , l'application convertit le texte affiché dans le champ Commande vocale en parole et le transmet dans le haut-parleur.

Accès seulement :

- [ViQi : Priorité des annonces vocales à la page 114](#) n'est pas réglé à **Désactivé**.
- [Moniteur activé à la page 280](#) est réglé à **TTS**.
- Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.8

Moniteur désactivé

Ce champ permet de sélectionner, s'il y a lieu, le fichier d'annonce vocale de Motorola (.MVA) affecté à la désactivation du mode Moniteur.

Si l'option de synthèse texte-paroles (TTS) est sélectionnée, le texte dans le champ de commande vocale correspondant est converti en parole et lu en tant que contenu audio. Ce mode est aussi appelé « échec de la ligne privée ». Le mode Moniteur vous permet de surveiller toutes les activités du silencieux de porteuse sur le canal courant de la radio.

Lorsque vous désactivez le mode Moniteur (échec de la ligne privée), le message-guide vocal se fait entendre. Cette sélection s'applique seulement aux communications conventionnelles.

**AVERTISSEMENT :**

- L'utilisateur d'une radio mobile peut exécuter le fichier d'annonce vocale seulement en appuyant sur le bouton associé à la fonction Moniteur ou en sélectionnant la commande de menu Moniteur.
- L'utilisateur d'une radio portative peut exécuter le fichier d'annonce vocale seulement à l'aide de la fonction Désact.

**REMARQUE :**

- La page Liste d'annonces vocales permet de charger les fichiers d'annonce vocale de Motorola (.MVA) dans la codeplug courante de l'application.
- Avec les radios mobiles, vous pouvez désactiver le mode Moniteur en utilisant une touche Moniteur ou une sélection de menu Moniteur.
- Avec les radios portatives, vous pouvez désactiver le mode Échec de la ligne privée (PL) au moyen du commutateur Désact PL.

Les sélections suivantes sont prises en charge :

Aucun

Cette fonction de la radio ne nécessite aucun message-guide vocal.

TTS

Lorsque la fonction Commande vocale est activée, le texte qui apparaît dans le champ Commande vocale pour le mode Moniteur désactivé est lu comme un contenu audio.

Fichier d'annonce vocale de Motorola (.MVA)

Énumère tous les fichiers vocaux possibles définis dans la page Liste de fichiers d'annonce vocale.

10.16.1.9

Moniteur désactivé – Annonce TTS

Un mot couramment prononcé pour la référence au champ « Moniteur désactivé » aux fins d'annonce de synthèse texte-parole (TTS).

**REMARQUE :**

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

Lorsqu'on appuie sur la touche **Lecture** , l'application convertit le texte affiché dans le champ Commande vocale en parole et le transmet dans le haut-parleur.

Accès seulement :

- [ViQi : Priorité des annonces vocales à la page 114](#) n'est pas réglé à **Désactivé**.
- [Moniteur désactivé à la page 282](#) est réglé à **TTS**.

- Lorsque le modèle ou l'option de la radio le permet.

**REMARQUE :**

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.10**Mode Direct activé**

Ce champ permet de sélectionner, s'il y a lieu, le fichier d'annonce vocale de Motorola (.MVA) affecté au fonctionnement Mode direct activé.

Si l'option de synthèse texte-paroles (TTS) est sélectionnée, le texte dans le champ de commande vocale correspondant est converti en parole et lu en tant que contenu audio. Lorsque vous activez le mode direct, un message-guide vocal se fait entendre. Vous pouvez activer le mode direct à l'aide d'une touche DEK Mode direct (clavier d'entrée directe).

Cette sélection s'applique à toute la radio.

**REMARQUE :**

La page Liste d'annonces vocales permet de charger les fichiers d'annonce vocale de Motorola (.MVA) dans la codeplug courante de l'application.

Les sélections suivantes sont prises en charge :

Aucun

Cette fonction de la radio ne nécessite aucun message-guide vocal.

TTS

Lorsque la fonction Commande vocale est activée, le texte qui apparaît dans le champ Commande vocale pour l'option Mode direct activé est lu comme un contenu audio.

Fichier d'annonce vocale de Motorola (.MVA)

Énumère tous les fichiers vocaux possibles définis dans la page Liste de fichiers d'annonce vocale.

10.16.1.11**Mode direct activé – Annonce TTS**

Un mot couramment prononcé pour la référence au champ « Mode Direct activé » aux fins d'annonce de synthèse texte-parole (TTS).

**REMARQUE :**

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

Lorsqu'on appuie sur la touche **Lecture** , l'application convertit le texte affiché dans le champ Commande vocale en parole et le transmet dans le haut-parleur.

Accès seulement :

- [ViQi : Priorité des annonces vocales à la page 114](#) n'est pas réglé à **Désactivé**.
- [Mode Direct activé à la page 283](#) est réglé à **TTS**.
- Lorsque le modèle ou l'option de la radio le permet.

**REMARQUE :**

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.12

Mode Direct désactivé

Ce champ permet de sélectionner, s'il y a lieu, le fichier d'annonce vocale de Motorola (.MVA) affecté au fonctionnement Mode direct activé.

Si l'option de synthèse texte-paroles (TTS) est sélectionnée, le texte dans le champ de commande vocale correspondant est converti en parole et lu en tant que contenu audio. Lorsque vous désactivez le mode direct, un message-guide vocal se fait entendre. Vous pouvez désactiver le mode direct à l'aide d'une touche DEK Mode direct (clavier d'entrée directe).

Cette sélection s'applique à toute la radio.

**REMARQUE :**

La page Liste d'annonces vocales vous permet de charger les fichiers d'annonce vocale de Motorola (.MVA) dans la codeplug courante.

Les sélections suivantes sont prises en charge :

Aucun

Cette fonction de la radio ne nécessite aucun message-guide vocal.

TTS

Lorsque la fonction Commande vocale est activée, le texte qui apparaît dans le champ Commande vocale pour le mode Annonce de canal est lu comme un contenu audio.

Fichier d'annonce vocale de Motorola (.MVA)

Énumère tous les fichiers vocaux possibles définis dans la page Liste de fichiers d'annonce vocale.

10.16.1.13

Mode Direct désactivé – Annonce TTS

Un mot couramment prononcé pour la référence au champ « Mode Direct désactivé » aux fins d'annonce de synthèse texte-parole (TTS).

**REMARQUE :**

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

Lorsqu'on appuie sur la touche **Lecture** , l'application convertit le texte affiché dans le champ Commande vocale en parole et le transmet dans le haut-parleur.

Accès seulement :

- [ViQi : Priorité des annonces vocales à la page 114](#) n'est pas réglé à **Désactivé**.
- [Mode Direct désactivé à la page 284](#) est réglé à **TTS**.
- Lorsque le modèle ou l'option de la radio le permet.

**REMARQUE :**

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.14

Alarme d'urgence activée

Ce champ permet de sélectionner, s'il y a lieu, le fichier d'annonce vocale de Motorola (.MVA) affecté à l'activation du mode d'urgence.

Si l'option de synthèse texte-paroles (TTS) est sélectionnée, le texte dans le champ de commande vocale correspondant est converti en parole et lu en tant que contenu audio. Lorsque vous activez le mode d'urgence, un message-guide vocal se fait entendre.

Vous pouvez lancer une transmission d'urgence en utilisant une touche d'urgence ou un interrupteur à pédale d'urgence, ou même, sans que cela nécessite une intervention de votre part, avec la fonction Avertissement de situation de détresse.

Cette sélection s'applique à toute la radio.

REMARQUE :

La page Liste d'annonces vocales permet de charger les fichiers d'annonce vocale de Motorola (.MVA) dans la codeplug courante de l'application.

Les sélections suivantes sont prises en charge :

Aucun

Cette fonction de la radio ne nécessite aucun message-guide vocal.

TTS

Lorsque la fonction Commande vocale est activée, le texte qui apparaît dans le champ Commande vocale pour le mode Urgence activée est lu comme un contenu audio.

Fichier d'annonce vocale de Motorola (.MVA)

Énumère tous les fichiers vocaux possibles définis dans la page Liste de fichiers d'annonce vocale.

10.16.1.15

Urgence activée – Annonce TTS

Un mot couramment prononcé pour la référence au champ « Urgence activée » aux fins d'annonce de synthèse texte-parole (TTS).

REMARQUE :

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

Lorsqu'on appuie sur la touche **Lecture** , l'application convertit le texte affiché dans le champ Commande vocale en parole et le transmet dans le haut-parleur.

Accès seulement :

- [ViQi : Priorité des annonces vocales à la page 114](#) n'est pas réglé à **Désactivé**.
- [Alarme d'urgence activée à la page 284](#) est réglé à **TTS**.
- Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.16

Sélection de Tx sécurisée activée

Ce champ permet de sélectionner, s'il y a lieu, le fichier d'annonce vocale de Motorola (.MVA) assigné à l'activation du chiffrement sécuritaire des transmissions.

Si l'option de synthèse texte-paroles (TTS) est sélectionnée, le texte dans le champ de commande vocale correspondant est converti en parole et lu en tant que contenu audio. Lorsque vous activez le mode de chiffrement sécuritaire des transmissions, un message-guide vocal se fait entendre.

Vous pouvez activer les transmissions chiffrées sécurisées en utilisant une touche Tx sécurisée, un commutateur Tx sécurisée ou la sélection de menu Tx sécurisée.

Cette sélection s'applique à toute la radio.

REMARQUE :

La page Liste d'annonces vocales permet de charger les fichiers d'annonce vocale de Motorola (.MVA) dans la codeplug courante de l'application.

Les sélections suivantes sont prises en charge :

Aucun

Cette fonction de la radio ne nécessite aucun message-guide vocal.

TTS

Lorsque la fonction Commande vocale est activée, le texte qui apparaît dans le champ Commande vocale pour le mode Sélection de Tx sécurisée activée est lu comme un contenu audio.

Fichier d'annonce vocale de Motorola (.MVA)

Énumère tous les fichiers vocaux possibles définis dans la page Liste de fichiers d'annonce vocale.

10.16.1.17

Sélection de Tx sécurisée activée – Annonce TTS

Un mot couramment prononcé pour la référence au champ « Sélection de Tx sécurisée activée » aux fins d'annonce de synthèse texte-parole (TTS).

REMARQUE :

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

Lorsqu'on appuie sur la touche **Lecture** , l'application convertit le texte affiché dans le champ Commande vocale en parole et le transmet dans le haut-parleur.

Accès seulement :

- [ViQi : Priorité des annonces vocales à la page 114](#) n'est pas réglé à **Désactivé**.
- [Sélection de Tx sécurisée activée à la page 285](#) est réglé à **TTS**.
- Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.18

Sélection de Tx sécurisée désactivée

Ce champ permet de sélectionner, s'il y a lieu, le fichier d'annonce vocale de Motorola (.MVA) assigné à la désactivation du chiffrement sécuritaire des transmissions (autrement dit, de permettre des transmissions non chiffrées).

Si l'option de synthèse texte-paroles (TTS) est sélectionnée, le texte dans le champ de commande vocale correspondant est converti en parole et lu en tant que contenu audio. Lorsque vous désactivez le mode de chiffrement sécuritaire des transmissions, un message-guide vocal se fait entendre.

Vous pouvez désactiver les transmissions chiffrées sécurisées en utilisant une touche Tx sécurisée, un commutateur Tx sécurisée ou la sélection de menu Tx sécurisée.

Cette sélection s'applique à toute la radio.

REMARQUE :

La page Liste d'annonces vocales permet de charger les fichiers d'annonce vocale de Motorola (.MVA) dans la codeplug courante de l'application.

Les sélections suivantes sont prises en charge :

Aucun

Cette fonction de la radio ne nécessite aucun message-guide vocal.

TTS

Lorsque la fonction Commande vocale est activée, le texte qui apparaît dans le champ Commande vocale pour le mode Sélection de Tx sécurisée désactivée est lu comme un contenu audio.

Fichier d'annonce vocale de Motorola (.MVA)

Énumère tous les fichiers vocaux possibles définis dans la page Liste de fichiers d'annonce vocale.

10.16.1.19

Sélection de Tx sécurisée désactivée – Annonce TTS

Un mot couramment prononcé pour la référence au champ « Sélection de Tx sécurisée désactivée » aux fins d'annonce de synthèse texte-parole (TTS).

REMARQUE :

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

Lorsqu'on appuie sur la touche **Lecture** , l'application convertit le texte affiché dans le champ Commande vocale en parole et le transmet dans le haut-parleur.

Accès seulement :

- [ViQi : Priorité des annonces vocales à la page 114](#) n'est pas réglé à **Désactivé**.
- [Sélection de Tx sécurisée désactivée à la page 286](#) est réglé à **TTS**.
- Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.20

Alerte de site sélectionnable en zone hors de portée

Ce champ permet à la radio de continuer à fournir une rétroaction ergonomique associée à la dernière alerte de site sélectionnable (SSA) reçue au cas où la radio serait sortie du rayon de couverture du site au moment d'une alerte.

La rétroaction ergonomique de la SSA décodée inclut le déclenchement de l'annonce vocale récurrente associée à la SSA et l'affichage de son alias d'alerte par éclairage intelligent, si cette fonction est activée. Cette sélection s'applique aux communications ADF.

Si cette option est désactivée, la radio cesse de fournir une rétroaction ergonomique pour la dernière alerte de site sélectionnable reçue dès que la radio sort du rayon de couverture du site.

REMARQUE :

- Vous pouvez attribuer une liste d'alertes de site sélectionnables à un système ADF ASTRO 25 au moyen du champ de Sélection de la liste d'alertes de site sélectionnables.
- Vous pouvez activer et désactiver les alertes de site sélectionnables dont le champ **Programmable par l'abonné** est **activé** au moyen de la sélection de menu Alertes de site sélectionnables. Il est possible de sélectionner un seul site ou tous les sites disponibles de la zone pour l'activation ou la désactivation d'une alerte de site sélectionnable.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.16.1.21

Blocage de transmission activé – Annonce TTS

Un mot couramment prononcé pour la référence au champ « Blocage de transmission activé » aux fins d'annonce de synthèse texte-parole (TTS).

**REMARQUE :**

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

Lorsqu'on appuie sur la touche **Lecture** , l'application convertit le texte affiché dans le champ Commande vocale en parole et le transmet dans le haut-parleur.

Accès seulement :

- [ViQi : Priorité des annonces vocales à la page 114](#) n'est pas réglé à **Désactivé**.
- Le champ d'annonce vocale correspondant est réglé à **TTS**.
- Lorsque le modèle ou l'option de la radio le permet.

**REMARQUE :**

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.22

Blocage de transmission désactivé – Annonce TTS

Un mot couramment prononcé pour la référence au champ « Blocage de transmission désactivé » aux fins d'annonce de synthèse texte-parole (TTS).

**REMARQUE :**

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

Lorsqu'on appuie sur la touche **Lecture** , l'application convertit le texte affiché dans le champ Commande vocale en parole et le transmet dans le haut-parleur.

Accès seulement :

- [ViQi : Priorité des annonces vocales à la page 114](#) n'est pas réglé à **Désactivé**.
- Le champ d'annonce vocale correspondant est réglé à **TTS**.
- Lorsque le modèle ou l'option de la radio le permet.

**REMARQUE :**

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.23

Alerte utilisateur en appel désactivée – Annonce TTS

Un mot couramment prononcé pour la référence au champ « Alerte utilisateur en appel désactivé » aux fins d'annonce de synthèse texte-parole (TTS).

**REMARQUE :**

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

Lorsqu'on appuie sur la touche **Lecture** , l'application convertit le texte affiché dans le champ Commande vocale en parole et le transmet dans le haut-parleur.

Accès seulement :

- [ViQi : Priorité des annonces vocales à la page 114](#) n'est pas réglé à **Désactivé**.
- Le champ d'annonce vocale correspondant est réglé à **TTS**.
- Lorsque le modèle ou l'option de la radio le permet.

**REMARQUE :**

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.24

Alerte utilisateur en appel activée – Annonce TTS

Un mot couramment prononcé pour la référence au champ « Alerte utilisateur en appel activée » aux fins d'annonce de synthèse texte-parole (TTS).

**REMARQUE :**

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

Lorsqu'on appuie sur la touche **Lecture** , l'application convertit le texte affiché dans le champ Commande vocale en parole et le transmet dans le haut-parleur.

Accès seulement :

- [ViQi : Priorité des annonces vocales à la page 114](#) n'est pas réglé à **Désactivé**.
- Le champ d'annonce vocale correspondant est réglé à **TTS**.
- Lorsque le modèle ou l'option de la radio le permet.

**REMARQUE :**

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.25

Mode primaire du bouton multifonction – Annonce TTS

Un mot couramment prononcé pour la référence au champ « Mode primaire du bouton multifonction » aux fins d'annonce de synthèse texte-parole (TTS).

**REMARQUE :**

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

Lorsqu'on appuie sur la touche **Lecture** , l'application convertit le texte affiché dans le champ Commande vocale en parole et le transmet dans le haut-parleur.

Accès seulement :

- [ViQi : Priorité des annonces vocales à la page 114](#) n'est pas réglé à **Désactivé**.
- Le champ d'annonce vocale correspondant est réglé à **TTS**.
- Lorsque le modèle ou l'option de la radio le permet.

**REMARQUE :**

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.26

Mode secondaire du bouton multifonction – Annonce TTS

Un mot couramment prononcé pour la référence au champ « Mode secondaire du bouton multifonction » aux fins d'annonce de synthèse texte-parole (TTS).

REMARQUE :

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

Lorsqu'on appuie sur la touche **Lecture** , l'application convertit le texte affiché dans le champ Commande vocale en parole et le transmet dans le haut-parleur.

Accès seulement :

- [ViQi : Priorité des annonces vocales à la page 114](#) n'est pas réglé à **Désactivé**.
- Le champ d'annonce vocale correspondant est réglé à **TTS**.
- Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.27

Verrouillage du clavier ou des commandes activé – Annonce TTS

Un mot couramment prononcé pour la référence au champ « Verrouillage du clavier ou des commandes activé » aux fins d'annonce de synthèse texte-parole (TTS).

REMARQUE :

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

Lorsqu'on appuie sur la touche **Lecture** , l'application convertit le texte affiché dans le champ Commande vocale en parole et le transmet dans le haut-parleur.

Accès seulement :

- [ViQi : Priorité des annonces vocales à la page 114](#) n'est pas réglé à **Désactivé**.
- Le champ d'annonce vocale correspondant est réglé à **TTS**.
- Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.28

Verrouillage du clavier ou des commandes désactivé – Annonce TTS

Un mot couramment prononcé pour la référence au champ « Verrouillage du clavier ou des commandes désactivé » aux fins d'annonce de synthèse texte-parole (TTS).

REMARQUE :

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

Lorsqu'on appuie sur la touche **Lecture** , l'application convertit le texte affiché dans le champ Commande vocale en parole et le transmet dans le haut-parleur.

Accès seulement :

- [ViQi : Priorité des annonces vocales à la page 114](#) n'est pas réglé à **Désactivé**.
- Le champ d'annonce vocale correspondant est réglé à **TTS**.
- Lorsque le modèle ou l'option de la radio le permet.

**REMARQUE :**

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.29**Alerte utilisateur en appel activée**

Ce champ permet de sélectionner, s'il y a lieu, le fichier d'annonce vocale de Motorola (.MVA) assigné lorsque la fonction de mise en sourdine de la voix est DÉSACTIVÉE pour les canaux dont la fonction d'alerte utilisateur en appel est activée.

Si l'option de synthèse texte-paroles (TTS) est sélectionnée, le texte dans le champ de commande vocale correspondant est converti en parole et lu en tant que contenu audio. Lorsque vous activez la mise en sourdine de la voix pour un canal dont la fonction d'alerte utilisateur en appel est activée, un message-guide vocal se fait entendre.

Vous pouvez activer la fonction de mise en sourdine de la voix en utilisant une touche de mise en sourdine ou une sélection de menu de mise en sourdine. Cette sélection s'applique à toute la radio.

Les sélections suivantes sont prises en charge :

Aucun

Cette fonction de la radio ne nécessite aucun message-guide vocal.

TTS

Lorsque la fonction Commande vocale est activée, le texte qui apparaît dans le champ Commande vocale pour l'activation d'alerte utilisateur en appel est lu comme un contenu audio.

Fichier d'annonce vocale de Motorola (.MVA)

Énumère tous les fichiers vocaux possibles définis dans la page Liste de fichiers d'annonce vocale.

10.16.1.30**Alerte utilisateur en appel désactivée**

Ce champ permet de sélectionner, s'il y a lieu, le fichier d'annonce vocale de Motorola (.MVA) assigné lorsque la fonction de mise en sourdine de la voix est DÉSACTIVÉE pour les canaux dont la fonction d'alerte utilisateur en appel est activée.

Si l'option de synthèse texte-paroles (TTS) est sélectionnée, le texte dans le champ de commande vocale correspondant est converti en parole et lu en tant que contenu audio. Lorsque vous désactivez la mise en sourdine de la voix pour un canal dont la fonction d'alerte utilisateur en appel est activée, un message-guide vocal se fait entendre.

Vous pouvez désactiver la fonction de mise en sourdine de la voix en utilisant une touche de mise en sourdine ou une sélection de menu de mise en sourdine.

Cette sélection s'applique à toute la radio.

**REMARQUE :**

La page Liste d'annonces vocales permet de charger les fichiers d'annonce vocale de Motorola (.MVA) dans la codeplug courante de l'application.

Les sélections suivantes sont prises en charge :

Aucun

Cette fonction de la radio ne nécessite aucun message-guide vocal.

TTS

Lorsque la fonction Commande vocale est activée, le texte qui apparaît dans le champ Commande vocale pour l'option Alerte utilisateur en appel désactivé est lu comme un contenu audio.

Fichier d'annonce vocale de Motorola (.MVA)

Énumère tous les fichiers vocaux possibles définis dans la page Liste de fichiers d'annonce vocale.

10.16.1.31

Mise hors tension

Ce champ vous permet de sélectionner le fichier d'annonce vocale Motorola (.MVA) prédéfini qui est assigné à l'événement de mise hors tension. La radio fait entendre une annonce vocale lorsque l'événement se produit.

**REMARQUE :**

Pour les plus récents modèles des normes en matière de service d'incendie, la sélection **AUCUN** est désactivée.

10.16.1.32

TTS Mise hors tension

Un mot couramment prononcé pour la référence au champ Mise hors tension aux fins d'annonce de synthèse texte-parole (TTS).

**REMARQUE :**

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.33

Hors de portée

Ce champ vous permet de sélectionner le fichier d'annonce vocale Motorola (.MVA) prédéfini qui est assigné à l'événement de zone hors de portée. La radio fait entendre une annonce vocale lorsque l'événement se produit.

**REMARQUE :**

Pour les plus récents modèles des normes en matière de service d'incendie, la sélection **AUCUN** est désactivée.

La communication Voix est entendue lorsque l'indicateur de zone hors de portée est réglé à **Alerte ou Alerte et affichage**.

Lorsque le canal du mode **zone de danger** est hors de portée, la radio fait entendre une annonce vocale lorsque l'événement se produit.

10.16.1.34

TTS Hors de portée

Un mot couramment prononcé pour la référence au champ Hors de portée aux fins d'annonce de synthèse texte-parole (TTS).

**REMARQUE :**

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.35

Échec de l'auto-évaluation

Ce champ vous permet de sélectionner le fichier d'annonce vocale Motorola (.MVA) prédéfini qui est assigné à l'opération d'échec de l'auto-évaluation. La radio fait entendre une annonce vocale lorsque les opérations échouent.

L'opération d'auto-évaluation vérifie ce qui suit :

- Connexion RSM à l'appareil RF.
- Perte de la connexion d'antenne à l'appareil RF.
- La température dépasse la température de surchauffe recommandée par le fabricant.
- Batterie avec au moins 50 % de la capacité totale disponible (mise sous tension seulement).

**REMARQUE :**

Pour les plus récents modèles des normes en matière de service d'incendie, la sélection **AUCUN** est désactivée.

10.16.1.36

TTS Échec de l'auto-évaluation

Un mot couramment prononcé pour la référence au champ Échec de l'auto-évaluation aux fins d'annonce de synthèse texte-parole (TTS).

**REMARQUE :**

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.37

Défaillance de l'accessoire

Ce champ vous permet de sélectionner le fichier d'annonce vocale Motorola (.MVA) prédéfini qui est assigné à l'événement de défaillance de l'accessoire. La radio fait entendre une annonce vocale lorsque l'événement se produit.

**REMARQUE :**

Pour les plus récents modèles des normes en matière de service d'incendie, la sélection **AUCUN** est désactivée.

10.16.1.38

TTS Défaillance de l'accessoire

Un mot couramment prononcé pour la référence au champ Défaillance de l'accessoire aux fins d'annonce de synthèse texte-parole (TTS).

**REMARQUE :**

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.39

Défaillance de l'antenne

Ce champ vous permet de sélectionner le fichier d'annonce vocale Motorola (.MVA) prédéfini qui est assigné à la défaillance de l'antenne. La radio fait entendre une annonce vocale lorsque les opérations se produisent.

**REMARQUE :**

Ce champ ne s'applique qu'aux radios APX NEXT NFPA.

10.16.1.40

TTS de défaillance de l'antenne

Un mot couramment prononcé pour la référence au champ TTS de défaillance de l'antenne aux fins d'annonce de synthèse texte-parole (TTS).

**REMARQUE :**

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.41

Surchauffe

Ce champ vous permet de sélectionner le fichier d'annonce vocale Motorola (.MVA) prédéfini qui est assigné à l'événement de surchauffe. La radio fait entendre une annonce vocale lorsque l'événement se produit.

**REMARQUE :**

Pour les plus récents modèles des normes en matière de service d'incendie, la sélection **AUCUN** est désactivée.

10.16.1.42

TTS de surchauffe

Un mot couramment prononcé pour la référence au champ Surchauffe aux fins d'annonce de synthèse texte-parole (TTS).

**REMARQUE :**

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

La valeur par défaut est vierge.

Caractères Unicode.

10.16.1.43

Surchauffe cumulative d'appareil RF

Ce champ vous permet de sélectionner le fichier d'annonce vocale Motorola (.MVA) prédéfini qui est assigné à l'événement de Surchauffe cumulative d'appareil RF. La radio fait entendre une annonce vocale lorsque l'événement se produit.

**REMARQUE :**

Ce champ ne s'applique qu'aux radios APX NEXT XN.

Pour les plus récents modèles des normes en matière de service d'incendie, la sélection

AUCUN est désactivée.

10.16.1.44

TTS Surchauffe cumulative d'appareil RF

Un mot couramment prononcé pour la référence au champ Surchauffe cumulative d'appareil RF aux fins d'annonce de synthèse texte-parole (TTS).

**REMARQUE :**

Ce champ ne s'applique qu'aux radios APX NEXT XN.

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.45

Surchauffe cumulative de composant facultatif

Ce champ vous permet de sélectionner le fichier d'annonce vocale Motorola (.MVA) qui est assigné à l'opération de surchauffe cumulative de composant facultatif. La radio fait entendre une annonce vocale lorsque les opérations se produisent.

**REMARQUE :**

Ce champ ne s'applique qu'aux radios APX NEXT XN.

Pour les plus récents modèles des normes en matière de service d'incendie, la sélection

AUCUN est désactivée.

10.16.1.46

TTS Surchauffe cumulative de composant facultatif

Un mot couramment prononcé pour la référence au champ Surchauffe cumulative de composant facultatif aux fins d'annonce de synthèse texte-parole (TTS).

REMARQUE :

Ce champ ne s'applique qu'aux radios APX NEXT XN.

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.47

Mode Quitter la zone de danger

Ce champ vous permet de sélectionner le fichier d'annonce vocale Motorola (.MVA) prédéfini qui est assigné à l'événement de mode Quitter la zone de danger.

La radio fait entendre une annonce vocale lorsque vous activez l'interrupteur concentrique bidirectionnel pour quitter le mode.

REMARQUE :

Pour les plus récents modèles des normes en matière de service d'incendie, la sélection **AUCUN** est désactivée.

10.16.1.48

TTS Mode Quitter la zone de danger

Un mot couramment prononcé pour la référence au champ Mode Quitter la zone de danger aux fins d'annonce de synthèse texte-parole (TTS).

REMARQUE :

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.49

Accessoire de mode non dangereux

Ce champ vous permet de sélectionner le fichier d'annonce vocale Motorola (.MVA) prédéfini qui est assigné à l'événement d'accessoire de mode non dangereux. La radio fait entendre une annonce vocale lorsque l'événement se produit.

REMARQUE :

Ce champ ne s'applique qu'aux radios APX NEXT XN.

Pour les plus récents modèles des normes en matière de service d'incendie, la sélection **AUCUN** est désactivée.

10.16.1.50

TTS Accessoire de mode non dangereux

Un mot couramment prononcé pour la référence au champ Accessoire de mode non dangereux aux fins d'annonce de synthèse texte-parole (TTS).

REMARQUE :

Ce champ ne s'applique qu'aux radios APX NEXT XN.

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.1.51

Surchauffe cumulative de batterie

Ce champ vous permet de sélectionner le fichier d'annonce vocale Motorola (.MVA) qui est assigné à l'événement de surchauffe cumulative de batterie. La radio fait entendre une annonce vocale lorsque l'événement se produit.

REMARQUE :

Ce champ ne s'applique qu'aux radios APX NEXT XN.

Pour les plus récents modèles des normes en matière de service d'incendie, la sélection **AUCUN** est désactivée.

10.16.1.52

TTS Surchauffe cumulative de batterie

Un mot couramment prononcé pour la référence au champ Surchauffe cumulative de batterie aux fins d'annonce de synthèse texte-parole (TTS).

REMARQUE :

Ce champ ne s'applique qu'aux radios APX NEXT XN.

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.16.2

Liste d'annonces vocales

Cette section vous permet de charger les fichiers d'annonce vocale de Motorola (*.MVA) dans la codeplug courante.

REMARQUE :

Pendant une opération de comparaison de codeplug, cette liste d'annonces vocales prend en charge uniquement la fonctionnalité **Copier tous les champs** (c'est-à-dire qu'il n'y aura pas un bouton Copier à côté du nom de chaque fichier vocal). Lorsque la fonction **Copier tous les champs** est lancée, tous les fichiers vocaux sont copiés de la codeplug secondaire dans la codeplug principale.

REMARQUE :

Un fichier d'annonce vocale de Motorola (*.MVA) peut être généré uniquement à partir d'un fichier *.WAV au moyen de l'utilitaire de conversion de l'annonce vocale.

Une fois chargés dans la liste, les fichiers audio/vocaux peuvent être sélectionnés dans les champs Annonce vocale de l'ensemble Toutes les annonces vocales, dans le champ Fichier audio d'alerte de la Liste d'alertes sélectionnables par le site et dans les champs Annonce du canal et Annonce de zone de la page Attribution du canal de zone.

REMARQUE :

Ajout d'un fichier vocal :

- Le signe d'addition de la barre d'outils Enregistrements multiples – Affichage en tableau vous permet d'ajouter un ou plusieurs fichiers vocaux/audio (et enregistrement/rangées) à la codeplug d'application courante.
- Une boîte de dialogue de sélection de fichier Windows s'ouvre pour vous permettre de naviguer jusqu'au système de fichiers de votre ordinateur et d'accéder aux fichiers vocaux désirés.

10.16.2.1

Nom du fichier vocal

Ce champ vous permet d'afficher ou de changer les noms reconnaissables pour les fichiers vocaux ou audio d'annonce vocale de Motorola (*.MVA) (enregistrement/rangée).

Chaque fichier audio d'annonce vocale hérite par défaut du nom de fichier MVA chargé initialement.

Vous pouvez cliquer sur le champ **Nom du fichier vocal** pour y taper du texte et modifier le nom donné à un enregistrement vocal ou audio.

Toutefois, les données du fichier sélectionné initialement ne sont pas modifiées.

10.17

Liste d'alertes de site sélectionnables

Cette section vous permet d'afficher ou de définir des alertes de site sélectionnables individuelles pour les communications ADF du système ASTRO 25.

Cette fonction s'applique aux communications ADF.

IMPORTANT :

il est possible de définir jusqu'à quinze alertes de site sélectionnables (SSA) différentes par liste pour le chiffrement ou le déchiffrement par la radio; toutefois, vous pouvez sélectionner une seule SSA ayant le champ Programmable par l'abonné réglé à **Activé** aux fins de chiffrement (transmission à FNE). Lorsque le FNE reçoit la SSA depuis une radio, il la diffuse à toutes les radios du site au moyen d'un OSP (paquet de signaux sortants) de diffusion système exclusif de Motorola Solutions sur le canal de contrôle sortant.

L'audio d'une annonce vocale standard (événement ponctuel) a toujours la priorité sur l'audio d'une alerte de site sélectionnable (événement récurrent).

Une seule alerte de site sélectionnable peut être active sur un site à la fois.

REMARQUE :

Les fichiers d'annonce vocale de Motorola (*.MVA) appropriés doivent au préalable être chargés dans la Liste d'annonces vocales afin de pouvoir être sélectionnés pour une rangée ou un enregistrement de liste d'alertes de site sélectionnables à partir du champ Fichier audio d'alerte correspondant.

Une liste d'alertes de site sélectionnables peut être attribuée à un système ADF à partir du champ Sélection de la liste d'alertes de site sélectionnables de ce système.

Vous pouvez activer et désactiver les alertes de site sélectionnables dont le champ Programmable par l'abonné est **activé** au moyen de la sélection de menu Alertes de site sélectionnables. Il est possible de sélectionner un seul site ou tous les sites disponibles de la zone pour l'activation ou la désactivation d'une alerte de site sélectionnable.

10.17.1

Nom de liste d'alertes de site sélectionnables

Ce champ vous permet d'afficher ou de définir des noms reconnaissables pour l'alerte de site sélectionnable courante dans la liste des alertes de site sélectionnables courante.

Vous pouvez sélectionner l'utilisation des listes d'alertes de site sélectionnables dans le champ **Sélection de la liste d'alertes de site sélectionnables** d'un système ADF.

REMARQUE :

Mine de fer, mine de cuivre, Liste SSA 3

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Vous pouvez utiliser jusqu'à 14 caractères.

10.17.2

Alias d'alerte

Ce champ vous permet d'afficher ou de définir des noms reconnaissables pour l'alerte de site sélectionnable courante dans la liste des alertes de site sélectionnables courante.

L'alias s'affiche alors sur l'écran de la radio lorsque vous faites défiler la Liste d'alertes de site sélectionnables ou lorsque la radio reçoit une diffusion d'alerte de site sélectionnable depuis l'équipement de réseau fixe (FNE).

Cette sélection s'applique aux communications ADF.

REMARQUE :

Évacuation, Stationnement, Sirène de tornade, Alerte 1

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Vous pouvez utiliser jusqu'à 14 caractères.

L'alias d'alerte s'affiche à l'écran.

10.17.3

Fichier audio d'alerte

Ce champ permet de sélectionner, s'il y a lieu, le fichier d'annonce vocale de Motorola (*.MVA) assigné à l'alerte de site sélectionnable courante (rangée/enregistrement) de la liste d'alertes de site sélectionnables courante.

L'audio ou le message-guide vocal correspondant se fait entendre lorsque la radio reçoit une diffusion d'alerte de site sélectionnable depuis l'équipement de réseau fixe (FNE).

Cette sélection s'applique aux communications ADF.

REMARQUE :

Les fichiers d'annonce vocale de Motorola (*.MVA) qui conviennent doivent au préalable être chargés dans la Liste d'annonces vocales afin de pouvoir être sélectionnés pour une rangée ou un enregistrement de Liste d'alertes de site sélectionnables.

Les sélections suivantes sont prises en charge :

Aucun

Aucune alerte audio/vocale n'est requise pour cette fonction radio.

Fichier d'annonce vocale de Motorola (*.MVA)

Répertorie tous les fichiers audio/vocaux chargés à la page Liste de fichiers d'annonce vocale.

10.17.4

Période d'alerte

Ce champ permet de sélectionner la période après laquelle la radio rejoue le fichier audio d'alerte pour l'alerte sélectionnable par le site courante (enregistrement/rangée) de la liste d'alertes sélectionnables par le site.

Cette sélection s'applique aux communications ADF.

AVERTISSEMENT :

Plus la période d'alerte est faible, plus la lecture audio est fréquente. La lecture audio constante pendant des heures/jours finit par diminuer la durée de vie de la batterie de la radio.

Tableau 113 : Portée

Minimum	Maximum	Incréments	Valeur par défaut
5 secondes	255 seconde	1 seconde	15 secondes

10.17.5

Programmable par l'abonné

Ce champ permet d'afficher l'alias d'alerte du champ Alerte sélectionnable par le site courant (enregistrement/rangée) sur l'écran de la radio (appareil d'abonné), afin que l'alerte sélectionnée soit encodable pour la diffusion.

Grâce à la sélection de menu Alertes sélectionnables par le site, vous pouvez faire défiler toutes les alertes encodables dans la Liste d'alertes sélectionnables par le site et l'activer ou, par la suite, désactiver une alerte sélectionnée.

Cette sélection s'applique aux communications ADF.

10.18

Toute la sécurité

Cette section vous permet d'afficher et de définir la fonctionnalité pour la transmission et la réception des communications encodées sécurisées.

REMARQUE :

Lorsque le champ Effectuer/Terminer la connexion est réglé à **Sélection** pour un certain canal, la touche Sélection de Tx sécurisée, le commutateur Sélection de Tx sécurisée ou la sélection de menu Sécurisé vous permet d'alterner entre les communications sécurisées et les communications non chiffrées sur ce canal.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.18.1

Général

Cette section permet d'afficher ou de définir la fonctionnalité de base du chiffrement sécurisé.

REMARQUE :

Lorsque le champ Effectuer/Terminer la connexion est réglé à **Sélection** pour un certain canal, la touche Sélection de Tx sécurisée, le commutateur Sélection de Tx sécurisée ou la sélection de menu Sécurisé vous permet d'alterner entre les communications sécurisées et les communications non chiffrées sur ce canal.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.18.1.1

Fonctionnement sécurisé

Ce champ permet de sélectionner le mode de communication à chiffrement sécurisé qui s'applique à l'ensemble de la radio.

REMARQUE :

Lorsqu'un champ [Connexion sécurisée/non chiffrée à la page 390](#) est réglé à **Sélection** pour un certain canal, la touche Sélection de Tx sécurisée, le commutateur [Sélection de Tx sécurisée à la page 206](#) ou la sélection de menu Sécurisé vous permet d'alterner entre les communications sécurisées et les communications non chiffrées sur ce canal.

AVERTISSEMENT :

Lorsque le champ Inhibition tactique - Activer est activé, ce champ peut être réglé uniquement sur **Désactivé** ou **Matériel**. Sinon, l'application la considère comme non valide.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Désactivé;

Le chiffrement sécurisé ne peut pas être utilisé.

Matériel

Les services de chiffrement sont assurés par un circuit intégré distinct certifié FIPS (Federal Information Processing Standard) 140-2 niveaux 2 et 3, selon la valeur du paramètre de chargement des clés rouges, et ils prennent en charge de multiples algorithmes de chiffrement instantané pour une sécurité accrue.

Logiciel

AVERTISSEMENT :

Ne peut pas être utilisé avec l'ADF de type II.

Les deux méthodes de chiffrement de logiciel suivantes sont prises en charge :

ADP (confidentialité numérique avancée)

Les services de chiffrement sont assurés par une mise en œuvre logicielle de l'algorithme RC4, qui n'est assujetti à aucun niveau de certification FIPS.

10.18.1.2

ADP (confidentialité numérique avancée)

Ce champ permet à la radio d'utiliser l'algorithme ADP SW pour les appels vocaux chiffrés.

AVERTISSEMENT :

Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel**, activer la confidentialité numérique avancée (ADP), [Norme de chiffrement avancée \(AES256\) à la page 302](#) ou [Norme de chiffrement de données \(DES\) à la page 303](#).

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel** et lorsque le modèle ou les options de la radio le permettent.

10.18.1.3

Norme de chiffrement avancée (AES256)

Ce champ permet à la radio de transmettre et de recevoir des communications de voix et de données chiffrées.

AVERTISSEMENT :

Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel**, activer [ADP \(confidentialité numérique avancée\) à la page 302](#), [Norme de chiffrement de données \(DES\) à la page 303](#) ou Norme de chiffrement avancé (AES256).

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel** et lorsque le modèle ou les options de la radio le permettent.

10.18.1.4

Source de chargement de clés

Ce champ vous permet de sélectionner la source de chargement de clés.

Les sélections suivantes sont prises en charge :

Liste des clés de chiffrement

Permet d'entrer des clés sécurisées dans la liste des clés de chiffrement. Disponible uniquement pour la confidentialité numérique avancée (ADP).

KVL

Permet de charger les clés de logiciel.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel** et lorsque le modèle ou les options de la radio le permettent.

10.18.1.5

Activer OTAR

Active la fonction ASTRO OTAR (changement de clé par onde radio) ou MDC OTAR conventionnelle, ou la fonction ASTRO 25 OTAR ADF pour l'ensemble de la radio.

**AVERTISSEMENT :**

Il faut activer le champ Activer ASTRO OTAR ou le champ Activer MDC OTAR, autrement, les deux radios deviennent non valides.

**REMARQUE :**

En fonction d'une personnalité conventionnelle individuelle, l'option ASTRO OTAR ou MDC OTAR est activée avec le champ ASTRO OTAR et les champs Tx OTAR de la personnalité.

En fonction du système ADF individuel, OTAR est activé à partir du champ ASTRO OTAR et des champs OTAR Tx.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** et que le modèle ou les options de la radio le permettent, ou lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel** et que le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est activé.

10.18.1.6

Effacement de la clé SW améliorée au blocage de la radio

Lorsque ce champ est activé, la radio efface toutes les clés de chiffrement ADP (Advanced Digital Privacy) ou AES (Advanced Encryption Standard) quand elle passe à l'état Blocage de la radio.

Le blocage de radio est activé selon qu'il s'agit d'un système conventionnel ou système ADF.

Lorsque ce champ est désactivé, toutes les clés de chiffrement ADP ou AES sont retenues par la radio quand celle-ci passe à l'état de blocage de la radio.

**AVERTISSEMENT :**

Ce champ est mutuellement exclusif avec le champ [Activer OTAR à la page 303](#).

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel** et que le modèle ou l'option de la radio le permet, et

lorsque le champ [ADP \(confidentialité numérique avancée\) à la page 302](#) est activé, ou

lorsque le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est activé, mais que le champ Fonctionnement OTAR est **Désactivé**.

10.18.1.7

Norme de chiffrement de données (DES)

Ce champ permet à la radio de transmettre et de recevoir des communications de voix et de données chiffrées.

**AVERTISSEMENT :**

Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel**, activez [ADP \(confidentialité numérique avancée\) à la page 302](#), [Norme de chiffrement avancée \(AES256\) à la page 302](#) ou Norme de chiffrement de données (DES).

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel** et lorsque le modèle ou les options de la radio le permettent.

10.18.2

ASTRO OTAR

La section **ASTRO OTAR** vous permet d'afficher et de définir des fonctions de changement de clé par onde radio (OTAR) pour les fonctions de communications ASTRO - conventionnel et ASTRO - 25.

ASTRO utilise un protocole de chiffrement sécurisé numérique. En plus des demandes de nouvelle attribution de clé, les transmissions OTAR comprennent : Accusés de réception et Accusés de réception à la mise sous tension retardés.

**AVERTISSEMENT :**

Il peut être nécessaire de configurer certaines des options sélectionnées dans le système de gestion de clés (KMF) pour qu'elles fonctionnent correctement.

**REMARQUE :**

La fonction ASTRO OTAR est activée séparément pour chaque personnalité conventionnelle selon la valeur du champ [Rx \(type voix/signal\) à la page 430](#). La configuration de la radio se poursuit avec le lancement des commandes OTAR en activant ASTRO OTAR et/ou les champs [Tx OTAR à la page 489](#) pour cette personnalité.

ASTRO OTAR est activé en fonction du système ADF à partir du champ ASTRO OTAR et des champs [Tx OTAR à la page 615](#).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.18.2.1

Activer ASTRO OTAR

Active la fonction ASTRO OTAR (changement de clé par onde radio) ou MDC OTAR conventionnelle, ou la fonction ASTRO 25 OTAR ADF pour l'ensemble de la radio.

**AVERTISSEMENT :**

Il faut activer le champ Activer ASTRO OTAR ou le champ Activer MDC OTAR, autrement, les deux radios deviennent non valides.

**REMARQUE :**

En fonction d'une personnalité conventionnelle individuelle, l'option ASTRO OTAR ou MDC OTAR est activée avec le champ ASTRO OTAR et les champs Tx OTAR de la personnalité.

En fonction du système ADF individuel, OTAR est activé à partir du champ ASTRO OTAR et des champs OTAR Tx.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique**, le champ [Activer OTAR à la page 303](#) est activé, et lorsque le modèle ou l'option de la radio le permet, ou

Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel**, que le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est activé, que le champ [Activer OTAR à la page 303](#) est activé et que le modèle et les options de la radio le permettent.

10.18.2.2

Blocage de la radio par ASTRO OTAR

Ce champ permet à la radio de recevoir et d'accepter une commande de blocage de changement de clé par onde radio (OTAR) ASTRO.

Cette commande est généralement transmise par un répartiteur ou un opérateur du système KMF et rend la radio temporairement inutilisable. Cette fonction s'applique au mode de chiffrement sécurisé pour les communications ASTRO du système Conventionnel et ASTRO 25 du système ADF.

AVERTISSEMENT :

Lorsque ce champ est activé et que le champ [Activer ASTRO OTAR à la page 304](#) est activé pour un système ADF, le blocage de la radio se fait à l'aide de la fonction « ASTRO OTAR ».

Lorsque ce champ est activé et que le champ [Activer ASTRO OTAR à la page 304](#) est désactivé pour un système ADF, les champs Blocage de la radio des systèmes ADF en question doivent être activés. Le blocage de la radio peut ainsi être exécuté par l'intermédiaire d'un système ADF ASTRO 25 « non chiffré ».

Lorsque le champ [Activer ASTRO OTAR à la page 304](#) est activé pour un système ADF et que le champ Blocage de la radio des systèmes ADF en question est désactivé, ce champ est activé et n'est accessible qu'en lecture seule. Le blocage de la radio est exécuté à l'aide de la fonction « ASTRO OTAR » pour ces systèmes.

IMPORTANT :

Pour annuler l'état dormant de la radio, envoyez une commande de déblocage à la radio ou rétablissez le processus Lecture/écriture de la radio.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel**, que le champ [Activer OTAR à la page 303](#) est activé, que le champ [Activer ASTRO OTAR à la page 304](#) est activé et que le modèle et les options de la radio le permettent.

Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel**, que le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est réglé à **Activé**, que le champ [Activer OTAR à la page 303](#) est activé, que le champ [Activer ASTRO OTAR à la page 304](#) est activé, et que le modèle et les options de la radio le permettent.

10.18.2.3

TKP activé

Ce champ permet à la radio d'exécuter l'attribution de clés sans contact (TKP) qui transmet des clés de chiffrement de bout en bout aux radios à partir d'un dispositif de gestion des clés (KMF) sans d'abord avoir besoin de configurer le chargeur de variable de clé (KVL) de la radio.

REMARQUE :

La radio doit avoir été configurée à l'usine de fabrication Motorola pour pouvoir exécuter cette fonction. Certaines radios peuvent ne pas être compatibles, même si la fonction est activée, si les radios sont expédiées avant l'introduction en usine de la fonction.

L'opérateur du KMF doit activer l'attribution de clés sans contact pour cette radio dans la configuration du KMF.

Lorsque ce champ est activé, le serveur KMF reçoit une notification lors de l'enregistrement OTAR.

10.18.2.4

Période entre les numéros de message

La période entre les numéros de message (MNP) définit une fenêtre de messages pouvant être acceptés à partir d'un dispositif de gestion des clés (KMF). La radio est programmée avec la valeur de MNP dans ce champ.

La fonction OTAR utilise cette valeur pendant les opérations.

L'objectif d'une petite fenêtre est d'empêcher un attaquant de mal configurer les clés de la radio en capturant les messages envoyés par le KMF et en les renvoyant ultérieurement à la radio.

Si la fenêtre est très petite et que des messages sont manqués par le KMF en raison de la désactivation de la radio ou du système radio hors de portée, la radio ignore les messages KMF et oblige le KMF à lancer une procédure de récupération.

Tableau 114 : Portée

Minimum	Maximum	Par défaut
2	65535	65535

REMARQUE :

Une valeur de 65535 désactive la protection contre la relecture.

10.18.2.5

RSI du KMF

L'indicateur radio du dispositif de gestion des clés (RSI KMF) est l'identificateur du KMF pour OTAR et doit correspondre à la valeur attribuée dans le KMF. Les messages d'une radio avec un paramètre incorrect pour cette valeur seront ignorés par le KMF.

La radio est programmée avec la valeur de KMF RSI dans ce champ. La fonction OTAR utilise cette valeur pendant les opérations.

Tableau 115 : Portée

Minimum	Maximum	Par défaut
1	9999999	9999999

10.18.2.6

Source des paramètres OTAR

Lorsque ce champ est réglé à **KVL**, le RSI et la période entre les numéros de message (MNP) du KMF de la radio ne peuvent être mis à jour que par l'intermédiaire du chargeur de variable de clé (KVL).

Lorsqu'elle est réglée à **Gestion des paramètres**, la radio est mise à jour avec les valeurs RSI et MNP du KMF RadioCentral, en écrasant les valeurs radio actuelles. Une mise à jour KVL subséquente écrase les valeurs fournies par Radio Central à nouveau.

10.18.3

MDC OTAR

Cette section permet d'afficher ou de définir les fonctions MDC de changement de clé par liaison radio (OTAR).

La fonction MDC OTAR s'applique uniquement au mode de chiffrement sécurisé et aux communications conventionnelles. En plus des demandes de nouvelle attribution de clé, les transmissions OTAR comprennent : Accusés de réception et Accusés de réception à la mise sous tension retardés.

REMARQUE :

La fonction MDC OTAR est activée par personnalité conventionnelle dans le champ Autre que ASTRO\Type d'émission de signaux. On configure par la suite la radio en activant le champ Tx OTAR de la personnalité voulue pour que la radio lance des commandes OTAR.

Lorsque le champ Effectuer/Terminer la connexion est réglé à **Sélection** pour un certain canal, la touche Sélection de Tx sécurisée, le commutateur Sélection de Tx sécurisée ou la sélection de menu Sécurisé vous permet d'alterner entre les communications sécurisées et les communications non chiffrées sur ce canal.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.18.3.1

Activer MDC OTAR

Permet d'activer la version MDC de la fonction OTAR (changement de clé par onde radio).

Cette fonction s'applique au mode de chiffrement sécurisé pour les communications MDC OTAR.

AVERTISSEMENT :

Lorsque le champ [Activer OTAR à la page 303](#) est activé, le module de Gestion radio exige que ce champ ou que le champ [Activer ASTRO OTAR à la page 304](#) soit activé. Autrement, les deux deviennent non valides. Ainsi, la fonction OTAR peut être utilisée sur un canal MDC ou ASTRO conventionnel.

REMARQUE :

La fonction MDC OTAR est activée par personnalité conventionnelle dans le champ Autre que ASTRO\Type d'émission de signaux. On configure par la suite la radio en activant le champ Tx OTAR de la personnalité voulue pour que la radio lance des commandes OTAR.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel**, le champ [Activer OTAR à la page 303](#) est activé, et lorsque le modèle ou l'option de la radio le permet.

10.18.3.2

Blocage de la radio par MDC OTAR

Ce champ permet à la radio de recevoir une commande de blocage MDC OTAR (changement de clé par onde radio) qui la rend temporairement inutilisable.

Cette commande est généralement transmise par un répartiteur ou un opérateur du contrôleur de gestion de clés (KMC). Cette fonction s'applique aux communications MDC OTAR du mode de chiffrement sécurisé.

IMPORTANT :

Pour annuler l'état dormant de la radio, envoyez une commande de déblocage à la radio ou rétablissez le processus Lecture/écriture de la radio.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique**, et lorsque le champ Fonctionnement OTAR est réglé à **ASTRO seulement** ou à **ASTRO et MDC**, et lorsque le modèle ou l'option de la radio le permet.

10.18.3.3

Accusés de réception OTAR\Activer

Ce champ permet à la radio d'accuser réception de tous les messages MDC OTAR (changement de clé par onde radio) qui nécessitent un tel avis.

Cette fonction s'applique aux communications MDC OTAR du mode de chiffrement sécurisé.

AVERTISSEMENT :

Vous devez vous assurer que toutes les fonctions Stat Alert sont également désactivées afin de préserver la sécurité de la radio. Les fonctions Stat Alert comprennent : Vérification de la radio, Mode radio à distance, Transmission d'appel de sélection automatique MDC, Rx/Tx d'alerte d'appel et Rx/Tx d'appel sélectif.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique**, et lorsque le champ Fonctionnement OTAR est réglé à **ASTRO seulement** ou à **ASTRO et MDC**, et lorsque le modèle ou l'option de la radio le permet.

10.18.3.4

Accusés de réception OTAR\Chiffrés seulement

Ce champ permet à la radio de chiffrer tous les accusés de réception MDC OTAR.

Cette fonction s'applique aux communications MDC OTAR du mode de chiffrement sécurisé. Si la fonction n'est pas activée, la radio envoie des accusés de réception MDC OTAR chiffrés ou non chiffrés, selon les consignes du contrôleur de gestion de clés (KMC) du répartiteur.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique**, que le champ Fonctionnement OTAR est réglé à **MDC seulement** ou à **ASTRO et MDC**, et lorsque le champ [Accusés de réception OTAR\Activer à la page 307](#) est activé, et lorsque le modèle ou l'option de la radio le permet.

10.18.3.5

Accusés de réception OTAR\Mise sous tension

Ce champ permet de sélectionner exactement à quel moment la radio envoie un accusé de réception de mise sous tension MDC OTAR (changement de clé par onde radio) au contrôleur de gestion de clés (KMC).

Grâce à cet avis, la radio peut se connecter au KMC aux fins de nouvelle attribution de clés par liaison radio. Cette fonction s'applique aux communications MDC OTAR du mode de chiffrement sécurisé.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique**, et lorsque le champ Fonctionnement OTAR est réglé à **ASTRO seulement** ou à **ASTRO et MDC**, et lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Désactivé;

Aucune confirmation de mise sous tension n'est envoyée.

Immédiat

La confirmation de mise sous tension est envoyée lorsque la radio est allumée et qu'elle a terminé sa séquence de mise sous tension.

Différé

La radio transmet la confirmation de mise sous tension lorsqu'une transmission est envoyée à l'aide de la touche PTT sur un canal prenant en charge la fonction OTAR.

10.18.3.6

Demande de réattribution de touche\Mode

Ce champ permet de sélectionner le protocole qu'utilise la radio pour transmettre une demande de nouvelle attribution de clé MDC OTAR (changement de clé par onde radio).

Cette demande est envoyée au contrôleur de gestion de clés (KMC) du répartiteur. Ces fonctions s'appliquent aux communications MDC OTAR du mode de chiffrement sécurisé.

**REMARQUE :**

Vous pouvez demander lancer une nouvelle demande d'attribution de clé en utilisant une touche Demande de nouvelle attribution de clé ou la sélection de menu [Demande de nouvelle attribution de clé à la page 223](#).

Accès seulement :

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique**, et lorsque le champ Fonctionnement OTAR est réglé à **ASTRO seulement** ou à **ASTRO et MDC**, et lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Chiffré

La demande de réattribution de clé est chiffrée.

Effacer

La demande de réattribution de clé n'est pas chiffrée.

Désactivé;

La procédure de nouvelle attribution de clé ne peut être lancée que par l'opérateur KMC.

10.18.3.7

Demande de nouvelle attribution de clé Tonalité d'alerte d'état

Ce champ permet à la radio de générer une tonalité de réussite ou d'échec une fois que le traitement d'une demande de nouvelle attribution de clé est terminé.

L'activation de cette fonction se répercute uniquement sur le déclenchement de cette tonalité d'alerte lorsque l'utilisateur quitte la section Demande de nouvelle attribution de clé du menu de la radio avant la fin du traitement de la demande. Si l'utilisateur ne quitte pas cette section du menu avant la fin du traitement, la tonalité d'alerte d'état retentit peu importe la valeur du champ. Une alarme visuelle indique également l'état du traitement de la demande à l'écran de la radio. Ces fonctions s'appliquent aux communications MDC OTAR du mode de chiffrement sécurisé.

**REMARQUE :**

Vous pouvez demander une nouvelle attribution de clé à l'aide de la sélection de menu Nouvelle attribution de clé.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique**, et lorsque le champ Fonctionnement OTAR est réglé à **ASTRO seulement** ou à **ASTRO et MDC**, et lorsque le modèle ou l'option de la radio le permet.

10.18.3.8

Effacer la modification précédente de l'utilisateur

Ce champ permet de supprimer TOUTES les clés de chiffrement sécurisé du jeu de clés précédemment actif (voir les champs Fente A, Fente B et Indexé) après un changement de jeu de clés que vous avez effectué.

Vous pouvez lancer le changement de jeu de clés à l'aide de la sélection de menu Jeu de clés. Cette fonction s'applique à toute la radio.

**AVERTISSEMENT :**

Lorsque ce champ est activé et lorsque le champ MDC OTAR Effacer l'index précédent lors de la modification de l'index, vous pouvez supprimer les deux jeux de clés et vous retrouver momentanément sans clé de chiffrement sécurisé.

EXEMPLE :

La radio utilise le jeu de clés 1 au moment où un changement de jeu de clés OTAR se produit. Ce changement fait passer la radio au jeu de clés 2 et supprime le jeu de clés 1. Par la suite, si vous réactivez manuellement le jeu de clés 1 supprimé et que la fonction Effacer la modification précédente de l'utilisateur supprime le jeu de clés 2, la radio se retrouve sans clé jusqu'à ce que vous chargiez manuellement de nouvelles clés ou que vous demandiez une nouvelle attribution de clés OTAR manuelle.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.18.3.9

ID de KMC

Ce champ permet de sélectionner l'ID de contrôleur de gestion de clés (KMC) de la radio afin de désigner celle-ci de façon exclusive.

Chaque radio d'un système devrait avoir un ID de KMC unique pour pouvoir communiquer individuellement avec le KMC par la transmission et la réception de commandes MDC OTAR. Cette fonction s'applique aux communications MDC OTAR du mode de chiffrement sécurisé.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique**, et lorsque le champ Fonctionnement OTAR est réglé à **ASTRO seulement** ou à **ASTRO et MDC**, et lorsque le modèle ou l'option de la radio le permet.

Tableau 116 : Portée

Minimum	Maximum
0000 hexadécimal	FFFF hexadécimal

10.18.3.10

Système MDC OTAR

Ce champ permet de sélectionner le système MDC conventionnel utilisé par les commandes de changement de clé par onde radio (OTAR) MDC.

Cette fonction s'applique aux communications conventionnelles du mode de chiffrement sécurisé.

IMPORTANT :

Un système MDC OTAR doit avoir sa fonction Plage d'ID MDC étendue réglée à **Désactivé**. Autrement, cette sélection est considérée comme non valide. Ces deux fonctions sont incompatibles.

REMARQUE :

Seuls les systèmes conventionnels de type MDC peuvent être sélectionnés (voir le champ Type de système). Une fois définis, les systèmes conventionnels sont associés à des personnalités conventionnelles.

La fonction MDC OTAR est activée par personnalité conventionnelle dans le champ Type d'émission de signaux Non ASTRO. On configure par la suite la radio en activant le champ OTAR Tx de la personnalité voulue pour que la radio lance des commandes OTAR.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique**, et lorsque le champ Fonctionnement OTAR est réglé à **ASTRO seulement** ou à **ASTRO et MDC**, et lorsque le modèle ou l'option de la radio le permet.

10.18.4

Fonctions

Cette section permet d'afficher ou de définir des réglages divers et parfois complexes de chiffrement sécurisé.

REMARQUE :

Lorsque le champ Effectuer/Terminer la connexion est réglé à **Sélection** pour un certain canal, la touche Sélection de Tx sécurisée, le commutateur Sélection de Tx sécurisée ou la sélection de menu Sécurisé vous permet d'alterner entre les communications sécurisées et les communications non chiffrées sur ce canal.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.18.4.1

Rétention infinie de clé

Si ce champ est activé, la radio conserve en permanence les clés de chiffrement, même si la batterie de la radio est retirée ou que la radio est reprogrammée. Cette fonction nécessite un chiffrement matériel.

Lorsque cette fonction est désactivée, les clés de chiffrement UKEK (clé de chiffrement de clé unique) sont effacées ou conservées selon le réglage du champ Rétention infinie de clé UKEK.

AVERTISSEMENT :

Lorsque cette fonction est active, le fait d'activer le champ Rétention infinie de clé UKEK peut rendre le champ non valide. Ces deux fonctions sont incompatibles.

Les modifications apportées au paramètre de ce champ peuvent avoir un impact potentiel sur le mode de fonctionnement FIPS de l'appareil. Cet impact entraîne l'effacement de tous les paramètres de sécurité critiques (matériel de clé et mot de passe). Pour plus d'informations, reportez-vous à la section Modes de fonctionnement FIPS.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** et que le modèle ou l'option de la radio le permet.

10.18.4.2

Tonalité d'alerte de défaillance de clé périodique

Ce champ permet de faire retentir une tonalité d'alerte périodique lorsque le canal courant de la radio a perdu sa clé de chiffrement sécurisé.

Et, lorsque l'une des conditions suivantes est respectée : Le [Connexion sécurisée/non chiffrée à la page 390](#) du canal courant est réglé à **Sécuriser**. Lorsque le champ [Connexion sécurisée/non chiffrée à la page 390](#) du canal courant est réglé à **Sélection** et que le bouton-poussoir Sélection de Tx sécurisée, la touche Sélection de Tx sécurisée ou la sélection de menu Sécurisée est réglé au mode sécurisé (et non au mode non chiffré).

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel** et que le modèle ou l'option de la radio le permet.

10.18.4.3

Tonalités d'alerte

Ce champ permet de faire retentir une tonalité d'alerte lors de la transmission ou de la réception de communications non chiffrées plutôt que de communications chiffrées.

Le mode non chiffré fait référence à des communications non chiffrées. Cette sélection s'applique à toute la radio.

REMARQUE :

Lorsque le champ Connexion sécurisée/non chiffrée est réglé à **Sélection** pour un certain canal, la touche Sélection de Tx sécurisée, le commutateur Sélection de Tx sécurisée ou la sélection de menu Sécurisé permet à l'utilisateur de la radio d'alterner entre les communications sécurisées et les communications non chiffrées sur ce canal.

AVERTISSEMENT :

lorsque le champ Activer Inhibition tactique est activé, ce champ peut être réglé uniquement sur **Réception seulement** ou **Tx et Rx**. Sinon, l'application la considère comme non valide.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel** et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Aucun

Aucune tonalité d'alerte n'est activée.

Transmission seulement

Une tonalité d'alerte retentit lorsque vous appuyez sur la touche PTT pour vous aviser que la radio est sur le point d'émettre en mode non chiffré.

Réception seulement

En ce qui concerne les signaux analogiques de type conventionnel (MDC, DTMF et QCII), cette fonction s'applique uniquement lorsque le préminutage du système conventionnel analogique associé au canal présentement syntonisé sur la radio est réglé à moins de 1 500 ms.

Transmission et réception

Voir la définition des sélections « Transmission seulement » et « Réception seulement » ci-dessus.

10.18.4.4

Ignorer interrupteur Sécurisé/Non chiffré lorsque câblé

Ce champ permet de faire en sorte que la radio ne tienne pas compte du réglage du commutateur Sélection de Tx sécurisée.

Le mode de transmission de la radio dépend alors de la valeur du champ [Connexion sécurisée/non chiffrée à la page 390](#), **Sécurisé** ou **Non chiffré**. Cette fonction s'applique à toute la radio.

**AVERTISSEMENT :**

Si cette fonction est désactivée et que le canal/mode actif de la radio est réglé à **Sécurisé** ou à **Non chiffré** (non sélectionnable), la radio vérifie la position du commutateur **Sélection de Tx sécurisée**. Si la valeur fixe du canal actif ne correspond pas au réglage du commutateur, la radio n'émet pas. Par défaut, cette fonction est désactivée.

Accès seulement : lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**, un système conventionnel ou ADF dont le commutateur concentrique « position A » est réglé à **Sélection de Tx sécurisée**, et lorsque le modèle ou l'option de la radio le permet.

10.18.4.5

Durée désactivation silencieux balayage non XL

Ce champ permet de sélectionner la durée pendant laquelle la radio attend, en mode balayage activé, qu'un signal de rebouclage par le chiffre non XL (à portée non étendue) chiffré par SecureNet soit détecté à la suite de la détection d'une onde porteuse.

Cette fonction s'applique aux communications de type conventionnel de l'ensemble de la radio. La durée est exprimée en millisecondes.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel** et que le modèle ou l'option de la radio le permet.

Tableau 117 : Portée

Minimum	Maximum	Incréments
0 (ms)	6 375 (ms)	25 (ms)

10.18.4.6

Durée désactivation silencieux balayage XL

Ce champ permet de sélectionner la durée pendant laquelle la radio attend, en mode balayage activé, qu'un signal de rebouclage par le chiffre non XL (à portée non étendue) chiffré par SecureNet soit détecté à la suite de la détection d'une onde porteuse.

Cette fonction s'applique aux communications conventionnelles de la radio. La durée est exprimée en millisecondes.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou **Confidentialité numérique avancée** et lorsque le modèle ou l'option de la radio le permet.

Tableau 118 : Portée

Minimum	Maximum	Incréments
0 (ms)	6 375 (ms)	25 (ms)

10.18.4.7

Rétention infinie de clé UKEK

Ce champ permet à la radio de conserver en permanence les UKEK (clés de chiffrement de clé unique) même si la batterie de la radio est retirée.

Une radio qui ne dispose que de clés UKEK peut recevoir une nouvelle attribution de clé par liaison radio (OTAR), mais ne peut émettre ou recevoir aucun autre appel vocal ou données sécurisées. Lorsque cette fonction est désactivée, les clés de chiffrement sont effacées ou conservées selon le réglage du champ Rétention infinie de clé. Si les deux champs sont désactivés, toutes les clés de chiffrement sont effacées lorsque la radio est reprogrammée ou que sa batterie est retirée.

**AVERTISSEMENT :**

Lorsque le champ [Rétention infinie de clé à la page 310](#) est activé, ce champ doit être désactivé. Sinon, l'application la considère comme non valide. Ces deux fonctions sont incompatibles.

**AVERTISSEMENT :**

Les modifications apportées au paramètre de ce champ peuvent avoir un impact potentiel sur le mode de fonctionnement FIPS de l'appareil, ce qui effacera tous les paramètres de sécurité critiques (matériel de clé et mot de passe). Pour plus d'informations, reportez-vous à la section Modes de fonctionnement FIPS.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** et que le modèle ou l'option de la radio le permet.

10.18.4.8

Désactiver la touche de remise à zéro

Ce champ vous permet de remettre à zéro les clés de chiffrement d'une radio en appuyant sur la touche latérale supérieure (mauve) et la touche orange simultanément.

Appuyez sur le côté supérieur (mauve) en premier pour éviter d'amorcer une tentative d'appel d'urgence.

Accès seulement : Lorsque le champ Fonctionnement sécurisé est réglé à **Matériel**, et lorsque le champ [Rétention infinie de clé à la page 310](#) est réglé à **Activé**, et lorsque le champ [Activer l'inhibition tactique](#) est réglé à **Désactivé**,

Ou encore, lorsque le champ Fonctionnement sécurisé est réglé à **Logiciel**, et lorsque le champ [Activer l'inhibition tactique](#) est réglé à **Désactivé**.

10.18.5

Multitouche

Cette section permet d'afficher ou de définir des paramètres qui ont une incidence sur le chiffrement sécurisé.

**REMARQUE :**

Lorsque le champ Effectuer/Terminer la connexion est réglé à **Sélection** pour un certain canal, la touche Sélection de Tx sécurisée, le commutateur Sélection de Tx sécurisée ou la sélection de menu Sécurisé vous permet d'alterner entre les communications sécurisées et les communications non chiffrées sur ce canal.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.18.5.1

Afficher lorsque l'interrupteur sécurisé est sélectionné

Ce champ permet de sélectionner le type d'information qui s'affiche à l'écran de la radio lorsque vous faites passer le canal courant au mode de chiffrement sécurisé.

Lorsque le champ Connexion sécurisée/non chiffrée est réglé à **Sélection** pour un certain canal, l'utilisation de la touche Sélection de Tx sécurisée, du commutateur [Sélection de Tx sécurisée à la page 206](#) ou de la sélection de menu Sécurisé provoque l'affichage de cette information à l'écran. Cette sélection s'applique à toute la radio.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou **Confidentialité numérique avancée** et lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Nom de la clé

Le contenu du champ Nom de la clé s'affiche à l'écran de la radio.

**AVERTISSEMENT :**

Cette sélection n'est valide que si le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**.

Nom du jeu de clés

Le nom du jeu de clés s'affiche à l'écran de la radio. Les jeux de clés sont habituellement assignés par un opérateur de la fonction de gestion de clés (KMF) et transmis à l'aide de la fonction OTAR (changement de clé par onde radio). Les noms de jeu par défaut sont « kset 1 » et « kset 2 ».

**AVERTISSEMENT :**

Cette sélection n'est valide que si le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel** avec le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) activé.

Désactivé;

Aucune information ne s'affiche à l'écran de la radio.

10.18.5.2

Afficher lorsque PTT

Ce champ permet de sélectionner le type d'information qui s'affiche à l'écran de la radio lorsque vous appuyez sur la touche PTT pendant que le canal courant de la radio fonctionne en mode de chiffrement sécurisé.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel** et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Nom de la clé

Le contenu du champ Nom de la clé s'affiche à l'écran de la radio.

**AVERTISSEMENT :**

Cette sélection n'est valide que si le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**.

Nom du jeu de clés

Le nom du jeu de clés s'affiche à l'écran de la radio. Les jeux de clés sont habituellement assignés par un opérateur de la fonction de gestion de clés (KMF) et transmis à l'aide de la fonction OTAR (changement de clé par onde radio). Les noms de jeu par défaut sont « kset 1 » et « kset 2 ».

**AVERTISSEMENT :**

Cette sélection n'est valide que si le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel** avec le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) activé.

Désactivé;

Aucune information ne s'affiche à l'écran de la radio.

10.18.5.3

Afficher lors du changement de mode

Ce champ permet de sélectionner le type d'information qui s'affiche à l'écran de la radio lorsque vous changez le canal ou le mode de la radio pour le remplacer par un canal relié au mode de chiffrement sécurisé (voir Effectuer/Terminer la connexion).

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel** et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Nom de la clé

Le contenu du champ Nom de la clé s'affiche à l'écran de la radio.

**AVERTISSEMENT :**

Cette sélection n'est valide que si le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**.

Nom du jeu de clés

Le nom du jeu de clés s'affiche à l'écran de la radio. Les jeux de clés sont habituellement assignés par un opérateur de la fonction de gestion de clés (KMF) et transmis à l'aide de la fonction OTAR (changement de clé par onde radio). Les noms de jeu par défaut sont « kset 1 » et « kset 2 ».

**AVERTISSEMENT :**

Cette sélection n'est valide que si le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel** avec le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) activé.

Désactivé;

Aucune information ne s'affiche à l'écran de la radio.

10.18.5.4

Gestion de clés PID pour mode ASN

Lorsque ce champ est sélectionné, il est possible d'utiliser la gestion de clés d'ID physique (PID) dans la radio.

Ce champ devient automatiquement activé et est accessible en lecture seule lorsque le champ [Activer MDC OTAR à la page 307](#) est activé. Cette fonction s'applique au mode chiffrement sécurisé dans toute la radio. La gestion de clés PID est un mécanisme hérité qui limite la radio à 16 clés dotées d'ID physiques. Si elle est désactivée, la gestion de clés de référence de clé commune (CKR) est utilisée par la radio uniquement pendant les communications chiffrées. La gestion de clés CKR permet d'associer plus de 16 clés et elle est obligatoire avec la fonction ASTRO OTAR (changement de clé par onde radio).

**IMPORTANT :**

Lors de l'emploi du mode ASN (SecureNet évolué) dans le chargeur de variable de clé (KVL) 3000 ou 3000 Plus, les clés de chiffrement peuvent uniquement être chargées dans la radio lorsque la gestion de clés PID a été activée dans la radio.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** et que le modèle ou l'option de la radio le permet.

10.18.5.5

ID de touche\Délai Rx

Ce champ permet de sélectionner le temps d'attente entre la fin d'un appel sécurisé reçu et le rechargement, par la radio, de la clé de chiffrement fixe ou de la dernière clé que vous avez sélectionnée ou enregistrée.

IMPORTANT :

Ce délai est uniquement nécessaire lorsque la radio doit changer temporairement de clé de chiffrement pour recevoir un appel transmis au moyen d'une clé différente. Cette fonction s'applique au mode chiffrement sécurisé et aux communications conventionnelles. La durée est exprimée en millisecondes.

REMARQUE :

Cette fonction s'applique au mode de chiffrement sécurisé ([Toute la sécurité à la page 301](#)) pour les communications conventionnelles et ADF lorsque le champ [ID de clé auto Rx à la page 622](#) est activé.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel** et que le modèle ou l'option de la radio le permet.

Tableau 119 : Portée

Minimum	Maximum	Incréments
0 (ms)	10000 (ms)	250 (ms)

10.18.5.6

ID de touche\Délai Tx

Ce champ permet de sélectionner le temps d'attente entre la fin d'un appel sécurisé transmis et le rechargement, par la radio, de la clé de chiffrement fixe ou de la dernière clé de chiffrement que vous avez sélectionnée ou enregistrée.

IMPORTANT :

Ce délai est uniquement nécessaire lorsque la radio doit changer temporairement de clé de chiffrement pour recevoir un appel transmis au moyen d'une clé différente, puis qu'elle continue d'utiliser cette clé temporaire pour la transmission. La durée est exprimée en millisecondes.

REMARQUE :

Cette fonction s'applique au mode de chiffrement sécurisé ([Toute la sécurité à la page 301](#)) pour les communications conventionnelles et ADF lorsque le champ [ID de clé auto Rx à la page 622](#) est activé.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel** et que le modèle ou l'option de la radio le permet.

Tableau 120 : Portée

Minimum	Maximum	Incréments
0 (ms)	10000 (ms)	250 (ms)

10.18.6

Liste des clés de chiffrement

Cette section permet de définir des clés de chiffrement matérielles ou logicielles multiples en vue de chiffrer de manière sécurisée les communications vocales et de données.

**REMARQUE :**

Le nombre de clés de chiffrement disponibles dépend de la gamme de modèle de la radio :
Haut de gamme = 128, gamme moyenne = 64 et bas de gamme = 48.

Lorsque le champ Effectuer/Terminer la connexion est réglé à **Sélection** pour un certain canal, la touche Sélection de Tx sécurisée, le commutateur Sélection de Tx sécurisée ou la sélection de menu Sécurisé vous permet d'alterner entre les communications sécurisées et les communications non chiffrées sur ce canal.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.18.6.1

Nom de la clé

Ce champ vous permet de définir des noms de clés reconnaissables pour la clé courante (rangée/enregistrement) dans la liste des clés de chiffrement.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel** et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

- Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.
- Le nombre de caractères permis dépend du modèle de la radio.

10.18.6.2

Numéro CKR

Ce champ permet d'assigner un numéro à la clé de référence de clé commune (CKR) (enregistrement/rangée) courante qui figure dans la liste des clés de chiffrement.

Ce numéro est associé à des personnalités, à des groupes de conversation ou à des fonctions, peu importe l'emplacement de stockage physique de la clé. Le programmeur radio n'a donc pas besoin d'établir une correspondance entre les clés de chiffrement et les emplacements de stockage physique pour différents appareils sécurisés faisant partie du même système de communication sur le terrain.

**AVERTISSEMENT :**

L'application attribue automatiquement une valeur « vide » pour le « Numéro CKR » par défaut. Chaque numéro CKR existant doit être défini en tant que valeur numérique pour qu'il soit possible de l'écrire ou de l'enregistrer dans la codeplug courante. Chaque numéro CKR doit être unique.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet et que le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel**.

Lorsque le modèle ou l'option de la radio le permet et que le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel**, et que le champ [Source de chargement de clés à la page 302](#) est réglé à **KVL**.

Tableau 121 : Portée

Minimum	Maximum
0001	4095

10.18.6.3

Indexé

Ce champ permet l'indexation de la clé de chiffrement de matériel (enregistrement/rangée) courante dans la liste des clés de chiffrement.

Grâce à l'indexation, deux jeux de clés uniques peuvent exister dans la radio. Le premier jeu est contenu dans le champ Fente A et le second, dans le champ Fente B. Une fois que l'indexation a été activée pour la clé courante (rangée ou enregistrement), une deuxième clé de chiffrement unique est entrée dans le champ Fente B. L'indexation permet également d'assigner deux clés uniques par canal radio, au lieu d'une seule.

IMPORTANT :

Lorsque la sélection de menu Clé conventionnelle a été programmée et qu'une paire de clés indexées a été sélectionnée pour un canal, vous pouvez peut passer de la clé de chiffrement du jeu A à celle du jeu B (et vice-versa) sans changer le canal de la radio. Cette fonction s'applique uniquement aux canaux de type conventionnel.

Lorsque la sélection de menu Jeu de clés a été programmée uniquement pour les communications conventionnelles ou ADF, le changement du jeu de clés courant de la radio est possible uniquement pour les canaux qui utilisent ce type de communications. Un jeu de clés s'applique à l'ensemble de la radio et donc aux deux types de canaux.

Lorsque la sélection de menu jeu de clés est programmée à la fois pour les communications de type conventionnel et les communications ADF, vous pouvez changer le jeu de clés de toute la radio, peu importe le canal actuellement syntonisé.

Le champ Fente B peut contenir jusqu'à 8 clés indexées, et les champs Fente A et Fente B réunis peuvent accueillir un maximum de 16 clés.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet et que le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel**.

Lorsque le modèle ou l'option de la radio le permet et que le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel**, et que le champ [Source de chargement de clés à la page 302](#) est réglé à **KVL**.

10.18.6.4

Fente A

L'application récupère et permet de voir en lecture seule le numéro de clé d'identification physique (PID) de matériel qui est associé à la clé courante (rangée ou enregistrement) de la liste des clés de chiffrement.

Le réglage du champ Indexé pour la rangée ou l'enregistrement courant (activé ou désactivé) a une incidence sur cette valeur. Lorsque le champ Indexé est activé, deux jeux de clés uniques peuvent être définis : un dans le champ Fente A, et l'autre dans le champ Fente B.

IMPORTANT :

Lorsque la sélection de menu Clé conventionnelle a été programmée et qu'une paire de clés indexées a été sélectionnée pour un canal, vous pouvez peut passer de la clé de chiffrement du jeu A à celle du jeu B (et vice-versa) sans changer le canal de la radio. Cette fonction s'applique uniquement aux canaux de type conventionnel.

Lorsque la sélection de menu Jeu de touches a été programmée pour les communications de type conventionnel ou les communications ADF, vous pouvez changer le jeu de clés pour toute la radio.

Lorsque la sélection de menu jeu de clés est programmée à la fois pour les communications de type conventionnel et les communications ADF, vous pouvez changer le jeu de clés de toute la radio, peu importe le canal actuellement syntonisé.

Le champ Fente B peut contenir jusqu'à 8 clés indexées, et les champs Fente A et Fente B réunis peuvent accueillir un maximum de 16 clés.

Accès seulement :

Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**, et lorsque le champ [Source de chargement de clés à la page 302](#) est réglé à **KVL** et lorsque le champ [Gestion de clés PID pour mode ASN à la page 315](#) est activé,

Et

Lorsque le nombre d'enregistrements dans la liste des clés de chiffrement est inférieur à 9, ou lorsque le numéro d'enregistrement de la clé dans le [Liste de références de clés de chiffrement de matériel sécurisées à la page 322](#) se situe entre 9 et 16, et

- Si l'un des huit premiers champs [Indexé à la page 318](#) est activé, alors la fente A de l'enregistrement 16 n'est pas valide, ou
- Si deux des huit premiers champs indexés sont activés, alors la fente A des enregistrements 15 et 16 n'est pas valide, ou
- Si trois des huit premiers champs indexés sont activés, alors la fente A des enregistrements 14, 15 et 16 n'est pas valide (cette règle s'applique aussi aux enregistrements restants

ou

lorsque le numéro d'enregistrement de la clé qui figure dans la liste de références de clés de chiffrement de matériel sécurisées est supérieur à 16, il est impossible d'accéder à la fente A de cet enregistrement),

et lorsque le modèle ou l'option de la radio le permet.

10.18.6.5

Fente B

L'application récupère et permet de voir en lecture seule le numéro de clé d'identification physique (PID) de matériel qui est associé à la clé courante (rangée ou enregistrement) de la liste des clés de chiffrement.

Le réglage du champ Indexé pour la rangée ou l'enregistrement courant (activé ou désactivé) a une incidence sur cette valeur. Lorsque le champ Indexé est activé, deux jeux de clés uniques peuvent être définis : un dans le champ Fente A, et l'autre dans le champ Fente B.

IMPORTANT :

Lorsque la sélection de menu Clé conventionnelle a été programmée et qu'une paire de clés indexées a été sélectionnée pour un canal, vous pouvez peut passer de la clé de chiffrement du jeu A à celle du jeu B (et vice-versa) sans changer le canal de la radio. Cette fonction s'applique uniquement aux canaux de type conventionnel.

Lorsque la sélection de menu Jeu de clés a été programmée pour les communications de type conventionnel ou les communications ADF, vous pouvez changer le jeu de clés pour toute la radio.

Lorsque la sélection de menu jeu de clés est programmée à la fois pour les communications de type conventionnel et les communications ADF, vous pouvez changer le jeu de clés de toute la radio, peu importe le canal actuellement syntonisé.

Le champ Fente B peut contenir jusqu'à 8 clés indexées, et les champs Fente A et Fente B réunis peuvent accueillir un maximum de 16 clés.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.18.6.6

Données de clé ADP sélectionnables

Ce champ vous permet de définir le schéma de clé ADP (confidentialité numérique avancée) de la clé courante (enregistrement/rangée) de la liste des clés de chiffrement.

Les schémas de clé constituent un élément essentiel de l'algorithme ADP sécurisé, car ils rendent possibles les communications vocales chiffrées.

AVERTISSEMENT :

Les clés ADP ne sont pas clonées sur la radio cible lorsque la codeplug est lue sur une radio. Lorsqu'une codeplug renfermant des clés ADP est lue sur une radio, les clés ADP ne sont pas chargées et les clés ADP figurent comme des astérisques (*). Dans ce cas, les données de clé ne seront pas clonées sur une radio cible. Si l'envoi des données de clé ADP vers la radio cible est souhaité, vous devez entrer de nouveau les clés ADP appropriées avant de lancer le processus Cloner la radio. Les données de clé ADP de la codeplug source remplaceront les données de clé ADP de la radio cible si ces dernières sont présentes.

Lorsqu'un fichier de codeplug contenant des clés ADP est ouvert, les clés ADP sont chargées et peuvent être clonées sur la radio cible. Les données de clé ADP de la codeplug source remplaceront les données de clé ADP de la radio cible si ces dernières sont présentes.

IMPORTANT :

Lorsque ce champ contient dix astérisques (« ***** »), aucun schéma n'a été défini.

Si aucun schéma de données de clé n'est nécessaire, il faut entrer dix astérisques (« ***** ») dans le champ.

Pour des raisons de sécurité, lorsqu'une codeplug de radio est lue, la valeur « ***** » est affichée dans le champ, peu importe le schéma de données de clé qui est enregistré dans la radio.

À chaque modification de l'ID de clé ADP sélectionnable, le schéma de données de clé de la rangée ou de l'enregistrement en question devient non valide et doit être redéfini.

Un maximum de 64 clés de chiffrement est permis.

Il n'existe aucun mécanisme qui permet d'effacer une clé ADP de la radio. Un champ affichant « ***** » indique simplement que la clé actuellement présente dans la radio ne sera pas écrasée.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel**, que le champ [Source de chargement de clés à la page 302](#) est réglé à **Liste de clés de chiffrement**, et que le modèle et les options de la radio le permettent.

Tableau 122 : Portée

Minimum	Maximum
000000000 hexadécimal	FFFFFFFFF hexadécimal

10.18.6.7

ID de clé ADP sélectionnable

Ce champ vous permet de définir le numéro d'ID qui représente la clé ADP (confidentialité numérique avancée) de la clé courante (enregistrement/rangée) de la liste des clés de chiffrement.

L'ID de clé est transmis en même temps que la communication vocale chiffrée. Les radios réceptrices qui récupèrent l'ID de clé peuvent charger le bon schéma de données de clé ADP sélectionnables et donc déchiffrer l'appel vocal entrant.

**IMPORTANT :**

Tous les ID de clé ADP sélectionnables doivent être uniques.

Un maximum de 64 clés de chiffrement est permis.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel**, que le champ [Source de chargement de clés à la page 302](#) est réglé à **Liste de clés de chiffrement**, et que le modèle et les options de la radio le permettent.

Tableau 123 : Portée

Minimum	Maximum
0000 hexadécimal	FFFF hexadécimal

10.18.6.8

Algorithme

Ce champ permet aux données de clé ADP de l'entrée sélectionnée d'être envoyées au module de sécurité du matériel (HSM) de la radio.

À l'heure actuelle, seules les clés ADP peuvent être programmées dans le module HSM par l'intermédiaire de RadioCentral. Toutes les autres clés doivent être envoyées à la radio à partir d'un chargeur de variable de clé (KVL) ou d'un dispositif de gestion des clés (KMF).

10.19

Ensemble Profil KMF sécurisé

Le jeu **Profil du dispositif de gestion des clés (KMF) sécurisées** vous permet d'afficher ou de définir les paramètres ASTRO OTAR (changement de clé par onde radio) relatifs aux profils KMF. Les profils KMF permettent de communiquer avec des systèmes KMF donnés. Un maximum de 5 profils

KMF sécurisés est permis. Ce nœud au complet et toutes ses fonctions sont accessibles uniquement si le champ Activer ASTRO OTAR Toute la sécurité est réglé à **Activé**.

**IMPORTANT :**

Les profils KMF visent à permettre à la radio de fonctionner avec différents systèmes KMF, voire avec d'autres systèmes. Cette fonctionnalité comporte toutefois la lacune suivante : le matériel de chiffrement sous-jacent ne peut gérer plusieurs versions de la même clé. Par exemple, la console KMF # 1 et la console KMF # 2 ne pourraient toutes deux avoir le même numéro CKR. Par exemple, la console KMF # 1 et la console KMF # 2 ne pourraient toutes deux avoir le même numéro CKR.

**REMARQUE :**

Une fois définis, les profils KMF peuvent être sélectionnés dans le champ Index de profil KMF de la fenêtre Système ADF, dans le champ Index de profil KMF de la fenêtre Personnalité de type conventionnel, et dans le champ Index de profil KMF de la fenêtre Liste de groupes de conversation du système ASTRO.

La fonction ASTRO OTAR est activée séparément pour chaque personnalité conventionnelle selon la valeur du champ Type voix/signal Rx. La configuration de la radio se poursuit avec le lancement des commandes OTAR en activant ASTRO OTAR ou les champs OTAR Tx pour cette personnalité.

ASTRO OTAR est activé en fonction du système ADF à partir du champ ASTRO OTAR et des champs Tx OTAR.

10.19.1**Liste de références de clés de chiffrement de matériel sécurisées**

La section **Références de clés de chiffrement de matériel sécurisées** du profil KMF sécurisé permet d'afficher ou de définir le jeu de CKR (références de clé communes) auxquels ce profil du dispositif de gestion des clés (KMF) sécurisées peut accéder.

La liste de références de clés de chiffrement de matériel sécurisées d'un profil KMF contient les clés de chiffrement à utiliser, et renvoie aux clés de matériel sous-jacentes de la liste des clés de chiffrement sécurisé. Chaque liste de références de clés de chiffrement associée à un profil KMF permet de communiquer avec un système KMF donné. Si un système KMF gère les mêmes références de clé commune qu'une radio, l'opérateur de ce système peut contrôler la fonction ASTRO OTAR (Over-The-Air-Rekeying) de cette radio. Les autres profils KMF peuvent communiquer avec d'autres systèmes KMF qui peuvent contrôler différentes références de clé commune pour la radio.

**IMPORTANT :**

Le nombre maximum de clés de chiffrement de matériel sécurisé correspond au nombre courant de clés de matériel sécurisées figurant dans la liste des clés de chiffrement sécurisé.

Une fois définis, les profils KMF peuvent être sélectionnés dans le champ Index de profil KMF de la fenêtre Système ADF, dans le champ Index de profil KMF de la fenêtre Personnalité conventionnelle, et dans le champ Index de profil KMF de la fenêtre Liste de groupes de conversation du système ASTRO.

Pour les canaux conventionnels dont le champ Voix\Connexion de clés est réglé à **Sélection**, vous pouvez sélectionner une nouvelle clé de chiffrement en utilisant la sélection de menu.

10.19.1.1**Numéro CKR**

L'application récupère et affiche les valeurs en lecture seule la référence de clé commune (CKR).

Chaque valeur CKR est fondée sur la valeur sélectionnée dans le champ [Référence de clé de chiffrement à la page 323](#) pour le même enregistrement/rangée dans la Liste de références de clé de chiffrement, qui s'applique au [profil ASTRO OTAR](#) courant.

REMARQUE :

La valeur CKR est définie dans le champ **CKR #** de la fenêtre [Liste des clés de chiffrement](#).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.19.1.2

Référence de clé de chiffrement

Ce champ permet de sélectionner une clé de matériel ou clé AES dans la liste des clés de chiffrement sécurisées.

Cette sélection s'applique à l'enregistrement/rangée de la liste de références de clés de chiffrement de matériel sécurisées courante, laquelle s'applique au [profil ASTRO OTAR](#) courant.

IMPORTANT :

Chaque sélection de clé de matériel et de clé AES doit être unique pour le profil OTAR sécurisé courant. Par conséquent, le nombre maximum de clés de chiffrement sécurisées (enregistrements/rangées) est égal au nombre courant de clés sécurisées disponibles dans la [liste des clés de chiffrement sécurisées](#).

Une fois définis, les profils ASTRO OTAR sont sélectionnés à partir du champ ADF - [Index de profil ASTRO OTAR à la page 616](#) et des champs [Index de profil ASTRO OTAR à la page 412](#) - Index de profil ASTRO OTAR conventionnel, Sélection de profil ASTRO OTAR - Profil de données et Liste de groupes ASTRO.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique** ou à **Logiciel**, et lorsque le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est réglé à **Activé**, et lorsque le champ [Opération de changement de clé par onde radio \(OTAR\)](#) est réglé à **ASTRO seulement** ou à **ASTRO et MDC**, et lorsque le modèle ou l'option de la radio le permet.

10.19.2

Information ASTRO OTAR

La section **Information ASTRO OTAR (changement de clé par onde radio)** de l'ensemble Profil KMF sécurisé vous permet d'afficher ou de définir des paramètres pour chaque Profil KMF sécurisé.

REMARQUE :

Une fois définis, les profils KMF peuvent être sélectionnés dans le champ Index de profil KMF de la fenêtre Système ADF, dans le champ Index de profil KMF de la fenêtre Personnalité conventionnelle, et dans le champ Index de profil KMF de la fenêtre Liste de groupes de conversation du système ASTRO.

La fonction ASTRO OTAR est activée séparément pour chaque personnalité conventionnelle selon la valeur du champ Type voix/signal Rx. La configuration de la radio se poursuit avec le lancement des commandes OTAR en activant ASTRO OTAR ou les champs OTAR Tx pour cette personnalité.

ASTRO OTAR est activé en fonction du système ADF à partir du champ ASTRO OTAR et des champs Tx OTAR.

10.19.2.1

Profil ASTRO OTAR

Ce champ vous permet de créer des noms reconnaissables pour le profil de changement de clé par onde radio (OTAR) ASTRO courant.

**REMARQUE :**

Une fois définis, les profils OTAR peuvent être sélectionnés dans les champs [Index de profil ASTRO OTAR à la page 412 ADF](#), [Index de profil ASTRO OTAR à la page 412 conventionnel](#) et [Index de profil ASTRO OTAR à la page 412](#) de la liste de groupes ASTRO.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

**REMARQUE :**

Exemples : Profil-05, Électrique1, N° 510

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Vous pouvez utiliser jusqu'à 14 caractères.

10.19.2.2

Effacer les jeux de clés précédents sur transfert OTAR

Ce champ permet de supprimer TOUTES les clés de chiffrement du jeu de clés précédemment actif après un changement de jeu de clés ASTRO OTAR (changement de clé par onde radio).

Cette fonction s'applique au fonctionnement ASTRO OTAR pour le [profil ASTRO OTAR](#) actuel.

**REMARQUE :**

Vous pouvez lancer un changement de jeu de clés OTAR à partir de la fonction de gestion de clés (KMF) ou de la sélection de menu de nouvelle attribution de clé programmable.

**IMPORTANT :**

Lorsque les champs « Effacer les jeux de clés précédents sur transfert OTAR » et Effacer la modification précédente de l'utilisateur sont activés, vous pouvez supprimer les deux jeux de clés; il se retrouve ainsi temporairement sans clé de chiffrement sécurisé.

Exemple : La radio utilise le jeu de clés 1 au moment où un changement de jeu de clés OTAR se produit. Ce changement fait passer la radio au jeu de clés 2 et supprime le jeu de clés 1. Par la suite, si vous réactivez manuellement le jeu de clés 1 supprimé et que la fonction Effacer la modification précédente de l'utilisateur supprime le jeu de clés 2, la radio se retrouve sans clé jusqu'à ce que vous chargiez manuellement de nouvelles clés ou que vous demandiez une nouvelle attribution de clés OTAR manuelle.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique**, et lorsque le champ [Opération de changement de clé par onde radio \(OTAR\)](#) est réglé à **ASTRO seulement** ou sur **ASTRO et MDC**, et lorsque le modèle ou l'option de la radio le permet.

10.19.2.3

Nombre de tentatives

Ce champ permet de définir le nombre de tentatives de la radio d'obtenir une confirmation d'inscription de la part du dispositif de gestion des clés (KMF).

Cette fonction s'applique au fonctionnement ASTRO OTAR pour le [profil ASTRO OTAR](#) actuel.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique** ou à **Logiciel**, et lorsque le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est réglé à **Activé**, et lorsque le champ [Opération de changement de clé par onde radio \(OTAR\)](#) est réglé à **ASTRO seulement** ou à **ASTRO**, et lorsque le champ [Type de réponse à la page 327](#) est réglé à **Confirmé**, et lorsque le modèle ou l'option de la radio le permet.

Tableau 124 : Portée

Minimum	Maximum
1	10

10.19.2.4

Minuterie d'inactivité OTAR

Ce champ permet de sélectionner la période de communication du dispositif de gestion des clés (KMF) avec la radio.

Après cette période, si la radio n'obtient aucune information de la part du système KMF, elle tentera de nouveau d'établir la communication.

Cette fonction s'applique au fonctionnement ASTRO OTAR pour le [profil ASTRO OTAR](#) actuel.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique** ou à **Logiciel**, et lorsque le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est réglé à **Activé**, et lorsque le champ [Opération de changement de clé par onde radio \(OTAR\)](#) est réglé à **ASTRO seulement** ou à **ASTRO et MDC**, et lorsque le modèle ou l'option de la radio le permet.

Tableau 125 : Portée

Minimum (heures)	Maximum (heures)
1	10

10.19.2.5

Niveau de sécurité Rx OTAR

Ce champ permet de sélectionner les niveaux de sécurité pour la réception des messages de gestion de clés (KMM).

Cette fonction s'applique au fonctionnement ASTRO OTAR pour le [profil ASTRO OTAR](#) actuel.

**REMARQUE :**

Les messages KMM relatifs aux demandes de nouvelles attributions de clés, aux enregistrements et aux décryptages impossibles sont toujours **chiffrés et authentifiés**.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique** ou à **Logiciel**, et lorsque le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est réglé à **Activé**, et lorsque le champ [Opération de changement de clé par onde radio \(OTAR\)](#) est réglé à **ASTRO seulement** ou à **ASTRO et MDC**, et lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

De base

La radio reçoit tout message KMM dont le format est permis par la norme Project 25.

Amélioré

Cette sélection n'est pas valide lorsque [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel**.

La radio recevra uniquement les KMM suivants :

- **Chiffré et authentifié**
- **Chiffré uniquement**
- **Authentifié uniquement**

10.19.2.6

Niveau de sécurité Tx OTAR

Ce champ permet de sélectionner les niveaux de sécurité pour la réception des messages de gestion de clés (KMM).

Cette fonction s'applique au fonctionnement ASTRO OTAR pour le [profil ASTRO OTAR](#) actuel.

REMARQUE :

Les messages KMM relatifs aux demandes de nouvelles attributions de clés, aux enregistrements et aux décryptages impossibles sont toujours **chiffrés et authentifiés**.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique** ou à **Logiciel**, et lorsque le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est réglé à **Activé**, et lorsque le champ [Opération de changement de clé par onde radio \(OTAR\)](#) est réglé à **ASTRO seulement** ou à **ASTRO et MDC**, et lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

De base

La radio reçoit tout message KMM dont le format est permis par la norme Project 25.

Amélioré

Cette sélection n'est pas valide lorsque [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel**.

La radio recevra uniquement les KMM suivants :

- Chiffrés et authentifiés
- Chiffrés seulement
- Authentifiés seulement

10.19.2.7

Demande de nouvelle attribution de clé Tonalité d'alerte d'état

Ce champ permet à la radio de générer une tonalité de succès ou d'échec une fois que le traitement d'une demande de nouvelle attribution de clé est terminé.

Cette fonction a une incidence uniquement sur le déclenchement de cette tonalité d'alerte lorsque l'utilisateur quitte la section « Demande de nouvelle attribution de touche » du menu de la radio avant la fin du traitement de la demande. Si l'utilisateur ne quitte pas cette section du menu avant la fin du traitement, la tonalité d'alerte d'état retentit, peu importe la valeur du champ. Cette fonction s'applique au fonctionnement ASTRO OTAR pour le [profil ASTRO OTAR](#) actuel.

REMARQUE :

Une alarme visuelle indique également l'état du traitement de la demande à l'écran de la radio.

Le répartiteur exécute une attribution de nouvelle clé de chiffrement OTAR à partir du dispositif de gestion des clés (KMF) après avoir reçu une demande à cet égard de votre part.

Vous pouvez effectuer une demande de nouvelle attribution de clé en utilisant la touche [Demande de nouvelle attribution de clé à la page 223](#) ou la sélection de menu [Demande de nouvelle attribution de clé à la page 223](#).

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique**, et lorsque le champ [Opération de changement de clé par onde radio \(OTAR\)](#) est réglé à **ASTRO seulement** ou sur **ASTRO et MDC**, et lorsque le modèle ou l'option de la radio le permet.

10.19.2.8

Type de réponse

Ce champ permet de sélectionner le type de réponse retourné à la radio lorsque cette dernière communique avec le dispositif de gestion des clés (KMF).

Cette fonction s'applique au fonctionnement ASTRO OTAR pour le [profil ASTRO OTAR](#) actuel.

Les sélections suivantes sont prises en charge :

Non confirmé

Le système de gestion de clés ne retourne pas d'accusé de réception à la radio lorsqu'il reçoit une transmission ASTRO OTAR.

Confirmé

Le système de gestion de clés doit retourner un accusé de réception à la radio lorsqu'il reçoit une transmission ASTRO OTAR.

Lorsque le champ [Transport OTAR à la page 329](#) est réglé à **Large bande seulement** ou à **Large bande privilégiée** et que la radio effectue le changement de clé par onde radio (OTAR) en utilisant la large bande, la radio utilise **Confirmé** comme type de réponse.

Lorsque la radio effectue l'OTAR par radio mobile terrestre (LMR), la radio utilise la valeur de ce champ comme type de réponse.

Accès seulement : Lorsque les conditions suivantes sont réunies :

- Le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**.
- Le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est réglé à **Activé**.
- Le champ [Opération de changement de clé par onde radio \(OTAR\)](#) est réglé à **ASTRO seulement** ou à **ASTRO et MDC**.
- Lorsque le modèle ou l'option de la radio le permet.

10.19.2.9

Intervalle entre les tentatives

Ce champ permet de déterminer la période après laquelle la radio tentera de nouveau de transmettre le dernier message.

Cette fonction s'applique au fonctionnement ASTRO OTAR pour le [profil ASTRO OTAR](#) actuel.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique** ou à **Logiciel**, et lorsque le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est réglé à **Activé**, et lorsque le champ [Opération de changement de clé par onde radio \(OTAR\)](#) est réglé à **ASTRO seulement** ou à **ASTRO et MDC**, et lorsque le champ [Type de réponse à la page 327](#) est réglé à **Confirmé**, et lorsque le modèle ou l'option de la radio le permet.

Tableau 126 : Portée

Minimum	Maximum	Incréments
5 secondes	90 seconde	5 secondes

10.19.2.10

Demande de nouvelle attribution de clé sélectionnable par l'utilisateur

Ce champ permet à la radio de transmettre les demandes de changement de clé par nouvelle attribution de clé ASTRO (OTAR).

La demande est transmise au dispositif de gestion des clés (KMF) du répartiteur. Cette fonction s'applique au fonctionnement ASTRO OTAR pour le [profil ASTRO OTAR](#) actuel.

REMARQUE :

Vous pouvez effectuer une demande de nouvelle attribution de clé en utilisant la touche [Demande de nouvelle attribution de clé à la page 191](#) ou la sélection de menu [Demande de nouvelle attribution de clé à la page 223](#).

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique** ou à **Logiciel**, et lorsque le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est réglé à **Activé**, et lorsque le champ [Opération de changement de clé par onde radio \(OTAR\)](#) est réglé à **ASTRO seulement** ou à **ASTRO et MDC**, et lorsque le modèle ou l'option de la radio le permet.

10.19.3

Transport de données

La section **Transport de données** de l'ensemble Profil KMF sécurisé vous permet d'afficher ou de définir les réglages qui serviront à la transmission et à la réception des messages de gestion de clés (KMM) au système de gestion de clés (KMF) et à la réception de ceux qui en proviennent.

IMPORTANT :

Ces réglages de Données de transport s'appliquent seulement au système ASTRO OTAR (Over-The-Air-Rekeying) ADF, qui est une application de données basée sur IP dans la radio. Le système ASTRO OTAR conventionnel communique avec l'abonné à l'aide de l'interface hertzienne commune P25 (protocole CAI) et n'est pas basé sur IP. Les fichiers dans cette section s'appliquent pour chaque Profil KMF sécurisé.

Une fois définis, les profils KMF peuvent être sélectionnés dans le champ Index de profil KMF de la fenêtre Système ADF, dans le champ Index de profil KMF de la fenêtre Personnalité conventionnelle, et dans le champ Index de profil KMF de la fenêtre Liste de groupes de conversation du système ASTRO.

10.19.3.1

Adresse IP KMF

Ce champ permet de sélectionner l'adresse Internet Protocol (IP) du dispositif de gestion des clés (KMF).

Cette sélection s'applique à la) fonctionnalité de changement de clé par onde radio (OTAR) ASTRO et pour le [profil ASTRO OTAR](#) courant.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique** ou à **Logiciel**, et lorsque le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est réglé à **Activé**, et lorsque le champ [Opération de changement de clé par onde radio \(OTAR\)](#) est réglé à **ASTRO seulement** ou à **ASTRO et MDC**, et lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

- Adresses IP valides dont les valeurs pour chaque octet se situent entre : [0-223] . [0-255] . [0-255] . [0-255]

10.19.3.2

Port UDP KMF

Ce champ permet de sélectionner le numéro de port UDP (User Datagram Protocol).

Lorsqu'elle communique avec le système de gestion de clés (KMF), la radio transmet des messages de gestion de clés (KMM) à ce port. Cette sélection s'applique à la fonctionnalité ASTRO OTAR (changement de clé par onde radio) pour le [profil ASTRO OTAR](#) courant.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique** ou à **Logiciel**, et lorsque le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est réglé à **Activé**, et lorsque le champ [Opération de changement de clé par onde radio \(OTAR\)](#) est réglé à **ASTRO seulement** ou à **ASTRO et MDC**, et lorsque le modèle ou l'option de la radio le permet.

Tableau 127 : Portée

Minimum	Maximum
0	65535

10.19.3.3

Port OTAR de l'abonné

Ce champ permet de sélectionner le numéro du port de changement de clé par onde radio (OTAR) à utiliser pour l'appareil d'un abonné mobile (MSU).

La radio reçoit les KMM (messages de gestion de clés) sur ce port lors de la communication avec le KMF (système de gestion de clés). Cette sélection s'applique à la fonctionnalité ASTRO OTAR et au [profil ASTRO OTAR](#) courant.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique** ou à **Logiciel**, et lorsque le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est réglé à **Activé**, et lorsque le champ [Opération de changement de clé par onde radio \(OTAR\)](#) est réglé à **ASTRO seulement** ou à **ASTRO et MDC**, et lorsque le modèle ou l'option de la radio le permet.

Tableau 128 : Portée

Minimum	Maximum
0	65535

10.19.3.4

Transport OTAR

Ce champ permet de sélectionner le type de transport pour le changement de clé par onde radio (OTAR).

Les options suivantes sont disponibles :

LMR seulement

L'OTAR est effectué par radio mobile terrestre (LMR) seulement.

Large bande uniquement

L'OTAR est effectué par LTE (Long Term Evolution) cellulaire ou Wi-Fi.

Accès seulement : Lorsque les conditions suivantes sont réunies :

- Le modèle de radio prend en charge l'OTAR, comme le modèle Radio Next.
- Le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**.
- Le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est réglé à **Activé**.
- Le champ [Activer OTAR à la page 303](#) est réglé à **Activé**.
- Le champ [Activer ASTRO OTAR à la page 304](#) est réglé à **Activé**.

10.19.3.5

ID large bande KMF

Ce champ permet de saisir un identifiant unique global du Centre de gestion des clés (KMF). La radio communique avec le KMF pour le changement de clé par onde radio (OTAR) en utilisant la large bande.

Accès seulement : Lorsque les conditions suivantes sont réunies :

- Le modèle de radio prend en charge l'OTAR, comme le modèle Radio Next.
- Le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**.
- Le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est réglé à **Activé**.
- Le champ [Activer OTAR à la page 303](#) est réglé à **Activé**.
- Le champ [Activer ASTRO OTAR à la page 304](#) est réglé à **Activé**.
- Le champ [Transport OTAR à la page 329](#) n'est pas réglé à **LMR seulement**.

10.20

Certificat CA

Cette section vous permet de charger les fichiers de certificat CA dans la codeplug courante.

Le nombre maximal de fichiers de certificat CA qui peuvent être ajoutés dans une codeplug est 20. Les fichiers de certificat CA dans la codeplug de la radio sont utilisés par la radio pour authentifier le serveur de passerelle SmartConnect pendant une session TLS.

10.20.1

le nom du certificat.

Ce champ vous permet de définir des noms reconnaissables pour le fichier de certificat CA.

Les sélections suivantes sont prises en charge :

REMARQUE :

Exemples : EMT-001, no 500, Électrique1, # A5.

Vous pouvez utiliser un maximum de 50 caractères ASCII, chiffres, espaces et caractères spéciaux.

10.20.2

Nom de fichier du certificat

Ce champ vous permet d'afficher ou de renommer le fichier de certificat CA.

Les sélections suivantes sont prises en charge :

REMARQUE :

Exemples : EMT-001, no 500, Électrique1, # A5.

Vous pouvez utiliser un maximum de 255 lettres, chiffres, espaces et caractères spéciaux.

10.21

Toutes les urgences

Cette section vous permet d'afficher ou de définir la fonctionnalité du mode d'urgence qui s'applique pour les profils d'urgence conventionnels et les profils d'urgence ADF.

Ces profils d'urgence peuvent ensuite être utilisés pour les communications conventionnelles et les communications ADF.

REMARQUE :

Les profils d'urgence conventionnels doivent être sélectionnés dans le champ Sélection du profil d'urgence du système conventionnel.

Les profils d'urgence ADF doivent être sélectionnés aux fins d'utilisation dans le Sélection du profil d'urgence de la personnalité ADF.

La fonctionnalité du mode d'urgence est lancée avec une radio programmée ou par vous, en activant la fonction.

10.21.1

Général

Cette section vous permet d'afficher ou de définir la fonctionnalité du mode d'urgence qui s'applique pour les profils d'urgence conventionnels et les profils d'urgence ADF.

Ces profils d'urgence peuvent ensuite être utilisés pour les communications conventionnelles et les communications ADF.

REMARQUE :

Les profils d'urgence conventionnels doivent être sélectionnés aux fins d'utilisation dans le champ Sélection du profil d'urgence du système conventionnel.

Les profils d'urgence ADF doivent être sélectionnés aux fins d'utilisation dans le Sélection du profil d'urgence de la personnalité ADF.

La fonctionnalité du mode d'urgence est lancée avec une radio programmée ou par vous, en activant la fonction.

10.21.1.1

Type d'indicateur de réception d'alarme d'urgence

Ce champ permet de sélectionner le type d'indicateur que vous entendez ou voyez lorsque la radio reçoit un signal d'alarme d'urgence provenant d'une autre radio.

Cette fonction doit aussi être activée (s'il y a lieu) dans le champ Indicateur Rx d'alarme d'urgence du système MDC ou du système ASTRO, ou dans le champ Indicateur Rx d'alarme d'urgence du système ADF. Cette sélection s'applique lorsque la radio est en mode d'urgence pour les communications conventionnelles et ADF.

IMPORTANT :

La durée de l'indicateur de réception d'alarme d'urgence est de 10 secondes. Pendant ces 10 secondes, vous pouvez désactiver l'indicateur en appuyant sur n'importe quelle touche de la radio, sauf celles du **Volume** et **Lumière**.

Une fois que l'indicateur s'éteint ou est désactivé, les alarmes d'urgence retransmises par le même ID principal de MDC, ou le même ID individuel du système ASTRO, ou le même ID d'unité du système ADF ne sont pas acceptées au cours des 20 secondes suivantes.

Les alarmes d'urgence ne sont pas détectées lorsque la radio est en mode balayage.

Les alarmes d'urgence ne sont pas détectées lorsque la radio est active sur un canal vocal.

Les sélections suivantes sont prises en charge :

Aucune indication

Aucune alerte visuelle ou sonore.

Alerte seulement

Une alerte sonore est émise.

Affichage seulement

Une alarme visuelle s'affiche. L'option d'alerte visuelle est disponible seulement dans les modèles de radios avec écran.

Alerte et affichage

Les alarmes d'urgence ne sont pas détectées lorsque la radio est active sur un canal vocal.

**REMARQUE :**

Pour les options **Affichage seulement** et **Alerte et affichage**, voici ce qui se produit :

- Lorsque la radio détecte une Alarme d'urgence, **EA-RCVD** (alarme d'urgence reçue) apparaît à l'écran de la radio.
- Lorsque la radio détecte un signal de balise d'urgence, le message **BCON RX** (réception de balise Toutes les alarmes) s'affiche.

Le message **EA-RCVD** s'affiche pendant dix secondes pour l'un ou l'autre des ID suivants de la radio qui émet l'alarme d'urgence : ID principal de MDC, ID individuel du système ASTRO ou ID d'unité du système ADF. On peut aussi utiliser la fonction d'identification de l'appelant (l'inverse de l'attribution d'un pseudonyme).

10.21.1.2

Garder actif

Ce champ permet à la radio de demeurer sous tension pendant la transmission d'une communication en mode d'urgence, peu importe la position de l'interrupteur d'alimentation.

Si l'interrupteur d'alimentation de la radio est placé à **ARRÊT**, la radio s'éteint lorsque l'utilisateur quitte le mode d'urgence en appuyant longuement sur le bouton d'urgence. Cette sélection s'applique lorsque la radio est en mode d'urgence pour les communications conventionnelles et ADF.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.21.1.3

Désactiver les indications d'appel d'urgence

Ce champ permet d'activer toutes les indications (affichage, DEL alertes et tonalités) normalement associées à un appel d'urgence (voir Type d'urgence) devant être désactivées lors de l'utilisation en mode Alarme silencieuse.

Seules les indications sonores et visuelles qui se produisent lors d'un appel de groupe/conventionnel standard; par conséquent, durant l'appel d'urgence, l'appel est identique à un simple appel de répartition en cours. Cette sélection s'applique lorsque la radio est en mode d'urgence pour les communications conventionnelles et ADF.

**AVERTISSEMENT :**

Le mode Appel d'urgence silencieux continue jusqu'à ce que vous mainteniez la touche Urgence enfoncée pour la Durée longue pression de touche pour urgence afin de quitter le mode d'urgence.

**IMPORTANT :**

Si le réglage est Activé, celui de la fonction étendue Désactiver les indications d'appel d'urgence est **Utilisé dans la codeplug = oui**.

Accès seulement : Lorsque la fonction étendue **Désactiver les indications d'appel d'urgence** apparaît dans le champ Nom de fonction étendue, et lorsque le champ Alarme silencieuse est activé (si désactivée, cette sélection doit l'être également; autrement, ce champ devient non valide).

10.21.1.4

Option de désactivation de sourdine

Ce champ permet à la radio de désactiver la sourdine en mode Alarme silencieuse.

L'option de désactivation de la sourdine permet au répartiteur de communiquer par mots codés avec vous à la suite du déclenchement de votre état d'urgence afin d'éviter d'attirer l'attention.

Cette sélection s'applique lorsque la radio est en mode d'urgence pour les communications conventionnelles et ADF.

AVERTISSEMENT :

Lorsque le champ [Désactiver les indications d'appel d'urgence à la page 332](#) est activé, le champ Option de désactivation de sourdine doit être activé; autrement, l'application considère la valeur comme non valide.

Accès seulement : Lorsque le champ Alarme silencieuse est activé.

10.21.1.5

Retard de canal

Ce champ permet de déterminer le temps d'attente de la radio avant la transmission des données d'urgence lorsque vous changez de canal.

Ce délai empêche la radio de transmettre, par inadvertance, des données d'urgence sur certains canaux lorsqu'elle est en mode d'urgence et que vous changez de canal. Cette sélection s'applique lorsque la radio est en mode d'urgence pour la transmission de communications de types conventionnel et ADF. La durée est exprimée en secondes.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 129 : Portée

Minimum	Maximum	Incrément
0 s	7 s	1 s

10.21.1.6

Distinguer le type d'urgence

Ce champ permet à la radio d'envoyer différents messages de demande de position/protocole de réponse (LRRP) d'avertissement de situation de détresse, de détection d'impact et d'autres situations d'urgence.

Cette fonction vous permet de distinguer les fausses alarmes des situations d'urgence réelles.

Les événements d'état de la radio incluent l'affichage texte de l'état et une tonalité d'urgence distincte est émise par le haut-parleur sélectionné pendant toute la durée de l'alarme.

Accès seulement : Lorsque le type d'indicateur de réception d'alarme d'urgence est réglé à Affichage seulement ou à Alerte et affichage.

10.21.2

Avertissement de situation de détresse

Cette section vous permet d'afficher ou de définir le fonctionnement du mode d'urgence Avertissement en situation de détresse.

La fonction Avertissement en situation de détresse transmet une urgence lorsqu'une radio portable et son opérateur sont considérés comme étant en position horizontale ou en position horizontale et immobiles.

Par conséquent, le mode d'urgence Avertissement en situation de détresse avertit les répartiteurs et les autres radios qu'une situation d'avertissement en situation de détresse vient de se produire.

IMPORTANT :

La fonction Avertissement de situation de détresse peut être configurée pour fonctionner sur toutes les radios ou selon le profil d'urgence qui comprend des tonalités d'alerte programmables. Voir le champ Niveau de la capacité de configuration d'appel de détresse et la page Tonalités d'urgence programmables.

REMARQUE :

Le champ Déclencheur d'avertissement en situation de détresse active la fonction et détermine si un seuil de sensibilité au mouvement est nécessaire pour valider l'état d'avertissement en situation de détresse. Le Niveau de la capacité de configuration d'appel de détresse, la minuterie de préalerte, la tonalité de préalerte et la minuterie de postalerte doivent également être définis.

Sur le terrain : Vous êtes prévenu de façon audible et visuelle que les conditions d'Avertissement en situation de détresse programmées dans la radio sont présentes durant la période de la minuterie préalerte. Une fois la période de la minuterie préalerte écoulée, la minuterie postalerte commence. Une fois la période de la minuterie postalerte écoulée, la radio commence à transmettre en mode d'urgence.

- À tout moment durant la période où les conditions d'Avertissement en situation de détresse sont présentes, si ces conditions sont interrompues en raison d'un repositionnement de la radio ou parce que l'utilisateur de la radio a appuyé sur le bouton Avt détr désac, alors l'état d'Avertissement en situation de détresse, les minuteries et les alertes sont réinitialisés et aucune transmission d'urgence n'est envoyée.
- Si l'urgence a déjà été transmise mais n'a pas encore été reçue et que les conditions d'Avertissement en situation de détresse sont interrompues en raison d'un repositionnement de la radio ou parce que l'utilisateur de la radio a appuyé sur le bouton Avt détr désac, alors la transmission de l'urgence est annulée.

Les angles de fonctionnement qui définissent la position verticale par rapport à la position horizontale d'une radio sont programmés en usine.

Le seuil de sensibilité au mouvement est programmé en usine.

REMARQUE :

Les profils d'urgence conventionnels doivent être sélectionnés aux fins d'utilisation dans le champ Sélection du profil d'urgence du système conventionnel.

Les profils d'urgence ADF doivent être sélectionnés aux fins d'utilisation dans le Sélection du profil d'urgence de la personnalité ADF.

La fonctionnalité du mode d'urgence est lancée avec une radio programmée ou par vous, en activant la fonction.

10.21.2.1

Déclencheur d'avertissement de situation de détresse

Ce champ permet de sélectionner le type de conditions de situation de détresse qui active la fonction du mode d'urgence Avertissement en situation de détresse.

Cette sélection s'applique aux communications conventionnelles et ADF.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Désactivé;

Désactive la fonction Avertissement de situation de détresse.

À l'horizontale seulement

Une urgence est transmise si la radio est inclinée en position horizontale.

À l'horizontale et immobile

Une urgence est transmise si la radio est inclinée en position horizontale et que le mouvement mesuré de la radio n'atteint pas le seuil de sensibilité au mouvement programmé en usine. Tout mouvement de la radio qui n'atteint pas le seuil de mouvement est considéré comme s'il n'y avait eu aucun mouvement de celle-ci.

**REMARQUE :**

Le seuil de sensibilité au mouvement est programmé en usine.

**REMARQUE :**

Les angles de fonctionnement qui définissent la position verticale par rapport à la position horizontale d'une radio sont programmés en usine.

10.21.2.2

Minuterie préalerte

Ce champ permet de déterminer l'intervalle de temps durant lequel un état d'avertissement en situation d'urgence doit être présent avant que vous soyez avisé par la tonalité préalerte sélectionnée.

Cette tonalité d'alerte est également accompagnée visuellement d'un `avertissement de situation de détresse` affiché à l'écran de la radio. Ces alertes visent à vous prévenir qu'un mode d'urgence est sur le point d'être activé, ce qui vous permet de placer la radio dans une position plus proche de la verticale et ainsi d'éviter la transmission d'une fausse urgence.

Cette sélection s'applique aux communications conventionnelles et ADF.

**IMPORTANT :**

Sur le terrain : Si l'état Avertissement en situation de détresse est interrompu en raison d'un repositionnement de la radio ou parce que vous avez appuyé sur le bouton Avt détr désac, alors l'état d'Avertissement en situation de détresse, les minuteriers et les alertes sont réinitialisés et la transmission du mode d'urgence est annulée.

Accès seulement : lorsque le modèle ou l'option de la radio le permet et que le champ `Déclencheur d'avertissement de situation de détresse à la page 334` n'est pas réglé à **Désactivé**.

Tableau 130 : Portée

Minimum	Maximum	Incrément
5 secondes	120 secondes	1 seconde

10.21.2.3

Minuterie post-alerte

Ce champ permet de déterminer l'intervalle de temps, après la fin de la minuterie préalerte, durant lequel une radio doit demeurer dans un état d'avertissement en situation de détresse avant que la transmission du mode d'urgence ne commence.

Cette sélection s'applique lors de l'utilisation de la radio en mode de communication conventionnel ou ADF. La durée est exprimée en secondes.

**IMPORTANT :**

Sur le terrain : Si l'état Avertissement en situation de détresse est interrompu en raison d'un repositionnement de la radio ou parce que vous avez appuyé sur le bouton Avt détr désac, alors l'état d'Avertissement en situation de détresse, les minuteriers et les alertes sont réinitialisés et la transmission du mode d'urgence est annulée.

Accès seulement : lorsque le modèle ou l'option de la radio le permet et que le champ [Déclencheur d'avertissement de situation de détresse à la page 334](#) n'est pas réglé à **Désactivé**.

Tableau 131 : Portée

Minimum	Maximum	Incrément
1 seconde	120 secondes	1 seconde

10.21.2.4

Tonalité préalerte

Ce champ permet de sélectionner le type de tonalité d'alerte émise lorsque le temps de la minuterie préalerte est écoulé.

La minuterie de préalerte débute lorsque la condition de situation de détresse programmée est remplie (voir [Déclencheur d'avertissement de situation de détresse à la page 334](#)). Une fois la période de la minuterie écoulée, cette tonalité d'alerte sélectionnée est émise. Cette tonalité d'alerte est également accompagnée visuellement d'un texte `avertissement de situation de détresse` affiché à l'écran de la radio.

Ces alertes sonores et visuelles visent à vous prévenir qu'un mode d'urgence est sur le point d'être activé, ce qui vous permet de placer la radio dans une position plus proche de la verticale et ainsi d'éviter la transmission d'une fausse urgence. Cette sélection s'applique aux communications conventionnelles et ADF.

IMPORTANT :

Afin de s'assurer que vous entendiez cette tonalité même lorsque le volume de la radio est bas, il est recommandé d'augmenter la valeur du paramètre Volume minimal ou celle du paramètre Compensation du volume (dB).

Accès seulement : lorsque le modèle ou l'option de la radio le permet et que le champ [Déclencheur d'avertissement de situation de détresse à la page 334](#) n'est pas réglé à **Désactivé**.

Les sélections suivantes sont prises en charge :

Tonalité d'avertissement unique

Une tonalité est émise lorsque le [Minuterie préalerte à la page 335](#) est écoulé.

Tonalité d'avertissement continue

Une tonalité continue est émise lorsque le [Minuterie préalerte à la page 335](#) durant la durée de la [Minuterie post-alerte à la page 335](#). Par conséquent, cette tonalité d'alerte prend fin lorsque la transmission du mode d'urgence commence.

10.21.2.5

Niveau de la capacité de configuration d'appel de détresse

Ce champ permet de définir si le mode d'urgence Avertissement de situation de détresse s'applique à toute la radio ou par profil d'urgence.

Cette sélection s'applique aux communications conventionnelles et ADF.

Accès seulement : lorsque le modèle ou l'option de la radio le permet et que le champ [Déclencheur d'avertissement de situation de détresse à la page 334](#) n'est pas réglé à **Désactivé**.

Les sélections suivantes sont prises en charge :

Toute la radio

La fonction Avertissement de situation de détresse s'applique à toute la radio.

Par profil d'urgence

Permet d'activer la fonction Avertissement en situation de détresse par profil d'urgence de type conventionnel ou par profil d'urgence ADF en sélectionnant le champ Avertissement de situation de

détresse activé correspondant. Voir aussi [Déclencheur d'avertissement en situation de détresse à la page 337](#).

10.21.3

Tonalités d'urgence programmables

Cette section permet d'afficher ou de définir la fonction de mode d'urgence Avertissement de situation de détresse associé aux listes de tonalités d'urgence du profil d'urgence.

REMARQUE :

Les profils d'urgence conventionnels doivent être sélectionnés aux fins d'utilisation dans le champ Sélection du profil d'urgence du système conventionnel.

Les profils d'urgence ADF doivent être sélectionnés aux fins d'utilisation dans le Sélection du profil d'urgence de la personnalité ADF.

La fonctionnalité du mode d'urgence est lancée avec une radio programmée ou par vous, en activant la fonction.

10.21.3.1

Déclencheur d'avertissement en situation de détresse

Ce champ permet d'utiliser une liste de tonalités d'urgence personnalisable par profil d'urgence, lorsque le mode d'urgence a été déclenché par une situation de détresse.

Cette sélection s'applique lorsque la radio est en mode d'urgence pour les communications conventionnelles et ADF.

Accès seulement : Lorsque le champ [Déclencheur d'avertissement de situation de détresse à la page 334](#) est réglé à **Désactivé**, et lorsque le champ [Niveau de la capacité de configuration d'appel de détresse à la page 336](#) est réglé à **Par profil d'urgence**, et lorsque le modèle ou l'option de la radio le permet.

10.22

Profils d'urgence conventionnels

La fenêtre **Profils d'urgence conventionnels** permet d'afficher ou de modifier la fonctionnalité du mode d'urgence conventionnel.

De nombreux paramètres peuvent être définis pour les transmissions d'urgence. Il est également possible de créer divers profils d'urgence.

REMARQUE :

Les fonctions et les réglages de la fenêtre [Toutes les urgences à la page 330](#) s'appliquent à ces profils.

Les profils d'urgence conventionnels sont sélectionnés dans le champ Sélection du profil d'urgence du système conventionnel.

Les systèmes conventionnels sont rattachés aux personnalités conventionnelles dans les champs du système ASTRO ou du système non ASTRO; seuls les systèmes ASTRO et MDC peuvent effectuer des transmissions en mode d'urgence.

La fonctionnalité du mode d'urgence est lancée avec une radio programmée ou par activation de la fonction.

10.22.1

Général

Cette section vous permet d'afficher ou de modifier les fonctions relatives aux communications d'urgence conventionnelles pour des profils d'urgence conventionnels de systèmes.

**REMARQUE :**

Les fonctions et les réglages de la fenêtre [Toutes les urgences à la page 330](#) s'appliquent à ces profils.

Les profils d'urgence conventionnels sont sélectionnés dans le champ Sélection du profil d'urgence du système conventionnel.

Les systèmes conventionnels sont rattachés aux personnalités conventionnelles dans les champs du système ASTRO ou du système non ASTRO; seuls les systèmes ASTRO et MDC peuvent effectuer des transmissions en mode d'urgence.

La fonctionnalité du mode d'urgence est lancée avec une radio programmée ou par vous, en activant la fonction.

10.22.1.1

Nom de profil d'urgence

Ce champ vous permet de créer des noms reconnaissables pour les profils d'urgence conventionnels courants.

Les profils d'urgence conventionnels doivent être sélectionnés dans le champ Sélection du profil d'urgence du système conventionnel.

**REMARQUE :**

Exemples : EMT-001, no 500, Électrique1, # A5.

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Vous pouvez utiliser jusqu'à 14 caractères.

10.22.1.2

Type d'urgence

Ce champ permet de sélectionner la fonctionnalité radio à utiliser lorsque vous activez le mode d'urgence.

Cette sélection s'applique aux [Profils d'urgence conventionnels à la page 337](#) courants.

**IMPORTANT :**

Les deux fonctions prennent en charge le canal d'annulation d'urgence, c'est-à-dire la transmission des appels d'urgence sur un canal prédéterminé.

Une fois que la radio a entamé la transmission d'un appel d'urgence, vous devez appuyer longuement sur la touche d'urgence (voir la valeur du champ Durée longue pression de touche pour urgence ou mettre la radio hors tension pour annuler cette fonction.

Les sélections suivantes sont prises en charge :

Alarme seulement

Une fois que l'utilisateur radio a appuyé sur le bouton d'urgence, la radio transmet de façon répétitive à la station de base un paquet de données d'alarme qui déclenche une communication d'urgence, jusqu'à ce que celle-ci soit annulée dans l'un ou l'autre des cas suivants :

- Les [Nouvelles tentatives polies à la page 340](#) et [Nouvelles tentatives impolies à la page 340](#) programmées sont épuisées.
- Un accusé de réception confirmant la transmission du paquet de données d'urgence a été reçu de la station de base.

- Appui de la touche PTT.
- Un appui long sur la touche d'urgence (voir la valeur du champ Durée longue pression de touche pour urgence).

Alarme et appel

Une fois que l'utilisateur radio a appuyé sur le bouton d'urgence, la radio transmet de façon répétitive à la station de base un paquet de données d'alarme qui déclenche une communication d'urgence, jusqu'à ce que celle-ci soit annulée dans l'un ou l'autre des cas suivants :

- Les [Nouvelles tentatives polies à la page 340](#) et [Nouvelles tentatives impolies à la page 340](#) programmées sont épuisées.
- Un accusé de réception confirmant la transmission du paquet de données d'urgence a été reçu de la station de base.
- Appui de la touche PTT.

Lorsque le paquet de données d'alarme a été transmis, des appels vocaux peuvent être émis sur le canal.

10.22.1.3

Confirmation de la console requise (DVRs)

Ce champ entraîne une réponse de confirmation supplémentaire de la console (« confirmation de la console ») lorsque vous activez le mode d'urgence.

Lorsqu'une alarme d'urgence a été envoyée (voir le champ Type d'urgence), la radio doit toujours recevoir une confirmation provenant de l'équipement de réseau fixe (FNE). Cette fonction entraîne l'envoi nécessaire d'une autre confirmation à partir de l'application de répartition/console.

Une confirmation reçue de l'équipement de réseau fixe (FNE) vous assure que les paquets de données de l'alarme d'urgence ont été envoyés au site courant de la radio. Quant à la confirmation reçue de la console, elle atteste que l'application de répartition/console envoie le message d'urgence au répartiteur. À la réception d'une confirmation provenant de la console, la radio émet une tonalité d'alerte (quatre bips).

Cette sélection s'applique au profil d'urgence conventionnel courant.

IMPORTANT :

Ce champ s'applique uniquement lorsque le canal courant de la radio fonctionne sur un système de répéteur numérique pour véhicule (DVRs) conventionnel (c'est-à-dire que la personnalité conventionnelle courante effectue un renvoi vers un système conventionnel DVRs). Ce champ n'a aucune incidence sur les systèmes conventionnels autres que DVRs.

Cette fonction doit être désactivée pour que la fonction **Urgence de microphone branché** ou **Urgence par audio silencieux** fonctionne correctement. Voir le champ [Mode de transmission automatique d'urgence à la page 341](#).

10.22.1.4

Accuser réception de la tonalité d'alerte

Ce champ permet à la radio d'émettre une tonalité dès la réception d'un message en mode d'urgence à la station de base et la transmission d'un accusé de réception par celle-ci.

Un accusé de réception est un message confirmant la réception réussie de l'alarme d'urgence de la radio (voir [Type d'urgence à la page 338](#)) par la station de base. Cette fonction s'applique au profil d'urgence conventionnel courant.

10.22.1.5

Nouvelles tentatives polies

Ce champ permet de sélectionner le nombre de fois que la radio tente de transmettre un appel poli en mode d'urgence (voir Type d'urgence).

Un appel poli a lieu lorsque la radio attend qu'un canal soit libre avant d'essayer d'effectuer une transmission. Les nouvelles tentatives polies sont annulées à la réception, par la radio, d'un accusé de réception confirmant la transmission de l'appel d'urgence.

Cette sélection s'applique aux [Profils d'urgence conventionnels à la page 337](#) courants.

IMPORTANT :

Si de nouvelles tentatives impolies sont effectuées avant l'expiration du délai Patience limitée, la radio utilisera la transmission polie jusqu'à la fin du délai. Après l'expiration du délai, toute tentative polie supplémentaire sera envoyée de manière impolie.

Tableau 132 : Portée

Minimum	Maximum	Incrément
0 tentative	15 tentatives	1 tentative

Tableau 133 : Portée

Minimum	Maximum
0 tentative	14 ou nombre illimité de tentatives

10.22.1.6

Nouvelles tentatives impolies

Ce champ permet de sélectionner le nombre de fois que la radio essaie de transmettre un appel impoli en mode d'urgence (voir la valeur du champ Type d'urgence).

Un appel impoli a lieu lorsque la radio transmet une communication même si le canal sélectionné est déjà utilisé par d'autres radios. Ces transmissions se superposent à celles d'autres radios sur le même canal. Les nouvelles tentatives impolies sont annulées à la réception, par la radio, d'un accusé de réception confirmant la transmission de l'appel d'urgence.

Cette sélection s'applique aux [Profils d'urgence conventionnels à la page 337](#) courants.

IMPORTANT :

Si de nouvelles tentatives impolies sont effectuées avant l'expiration du délai Patience limitée, la radio utilisera la transmission polie jusqu'à la fin du délai. Après l'expiration du délai, toute tentative polie supplémentaire sera envoyée de manière impolie.

Tableau 134 : Portée

Minimum	Maximum	Incrément
1 tentative	15 tentatives	1 tentative

10.22.1.7

Sortie d'urgence sur changement de canal

Ce champ permet à la radio de quitter le mode d'urgence sur changement de mode.

10.22.1.8

Avertissement de situation de détresse activé

Ce champ permet d'activer le mode d'urgence Fonctionnement pour situation de détresse pour les profils d'urgence conventionnels actuellement définis.

Accès seulement : Lorsque le champ Déclencheur d'avertissement de situation de détresse n'est pas réglé à **Désactivé**, et lorsque le champ Niveau de la capacité de configuration d'appel de détresse est réglé à **Par profil d'urgence**, et lorsque le modèle ou les options de la radio le permettent.

10.22.1.9

Mode de transmission automatique d'urgence

Le champ permet de sélectionner une transmission d'urgence supplémentaire et précise associée à l'ensemble Profils d'urgence conventionnels courant.

Urgence de microphone branché ou audio silencieux sont possibles.

**AVERTISSEMENT :**

si cette fonction n'est pas désactivée, la fonction sélectionnée remplace ou bonifie la fonction d'urgence correspondant au type **Alarme et appel d'urgence** défini dans le champ [Type d'urgence à la page 338](#).

Les sélections suivantes sont prises en charge :

Désactivé;

Aucune autre fonction de transmission automatique n'est sélectionnée.

Urgence de microphone branché

Une fois que vous avez activé le mode d'urgence déclenché en appuyant sur la touche Urgence, après une seule transmission impolie d'alarme d'urgence, cette sélection fait en sorte que la radio s'active automatiquement et transmet un appel d'urgence (voir [Type d'urgence à la page 338](#)). L'appel est transmis par le microphone automatiquement ouvert pendant la durée sélectionnée dans le champ Période de Tx microphone branché. La radio passe au mode d'appel d'urgence normal. Ce que l'on appelle également « Urgence ADF avec voix à suivre ».

Si la valeur du champ Durée longue pression de touche pour urgence n'est pas réglée à **0**, l'utilisateur peut quitter le mode d'appel d'urgence en appuyant longuement sur le bouton d'urgence.

Disponible pour : les systèmes de type conventionnel ASTRO et MDC.

**AVERTISSEMENT :**

La valeur du champ Type d'urgence du profil courant doit être **Alarme et appel**, sinon cette sélection ne sera pas valide.

Les personnalités conventionnelles qui utilisent la fonction Urgence de microphone branché doivent sélectionner, dans le champ Minuterie de délai d'attente, une valeur supérieure à celle du champ Période de Tx microphone branché; autrement, la transmission par microphone branché est annulée à l'expiration du délai d'attente.

**REMARQUE :**

Les paramètres [Nouvelles tentatives polies à la page 340/Nouvelles tentatives impolies à la page 340](#) sont ignorés lors de l'entrée en mode Microphone branché. Une fois sorti du mode microphone branché ou appel d'urgence, les valeurs des champs Nouvelles tentatives polies/Nouvelles tentatives impolies sont rétablies dans le canal du profil/de la radio.

Urgence par audio silencieux

Une fois que vous avez activé le mode d'urgence en appuyant sur la touche Urgence, après une seule transmission impolie d'alarme d'urgence, cette sélection fait en sorte que la radio amorce et transmet un appel d'urgence avec son microphone qui demeure fermé/en sourdine. Cette transmission se poursuit pendant la durée indiquée dans le champ Période de Tx audio silencieux (s). La radio passe au mode d'appel d'urgence normal.

Si la valeur du champ **Durée longue pression de touche pour urgence** n'est pas réglée à **0**, l'utilisateur peut quitter le mode d'appel d'urgence en appuyant longuement sur le bouton d'urgence.

Disponible pour : systèmes conventionnels ASTRO seulement.

AVERTISSEMENT :

La valeur du champ **Type d'urgence** du profil courant doit être **Alarme et appel**, sinon cette sélection ne sera pas valide.

Pour les personnalités conventionnelles qui utilisent cette fonction, la valeur du champ **Minuterie de délai d'attente** doit être supérieure à celle du champ **Période de Tx audio silencieux à la page 343**; autrement, la transmission est annulée à l'expiration du délai d'attente.

REMARQUE :

Les paramètres **Nouvelles tentatives polies à la page 340/Nouvelles tentatives impolies à la page 340** sont ignorés lors de l'entrée en mode Audio silencieux. Une fois sorti du mode Audio silencieux ou appel d'urgence, les valeurs des champs **Nouvelles tentatives polies/Nouvelles tentatives impolies** sont rétablies dans le canal du profil/de la radio.

10.22.1.10

Période de Tx microphone branché

Ce champ permet de déterminer la période pendant laquelle la radio s'active et transmet de façon automatique en mode d'urgence par microphone branché (voir **Mode de transmission automatique d'urgence**).

Cette sélection s'applique aux **Profils d'urgence conventionnels à la page 337** courants.

IMPORTANT :

Pour les personnalités conventionnelles qui utilisent cette fonction, la valeur du champ **Minuterie de délai d'attente** doit être supérieure à celle du champ **Période de Tx audio silencieux à la page 343**; autrement, la transmission est annulée à l'expiration du délai d'attente.

Accès seulement : lorsque le champ **Type d'urgence à la page 338** est réglé à **Alarme et appel**, et lorsque le champ **Mode de transmission automatique d'urgence à la page 341** est réglé à **Urgence de microphone branché**.

IMPORTANT :

Les anciennes versions du codeplug doivent utiliser les paramètres ci-dessous :

Tableau 135 : Portée

Minimum	Maximum	Incréments
10 seconde	120 secondes	10 seconde

IMPORTANT :

Cela s'applique à la version 19.00.00 et aux versions ultérieures du codeplug :

Tableau 136 : Portée

Minimum	Maximum	Incréments
1 seconde	120 secondes	10 seconde

10.22.1.11

Période de Tx audio silencieux

Ce champ permet de sélectionner la période pendant laquelle la radio s'active et émet en fonctionnant en mode d'activation de l'urgence **Urgence par audio silencieux**.

Voir [Mode de transmission automatique d'urgence à la page 341](#).

Cette sélection s'applique aux [Profils d'urgence conventionnels à la page 337](#) courants et est uniquement possible pour les systèmes de composition ASTRO.

Accès seulement : lorsque le champ [Type d'urgence à la page 338](#) est réglé à **Alarme et appel**, et lorsque le champ [Mode de transmission automatique d'urgence à la page 341](#) est réglé à **Urgence par audio silencieux**.

Tableau 137 : Portée

Minimum	Maximum	Incrément
1 seconde	5 secondes	1 seconde

Tableau 138 : Portée

Minimum	Maximum
1 seconde	5 secondes

10.22.1.12

Activer multiplicateur de Tx

Ce champ fait en sorte que la valeur du facteur du multiplicateur de Tx est doublé, ce qui détermine ensuite la durée d'activation de la radio et de transmission automatique d'un appel d'urgence impoli (voir Type d'urgence).

Cette sélection s'applique aux [Profils d'urgence conventionnels à la page 337](#) courants.

10.22.1.13

Multiplicateur de Tx

Ce champ permet de déterminer la durée d'activation de la radio et de transmission automatique d'un appel d'urgence impoli (voir Type d'urgence).

Cette période débute seulement après que la radio ait utilisé toutes les [Nouvelles tentatives polies à la page 340](#) et [Nouvelles tentatives impolies à la page 340](#) d'Urgence sans recevoir d'accusé de réception.

Cette sélection s'applique aux [Profils d'urgence conventionnels à la page 337](#) courants.

**IMPORTANT :**

lorsque la valeur du champ Mode radio à distance est **Traceur radio** ou **Surveillance radio**, ce chiffre est multiplié par le Temps de base Tx pour produire une valeur exprimée en secondes.

Les sélections suivantes sont

Tableau 139 : Portée

Minimum	Maximum
0	3

10.22.1.14

Toutes les urgences

La fonction Toutes les urgences vous averti lorsqu'une personne à proximité émet une activation d'urgence.

Lorsque cette fonction est activée, vous pouvez effectuer les actions suivantes :

- Émettre une balise Bluetooth basse énergie (BLE) toutes les deux secondes pendant que la radio est en mode d'urgence.
- Recevoir des balises d'urgence et voir les notifications « balise reçu ».
- Recevoir une tonalité d'alerte lorsqu'une balise est reçue durant les dix dernières secondes.
- Entrer dans l'option de menu pour afficher toutes les balises reçues.
- Ignorer la notification pour arrêter la réception des tonalités et l'affichage.

Pour activer la fonction Toutes les urgences, vous devez activer les champs **Activer la transmission** et **Activer la réception** dans la section Toutes les urgences du profil d'urgence conventionnel.

10.22.1.15

Transmission activée

Lorsque ce champ est activé, la radio peut émettre la balise Toutes les urgences en cas d'urgence.

L'émission de la balise d'urgence est déclenchée grâce à la fonction d'urgence en appuyant sur le commutateur ou la touche d'urgence ou en utilisant la fonction Avertissement de situation de détresse. Lorsque vous passez en mode d'urgence, aucune autre mesure n'est requise. Lorsque la radio passe en mode d'urgence, la fonction Bluetooth est automatiquement activée et les balises sont émises. Les balises d'urgence sont émises toutes les deux secondes lorsque la radio est en mode d'urgence.

Pour en savoir plus sur la fonction Toutes les urgences, reportez-vous à [Toutes les urgences à la page 344](#).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.22.1.16

Réception (activer)

Lorsque ce champ est activé, la radio reçoit une transmission de balise Toutes les urgences.

Lorsque vous passez à un canal dans lequel la Réception de balise est activée, la fonction Bluetooth s'active automatiquement. Lorsque vous recevez une balise d'urgence, la radio émet une tonalité et affiche la balise reçue sur l'écran supérieur et le widget de commande radio de l'écran avant. La radio continue à émettre une tonalité toutes les dix secondes tout en recevant activement des balises.

Si le destinataire ignore la notification ou si aucune balise n'est reçue pendant quatre minutes, la notification « balise reçue » disparaît. Si plusieurs balises sont disponibles, l'écran affiche l'ID ou l'alias du dernier l'appareil qui est passé en mode d'urgence.

Pour en savoir plus sur la fonction Toutes les urgences, reportez-vous à [Toutes les urgences à la page 344](#).

**REMARQUE :**

Sur les radios APX standards avec écran avant, vous pouvez utiliser le menu pour afficher l'ID de la radio émettrice et l'indicateur d'intensité du signal reçu (RSSI) Bluetooth.

Sur les radios APX NEXT, vous pouvez ignorer la balise en appuyant sur **IGNORER** dans la notification. Vous pouvez également afficher la liste des expéditeurs en appuyant sur **DÉTAILS**.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.22.1.17

Activation à distance de l'urgence

Ce champ permet de sélectionner une fonctionnalité spécifique de la fonction Activation d'urgence à distance pour l'ensemble Profil d'urgence qui est présentement utilisé. Cette fonction permet à une radio source (encodage) d'activer la fonction d'urgence sur une radio cible (décodage) par liaison radio, comme si l'utilisateur cible avait appuyé lui-même sur le bouton d'urgence.

Ce champ n'est valide que lorsque le modèle ou l'option de la radio permet le fonctionnement conventionnel APCO 25 ou ADF APCO 25.

Les sélections suivantes sont prises en charge :

Désactivé;

Aucune fonctionnalité d'Activation d'urgence à distance n'est sélectionnée.

Encodage seulement

Une radio est uniquement autorisée à lancer des communications d'urgence à distance vers une radio cible.

Décoder uniquement

Une radio est uniquement autorisée à recevoir des communications d'urgence à distance depuis une radio source et, suite au décodage des communications, la radio lance immédiatement la fonction d'urgence.

Encodage et décodage

Une radio est autorisée à lancer des communications d'urgence à distance vers une radio cible et à recevoir des communications d'urgence à distance depuis une radio source.

**REMARQUE :**

Ce champ est désactivé par défaut.

10.22.2

MDC

Cette section vous permet d'afficher ou de modifier les fonctions relatives aux communications d'urgence conventionnelles pour des profils d'urgence conventionnels de systèmes de type MDC.

**REMARQUE :**

Les fonctions et les réglages de la fenêtre Toutes les urgences s'appliquent à ces profils.

Les profils d'urgence conventionnels sont sélectionnés dans le champ Sélection du profil d'urgence du système conventionnel.

Les systèmes conventionnels MDC renvoient aux personnalités conventionnelles définies dans le champ Système non ASTRO.

La fonctionnalité du mode d'urgence est lancée avec une radio programmée ou par vous, en activant la fonction.

10.22.2.1

Tonalité auxiliaire PTT-ID d'urgence

Ce champ permet à une tonalité d'avertissement de se faire entendre pendant la transmission d'un ID de PTT d'urgence, en mode d'urgence.

La tonalité est émise dès que l'utilisateur radio appuie sur le bouton PTT et dure jusqu'à la fin de la transmission de l'ID de PTT d'urgence. Pendant cette brève période, le microphone de la radio (transmission vocale) est automatiquement désactivé. La fin de la tonalité d'avertissement vous indique que vous pouvez utiliser le microphone pour accepter la voix lors des transmissions.

Cette sélection s'applique aux [Profils d'urgence conventionnels à la page 337](#) courants.

AVERTISSEMENT :

Cette fonction s'applique uniquement si le champ Non ASTRO\ID de PTT d'urgence est activé dans une personnalité conventionnelle qui renvoie à un système conventionnel associé au profil d'urgence conventionnel courant.

Accès seulement : Lorsque le champ [Type d'urgence à la page 338](#) est réglé à **Alarme et appel**.

10.22.2.2

Surveillance à distance d'urgence\Temps de base Tx

Ce champ permet de sélectionner le nombre qui servira au calcul de la période pendant laquelle la radio s'active automatiquement en mode de surveillance à distance d'urgence MDC.

Une fois la période de transmission expirée, la radio désactive le bouton PTT pendant la période déterminée au moyen du [Surveillance à distance d'urgence\Temps de base Rx à la page 346](#). Cette fonction s'applique au profil d'urgence conventionnel courant. La durée est exprimée en secondes.

IMPORTANT :

La valeur du Multiplicateur de Tx (fournie dans un accusé de réception **Ack** envoyé à la radio ou une commande de surveillance à distance envoyée par le répartiteur) multipliée par le temps de base Tx détermine la période de transmission en mode de surveillance à distance d'urgence.

Si le multiplicateur global (envoyé à la radio dans un accusé de réception **Ack** ou une commande de surveillance à distance d'urgence transmise par le répartiteur) correspond à **Vrai**, la période de transmission calculée est doublée.

Accès seulement : Lorsque le champ Type d'urgence est réglé à **Alarme et appel** et lorsque le modèle ou les options de la radio le permettent.

Tableau 140 : Portée

Minimum	Maximum	Incréments
10 s	120 s	10 s

10.22.2.3

Surveillance à distance d'urgence\Temps de base Rx

Ce champ permet de sélectionner le nombre qui servira au calcul de la période pendant laquelle la radio désactive automatiquement le bouton PTT et attend en mode Surveillance à distance d'urgence.

La période de réception et d'attente débute une fois que le [Surveillance à distance d'urgence\Temps de base Tx à la page 346](#) a expiré. Cette fonction s'applique au profil d'urgence conventionnel courant. La durée est exprimée en secondes.

IMPORTANT :

La valeur du multiplicateur de Rx (fournie dans un accusé de réception **Ack** envoyé à la radio ou par une commande de surveillance à distance envoyée par le répartiteur) multipliée par le Temps de base Rx détermine la période de réception et d'attente en mode Surveillance à distance d'urgence.

Si le multiplicateur global (envoyé à la radio dans un accusé de réception **Ack** ou une commande de surveillance à distance d'urgence transmise par le répartiteur) correspond à **Vrai**, la période de réception et d'attente calculée est doublée.

Accès seulement : Lorsque le champ Type d'urgence est réglé à **Alarme et appel** et lorsque le modèle ou les options de la radio le permettent.

Tableau 141 : Portée

Minimum	Maximum	Incréments
10 s	120 s	10 s

10.22.2.4

Activer surveillance à distance d'urgence

Ce champ permet d'activer la surveillance à distance en mode d'urgence.

La surveillance à distance en mode d'urgence sur la radio a lieu dans l'un des deux cas définis. D'abord, lorsqu'une alarme d'urgence (voir « Alarme et appel » dans [Type d'urgence à la page 338](#)) est reçue avec succès par le répartiteur ou la console, puis lorsqu'un accusé de réception d'alarme est reçu avec succès par la radio. Deuxième, lorsqu'une commande de surveillance à distance MDC a été reçue (par la radio) pendant le mode urgence. Une fois que la radio est en mode de surveillance à distance d'urgence, elle s'active et transmet automatiquement des communications audio ambiophoniques à partir de son microphone « branché ». Cette fonction s'applique aux [Profils d'urgence conventionnels à la page 337](#) courants.

**AVERTISSEMENT :**

Pour que cette sélection soit valide, le champ [Type d'urgence à la page 338](#) doit être **Alarme et appel**.

**IMPORTANT :**

L'« accusé de réception » et la « commande de surveillance à distance » comportent tous deux un multiplicateur de Tx, un multiplicateur de Rx et un multiplicateur global (réglé à **Vrai** ou à **Faux**). Ces valeurs sont définies par le répartiteur ou la console.

La radio utilise le multiplicateur de Tx (fourni dans l'accusé de réception ou la commande de surveillance à distance) multiplié par le temps de base Tx programmé pour déterminer la durée de la communication transmise par le microphone « branché ». Si le multiplicateur global (fourni dans l'accusé de réception ou la commande de surveillance à distance) est réglé à **Vrai**, la durée de la transmission calculée est doublée.

Une fois la période de transmission expirée, la radio désactive le bouton PTT pendant la période de réception et d'attente donnée. La valeur du multiplicateur Rx (fournie dans l'accusé de réception ou la commande de surveillance à distance) multipliée par le temps de base Rx programmé détermine cette période de réception et d'attente. Si le multiplicateur global (fourni dans l'accusé de réception ou la commande de surveillance à distance) est réglé à **Vrai**, la période de réception et d'attente calculée est doublée.

Après la période de transmission et la période de réception et d'attente, la radio lance la séquence d'alarme d'urgence (voir le type d'urgence **Alarme et appel**).

Le cycle de surveillance à distance d'urgence recommence à la réception d'un accusé de réception ou d'une commande de surveillance à distance par la radio (en mode d'urgence).

Ce cycle de surveillance à distance d'urgence prend fin lorsque le répartiteur envoie un accusé de réception de l'alarme d'urgence contenant une valeur de multiplicateur de Tx de **0** et une valeur de multiplicateur de Rx de **0** (aussi appelées **valeurs de la console de répartition**), ou lorsque vous appuyez sur la touche PTT.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.22.3

Liste de tonalités d'urgence

Cette section vous permet d'afficher ou de modifier le déclencheur du mode d'urgence et les fonctions de tonalité d'alerte pour des profils d'urgence conventionnels individuels.

REMARQUE :

Les fonctions et les réglages de la fenêtre Toutes les urgences s'appliquent à ces profils.

Les profils d'urgence conventionnels sont sélectionnés dans le champ Sélection du profil d'urgence du système conventionnel.

Les systèmes conventionnels MDC renvoient aux personnalités conventionnelles définies dans le champ Système non ASTRO.

La fonctionnalité du mode d'urgence est lancée avec une radio programmée ou par vous, en activant la fonction.

10.22.3.1

Déclencheur

Ce champ permet de sélectionner la condition ou le déclencheur qui lance le mode d'urgence dans le profil d'urgence ADF actif.

Selon le type de tonalité d'urgence sélectionnée, il est également possible de configurer les paramètres Volume minimum de tonalité, Période de tonalité et Acheminement audio dans le même enregistrement ou la même rangée de la Liste de tonalités d'urgence.

Accès seulement : lorsque le champ Déclencheur d'avertissement de situation de détresse n'est pas réglé à **Désactivé**, et lorsque le Déclencheur de tonalité d'avertissement en situation de détresse est **activé**, et lorsque le modèle et les options de la radio le permettent.

La sélection suivante est prise en charge :

Situation de détresse

Une condition Avertissement de situation de détresse lance le mode d'urgence dans le [Profils d'urgence conventionnels à la page 337](#) courant.

S'applique uniquement : Lorsque le champ [Avertissement de situation de détresse activé à la page 341](#) est activé dans le Profil d'urgence conventionnel.

10.22.3.2

Tonalité

Ce champ permet de sélectionner le type de tonalité d'alerte émise lorsqu'une transmission en mode d'urgence est lancée par l'intermédiaire de la sélection de déclencheur correspondante.

Cette sélection s'applique au profil d'urgence conventionnel courant.

Accès seulement : lorsque le champ Déclencheur d'avertissement de situation de détresse n'est pas réglé à **Désactivé**, et lorsque le Déclencheur d'avertissement en situation de détresse est activé, et lorsque le modèle et les options de la radio le permettent.

Les sélections suivantes sont prises en charge :

Tonalité d'urgence héritée

Les niveaux audio et la tonalité d'avertissement d'urgence hérités sont utilisés.

Tonalité d'urgence critique

La tonalité d'urgence critique retentit. Les champs Volume minimum de tonalité, Période de la tonalité et Acheminement audio doivent également être définis.

10.22.3.3

Volume minimum de tonalité

Ce champ permet de sélectionner le niveau audio minimal pour la tonalité d'alerte du mode d'urgence correspondant.

Si cette valeur est supérieure au volume de la radio, elle sera utilisée; sinon, elle retentira au volume courant de la radio. Cette fonction s'applique aux [Profils d'urgence conventionnels à la page 337](#) courants.

Accès seulement : lorsque le champ [Tonalité à la page 348](#) est réglé à **Tonalité d'urgence critique** et que le modèle ou les options de la radio le permettent.

Tableau 142 : Portée

Minimum	Maximum	Incréments
0	255	1

10.22.3.4

Période de tonalité

Ce champ vous permet de sélectionner la tonalité d'alerte du mode d'urgence (temporaire ou répétitive).

Il est possible de définir la périodicité de la minuterie de la tonalité répétitive. Cette fonction s'applique au profil d'urgence conventionnel courant.

Accès seulement : lorsque le champ [Tonalité à la page 348](#) est réglé à **Tonalité d'urgence critique** et que le modèle ou les options de la radio le permettent.

**REMARQUE :**

Lorsqu'il est réglé à **0-Une seule fois** (heure zéro), la tonalité d'alerte indiquée dans le champ Tonalité retentit une seule fois lorsque le mode d'urgence est actif.

Tableau 143 : Portée

Minimum	Maximum	Incrément
5	255	1

10.22.3.5

Acheminement audio

Ce champ permet de sélectionner l'acheminement de la tonalité d'alerte et l'audio entrant vers un haut-parleur précis lorsqu'une transmission en mode d'urgence est lancée par l'intermédiaire de la sélection de déclencheur correspondante.

Cette sélection s'applique à l'ensemble Profil d'urgence conventionnel courant.

Accès seulement : lorsque le champ [Tonalité à la page 348](#) est réglé à **Tonalité d'urgence critique**, et lorsque le champ [Période de tonalité à la page 349](#) n'est pas réglé à **Une fois**, et lorsque le modèle et les options de la radio le permettent.

Les sélections suivantes sont prises en charge :

Acheminement audio normal

La tonalité d'alerte et l'audio entrant sont acheminés selon les paramètres d'acheminement audio actifs du haut-parleur de la radio (voir aussi Acheminement audio au haut-parleur et bouton Itinéraire de rechange pour audio Bluetooth).

Acheminement audio au haut-parleur interne

La tonalité d'alerte et l'audio entrant sont acheminés au haut-parleur interne de la radio, indépendamment des accessoires externes connectés, ou selon le paramètre Acheminement audio au haut-parleur du canal actif.

10.22.4

Options de compatibilité d'urgence

Cette section se rapporte à l'interopérabilité du système Harris.

Elle vous permet de contrôler l'annulation d'un appel d'urgence (par vous, par une console ou les deux) et de réamorcer le microphone branché.

REMARQUE :

Les fonctions et les réglages de la fenêtre [Toutes les urgences à la page 330](#) s'appliquent à ces profils.

Les profils d'urgence conventionnels sont sélectionnés dans le champ Sélection du profil d'urgence du système conventionnel.

Les systèmes conventionnels sont rattachés aux personnalités conventionnelles dans les champs du système ASTRO ou du système non ASTRO; seuls les systèmes ASTRO et MDC peuvent effectuer des transmissions en mode d'urgence.

La fonctionnalité du mode d'urgence est lancée avec une radio programmée ou par vous, en activant la fonction.

10.22.4.1

Contrôle de la sortie d'urgence

Ce champ permet de configurer la radio de manière à ce que la sortie de l'urgence puisse être désactivée par vous, par la console ou par les deux.

Les sélections suivantes sont prises en charge :

Abonné seulement

Valeur par défaut

Console seulement

Sélectionnable uniquement si l'opération d'urgence est réglée à Alarme et appel d'urgence, le type de système et DVRS et le type de signal est ASTRO.

Abonné et console

Sélectionnable uniquement si l'opération d'urgence est réglée à Alarme et appel d'urgence, le type de système et DVRS et le type de signal est ASTRO.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.22.4.2

Redémarrage du microphone branché d'urgence

Ce champ permet au son du micro branché d'être retransmis en appuyant sur la touche d'urgence pendant une situation d'urgence.

Accès seulement : Lorsque le champ [Type d'urgence à la page 338](#) est réglé à **Alarme et appel**, et lorsque le champ Type de système est réglé à **DVRS**, et lorsque le champ Type voix/signal Rx et Type voix/signal Tx est réglé à **ASTRO**, et que le modèle ou l'option de la radio le permet.

10.23

Profils d'urgence ADF

La fenêtre **Profils d'urgence ADF** permet d'afficher ou de modifier la fonctionnalité du mode d'urgence - ADF.

Les transmissions d'urgence peuvent être associées à plusieurs paramètres programmés. Il est également possible de créer divers profils d'urgence. Les deux types de protocoles ADF, **ASTRO 25** et **Type II**, prennent en charge les transmissions en mode d'urgence.

10.23.1

Général

Cette section vous permet d'afficher ou de modifier les fonctions d'urgence ADF pour les profils d'urgence ADF individuels.

Les deux types de protocoles ADF, **ASTRO 25** et **Type II**, prennent en charge les transmissions en mode d'urgence.

**REMARQUE :**

Les fonctions et les réglages de la fenêtre [Toutes les urgences à la page 330](#) s'appliquent à ces profils.

Les profils d'urgence ADF sont sélectionnés dans le champ Sélection du profil d'urgence de la personnalité ADF.

La fonctionnalité du mode d'urgence est lancée avec une radio programmée ou par vous, en activant la fonction.

10.23.1.1

Nom de profil d'urgence

Ce champ vous permet de créer des noms reconnaissables pour le profil DVRS courant.

Les profils d'urgence ADF sont sélectionnés dans le champ Sélection du profil d'urgence de la personnalité ADF.

**REMARQUE :**

Exemples : EMT-001, no 500, Électrique1, # A5.

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Vous pouvez utiliser jusqu'à 14 caractères.

10.23.1.2

Opérations d'urgence

Ce champ permet de sélectionner la fonctionnalité radio à utiliser lorsque vous activez le mode d'urgence.

Cette sélection s'applique au profil d'urgence ADF courant.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Alarme seulement

Après que l'utilisateur a appuyé sur le bouton d'urgence, la radio transmet les paquets de données de l'alarme d'urgence au répartiteur. Ces derniers sont transmis jusqu'à ce que la radio reçoive un accusé de réception ou ait effectué le nombre de nouvelles tentatives indiqué dans le champ Compteur de nouvelles tentatives. La valeur du champ **Confirmation de la console requise** détermine le type d'accusé de réception attendu.

Appel seulement

Après que l'utilisateur a appuyé sur le bouton d'urgence, la radio passe en mode Appel d'urgence. Dans ce mode, les requêtes PTT et les transmissions vocales envoyées par vous-même ou par d'autres radios sont désignées comme étant des urgences; elles ont donc la priorité sur les autres activités du groupe ADF courant.

Alarme et appel

Lorsque l'utilisateur appuie sur le bouton d'urgence, après la réception d'un accusé de réception pour la séquence d'alarme et l'exécution de toutes les nouvelles tentatives, la radio passe en mode Appel d'urgence.

10.23.1.3

Compteur de nouvelles tentatives

Ce champ permet de sélectionner le nombre de fois qu'une alarme d'urgence est transmise si aucune confirmation de cette transmission n'a été reçue.

REMARQUE :

Si la radio ne réussit pas à effectuer une transmission dans le cas d'un appel en ressources ADF normal, elle tente une nouvelle fois d'envoyer une séquence de données de signal entrant (ISD) avant de cesser toute tentative. Pour ce qui est des alarmes d'urgence, la radio effectue le nombre de nouvelles tentatives d'envoi de séquences ISD sélectionné pour ce compteur.

Cette sélection s'applique au profil d'urgence ADF courant.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 144 : Portée

Minimum	Maximum	Incréments
1	255	1

REMARQUE :

Lorsque réglé à **Infini**, le nombre de tentatives est illimité.

10.23.1.4

Confirmation de la console requise

Ce champ permet d'exiger une réponse de confirmation supplémentaire de la console (« Confirmation de la console »).

Lorsqu'une alarme d'urgence est envoyée, la radio doit toujours recevoir une confirmation provenant de l'équipement de réseau fixe (FNE). Cette fonction entraîne une confirmation additionnelle de l'application de répartition. La réception d'une confirmation du FNE vous assure que le site courant de la radio a reçu le paquet d'alarme d'urgence. Recevoir une confirmation de console fait en sorte que l'application de répartition affiche la condition d'urgence au répartiteur. À la réception d'une confirmation provenant de la console, la radio émet une tonalité d'alerte (quatre bips). Cette sélection s'applique au profil d'urgence ADF courant.

IMPORTANT :

Cette fonction doit être désactivée pour que la fonction **Urgence de microphone branché** ou **Urgence par audio silencieux** fonctionne correctement.

Accès seulement : Lorsque le champ Opération d'urgence est réglé à **Alarme uniquement** ou **Alarme et appel**, et lorsque le modèle ou l'option de la radio le permet.

10.23.1.5

Réponse d'urgence

Ce champ permet de sélectionner le type de canal de transmission/type de canal (Tactique ou Non tactique) que la radio utilise en mode d'urgence.

Cette sélection s'applique au profil d'urgence ADF courant.

**IMPORTANT :**

Si le mode d'urgence est activé à partir d'une radio d'un groupe d'annonce ou d'un regroupement dynamique, la radio utilise le groupe d'annulation d'urgence (de la personnalité ADF qui renvoie au profil d'urgence des ressources ADF courant) pour effectuer ses transmissions, que la valeur du champ soit **Tactique** ou **Annuler** (non tactique).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Tactique

Les alarmes et les appels d'urgence sont transmis à l'aide du canal et du groupe actuellement sélectionnés de la radio.

Ces transmissions sont aussi appelées « urgences tactiques ».

**AVERTISSEMENT :**

Le mode Tactique ne fonctionne pas si le canal ADF actuel de la radio comporte un champ Mode de transmission défini à **TG/AG désactivé**.

Annuler (non tactique)

Les alarmes et les appels d'urgence sont transmis sur un canal précis. Ce canal est déterminé selon la sélection du champ Type d'annulation d'urgence de la Personnalité ADF définie pour ce Profil d'urgence ADF.

**REMARQUE :**

Ces transmissions sont aussi appelées « urgences non tactiques ».

10.23.1.6

ID PTT retour

Lorsque ce champ est activé, le groupe de redirection pour réponse d'urgence de la personnalité ADF qui renvoie à ce profil d'urgence ADF utilise le type de conversation « ID PTT », en mode d'appel d'urgence.

Cette sélection s'applique au profil d'urgence ADF courant.

Si le champ est désactivé, que la radio est en mode d'appel d'urgence et que la personnalité ADF qui renvoie à ce profil d'urgence utilise le type de conversation « Transmission », la radio utilise par défaut le type de conversation « PTT-ID ». Cette sélection s'applique au Profil d'urgence ADF courant ou au groupe d'annonce sélectionné de cette personnalité.

**REMARQUE :**

Cette fonction est aussi appelée « ID PTT par défaut ».

**AVERTISSEMENT :**

Cette fonction s'applique seulement si la valeur du champ Réponse d'urgence est **Annuler**.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.23.1.7

Sortie d'urgence sur changement de canal

Ce champ permet à la radio de quitter le mode d'urgence sur changement de mode.

10.23.1.8

Avertissement de situation de détresse activé

Ce champ permet d'activer le mode d'urgence Fonctionnement pour situation de détresse pour le profil d'urgence ADF courant.

Accès seulement : Lorsque le champ Déclencheur d'avertissement de situation de détresse n'est pas réglé à **Désactivé**, et lorsque le champ Niveau de la capacité de configuration d'appel de détresse est réglé à **Par profil d'urgence**, et lorsque le modèle ou les options de la radio le permettent.

10.23.1.9

Mode de transmission automatique d'urgence

Ce champ permet de sélectionner une transmission supplémentaire et précise, en mode d'urgence, associée au profil d'urgence des ressources ADF en cours.

Urgence de microphone branché ou audio silencieux sont possibles.

**AVERTISSEMENT :**

Si cette fonction n'est pas désactivée, la fonction sélectionnée remplace ou bonifie la fonction d'urgence correspondant au type « Alarme et appel » du champ **Opération d'urgence**.

Accès seulement : Pour les modèles de radio utilisant la version R16.00.00 ou une version ultérieure du logiciel,

Lorsque le champ [Opérations d'urgence à la page 351](#) est réglé à **Alarme et appel**, et

Lorsque le champ [Confirmation de la console requise à la page 352](#) est **désactivé**, et

Lorsque le champ [ID PTT retour à la page 353](#) est réglé à **Activé**.

Les sélections suivantes sont prises en charge :

Désactivé;

Aucune autre fonction de transmission automatique n'est sélectionnée.

Urgence de microphone branché

Lorsque le mode d'urgence a été activé par l'utilisateur à l'aide du bouton d'urgence et que la radio a reçu une confirmation de réception de l'alarme d'urgence (du répartiteur/de la console), ou que toutes les tentatives d'alarme ont échoué, le mode Urgence de microphone branché entraîne l'activation de la radio et la transmission automatique de l'appel d'urgence. L'appel est transmis par le microphone automatiquement ouvert pendant la durée sélectionnée dans le champ **Période de Tx microphone branché**. La radio passe au mode d'appel d'urgence normal. Ce que l'on appelle également « Urgence ADF avec voix à suivre ».

Si la valeur du champ Durée longue pression de touche pour urgence n'est pas réglée à **0**, l'utilisateur peut quitter le mode d'appel d'urgence en appuyant longuement sur le bouton d'urgence.

**REMARQUE :**

Ce que l'on appelle également « Urgence ADF avec voix à suivre ».

**AVERTISSEMENT :**

Le fait d'appuyer une deuxième fois sur le bouton d'urgence ne lance pas une autre transmission par microphone branché. Il faut quitter le mode d'urgence et relancer la transmission pour que la radio puisse s'activer de nouveau pour la transmission automatique par microphone branché.

Pour quitter le mode d'urgence, il faut appuyer sur le bouton d'urgence pendant la durée déterminée dans le champ Durée longue pression de touche ou mettre la radio hors tension.

Urgence par audio silencieux

Une fois le mode d'urgence activé par l'utilisateur à l'aide du bouton d'urgence et que la radio a reçu une confirmation de réception de l'alarme d'urgence (du répartiteur ou de la console) ou

que toutes les tentatives d'alarme ont échoué, la radio s'active automatiquement dans le mode d'urgence sélectionné avec son microphone toujours en sourdine/fermé. Cette transmission se poursuit pendant la durée indiquée dans le champ Période de Tx audio silencieux (s). La radio passe au mode d'appel d'urgence normal.

Si la valeur du champ Durée longue pression de touche pour urgence n'est pas réglée à **0**, l'utilisateur peut quitter le mode d'appel d'urgence en appuyant longuement sur le bouton d'urgence.

IMPORTANT :

Disponible pour les communications ADF ASTRO 25 SEULEMENT.

10.23.1.10

Période de Tx microphone branché

Ce champ permet de sélectionner la période où la radio s'active et transmet automatiquement en « mode d'opération d'urgence » par microphone branché.

Permet également de sélectionner une transmission particulière, en mode d'urgence, associée au profil d'urgence des ressources ADF courant.

Accès seulement : Lorsque le champ Mode de transmission automatique d'urgences est réglé à **Urgence de microphone branché**, et lorsque le champ Opération d'urgence est réglé à **Alarme et appel**, et lorsque le champ ID PTT retour est **activé**, et lorsque le champ Confirmation de la console requise est **désactivé**, et lorsque le modèle ou l'option de la radio le permet.

IMPORTANT :

Les anciennes versions du codeplug doivent utiliser les paramètres ci-dessous :

Tableau 145 : Portée

Minimum	Maximum	Incrément
10 seconde	120 secondes	10 seconde

IMPORTANT :

Cela s'applique à la version 19.00.00 et aux versions ultérieures du codeplug :

Tableau 146 : Portée

Minimum	Maximum	Incrément
1 seconde	120 secondes	10 seconde

10.23.1.11

Période de Tx audio silencieux

Ce champ permet de sélectionner la période pendant laquelle la radio s'active et transmet automatiquement (avec son microphone toujours en sourdine ou fermé) en mode **Urgence par audio silencieux**.

Permet également de sélectionner une transmission particulière, en mode d'urgence, associée au profil d'urgence des ressources ADF courant.

Accès seulement : Lorsque le champ Mode de transmission automatique d'urgences est réglé à **Urgence par audio silencieux**, et lorsque le champ Opération d'urgence est réglé à **Alarme et appel**, et lorsque le champ ID PTT retour est **activé**, et lorsque le champ Confirmation de la console requise est **désactivé**, et lorsque le modèle ou l'option de la radio le permet.

Tableau 147 : Portée

Minimum	Maximum
1 s	5 s

10.23.1.12

Toutes les urgences

La fonction Toutes les urgences vous averti lorsqu'une personne à proximité émet une activation d'urgence.

Lorsque cette fonction est activée, vous pouvez effectuer les actions suivantes :

- Émettre une balise Bluetooth basse énergie (BLE) toutes les deux secondes pendant que la radio est en mode d'urgence.
- Recevoir des balises d'urgence et voir les notifications « balise reçu ».
- Recevoir une tonalité d'alerte lorsqu'une balise est reçue durant les dix dernières secondes.
- Entrer dans l'option de menu pour afficher toutes les balises reçues.
- Ignorer la notification pour arrêter la réception des tonalités et l'affichage.

Pour activer la fonction Toutes les urgences, vous devez activer les champs **Activer la transmission** et **Activer la réception** dans la section Toutes les urgences du profil d'urgence ADF.

10.23.1.13

Transmission activée

Lorsque ce champ est activé, la radio peut émettre la balise Toutes les urgences en cas d'urgence.

L'émission de la balise d'urgence est déclenchée grâce à la fonction d'urgence en appuyant sur le commutateur ou la touche d'urgence ou en utilisant la fonction Avertissement de situation de détresse. Lorsque vous passez en mode d'urgence, aucune autre mesure n'est requise. Lorsque la radio passe en mode d'urgence, la fonction Bluetooth est automatiquement activée et les balises sont émises. Les balises d'urgence sont émises toutes les deux secondes lorsque la radio est en mode d'urgence.

Pour en savoir plus sur la fonction Toutes les urgences, reportez-vous à [Toutes les urgences à la page 356](#).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.23.1.14

Réception (activer)

Lorsque ce champ est activé, la radio reçoit une transmission de balise Toutes les urgences.

Lorsque vous passez à un canal dans lequel la Réception de balise est activée, la fonction Bluetooth s'active automatiquement. Lorsque vous recevez une balise d'urgence, la radio émet une tonalité et affiche la balise reçue sur l'écran supérieur et le widget de commande radio de l'écran avant. La radio continue à émettre une tonalité toutes les dix secondes tout en recevant activement des balises.

Si le destinataire ignore la notification ou si aucune balise n'est reçue pendant quatre minutes, la notification « balise reçue » disparaît. Si plusieurs balises sont disponibles, l'écran affiche l'ID ou l'alias du dernier l'appareil qui est passé en mode d'urgence.

Pour en savoir plus sur la fonction Toutes les urgences, reportez-vous à [Toutes les urgences à la page 356](#).

REMARQUE :

Sur les radios APX standards avec écran avant, vous pouvez utiliser le menu pour afficher l'ID de la radio émettrice et l'indicateur d'intensité du signal reçu (RSSI) Bluetooth.

Sur les radios APX NEXT, vous pouvez ignorer la balise en appuyant sur **IGNORER** dans la notification. Vous pouvez également afficher la liste des expéditeurs en appuyant sur **DÉTAILS**.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.23.1.15

Activation à distance de l'urgence

Ce champ permet de sélectionner une fonctionnalité spécifique de la fonction Activation d'urgence à distance pour l'ensemble Profil d'urgence qui est présentement utilisé. Cette fonction permet à une radio source (encodage) d'activer la fonction d'urgence sur une radio cible (décodage) par liaison radio, comme si l'utilisateur cible avait appuyé lui-même sur le bouton d'urgence.

Ce champ n'est valide que lorsque le modèle ou l'option de la radio permet le fonctionnement conventionnel APCO 25 ou ADF APCO 25.

Les sélections suivantes sont prises en charge :

Désactivé;

Aucune fonctionnalité d'Activation d'urgence à distance n'est sélectionnée.

Encodage seulement

Une radio est uniquement autorisée à lancer des communications d'urgence à distance vers une radio cible.

Décoder uniquement

Une radio est uniquement autorisée à recevoir des communications d'urgence à distance depuis une radio source et, suite au décodage des communications, la radio lance immédiatement la fonction d'urgence.

Encodage et décodage

Une radio est autorisée à lancer des communications d'urgence à distance vers une radio cible et à recevoir des communications d'urgence à distance depuis une radio source.

REMARQUE :

Ce champ est désactivé par défaut.

10.23.2

Liste de tonalités d'urgence

Cette section vous permet d'afficher ou de modifier le déclencheur du mode d'urgence et les fonctions de tonalité d'alerte pour des profils d'urgence conventionnels individuels.

REMARQUE :

Les fonctions et les réglages de la fenêtre [Toutes les urgences à la page 330](#) s'appliquent à ces profils.

Les profils d'urgence ADF sont sélectionnés dans le champ Sélection du profil d'urgence de la personnalité ADF.

La fonctionnalité du mode d'urgence est lancée avec une radio programmée ou par vous, en activant la fonction.

10.23.2.1

Déclencheur

Ce champ permet de sélectionner/déclencher la condition/le déclencheur qui lance le mode d'urgence dans le profil d'urgence ADF courant.

Selon le type de tonalité d'urgence sélectionnée, il est également possible de configurer les paramètres Volume minimum de tonalité, Période de tonalité et Acheminement audio dans le même enregistrement ou la même rangée de la Liste de tonalités d'urgence.

Accès seulement : lorsque le champ Déclencheur d'avertissement de situation de détresse n'est pas réglé à **Désactivé**, et lorsque le Déclencheur de tonalité d'avertissement en situation de détresse est **activé**, et lorsque le modèle et les options de la radio le permettent.

Les sélections suivantes sont prises en charge :

Situation de détresse

Une condition Avertissement de situation de détresse lance le mode d'urgence dans le profil d'urgence ADF actif.

S'applique uniquement : Si le champ Avertissement de situation de détresse activé est réglé à **Activé** dans le profil d'urgence ADF actif.

10.23.2.2

Tonalité

Ce champ permet de sélectionner le type de tonalité d'alerte émise lorsqu'une transmission en mode d'urgence est lancée par l'intermédiaire de la sélection de déclencheur correspondante.

Cette sélection s'applique au profil d'urgence ADF courant.

Accès seulement : lorsque le champ Déclencheur d'avertissement de situation de détresse n'est pas réglé à **Désactivé**, et lorsque le Déclencheur de tonalité d'avertissement en situation de détresse est **activé**, et lorsque le modèle et les options de la radio le permettent.

Tonalité d'urgence héritée

Les niveaux audio et la tonalité d'avertissement d'urgence hérités sont utilisés.

Tonalité d'urgence critique

La tonalité d'urgence critique retentit. Les champs Volume minimum de tonalité, Période de la tonalité et Acheminement audio doivent également être définis.

10.23.2.3

Volume minimum de tonalité

Ce champ permet de sélectionner le niveau audio minimal pour la tonalité d'alerte du mode d'urgence correspondant.

Si cette valeur est supérieure au volume de la radio, elle sera utilisée; sinon, elle retentira au volume courant de la radio. Cette fonction s'applique au profil d'urgence ADF actif.

Accès seulement : Lorsque le champ Tonalité est réglé à **Tonalité d'urgence critique** et que le modèle ou l'option de la radio le permet.

Tableau 148 : Portée

Minimum	Maximum	Incréments
0	255	1

10.23.2.4

Période de tonalité

Ce champ permet de sélectionner si la tonalité d'alerte du mode d'urgence sera une tonalité temporaire ou une tonalité répétitive.

Vous pouvez définir la périodicité de la minuterie de la tonalité répétitive.

Cette fonction s'applique au profil d'urgence ADF actif.

Accès seulement : Lorsque le champ Tonalité est réglé à **Tonalité d'urgence critique** et que le modèle ou l'option de la radio le permet.

**REMARQUE :**

Lorsque réglé à **0 = Une fois** (heure zéro), la tonalité d'alerte spécifiée dans le champ Tonalité retentit une seule fois lorsque le Mode d'urgence est actif.

Tableau 149 : Portée

Minimum	Maximum	Incréments
5	255	1

10.23.2.5

Acheminement audio

Ce champ permet de sélectionner l'acheminement de la tonalité d'alerte et l'audio entrant vers un haut-parleur précis lorsqu'une transmission en mode d'urgence est lancée avec la sélection de déclencheur correspondante.

Cette sélection s'applique au profil d'urgence ADF courant.

Accès seulement : lorsque le champ Tonalité est réglé à **Tonalité d'urgence critique**, et lorsque le champ Période de tonalité n'est pas réglé sur **Une fois**, et lorsque le modèle et les options de la radio le permettent.

Acheminement audio normal

La Tonalité d'alerte et l'audio entrant sont acheminés selon les paramètres d'acheminement audio actifs du haut-parleur de la radio.

Acheminement audio au haut-parleur interne

La tonalité d'alerte et l'audio entrant sont acheminés au haut-parleur interne de la radio, indépendamment des accessoires externes connectés, ou selon le paramètre Acheminement audio au haut-parleur du canal actif.

10.23.3

Options de compatibilité d'urgence

Cette section se rapporte à l'interopérabilité du système Harris.

Elle vous permet de contrôler l'annulation d'un appel d'urgence (par vous, par une console ou les deux) et de réamorcer le microphone branché.

**REMARQUE :**

Les fonctions et les réglages de la fenêtre [Toutes les urgences à la page 330](#) s'appliquent à ces profils.

Les profils d'urgence ADF sont sélectionnés dans le champ Sélection du profil d'urgence de la personnalité ADF.

La fonctionnalité du mode d'urgence est lancée avec une radio programmée ou par vous, en activant la fonction.

10.23.3.1

Contrôle de la sortie d'urgence

Ce champ permet de configurer la radio de manière à ce que la sortie de l'urgence puisse être désactivée par vous, par la console ou par les deux.

Les sélections suivantes sont prises en charge :

Abonné seulement

Valeur par défaut

Console seulement

Peut être sélectionné si le champ Opération d'urgence est réglé à **Appel seulement** ou à **Alarme d'urgence et appel** sur un système ADF P25 et si les fonctionnalités propriétaires de Motorola sont désactivées.

Abonné et console

Peut être sélectionné si le champ Opération d'urgence est réglé à **Appel seulement** ou à **Alarme d'urgence et appel** sur un système ADF P25 et si les fonctionnalités propriétaires de Motorola sont désactivées.

Superviseur

Sélectionnable par le superviseur si le champ Opération d'urgence est réglé à **Appel seulement** ou à **Alarme et appel** sur le système ADF P25, si les caractéristiques propriétaires de Motorola sont désactivées et si la sélection du profil DVRS est réglée à **DVRS désactivé**. Pour la radio double, la sélection de la radio est réglée à **Radio autonome** ou à **Radio principale**.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.23.3.2

Redémarrage du microphone branché d'urgence

Ce champ permet au son du micro branché d'être retransmis en appuyant sur la touche d'urgence pendant une situation d'urgence.

Accès seulement : Lorsque le champ [Type d'urgence à la page 338](#) est réglé à **Appel seulement**, **Alarme et appel**, et lorsque le champ Mode de transmission automatique d'urgence est réglé à **Urgence par microphone branché**, et que le champ Type de système est réglé à **ASTRO 25**, et lorsque le champ Caractéristiques propriétaires de Motorola est désactivé, et lorsque le modèle ou l'option de la radio le permet.

10.24

Toutes les données

Cette section vous permet d'afficher ou de modifier les réglages de données applicables à tous les profils de données.

Les profils de données sont définis de manière à communiquer les données radio sur les canaux conventionnels ou ADF, et à communiquer les données radio sur un réseau LTE large bande.

IMPORTANT :

Les profils de données sont sélectionnés à partir du champ Sélection du profil de données du système ADF ou du champ Sélection du profil de données du système conventionnel.

Pour les communications par système conventionnel, les profils de données s'appliquent seulement aux systèmes conventionnels pour lesquels le champ Type de système est réglé à **ASTRO**.

Pour les communications ADF, les profils de données s'appliquent seulement aux systèmes ADF pour lesquels la valeur du champ Type de système est réglée à **ASTRO 25**.

10.24.1

Général

Cette section vous permet d'afficher ou de modifier les réglages de données applicables à tous les profils de données.

IMPORTANT :

Les profils de données sont sélectionnés à partir du champ Sélection du profil de données du système ADF ou du champ Sélection du profil de données du système conventionnel.

Pour les communications par système conventionnel, les profils de données s'appliquent seulement aux systèmes conventionnels pour lesquels le champ Type de système est réglé à **ASTRO**.

Pour les communications ADF, les profils de données s'appliquent seulement aux systèmes ADF pour lesquels la valeur du champ Type de système est réglée à **ASTRO 25**.

10.24.1.1

Interruption SNMP

Lorsque ce champ est sélectionné, la génération d'interruptions SNMP (protocole de gestion de réseau simple) est activée sur la liaison série.

Cette fonction s'applique à tous les profils de données.

S'il n'est pas sélectionné, la radio ne génère aucune interruption, à moins d'en recevoir la demande par l'intermédiaire de la base d'information de gestion des enregistrements d'interruption (MIB).

10.24.1.2

Tonalité d'alerte de désactivation du contexte

Ce champ permet à la radio d'émettre une tonalité d'alerte dès la fin d'une session de données.

Une session de données est considérée comme étant active une fois que la communication a été établie. Cette fonction s'applique à tous les profils de données.

10.24.1.3

Écho ICMP

Ce champ permet à la radio de renvoyer un accusé de réception dès qu'une requête d'écho (ping) ICMP (protocole de message de contrôle Internet) a été reçue.

Pour les radios APX NEXT et APX N70, cette fonction s'applique uniquement aux données LMR.

Cette fonction s'applique à tous les profils de données.

10.24.1.4

Type d'affectation de l'adresse IP 1 du pair

Ce champ permet de sélectionner la méthode d'affectation de l'adresse IP (Internet Protocol) à l'extrémité unité d'abonné (SU) de la liaison série 1.

Cette fonction s'applique en tout temps, à l'exception des systèmes conventionnels comportant un profil de données sélectionné. Lorsqu'un profil de données est sélectionné pour un système

conventionnel, le système conventionnel utilise l'adresse IP du pair définie dans le champ adresse IP du pair du profil de données.

REMARQUE :

Lorsque vous attribuez une adresse IP, s'assurer que l'adresse IP n'est pas en conflit avec toute autre adresse IP ou un sous-réseau utilisé par la radio. Les appareils externes tels que Wi-Fi, Modem de données externe et Si500 peuvent attribuer des adresses IP à certaines interfaces. Si des adresses IP ou des sous-réseaux en conflit sont utilisés, il est impossible de garantir le bon fonctionnement des fonctions de données.

169. 254. X. X. est réservé pour la fonction de clonage de zone à zone, de sorte qu'aucune adresse IP ne peut commencer par 169. 254. X. X., autrement, ce champ ne sera pas valide.

Les sélections suivantes sont prises en charge :

Dynamique

La radio affecte l'adresse IP du pair à l'ordinateur mobile (MC) une fois la liaison série établie.

Statique

L'ordinateur mobile confirme l'adresse IP à utiliser après l'établissement d'une liaison série. Cette sélection s'applique seulement aux liaisons séries par connecteur RS-232 ou selon le protocole PPP.

10.24.1.5

Affichage de contenu TMS direct

Ce champ permet à la radio d'accéder directement à sa boîte de réception du service de message texte (TMS) et de voir immédiatement le contenu du message texte sans intervention de votre part.

Cette fonction s'applique à tous les profils de données.

REMARQUE :

L'icône **Non lus** est retirée, car le contenu des messages est déjà affiché.

Lorsque l'état d'affichage de la radio est configuré ainsi et qu'un autre message texte est reçu, l'affichage est mis à jour pour indiquer les derniers messages entrants. Vous pouvez toujours naviguer parmi d'autres messages dans la boîte de réception de la radio.

Cet état est quitté lors d'un changement de mode, du lancement d'une autre fonction de configuration du menu ou de l'utilisation de la touche **Accueil** ou de la sélection du menu programmable **Quitter**.

Lorsque cette fonction est désactivée, vous devez respecter les procédures TMS standards pour accéder aux messages texte de la boîte de réception de la radio.

10.24.1.6

Sous-réseau interne de la radio

Ce champ permet de définir le sous-réseau interne de la radio (trois premiers octets) de l'adresse Internet Protocol (IP) utilisée à la mise sous tension de la radio afin d'établir des communications internes entre la radio et sa carte d'options.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Cette sélection s'applique aux communications Large bande.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les valeurs suivantes sont prises en charge :

- Les trois octets de l'adresse IP du sous-réseau doivent être compris dans la plage 193.0.0 à 207.255.255 inclusivement.
- Cette adresse IP du sous-réseau ne peut pas être identique aux trois premiers octets de toute autre adresse IP définie pour la radio. Sinon, l'application considère cette valeur comme non valide.
- La valeur de ce sous-réseau par défaut = 199.0.0

10.24.1.7

Rapport de mesure du capteur

Ce champ permet à la radio de traiter les messages de données du capteur.

Cela est nécessaire lorsque la radio échange des renseignements de données de capteur avec le serveur de données de capteur dans une infrastructure de communication conventionnelle ou ADF. Cette fonction s'applique à toute la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.24.1.8

Accusé de réception de l'activation de rapport d'événement d'usage d'arme à feu

Cette fonction permet de transmettre les événements d'usage d'arme à feu sur le canal de commande.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet et que le champ Rapport de mesure du capteur est activé.

10.24.2

LTE

La section Évolution à long terme (LTE) vous permet d'afficher ou de définir la fonctionnalité LTE.

Ces réglages s'appliquent à tout type de profil de données **Large bande** dans les profils de données.

IMPORTANT :

Les profils de données sont sélectionnés à partir du champ Sélection du profil de données du système ADF ou du champ Sélection du profil de données du système conventionnel.

Pour les communications par système conventionnel, les profils de données s'appliquent seulement aux systèmes conventionnels pour lesquels le champ Type de système est réglé à **ASTRO**.

Pour les communications ADF, les profils de données s'appliquent seulement aux systèmes ADF pour lesquels la valeur du champ Type de système est réglée à **ASTRO 25**.

10.24.2.1

Durée du seuil LTE hors de portée

Ce champ permet de déterminer la période pendant laquelle un signal LTE large bande est perdu avant de déterminer que la radio est hors de portée de la couverture du réseau LTE.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Cette sélection s'applique à tous les Type de profil de données des profils de données large bande. La durée est exprimée en secondes.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Cette fonction est uniquement disponible dans l'Affichage expert (voir Affichage codeplug).

Tableau 150 : Portée

Minimum	Maximum
60 secondes	3600 secondes

10.24.2.2

Données en itinérance

Les données en itinérance permettent à l'utilisateur d'activer les données de l'utilisateur (pas de joindre) en itinérance.

10.24.2.3

Nom du point d'accès

Ce champ permet de définir des noms reconnaissables utilisés par la radio pour une connexion LTE de classe 3.

AVERTISSEMENT :

la valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié à la demande de l'opérateur LTE. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

AVERTISSEMENT :

Cette valeur doit uniquement être modifiée par les techniciens sur le terrain à la demande de l'opérateur LTE.

Cette sélection s'applique à tous les Type de profil de données des profils de données large bande.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Cette fonction est uniquement disponible dans l'Affichage expert (voir Affichage codeplug).

10.24.3

Wi-Fi

Cette section vous permet d'afficher ou de modifier les réglages Wi-Fi applicables à tous les profils de données.

IMPORTANT :

Les profils de données sont sélectionnés à partir du champ Sélection du profil de données du système ADF ou du champ Sélection du profil de données du système conventionnel.

Pour les communications par système conventionnel, les profils de données s'appliquent seulement aux systèmes conventionnels pour lesquels le champ Type de système est réglé à **ASTRO**.

Pour les communications ADF, les profils de données s'appliquent seulement aux systèmes ADF pour lesquels la valeur du champ Type de système est réglée à **ASTRO 25**.

Pour des raisons de sécurité, l'attribution de modèles et l'importation de fichiers .csv sont autorisées si vous entrez le ou les bons mots de passe pour chaque entrée réseau dans le tableau Wi-Fi. Vous devez également entrer le ou les bons mots de passe dans l'application autonome pour l'exécution des tâches de clonage/clonage express et de programmation par lot.

10.24.3.1

Activer Wi-Fi

Ce champ indique si Wi-Fi est activé ou désactivé sur la radio.

Cette fonction s'applique à tous les profils de données.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.24.3.2

Autoriser le contrôle de l'utilisateur

Ce champ permet à l'utilisateur de contrôler le Wi-Fi.

Cette fonction s'applique à tous les profils de données.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.24.3.3

Priorité réseau

Ce champ définit la priorité des réseaux Wi-Fi disponibles.

Plus cette valeur est basse, plus la priorité est élevée.

Accès seulement : Lorsque le champ [Activer Wi-Fi à la page 364](#) est réglé à **Activé** et que le modèle ou l'option de la radio le permet.

Tableau 151 : Portée

Minimum	Maximum	Incréments
1	255	1

10.24.3.4

SSID réseau

Ce champ spécifie le nom du réseau (SSID) d'un réseau Wi-Fi dans la liste des réseaux configurés.

REMARQUE :

Le SSID ne peut pas être enregistré si ce champ est laissé vierge ou vide.

Le SSID doit comporter des caractères ASCII et les SSID dupliqués ne sont acceptés.

Accès seulement : Lorsque le champ [Activer Wi-Fi à la page 364](#) est réglé à **Activé** et que le modèle ou l'option de la radio le permet.

10.24.3.5

Type de sécurité

Ce champ indique le protocole de sécurité utilisé pour le réseau Wi-Fi.

Les sélections suivantes sont prises en charge :

- **AUCUNE**
- **WEP**
- **WPA2/WPA**

Accès seulement : Lorsque le champ [Activer Wi-Fi à la page 364](#) est réglé à **Activé** et que le modèle ou l'option de la radio le permet.

10.24.3.6

Mot de passe réseau chiffré

Mot de passe de 63 caractères pour le réseau Wi-Fi.

**REMARQUE :**

Pour le Type de sécurité **WEP**, le mot de passe sera composé de 5 ou 13 caractères. Pour tous les autres types, le mot de passe sera composé d'au moins 8 caractères et ne peut pas être laissé vierge ou nul. Pour tous les types de sécurité, les caractères ASCII sont autorisés.

L'appareil de l'abonné (SU) prend en charge la configuration clé WEP en mode ASCII uniquement pour la sécurité WEP. Par conséquent, la configuration ASCII WEP40 (touche 5 caractères telle que « abcde ») ou WEP104 (clé à 13 caractères telle que « 1234567890123 ») est prise en charge dans le module. Le SU ne prend pas en charge la configuration clé WEP hexadécimale.

Accès seulement : Lorsque le champ [Activer Wi-Fi à la page 364](#) est réglé à **Activé**, que le champ [Type de sécurité à la page 365](#) est réglé à n'importe quoi sauf **Aucun**, et lorsque le modèle ou les options de la radio le permettent.

10.24.4

Liste NAT

Cette section vous permet d'afficher ou de définir jusqu'à 16 ensembles de règles de traduction d'adresse réseau (NAT) statiques basées sur le port pour la liste NAT.

Ces paramètres s'appliquent pour tous les [Profils de données à la page 375](#) ADF ou pour tous les [Profils de données à la page 375](#) conventionnels lorsque le champ Activer NAT des profils de données est réglé à **Activé**.

**IMPORTANT :**

Lorsqu'une des 5 fonctions suivantes est activée, l'une des 16 règles NAT possibles (enregistrements/rangées) est utilisée par RadioCentral :

- Service de messagerie texte (TMS)
- Service d'inscription automatique (ARS) – voir le champ Mode ARS
- [Activer l'emplacement à la page 119](#)
- Par liaison radio (OTAR) – voir le champ Activer OTAR

Les profils de données sont sélectionnés à partir du champ Sélection du profil de données du système ADF ou du champ Sélection du profil de données du système conventionnel.

Pour les communications par système conventionnel, les profils de données s'appliquent seulement aux systèmes conventionnels pour lesquels le champ Type de système est réglé à **ASTRO**.

Pour les communications ADF, les profils de données s'appliquent seulement aux systèmes ADF pour lesquels la valeur du champ Type de système est réglée à **ASTRO 25**.

10.24.4.1

Port LAN

Ce champ permet de sélectionner le port du réseau étendu (LAN) pour la règle en vigueur relative au protocole de traduction d'adresses de réseau (NAT) (enregistrement/rangée) de la Liste NAT.

Exemple : Le protocole NATing statique permet l'acheminement des demandes externes reçues par le port 90 de la radio au port 80 de l'ordinateur mobile (MC). Dans cet exemple, l'adresse IP NAT statique correspondrait à l'adresse IP de l'ordinateur mobile. Le port de ce dernier (80) serait le port LAN, et le port externe de la radio (90), le port WAN (réseau étendu).

S'applique uniquement :

- Pour tous les profils de données ADF
- Pour tous les Profils de données conventionnelles, lorsque le champ Profils de données, Activer NAT est réglé à **Activé**.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 152 : Portée

Minimum	Maximum
1	65535

AVERTISSEMENT :

La valeur par défaut « 0 » est considérée comme non valide par la RM et doit être correctement définie.

10.24.4.2

Adresse IP NAT statique

Ce champ permet de sélectionner l'adresse IP (Internet Protocol) NAT (traduction d'adresses de réseau) du réseau local qui met en correspondance les adresses IP de l'application ou de l'ordinateur mobile interne et les adresses IP affectées par le système.

Cette sélection s'applique pour la règle en vigueur relative au NAT (enregistrement/ rangée) de la liste NAT.

Exemple : Le protocole NAT statique permet l'acheminement des demandes externes reçues par le port 90 de la radio au port 80 de l'ordinateur mobile. Dans cet exemple, l'adresse IP NAT statique correspondrait à l'adresse IP de l'ordinateur mobile. Le port de ce dernier (80) serait le port LAN, et le port externe de la radio (90), le port WAN (réseau étendu).

S'applique uniquement :

- Pour tous les Profils de données - ADF
- Pour tous les Profils de données - Conventionnel, lorsque le champ Profils de données, Activer NAT est **Activé**

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

Chaque octet de l'adresse IP doit se situer entre : [0-223] . [0-255] . [0-255] . [0-255]

AVERTISSEMENT :

La valeur par défaut 0 . 0 . 0 . 0 est considérée comme non valide par la Gestion radio et doit être correctement définie.

10.24.4.3

Port WAN

Ce champ permet de sélectionner le port du réseau étendu (WAN) pour la règle en vigueur relative au protocole de traduction d'adresses de réseau (NAT) (enregistrement/rangée) de la Liste NAT.

Exemple : Le protocole NATing statique permet l'acheminement des demandes externes reçues par le port 90 de la radio au port 80 de l'ordinateur mobile. Dans cet exemple, l'adresse IP NAT statique correspondrait à l'adresse IP de l'ordinateur mobile. Le port de ce dernier (80) serait le port LAN, et le port externe de la radio (90), le port WAN (réseau étendu).

S'applique uniquement :

- Pour tous les Profils de données - ADF

- Pour tous les Profils de données - Conventiennel, lorsque le champ Profils de données, Activer NAT est **Activé**

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 153 : Portée

Minimum	Maximum
1	65535

AVERTISSEMENT :

La valeur par défaut « 0 » est considérée comme non valide par la RM et doit être correctement définie.

10.24.5

Configuration de protocole de données

Cette section permet d'afficher ou de modifier les paramètres relatifs aux algorithmes de compression d'en-tête Internet Protocol (IP).

Ces sélections s'appliquent donc à tous les profils de données.

IMPORTANT :

Les profils de données sont sélectionnés à partir du champ Sélection du profil de données du système ADF ou du champ Sélection du profil de données du système conventiennel.

Pour les communications par système conventiennel, les profils de données s'appliquent seulement aux systèmes conventiennels pour lesquels le champ Type de système est réglé à **ASTRO**.

Pour les communications ADF, les profils de données s'appliquent seulement aux systèmes ADF pour lesquels la valeur du champ Type de système est réglée à **ASTRO 25**.

AVERTISSEMENT :

Ces paramètres devraient être modifiés au besoin et uniquement par le personnel d'entretien qualifié. Une configuration inadéquate du protocole de données peut sérieusement nuire à la performance de la radio ou du système.

10.24.5.1

Nombre maximal de contextes de compression d'en-tête IP autre que TCP

Ce champ permet de déterminer le nombre maximal de contextes de compression d'en-tête IP autre que TCP (Transmission Control Protocol – Internet Protocol) permis pour chaque abonné.

Les directives sont conformes au document RFC2507, créé et mis à jour par le groupe de travail IETF (Internet Engineering Task Force). Le document RFC2507 les normes relatives aux algorithmes de compression des en-têtes IP. Cette sélection s'applique à tous les profils de données.

AVERTISSEMENT :

Ce champ doit être modifié par le personnel d'entretien qualifié au besoin seulement. Une configuration inadéquate du protocole de données peut sérieusement nuire à la performance de la radio ou du système.

Tableau 154 : Portée

Minimum	Maximum
0	16

10.24.5.2

Nombre maximal d'en-têtes compressés entre des en-têtes complets

Ce champ permet de déterminer le nombre maximal d'en-têtes IP autre que TCP (Transmission Control Protocol – Internet Protocol) compressés et envoyés entre des en-têtes complets.

Les directives sont conformes au document RFC2507, créé et mis à jour par le groupe de travail IETF (Internet Engineering Task Force). Le document RFC2507 les normes relatives aux algorithmes de compression des en-têtes IP. Cette sélection s'applique à tous les profils de données.

**AVERTISSEMENT :**

Ce champ doit être modifié par le personnel d'entretien qualifié au besoin seulement. Une configuration inadéquate du protocole de données peut sérieusement nuire à la performance de la radio ou du système.

Tableau 155 : Portée

Minimum	Maximum	Incréments
0	4080	16

10.24.5.3

Taille maximale d'en-tête permise pour la compression

Ce champ permet de déterminer la taille maximale des en-têtes pouvant être compressés.

Les directives sont conformes au document RFC2507, créé et mis à jour par le groupe de travail IETF (Internet Engineering Task Force). Le document RFC2507 décrit les normes relatives aux algorithmes de compression des en-têtes IP (protocole Internet). Cette sélection s'applique à tous les profils de données.

**AVERTISSEMENT :**

Ce champ doit être modifié par le personnel d'entretien qualifié au besoin seulement. Une configuration inadéquate du protocole de données peut sérieusement nuire à la performance de la radio ou du système.

Tableau 156 : Portée

Minimum	Maximum
60	255

10.24.5.4

Intervalle maximal entre les en-têtes complets

Ce champ permet de déterminer l'intervalle maximal entre les contextes de compression des en-têtes complets.

Les en-têtes non TCP compressés ne peuvent pas être transmis une fois que cet intervalle s'est écoulé après envoi du dernier en-tête. Les directives sont conformes au document RFC2507, créé et mis à jour par le groupe de travail IETF (Internet Engineering Task Force). Le document RFC2507 décrit les normes relatives aux algorithmes de compression des en-têtes IP (protocole Internet). Cette sélection s'applique à tous les profils de données. La durée est exprimée en secondes.

**AVERTISSEMENT :**

Ce champ doit être modifié par le personnel d'entretien qualifié au besoin seulement. Une configuration inadéquate du protocole de données peut sérieusement nuire à la performance de la radio ou du système.

Tableau 157 : Portée

Minimum	Maximum	Incréments
0 seconde	1275 seconde	5 seconde

10.24.5.5

Temps maximal de configuration de l'accès aux canaux contrôlés

Ce champ permet de sélectionner le temps requis pour accéder aux canaux contrôlés des paquets de données aux fins de transmission des données agencées par tranche.

La valeur de ce champ permet à la radio de déterminer si le temps d'accès aux canaux des paquets de données peut retarder la transmission après la tranche de données requise. Le cas échéant, les procédures d'accès aux canaux contrôlés ne sont pas entamées. Cette sélection s'applique à tous les profils de données. La durée est exprimée en millisecondes.

AVERTISSEMENT :

Ce champ doit être modifié par le personnel d'entretien qualifié au besoin seulement. Une configuration inadéquate du protocole de données peut sérieusement nuire à la performance de la radio ou du système.

Tableau 158 : Portée

Minimum	Maximum
0 (ms)	65535 (ms)

10.24.5.6

Variation de la source de temps

Ce champ permet de sélectionner l'écart de temps (microfentes) avant et après la valeur zéro, pendant lequel les deux horloges qui fournissent l'heure de diffusion synchronisée ne concordent pas.

Est considérée comme une fenêtre de vulnérabilité toute la période au cours de laquelle les données faisant l'objet de diffusions synchronisées peuvent être erronées ou trompeuses. Le processeur de signal numérique (DSP) ne tient pas compte des diffusions synchronisées pendant cette période. Celles-ci ne servent donc pas à l'établissement ni au maintien de la synchronisation avec l'heure du système. Cette sélection s'applique à tous les profils de données.

AVERTISSEMENT :

Ce champ doit être modifié par le personnel d'entretien qualifié au besoin seulement. Une configuration inadéquate du protocole de données peut sérieusement nuire à la performance de la radio ou du système.

Tableau 159 : Portée

Minimum	Maximum	Incréments
0 microfentes	268 microfentes	2 microfentes

REMARQUE :

Une microfente équivaut à 7,5 millisecondes.

10.24.6

Configuration du port

Cette section permet d'afficher ou de définir les réglages qui serviront au transfert des clés entre le chargeur de clé (KVL) et une radio. Ces réglages s'appliquent à tous les profils de données.

**IMPORTANT :**

Les profils de données sont sélectionnés à partir du champ Sélection du profil de données du système ADF ou du champ Sélection du profil de données du système conventionnel.

Pour les communications ADF, les profils de données s'appliquent seulement aux systèmes ADF pour lesquels la valeur du champ Type de système est réglée à **ASTRO 25**.

10.24.6.1

Port UDP d'authentification

Ce champ permet de sélectionner le numéro du port UDP (User Datagram Protocol) qui sert à communiquer avec le chargeur de variable de clé (KVL).

Un KVL est utilisé pour fournir les clés d'authentification à la radio. Cette fonction s'applique aux systèmes ADF APCO P25 (ASTRO 25).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 160 : Portée

Minimum	Maximum
49152	65535

10.24.6.2

Port UDP du rapport de position P25

Ce champ permet de sélectionner le numéro du port User Datagram Protocol (UDP) pour le Serveur de position que la radio écoute et sur lequel elle transmet les données du Rapport de position P25.

Cette fonction s'applique aux systèmes ADF ASTRO 25 (APCO P25) .

AVERTISSEMENT :

Cette sélection est valide uniquement si elle n'est pas égale à la valeur du Port UDP d'authentification, du Port LAN, du Port WAN, du Port de destination PAD, du Port OTAR de l'abonné, du Port UDP KMF ou du port de serveur KMF/OTAR (64414) et quand elle n'est pas égale aux valeurs de port UDP réservées utilisées par un autre service comme suit :

- Application Agent SNMP 0161– GET/SET
- Agent SNMP 0162 - Interruptions signalées
- Port de boucle UDP 4000 (pour tests internes)
- Application de services de position 4001 dans la plateforme principale globale
- Application de diagnostic 4002 - doit pouvoir effectuer des diagnostics livrés par des composants de radio internes à un ordinateur portable.
- Application du système 4003 - offre des services pour accéder aux ressources internes de l'appareil de l'abonné, telles que les touches, les affichages, les communications, etc.
- 4004 Un numéro de port « proxy » que l'application de système commence au nom d'une application de tiers exécutée sur un périphérique sans capacité IP.
- 4005 PN Server (ARS)
- 4006 Serveur DHCP (Dynamic Host Configuration Protocol)
- 4007 Service de messagerie texte APCO
- 4011 Réponse demande de diagnostic UDP
- 4012 Diffusion de diagnostics UDP
- 4050 Application OTAR
- 49223 Messages d'authentification utilisateur Envoyer/Recevoir

Accès seulement : lorsque le champ Activer l'emplacement est activé, le champ Rapport de localisation P25 est activé et lorsque le modèle ou les options de la radio le permettent.

Tableau 161 : Portée

Minimum	Maximum
1	65535

10.24.6.3

Port UDP de rapport de mesure du capteur

Ce champ permet de sélectionner le numéro du port UDP (User Datagram Protocol) pour le serveur de données de capteur que la radio écoute et auquel elle transmet les données du rapport de mesure.

Ce champ s'applique à la fois aux infrastructures de communication conventionnelles et ADF.

REMARQUE :

Ce champ devient applicable lorsque [Rapport de mesure du capteur à la page 363](#) est activé.

La valeur du port UDP de rapport de mesure du capteur ne doit pas être égale à la valeur de l'un des champs ci-dessous (configurables par le module RadioCentral) : Port LAN, Port WAN, Port UDP d'authentification, Port UDP du rapport de position P25, Port TCP de programmation sans fil, Numéro de port, Port OTAR de l'abonné, Port UDP KMF et Port de destination PAD.

Tableau 162 : Portée

Minimum	Maximum
49625	65535

Accès seulement : Lorsque le modèle ou l'option de la radio le permet et que le champ Rapport de mesure du capteur est activé.

10.24.6.4

Port UDP de chargement de clés KVL

Ce champ vous permet d'entrer le numéro de port User Datagram Protocol (UDP) pour le chargement de clé avec le chargeur de variable de clé (KVL).

AVERTISSEMENT :

La valeur du port UDP pour le chargement de clé KVL ne doit être égale à aucun des champs suivants :

- [Port LAN à la page 366](#)
- [Port WAN à la page 367](#)
- [Port UDP d'authentification à la page 371](#)
- [Port UDP du rapport de position P25 à la page 371](#)
- [Port TCP de programmation sans fil](#)
- [Numéro de port à la page 401](#)
- [Port OTAR de l'abonné à la page 329](#)
- [Port UDP KMF à la page 328](#)
- [Port de destination PAD à la page 387](#)
- [Port UDP de rapport de mesure du capteur à la page 372](#)

Tableau 163 : Portée

Minimum	Maximum	Incrément
49152	65535	1

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel**, et lorsque le champ [Source de chargement de clés à la page 302](#) est réglé à **KVL 25**, et lorsque le modèle ou l'option de la radio le permet.

10.25

Liste d'utilisateurs de données

Cette section vous permet d'afficher ou de définir le Service d'inscription automatique et les noms d'utilisateur et ID d'unité pour l'authentification utilisateur lorsque des justificatifs d'identité pour un autre serveur sont requis.

De plus, vous pouvez également définir les ID de radio des radios visées (voir Système conventionnel - ASTRO - ID individuels, et Système ADF - ASTRO 25 - ID d'unité). Ces noms d'utilisateur, ID d'unité et ID de radio sont utilisés pour des applications de données telles que la messagerie texte

REMARQUE :

Les valeurs de nom d'utilisateur et d'ID d'unité par défaut peuvent être programmées.

La sélection des profils de données s'effectue dans le champ Sélection du profil de données du système ADF.

La sélection des profils de données s'effectue dans le champ Sélection du profil de données du système conventionnel.

La touche Utilisateur et la sélection de menu Utilisateur vous permettent de vous connecter à un serveur de service d'inscription automatique spécifique ou à un serveur UNS (Unified Network Services) d'authentification utilisateur à l'aide de la combinaison exacte Nom de l'utilisateur, NIP / mot de passe et ID d'unité. Vous pouvez entrer manuellement les nom d'utilisateurs, les NIP/mots de passe et ID d'unités à l'aide du clavier de la radio.

10.25.1

Nom de l'utilisateur de données

Ce champ vous permet d'afficher ou de définir le Service d'inscription automatique et les noms d'utilisateur et ID d'unité pour l'authentification utilisateur lorsque des justificatifs d'identité pour un autre serveur sont requis.

De plus, vous pouvez également définir les ID de radio des radios visées (voir Système conventionnel - ASTRO - ID individuels, et Système ADF - ASTRO 25 - ID d'unité). Ces noms d'utilisateur, ID d'unité et ID de radio sont utilisés pour des applications de données telles que la messagerie texte.

REMARQUE :

Les valeurs de nom d'utilisateur et d'ID d'unité par défaut peuvent être programmées.

La sélection des profils de données s'effectue dans le champ Sélection du profil de données du système ADF.

La sélection des profils de données s'effectue dans le champ Sélection du profil de données du système conventionnel.

La touche Utilisateur et la sélection de menu Utilisateur vous permettent de vous connecter à un serveur de service d'inscription automatique spécifique ou à un serveur UNS (Unified Network Services) d'authentification utilisateur à l'aide de la combinaison exacte Nom de l'utilisateur, NIP / mot de passe et ID d'unité. Vous pouvez entrer manuellement les nom d'utilisateurs, les NIP/mots de passe et ID d'unités à l'aide du clavier de la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

Exemples : EMT-001, N° 500, UTILISATEURDEDONNÉES 1, N° A5

Les noms d'utilisateur acceptent les caractères A à Z, a à z, 0 à 9, -, *, #, &, \$, /, +, % et les espaces.

Vous pouvez utiliser jusqu'à 40 caractères.

Le nombre minimum d'entrées de la liste est 1, jusqu'à un maximum de 100.

10.26

Ensemble Liste de message texte rapide

L'ensemble **Liste de message texte rapide** permet à l'utilisateur d'afficher ou de définir des messages/requêtes de texte rapides à partir de contenu fréquemment utilisé pour le service de message texte. L'utilisateur radio peut ainsi sélectionner un message dans la liste de messages texte

rapide ou de requêtes et le transmettre facilement. Une fois sélectionné, un message de texte ou de requête rapide peut être modifié par l'utilisateur de la radio avant sa transmission (à condition que le service de messagerie texte soit réglé à **Illimité**). Les modifications s'appliquent uniquement pour cette transmission. L'original demeure tel qu'il a été défini dans la liste Liste de message texte rapide. Une requête TMS (service de messagerie texte) permet à l'utilisateur de la radio de définir l'information à inclure dans un modèle de requête prédéfini et d'envoyer ce modèle en tant que message à un serveur de requête; le serveur de requête transmet en retour un message texte contenant l'information demandée.

Accès seulement : Lorsque le service de requête TMS est seulement disponible avec une authentification utilisateur à un ou à deux facteurs, et que la Messagerie intelligente est réglée à **LMR**.

REMARQUE :

La fonction TMS est activée par système ADF ou système conventionnel distinct.

L'utilisateur radio accède à la messagerie texte en appuyant sur le bouton Service de messagerie texte, ou en sélectionnant la fonction Service de messagerie texte du menu.

La touche Texte rapide TMS et Requête TMS permet à l'utilisateur de la radio d'accéder directement aux fonctions de message texte et de requête rapide.

Le champ suivant est pris en charge :

10.26.1

Message texte rapide

Ce champ vous permet d'afficher ou de définir les messages Texte rapide ou de requête fréquemment utilisés du service de messagerie texte.

Vous pouvez ainsi sélectionner un message dans la liste de messages texte rapide ou de requêtes et le transmettre facilement.

Une fois sélectionné, vous pouvez modifier les messages texte rapide/requête avant leur transmission (à condition que le service de messagerie texte soit réglé à **Illimité**). Les modifications s'appliquent uniquement pour cette transmission. L'original demeure tel qu'il est défini. Une requête TMS vous permet de demander des informations à l'aide d'un modèle de requête préformaté et de l'envoyer en tant que message au serveur de requête. Ce serveur répond alors par un message texte contenant l'information demandée.

Accès seulement : lorsque le modèle ou les options de la radio le permettent et lorsque le service de requête TMS est disponible uniquement avec une authentification utilisateur à un ou à deux facteurs.

REMARQUE :

La fonction Service de messagerie texte est activée en fonction d'un système [Système ADF](#) or [Système conventionnel à la page 415](#).

Vous pouvez accéder à la messagerie texte en appuyant sur la touche [Service de messagerie texte](#) ou utilisant la sélection de menu [Service de messagerie texte à la page 224](#).

La touche [Texte rapide TMS à la page 194](#) et [Requête TMS à la page 193](#) vous permet d'accéder directement aux fonctions de texte rapide et de message de requête. Les valeurs de nom d'utilisateur et d'ID d'unité par défaut peuvent être programmées.

10.27

Profils de données

La fenêtre **Profils de données** permet de définir des profils différents selon les types et la configuration requise pour les communications de données.

Finalement, les profils de données sont définis dans les données de radio transmises sur des canaux conventionnels ou ADF, ou celles transmises sur un réseau LTE large bande.

**IMPORTANT :**

Les sélections et fonctions relatives à toutes les données s'appliquent à tous les profils de données.

Selon le type de profil de données sélectionné, les profils de données sont sélectionnés depuis le champ Sélection de profil de données du système ADF ou le champ Sélection de profil de données du système conventionnel.

Pour les communications par système conventionnel, les profils de données s'appliquent seulement aux systèmes conventionnels pour lesquels le champ Type de système est réglé à **ASTRO**.

Pour les communications ADF, les profils de données s'appliquent seulement aux systèmes ADF pour lesquels la valeur du champ Type de système est réglée à **ASTRO 25**.

10.27.1

Général

Cette section vous permet d'afficher ou de modifier les réglages de données pour chaque profil de données.

**REMARQUE :**

Les profils de données sont sélectionnés à partir du champ Sélection du profil de données du système ADF ou du champ Sélection du profil de données du système conventionnel.

Pour les communications par système conventionnel, les profils de données s'appliquent seulement aux systèmes conventionnels pour lesquels le champ Type de système est réglé à **ASTRO**.

Pour les communications ADF, les profils de données s'appliquent seulement aux systèmes ADF pour lesquels la valeur du champ Type de système est réglée à **ASTRO 25**.

10.27.1.1

Nom du profil de données

Ce champ vous permet de créer un nom reconnaissable pour le profil de données courant.

Les profils de données sont sélectionnés à partir du champ Sélection du profil de données du système ADF ou du champ Sélection du profil de données du système conventionnel.

Les sélections suivantes sont disponibles :

- Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.
- Vous pouvez utiliser jusqu'à 14 caractères.
- **Exemples** : EMT-001, #500, Électrique1, # A5
- Voir aussi : Validation des données dans les champs de nom.

10.27.1.2

Type de profil de données

Ce champ permet de sélectionner les capacités de communication de données de la radio pour le profil de données courant.

Les profils de données sont sélectionnés à partir du champ Sélection du profil de données du système ADF ou du champ Sélection du profil de données du système conventionnel.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont disponibles :

Conventionnel

La radio envoie et reçoit des données (et la voix) uniquement sur un système conventionnel ASTRO à équipement de réseau fixe (FNE).

ADF

La radio envoie et reçoit des données (et la voix) uniquement sur un système ADF ASTRO 25 IV & D (voix et données intégrées) .

Large bande uniquement

La radio envoie et reçoit des données uniquement sur un réseau de données LTE large bande (les opérations de voix se poursuivent sur un système conventionnel ASTRO ou ADF ASTRO 25).

Conventionnel et large bande

La radio peut envoyer et recevoir des données sur un système FNE conventionnel ASTRO ou un réseau de données LTE large bande (opérations de voix se poursuivent sur un système FNE conventionnel ASTRO). Lorsque les deux systèmes/réseaux sont disponibles pour les transmissions de données, la priorité est accordée au réseau LTE.

**AVERTISSEMENT :**

Lorsque sélectionné, le champ Mode de paquets de données doit être réglé sur « FNE »,

ADF et large bande

La radio peut envoyer et recevoir des données sur un système IV & D ADF ASTRO 25 ou un réseau de données LTE large bande (opérations de voix se poursuivent sur un système ADF ASTRO 25). Lorsque les deux systèmes/réseaux sont disponibles pour les transmissions de données, la priorité est accordée au réseau LTE.

10.27.1.3

Minuterie de retard programmé en file d'attente

Ce champ permet de déterminer la durée pendant laquelle les datagrammes IP (protocole Internet) peuvent rester dans la file d'attente de la radio, sans être transmis, avant leur suppression de la file.

Ce réglage détermine la durée d'attente des données dans la file de la radio, sans qu'elles soient transmises, avant leur suppression de la file. La radio reçoit parfois des données de l'ordinateur mobile à une vitesse excédant sa capacité de transmission, donc celles-ci doivent donc, le cas échéant, attendre dans la file d'attente de la radio. La sélection s'applique au profil de données actif. La durée est exprimée en secondes.

Accès seulement : Lorsque le champ [Type de profil de données à la page 376](#) n'est pas réglé à **Large bande seulement** et lorsque le modèle ou les options de la radio le permettent.

Tableau 164 : Portée

Minimum	Maximum
15 secondes	120 secondes

10.27.1.4

Données d'interruption de Rx vocale

Ce champ permet à une transmission vocale reçue (Rx) d'interrompre une communication de données.

Les communications de données sont interrompues dès la réception d'une transmission vocale pertinente par la radio. Cette fonction s'applique au profil de données ADF actif.

Accès seulement : Lorsque le [Type de profil de données à la page 376](#) est réglé à **ADF** ou à **ADF et large bande** et que le modèle ou l'option de la radio le permet.

IMPORTANT :

Si le type de balayage de la radio est réglé à Surv. prioritaire (voir Type de balayage), seule l'activité de transmission vocale en direct sélectionnée interrompt la communication de données.

10.27.1.5

Interruption de données par Rx vocale en mode de balayage prioritaire

Ce champ permet l'interruption d'une communication de données lors de la réception d'une transmission vocale (Rx) quand la radio est en mode de balayage de suivi prioritaire et reçoit une activité de membre prioritaire.

Accès seulement : lorsque [Type de profil de données à la page 376](#) est réglé à **ADF** ou à **ADF et large bande** et que [Données d'interruption de Rx vocale à la page 377](#) est activé.

10.27.1.6

Diffusion limitée

Ce champ permet à la radio d'acheminer des datagrammes de diffusion limitée par liaison radio à partir de l'ordinateur mobile (MC).

La fonction s'applique au profil de données actif.

Si la case n'est pas cochée, les datagrammes de diffusion limitée ne peuvent être transmis par liaison radio à partir de l'ordinateur mobile.

Accès seulement : Lorsque le champ [Type de profil de données à la page 376](#) n'est pas réglé à **Large bande seulement** et lorsque le modèle ou les options de la radio le permettent.

10.27.1.7

Données intersystèmes

Ce champ permet à une radio de tenter automatiquement l'activation du contexte tout en étant en itinérance sur un système ADF étranger.

Facilite l'accès aux services de données (tels qu'Emplacement et OTAR) sur ce système (voir aussi Itinérance inter-WACN). S'applique uniquement aux systèmes ASTRO 25 connectés à ISSI 8000 qui fonctionnent dans un réseau d'entreprise d'un client (CEN) combiné (étranger + système d'accueil). La sélection s'applique au Profil de données - ADF actif.

IMPORTANT :

Si l'activation du contexte est réussie sur le Système ADF étranger, alors la radio peut généralement accéder à tous les services de données disponibles sur ce système. Il ne peut pas répondre aux diffusions de données à l'échelle du système.

Accès seulement : Lorsque le champ [Type de profil de données à la page 376](#) est réglé à **ADF** ou à **ADF et large bande** et que le modèle ou les options de la radio le permettent.

10.27.1.8

Temps de retardement aléatoire

Ce champ permet à la radio de calculer une valeur de retardement aléatoire se situant entre 0 (zéro) et le temps de retardement de l'activation du contexte utilisé pendant l'activation du contexte du système.

Cette fonction s'applique uniquement au profil de données ADF actif. Si la case est décochée, le temps de retardement de l'activation du contexte est utilisé.

Accès seulement : Lorsque le [Type de profil de données à la page 376](#) est réglé à **ADF** ou à **ADF et large bande**.

10.27.1.9

Temps de retardement de l'activation du contexte

Ce champ permet de déterminer la durée maximale de retardement des tentatives d'activation du contexte du système.

La minuterie se met en marche après la première demande d'activation du contexte rejetée. Le champ Temps de retardement aléatoire permet de définir la façon dont cette valeur sera utilisée, et le champ Mode de retardement de l'activation du contexte contribue à déterminer le moment de son utilisation. Cette sélection s'applique uniquement au profil de données ADF courant. La durée est exprimée en minutes.

Accès seulement : Lorsque le [Type de profil de données à la page 376](#) est réglé à **ADF** ou à **ADF et large bande**.

Tableau 165 : Portée

Désactivé;	Minimum	Maximum
0 - désactivé	1 min	60 min

10.27.1.10

Version d'enregistrement des paquets de données

Ce champ permet de faire le choix entre les deux versions du protocole de convergence dépendant du sous-réseau (SNDCP) pour les données agencées par tranche.

Cette sélection s'applique uniquement au profil de données ADF courant.

Accès seulement : Lorsque le [Type de profil de données à la page 376](#) est réglé à **ADF** ou à **ADF et large bande**.

Les sélections suivantes sont disponibles :

SNDCPv1

La version 1 du SNDCP permet l'échange de messages d'enregistrement des paquets de données avec un système ASTRO 25 antérieur à la version 7.3. Cette sélection est non valide dans les cas suivants : Le Type de profil de données est réglé sur **ADF** ou **ADF et large bande** et que la Sélection de la liste de ports - Données améliorées n'est pas réglée sur **désactivé**.

SNDCPv3

La version 3 du SNDCP permet l'échange de messages d'enregistrement des paquets de données avec un système ASTRO 25 postérieur à la version 7.3.

10.27.1.11

Activer la compression d'en-têtes IP

Ce champ permet à la radio de transférer les messages plus efficacement en réduisant un nombre assez important d'utilisateurs de données actifs pour chaque voie d'acheminement des paquets de données.

Les en-têtes UDP (protocole de datagrammes utilisateur) ou IP (protocole Internet) excédentaires sont compressés avant d'être envoyés à destination. Cette sélection s'applique uniquement au profil de données ADF courant.

AVERTISSEMENT :

Cette fonction n'est pas compatible avec la fonction Effectuer/Terminer la connexion réglée sur **Sécurisé**.

Accès seulement : Lorsque le champ [Type de profil de données à la page 376](#) est réglé à **ADF** ou à **ADF et large bande**, et lorsque le champ [Version d'enregistrement des paquets de données à la page 379](#) est réglé à : **SNDCPv3**.

10.27.2

Fonctions

Cette section vous permet d'afficher ou de modifier les réglages de données pour chaque profil de données.

REMARQUE :

Les profils de données sont sélectionnés à partir du champ Sélection du profil de données du système ADF ou du champ Sélection du profil de données du système conventionnel.

Pour les communications par système conventionnel, les profils de données s'appliquent seulement aux systèmes conventionnels pour lesquels le champ Type de système est réglé à **ASTRO**.

Pour les communications ADF, les profils de données s'appliquent seulement aux systèmes ADF pour lesquels la valeur du champ Type de système est réglée à **ASTRO 25**.

10.27.2.1

Données de terminal

Ce champ permet à l'ordinateur mobile (MC) de transmettre ou de recevoir des paquets de données par liaison radio.

Cette fonction s'applique au profil de données actif.

Si la case est décochée, l'ordinateur mobile peut quand même communiquer à l'aide des applications de données internes, par liaison radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.27.2.2

Mode de retardement de l'activation du contexte

Ce champ permet de sélectionner les conditions d'utilisation du temps de retardement de l'activation du contexte par la radio.

La minuterie et le mode de retardement peuvent limiter le nombre de demandes radio concernant l'activation du contexte du système. Le réglage du champ Temps de retardement aléatoire détermine la façon dont le temps de retardement de l'activation du contexte sera utilisé dans le système ADF actif. La sélection s'applique au profil de données actif.

Les sélections suivantes sont disponibles :

Toujours retarder

La radio utilise le Temps de retardement de l'activation du contexte dans les cas suivants : si la tentative initiale d'activation du contexte du système a échoué, un échec du contexte ou s'il y a une perte du contexte causée par l'exécution d'une commande de désactivation reçue par le système ou si une réactivation est nécessaire.

Retarder en cas d'échec

La radio utilise le temps de retardement de l'activation du contexte seulement si l'activation du contexte du système a échoué.

10.27.2.3

Minuteries de nouvelle tentative et minuterie longue

Ce champ permet de définir la période d'attente de la radio après que toutes les nouvelles tentatives d'enregistrement sur le serveur pour l'enregistrement automatique aient échoué.

La radio permet cinq tentatives d'inscription (non modifiables) : une tentative initiale et quatre tentatives subséquentes. La minuterie se met en marche après la transmission de la quatrième tentative. La sélection s'applique au profil de données actif.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont disponibles :

**REMARQUE :**

Lorsque ce champ est réglé à **0-Désactivé**, la radio n'attend plus que l'inscription au serveur ARS se produise - 0 (zéro minute).

Tableau 166 : Portée

Minimum	Maximum	Incréments
5 (minutes)	300 (minutes)	1 (minute)

Tableau 167 : Portée

Désactivé;	Minimum	Maximum
4 - désactivé	5 minutes	300 minutes

10.27.2.4

Minuteries de nouvelle tentative et minuterie courte

Ce champ permet de déterminer l'intervalle entre chaque nouvelle tentative.

Certaines procédures d'application des données nécessitent parfois de nouvelles tentatives. La sélection s'applique au profil de données actif.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 168 : Portée

Minimum	Maximum	Incréments
5 secondes	90 seconde	5 secondes

10.27.2.5

Nombre de nouvelles tentatives

Ce champ permet d'établir le nombre de tentatives qu'effectue la radio pour certaines procédures d'application de données, jusqu'à ce qu'elle réussisse.

Le temps d'attente de la radio entre chaque tentative est déterminé par la valeur du champ [Minuteries de nouvelle tentative et minuterie courte à la page 381](#). La sélection s'applique au profil de données actif.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 169 : Portée

Minimum	Maximum
1	10

10.27.2.6

Mode ARS

Ce champ permet de sélectionner le mode Service d'inscription automatique (ARS) pour le profil de données courant.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont disponibles :

Désactivé;

Le mode ARS est désactivé.

BAR

Réglez ce paramètre lorsqu'un service ARS est utilisé dans le système. Cette option s'applique aussi bien à un serveur de notification de présence ARS (PN) existant qu'à un serveur d'authentification des utilisateurs.

Autre que serveur

Utilisez ce paramètre lorsque des services de résolution du nom sont nécessaires et qu'un serveur ARS n'est pas accessible. Cette sélection est uniquement valide : Lorsque le Type de profil de données est réglé à **Conventionnel** ou à **Conventionnel et large bande**, et lorsque le champ Mode de paquets de données n'est pas réglé à **FNE**.

Serveur amélioré

Active l'enregistrement ARS amélioré qui est uniquement pris en charge par une version logicielle UNS 5.1 ou supérieure.

10.27.2.7

Adresse de serveur pour l'enregistrement automatique

Ce champ permet de définir l'adresse IP (protocole Internet) du serveur d'inscription automatique (ARS) pour le profil de données courant.

Accès seulement : lorsque le champ [Mode ARS à la page 382](#) est réglé à **Serveur** et que le modèle ou l'option de la radio le permet.

Les sélections sont valides si les critères suivants sont respectés :

- Les quatre octets doivent être dans la plage : [1-223] . [0-255] . [0-255] . [0-255]
- L'adresse IP ne peut pas être l'adresse de diffusion limitée : 255.255.255.255

L'adresse IP doit appartenir à une classe A, B ou C valide :

- L'adresse IP est de classe A lorsque le premier octet se situe entre 0 et 127; l'ID du réseau est représenté par ce premier octet :
 - Lorsque l'adresse IP appartient à la classe A, l'adresse IP peut être dans la plage 1.0.0.1 à 126.255.255.254
 - Lorsque l'adresse IP appartient à la classe A, l'adresse IP ne peut pas être 0.xxx.xxx.xxx ou xxx.255.255.255 ou xxx.0.0.0 ou 127.xxx.xxx.xxx
- **L'adresse IP est de classe B lorsque l'octet 1 se situe entre 128-191; l'ID du réseau est représenté par les 2 premiers octets**
 - Lorsque l'adresse IP appartient à la classe B, l'adresse IP peut être dans la plage 128.1.0.1 à 191.255.255.254

- Lorsque l'adresse IP appartient à la classe B, l'adresse IP ne peut pas être 128.0.XXX.XXX ou XXX.XXX.255.255 ou XXX.XXX.0.0
- **L'adresse IP appartient à la classe C lorsque le premier octet est dans la plage 192-223; l'ID réseau correspond alors aux trois premiers octets :**
 - Lorsque l'adresse IP appartient à la classe C, l'adresse IP peut être dans la plage 192.0.1.1 à 223.255.255.254
 - Lorsque l'adresse IP appartient à la classe C, l'adresse IP ne peut pas être 192.0.0.XXX ou XXX.XXX.XXX.255 ou XXX.XXX.XXX.0

10.27.2.8

Inscription de localisation directe

Ce champ permet à la radio de s'inscrire directement sur un serveur de localisation prenant en charge le format de données de rapport de localisation P25 (Projet 25) (voir aussi Rapport de localisation P25).

La radio avertit le serveur de localisation de sa disponibilité par l'entremise d'un message LRRP (demande de position/protocole de réponse) et s'inscrit ensuite sur le serveur. Cette fonction s'applique au profil de données actif.

Accès seulement : lorsque le champ Activer l'emplacement est activé, que le champ [Mode ARS à la page 382](#) n'est pas réglé à **Serveur** et que le modèle ou l'option de la radio le permet.

10.27.2.9

Adresse IP serveur de localisation

Ce champ permet de définir l'adresse IP (Internet Protocol) du serveur d'emplacement sur lequel la radio s'enregistrera directement lorsqu'un serveur d'ARS (serveur d'inscription automatique) ou UNS (services de réseau unifiés) n'est pas disponible (voir aussi Inscription de localisation directe).

Cette fonction s'applique au profil de données actif.

REMARQUE :

Lorsque vous attribuez une adresse IP, s'assurer que l'adresse IP n'est pas en conflit avec toute autre adresse IP ou un sous-réseau utilisé par la radio. Les appareils externes tels que Wi-Fi, Modem de données externe et Si500 peuvent attribuer des adresses IP à certaines interfaces. Si des adresses IP ou des sous-réseaux en conflit sont utilisés, il est impossible de garantir le bon fonctionnement des fonctions de données.

169. 254. Le sous-réseau X. X. est réservé pour la de clonage de zone à zone, de sorte qu'aucune adresse IP ne peut commencer par 169. 254. X. X; sinon, ce champ sera non valide.

Accès seulement : Lorsque les champs suivants sont activés : Activer l'emplacement, Rapport de localisation P25 et Inscription de localisation directe. Le champ [Mode ARS à la page 382](#) n'est pas réglé à **Serveur**. Le modèle et les options de la radio le permettent.

Les sélections sont valides si les critères suivants sont respectés :

- Les quatre octets doivent être dans la plage : [1-223] . [0-255] . [0-255] . [0-255], et
- cette adresse IP peut correspondre à une adresse de diffusion limitée : 255255255255

Et, cette adresse IP :

- ne peut être parfaitement identique au champ Adresse IP de l'abonné 1 et
- ne peut être parfaitement identique au champ Adresse IP de l'abonné et
- ne peut être égale au champ Adresse IP de l'interface radio de l'abonné et
- ne peut être identique à l'adresse IP Bluetooth de l'abonné ou à l'adresse IP Bluetooth du pair et

- ne peut être parfaitement égale au champ Adresse de base du réseau PAN Bluetooth et
- ne peut correspondre entièrement au Sous réseau radio interne sur un quelconque profil de données.
- Ne peut pas être identique à l'adresse IP liaison série 1 et à l'adresse IP liaison série 2.

L'adresse IP doit faire partie d'une classe valide (A, B ou C) :

- **L'adresse IP est de classe A lorsque le premier octet se situe entre 0 et 127; l'ID du réseau est représenté par ce premier octet :**
 - lorsque l'adresse IP est Classe A, alors l'adresse IP peut être entre 1.0.0.1 et 126.255.255.254.
 - lorsque l'adresse IP est de classe A, alors l'adresse IP ne peut pas être 0.xxx.xxx.xxx ou xxx.255.255.255 ou xxx.0.0.0 ou 127.xxx.xxx.xxx
- **L'adresse IP est de classe B lorsque l'octet 1 se situe entre 128-191; l'ID du réseau est représenté par les 2 premiers octets**
 - lorsque l'adresse IP est Classe B, alors l'adresse IP peut être entre 128.1.0.1 et 191.255.255.254.
 - Lorsque l'adresse IP appartient à la classe B, l'adresse IP ne peut pas être 128.0.xxx.xxx ou xxx.xxx.255.255 ou xxx.xxx.0.0
- L'adresse IP appartient à la classe C lorsque le premier octet est dans la plage 192-223; l'ID réseau correspond alors aux trois premiers octets :
 - Lorsque l'adresse IP appartient à la classe C, l'adresse IP peut être dans la plage 192.0.1.1 à 223.255.255.254
 - Lorsque l'adresse IP appartient à la classe C, l'adresse IP ne peut pas être 192.0.0.xxx ou xxx.xxx.xxx.255 ou xxx.xxx.xxx.0

10.27.2.10

Mode PAD

Ce champ permet de sélectionner le mode de fonctionnement de l'application PAD (Assembleur/Désassembleur de protocole).

L'[Adresse de destination de l'application PAD à la page 387](#) et le [Port de destination PAD à la page 387](#) doivent être définis lorsque ce champ n'est pas réglé à **Désactivé**. La sélection s'applique au profil de données actif.

AVERTISSEMENT :

Lorsque le champ [Type de profil de données à la page 376](#) est réglé à **Large bande seulement** ou à **Conventionnel et large bande** ou à **ADF et large bande**, ce champ doit être réglé à **Désactivé**. Sinon, l'application considère que cela n'est pas valide.

Les sélections suivantes sont prises en charge :

Désactivé;

Le mode PAD n'est pas utilisé.

Continu

Mode qui sert aux appareils et aux applications qui doivent toujours envoyer des paquets de données d'une longueur fixe.

Phrase

Mode d'envoi de paquets de données sur la base de certains caractères de départ et d'arrêt (comme une phrase de données GPS). La Séquence de début PAD et la Séquence d'arrêt PAD doivent être définies.

Immédiat

Transfert de données brutes, c'est-à-dire qu'elles sont toutes transmises telles quelles (peu importe la taille).

10.27.2.11

Séquence de début du mode PAD

Ce champ vous permet d'entrer la séquence de début du mode Assembleur/Désassembleur de protocole (PAD) **Phrase**.

L'application PAD en réseau se sert de cette séquence pour détecter le début de la « phrase » de données. Les valeurs de début et [Séquence d'arrêt du mode PAD à la page 385](#) doivent être définies pour le mode PAD « phrase ». La sélection s'applique au profil de données actif.

Accès seulement : lorsque le champ [Mode PAD à la page 384](#) est réglé à **Phrase**.

Les sélections suivantes sont prises en charge :

- Les entrées doivent être composées de caractères hexadécimaux (0 à 9 et A à F).
- Les entrées doivent comprendre un nombre de caractères pair.
- Les entrées doivent contenir :
 - un minimum de 2 caractères et
 - un maximum de 18 caractères.

10.27.2.12

Séquence d'arrêt du mode PAD

Ce champ vous permet d'entrer la séquence d'arrêt du mode Assembleur/Désassembleur de protocole (PAD) **Phrase**.

L'application PAD en réseau se sert de cette séquence pour détecter la fin de la « phrase » de données. La [Séquence de début du mode PAD à la page 385](#) et la séquence d'arrêt doivent être définies pour le mode PAD « phrase ». La sélection s'applique au profil de données actif.

Accès seulement : lorsque le champ [Mode PAD à la page 384](#) est réglé à **Phrase**.

Les sélections suivantes sont prises en charge :

- Les entrées doivent être composées de caractères hexadécimaux (0 à 9 et A à F).
- Les entrées doivent comprendre un nombre de caractères pair.
- Les entrées doivent contenir :
 - un minimum de 2 caractères et
 - un maximum de 18 caractères.

10.27.2.13

Séquence d'échappement du mode PAD

Ce champ vous permet d'entrer la séquence d'échappement du mode Assembleur/Désassembleur de protocole (PAD) **Phrase**.

Cette séquence d'octets facultative sert à « échapper » à la détection des séquences de début et d'arrêt, advenant qu'elles fassent partie des données normales, afin qu'on ne les confonde pas avec le début ou la fin de la phrase. La sélection s'applique au profil de données actif.

Accès seulement : lorsque le champ [Mode PAD à la page 384](#) est réglé à **Phrase**.

Les sélections suivantes sont prises en charge :

- Les entrées doivent être composées de caractères hexadécimaux (0 à 9 et A à F).

- Les entrées doivent comprendre un nombre de caractères pair.
- Les entrées doivent contenir :
 - un minimum de 0 caractère
 - un maximum de 10 caractères.

10.27.2.14

Délai d'inactivité de réception en mode PAD

Ce champ permet de sélectionner la valeur de temporisation utilisée pour les modes Assembleur/Désassembleur de protocole (PAD) **Continu Phrase**.

En mode **Mode PAD à la page 384 Continu**, ce délai est utilisé pour le déclenchement de la transmission des données recueillies par l'application PAD, même si le seuil de tampon maximal n'est pas été atteint. La sélection s'applique au profil de données actif. La durée est exprimée en millisecondes.

Accès seulement : lorsque le champ **Mode PAD à la page 384** est réglé à **Phrase** ou à **Continu**.

Tableau 170 : Portée

Minimum	Maximum
0 (ms) (0 = Désactivé)	15000 (ms)

10.27.2.15

Valeur de blocage de transmission de l'application PAD

Ce champ permet de sélectionner le délai de transmission d'un groupe de données (provenant de l'application Assembleur/Désassembleur de protocole [PAD]) après la transmission du groupe de données précédent, ce qui maintient un intervalle régulier entre les transmissions (contrôle du débit).

Ainsi, l'application PAD (Assembleur/Désassembleur de protocole) peut envoyer uniquement (au maximum) un seul groupe de données dans ce délai. Ce dernier sert à différer les transmissions quel que soit le mode PAD. La sélection s'applique au profil de données actif.

Accès seulement : lorsque le champ **Mode PAD à la page 384** n'est pas réglé à **Désactivé**.

Tableau 171 : Portée

Minimum	Maximum
0 (ms) (0 = Désactivé)	15000 (ms)

10.27.2.16

Seuil de tampon maximal

Ce champ permet de sélectionner le seuil de tampon maximal (en octets) qui sert au déclenchement des transmissions en mode PAD « continu ».

Cette sélection correspond à la longueur des données recueillies en mode PAD Continu, avant l'envoi de ces dernières. Une fois que le seuil de tampon a été atteint, l'application PAD transmet les données (en mode continu seulement). La sélection s'applique au profil de données actif.

Accès seulement : lorsque le champ **Mode PAD à la page 384** est réglé à **Phrase** ou à **Continu**.

Tableau 172 : Portée

Minimum	Maximum
1 octet	3000 octets

10.27.2.17

Adresse de destination de l'application PAD

Ce champ permet d'entrer l'adresse de destination IP (extrémité distante) de l'application PAD (Assembleur/Désassembleur de protocole).

Cette entrée désigne l'adresse figurant dans la combinaison adresse-port qui représente la destination (extrémité distante) des paquets de données générés par l'application PAD. La sélection s'applique au profil de données actif.

Accès seulement : lorsque le champ [Mode PAD à la page 384](#) n'est pas réglé à **Désactivé**.

**REMARQUE :**

L'adresse IP peut correspondre à toute adresse valide saisie dans le format numérique avec points.

10.27.2.18

Port de destination PAD

Ce champ permet d'entrer le port de destination IP (extrémité distante) de l'application PAD (Assembleur/Désassembleur de protocole).

Cette entrée désigne le port figurant dans la combinaison adresse-port qui représente la destination (extrémité distante) des paquets de données générés par l'application PAD. La sélection s'applique au profil de données actif.

Accès seulement : lorsque le champ [Mode PAD à la page 384](#) n'est pas réglé à **Désactivé**.

Tableau 173 : Portée

Minimum	Maximum
1	65535

**IMPORTANT :**

La valeur par défaut « 0 » est une entrée non valide. Lorsque ce champ est applicable, la valeur doit être changée pour une valeur valide.

10.27.3

ID de groupe ADF

Cette section vous permet d'afficher ou de modifier les ID de groupe de données 1 à 8 de l'interface radio commune ASTRO 25.

Ces ID servent au décodage des adresses des données reçues seulement.

REMARQUE :

Grâce aux groupes de données, la radio peut recevoir les messages de groupe envoyés à ces ID ainsi que les paquets de données de diffusion transmis à l'ID TOUS LES APPELS (IP = 255.255.255.255). Ces sélections s'appliquent seulement au profil de données ADF actif.

IMPORTANT :

Les profils de données ADF sont sélectionnés dans le champ Sélection du profil de données du système ADF.

Pour les communications ADF, les profils de données s'appliquent seulement aux systèmes ADF pour lesquels la valeur du champ Type de système est réglée à **ASTRO 25**.

10.27.3.1

ID de groupe de données ASTRO 25

Ce champ permet de sélectionner l'ID de groupe de données de l'interface radio commune ASTRO 25 (au format décimal ou hexadécimal) pour la rangée ou l'enregistrement courant (1 à 8).

Cet ID sert au décodage des adresses des données reçues seulement. Grâce aux groupes de données, la radio peut recevoir les messages de groupe envoyés à ces ID ainsi que les paquets de données de diffusion transmis à l'ID TOUS LES APPELS (IP = 255.255.255.255). Cette sélection s'applique uniquement au profil de données ADF courant.

IMPORTANT :

L'ID « TOUS LES APPELS » est 6777215 (format hexadécimal 0xFFFFF); il est possible que cet ID ne soit pas entré parce qu'il existe dans la radio.

Accès seulement : Lorsque le [Type de profil de données à la page 376](#) est réglé à **ADF** ou à **ADF et large bande**.

Tableau 174 : Portée

Minimum	Maximum
1000000 (format hexadécimal 989680)	16777214 (format hexadécimal FFFFFE)

10.27.4

Large bande

Cette section vous permet d'afficher ou de définir la fonctionnalité LTE (Évolution à long terme). Ces paramètres s'appliquent uniquement aux Profils de données.

IMPORTANT :

Les profils de données sont sélectionnés dans le champ Sélection du profil de données du système ADF.

Pour les communications ADF, les profils de données s'appliquent seulement aux systèmes ADF pour lesquels la valeur du champ Type de système est réglée à **ASTRO 25**.

LTE large bande est une autre solution d'infrastructure de données pour les services et les applications de radio mobile terrestre (LMR). La fonction Large bande LTE peut considérablement augmenter la capacité de données et la vitesse de transmission de données de programmation radio (OTAP) sans fil de l'application. La fonction Large bande LTE peut également s'appliquer aux applications de données et services de données, comme le service de messagerie texte (TMS), la localisation GPS, le service d'inscription automatique (ARS) et le changement de clé par onde radio (OTAR). La large bande s'interface avec l'infrastructure de téléphone cellulaire standard pour fournir les connexions haute vitesse sans fil fondées sur l'adresse IP. Le chiffrement sécurisé pour les données à large bande radio s'effectue au moyen des technologies de réseau privé virtuel (VPN) programmées. Les communications vocales radio ne sont pas possibles avec le LTE large bande; par conséquent, les

communications vocales numériques se poursuivent sur une infrastructure de radio mobile terrestre (LMR) ASTRO conventionnelle ou ASTRO 25 ADF.

AVERTISSEMENT :

Les radios à capacité LTE ne prennent pas en charge les appareils Bluetooth (commerciaux prêts à l'emploi). Cependant, l'appariement basses fréquences exclusif à Motorola (LF MPP) Type d'appariement Bluetooth est possible sur les canaux dont le LTE large bande est activé.

REMARQUE :

Le LTE est actuellement uniquement disponible pour les radios portables APX 7000L.

10.27.4.1

Activer LTE

Permet l'utilisation des données sur LTE large bande (long Term Evolution) sur le profil de données courant.

AVERTISSEMENT :

Lorsque le champ [Type de profil de données à la page 376](#) est réglé sur **Conventionnel et large bande**, **ADF et large bande**, ou **Large bande seulement**, ce champ doit être **activé**. Sinon, RadioCentral considère cette sélection comme non valide.

Accès seulement : Lorsque le champ [Type de profil de données à la page 376](#) est réglé sur **Conventionnel** ou **Conventionnel et large bande** ou **ADF et large bande** et que le modèle ou les options de la radio le permettent.

10.27.4.2

Nom de l'hôte de la passerelle SmartConnect

Le nom de l'hôte de la passerelle SmartConnect définit l'emplacement de la passerelle SmartConnect sous la forme d'un domaine hôte entièrement qualifié (FQDN).

Le nombre maximal de caractères ASCII est 63.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.27.4.3

Numéro de port TLS de la passerelle SmartConnect

Ce champ vous permet de sélectionner le numéro de port TLS utilisé pour la fonction SmartConnect.

Le numéro de port TLS de la passerelle SmartConnect doit être unique à tout autre port configurable de l'application.

Tableau 175 : Portée

Par défaut	Minimum	Maximum	Incréments
49665	1	65535	1

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.27.5

Sécurité de la couche réseau

Cette section permet d'afficher ou de modifier les réglages des communications de données à chiffrement sécurisé et pour celles sur un réseau privé virtuel (RPV).

Voir aussi [Fonction LTE large bande](#).

Ces réglages s'appliquent aux profils de données individuels.

REMARQUE :

Les profils de données sont sélectionnés à partir du champ Sélection du profil de données du système ADF ou du champ Sélection du profil de données du système conventionnel.

Pour les communications par système conventionnel, les profils de données s'appliquent seulement aux systèmes conventionnels pour lesquels le champ Type de système est réglé à **ASTRO**.

Pour les communications ADF, les profils de données s'appliquent seulement aux systèmes ADF pour lesquels la valeur du champ Type de système est réglée à **ASTRO 25**.

10.27.5.1

Connexion sécurisée/non chiffrée

Ce champ permet de sélectionner le chiffrement sécurisé ou non des paquets de données transmis et reçus.

Les paquets de données chiffrés sont transmis sur la troisième couche réseau du modèle d'interconnexion de systèmes ouverts (OSI) à sept couches pour les communications en couches. Cette fonction s'applique au profil de données ADF actif.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique** ou à **Logiciel**, et lorsque le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est activé,

Et

Lorsque le [Type de profil de données à la page 376](#) est réglé à **ADF** ou à **ADF et large bande** et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont disponibles :

Effacer

Relie ou engage la transmission de données paquet APCO 25 ADF en mode normal (non chiffré).

Sécurisé

Permet la transmission chiffrée des paquets de données APCO 25 en mode ADF.

AVERTISSEMENT :

Valide uniquement lorsque le champ Activer la compression d'en-têtes IP est désactivé et que tous les enregistrements Mode de fonctionnement DAC dossiers ne sont pas réglés à **Accès au canal contrôlé**.

10.27.5.2

Sélection de profil KMF

Permet de sélectionner le profil KMF sécurisé à associer au profil de données ADF actif.

Les paquets de données chiffrés sont transmis sur la troisième couche réseau du modèle d'interconnexion de systèmes ouverts (OSI) à sept couches pour les communications en couches.

AVERTISSEMENT :

Ce champ est non valide lorsque le champ Adresse IP KMF du Profil KMF sécurisé est réglé sur 0.0.0.0.

IMPORTANT :

Lorsque ce champ n'est pas réglé à **Désactivé**, le champ [Sélection de clé à la page 391](#) du profil de données courant ne doit contenir que les clés sélectionnées à partir de la liste de clés de référence de chiffrement de matériel sécurisées associée à ce profil KMF sécurisé sélectionné.

L'application renvoie dans les faits aux clés de la liste des clés de chiffrement pour cette sélection. Les clés individuelles de la Liste de références de clés de chiffrement de matériel sécurisées renvoient aux clés de la Liste des clés de chiffrement du champ Référence de clé de chiffrement. Par conséquent, les clés sélectionnées lorsque le champ ASTRO OTAR est activé doivent d'abord être définies dans la Liste de références de clés de chiffrement de matériel sécurisées.

Lorsque ce champ est réglé à **Désactivé**, la valeur du champ [Sélection de clé à la page 391](#) pour le profil de données courant est choisie directement dans la liste des clés de chiffrement de la fenêtre Toute la sécurité.

Accès seulement : lorsque le champ [Type de profil de données à la page 376](#) est réglé à **ADF** ou à **ADF et large bande**, le [Connexion sécurisée/non chiffrée à la page 390](#) s'applique et est réglé sur **sécurisé** et lorsque le modèle et les options de la radio le permettent.

Les sélections suivantes sont disponibles :

Désactivé;

Voir la note importante ci-dessus.

Parcourir

Profils KMF sécurisés disponibles - les sélections de profils KMF sécurisés s'appliquent uniquement lorsque le champ Activer OTAR Toute la sécurité est activé et que la case Activer ASTRO OTAR Toute la sécurité est cochée.

10.27.5.3

Sélection de clé

Ce champ permet de sélectionner la clé de chiffrement sécurisée à utiliser pour les paquets de données transmis et reçus.

Les paquets de données chiffrés sont transmis sur la troisième couche réseau du modèle d'interconnexion de systèmes ouverts (OSI) à sept couches pour les communications en couches. La sélection s'applique au profil de données ADF actif.

IMPORTANT :

Lorsque le champ Sélection de profil ASTRO OTAR n'est pas réglé à **Désactivé**, pour le Profil de données courant, il est uniquement possible de sélectionner des clés à partir de la Liste de références de clés de chiffrement de matériel sécurisées de ce Profil ASTRO OTAR sécurisé sélectionné.

L'application renvoie en fait aux clés de la liste de clés de chiffrement applicable à cette sélection; les clés figurant dans la liste de clés de référence de chiffrement sécurisées correspondent aux clés de la liste de clés de chiffrement sélectionnée dans le champ Référence de clé de chiffrement Par conséquent, toute clé sélectionnée lorsque le champ Index de profil ASTRO OTAR est activé doit d'abord être définie dans la liste de références de clés de chiffrement sécurisé. Les clés prises dans le profil ASTRO OTAR avec le champ de liste des clés indépendante activé sont disponibles.

Lorsque le champ Sélection du profil ASTRO OTAR est réglé à **Désactivé**, cette valeur pour le profil de données courant est choisie directement dans la liste des clés de chiffrement de la fenêtre Toute la sécurité.

Accès seulement : lorsque le champ [Type de profil de données à la page 376](#) est réglé à **ADF** ou à **ADF et large bande**, le [Connexion sécurisée/non chiffrée à la page 390](#) s'applique et est réglé sur **sécurisé** et lorsque le modèle et les options de la radio le permettent.

Les sélections suivantes sont disponibles :

Tche Sec 1

Voir la note importante ci-dessus.

Parcourir

Sélections disponibles Toute la sécurité

10.27.5.4

Adresse de passerelle chiffrée

Ce champ permet d'entrer l'adresse de destination Internet Protocol version 4 (IPv4) de la passerelle de paquets de données chiffrée.

Cette fonction s'applique au profil de données ADF actif.

Accès seulement : Lorsque le champ [Type de profil de données à la page 376](#) est réglé à **ADF** ou à **ADF et large bande**, le [Connexion sécurisée/non chiffrée à la page 390](#) s'applique et est réglé à **sécurisé** et lorsque le modèle et les options de la radio le permettent.

Les sélections sont valides si les critères suivants sont respectés :

- Les quatre octets doivent être dans la plage : [1-223] . [0-255] . [0-255] . [0-255]
- Cette adresse IP peut correspondre à une adresse de diffusion limitée : 225.255.255.255

L'adresse IP doit faire partie d'une classe valide (A, B ou C) :

- L'adresse IP est de classe A dans ces circonstances :
 - l'octet 1 se situe entre 0-127; l'ID du réseau est représenté par ce premier octet
 - L'adresse IP est Classe A, alors l'adresse IP peut être entre 1.0.0.0 et 126.255.255.255.
 - L'adresse IP ne peut pas être 0.xxx.xxx.xxx ou 127.xxx.xxx.xxx
- L'adresse IP est de classe B dans ces circonstances :
 - L'octet 1 se situe entre 128-191; l'ID du réseau est représenté par les 2 premiers octets
 - L'adresse IP peut être 128.0.0.0 à 191.255.255.255

- L'adresse IP ne peut pas être x.x.255.255
- L'adresse IP est de classe C dans ces circonstances :
 - L'octet 1 se situe entre 192-223; l'ID du réseau est représenté par les 3 premiers octets
 - L'adresse IP est Classe C, alors l'adresse IP peut être entre 192.0.0.0 et 223.255.255.255.
 - L'adresse IP ne peut pas être x.x.x.255.255

10.27.5.5

Permettre Rx de paquets de données non chiffrés

Ce champ permet la réception de paquets de données non chiffrés, même si l'option **Sécurisé** a été sélectionnée dans le champ Effectuer/Terminer la connexion des données paquet.

Cette fonction s'applique au profil de données ADF actif.

Accès seulement : Lorsque le champ [Type de profil de données à la page 376](#) est réglé à **ADF** ou à **ADF et large bande**, le [Connexion sécurisée/non chiffrée à la page 390](#) s'applique et est réglé à **sécurisé** et lorsque le modèle et les options de la radio le permettent.

10.27.5.6

RPV chiffré/clair

Ce champ permet de sélectionner le chiffrement sécurisé ou aucun chiffrement sécurisé pour les données LTE large bande qui sont transmises ou reçues sur un réseau privé virtuel (RPV).

REMARQUE :

À la suite de l'authentification à l'aide d'une clé sécurisée pendant les négociations de protocole IKE (Internet Key Exchange) (voir [Sélection de clé VPN à la page 393](#)), les données large bande sont chiffrées avec les protocoles IPsec (sécurité du protocole Internet) et transmises à travers le réseau LTE via un tunnel RPV sécurisé qui relie la radio à une passerelle RPV dans le réseau d'entreprise d'un client (CEN). Cette fonction s'applique au profil de données actif.

Accès seulement : Lorsque le champ Fonctionnement sécurisé est réglé sur **Matériel**, le champ [Type de profil de données à la page 376](#) est réglé sur **Large bande seulement** ou **Conventionnel et large bande** ou **ADF et large bande** et le modèle et les options de la radio le permettent.

Les sélections suivantes sont disponibles :

Effacer

Relie ou engage la transmission de données large bande LTE en mode normal (non chiffré).

Sécurisé

Permet la transmission chiffrée des données en mode LTE large bande.

10.27.5.7

Sélection de clé VPN

Ce champ permet de sélectionner la clé de chiffrement sécurisé qui sera utilisée dans la phase d'authentification du protocole IKE (Internet Key Exchange) lors de l'établissement d'un tunnel sécurisé avec la passerelle du réseau privé virtuel (RPV).

Il ne s'agit pas de la clé qui sera utilisée pour sécuriser le tunnel avec la passerelle VPN, ces clés étant des clés de session dérivées du protocole IKE. Cette sélection s'applique au chiffrement sécurisé pour les communications de données LTE large bande, et uniquement pour le profil de données courant.

IMPORTANT :

Cette clé doit être une clé Advanced Encryption Standard AES-256 pour que cette fonction marche. Autrement, un message d'erreur s'affiche lors de la tentative d'établir un tunnel avec la passerelle VPN. La valeur Sélection de clé RPV du profil de données courant est directement choisie à partir de la fenêtre Toute la sécurité dans la liste des clés de chiffrement.

Accès seulement : Lorsque le champ Fonctionnement sécurisé est réglé sur **Matériel**, le champ [Type de profil de données à la page 376](#) est réglé sur **Large bande seulement** ou **Conventionnel et large bande** ou **ADF et large bande**, le champ [RPV chiffré/clair à la page 393](#) est réglé sur **Sécurisé** et le modèle et les options de la radio le permettent.

10.27.5.8

Adresse IP de la passerelle RPV

Ce champ vous permet d'entrer l'adresse de destination Internet Protocol version 4 (IPv4) de la passerelle du réseau privé virtuel (RPV) résidant dans le réseau d'entreprise du client (CEN).

Cette sélection s'applique au chiffrement sécurisé pour les communications de données LTE large bande, et uniquement pour le profil de données courant.

REMARQUE :

Lorsque vous attribuez une adresse IP, s'assurer que l'adresse IP n'est pas en conflit avec toute autre adresse IP ou un sous-réseau utilisé par la radio. Les appareils externes tels que Wi-Fi, Modem de données externe et Si500 peuvent attribuer des adresses IP à certaines interfaces. Si des adresses IP ou des sous-réseaux en conflit sont utilisés, il est impossible de garantir le bon fonctionnement des fonctions de données.

169. 254. x. x. est réservé pour la fonction de clonage de zone à zone, de sorte qu'aucune adresse IP ne peut commencer par 169. 254. x. x., autrement, ce champ ne sera pas valide.

Accès seulement : Lorsque le champ Fonctionnement sécurisé est réglé à **Matériel**, et lorsque le champ [Type de profil de données à la page 376](#) est réglé à **Large bande seulement** ou à **Conventionnel et large bande** ou à **ADF et large bande**, et que le champ [RPV chiffré/clair à la page 393](#) est réglé à **Sécurisé** et que le modèle ou l'option de la radio le permet.

Les sélections sont valides si les critères suivants sont respectés :

- Les quatre octets doivent être dans la plage : [1-223] . [0-255] . [0-255] . [0-255]
- Valeur par défaut de cette adresse IP = 0.0.0.0 et doit être définie.

L'adresse IP doit faire partie d'une classe valide (A, B ou C) :

- L'adresse IP est de classe A dans ces circonstances :
 - l'octet 1 se situe entre 0-127; l'ID du réseau est représenté par ce premier octet
 - L'adresse IP est Classe A, alors l'adresse IP peut être entre 1.0.0.1 et 126.255.255.254.
 - L'adresse IP ne peut pas être 0.xxx.xxx.xxx ou 127.xxx.xxx.xxx
- L'adresse IP est de classe B dans ces circonstances :
 - L'octet 1 se situe entre 128-191; l'ID du réseau est représenté par les 2 premiers octets
 - L'adresse IP est Classe B, alors l'adresse IP peut être entre 128.1.1.0 et 191.255.255.254.
- L'adresse IP est de classe C dans ces circonstances :
 - L'octet 1 se situe entre 192-223; l'ID du réseau est représenté par les 3 premiers octets

- L'adresse IP est Classe C, alors l'adresse IP peut être entre 192.0.1.1 et 223.255.255.254.
- L'adresse IP ne peut pas être x.x.x.0 ou x.x.x.255

10.27.5.9

Durée de retransmission du message VPN

Ce champ permet de sélectionner la tentative et l'intervalle de retransmission de message du réseau virtuel privé (RPV).

Voir [Tentatives de retransmission de message RPV à la page 395](#).

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Cette sélection s'applique au chiffrement sécurisé pour les communications de données LTE large bande, et uniquement pour le profil de données courant.

Accès seulement : Lorsque le champ Fonctionnement sécurisé est réglé sur **Matériel**, le champ [Type de profil de données à la page 376](#) est réglé sur **Large bande seulement** ou **Conventionnel et large bande** ou **ADF et large bande**, le champ [RPV chiffré/clair à la page 393](#) est réglé sur **Sécurisé** et le modèle et les options de la radio le permettent.

Tableau 176 : Portée

Minimum	Maximum	Incréments
10 secondes	60 secondes	1 seconde

10.27.5.10

Tentatives de retransmission de message RPV

Ce champ permet de sélectionner le nombre maximal de fois qu'un message est retransmis sur un réseau privé virtuel (RPV) en intervalles avant de déterminer la destination comme ne répondant pas.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Ces tentatives se poursuivront jusqu'à ce la confirmation de la réception de la transmission ou jusqu'à ce que le nombre de tentatives prévues soit atteint. Cette sélection s'applique au chiffrement sécurisé pour les communications de données LTE large bande, et uniquement pour le profil de données courant.

Accès seulement : Lorsque le champ Fonctionnement sécurisé est réglé sur **Matériel**, le champ [Type de profil de données à la page 376](#) est réglé sur **Large bande seulement** ou **Conventionnel et large bande** ou **ADF et large bande**, le champ [RPV chiffré/clair à la page 393](#) est réglé sur **Sécurisé** et le modèle et les options de la radio le permettent.

Tableau 177 : Portée

Minimum	Maximum
2	10

10.27.5.11

Intervalle de détection de pair inactif RPV

Ce champ permet de sélectionner la durée maximale d'inactivité au-delà de laquelle la connexion au réseau privé virtuel (RPV) sera indiquée comme perdue.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Cette sélection s'applique au chiffrement sécurisé pour les communications de données LTE large bande, et uniquement pour le profil de données courant. La durée est exprimée en minutes.

Accès seulement : Lorsque le champ Fonctionnement sécurisé est réglé à **Matériel informatique**, le champ [Type de profil de données à la page 376](#) est réglé à **Large bande seulement** ou **Conventionnel et large bande** ou à **ADF et large bande**, le champ [RPV chiffré/clair à la page 393](#) est réglé à **Sécurisé**, et le modèle et les options de la radio le permettent.

Tableau 178 : Portée

Minimum	Maximum	Incréments
5 (minutes)	60 (minutes)	1 (minute)

10.27.5.12

Marge de réattribution de clé RPV

Ce champ permet de sélectionner la durée avant que la connexion au réseau privé virtuel (RPV) ou l'activation du canal se termine avant de tenter de renégocier la connexion/réactivation.

Voir [Tentatives de réattribution de clé RPV à la page 396](#).

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Cette sélection s'applique au chiffrement sécurisé pour les communications de données LTE large bande, et uniquement pour le profil de données courant. La durée est exprimée en minutes.

Accès seulement : Lorsque le champ Fonctionnement sécurisé est réglé sur **Matériel**, le champ [Type de profil de données à la page 376](#) est réglé sur **Large bande seulement** ou **Conventionnel et large bande** ou **ADF et large bande**, le champ [RPV chiffré/clair à la page 393](#) est réglé sur **Sécurisé** et le modèle et les options de la radio le permettent.

REMARQUE :

Cette fonction est disponible uniquement dans l'Affichage expert (voir Affichage de la codeplug)

Tableau 179 : Portée

Minimum	Maximum	Incréments
1 (minute)	9 (minutes)	1 (minute)

10.27.5.13

Tentatives de réattribution de clé RPV

Ce champ permet de sélectionner le nombre de tentatives de négociation d'une connexion au réseau privé virtuel (RPV) ou d'un remplacement avant de renoncer.

Voir [Marge de réattribution de clé RPV à la page 396](#).

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Cette sélection s'applique au chiffrement sécurisé pour les communications de données LTE large bande, et uniquement pour le profil de données courant.

Accès seulement : Lorsque le champ Fonctionnement sécurisé est réglé sur **Matériel**, le champ [Type de profil de données à la page 376](#) est réglé sur **Large bande seulement** ou **Conventionnel et large bande** ou **ADF et large bande**, le champ [RPV chiffré/clair à la page 393](#) est réglé sur **Sécurisé** et le modèle et les options de la radio le permettent.

REMARQUE :

Cette fonction est disponible uniquement dans l'Affichage expert (voir Affichage de la codeplug)

Tableau 180 : Portée

Minimum	Maximum
1	10

10.27.6

Liste de contournement

Cette section vous permet d'afficher ou de modifier l'adresse d'origine, l'adresse de destination ou les deux (Ipv4) du protocole Internet version 4 pour les paquets de données qui devraient contourner le traitement sécurisé.

La fonction Liste de contournement s'applique uniquement aux Types de profil de données **ADF**, **Large bande seulement** et **ADF et large bande**, dont les profils sont définis pour les données radio transmises sur des canaux ADF par l'entremise d'un réseau LTE large bande.

Accès seulement : Lorsque la radio est compatible au niveau du modèle et de l'option et

- lorsque que le champ [Type de profil de données à la page 376](#) est réglé à **ADF** et que le champ [Connexion sécurisée/non chiffrée à la page 390](#) est réglé à **Sécurisé**, ou
- lorsque le Type de profil de données est réglé à **Large bande seulement** ou à **Conventionnel et large bande** et que le champ [RPV chiffré/clair à la page 393](#) est réglé à **Sécurisé**, ou
- Lorsque le Type de profil de données est réglé à **ADF et large bande** et que le champ Effectuer/ Terminer la connexion est réglé à **Sécurisé**, ou que le champ RPV chiffré/clair est réglé à **Sécurisé**.

10.27.6.1

Adresse IP

Ce champ vous permet de définir les adresses de contournement IPv4 (version 4 du protocole Internet) pour le Profil de données courant.

Les adresses de contournement IP s'appliquent aux paquets de données qui n'ont pas à faire l'objet d'un traitement sécurisé. Il est possible de créer plusieurs adresses de contournement IP (enregistrement ou rangées) dans la liste ou la table de contournement de chaque profil de données.

REMARQUE :

Lorsque vous attribuez une adresse IP, s'assurer que l'adresse IP n'est pas en conflit avec toute autre adresse IP ou un sous-réseau utilisé par la radio. Les appareils externes tels que Wi-Fi, Modem de données externe et Si500 peuvent attribuer des adresses IP à certaines interfaces. Si des adresses IP ou des sous-réseaux en conflit sont utilisés, il est impossible de garantir le bon fonctionnement des fonctions de données.

169. 254. X. X. est réservé pour la fonction de clonage de zone à zone, de sorte qu'aucune adresse IP ne peut commencer par 169. 254. X. X., autrement, ce champ ne sera pas valide.

Accès seulement : Lorsque la radio est compatible au niveau du modèle et de l'option et

- Le champ [Type de profil de données à la page 376](#) est réglé à **ADF** et le champ [Connexion sécurisée/non chiffrée à la page 390](#) est réglé à **Sécurisé**, ou
- Le [Type de profil de données à la page 376](#) est réglé à **Large bande uniquement** ou **Conventionnel et large bande** et le champ [RPV chiffré/clair à la page 393](#) est réglé à **Sécurisé**, ou
- Le [Type de profil de données à la page 376](#) est réglé à **ADF et large bande** et le champ [Connexion sécurisée/non chiffrée à la page 390](#) est réglé à **Sécurisé** ou si le champ [RPV chiffré/clair à la page 393](#) est réglé à **Sécurisé**

Les sélections sont valides si les critères suivants sont respectés :

- Les quatre octets doivent être dans la plage : [1-223] . [0-255] . [0-255] . [0-255]
- L'adresse IP peut correspondre à une adresse de diffusion limitée : 255255255255
- L'adresse IP doit faire partie d'une classe valide (A, B ou C) :
 - L'adresse IP est de classe A lorsque :
 - + l'octet 1 se situe entre 0-127; l'ID du réseau est représenté par ce premier octet
 - + L'adresse IP peut être 1.0.0.0 à 126.255.255.255
 - + L'adresse IP ne peut pas correspondre à 0. XXX . XXX . XXX ni à 127 . XXX . XXX . XXX
 - L'adresse IP est de classe B lorsque l'octet 1 se situe entre 128-191; l'ID du réseau est représenté par les 2 premiers octets
 - + L'adresse IP est Classe B, alors l'adresse IP peut être entre 128.0.0.0 et 191.255.255.255.
 - L'adresse IP est de classe C lorsque l'octet 1 se situe entre 192-223; l'ID du réseau est donc représenté par les 3 premiers octets :
 - + L'adresse IP est Classe C, alors l'adresse IP peut être entre 192.0.0.0 et 223.255.255.255.

10.27.6.2

Type d'adresse

Ce champ permet de sélectionner le type de l'adresse de contournement IP courante (enregistrement/rangée).

Les adresses de contournement IP s'appliquent aux paquets de données qui n'ont pas à faire l'objet d'un traitement sécurisé. Il est possible de créer plusieurs adresses de contournement IP (enregistrement/rangées) dans la liste ou la table de contournement de chaque profil de données.

Accès seulement : Lorsque le modèle et les options de la radio le permettent :

- Le champ [Type de profil de données à la page 376](#) est réglé à **ADF** et le champ [Connexion sécurisée/non chiffrée à la page 390](#) est réglé à **Sécurisé** ou à
- Le [Type de profil de données à la page 376](#) est réglé à **Large bande uniquement** ou **Conventionnel et large bande** et le champ [RPV chiffré/clair à la page 393](#) est réglé à **Sécurisé**, ou
- Le [Type de profil de données à la page 376](#) est réglé à **ADF et large bande** et le champ [Connexion sécurisée/non chiffrée à la page 390](#) est réglé à **Sécurisé** ou si le champ [RPV chiffré/clair à la page 393](#) est réglé à **Sécurisé**

Les sélections suivantes sont prises en charge :

Source

Permet à l'adresse IP courante de contournement (enregistrement/rangée) de ne pas nécessiter le chiffrement des paquets de données reçus. Par conséquent, ces paquets de données peuvent être reçus en mode non chiffré.

Destination

Permet à l'adresse IP courante de contournement (enregistrement/rangée) de ne pas nécessiter le chiffrement des paquets de données transmis. Par conséquent, ces paquets de données peuvent être transmis en mode non chiffré.

Les deux

Permet à l'adresse IP courante de contournement (enregistrement/rangée) de ne pas nécessiter le chiffrement des paquets de données reçus et transmis. Par conséquent, ces paquets de données peuvent être reçus et transmis en mode non chiffré.

10.27.7

Service de données améliorées

Cette section vous permet d'afficher ou de définir la fonctionnalité Données améliorées.

REMARQUE :

Les données améliorées fournissent un canal de communication de données agencées par tranche TDMA (accès multiple par répartition dans le temps) de phase 2 P25. Ce système offre une capacité et une fiabilité accrues par rapport au canal de données FDMA (accès multiple par répartition en fréquence) de phase 1.

IMPORTANT :

Les procédures de données améliorées s'appliquent exclusivement aux messages (radio à infrastructure) entrants courts, notamment les mises à jour de localisation GPS, à l'aide de tranches réservés attribuées par l'équipement de réseau fixe (FNE). Ces paramètres s'appliquent seulement aux profils de données qui servent aux communications ADF.

IMPORTANT :

Pour les communications ADF, les profils de données s'appliquent seulement aux systèmes ADF pour lesquels la valeur du champ Type de système est réglée à **ASTRO 25**.

Les profils de données sont sélectionnés dans le champ Sélection du profil de données du système ADF.

10.27.7.1

Sélection de la liste de ports

Ce champ permet de sélectionner la liste de ports de données améliorées à utiliser avec le profil de données courant.

REMARQUE :

les noms disponibles pour la sélection sont définis dans le champ Alias de la liste de ports.

Accès seulement : Lorsque le [Type de profil de données à la page 376](#) est réglé à **ADF** ou à **ADF et large bande** et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

- Désactivé;
- Parcourir (Listes des ports de données améliorées disponibles)

10.27.7.2

Permettre les données améliorées dans le canal de données classique

Ce champ permet de transmettre un datagramme d'entrée pour l'un des ports de données améliorées programmés à envoyer sur un canal de données classiques P25.

Se produit lorsqu'un canal de données améliorées n'est pas disponible ou que la radio utilise déjà un canal de données classiques P25. Cette fonction s'applique au profil de données courant.

Si cette fonction est désactivée, le datagramme est supprimé lorsque :

- la radio utilise déjà un canal de données classiques P25 et que le datagramme de données améliorées est transmis de force sur un canal de données améliorées, ou
- un canal de données améliorées n'est pas disponible

Accès seulement : lorsque le champ [Type de profil de données à la page 376](#) est réglé à **ADF** ou à **ADF et large bande**, que le champ [Sélection de la liste de ports à la page 399](#) n'est pas réglé à **Désactivé** et que le modèle ou l'option de la radio le permet.

10.27.7.3

Minuterie de retard programmé en file d'attente pour les données améliorées

Ce champ permet de définir la durée pour laquelle le datagramme de données amélioré est autorisé à rester dans la file d'attente de la radio avant d'être supprimé de la file s'il n'a pas été transmis.

REMARQUE :

lorsque les données proviennent d'une application interne ou sont transmises d'un ordinateur mobile (MC) à la radio, la vitesse de réception des données par la radio est parfois supérieure à celle de la transmission. Les données doivent parfois attendre dans la file d'attente de la radio. La sélection s'applique au profil de données actif. La durée est exprimée en secondes.

Accès seulement : lorsque le champ [Type de profil de données à la page 376](#) est réglé à **ADF** ou à **ADF et large bande**, que le champ [Sélection de la liste de ports à la page 399](#) n'est pas réglé à **Désactivé** et que le modèle ou l'option de la radio le permet.

Tableau 181 : Portée

Minimum	Maximum	Incréments
5 secondes	120 secondes	1 seconde

10.27.7.4

Envoyer des données pendant un délai d'urgence

Permet aux données d'être envoyée pendant un délai d'urgence.

10.27.8

Activation/désactivation des données ATAK

Ce champ active ou désactive les données ATAK de l'application ATAK sur la radio.

10.28

Liste de ports de données améliorées

La fenêtre **Liste de ports de données améliorées** permet d'afficher ou de définir les listes de ports de destination UDP (User Datagram Protocol) pour lesquels la transmission de données améliorées est autorisée. Vous pouvez définir jusqu'à vingt listes de ports de données améliorées.

**REMARQUE :**

une fois définie, une liste de ports de données améliorées peut être sélectionnée par profil de données à partir du champ Sélection de la liste de ports.

10.28.1

Alias de la liste de ports

Ce champ vous permet de définir des noms reconnaissables pour la liste de ports de données améliorées courante.

Une fois définie, une liste de ports de données améliorées peut être sélectionnée par [Profils de données à la page 375](#) à partir du champ [Sélection de la liste de ports à la page 399](#).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

**REMARQUE :**

Exemples : GPS 5, Liste de ports 1, Données am. 14

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Vous pouvez utiliser jusqu'à 14 caractères.

10.28.2

Numéro de port

Ce champ permet de sélectionner un numéro de port de destination UDP (User Datagram Protocol) pour un port associé à l'envoi de données améliorées pour l'enregistrement ou la rangée en cours de la liste de ports de données améliorées active.

Une fois définie, une liste de ports de données améliorées peut être sélectionnée par [Profils de données à la page 375](#) à partir du champ [Sélection de la liste de ports à la page 399](#).

**AVERTISSEMENT :**

Cette sélection est uniquement valide :

lorsque la valeur est unique à chaque enregistrement/rangée de la liste de ports de données améliorées, et

lorsqu'elle n'est pas égale à la valeur de [Port UDP d'authentification à la page 371](#), [Port OTAR de l'abonné à la page 329](#), ou [Port UDP KMF à la page 328](#) et

lorsqu'elle n'est pas égale à la valeur du port utilisé par un autre service : **4005** (serveur PN (ARS)), **4007** (service de messagerie texte), **4000** (Port de boucle UDP), **64414** (serveur KMF (OTAR)), **162** (SNMP (Simple Network Management Protocol) Agent), **49223** (authentification utilisateur) et **49165** (authentification radio).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Tableau 182 : Portée

Minimum	Maximum	Incréments
1	65535	1

10.29

Totalité du conventionnel

Cette section vous permet d'afficher ou de définir la fonctionnalité applicable à toute la radio pour toutes les personnalités conventionnelles.

Cette fonction ne s'applique pas lorsque la radio est utilisée en mode de communication ADF.

10.29.1

Général

Cette section permet d'afficher ou de définir la fonctionnalité de base de toute la radio qui s'applique uniquement au mode de communications conventionnel.

10.29.1.1

Type de moniteur

Ce champ permet de sélectionner la façon dont la radio désactive la sourdine lorsque la touche Moniteur est enfoncée. Le mode Moniteur silencieux, aussi appelé « échec de la ligne privée », vous permet d'écouter le canal avant une transmission.

Cette sélection s'applique aux communications conventionnelles.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Silencieux

Désactive la PL ou la DPL.

Ouvrir le silencieux

Désactive le silencieux; la sourdine du haut-parleur de la radio est désactivée afin de recevoir toute onde porteuse qui utilise le canal, peu importe l'intensité du signal. S'il n'y a pas d'onde porteuse, la radio active le son pour laisser entendre les bruits.

10.29.1.2

Activer fréquence directe

Ce champ permet de définir séparément les paramètres relatifs au mode Direct/Talkaround (En direct) pour tous les profils Options de fréquence.

Lorsque cette case n'est pas cochée, tous les paramètres relatifs au mode Direct/Talkaround (En direct) sont rétablis aux champs de paramètre Rx de la fonctionnalité Direct/Talkaround (En direct). Cette fonction s'applique à toute la radio en mode de communication conventionnel seulement.

REMARQUE :

Le champ Direct/Talkaround (En direct) de la fenêtre Personnalité conventionnelle permet d'activer ou de désactiver le mode Direct/Talkaround (En direct) selon le profil Options de fréquence de la Personnalité conventionnelle.

Vous pouvez sélectionner le mode Direct/Talkaround (En direct) au moyen de la touche Direct/Talkaround (En direct), du commutateur Talkaround/Direct (En direct) ou de la sélection de menu Direct/Talkaround (En direct).

10.29.1.3

Tonalité d'activation du loquet

Ce champ permet à la radio d'émettre une tonalité d'alerte chaque fois que la fonction « Moniteur » est verrouillée (voir la fonction Type de moniteur).

Le fait d'appuyer sur le bouton Moniteur pendant le temps indiqué pour l'activation du loquet verrouille la fonction d'écoute. La tonalité d'alerte confirme le verrouillage. Pour déverrouiller le mode d'écoute, il suffit d'appuyer de nouveau sur le bouton Moniteur. Cette fonction s'applique également aux communications conventionnelles.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.29.1.4

Temps d'activation du loquet

Ce champ permet de sélectionner la durée pendant vous devez maintenir la touche Moniteur enfoncée pour que la fonction **Moniteur** demeure verrouillée en continu.

Une fois ce délai échu, vous pouvez relâcher la touche Moniteur, et le mode « Moniteur » demeure actif. Si toutefois, pendant cette durée, l'utilisateur radio relâche le bouton, le mode d'écoute ne sera pas activé (c'est-à-dire que le verrouillage n'aura pas lieu). La radio reprend alors son fonctionnement normal. Pour déverrouiller le mode d'écoute, il suffit d'appuyer de nouveau sur le bouton Moniteur. Cette fonction s'applique également aux communications conventionnelles.

Voir la sélection [Type de moniteur à la page 402](#) pour plus de détails.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

Lorsque réglé à Désactivé, il n'y a pas de minuterie - 0 (zéro seconde). Le mode d'écoute se verrouille automatiquement dès que l'utilisateur radio appuie sur le bouton Moniteur.

Tableau 183 : Portée

Minimum	Maximum	Incréments
0,5 s	6 s	0,5 s

10.29.2

Fonctions

Cette section permet d'afficher ou de définir des paramètres qui s'appliquent à toutes les personnalités conventionnelles.

10.29.2.1

Minuterie de touche rapide PTT intelligent

Ce champ permet de sélectionner la durée maximale entre les pressions de la touche PTT, qui détermine la vitesse à laquelle vous devez enfoncer la touche PTT pour correspondre à un enfoncement Touche rapide.

La fonction de touche rapide (double pression) du bouton PTT peut avoir préséance sur les sélections Type de PTT intelligent ou **Blocage de Tx** pour une personnalité conventionnelle donnée. La radio peut donc transmettre des signaux même si le canal courant est occupé (voir aussi Minuterie de nouvelle tentative PTT intelligent).

Tableau 184 : Portée

Minimum	Maximum	Incréments
100 ms	5000 ms	100 ms

10.29.2.2

Minuterie de nouvelle tentative PTT intelligent

Ce champ permet de sélectionner le temps de recherche d'un canal libre (sans onde porteuse).

Cette minuterie est utilisée lorsque l'une ou l'autre des sélections Type de PTT intelligent, **Blocage Tx** est choisie pour une Personnalité conventionnelle. Si l'on appuie sur le bouton PTT et que le canal courant est occupé, la radio émettra une tonalité d'alerte jusqu'au relâchement du bouton PTT.

IMPORTANT :

La fonction Priorité de touche rapide est une fonction d'annulation qui vous permet d'émettre peu importe la règle de Blocage de Tx pour le type de PTT intelligent sélectionné actuellement. Voir aussi Minuterie de touche rapide PTT intelligent.

Tableau 185 : Portée

Minimum	Maximum	Incréments
0 ms	5000 ms	25 ms

10.29.2.3

Nombre de tentatives d'état

Ce champ permet de sélectionner le nombre maximal de fois que la radio tente d'envoyer un état défini dans RadioCentral.

La radio essaie de transmettre l'état jusqu'à ce qu'elle reçoive un accusé confirmant la réussite de l'opération ou jusqu'à ce qu'elle atteigne le nombre maximal de tentatives d'état. Voir aussi Sortie automatique de l'état. Cette sélection s'applique à tous les systèmes conventionnels.

Tableau 186 : Portée

Minimum	Maximum
1 tentative	14 tentatives

10.29.3

Ensemble d'ID de groupe ASTRO

L'**Ensemble d'ID de groupe ASTRO** permet à l'utilisateur de visualiser ou de modifier une fonctionnalité qui peut s'appliquer à tous les systèmes conventionnels de type ASTRO et donc à toutes les personnalités conventionnelles disposant d'une fonctionnalité de système ASTRO.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Le champ suivant est pris en charge :

10.29.3.1

ID de groupe

Ce champ permet de sélectionner (au format décimal ou hexadécimal) l'ID de groupe de données de l'interface radio commune (CAI) utilisée uniquement pour le décodage de l'adresse lors de la réception de données.

Ce numéro d'identification de groupe sert à associer la radio à un groupe de données précis pour l'adressage de messages de données. L'ID de groupe de données n'est pas utilisé lorsque les données sont transmises par radio. Cette sélection s'applique à l'ID de groupe courant (enregistrement/rangée) pour les systèmes conventionnels de type ASTRO.

10.29.4

Données ASTRO

Cette section vous permet d'afficher ou de modifier les fonctionnalités qui peuvent s'appliquer à tous les systèmes conventionnels de type ASTRO et donc, à toutes les personnalités conventionnelles ayant un système ASTRO.

**REMARQUE :**

Pour en savoir plus sur l'accès aux canaux de transmission de données, consultez la description opérationnelle de l'interface radio commune APCO-25 pour les canaux de communication conventionnels.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.29.4.1

Données CAI Tentatives Tx max.

Ce champ permet de sélectionner le nombre maximal de tentatives d'envoi d'un paquet de données par l'interface radio commune (CAI).

La radio essaie de transmettre le paquet jusqu'à ce qu'elle reçoive un accusé confirmant la réussite de l'opération ou jusqu'à ce qu'elle atteigne le nombre maximal de tentatives.

**REMARQUE :**

Cette sélection s'applique à tous les types de systèmes conventionnels ASTRO.

Tableau 187 : Portée

Minimum	Maximum	Incrément
2 tentatives	10 tentatives	1 tentative

10.29.4.2

Données CAI Minuterie de réponse

Ce champ permet de sélectionner la période minimale d'attente de la radio pour la réception d'un accusé confirmant la transmission des données par l'interface radio commune et avant le renvoi d'un autre paquet de données CAI.

**REMARQUE :**

Cette sélection s'applique à tous les types de systèmes conventionnels ASTRO.

Tableau 188 : Portée

Minimum	Maximum	Incréments
100 ms	5000 ms	100 ms

10.29.4.3

Données CAI Minuterie de réponse min.

Ce champ permet de sélectionner la période minimale d'attente de la radio pour l'envoi, sur l'ensemble du canal, d'un accusé confirmant la transmission de données par l'interface radio commune.

La valeur de ce paramètre doit être légèrement supérieure à celle du temps de transfert des données entre le contrôleur de réseau de radiocommunication et la radio. Cette sélection s'applique à tous les types de systèmes conventionnels ASTRO.

**IMPORTANT :**

Ne tentez pas de modifier ce paramètre avant d'avoir vérifié les particularités de l'ensemble du système.

Tableau 189 : Portée

Minimum	Maximum	Incréments
50 ms	2000 ms	50 ms

10.29.4.4

Taille maximale des paquets

Ce champ permet de sélectionner le nombre maximal d'octets que peut comporter un paquet de données transmis par l'interface radio commune (CAI). Cette sélection s'applique à tous les types de systèmes conventionnels ASTRO.

Tableau 190 : Portée

Minimum	Maximum	Incréments
16 octets	512 octets	16 octets

10.29.4.5

Période de recherche synchronisation image

Ce champ permet de sélectionner la période pendant laquelle la radio recherche une séquence de synchronisation de trames. La présence d'une séquence sur le canal indique qu'il y a une activité sur celui-ci.

Si aucune séquence de synchronisation de trames n'est détectée durant cette période, la radio considère que le canal est inactif et envoie le paquet de données d'interface radio commune (CAI) suivant dans la file d'attente d'émission. Cette sélection s'applique à tous les types de systèmes conventionnels ASTRO. La durée est exprimée en millisecondes.

**IMPORTANT :**

Cette valeur doit correspondre à la durée maximale de transmission de paquets de données par liaison radio. Exemple : Par exemple, pour un paquet de données d'interface radio commune (CAI) d'une taille maximale de 512 octets, la durée serait de 750 ms. Par conséquent, pour un fonctionnement approprié sur le canal en mode ASTRO, la durée devrait être supérieure à 200 millisecondes en raison de la taille de la trame ASTRO pour la voix.

Tableau 191 : Portée

Minimum	Maximum	Incréments
0 ms	5000 ms	50 ms

10.29.4.6

Tx plage aléatoire courte

Ce champ permet de sélectionner la période maximale pendant laquelle la radio doit attendre pour transmettre des données après la réception d'une première séquence de synchronisation des trames indiquant que le canal n'est pas occupé.

La radio vérifie de manière aléatoire l'état d'accès d'un canal en fonction de cette période d'attente maximale. Cette sélection s'applique à tous les types de systèmes conventionnels ASTRO. La durée est exprimée en millisecondes.

IMPORTANT :

L'augmentation de cette valeur a pour effet de réduire le risque de conflits avec d'autres radios tentant de transmettre des données (taille du canal), mais aussi d'accroître les délais d'accès aux canaux.

Tableau 192 : Portée

Minimum	Maximum	Incréments
50 ms	500 ms	50 ms

10.29.4.7

Plage aléatoire longue Tx

Ce champ permet de sélectionner la période maximale d'attente avant que la radio revérifie l'état d'un canal suivant la réception d'un avis indiquant que le canal est occupé.

Dès que le canal se libère, la radio peut envoyer le paquet de données CAI suivant se trouvant dans la file d'attente de transmission. La radio vérifie de manière aléatoire l'état d'accès d'un canal en fonction de cette période d'attente maximale. Cette sélection s'applique à tous les types de systèmes conventionnels ASTRO. La durée est exprimée en millisecondes.

Tableau 193 : Portée

Minimum	Maximum	Incréments
50 ms	5000 ms	50 ms

10.29.4.8

Tx plage aléatoire réponse

Ce champ permet de sélectionner la période maximale d'attente avant que la radio revérifie l'état d'un canal suivant la réception d'un avis indiquant que le canal est occupé.

Cette sélection s'applique uniquement aux avis se rapportant à l'interface radio commune (CAI). Dès que le canal se libère, la radio peut envoyer l'avis CAI suivant se trouvant dans la file d'attente de transmission. La radio vérifie de manière aléatoire l'état d'accès d'un canal en fonction de cette période d'attente maximale. Cette sélection s'applique à tous les types de systèmes conventionnels ASTRO. La durée est exprimée en millisecondes.

IMPORTANT :

L'augmentation cette valeur a pour effet de réduire le risque de conflits avec d'autres radios tentant de transmettre des données (taille du canal), mais aussi d'accroître les délais d'accès aux canaux.

Tableau 194 : Portée

Minimum	Maximum	Incréments
50 ms	1000 ms	50 ms

10.29.4.9

Patience limitée pour Tx

Ce champ permet de sélectionner la durée maximale de tentative de transmission d'un paquet de données par l'interface radio commune (CAI).

Une fois cette durée échu, la radio cesse ses tentatives de transmission. Cette sélection s'applique à tous les types de systèmes conventionnels ASTRO. La durée est exprimée en secondes.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

Lorsque réglé à **Infini**, aucune minuterie n'est utilisée; par conséquent, il n'y a pas de limite de temps de transmission.

Tableau 195 : Portée

Minimum	Maximum	Incréments
2 s	255 s	1 s

10.29.4.10

Profondeur de cache ARP

Ce champ permet de sélectionner le nombre d'entrées enregistrées dans la table ARP (protocole de résolution d'adresse) de la radio.

La table ARP est une mémoire cache qui stocke les mises en correspondance entre les adresses IP et les ID individuels. La profondeur de cache ARP accroît l'efficacité de la radio lorsque le nombre sélectionné dans RadioCentral correspond au nombre prévu d'appareils (disposant d'une adresse IP unique) avec lesquels la radio entre en communication. Cette sélection s'applique à tous les types de systèmes conventionnels ASTRO.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 196 : Portée

Minimum	Maximum
0	50

REMARQUE :

Une profondeur de cache de « 0 » indique qu'aucune adresse IP ne sera stockée. En d'autres mots, la sélection de cette valeur désactive la fonction de mémorisation ARP.

10.29.4.11

Temps de cache ARP

Ce champ permet de sélectionner la durée de stockage des entrées dans la profondeur de cache ARP. Si tous les appareils de communication du réseau disposent d'adresses IP fixes, il est recommandé de régler le champ Temps de cache à **Infini**. Ainsi, les entrées dans le cache ARP demeureront en mémoire.

Si la valeur de ce champ n'est pas réglée à **Infini**, le cache ARP sera vidé à la fin de la durée indiquée. Cette sélection s'applique à tous les types de systèmes conventionnels ASTRO. La durée est exprimée en heures.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet et que le champ Profondeur de cache ARP n'est pas réglé à 0.

REMARQUE :

Lorsque réglé à l'infini, les entrées dans la cache ARP y demeurent indéfiniment.

Tableau 197 : Portée

Minimum	Maximum	Incréments
1 heure	24 heures	1 heure

10.29.4.12

ID de client conventionnel (hexadécimal)

Ce champ permet de sélectionner un numéro d'ID du système de clé conventionnelle avancée (ACK) valide (voir Rapport de la clé du système) qui permet l'utilisation de l'opération des services tactiques (commande de blocage).

Le numéro d'ID du système ACK peut être sélectionné uniquement lorsque l'ACK est actuellement chargé dans RadioCentral. Les ACK sont chargés dans RadioCentral par l'entremise du port USB de l'ordinateur en utilisant les dispositifs de clé insérés dans un lecteur de dispositif de clé par port USB. Cette sélection s'applique à toutes les radio pour tous les systèmes conventionnels ASTRO.

AVERTISSEMENT :

Une fois que le champ opération des services tactiques est **Décoder** ou **Décoder et encoder**, et que l'action de décodage de déblocages de la radio est **Désactivée**, ce champ doit contenir un numéro ACK valide.

Une fois qu'un numéro ACK valide a été entré, une écriture de codeplug dans la radio peut avoir lieu lorsque l'ACK est actuellement chargée dans RadioCentral (voir le rapport de la clé du système).

Accès seulement : lorsque le champ Activer l'inhibition tactique est **activé** et que le modèle ou l'option de la radio le permet, et une fois qu'un numéro ACK valide a été entré dans ce champ et enregistré, cette valeur ne peut être modifiée que si son numéro ACK est actuellement chargé dans RadioCentral (voir le rapport de la clé du système).

La sélection suivante est prise en charge :

- la valeur d'usine par défaut est **0000**.

10.30

Liste d'alias état conventionnel

La **liste d'alias état conventionnel** permet d'afficher ou de définir des états conventionnels.

Vos états peuvent uniquement être transmis d'une radio à une unité principale (répartiteur). Ils rendent l'utilisation d'un canal plus efficace que les signaux vocaux. Cette fonction s'applique uniquement au mode de communication conventionnel.

REMARQUE :

Les alias état doivent être identiques (ou avoir la même signification) pour le répartiteur et les radios. Par exemple, l'alias de l'état 1 provenant du répartiteur doit être identique à l'alias de l'état 1 de la radio (ou en avoir la même signification).

Les messages MDC, DVRS et ASTRO sont activés individuellement par [Système conventionnel à la page 415](#), à partir du champ [État à la page 419](#).

Vous pouvez ensuite activer la fonction État à l'aide d'une touche État, d'une touche État direct ou d'une sélection de menu État (voir aussi [Nombre de tentatives d'état à la page 404](#) et [Sortie automatique de l'état à la page 238](#)).

10.30.1

Numéro de l'alias d'état

Ce champ permet de sélectionner un numéro unique pour l'état courant (enregistrement/rangée).

Ce numéro est mis en correspondance par la radio émettrice et la radio réceptrice; la correspondance détermine le texte d'alias d'état qui s'affiche à l'écran de la radio réceptrice.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.30.2

Texte de l'alias d'état

Ce champ vous permet de définir des noms reconnaissables pour l'état (enregistrement/rangée) courant.

Le [Numéro de l'alias d'état à la page 410](#) est mis en correspondance par la radio émettrice et la radio réceptrice; la correspondance détermine le texte d'alias d'état qui s'affiche à l'écran de la radio réceptrice.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

Exemples : MESSAGE-5, #510, Électrique

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Vous pouvez utiliser jusqu'à 14 caractères.

Voir aussi [Validation des données dans les champs de nom du CPS](#).

10.31

Liste d'ID du répéteur

La fenêtre **Liste d'ID du répéteur** vous permet d'afficher ou de définir les ID d'accès aux répéteurs lors du fonctionnement en mode de communications conventionnel.

Cela s'applique seulement si au moins l'un des deux champs Type de code d'accès au répéteur de la personnalité conventionnelle est réglé à **MDC** pour toute personnalité conventionnelle donnée.

REMARQUE :

Les ID de répéteur sont sélectionnées dans les champs ID du répéteur MDC de personnalité conventionnelle.

10.31.1

ID du répéteur

Ce champ permet de sélectionner un ID de répéteur (enregistrement/rangée) transmis par la radio pour que le répéteur accède à un canal de communications conventionnel.

L'ID de répéteur doit ensuite être sélectionné dans le champ ID du répéteur MDC de la personnalité conventionnelle pour utilisation sur des canaux de communications conventionnels précis. Le code d'accès au répéteur (RAC) permet à la radio d'accéder à un/des répéteur(s) particulier(s).

IMPORTANT :

Cela est vrai seulement lorsque le champ Type de code (bouton d'accès au répéteur 1/PTT) et/ou le champ Type de code (bouton d'accès au répéteur 2) pour l'accès au répéteur de la personnalité conventionnelle sont réglés sur **MDC** pour toute [Personnalité conventionnelle à la page 428](#) individuelle.

Tableau 198 : Portée

Minimum	Maximum	Incréments
1	9999	1

10.31.2

Tonalité (Hz)

Permet de sélectionner une seule tonalité (fréquence) transmise par la radio pour que le répéteur accède au canal de communications conventionnel.

Les tonalités (fréquences) uniques doivent ensuite être sélectionnées aux fins d'utilisation avec des canaux de communications conventionnels précis dans les champs de fréquences de tonalités uniques à personnalité conventionnelle. Chaque code d'accès au répéteur (RAC) permet à la radio d'accéder à un répéteur particulier.

**IMPORTANT :**

Cela s'applique seulement si au moins un des deux champs Type de code d'accès au répéteur de la personnalité conventionnelle est réglé à **Tonalité unique** pour tout **Personnalité conventionnelle** à la page 428 individuel dans la section RAC (personnalité conventionnelle).

Tableau 199 : Portée

Minimum	Maximum	Incréments
300 Hz	3000 Hz	0,1 Hz

10.32

Liste de groupes de conversation du système ASTRO

La **Liste de groupes ASTRO** vous permet de définir la fonctionnalité pour les membres individuels de la liste de groupes ASTRO courante. Les groupes de conversation ASTRO ne sont utilisés qu'avec les personnalités conventionnelles dans les systèmes conventionnels de type ASTRO.

**REMARQUE :**

On peut associer une liste de groupes de conversation à une personnalité conventionnelle au moyen du champ Liste de groupes de conversation.

Une fois qu'une liste a été sélectionnée pour une personnalité donnée, il est possible de choisir un groupe par défaut pour cette personnalité dans le champ ID de groupe ASTRO de la page Options de fréquence.

Selon la valeur du champ Type de sélection de la fenêtre Personnalité conventionnelle, vous pouvez accéder à une liste de groupes complète ou à un seul groupe lié au canal.

10.32.1

Général

Cette section vous permet de définir la fonctionnalité des listes de groupes ASTRO individuels et des membres des groupes dans chaque liste.

Les groupes de conversation ASTRO ne sont utilisés qu'avec les personnalités conventionnelles dans les systèmes conventionnels de type ASTRO. Vous pouvez vous servir des membres de la liste des groupes ASTRO pour faire des appels sélectifs ou envoyer des alertes d'appel. Selon la valeur du

champ Type de sélection de la fenêtre Personnalité conventionnelle, vous pouvez accéder à une liste de groupes complète ou à un seul groupe lié au canal.

REMARQUE :

On peut associer une liste de groupes de conversation à une personnalité conventionnelle au moyen du champ Liste de groupes de conversation. Une fois qu'une liste a été sélectionnée pour une personnalité, il est possible de choisir un groupe par défaut pour cette personnalité dans le champ Groupe ASTRO de la page Options de fréquence.

10.32.1.1

Nom de liste de groupes de conversation ASTRO

Ce champ vous permet de créer des noms reconnaissables pour la liste de groupes ASTRO courante.

Cette liste est sélectionnée dans le champ Liste de groupes de conversation du système ASTRO (fenêtre Personality Conventional).

REMARQUE :

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Vous pouvez utiliser jusqu'à 14 caractères.

10.32.1.2

Alias des groupes de conversation

Ce champ permet d'afficher l'information texte sur l'alias de groupe qui apparaît à l'écran.

Cette fonction s'applique à la liste de groupe ASTRO courante.

L'alias de groupe permet à votre nom reconnaissable de s'afficher lorsque vous faites défiler la liste de groupes ASTRO.

Si la case n'est pas cochée, les ID de groupe s'affichent à l'écran de la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.32.1.3

Index de profil ASTRO OTAR

Ce champ permet de sélectionner le profil KMF sécurisé qui sera utilisé par la liste de groupes ASTRO courante.

IMPORTANT :

Lorsque ce champ n'est pas réglé à **Désactivé**, le champ Sélectionner une clé pour la liste de groupes ASTRO courante ne doit contenir que les clés sélectionnées à partir de la liste de clés de référence de chiffrement de matériel sécurisées associée à ce profil KMF sécurisé sélectionné.

Veillez noter que le RadioCentral renvoie en fait aux clés de la liste de clés de chiffrement pour cette sélection; les clés individuelles provenant de la liste de références de clés matériel sécurisées renvoie aux clés de la liste de clés de chiffrement tirées du champ Référence de clé de chiffrement . Par conséquent, toute clé sélectionnée lorsque ce champ n'est pas réglé à **Désactivé** doit d'abord être définie dans la liste de références de clés de chiffrement de matériel sécurisées .

Lorsque ce champ est réglé à **Désactivé** ou qu'il est non applicable (grisé), la valeur du champ Sélectionner une clé est choisie directement dans la liste de clés de chiffrement de la fenêtre Toute la sécurité

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**, et lorsque le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est activé, et

Lorsque le champ [Activer OTAR à la page 303](#) est activé, lorsque le champ [Activer ASTRO OTAR à la page 304](#) est activé, et lorsque le modèle ou l'option de la radio le permet.

10.32.2

Liste de groupes de conversation

Cette section vous permet de définir la fonctionnalité des membres individuels des groupes de la liste de groupes ASTRO courante.

Les groupes de conversation ASTRO ne sont utilisés qu'avec les personnalités conventionnelles dans les systèmes conventionnels de type ASTRO.

REMARQUE :

On peut associer une liste de groupes de conversation à une personnalité conventionnelle au moyen du champ Liste de groupes de conversation. Une fois qu'une liste a été sélectionnée pour une personnalité donnée, il est possible de choisir un groupe par défaut pour cette personnalité dans le champ ID de groupe ASTRO de la page Options de fréquence.

Selon la valeur du champ Type de sélection de la fenêtre Personnalité conventionnelle, vous pouvez accéder à une liste de groupes complète ou à un seul groupe lié au canal.

10.32.2.1

Alias des groupes de conversation

Ce champ permet d'afficher l'information texte sur l'alias de groupe qui apparaît à l'écran.

Cette fonction s'applique à la liste de groupe ASTRO courante.

L'alias de groupe permet à votre nom reconnaissable de s'afficher lorsque vous faites défiler la liste de groupes ASTRO.

Si la case n'est pas cochée, les ID de groupe s'affichent à l'écran de la radio.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.32.2.2

ID de groupe

Ce champ permet de sélectionner un numéro d'identification unique (au format décimal ou hexadécimal) pour le groupe.

Cette sélection s'applique au groupe courant (rangée ou enregistrement) de la [Liste de groupes de conversation du système ASTRO à la page 411](#) courante.

Tableau 200 : Portée

Minimum	Maximum
0	65535

IMPORTANT :

Le groupe 65535 (FFFF hexadécimal) est un groupe de type « Tous les appels » qui s'applique à l'ensemble du système. Tous les autres groupes désactivent la sourdine lors d'une transmission du groupe 65535, et le groupe 65535 désactive la sourdine lors des transmissions pour tout ID de groupe.

Le groupe 0 est un groupe de type « Réception seulement » qui s'applique à l'ensemble du système et qui reçoit les émissions « Tous les appels » provenant du groupe 65535. Le groupe « 0 » reçoit également les appels sélectifs destinés à l'ID individuel ASTRO de l'utilisateur. Cette condition est possible uniquement si le champ Règle de désactivation de la sourdine Rx ASTRO d'une Personnalité ou d'un canal pour lequel cet ID de groupe est sélectionné contient la valeur **Silencieux sélectif**.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.32.2.3

Effectuer/Terminer la connexion vocale

Ce champ permet de sélectionner le mode de transmission du groupe courant.

Cette sélection s'applique au groupe courant (rangée ou enregistrement) de la [Liste de groupes de conversation du système ASTRO à la page 411](#) courante.

Les sélections suivantes sont prises en charge :

Sélectionner

Vous permet d'activer ou de désactiver le chiffrement sécurisé des communications.

REMARQUE :

La touche Sélection de Tx sécurisée, le commutateur Sélection de Tx sécurisée ou la sélection de menu Sélection de Tx sécurisée vous permet d'accéder aux communications chiffrées sécurisées.

Effacer

Permet au canal de transmettre uniquement des communications conventionnelles (non sécurisées).

Sécurisé

Permet au canal de transmettre uniquement des communications chiffrées.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**.

10.32.2.4

Sélectionner une clé

Ce champ permet de sélectionner la clé de chiffrement sécurisé à utiliser en mode Chiffrement sécurisé pour le groupe (enregistrement/rangée) courant.

Cette sélection s'applique au groupe courant de la personnalité ADF courante.

IMPORTANT :

Lorsque le champ [Index de profil ASTRO OTAR à la page 412](#) n'est pas désactivé pour la liste de groupes ASTRO courante, cette valeur de sélection de clé est sélectionnée dans [Liste de références de clés de chiffrement de matériel sécurisées à la page 322](#) le profil KMF sécurisé sélectionné dans le champ Index de profil KMF.

AVERTISSEMENT :

Veillez noter que RadioCentral renvoie en fait aux clés de la [Liste des clés de chiffrement à la page 317](#) à cette sélection; les clés individuelles figurant dans la liste de clés de référence de chiffrement de matériel sécurisées correspondent aux clés de la [Référence de clé de chiffrement à la page 323](#) . Par conséquent, toute clé sélectionnée lorsque ASTRO OTAR est activé doit d'abord être définie dans la liste de références de clés de chiffrement de matériel sécurisées.

Lorsque le champ Index de profil KMF est désactivé ou non applicable (estompé) à la liste de groupes ASTRO courante, cette valeur de sélection de clé est choisie directement dans la liste des clés de chiffrement.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**, et lorsque le champ [Effectuer/Terminer la connexion vocale à la page 414](#) est réglé à **Sécurisé** ou à **Sélectionner**, et lorsque le modèle ou l'option de la radio le permet.

10.33

Système conventionnel

La fenêtre **Systèmes conventionnels** vous permet d'afficher ou de définir les systèmes d'émission de signaux individuels.

Les types de systèmes sont les suivants : **ASTRO**, **MDC**, **DVRS** et **Appel rapide II**. Les systèmes d'émission de signaux sont sélectionnés aux fins d'utilisation pour les personnalités conventionnelles.

REMARQUE :

Les systèmes conventionnels sont sélectionnés dans le champ Système ASTRO ou dans le champ Système non ASTRO de la personnalité conventionnelle.

10.33.1

Général

La section **Général** permet d'afficher ou de définir la fonctionnalité de base des systèmes d'émission de signaux de communications conventionnelles individuelles.

REMARQUE :

Les champs qui sont pris en charge sont dépendants de la valeur définie pour le Type de système.

Les systèmes conventionnels sont sélectionnés dans le champ Système ASTRO ou dans le champ Système non ASTRO de la personnalité conventionnelle.

10.33.1.1

Système ASTRO ou DVRS

Les champs suivants sont pris en charge lorsque le Type de système est réglé à **ASTRO** ou **DVRS** :

10.33.1.1.1

Nom du système conventionnel

Ce champ vous permet de créer des noms reconnaissables pour le système conventionnel courant.

Les systèmes conventionnels sont sélectionnés dans le champ Système ASTRO ou dans le champ Système non ASTRO de la personnalité conventionnelle.

REMARQUE :

Exemples : Byrne004, Alimentation03, N° 510

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Vous pouvez utiliser jusqu'à 14 caractères.

10.33.1.1.2

Type de système

Ce champ permet de sélectionner le type de système voulu pour le système conventionnel courant.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

- ASTRO
- MDC
- DVRS
- DTMF
- Appel rapide II
- Tonalité unique

REMARQUE :

Ces fonctions dépendent du modèle de radio ou des options choisies.

10.33.1.1.3

Numéro de groupe du système

Ce champ vous permet de définir un numéro de groupe de système pour un système conventionnel ASTRO non défini dans la codeplug courante.

Le numéro de groupe du système permet de regrouper logiquement dans la codeplug les systèmes conventionnels qui forment un système de liaison radio.

IMPORTANT :

Cette sélection s'applique seulement si le champ Nom du système est réglé à **Personnalisé** pour la rangée ou l'enregistrement actuel. La sélection correspond alors à un système conventionnel ASTRO « sur le terrain ». Cette sélection s'applique à l'ensemble d'identification d'appel actuel (rangée ou enregistrement) du contact actuel dans la liste d'appel unifiée. Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 667](#).

Accès seulement : Lorsque le champ Type de système est réglé à **Personnalisé** ou le modèle ou l'option de la radio le permet.

10.33.1.1.4

Délai de groupe pour tout le système

Ce champ permet de sélectionner la période d'attente de la radio une fois qu'un appel de groupe à l'échelle du système a pris fin.

Durant cette période d'attente, l'ID de groupe 65535 (format hexadécimal FFFF) sert pour tous les appels de groupe ASTRO. Cette sélection s'applique pendant le fonctionnement selon le système conventionnel ASTRO courant. La durée est exprimée en secondes.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO** et lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

- Désactivé;
- 12 heures
- 24 heures

REMARQUE :

La durée est exprimée en secondes.

10.33.1.1.5

Longueur du préambule

Ce champ permet de sélectionner la durée qui détermine le nombre minimal de paquets de bits de synchronisation envoyés au début de toutes les transmissions ASTRO.

Ces paquets permettent aux radios émettrices et réceptrices de se synchroniser avant les transmissions des systèmes ASTRO. Cette durée correspond à la longueur de préambule multipliée par 0,2083 millisecondes (ms). Cette sélection s'applique pendant le fonctionnement selon le système conventionnel ASTRO courant.

IMPORTANT :

Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique** ou à **Confidentialité numérique avancée**, la radio transmet un minimum de 50 millisecondes de préambule en raison des retards entraînés par le chiffrement du flux de données.

Accès seulement : lorsque le champ Type de système est défini à **ASTRO** ou **DVRS**.

Tableau 201 : Portée

Minimum	Maximum
0	1275

10.33.1.1.6

Patience limitée

Ce champ permet de sélectionner la durée pendant laquelle la radio attend que le trafic diminue au minimum sur le canal courant.

Exemples de transmissions utilisant cette valeur : Transmissions Avis d'appel, Appels sélectifs, Messages, États et Urgence. Cette sélection s'applique au système conventionnel courant. Dans le cas d'urgence, la radio attend poliment l'expiration des nouvelles tentatives impolies.

Accès seulement : Lorsque le champ Type de système est défini à **ASTRO**, **MDC** ou **DVRS**.

REMARQUE :

Lorsque réglé sur Infini, aucune minuterie n'est utilisée; par conséquent, la période d' est infinie.

Tableau 202 : Portée

Minimum	Maximum	Incréments
1 s	255 s	1

10.33.1.1.7

Sélection du profil d'urgence

Ce champ permet de sélectionner le profil d'urgence conventionnel à utiliser pour le système conventionnel courant.

Vous pouvez activer le mode d'urgence en appuyant sur la touche d'urgence

REMARQUE :

Le nom des choix qui s'affichent est défini dans le champ Nom de profil d'urgence.

Accès seulement : Lorsque le champ Type de système est réglé à **DVRS** ou à **MDC** ou (lorsque le champ Type de système est réglé à **ASTRO**, et lorsque le champ Système d'interface du site distant est désactivé).

Les sélections suivantes sont prises en charge :

- Tx d'urgence désactivée
- Profils d'urgence conventionnels possibles

10.33.1.1.8

Sélection du profil de données

Ce champ permet de sélectionner le profil de données à utiliser avec le système conventionnel ASTRO ou DVRS.

AVERTISSEMENT :

Pour le type de système **DVRS**, un profil de données est valide uniquement lorsque le Type de profil de données est réglé à **ADF**, et lorsque le champ Données d'interruption de Rx vocale est **activé**, et lorsque le champ Diffusion limitée est **désactivé**, et lorsque le champ Activer la compression d'en-tête IP est **désactivé**, et lorsque le champ Données de terminal est **désactivé**, et lorsque le champ Mode PAD est réglé à **Désactivé**, et lorsque toutes les entrées de la liste DAC ont leur mode de fonctionnement réglé à **APCO 25 classique**, et lorsque le champ (Données de paquet APCO 25) Connexion chiffrée/claire est réglé à **Non chiffré** ou à **Sécurisé**, et que la sélection de la liste de ports est réglée à **Désactivé**.

Lorsque le champ Radio double - Sélection de radio est réglé à **Radio secondaire** et que le champ Activer transmission sur radio secondaire est réglé à **Désactivé**, ce champ doit être réglé à **Désactivé** pour être considéré comme valide.

IMPORTANT :

Les systèmes ASTRO et DVRS conventionnels sont sélectionnés dans le champ Système ASTRO de la personnalité conventionnelle.

Accès seulement : Lorsque le champ Type de système est réglé à **DVRS**, ou (lorsque le champ Type de système est réglé à **ASTRO**, et lorsque le champ Système d'interface du site distant n'est pas coché).

Les sélections suivantes sont prises en charge :

- Données désactivées
- Profils de données disponibles

10.33.2

Fonctions

Cette section permet d'afficher ou de définir les fonctionnalités de base des systèmes d'émission de signaux ASTRO.

REMARQUE :

Les systèmes conventionnels sont sélectionnés dans le champ Système ASTRO ou dans le champ Système non ASTRO de la personnalité conventionnelle.

10.33.2.1

Blocage de la radio

Ce champ permet à la radio de recevoir, à distance, un signal de blocage lorsqu'elle fonctionne selon le système conventionnel courant.

Ce signal est en fait une commande de fermeture provenant de l'unité du répartiteur. À la réception de cette commande, la radio transmet un bref avis à l'équipement de répartition. La radio passe ensuite à l'état dormant; le récepteur audio se met en sourdine et la voie de transmission est bloquée. Pendant le blocage de tous les utilisateurs, toutes vos commandes sont désactivées; le mode balayage cesse de fonctionner sur le canal de réception de la commande et tous les voyants DEL de la radio s'éteignent.

**IMPORTANT :**

Pour annuler l'état dormant de la radio, envoyez une commande de déblocage à la radio ou rétablissez le processus Lecture/écriture de la radio.

Accès seulement : lorsque le champ Type de système est réglé à **DVRS** ou **MDC**) ou (lorsque le champ Type de système est réglé à **ASTRO**, et lorsque le champ Système d'interface du site distant n'est pas coché.)

10.33.2.2

Vérification de la radio

Ce champ permet à la radio de décoder une vérification radio et d'y répondre automatiquement.

La vérification radio permet au répartiteur de vérifier l'état de la radio (activée ou désactivée) pourvu qu'elle soit à la portée du système. Cette fonction s'applique au système conventionnel courant.

Accès seulement : lorsque le champ Type de système est réglé à **DVRS** ou **MDC**) ou (lorsque le champ Type de système est réglé à **ASTRO**, et lorsque le champ Système d'interface du site distant n'est pas coché.)

10.33.2.3

État

Ce champ permet d'activer la fonction État pour le système conventionnel courant.

La fonction État permet à l'utilisateur de sélectionner et d'envoyer un état précis à partir de la liste d'alias d'état programmée. Vous pouvez activer la fonction d'état à l'aide de la touche État ou État direct, ou avec la sélection de menu État (voir aussi Nombre de tentatives d'état et Sortie automatique de l'état).

Accès seulement : lorsque le modèle ou l'option de la radio le permet, et ((lorsque le champ Type de système est réglé à **DVRS** ou **MDC**) ou (lorsque le champ Type de système est réglé à **ASTRO**, et lorsque le champ Système d'interface du site distant n'est pas coché)).

10.33.2.4

Statut Request (Demande d'état)

Ce champ permet à la radio de répondre automatiquement à une demande d'état à distance en indiquant l'état à la dernière tentative. Cette fonction s'applique au système conventionnel courant.

Accès seulement : lorsque le modèle ou les options de la radio le permettent, et lorsque le champ Type de système est réglé à **DVRS** ou **MDC** ou (lorsque le champ Type de système est réglé à **ASTRO**, et lorsque le champ Système d'interface du site distant n'est pas coché)).

10.33.2.5

Indicateur Rx d'alarme d'urgence

Ce champ permet de sélectionner le type de notification que vous entendez et voyez lorsqu'une alarme d'urgence est reçue d'une autre radio.

Cette fonction doit aussi être activée (s'il y a lieu) dans le champ Indicateur Rx d'alarme d'urgence du système MDC ou du système ASTRO, ou dans le champ Indicateur Rx d'alarme d'urgence du système ADF. Cette sélection s'applique lorsque la radio est en mode d'urgence pour les communications conventionnelles et ADF.

IMPORTANT :

La durée de l'indicateur de réception d'alarme d'urgence est de 10 secondes. Pendant ces 10 secondes, vous pouvez désactiver l'indicateur en appuyant sur n'importe quelle touche, sauf celles du **volume** et des **voyants**.

Une fois que l'indicateur est éteint ou désactivé, les alarmes retransmises par le même ID principal de MDC ou ID individuel de système ASTRO ne sont pas acceptées au cours des 20 secondes suivantes.

Les alarmes d'urgence ne sont pas détectées lorsque la radio est en mode balayage.

Les alarmes d'urgence ne sont pas détectées lorsque la radio est active sur un canal vocal.

Les sélections suivantes sont prises en charge :

Aucune indication

Aucune alerte visuelle ou sonore.

Alerte seulement

Une alerte sonore est émise.

Affichage seulement

Une alarme visuelle s'affiche. L'option d'alerte visuelle est disponible seulement dans les modèles de radios avec écran.

Alerte et affichage

Une alerte sonore est émise, et une alerte visuelle s'affiche. L'option d'alerte visuelle est disponible seulement dans les modèles de radios avec écran.

REMARQUE :

Pour les options **Affichage seulement** et **Alerte et affichage**, voici ce qui se produit : Lorsque la radio détecte une alarme d'urgence, le message **EA-RCVD** (alarme d'urgence reçue) est affiché. Lorsque la radio détecte un signal de balise Toutes les alarmes, le message **BCON RX** (réception de balise d'urgence) s'affiche.

Le message **EA-RCVD** s'affiche pendant dix secondes pour l'un ou l'autre des ID suivants de la radio qui émet l'alarme d'urgence : ID principal de MDC, ID individuel du système ASTRO ou ID d'unité du système ADF. On peut aussi utiliser la fonction d'identification de l'appelant (l'inverse de l'attribution d'un pseudonyme).

10.33.2.6

Activer le protocole POP25

Ce champ permet à la radio de recevoir des communications Projet 25 (POP25) tout en fonctionnant sur le système conventionnel ASTRO courant.

La fonction POP25 est aussi appelée « OTAP » (programmation par liaison radio).

IMPORTANT :

Pour réaliser une communication POP25 sur un système ASTRO, il faut charger une clé conventionnelle avancée ou une clé de système avancé avec un accès OTAP/POP25 dans le module RadioCentral.

Accès seulement : lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel**, lorsque le champ Type de système est réglé à **ASTRO**, et lorsqu'un profil de données référencé valide a été sélectionné pour le système courant, lorsque le champ Système d'interface du site distant est désactivé, et lorsque le modèle ou l'option de la radio le permet.

10.33.2.7

Inscription de données CAI

Ce champ permet à la radio de s'inscrire dans la partie de données de l'infrastructure de l'équipement de réseau fixe (FNE, aussi appelé le « système »).

Le système envoie par la suite à la radio une réponse d'inscription des données CAI (interface hertzienne commune) ou un accusé de réception confirmant l'inscription. Les événements qui entraînent cette inscription sont les suivants : la mise sous tension de la radio, le changement de mode, la fin d'un balayage et la mise hors tension de la radio. Cette fonction s'applique au système conventionnel courant.

AVERTISSEMENT :

Ce champ devient non valide dans l'un des cas suivants :

- Lorsque le Type de système est réglé à **ASTRO**, lorsque le type du Profil de données défini est **Large bande seulement** et si ce champ est réglé à **Activé**.
- Lorsque le Type de système est réglé à **ASTRO**, lorsque le type du Profil de données défini est **Conventionnel et large bande** et si ce champ est réglé à **Désactivé**.

IMPORTANT :

La radio n'essaie d'inscrire les données CAI que si une fonction de données est activée pour le canal ou la personnalité sélectionnée.

Les fonctions de données de la radio ne deviennent accessibles que lorsque la radio est enregistrée dans le système et qu'elle reçoit du système une confirmation de l'inscription.

Accès seulement : Lorsque le champ Type de système est réglé sur **ASTRO**, lorsque le champ Système d'interface de site distant est désactivé et lorsque le modèle ou les options de la radio le permettent.

10.33.2.8

Envoyer la position à un pair/sur PTT

Le système ASTRO permet à la radio émettrice de chiffrer les coordonnées de sa position dans sa transmission vocal ASTRO d'une manière similaire à un ID de PTT (voir également Afficher la localisation du pair).

AVERTISSEMENT :

Le Mode ARS doit être réglé à **Serveur amélioré** dans le dossier du profil de données afin d'empêcher d'avoir un rapport sur les champs non valides lorsque le type de système est DVRS.

IMPORTANT :

Dans un système ASTRO, les émissions vocales radio à radio prennent en charge le chiffrement des coordonnées d'emplacement dans le flux vocal; en d'autres mots, les notifications conventionnelles et les appels sélectifs prennent en charge l'affichage de la localisation du pair; par contre, le mode téléphone DVRS et les autres fonctions dépendantes de l'infrastructure ne prennent pas en charge cet affichage. Dans un système DVRS, la transmission vocale radio à infrastructure prend en charge le chiffrement des coordonnées de position dans le flux vocal.

Si les coordonnées de position ne sont pas obtenues par le récepteur GPS de la radio (soit en raison d'une interruption du signal GPS d'une façon quelconque, soit parce que la fonction Activer

l'emplacement sélectionnable par l'utilisateur est activé et que vous avez désactivé la fonction GPS en appuyant sur le bouton Emplacement ou par la sélection de menu Emplacement), la radio chiffre les dernières coordonnées de position enregistrées dans le flux vocal.

Si l'intervalle de mise à jour depuis le dernier enregistrement des coordonnées de la position dépasse une minuterie interne, alors la radio marque les coordonnées de position dans le flux vocal comme étant « obsolètes »; s'il n'y a aucune coordonnée de position enregistrée, la radio envoie le flux vocal sans données de position.

Accès seulement : lorsque le modèle ou les options de la radio le permettent, et lorsque le champ Type de système est réglé à **ASTRO**, et lorsque le champ Type de système est réglé à **DVRS** et le mode ARS est **Serveur amélioré** dans son profil de données, et lorsque le champ Activer l'emplacement est activé.

10.33.2.9

Service de messagerie texte

Ce champ permet de sélectionner le mode de messagerie texte pour le système ASTRO conventionnel courant.

AVERTISSEMENT :

Si le service de messagerie texte est utilisé pendant le balayage des données et que la longueur du préambule de balayage de données est inférieure ou supérieure à la valeur par défaut, la minuterie courte de nouvelle tentative) doit être ajustée en conséquence. Par exemple, dans le mode de données directes (voir Mode de paquets de données), si la longueur du préambule de balayage de données augmente à 30 (20 étant la valeur par défaut), la minuterie courte de nouvelle tentative doit être ajustée à 25 secondes (15 étant la valeur par défaut). Pour chaque tranche de dix unités ajoutées à la longueur du préambule de balayage de données, on devra augmenter de 10 secondes la valeur de la minuterie courte.

IMPORTANT :

Vous pouvez accéder à la messagerie texte en appuyant sur la touche Service de messagerie texte ou utilisant la sélection de menu Service de messagerie texte.

Vous pouvez accéder à la messagerie texte rapide en appuyant sur la touche Texte rapide TMS.

Vous pouvez accéder à la messagerie de requête en appuyant sur la touche Requête TMS.

Accès seulement : lorsque le champ Type de système est réglé à **ASTRO**, et lorsqu'un profil de données référencé valide a été sélectionné pour le système courant, lorsque la sélection du profil de données n'est pas réglé à **Données désactivées**, que le mode Messagerie intelligente est réglé à **LMR**, et lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Aucun

La fonction est désactivée.

Liste seulement

Vous permet de sélectionner seulement les messages texte à partir de la liste Messages texte rapide programmés.

Illimité

Permet de faire une sélection parmi les messages texte rapide et d'entrer vos propres messages texte à partir du clavier de la radio.

AVERTISSEMENT :

Cette sélection est seulement disponible sur les radios dotées d'un clavier ou d'un microphone à clavier.

REMARQUE :

Cette sélection ne s'applique pas à l'APX N70.

10.33.2.10

Service de messagerie texte de groupe

Ce champ permet de sélectionner le mode de messagerie de groupe pour le système conventionnel ASTRO ou DVRS courant.

Accès seulement : lorsque le champ Type de système est réglé à **ASTRO** ou **DVRS** et lorsque le modèle ou les options de la radio le permettent.

Les sélections suivantes sont prises en charge :

Désactivé;

Le message texte de groupe ne sera pas reçu.

Décodage intégral

Le message texte de groupe sera reçu.

10.33.2.11

Sélection d'appel/Réinitialisation durant l'appel

Ce champ permet de choisir le déblocage avec une durée établie ou manuelle à la Règle de désactivation de la sourdine Rx ASTRO de la personnalité conventionnelle programmée et une durée limitée ou une exception de déblocage manuelle pour les avertissements d'appel lorsque vous activez la sourdine de voix du canal (voir également la fonction Activer l'alerte utilisateur en appel de la personnalité conventionnelle).

La durée de l'exception (différée ou manuelle) est appelée période d'arrêt du silencieux. Pour les deux sélections différées présentées ci-dessous, le champ Temps de réinitialisation automatique détermine en partie la durée de la période d'arrêt du silencieux. Cette sélection s'applique au système conventionnel courant.

**REMARQUE :**

Les systèmes ASTRO et DVRS conventionnels sont sélectionnés dans le champ Système ASTRO de la personnalité conventionnelle.

**IMPORTANT :**

Pour les avis d'appel, la période d'arrêt du silencieux commence lorsque la fonction Activer l'alerte utilisateur en appel pour la mise en sourdine de la voix est active et que la sourdine de la radio a été désactivée.

Pour les appels du système ASTRO, lorsque la fonction Alerte utilisateur en appel pour la mise en sourdine de la voix n'est pas active, la période d'arrêt du silencieux commence lorsque la règle de désactivation de la sourdine Rx ASTRO associée à la personnalité est respectée et que la sourdine de la radio a été désactivée. Lorsque vous activez la fonction Alerte utilisateur en appel pour la mise en sourdine de la voix, la période d'arrêt du silencieux s'applique seulement aux avis d'appel. Ceci s'explique par le fait que la fonction Mettre la voix en sourdine permet seulement à la radio de désactiver la sourdine pour les avis d'appel.

Accès seulement :

- Lorsque le champ Type de système est défini à **DVRS**, ou
- Lorsque le champ Type de système est réglé à **ASTRO** et lorsque le champ Système d'interface de site distant est activé.

Les sélections suivantes sont prises en charge :

Appel sélectif : Pour les deux sélections différées, lorsque le temps de réinitialisation automatique s'écoule et que la touche PTT de la radio est enfoncée, la minuterie s'arrête et se réinitialise; une fois la touche PTT relâchée, la minuterie redémarre (à zéro), ce qui prolonge la période d'arrêt du silencieux.

Manuelle

- Pour radio mobile : actuellement, cette sélection ne s'applique pas aux appels sélectifs.
- Pour radio portative : La touche « Moniteur » permet de mettre fin à la période d'arrêt du silencieux.

Auto

Si la minuterie vient à échéance, que la sourdine soit activée ou non, la période d'arrêt du silencieux prend fin et les règles de désactivation de la sourdine de Rx ASTRO devront de nouveau être appliquées pour désactiver la sourdine lors de prochaines transmissions.

Auto avec onde porteuse

Si la sourdine de la radio est désactivée lorsque la minuterie vient à échéance (en raison d'un changement d'onde porteuse), la sourdine demeure désactivée jusqu'à ce que l'onde porteuse ne soit plus captée. Lorsque l'onde porteuse n'est plus captée et que la radio est mise en sourdine, la minuterie est réinitialisée et redémarrée, ce qui a pour effet de prolonger la période d'arrêt du silencieux; si, par la suite, la sourdine de la radio reste active pendant tout le temps prévu à la minuterie (sans remplacement de l'onde porteuse), la période d'arrêt du silencieux prendra fin et les règles de désactivation de la sourdine de Rx ASTRO devront de nouveau être appliquées pour désactiver la sourdine lors de prochaines transmissions.

Alerte d'appel**Manuelle**

Vous pouvez appliquer les deux méthodes d'arrêt du silencieux suivantes si les valeurs « Auto » ou « Auto avec onde porteuse » (Auto av. fourn.) sont sélectionnées.

- Lorsque la fonction Activer l'alerte utilisateur en appel pour la mise en sourdine de la voix est active, le fait d'appuyer sur la touche de mise en sourdine de la voix ou de choisir la commande de menu Mettre la voix en sourdine désactive la mise en sourdine de la voix et met fin à la période d'arrêt du silencieux.
- La touche PTT permet de mettre fin à la période d'arrêt du silencieux.

Auto

Si la minuterie vient à échéance, que la sourdine soit activée ou non, la période d'arrêt du silencieux prend fin et les règles associées à la fonction Activer l'alerte utilisateur en appel pour la mise en sourdine de la voix devront de nouveau être appliquées pour désactiver la sourdine lors de prochaines transmissions.

Auto avec onde porteuse

Si la sourdine de la radio est désactivée lorsque la minuterie vient à échéance (en raison d'un changement d'onde porteuse), la sourdine demeure désactivée jusqu'à ce que l'onde porteuse ne soit plus captée. Lorsque l'onde porteuse n'est plus captée et que la radio est mise en sourdine, la minuterie est réinitialisée et redémarrée, ce qui a pour effet de prolonger la période d'arrêt du silencieux; si, par la suite, la sourdine de la radio reste active pendant tout le temps prévu à la minuterie (sans remplacement de l'onde porteuse), la période d'arrêt du silencieux prendra fin et les règles d'activation de l'alerte utilisateur en appel pour la mise en sourdine de la voix devront de nouveau être appliquées pour désactiver la sourdine lors de prochaines transmissions.

10.33.2.12**Temps de réinitialisation automatique**

Ce champ permet de sélectionner la durée de désactivation de la sourdine pour la règle de désactivation de la sourdine Rx ASTRO ou le type de désactivation de la sourdine non ASTRO programmé, et de choisir la durée de désactivation d'exception de la sourdine s'appliquant aux alertes d'appel si vous avez activé la mise en sourdine de la voix sur le canal (voir le champ Activer l'alerte utilisateur en appel pour les appels ASTRO ou le champ Activer l'alerte utilisateur en appel pour les appels autres que ASTRO).

Le temps de l'exception correspond à la période d'arrêt du silencieux. Cette période s'applique uniquement aux deux sélections différées du champ Sélection d'appel/Réinitialisation durant l'appel. Cette sélection s'applique au système conventionnel courant. La durée est exprimée en secondes.

Accès seulement : Lorsque le champ Sélection d'appel/Réinitialisation durant l'appel n'est pas réglé à **Manuel**, lorsque le champ Type de système est réglé à **DVRS, MDC, DTMF, Appel rapide II** ou **ASTRO**, et lorsque le champ Système d'interface de site distant est désactivé.

Tableau 203 : Portée

Minimum	Maximum
0 s	255 s

10.33.2.13

Mode radio à distance

Ce champ permet à la radio de décoder une commande de surveillance à distance ou de traceur radio pour le système conventionnel courant.

REMARQUE :

Le voyant DEL d'émission de la radio s'allume en rouge fixe, ce qui indique que la radio émet en mode surveillance à distance.

Vous pouvez quitter le mode de surveillance à distance en changeant manuellement de canal ou en mettant la radio hors tension.

Accès seulement : lorsque le champ Type de système est réglé à **ASTRO** ou **MDC** et lorsque le modèle ou les options de la radio le permettent.

Les sélections suivantes sont prises en charge :

Désactivé;

Le mode radio à distance n'est pas disponible.

Traceur radio (impossible pour MDC)

La radio s'active automatiquement et transmet une onde porteuse non modulée qui permet de trouver une radio perdue ou volée. La radio reste active durant le temps de base Tx indiqué.

Surveillance à distance

La radio s'active automatiquement en vue de transmettre un signal audio. Cela est particulièrement utile en cas d'appel de détresse. La radio reste active durant le temps de base Tx indiqué.

10.33.2.14

Temps de base Tx

Ce champ permet de sélectionner la durée pendant laquelle la radio demeure active après la réception d'une commande relative au mode radio à distance.

Cette sélection s'applique au système conventionnel courant. La durée est exprimée en secondes.

Accès seulement : lorsque le champ Type de système est réglé à **ASTRO** ou **MDC**, et lorsque le Mode radio à distance est réglé à **Traceur radio** ou **Surveillance à distance**, et lorsque le modèle ou les options de la radio le permettent.

Tableau 204 : Portée

Minimum	Maximum	Incréments
10 s	120 s	10 s

10.33.2.15

Type d'alias radio OTA

Ce champ permet de configurer le chiffrement (émission) et le déchiffrement (réception) de la fonction d'alias radio Par liaison radio (OTA).

**AVERTISSEMENT :**

La radio ne peut pas afficher l'alias radio si la radio reçoit des ID en double jusqu'à ce que le double soit retiré. L'écriture de la codeplug sur la radio fera en sorte que la liste d'appels retourne à son état d'origine et toutes les mises à jour d'alias OTA seront perdues.

**IMPORTANT :**

Si la mise à jour d'alias OTA ne s'est pas affichée à l'écran, vous devez mettre à jour la liste d'appel de la radio dans le module RadioCentral ou dans le gestionnaire d'approvisionnement.

Les sélections suivantes sont prises en charge :

Désactivé;

La radio ne transmet ni ne reçoit les données d'alias de la radio.

Avant uniquement

Les données d'alias de la radio sont transmises avant les communications vocales uniquement.

**AVERTISSEMENT :**

Cette sélection est uniquement valide lorsque le champ [Type voix/signal Tx à la page 434](#) est réglé à **ASTRO**, et lorsque le système conventionnel défini n'est pas un DVRS.

Après uniquement

Les données d'alias de la radio sont transmises après les communications vocales uniquement.

**AVERTISSEMENT :**

Cette sélection est uniquement valide lorsque le champ Type voix/signal Tx est réglé à **ASTRO**, et lorsque le système conventionnel défini n'est pas un DVRS.

Avant et après

Les données d'alias de la radio sont transmises avant et après les communications vocales.

**AVERTISSEMENT :**

Cette sélection est uniquement valide lorsque le champ Type voix/signal Tx est réglé à **ASTRO**, et lorsque le système conventionnel défini n'est pas un DVRS.

Décoder uniquement

Les données d'alias de la radio reçoivent les données sans aucune limite.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.33.2.16

Mise à jour d'alias radio OTA activée

Ce champ permet au système courant de mettre à jour l'alias radio.

Accès seulement : Lorsque l'option Activer l'ID de radio est activée, et lorsque le champ [Rx \(type voix/signal\) à la page 430](#) n'est pas réglé à **Non-ASTRO**, et que le champ [Système ASTRO à la page 459](#) renvoie à un système DVRS, et lorsque le champ [Type d'alias radio OTA à la page 426](#) n'est pas réglé à **Désactivé**, et lorsque le modèle ou l'option de la radio le permet.

10.33.2.17

de Sélection de la liste d'imputabilité du personnel

Ce champ vous permet de sélectionner une Liste de localisation du personnel à utiliser tout en utilisant un système ADF.

Accès seulement : lorsque le champ Type de système est réglé à **ASTRO** ou **DVRS** et lorsque le modèle ou les options de la radio le permettent.

Les sélections suivantes sont prises en charge :

- Désactivé;
- Localisation du personnel disponible

10.33.2.18

Qualifier la réception des alarmes d'urgence

Si ce champ est activé, la radio ne peut recevoir d'alarmes d'urgence de communication de données (MDC) Motorola lorsque la transmission entrante est qualifiée comme une ligne privée (PL) ou une ligne privée numérique (DPL). Cette qualification signifie que la transmission entrante correspond au type de silencieux Rx/TA et au code de silencieux Rx/TA de la personnalité conventionnelle.

Le cas échéant, vous devez également activer cette fonction à partir du champ **Indicateur de réception d'alarme d'urgence**. Cette sélection s'applique au système MDC conventionnel courant.

IMPORTANT :

Si ce champ est activé et que le signal entrant échoue à la qualification PL ou DPL, les alarmes d'urgence ne sont pas détectées.

Évalué uniquement : Lorsque le champ type de système est réglé à **MDC** et que le champ indicateur Rx d'alarme d'urgence est activé.

10.33.2.19

Service de messagerie texte

Ce champ permet de sélectionner le mode de messagerie texte pour le système ASTRO conventionnel courant.

AVERTISSEMENT :

Si le service de messagerie texte est utilisé pendant le balayage des données et que la longueur du préambule de balayage de données est inférieure ou supérieure à la valeur par défaut, la minuterie courte de nouvelle tentative) doit être ajustée en conséquence. Par exemple, dans le mode de données directes (voir Mode de paquets de données), si la longueur du préambule de balayage de données augmente à 30 (20 étant la valeur par défaut), la minuterie courte de nouvelle tentative doit être ajustée à 25 secondes (15 étant la valeur par défaut). Pour chaque tranche de dix unités ajoutées à la longueur du préambule de balayage de données, on devra augmenter de 10 secondes la valeur de la minuterie courte.

IMPORTANT :

Vous pouvez accéder à la messagerie texte en appuyant sur la touche Service de messagerie texte ou utilisant la sélection de menu Service de messagerie texte.

Vous pouvez accéder à la messagerie texte rapide en appuyant sur la touche Texte rapide TMS.

Vous pouvez accéder à la messagerie de requête en appuyant sur la touche Requête TMS.

Accès seulement : lorsque le champ Type de système est réglé à **ASTRO**, et lorsqu'un profil de données référencé valide a été sélectionné pour le système courant, lorsque la sélection du profil de données n'est pas réglé à **Données désactivées**, que le mode Messagerie intelligente est réglé à **LMR**, et lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Aucun

La fonction est désactivée.

Liste seulement

Vous permet de sélectionner seulement les messages texte à partir de la liste Messages texte rapide programmés.

Illimité

Permet de faire une sélection parmi les messages texte rapide et d'entrer vos propres messages texte à partir du clavier de la radio.

**AVERTISSEMENT :**

Cette sélection est seulement disponible sur les radios dotées d'un clavier ou d'un microphone à clavier.

**REMARQUE :**

Cette sélection ne s'applique pas à l'APX N70.

10.33.3

Appel rapide II

Cette section permet d'afficher ou de définir la fonctionnalité de tonalité Appel rapide II (QCII) pour les systèmes conventionnels QCII.

**REMARQUE :**

Les systèmes conventionnels Quik-Call II sont sélectionnés sous Personnalité conventionnelle, dans le champ Système Non ASTRO.

Accès seulement : Lorsque le champ Type de système est réglé sur **Appel rapide II** et lorsque le modèle ou les options de la radio le permettent.

10.33.3.1

Décodage QCII

Cette fonction fait référence au système Quik-Call II (QCII) disponible qui coexistera avec les communications de données Motorola sélectionnées (MDC). Cette fonction permet de décoder et d'encoder QCII et d'encoder ou décoder MDC sur le même canal.

Si cette fonction est activée, vous pouvez sélectionner le format d'appel. Elle permet également de sélectionner les différentes tonalités disponibles dans la liste de composition de tonalité numérique en analogique.

**REMARQUE :**

Cette fonction ne peut pas être activée avec le rappel instantané.

10.34

Personnalité conventionnelle

La fenêtre **Personnalité conventionnelle** permet de créer, de supprimer et de définir des personnalités conventionnelles. Il existe deux modes de communication : conventionnel et ADF.

Types de personnalités conventionnelles : **ASTRO**, **DVRS**, **Mode mixte**, **MDC**, **Appel rapide II** et **Aucune émission de signaux**.

**REMARQUE :**

Après avoir défini de façon unique les fonctions des personnalités conventionnelles, chaque personnalité peut être assignée à la position désirée du sélecteur de canaux de la radio. Cette opération est effectuée à partir de la page Canaux, dans la fenêtre Attribution du canal de zone.

10.34.1

Général

Cette section permet d'afficher ou de définir la fonctionnalité pour les personnalités conventionnelles individuelles.

**REMARQUE :**

Après avoir défini de façon unique les fonctions des personnalités conventionnelles, chaque personnalité peut être assignée à la position désirée du sélecteur de canaux de la radio. Cette opération est effectuée à partir de la page Canaux, dans la fenêtre Attribution du canal de zone.

10.34.1.1

Nom de la personnalité conventionnelle

Ce champ vous permet de définir réer un nom reconnaissable pour la personnalité conventionnelle courante.

**REMARQUE :**

Exemples : Fire005, Électrique1, N° 510

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Vous pouvez utiliser jusqu'à 14 caractères.

10.34.1.2

Type de personnalité conventionnelle

Ce champ affiche le type qui était sélectionné au moment où la personnalité a été créée.

Types de personnalités conventionnelles : **ASTRO**, **DVRS**, **Mode mixte**, **MDC**, **Appel rapide II** et **Aucune émission de signaux**.

10.34.1.3

AGC RF avancé

Ce champ permet de sélectionner le type de commande automatique du gain (AGC) de la fréquence de réception (RF) qui s'applique à la personnalité conventionnelle courante.

Les sélections suivantes sont prises en charge :

Désactivé;

Même lorsque la valeur du champ est **Désactivé**, une commande automatique du gain de base, qui est intégrée au récepteur de la radio, est utilisée. Cette protection intégrée contribue à éviter l'écrêtage du signal et la saturation du récepteur, qui risquent d'endommager les composants de la radio.

Standard

Cette valeur permet d'activer une forme évoluée de commande automatique du gain qui offre une protection contre l'interférence d'intermodulation (IM) en détectant et en supprimant toute interférence provenant de sources externes.

Amélioré

Cette valeur permet à la radio d'utiliser d'autres techniques de réduction de l'interférence d'IM, qui permettent de nettoyer le signal.

Intelligente

Cette valeur permet à la radio d'utiliser une technique unique pour améliorer l'immunité aux interférences à proximité des stations de base Linear Simulcast et APCO phase 2. L'option intelligente s'exclut mutuellement avec la case à cocher Protection large bande.

IMPORTANT :

Il se peut que les formes standard et améliorée de la commande automatique du gain diminuent la performance sur les **canaux** qui ne subissent **aucune** interférence d'IM. Par conséquent, cette fonction doit être activée uniquement sur les canaux qui sont soumis à ce type d'interférence.

10.34.2

Options de Rx

Cette section permet d'afficher ou de définir des réglages qui se rapportent uniquement au mode de réception (Rx) de la radio pour des personnalités conventionnelles.

REMARQUE :

Après avoir défini de façon unique les fonctions des personnalités conventionnelles, chaque personnalité peut être assignée à la position désirée du sélecteur de canaux de la radio. Cette opération est effectuée à partir de la page Canaux, dans la fenêtre Attribution du canal de zone.

10.34.2.1

Personnalité réception seulement

Ce champ permet d'empêcher la radio d'émettre pendant le fonctionnement sur la personnalité conventionnelle courante.

La réception d'appels est la seule opération permise par cette personnalité.

REMARQUE :

Si la personnalité est créée par la fonction de clonage de zone, elle ne peut pas être une personnalité de type réception seulement.

Accès seulement : lorsque la personnalité n'est pas créée par la fonction de clonage de zone.

10.34.2.2

Rx (type voix/signal)

Ce champ permet de sélectionner le mode d'émission de signaux lors de la réception (Rx) vocale pour la personnalité conventionnelle courante.

AVERTISSEMENT :

Lorsque le champ Système d'interface de site à distance (RSI) du système conventionnel référencé est **activé**, ce champ doit être réglé à **ASTRO**; autrement, le module RadioCentral considère que la valeur de ce champ est non valide.

Lorsque le champ Audio analogique uniforme est **activé**, le champ Type voix/signal Rx **doit** être réglé à « Non ASTRO » pour que le module RadioCentral considère la valeur de ce champ comme non valide.

Lorsque le champ [Activer le balayage de vote en mode mixte à la page 478](#) est **activé**, le champ Type voix/signal Rx doit être réglé à **Non ASTRO** ou **ASTRO**; sinon, le module RadioCentral considère la valeur de ce champ comme non valide.

Les sélections suivantes sont prises en charge :

Non ASTRO

Seuls les signaux analogiques Non-ASTRO sont reçus.

Un type de système **MDC** ou **QCII** doit être sélectionné dans le champ Type d'émission de signaux non ASTRO et ensuite un Système non ASTRO doit être sélectionné.

Mode mixte

Les signaux numériques ASTRO et les signaux analogiques non ASTRO peuvent être reçus.

Un système conventionnel – ASTRO doit être sélectionné dans le champ Système ASTRO, et un Type de système **MDC** ou **QCII** doit être sélectionné dans le champ Type d'émission de signaux non ASTRO et ensuite il faut sélectionner un Système non ASTRO.

**IMPORTANT :**

Les communications ASTRO ont la priorité sur les communications de type d'émission de signaux non ASTRO reçues.

ASTRO

Seuls les signaux numériques ASTRO sont reçus.

Un système conventionnel – ASTRO doit être sélectionné dans le champ [Système ASTRO à la page 459](#).

10.34.2.3

Type de désactivation/activation de la sourdine

Ce champ permet de sélectionner la règle qui détermine le moment auquel une radio ouvre et ferme son haut-parleur pour recevoir des signaux audio pour la personnalité conventionnelle courante.

Les règles de désactivation et d'activation de la sourdine s'appliquent uniquement lorsque la valeur PL est sélectionnée dans le champ [Type de silencieux Rx/TA à la page 445](#) de canal conventionnel courant.

**REMARQUE :**

La désactivation de la sourdine allume le haut-parleur de la radio pour la réception de signaux audio. L'activation de la sourdine éteint le haut-parleur.

Les sélections suivantes sont prises en charge :

Standard

Sert à désactiver la sourdine à la détection du code de ligne privée (PL) approprié, et à l'activer en l'absence de ce code.

Désactiver, sourdine standard

Sert à désactiver la sourdine à la détection du code de PL approprié et du silencieux de porteuse, et à l'activer en l'absence de ce code.

Désactiver ou activer la sourdine

Sert à désactiver la sourdine à la détection du code de PL approprié et du silencieux de porteuse, et à l'activer en l'absence de ce code ou du silencieux de porteuse.

**REMARQUE :**

Pour que le code soit « approprié », il doit y avoir correspondance entre le [Code Tx PL à la page 455](#) de la radio émettrice et le [Code Rx/TA PL à la page 448](#) de la radio réceptrice. Le [Type de silencieux Tx à la page 453](#) de la radio émettrice doit également correspondre au type de silencieux Rx/TA de la radio réceptrice (Tx TPL et Rx TPL ou Tx DPL et Rx DPL).

10.34.2.4

Retard de désactivation de sourdine Rx

Ce champ permet de sélectionner la durée pendant laquelle la radio demeure en sourdine après la détection d'un silencieux de porteuse pour la personnalité conventionnelle courante.

Cette période est parfois nécessaire pour que les données d'émission de signaux arrivent en silence. La durée est exprimée en millisecondes.

Tableau 205 : Portée

Minimum	Maximum
0 ms	2150 ms

10.34.2.5

Silencieux (mise au point)

Ce champ permet de sélectionner la valeur qui, combinée à la valeur de silencieux principale, détermine le seuil global du silencieux de porteuse pour la personnalité conventionnelle courante.

Plus cette valeur est élevée, plus le seuil de silencieux est élevé. Si le seuil est élevé, le signal d'onde porteuse doit être fort pour désactiver la sourdine du haut-parleur de la radio. L'interférence est par conséquent réduite.

Accès seulement : Lorsque le champ Silencieux par personnalité est **activé**.

Tableau 206 : Portée

Minimum	Maximum
0	15

10.34.2.6

Voyant DEL d'occupation

Ce champ permet d'allumer le voyant DEL jaune afin d'indiquer la présence d'une onde porteuse (canal occupé) pour la personnalité conventionnelle courante.

10.34.2.7

Désaccentuation Rx

Ce champ permet d'activer la désaccentuation à la réception (Rx) pour la personnalité conventionnelle courante.

REMARQUE :

La désaccentuation inverse le signal préaccentué reçu par la radio.

La préaccentuation de transmission ([Préaccentuation de transmission à la page 435](#)) augmente le rapport signal-bruit à des fréquences élevées. Autrement dit, les bruits de basse fréquence sont réduits, tandis que les voix dont les fréquences sont plus élevées sont augmentées.

10.34.2.8

HearClear

Ce champ permet d'améliorer la qualité sonore en appliquant un algorithme de compression et d'extension aux signaux transmis et aux signaux reçus.

Cette fonction s'applique à la personnalité conventionnelle courante.

IMPORTANT :

La compression-extension consiste à comprimer la plage dynamique des signaux audio transmis, puis à décompresser jusqu'à son niveau d'origine dans les signaux audio reçus. Il est donc essentiel d'activer la compression-extension sur la radio émettrice et la radio réceptrice pour éviter la distorsion des signaux audio. Puisque l'algorithme de compression et d'extension est actif sur les deux radios, l'extension de signaux audio non comprimés ou la compression de signaux sans extension subséquente entraînera des sons non naturels. Les signaux audio transmis au répartiteur doivent aussi subir la compression-extension.

Cette fonction s'applique uniquement aux signaux analogiques.

Accès seulement : Lorsque le champ **Rx (type voix/signal)** à la page 430 est réglé à **Non-ASTRO** ou **Mode mixte** et lorsque le système conventionnel défini sélectionné dans le champ Système ASTRO n'est pas Type de système DVRS, et lorsque le champ Activer le matériel DVRS est **Désactivé**.

Les sélections suivantes sont prises en charge :

Désactivé;

Aucune suppression de bruit ni compression-extension n'est appliquée aux signaux transmis ou aux signaux reçus.

Compression-extension seulement

La compression-extension est appliquée aux signaux audio transmis et aux signaux audio reçus (voir Remarque importante).

Suppression du bruit seulement

La suppression du bruit est appliquée aux signaux audio reçus.

Compression-extension et suppression du bruit

La compression-extension est appliquée aux signaux audio transmis et aux signaux audio reçus (voir la Note importante), et la suppression du bruit est appliquée aux signaux reçus.

REMARQUE :

Les paramètres **Suppression du bruit seulement** et **Compression-extension et suppression du bruit** ne peuvent s'appliquer que si toutes les fréquences sur la personnalité actuelle se situent dans la plage 900 MHz.

10.34.2.9

Activer Rx concomitant

Lorsque ce champ est activé en même temps que le champ **Activer Rx concomitant** dans toute la radio, vous pouvez contrôler les Rx concomitants sur une base de personnalité au lieu de toute la radio.

REMARQUE :

Ce champ est activé par défaut.

Accès seulement : Lorsque le champ Activer Rx concomitant dans toute la radio est activé.

10.34.3

Options de Tx

Cette section permet d'afficher et de définir les fonctions propres au mode de transmission de la radio pour les personnalités conventionnelles courantes.

REMARQUE :

Après avoir défini de façon unique les fonctions des personnalités conventionnelles, chaque personnalité peut être assignée à la position désirée du sélecteur de canaux de la radio. Cette opération est effectuée à partir de la page Canaux, dans la fenêtre Attribution du canal de zone.

Accès seulement : Lorsque le champ Personnalité réception seulement est défini à **Désactivé**.

10.34.3.1

Type voix/signal Tx

Ce champ permet de sélectionner le mode d'émission de signaux pour la transmission (Tx) vocale qui s'applique lorsque le champ Type voix/signal Tx de la personnalité conventionnelle est réglé à **Mode mixte**.

IMPORTANT :

Lorsque le champ **Rx (type voix/signal)** à la page 430 est réglé à **Non ASTRO** ou à **ASTRO**, cette sélection doit être exactement la même que celle du Type voix/signal Rx pour la personnalité conventionnelle courante, de sorte qu'elle soit considérée comme étant valide par RadioCentral.

Le champ demeure accessible même si le champ **Personnalité réception seulement** à la page 430 de cette personnalité est **Activé**, car cette dernière pourra toujours activer le mode d'urgence lorsque le champ **Type d'annulation d'urgence** à la page 462 est réglé à **Canal de redirection** et que les affectations **Zone d'annulation d'urgence** à la page 463 et **Canal d'annulation d'urgence** à la page 463 sont définies pour cette personnalité.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

ASTRO

Seuls les signaux numériques ASTRO sont transmis.

Non ASTRO

Les signaux analogiques sont transmis.

REMARQUE :

Selon la version de RadioCentral utilisée et/ou de la capacité de la radio, le fonctionnement en mode Téléphone peut ne pas être disponible en mode **ASTRO**.

10.34.3.2

Minuterie de délai d'attente

Ce champ permet de sélectionner la durée de transmission possible de la radio.

Lorsque la durée de transmission est échuë, la radio cesse automatiquement toute transmission et une tonalité d'avertissement se fait entendre aussi longtemps que l'on appuie sur la touche PTT. Pour que la radio reprenne les transmissions, la touche PTT doit être relâchée et une nouvelle clé doit être attribuée. Cette fonction s'applique à la personnalité conventionnelle courante. La durée est exprimée en secondes.

Accès seulement : Lorsque le champ **Personnalité réception seulement** à la page 430 est réglé à **Désactivé**, et (si le champ **Rx (type voix/signal)** à la page 430 est réglé à **ASTRO**, alors, le champ **Système d'interface du site distant** dans le système conventionnel référencé doit être réglé à **Désactivé**).

REMARQUE :

lorsque réglé à **Infini**, aucune minuterie n'est utilisée; par conséquent, le temps de discussion est infini pour les radios non-APX4000XH. Cette sélection est non valide pour les radios APX4000XH.

Tableau 207 : Plage (pour les radios non-APX4000XH)

Minimum	Maximum	Incréments
15 s	465 s	15 s

Tableau 208 : Plage (pour les radios APX4000XH)

Minimum	Maximum	Incréments
15 s	60 s	15 s

10.34.3.3

Préaccentuation de transmission

Ce champ permet d'effectuer la préaccentuation de transmission (préparation du signal par filtrage) pour la personnalité conventionnelle courante.

**REMARQUE :**

La préaccentuation augmente le rapport signal-bruit pour les fréquences élevées. Ainsi, les bruits de basse fréquence sont réduits tandis que les voix dont les fréquences sont plus élevées sont augmentées.

**REMARQUE :**

La [Désaccentuation Rx à la page 432](#) inverse le signal préaccentué reçu par la radio.

**AVERTISSEMENT :**

Lorsque cette fonction est activée, elle devient non valide lorsque le champ Audio analogique uniforme est également réglé à **Activé**. Ces deux fonctions ne peuvent donc pas être activées pour la même personnalité.

Accès seulement : Lorsque le champ [Personnalité réception seulement à la page 430](#) est réglé à **Désactivé**.

10.34.3.4

Code de rafale en arrière/désactivation

Ce champ permet d'activer le code de rafale en arrière de la ligne privée audiofréquence (TPL) ou le code de désactivation de la ligne privée numérique (DPL) à transmettre lors de la désactivation de la radio.

Ce choix est fondé sur le [Type de silencieux Tx à la page 453](#) (TPL ou DPL) sélectionné pour la personnalité conventionnelle courante.

**REMARQUE :**

Ces deux fonctions émettent une tonalité infravocale qui indique à la radio réceptrice de désactiver le son de ses haut-parleurs avant la détection de la perte d'une porteuse. La désactivation du son supprime les bruits indésirables (signal de silence résiduel) lors de la perte d'une onde porteuse.

Accès seulement : Lorsque le champ [Personnalité réception seulement à la page 430](#) est réglé à **Désactivé**.

10.34.3.5

Niveau de puissance de transmission

Ce champ permet de sélectionner le niveau de puissance de transmission pendant le fonctionnement selon la personnalité conventionnelle courante.

**REMARQUE :**

La touche Tx à faible tension, le commutateur Tx à faible tension et la fonction de menu Alimentation ont préséance sur ce réglage lorsque vous le sélectionnez.

En mode d'urgence, la radio transmet à puissance élevée.

Accès seulement : Lorsque le champ [Personnalité réception seulement à la page 430](#) est réglé à **Désactivé**.

Les sélections suivantes sont prises en charge :

Faible

Niveau utilisé pour les communications effectuées à proximité, ce qui empêche la radio de transmettre des signaux à d'autres groupes géographiques se servant de la même fréquence.

Élevé

Niveau utilisé lorsqu'on a besoin d'un signal de plus forte intensité afin d'élargir la zone de transmission.

10.34.3.6

Puissance adaptative

Ce champ permet à la radio d'utiliser un niveau de puissance opérationnelle intermédiaire si la station de répartition signale que l'intensité du signal reçu est élevée.

La radio émet toujours d'abord un signal à pleine puissance. Lorsque les touches de la radio sont relâchées, la radio cherche un message de données provenant de la station. Si la station signale que la dernière réception était de forte intensité, la radio passe automatiquement au réglage de puissance intermédiaire. Cette fonction s'applique au mode d'émission de signaux ASTRO et à la personnalité conventionnelle courante.

REMARQUE :

La puissance adaptative n'est disponible que sur les canaux de transmission ASTRO.

Accès seulement : (Lorsque le modèle ou les options de la radio le permettent et lorsque le champ [Niveau de puissance de transmission à la page 435](#) est réglé à **Élevé**) et ((lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **Mode mixte**) ou (lorsque le champ Type voix/signal Rx est réglé à **ASTRO**, et lorsque le champ Système d'interface du site distant dans le système conventionnel référencé est réglé à **Désactivé**)).

10.34.4

Options de fréquence

Cette section permet d'afficher et de définir de nombreux réglages d'émission, de réception et Direct/Talkaround (En direct) en mode conventionnel dans des profils uniques de la personnalité conventionnelle courante.

IMPORTANT :

Si le [Activer le balayage de vote en mode mixte à la page 478](#) est réglé à **Activé** pour la personnalité courante, tous les enregistrements/rangées des Options de fréquence associés à la personnalité courante sont utilisés pour former la liste de balayage. Le nombre maximal d'Options de fréquence est limité à 15.

REMARQUE :

Après avoir défini de façon unique les fonctions des personnalités conventionnelles, chaque personnalité peut être assignée à la position désirée du sélecteur de canaux de la radio. Cela est accompli à partir de la section [Canaux à la page 671](#) de [Affectation du canal de zone à la page 668](#).

Si la personnalité est créée par la fonction de clonage de zone, la liste d'option de fréquences peut contenir un seul enregistrement.

10.34.4.1

Interférence de fréquence LTE présente

Le champ qui active cette fonction fait en sorte que RadioCentral est au courant que ce tableau d'options de fréquence contient au moins une fréquence de 700 MHz sur cette personnalité/ce canal sans capacité LTE large bande.

**AVERTISSEMENT :**

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Comme le LTE fonctionne aussi sur la bande 700 MHz, les communications radio peuvent subir des interférences nuisibles. Cette fonction s'applique uniquement aux profils Options de fréquence (rangée ou enregistrement) actuels de la Personnalité conventionnelle courante.

Si LTE large bande est activé sur cette personnalité ou ce canal, cette fonction doit être **désactivée**, autrement, elle devient non valide.

**REMARQUE :**

Le LTE est activé sur un canal conventionnel lorsqu'un profil de données avec un type de profil de données associé équivaut à **Conventionnel et large bande** ou **Large bande uniquement** est associé au système conventionnel - ASTRO de la Personnalité et lorsque le champ Source large bande du profil de données est réglé à **Modem LTE interne**.

**REMARQUE :**

On peut choisir les profils d'options de fréquences à utiliser dans la page Canaux de la fenêtre Attribution du canal de zone; il faut d'abord sélectionner la personnalité dans le champ Personnalité, puis le profil d'options de fréquence dans le champ Options de fréquence.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.34.4.2

Nom d'options de fréquence

Ce champ vous permet de modifier le nom par défaut affecté par RadioCentral pour les options de fréquence.

**REMARQUE :**

Exemples : Frequencies004, Power03, #510

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Un maximum de 14 caractères sont pris en charge.

10.34.4.3

Fréquence Rx/TA

Ce champ permet de sélectionner la fréquence à utiliser pour recevoir le signal d'onde porteuse d'une communication radio et, au besoin, pour transmettre ce signal pendant que le mode Direct/Talkaround (En direct) est activé sur le canal.

Cette sélection s'applique uniquement au profil d'options de fréquence (rangée ou enregistrement) actuel de la personnalité conventionnelle courante.

AVERTISSEMENT :

Incrément de 6,25 KHz pour la bande de fréquence 800 MHz :

Depuis la version R09.01.00, lorsque la valeur de [Écart Tx/Séparation des canaux à la page 441](#) est de **2.5 kHz/12,5 kHz**, RadioCentral permet un incrément de 6,25 kHz pour une fréquence conventionnelle de bande de fréquence de 800 MHz afin de se conformer aux réglementations de certains pays (non-FCC); cependant, n'oubliez pas que deux radios fonctionnant sur des canaux adjacents séparés par un incrément de 6,25 kHz uniquement peuvent rencontrer un phénomène de diaphonie.

REMARQUE :

On peut choisir les profils d'options de fréquence à utiliser dans la page Canaux de la fenêtre Attribution du canal de zone; il faut d'abord sélectionner la personnalité dans le champ [Personnalité à la page 672](#), puis le profil d'options de fréquence est sélectionné dans le champ [Option de fréquence conventionnelle à la page 674](#).

IMPORTANT :

(Applicable à l'émission de signaux ASTRO)

Lorsque le mode Direct/Talkaround est **activé** pour ce profil d'options de fréquence et que le champ [Activer fréquence directe à la page 402](#) est **activé**, l'ID de réseau direct peut être modifié sur la base du profil d'options de fréquence. Lorsque vous passez en mode Direct/Talkaround (En direct), la radio émet et reçoit alors sur la fréquence directe au lieu de la fréquence Rx/TA.

Lorsque le mode Direct/Talkaround (En direct) est réglé à **Activé** pour ce profil Options de fréquence et que le champ Fréquence directe est réglé à **Désactivé**, la fréquence Rx/TA et les paramètres [ID du réseau Rx à la page 442](#) sont utilisés chaque fois que vous passez en mode Direct/Talkaround (En direct).

Le mode Direct/Talkaround (En direct) doit être **activé** dans un profil d'options de fréquence pour que vous puissiez vous en servir sur un canal radio. Vous pouvez sélectionner le mode Direct/Talkaround (En direct) en appuyant sur la touche [Talkaround/Direct à la page 193](#), en sélectionnant le commutateur [Talkaround/Direct à la page 206](#) ou en utilisant la sélection de menu [Direct/Talkaround \(En direct\) à la page 217](#).

IMPORTANT :

(Applicable à l'émission de signaux Non-ASTRO [MDC, DTMF, Appel rapide et Tonalité unique])

Lorsque le mode Direct/Talkaround (En direct) est **activé** pour ce profil d'options de fréquence courant et que le champ Activer la fréquence directe est **activé**, les paramètres relatifs au mode Direct/Talkaround (En direct) peuvent être modifiés par profil d'options de fréquence. Lorsque vous passez en mode Direct/Talkaround (En direct), la radio émet et reçoit alors sur la fréquence directe en fonction de ces paramètres de fréquence.

Lorsque le mode Direct/Talkaround (En direct) est **activé** pour ce profil Options de fréquence et que le champ Fréquence directe est **désactivé**, les paramètres des champs Rx sont utilisés chaque fois que l'utilisateur démarre le mode Direct/Talkaround (En direct).

Le mode Direct/Talkaround (En direct) doit être **activé** dans un profil d'options de fréquence pour que vous puissiez vous en servir sur un canal radio. Vous pouvez sélectionner le mode Direct/Talkaround (En direct) au moyen du bouton Direct/Talkaround (En direct), du commutateur Talkaround/Direct (En direct) ou de la sélection de menu Direct/Talkaround (En direct).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.34.4.4

Fréquence Tx

Ce champ permet de sélectionner la fréquence à utiliser pour transmettre le signal d'onde porteuse d'une communication radio.

Cette sélection s'applique uniquement au profil [Options de fréquence à la page 436](#) courant (enregistrement/rangée) de la [Personnalité conventionnelle à la page 428](#) courante.

AVERTISSEMENT :

Lorsque le champ [Activer le balayage de vote en mode mixte à la page 478](#) est réglé à **Activé** et que le champ [Guidage de Tx du balayage de vote en mode mixte à la page 478](#) est réglé à **Désactivé**, ce champ doit correspondre à toutes les Options de fréquence dans la personnalité courante; autrement, l'application considère la valeur de ce champ comme étant non valide.

Incrément de 6,25 KHz pour la bande de fréquence 800 MHz :

Depuis la version R09.01.00, lorsque [Écart Tx/Séparation des canaux à la page 441](#) correspond à **2.5 kHz/12,5 kHz**, l'application permet un incrément de 6,25 kHz pour une fréquence conventionnelle de bande de fréquence de 800 MHz afin de se conformer aux réglementations de certains pays (non-FCC); cependant, n'oubliez pas que deux radios fonctionnant sur des canaux adjacents séparés par un incrément de 6,25 kHz uniquement peuvent rencontrer un phénomène de diaphonie.

REMARQUE :

On peut choisir les profils d'options de fréquence à utiliser dans la page Canaux de la fenêtre Attribution du canal de zone; il faut d'abord sélectionner la personnalité dans le champ [Personnalité à la page 672](#), puis le profil d'options de fréquence est sélectionné dans le champ [Option de fréquence conventionnelle à la page 674](#).

Accès seulement : Lorsque le champ [Personnalité réception seulement à la page 430](#) est **désactivé** et que le modèle ou l'option de la radio le permet.

10.34.4.5

Direct/Talkaround (En direct)

Ce champ permet d'activer la fonctionnalité Direct/Talkaround (en direct) pour le profil d'options de fréquence courant.

La fonction Direct/Talkaround (En direct) est généralement utilisée pour communiquer directement avec une autre radio située à proximité ou lorsque le répéteur ne fonctionne pas ou est hors de portée.

Cette fonction s'applique uniquement au profil d'options de fréquence (rangée ou enregistrement) courant de la personnalité conventionnelle courante.

REMARQUE :

On peut choisir les profils d'options de fréquence à utiliser dans la page Canaux de la fenêtre Attribution du canal de zone; il faut d'abord sélectionner la personnalité dans le champ [Personnalité à la page 672](#), puis le profil d'options de fréquence est sélectionné dans le champ [Option de fréquence conventionnelle à la page 674](#).

IMPORTANT :

(Applicable à l'émission de signaux ASTRO)

Lorsque le mode Direct/Talkaround est **activé** pour ce profil d'options de fréquence et que le champ [Activer fréquence directe à la page 402](#) est **activé**, l'ID de réseau direct peut être modifié par profil d'options de fréquence. Lorsque vous lancez le mode Direct/Talkaround (En direct), la radio émet et reçoit alors sur la fréquence directe au lieu de la [Fréquence Rx/TA à la page 437](#).

Lorsque le mode Direct/Talkaround (En direct) est réglé à **Activé** pour ce profil Options de fréquence et que le champ Fréquence directe est réglé à **Désactivé**, la fréquence Rx/TA et les paramètres [ID du réseau Rx à la page 442](#) sont utilisés chaque fois que vous passez en mode Direct/Talkaround (En direct).

Le mode Direct/Talkaround (En direct) doit être **activé** dans un profil d'options de fréquence pour que vous puissiez vous en servir sur un canal radio. Vous pouvez sélectionner le mode Direct/Talkaround (En direct) en appuyant sur la touche [Talkaround/Direct à la page 193](#), en sélectionnant le commutateur [Talkaround/Direct à la page 206](#) ou en utilisant la sélection de menu [Direct/Talkaround \(En direct\) à la page 217](#).

IMPORTANT :

(Applicable à l'émission de signaux Non-ASTRO [MDC, DTMF, Appel rapide et Tonalité unique])

Lorsque le mode Direct/Talkaround est **activé** pour ce profil d'options de fréquence courant et que le champ Activer la fréquence directe est **activé**, les paramètres relatifs au mode Direct/Talkaround peuvent être modifiés par profil d'options de fréquence. Lorsque vous passez en mode Direct/Talkaround (En direct), la radio émet et reçoit alors sur la fréquence directe en fonction de ces paramètres de fréquence.

Lorsque le mode Direct/Talkaround (En direct) est **activé** pour ce profil Options de fréquence et que le champ Fréquence directe est **désactivé**, les paramètres des champs Rx sont utilisés chaque fois que l'utilisateur démarre le mode Direct/Talkaround (En direct).

Le mode Direct/Talkaround (En direct) doit être **activé** dans un profil d'options de fréquence pour que vous puissiez vous en servir sur un canal radio. Vous pouvez sélectionner le mode Direct/Talkaround (En direct) au moyen du bouton Direct/Talkaround (En direct), du commutateur Talkaround/Direct (En direct) ou de la sélection de menu Direct/Talkaround (En direct).

Accès seulement : Lorsque le champ [Personnalité réception seulement à la page 430](#) est **désactivé**, et (si le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **ASTRO**, alors le champ Système d'interface du site distant dans le système conventionnel référencé doit être **désactivé**), et (lorsque le champ [Type voix/signal Tx à la page 434](#) est **Non ASTRO** et lorsque le champ [Fréquence Rx/TA à la page 437](#) n'est pas identique au champ [Fréquence Tx à la page 439](#) ou lorsque l'index [Type de silencieux Rx/TA à la page 445](#) n'est pas identique à l'index [Type de silencieux Tx à la page 453](#) ou lorsque le Type de silencieux Rx/TA n'est pas **CSQ**), et (lorsque le Type de silencieux Rx/TA n'est pas PL ou que l'index [Fréquence Rx/TA PL à la page 446](#) n'est pas identique à l'index [Fréquence Tx PL à la page 453](#)) et (lorsque le Type de silencieux Rx/TA n'est pas **DPL** ou l'index [Code Rx/TA PL à la page 448](#) n'est pas identique à l'index [Code Tx DPL à la page 456](#) ou la valeur [Inverser Rx/TA DPL à la page 452](#) n'est pas égale à la valeur [Inverser Tx DPL à la page 458](#)) ou (lorsque [Type voix/signal Tx à la page 434](#) n'est pas **Non-ASTRO** et la fréquence Rx/TA n'est pas identique à la Fréquence Tx, ou [ID du réseau Rx à la page 442](#) n'est pas égal à [ID du réseau Tx à la page 443](#).)

10.34.4.6

Écart Tx/Séparation des canaux

Ce champ permet de sélectionner l'écart de transmission (Tx) et la séparation de canaux correspondante pour le profil d'options de fréquence (rangée ou enregistrement) courant de la personnalité conventionnelle courante.

L'écart Tx constitue la variation maximale (en kHz) entre la fréquence d'onde porteuse sélectionnée et sa fréquence centrale non modulée. La séparation des canaux correspond quant à elle à la différence de fréquence entre des canaux adjacents d'une bande de fréquences particulière.

**REMARQUE :**

La radio utilise également les valeurs Écart de transmission (Tx) et Séparation de canaux sélectionnés lorsque la personnalité courante est en mode [Direct/Talkaround \(En direct\)](#) à la [page 439](#).

**AVERTISSEMENT :**

Lorsque le champ [Activer le balayage de vote en mode mixte à la page 478](#) est **activé** et que le champ [Guidage de Tx du balayage de vote en mode mixte à la page 478](#) est **désactivé**, ce champ doit correspondre à toutes les options de fréquence dans la personnalité courante. Autrement, RadioCentral considère la valeur de ce champ comme non valide.

**REMARQUE :**

On peut choisir les profils d'options de fréquence à utiliser dans la page Canaux de la fenêtre Attribution du canal de zone; il faut d'abord sélectionner la personnalité dans le champ [Personnalité à la page 672](#), puis le profil d'options de fréquence est sélectionné dans le champ [Option de fréquence conventionnelle à la page 674](#).

Accès seulement : Lorsque le champ [Personnalité réception seulement à la page 430](#) est réglé à **Désactivé**.

Les sélections suivantes sont prises en charge :

4 kHz/20 kHz

Bande passante de 821 MHz et séparation des canaux de 20 kHz.

**AVERTISSEMENT :**

Cette sélection est non valide si le scénario suivant est vrai lorsque le Mandat de réduction de la largeur FCC 12,5 kHz s'applique au codeplug, et lorsque la valeur de la [Fréquence Tx à la page 439](#) ou ([Fréquence directe](#) ou [Fréquence Rx/TA à la page 437](#) est activée pour le fonctionnement Direct/Talkaround) se situe dans l'une des plages de l'exigence de la FCC.

5 kHz/25 kHz

Bandes passantes VHF, UHF et de 800 MHz avec séparation des canaux de 30/25/25 kHz.

**AVERTISSEMENT :**

Cette sélection est non valide si le scénario suivant est vrai lorsque le Mandat de réduction de la largeur FCC 12,5 kHz s'applique au codeplug, et lorsque la valeur de la Fréquence Tx ou ([Fréquence directe](#) ou [Fréquence TA](#) est activée pour le fonctionnement Direct/Talkaround) se situe dans l'une des plages de l'exigence de la FCC.

2,5 kHz/12,5 kHz

Bandes passantes VHF, UHF, de 800 MHz et de 900 MHz (analogique) et séparation des canaux de 12,5 kHz.

AVERTISSEMENT :

Lorsque la Fréquence Tx se situe dans la bande de 900 MHz, cette sélection est la seule valide et ce champ n'est accessible qu'en lecture seule.

Cette sélection est non valide dans les cas suivants :

(Lorsque le champ Rx (type voix/signal) à la page 430 est réglé à **Mode Non ASTRO**, et lorsque le champ **Fonctionnement sécurisé** à la page 301 est réglé à **Matériel**, et lorsque le champ **Effectuer/Terminer la connexion vocale** à la page 486 n'est pas réglé à **Non chiffré**) ou (lorsque le champ Rx (type voix/signal) à la page 430 est réglé à **Mode mixte** ou **Mode ASTRO**, et lorsque le champ **Type de modulateur numérique ASTRO** à la page 459 ASTRO est réglé à **Large**).

10.34.4.7

ID du réseau Rx

Ce champ permet de sélectionner le code d'accès au réseau (NAC) de réception (Rx) (en format décimal ou hexadécimal) en mode Système ASTRO (numérique).

Grâce à ce code, la radio peut accéder de manière sélective à l'un des répéteurs situés dans des zones de couverture qui se chevauchent. En fin de compte, cet ID permet la séparation des modes d'adressage parmi les utilisateurs du même canal ou de canaux adjacents; son utilité est identique à celle de la ligne privée (PL), qui est employée en mode analogique. Cette sélection s'applique uniquement au profil d'options de fréquence (rangée ou enregistrement) actuel de la personnalité conventionnelle courante.

AVERTISSEMENT :

Lorsque le champ **Activer le balayage de vote en mode mixte** à la page 478 est réglé à **Activé** et que le champ **Guidage de Tx du balayage de vote en mode mixte** à la page 478 est réglé à **Désactivé**, ce champ doit correspondre à toutes les Options de fréquence dans la personnalité courante; autrement, l'application considère la valeur de ce champ comme étant non valide.

REMARQUE :

On peut choisir les profils d'options de fréquence à utiliser dans la page Canaux de la fenêtre Attribution du canal de zone; il faut d'abord sélectionner la personnalité dans le champ **Personnalité** à la page 672, puis le profil d'options de fréquence est sélectionné dans le champ **Option de fréquence conventionnelle** à la page 674.

IMPORTANT :

Lorsque le mode Direct/Talkaround est **activé** pour ce profil d'options de fréquence et que le champ **Activer fréquence directe** à la page 402 est **activé**, l'ID de réseau direct peut être modifié sur la base du profil d'options de fréquence. Lorsque vous passez en mode Direct/Talkaround (En direct), la radio émet et reçoit alors sur la fréquence directe (MHz) au lieu de la **Fréquence Rx/TA** à la page 437.

Lorsque le mode Direct/Talkaround (En direct) est **activé** pour ce profil Options de fréquence et que le champ **Fréquence directe** est **désactivé**, la fréquence Rx/TA et les paramètres de l'ID du réseau Rx/TA sont utilisés chaque fois que vous passez en mode Direct/Talkaround (En direct).

Le mode Direct/Talkaround (En direct) doit être **activé** dans un profil d'options de fréquence pour que vous puissiez vous en servir sur un canal radio. Vous pouvez sélectionner le mode Direct/Talkaround (En direct) en appuyant sur la touche **Talkaround/Direct** à la page 193, en sélectionnant le commutateur **Talkaround/Direct** à la page 206 ou en utilisant la sélection de menu **Direct/Talkaround (En direct)** à la page 217.

Accès seulement : Lorsque le champ Rx (type voix/signal) à la page 430 est réglé à **Mode ASTRO** ou **Mode mixte** et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Tableau 209 : Portée

Minimum	Maximum	Surveillance de NAC
0 hexadécimal	FFF hex	F7E hex

IMPORTANT :

Lorsque l'ID du réseau (NAC) est réglé à **F7E**, la radio désactive la sourdine lors de n'importe quel appel ASTRO, peu importe le NAC associé à l'appel ou l'ensemble [Règle de désactivation de la sourdine Rx ASTRO à la page 460](#) établi de la radio pour le profil Options de fréquence courant.

10.34.4.8

ID du réseau Tx

Ce champ permet de sélectionner le code d'accès au réseau (NAC) (en format décimal ou hexadécimal) à utiliser pour la transmission (Tx) en mode Système ASTRO (numérique).

Grâce à ce code, la radio peut accéder de manière sélective à l'un des répéteurs situés dans des zones de couverture qui se chevauchent afin de lui demander de retransmettre le signal. En fin de compte, cet ID permet la séparation des modes d'adressage parmi les utilisateurs du même canal ou de canaux adjacents; son utilité est identique à celle de la ligne privée (PL), qui est employée en mode analogique. Cette sélection s'applique uniquement au profil d'options de fréquence (rangée ou enregistrement) actuel de la personnalité conventionnelle courante.

AVERTISSEMENT :

Lorsque le champ [Activer le balayage de vote en mode mixte à la page 478](#) est **activé** et que le champ [Guidage de Tx du balayage de vote en mode mixte à la page 478](#) est **désactivé**, ce champ doit correspondre à toutes les options de fréquence dans la personnalité courante. Autrement, RadioCentral considère la valeur de ce champ comme non valide.

REMARQUE :

On peut choisir les profils d'options de fréquence à utiliser dans la page Canaux de la fenêtre Attribution du canal de zone; il faut d'abord sélectionner la personnalité dans le champ [Personnalité à la page 672](#), puis le profil d'options de fréquence est sélectionné dans le champ [Option de fréquence conventionnelle à la page 674](#).

Accès seulement : Lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **ASTRO** ou **Mode mixte** et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Tableau 210 : Portée

Minimum	Maximum
0 hexadécimal	FFF hex

AVERTISSEMENT :

F7E est une sélection non valide; pour de plus amples renseignements, reportez-vous au champ [ID du réseau Rx à la page 442](#).

10.34.4.9

ID de groupe ASTRO

Ce champ permet de choisir un groupe par défaut dans la liste ASTRO sélectionnée du champ Liste de groupes de la personnalité courante.

Cette sélection s'applique toujours pour vous si la valeur du champ [Type de sélection à la page 474](#) du groupe est **Câblé**. Toutefois, si la valeur du champ Type de sélection est réglée à **Sélectionnable**, ce groupe s'applique seulement jusqu'à ce que vous choisissiez un autre ID dans la liste de groupes sélectionnée. Cette sélection s'applique uniquement au profil d'options de fréquence (rangée ou enregistrement) de la personnalité conventionnelle courante.

**REMARQUE :**

Les profils d'option de fréquence peuvent être sélectionnés pour être utilisés dans la section [Canaux à la page 671](#) de [Affectation du canal de zone à la page 668](#) de la page [Affectation du canal de zone à la page 668](#); pour commencer, la personnalité est sélectionnée dans le champ [Personnalité à la page 672](#), puis le profil d'options de fréquence est sélectionné dans le champ Options de fréquences.

Accès seulement : lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **ASTRO** ou à **Mode mixte**, et lorsque le champ Groupe est activé, et lorsque la personnalité n'est pas créée automatiquement par la fonction de clonage de zone.

Les sélections suivantes sont prises en charge :

Sélection de groupe de conversation

Les groupes affichés dans la liste de sélection dépendent de la liste de groupe ASTRO sélectionnée dans le champ Liste de groupes de cette personnalité.

DYN (Regroupement dynamique)**AVERTISSEMENT :**

Une configuration de regroupement dynamique est uniquement valide quand le champ Activer le regroupement dynamique est réglé à « Activé ».

**REMARQUE :**

On ne peut définir qu'un seul canal de regroupement dynamique par Système ADF associé.

Vous pouvez demander une nouvelle attribution de regroupement dynamique auprès du répartiteur au moyen du bouton Demande de reprogrammation ou utiliser l'option de menu Demande de reprogrammation. Les fonctions et les paramètres du groupe d'un regroupement dynamique sont définis et retransmis par le répartiteur.

Pour que le groupe d'un regroupement dynamique puisse transmettre en mode sécurisé, l'utilisateur doit pouvoir utiliser le bouton associé à la fonction Sélection de Tx sécurisée ou le commutateur Sélection de Tx l'option de menu Sécurisé; sinon, le groupe devra transmettre en mode non chiffré.

ATG (Groupe d'annonce)

Actuellement non pris en charge

10.34.4.10

Type de silencieux Rx/TA

Ce champ permet de sélectionner le type de ligne privée (PL) ou de silencieux de porteuse nécessaire pour communiquer avec une autre radio.

**IMPORTANT :**

Le [Type de désactivation/activation de la sourdine à la page 431](#) sélectionné pour la personnalité détermine également si un appel peut être reçu. Cette sélection s'applique uniquement au profil d'options de fréquence (rangée ou enregistrement) de la personnalité conventionnelle courante.

**AVERTISSEMENT :**

Lorsque le champ [Activer le balayage de vote en mode mixte à la page 478](#) est **activé** et que le champ [Guidage de Tx du balayage de vote en mode mixte à la page 478](#) est **désactivé**, ce champ doit correspondre à toutes les options de fréquence dans la personnalité courante. Autrement, RadioCentral considère la valeur de ce champ comme non valide.

**REMARQUE :**

On peut choisir les profils d'options de fréquence à utiliser dans la page Canaux de la fenêtre Attribution du canal de zone; il faut d'abord sélectionner la personnalité dans le champ [Personnalité à la page 672](#), puis le profil d'options de fréquence est sélectionné dans le champ [Option de fréquence conventionnelle à la page 674](#).

**IMPORTANT :**

Lorsque le mode [Direct/Talkaround \(En direct\) à la page 439](#) est **activé** pour le profil Options de fréquence courant et que le champ [Activer fréquence directe à la page 402](#) est **activé**, les paramètres Direct/Talkaround peuvent être modifiés selon le profil Options de fréquence. Lorsque vous passez en mode Direct/Talkaround (En direct), la radio émet et reçoit alors sur la fréquence directe en fonction de ces paramètres de fréquence.

Lorsque le mode Direct/Talkaround (En direct) est **activé** pour ce profil Options de fréquence et que le champ Fréquence directe est **désactivé**, les paramètres des champs Rx sont utilisés chaque fois que l'utilisateur démarre le mode Direct/Talkaround (En direct).

Le mode Direct/Talkaround (En direct) doit être **activé** dans un profil d'options de fréquence pour que vous puissiez vous en servir sur un canal radio. Vous pouvez sélectionner le mode Direct/Talkaround (En direct) en appuyant sur la touche [Talkaround/Direct à la page 193](#), en sélectionnant le commutateur [Talkaround/Direct à la page 206](#) ou en utilisant la sélection de menu [Direct/Talkaround \(En direct\) à la page 217](#).

Accès seulement : lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **Non-ASTRO** ou **Mode mixte** et lorsque le champ LP sélectionnable par l'utilisateur [MPL] est réglé à **Désactivé** ou à **Tx**.

Les sélections suivantes sont prises en charge :

- CSQ (silencieux de porteuse)
- TPL (ligne privée audiofréquence)
- DPL (ligne privée numérique)

10.34.4.11

Fréquence Rx/TA PL

Ce champ permet de sélectionner la fréquence à utiliser lors de la réception d'une communication de ligne privée (PL) transmise par une autre radio.

**REMARQUE :**

Cette fréquence est directement liée au [Code Rx/TA PL à la page 448](#); la sélection d'une valeur dans ce champ entraîne automatiquement la sélection du code Rx PL, et vice-versa. Cette sélection s'applique uniquement au profil d'options de fréquence (rangée ou enregistrement) de la personnalité conventionnelle courante.

**AVERTISSEMENT :**

Lorsque le champ [Activer le balayage de vote en mode mixte à la page 478](#) est **activé** et que le champ [Guidage de Tx du balayage de vote en mode mixte à la page 478](#) est **désactivé**, ce champ doit correspondre à toutes les options de fréquence dans la personnalité courante. Autrement, RadioCentral considère la valeur de ce champ comme non valide.

**REMARQUE :**

On peut choisir les profils d'options de fréquence à utiliser dans la page Canaux de la fenêtre Attribution du canal de zone; il faut d'abord sélectionner la personnalité dans le champ [Personnalité à la page 672](#), puis le profil d'options de fréquence est sélectionné dans le champ [Option de fréquence conventionnelle à la page 674](#).

**IMPORTANT :**

Lorsque le mode [Direct/Talkaround \(En direct\) à la page 439](#) est **activé** pour le profil Options de fréquence courant et que le champ [Activer fréquence directe à la page 402](#) est **activé**, les paramètres Direct/Talkaround peuvent être modifiés selon le profil Options de fréquence. Lorsque vous passez en mode Direct/Talkaround (En direct), la radio émet et reçoit alors sur la fréquence directe (MHz) en fonction de ces paramètres de fréquence.

Lorsque le mode Direct/Talkaround (En direct) est **activé** pour ce profil Options de fréquence et que le champ Fréquence directe est **désactivé**, les paramètres des champs Rx sont utilisés chaque fois que vous démarrez le mode Direct/Talkaround (En direct).

Le mode Direct/Talkaround (En direct) doit être **activé** dans un profil d'options de fréquence pour que vous puissiez vous en servir sur un canal radio. Vous pouvez sélectionner le mode Direct/Talkaround (En direct) en appuyant sur la touche [Talkaround/Direct à la page 193](#), en sélectionnant le commutateur [Talkaround/Direct à la page 206](#) ou en utilisant la sélection de menu [Direct/Talkaround \(En direct\) à la page 217](#).

Accès seulement : Lorsque le champ [Type de silencieux Rx/TA à la page 445](#) est réglé à **PL**, et que le champ LP sélectionnable par l'utilisateur [MPL] est réglé à **Désactivé** ou à **Tx**.

Les sélections suivantes sont prises en charge :

Tableau 211 : Fréquences et codes de silencieux de TPL

10.34.4.12

Code Rx/TA PL

Ce champ permet de sélectionner le code spécifique accepté lors de la réception d'une communication de ligne privée (PL) transmise par une autre radio.

**REMARQUE :**

Ce code est directement lié à la [Fréquence Rx/TA PL à la page 446](#); la sélection d'une valeur dans ce champ entraîne automatiquement la sélection de la Fréquence PL Rx/TA, et vice-versa. Cette sélection s'applique uniquement au profil d'options de fréquence (rangée ou enregistrement) de la personnalité conventionnelle courante.

**AVERTISSEMENT :**

Lorsque le champ [Activer le balayage de vote en mode mixte à la page 478](#) est **activé** et que le champ [Guidage de Tx du balayage de vote en mode mixte à la page 478](#) est **désactivé**, ce champ doit correspondre à toutes les options de fréquence dans la personnalité courante. Autrement, RadioCentral considère la valeur de ce champ comme non valide.

**REMARQUE :**

On peut choisir les profils d'options de fréquence à utiliser dans la page Canaux de la fenêtre Attribution du canal de zone; il faut d'abord sélectionner la personnalité dans le champ [Personnalité à la page 672](#), puis le profil d'options de fréquence est sélectionné dans le champ [Option de fréquence conventionnelle à la page 674](#).

**IMPORTANT :**

Lorsque le mode [Direct/Talkaround \(En direct\) à la page 439](#) est **activé** pour le profil Options de fréquence courant et que le champ [Activer fréquence directe à la page 402](#) est **activé**, les paramètres Direct/Talkaround peuvent être modifiés selon le profil Options de fréquence. Lorsque vous passez en mode Direct/Talkaround (En direct), la radio émet et reçoit alors sur la fréquence directe (MHz) en fonction de ces paramètres de fréquence.

Lorsque le mode Direct/Talkaround (En direct) est **activé** pour ce profil Options de fréquence et que le champ Fréquence directe est **désactivé**, les paramètres des champs Rx sont utilisés chaque fois que l'utilisateur démarre le mode Direct/Talkaround (En direct).

Le mode Direct/Talkaround (En direct) doit être **activé** dans un profil d'options de fréquence pour que vous puissiez vous en servir sur un canal radio. Vous pouvez sélectionner le mode Direct/Talkaround (En direct) en appuyant sur la touche [Talkaround/Direct à la page 193](#), en sélectionnant le commutateur [Talkaround/Direct à la page 206](#) ou en utilisant la sélection de menu [Direct/Talkaround \(En direct\) à la page 217](#).

Accès seulement : Lorsque le champ [Type de silencieux Rx/TA à la page 445](#) est réglé à **PL**, et que le champ LP sélectionnable par l'utilisateur [MPL] est réglé à **Désactivé** ou à **Tx**.

Les sélections suivantes sont prises en charge :

10.34.4.13

Code Rx/TA DPL

Ce champ permet de sélectionner le code spécifique accepté lors de la réception d'une communication de ligne privée numérique (DPL) transmise par une autre radio.

Cette sélection s'applique uniquement au profil d'options de fréquence (rangée ou enregistrement) de la personnalité conventionnelle courante.

AVERTISSEMENT :

Lorsque le champ [Activer le balayage de vote en mode mixte à la page 478](#) est réglé à **Activé** et que le champ [Guidage de Tx du balayage de vote en mode mixte à la page 478](#) est réglé à **Désactivé**, ce champ doit correspondre à toutes les Options de fréquence dans la personnalité courante; autrement, l'application considère la valeur de ce champ comme étant non valide.

REMARQUE :

On peut sélectionner les profils d'options de fréquence à utiliser dans la page Canaux de la fenêtre Affectation du canal de zone; il faut d'abord sélectionner la personnalité dans le champ [Personnalité à la page 672](#) [Option de fréquence conventionnelle à la page 674](#).

IMPORTANT :

Lorsque le mode [Direct/Talkaround \(En direct\) à la page 439](#) est **activé** pour le profil Options de fréquence courant et que le champ [Activer fréquence directe à la page 402](#) est **activé**, les paramètres Direct/Talkaround peuvent être modifiés selon le profil Options de fréquence. Lorsque vous passez en mode Direct/Talkaround (En direct), la radio émet et reçoit alors sur la fréquence directe (MHz) en fonction de ces paramètres de fréquence.

Lorsque le mode Direct/Talkaround (En direct) est **activé** pour ce profil Options de fréquence et que le champ Fréquence directe est **désactivé**, les paramètres des champs Rx sont utilisés chaque fois que l'utilisateur démarre le mode Direct/Talkaround (En direct).

Le mode Direct/Talkaround (En direct) doit être **activé** dans un profil d'options de fréquence pour que vous puissiez vous en servir sur un canal radio. Vous pouvez sélectionner le mode Direct/Talkaround (En direct) en appuyant sur la touche [Talkaround/Direct à la page 193](#), en sélectionnant le commutateur [Talkaround/Direct à la page 206](#) ou en utilisant la sélection de menu [Direct/Talkaround \(En direct\) à la page 217](#).

Accès seulement : Lorsque le champ [Type de silencieux Rx/TA à la page 445](#) est réglé à **DPL** et que le champ LP sélectionnable par l'utilisateur [MPL] est réglé à **Désactivé** ou à **Tx**.

Les sélections suivantes sont prises en charge :

Tableau 213 : Codes de silencieux de DPL

Code	Code	Code	Code
023	152	343	565
025	155	346	606
026	156	351	612

115	263	466	732
116	265	503	734
125	271	506	743
131	306	516	754
132	311	525*	
134	315	532	
143	331	546	

REMARQUE :

Les codes suivis d'un astérisque ne font pas partie des 83 codes standard des normes EIA/TIA-603.

10.34.4.14

Inverser Rx/TA DPL

Ce champ permet d'inverser les signaux de ligne privée numérique (DPL) au moment de leur réception par la radio.

**REMARQUE :**

Le codage inversé permet une utilisation accrue des fréquences.

**IMPORTANT :**

La fonction Inverser DPL doit être réglée à les radios émettrices et réceptrices pour que la communication soit possible. Cette fonction s'applique uniquement au profil d'options de fréquence (rangée ou enregistrement) courant de la personnalité conventionnelle courante.

**AVERTISSEMENT :**

Lorsque le champ [Activer le balayage de vote en mode mixte à la page 478](#) est **activé** et que le champ [Guidage de Tx du balayage de vote en mode mixte à la page 478](#) est **désactivé**, ce champ doit correspondre à toutes les options de fréquence dans la personnalité courante. Autrement, RadioCentral considère la valeur de ce champ comme non valide.

**REMARQUE :**

On peut choisir les profils d'options de fréquence à utiliser dans la page Canaux de la fenêtre Attribution du canal de zone; il faut d'abord sélectionner la personnalité dans le champ [Personnalité à la page 672](#), puis le profil d'options de fréquence est sélectionné dans le champ [Option de fréquence conventionnelle à la page 674](#).

**IMPORTANT :**

Lorsque le mode [Direct/Talkaround \(En direct\) à la page 439](#) est **activé** pour le profil Options de fréquence courant et que le champ [Activer fréquence directe à la page 402](#) est **activé**, les paramètres Direct/Talkaround peuvent être modifiés selon le profil Options de fréquence. Lorsque vous passez en mode Direct/Talkaround (En direct), la radio émet et reçoit alors sur la fréquence directe en fonction de ces paramètres de fréquence.

Lorsque le mode Direct/Talkaround (En direct) est **activé** pour ce profil Options de fréquence et que le champ Fréquence directe est **désactivé**, les paramètres des champs Rx sont utilisés chaque fois que vous démarrez le mode Direct/Talkaround (En direct).

Le mode Direct/Talkaround (En direct) doit être **activé** dans un profil d'options de fréquence pour que vous puissiez vous en servir sur un canal radio. Vous pouvez sélectionner le mode Direct/Talkaround (En direct) en appuyant sur la touche [Talkaround/Direct à la page 193](#), en sélectionnant le commutateur [Talkaround/Direct à la page 206](#) ou en utilisant la sélection de menu [Direct/Talkaround \(En direct\) à la page 217](#).

Accès seulement : Lorsque le champ [Type de silencieux Rx/TA à la page 445](#) est réglé à **DPL** et que le champ LP sélectionnable par l'utilisateur [MPL] est réglé à **Désactivé** ou à **Tx**.

10.34.4.15

Type de silencieux Tx

Ce champ permet de sélectionner le type de ligne privée (PL) ou de silencieux de porteuse pour la transmission, nécessaire pour la communication avec une autre radio.

**IMPORTANT :**

Le [Type de désactivation/activation de la sourdine à la page 431](#) sélectionné pour la personnalité détermine également si un appel peut être reçu. Cette sélection s'applique uniquement au profil d'options de fréquence (rangée ou enregistrement) de la personnalité conventionnelle courante.

**AVERTISSEMENT :**

Lorsque le champ [Activer le balayage de vote en mode mixte à la page 478](#) est **activé** et que le champ [Guidage de Tx du balayage de vote en mode mixte à la page 478](#) est **désactivé**, ce champ doit correspondre à toutes les options de fréquence dans la personnalité courante. Autrement, RadioCentral considère la valeur de ce champ comme non valide.

**REMARQUE :**

On peut choisir les profils d'options de fréquence à utiliser dans la page Canaux de la fenêtre Attribution du canal de zone; il faut d'abord sélectionner la personnalité dans le champ [Personnalité à la page 672](#), puis le profil d'options de fréquence est sélectionné dans le champ [Option de fréquence conventionnelle à la page 674](#).

Accès seulement : lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **Non ASTRO** ou à **Mode mixte**, et lorsque le champ [Personnalité réception seulement à la page 430](#) est réglé à **Désactivé**, et lorsque le champ LP sélectionnable par l'utilisateur (MPL) est **désactivé** ou réglé à **Rx**.

Les sélections suivantes sont prises en charge :

- Désactivé;
- TPL (ligne privée audiofréquence)
- DPL (ligne privée numérique)

10.34.4.16

Fréquence Tx PL

Ce champ permet de sélectionner une fréquence désignée utilisée pour transmettre une communication de ligne privée (PL) à une autre radio.

**REMARQUE :**

Cette fréquence est directement liée au [Code Tx PL à la page 455](#); la sélection d'une valeur dans ce champ entraîne automatiquement la sélection du code Rx PL, et vice-versa. Cette sélection s'applique uniquement au profil d'options de fréquence (rangée ou enregistrement) de la personnalité conventionnelle courante.

**AVERTISSEMENT :**

Lorsque le champ [Activer le balayage de vote en mode mixte à la page 478](#) est **activé** et que le champ [Guidage de Tx du balayage de vote en mode mixte à la page 478](#) est **désactivé**, ce champ doit correspondre à toutes les options de fréquence dans la personnalité courante. Autrement, RadioCentral considère la valeur de ce champ comme non valide.

**REMARQUE :**

On peut choisir les profils d'options de fréquence à utiliser dans la page Canaux de la fenêtre Attribution du canal de zone; il faut d'abord sélectionner la personnalité dans le champ [Personnalité à la page 672](#), puis le profil d'options de fréquence est sélectionné dans le champ [Option de fréquence conventionnelle à la page 674](#).

Accès seulement : Lorsque le champ [Personnalité réception seulement à la page 430](#) est **désactivé**, et lorsque le champ [Type de silencieux Tx à la page 453](#) est réglé à **PL**, et lorsque le champ LP sélectionnable par l'utilisateur [MPL] est **désactivé** ou réglé à **Rx**.

Les sélections suivantes sont prises en charge :

Tableau 214 : Fréquences et codes de silencieux de TPL

Fréq. (Hz) = Code		Fréq. (Hz) = Code

10.34.4.17

Code Tx PL

Ce champ permet de sélectionner le code utilisé pour transmettre une communication de ligne privée (PL) à une autre radio.

**REMARQUE :**

Ce code est directement lié à la [Fréquence Tx PL à la page 453](#); la sélection d'une valeur dans ce champ entraîne automatiquement la sélection de la fréquence PL Tx, et vice-versa. Cette sélection s'applique uniquement au profil d'options de fréquence (rangée ou enregistrement) de la personnalité conventionnelle courante.

**AVERTISSEMENT :**

Lorsque le champ [Activer le balayage de vote en mode mixte à la page 478](#) est **activé** et que le champ [Guidage de Tx du balayage de vote en mode mixte à la page 478](#) est **désactivé**, ce champ doit correspondre à toutes les options de fréquence dans la personnalité courante. Autrement, RadioCentral considère la valeur de ce champ comme non valide.

**REMARQUE :**

On peut choisir les profils d'options de fréquence à utiliser dans la page Canaux de la fenêtre Attribution du canal de zone; il faut d'abord sélectionner la personnalité dans le champ [Personnalité à la page 672](#), puis le profil d'options de fréquence est sélectionné dans le champ [Option de fréquence conventionnelle à la page 674](#).

Accès seulement : Lorsque le champ [Personnalité réception seulement à la page 430](#) est **désactivé**, et lorsque le champ [Type de silencieux Tx à la page 453](#) est réglé à **PL**, et lorsque le champ LP sélectionnable par l'utilisateur [MPL] est **désactivé** ou réglé à **Rx**.

Les sélections suivantes sont prises en charge :

Tableau 215 : Fréquences et codes de silencieux de TPL

10.34.4.18

Code Tx DPL

Ce champ permet de sélectionner le code de ligne privée numérique (DPL) qui sert à la transmission lorsque l'utilisateur appuie sur le bouton PTT.

Cette sélection s'applique uniquement au profil d'options de fréquence (rangée ou enregistrement) de la personnalité conventionnelle courante.

**AVERTISSEMENT :**

Lorsque le champ [Activer le balayage de vote en mode mixte à la page 478](#) est **activé** et que le champ [Guidage de Tx du balayage de vote en mode mixte à la page 478](#) est **désactivé**, ce champ doit correspondre à toutes les options de fréquence dans la personnalité courante. Autrement, RadioCentral considère la valeur de ce champ comme non valide.

**REMARQUE :**

On peut choisir les profils d'options de fréquence à utiliser dans la page Canaux de la fenêtre Attribution du canal de zone; il faut d'abord sélectionner la personnalité dans le champ [Personnalité à la page 672](#), puis le profil d'options de fréquence est sélectionné dans le champ [Option de fréquence conventionnelle à la page 674](#).

Accès seulement : Lorsque le champ [Personnalité réception seulement à la page 430](#) est **désactivé**, et lorsque le champ [Type de silencieux Tx à la page 453](#) est réglé à **DPL**, et lorsque le champ LP sélectionnable par l'utilisateur [MPL] est **désactivé** ou réglé à **Rx**.

Les sélections suivantes sont prises en charge :

Tableau 216 : Codes de silencieux de DPL

Code	Code	Code	Code
023	152	343	565
025	155	346	606
026	156	351	612
031	162	364	624
032	165	365	627
043	172	371	631
047	174	411	632
051	205	412	645*

115	263	466	732
116	265	503	734
125	271	506	743
131	306	516	754
132	311	525*	
134	315	532	
143	331	546	

REMARQUE :

Les codes suivis d'un astérisque ne font pas partie des 83 codes standard des normes EIA/TIA-603.

10.34.4.19

Inverser Tx DPL

Ce champ permet d'inverser les signaux de ligne privée numérique (DPL) avant leur transmission.

REMARQUE :

Le codage inversé permet une utilisation accrue des fréquences.

IMPORTANT :

La fonction Inverser Tx DPL doit être réglée sur la radio émettrice et la radio réceptrice pour que la communication soit possible. Cette fonction s'applique uniquement au profil d'options de fréquence (rangée ou enregistrement) courant de la personnalité conventionnelle courante.

AVERTISSEMENT :

Lorsque le champ [Activer le balayage de vote en mode mixte à la page 478](#) est **activé** et que le champ [Guidage de Tx du balayage de vote en mode mixte à la page 478](#) est **désactivé**, ce champ doit correspondre à toutes les options de fréquence dans la personnalité courante. Autrement, RadioCentral considère la valeur de ce champ comme non valide.

REMARQUE :

On peut choisir les profils d'options de fréquence à utiliser dans la page Canaux de la fenêtre Attribution du canal de zone; il faut d'abord sélectionner la personnalité dans le champ [Personnalité à la page 672](#), puis le profil d'options de fréquence est sélectionné dans le champ [Option de fréquence conventionnelle à la page 674](#).

Accès seulement : Lorsque le champ [Personnalité réception seulement à la page 430](#) est **désactivé**, et lorsque le champ [Type de silencieux Tx à la page 453](#) est réglé à **DPL**, et lorsque le champ LP sélectionnable par l'utilisateur [MPL] est **désactivé** ou réglé à **Rx**.

10.34.4.20

Membre du balayage de vote en mode mixte constant

Ce champ fait en sorte que la radio vérifie toujours la Fréquence Rx/TA sélectionnée (enregistrement/ rangée) quand elle fonctionne en mode Balayage et balaie activement cette personnalité conventionnelle avec le balayage de vote mixte.

Cela survient même à des fréquences/canaux plus puissants qui se trouvent sur la même liste de balayage quand cette personnalité conventionnelle est sélectionnée. Cette sélection s'applique uniquement au profil d'options de fréquence (rangée ou enregistrement) actuel de la personnalité conventionnelle courante.

REMARQUE :

On peut choisir les profils d'options de fréquences à utiliser dans la page Canaux de la fenêtre Attribution du canal de zone; il faut d'abord sélectionner la personnalité dans le champ Personnalité, puis le profil d'options de fréquence dans le champ Options de fréquence.

Accès seulement : Lorsque le champ [Activer le balayage de vote en mode mixte à la page 478](#) est réglé à **Activé**.

10.34.5

Émission de signaux

Cette section vous permet d'afficher et de définir les fonctionnalités d'émission de signaux ASTRO ou non ASTRO (MDC, DTMF, Appel rapide II et Tonalité unique) pour des personnalités conventionnelles individuelles.

REMARQUE :

Après avoir défini de façon unique les fonctions des personnalités conventionnelles, chaque personnalité peut être assignée à la position désirée du sélecteur de canaux de la radio. Cette opération est effectuée à partir de la page Canaux, dans la fenêtre Attribution du canal de zone.

10.34.5.1

Système ASTRO

Ce champ permet de sélectionner le système d'émission de signaux ASTRO ou DVRS à utiliser pour la personnalité conventionnelle courante.

Le système conventionnel défini précédemment et tous ses paramètres programmés s'appliquent alors à ce canal.

**IMPORTANT :**

Seuls les systèmes conventionnels comportant un système de type ASTRO ou DVRS (défini au préalable dans le champ Type de système) peuvent être sélectionnés.

**REMARQUE :**

La valeur du système ASTRO est associée au premier enregistrement de système conventionnel si la personnalité n'est pas créée automatiquement par la fonction de clonage de zone. La valeur ne peut pas être modifiée.

Accès seulement : Lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **ASTRO** ou **Mode mixte** et que le modèle ou l'option de la radio le permet.

10.34.5.2

Type de modulateur numérique ASTRO

Ce champ permet de sélectionner le type de modulateur numérique utilisé en mode d'émission de signaux ASTRO et pour la personnalité conventionnelle courante.

Accès seulement : Lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **ASTRO** ou **Mode mixte** et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

C4FM

Modulation continue de fréquence porteuse à quatre niveaux prenant en charge la diffusion non simultanée.

CQPSK

Modulation par déplacement de phase quadrivalente permettant la diffusion au moyen d'une bande étroite. Accessible lorsque le modèle de la radio peut prendre en charge les opérations effectuées à partir d'une interface hertzienne commune (CAI) numérique.

LARGE

Diffusion au moyen d'une large bande. Disponible lorsque le champ [Écart Tx/Séparation des canaux à la page 441](#) n'est pas réglé à **2,5 kHz**.

**AVERTISSEMENT :**

Cette sélection n'est pas valide si ce qui suit est vrai lorsque le champ Type voix/signal Rx est réglé à **ASTRO** ou à **Mode mixte**, et ((lorsque la Bande de fréquences primaire est **900 MHz**), ou (lorsque le champ Permettre les fréquences non valides est **Activé**, et lorsque le champ 900 MHz utilisé dans la codeplug est **activé**)).

10.34.5.3

Règle de désactivation de la sourdine Rx ASTRO

Ce champ permet de sélectionner le mode de désactivation de la sourdine Rx ASTRO et d'utiliser le mode d'émission des signaux ASTRO ou DVRS pour la personnalité conventionnelle courante.

**AVERTISSEMENT :**

Lorsque l'ID de groupe **65535** de type Tous les appels (s'appliquant à l'ensemble du système) est sélectionné pour le canal courant ou la personnalité actuelle (dans le champ ID de groupe ASTRO), et que le champ [Type de sélection à la page 474](#) contient la valeur **Câblé**, la valeur **Silencieux normal** est la seule valeur valide pour ce champ.

Lorsque l'ID de groupe **0** de type « Réception seulement » (s'appliquant à l'ensemble du système) est sélectionné pour le canal courant ou la Personnalité courante, la valeur **Silencieux sélectif** est la seule valeur valide pour ce champ.

**REMARQUE :**

Lors d'une transmission sous l'ID de groupe **65535** de type Tous les appels s'appliquant à l'ensemble du système (pour le canal courant ou la personnalité actuelle), la radio reçoit automatiquement les signaux vocaux ASTRO selon le réglage **Silencieux normal**, peu importe le réglage du champ en question.

Accès seulement : Lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **ASTRO** ou **Mode mixte** et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Silencieux normal

La radio désactive la sourdine après avoir trouvé une correspondance d'[ID du réseau Rx à la page 442](#). La radio désactive la sourdine, même lorsqu'elle s'attend à recevoir un appel vocal DES-XL, mais qu'elle reçoit un appel DES-OFB (voir le champ [DES-XL Tx par défaut à la page 485](#)).

**REMARQUE :**

Accessible lorsque le champ [Groupe à la page 474](#) ou [Rx/Tx d'appel sélectif à la page 470](#) est **activé**.

Silencieux sélectif

La radio désactive la sourdine après avoir trouvé une correspondance d'ID réseau (et soit un ID de groupe correspondant, soit un Appel sélectif). Si la sélection de DES-XL Tx par défaut détermine le type d'algorithme de chiffrement que la radio s'attend à recevoir dans ce mode.

**REMARQUE :**

Accessible lorsque le champ Groupe ou Rx/Tx d'appel sélectif est **activé**.

Données et silencieux

La radio désactive la sourdine après avoir trouvé une correspondance d'ID réseau et un appel sélectif.

**REMARQUE :**

Disponible lorsque le champ Rx/Tx d'appel sélectif est **activé**.

CSQ numérique

La radio désactive la sourdine de tous les signaux vocaux conformes à l'interface radio commune (CAI) numérique.

10.34.5.4

ASTRO\ Dernière entrée – Activation rapide du son

Ce champ permet à la radio de désactiver la sourdine pour un appel déjà cours avant de déterminer s'il s'agit d'un appel sécurisé.

Cette fonction permet de désactiver le son d'un appel plus rapidement (de 180 à 360 ms plus rapidement). Cette fonction s'applique au mode d'émission de signaux ASTRO et à la personnalité conventionnelle courante.

**IMPORTANT :**

Il est recommandé de n'utiliser cette fonction que sur des canaux non sécurisés; les radios recevant des appels sécurisés désactivent la sourdine et émettent des sons non compréhensibles jusqu'à ce qu'un appel soit considéré comme sécuritaire.

Accès seulement : Lorsque le champ **Rx (type voix/signal)** à la page 430 est réglé à **ASTRO** ou **Mode mixte** et que le modèle ou l'option de la radio le permet.

10.34.5.5

Autre que ASTRO\Type d'émission de signaux

Ce champ permet de sélectionner le type de système d'émission de signaux analogiques à utiliser pour la réception et la transmission des communications pendant le fonctionnement selon la personnalité conventionnelle courante.

**AVERTISSEMENT :**

Lorsque le champ Audio analogique uniforme est **activé**, ce champ doit être réglé à **Aucun**; autrement, il devient non valide. Ces deux fonctions ne peuvent donc pas être activées pour la même personnalité.

Accès seulement : Lorsque le champ **Rx (type voix/signal)** à la page 430 est réglé à **Non-ASTRO** ou à **Mode mixte** et lorsque la personnalité n'est pas créée automatiquement par la fonction de clonage de zone.

Les sélections suivantes sont prises en charge :

- Aucun
- MDC
- DTMF
- Appel rapide II

**REMARQUE :**

Certaines fonctions dépendent du modèle ou des options de la radio.

10.34.5.6

Numéro du système

10.34.5.7

Autre que ASTRO\ID de PTT

Ce champ permet d'activer l'ID de PTT d'un signal MDC ou DTMF à transmettre avec chaque communication sortante.

**REMARQUE :**

L'ID de PTT correspond à l'ID principale définie dans le module RadioCentral. La transmission de l'ID principal permet l'ID de l'appelant sur la radio réceptrice. Cette fonction s'applique à la personnalité conventionnelle courante.

**REMARQUE :**

Lorsque le champ ID de PTT contient la valeur **Front montant** ou **Les deux**, l'ID de PTT est transmis chaque fois que la touche PTT est enfoncée.

Lorsque la sélection du champ PTT-ID est **Front descendant** ou **Les deux**, c

**AVERTISSEMENT :**

Le champ ID de PTT ne doit pas contenir la valeur **Aucun** pour les systèmes conventionnels référencés de type MDC ou DTMF.

Accès seulement : Lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est **Non-ASTRO** ou **Mode mixte** et lorsque le champ Type d'émission de signaux Non-ASTRO est **MDC**, **DTMF** et lorsque le [Personnalité réception seulement à la page 430](#) est **Désactivé**.

10.34.5.8

ID de PTT d'urgence

Ce champ permet d'activer l'unité MDC/ID principal actuellement sélectionné à transmettre avec chaque appel en mode d'urgence.

Ainsi, l'ID de PTT d'urgence ne s'applique que si le champ Type d'urgence contient la valeur **Alarme et appel**. Cette fonction s'applique à la personnalité conventionnelle courante.

**REMARQUE :**

L'ID de PTT d'urgence transmis est déterminé par le numéro de système associé (MDC seulement) à la personnalité conventionnelle courante.

Accès seulement : Lorsque le champ [Personnalité réception seulement à la page 430](#) est **Désactivé**, et lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est **Non-ASTRO** ou **Mode mixte** et lorsque le champ Type d'émission de signaux Non-ASTRO est **MDC**, et lorsqu'un système conventionnel défini est de type **MDC** avec un profil d'urgence conventionnel défini a été sélectionné, et lorsque le champ Type d'urgence de ce dernier est réglé à **Alarme et appel**.

10.34.5.9

Type d'annulation d'urgence

Ce champ permet de sélectionner le type de redirection d'urgence à utiliser pour la personnalité conventionnelle courante.

Accès seulement : (Lorsque le champ [Type voix/signal Tx à la page 434](#) est réglé à **ASTRO**, et lorsque le champ Type de système ASTRO du Système conventionnel avec un Profil d'urgence conventionnel défini a été sélectionné) ou (lorsque le champ Type voix/signal Tx est réglé à **Non-ASTRO**, et lorsque le champ Type d'émission de signaux non-ASTRO est réglé à **MDC**, et quand un système conventionnel défini avec un type MDC ayant un profil d'urgence conventionnel défini a été sélectionné.)

Les sélections suivantes sont prises en charge :

Canal sélectionné

Aucun canal d'annulation n'est utilisé; les urgences sont transmises au moyen du canal sélectionné actuellement.

Canal de redirection

La [Zone d'annulation d'urgence à la page 463](#) et le [Canal d'annulation d'urgence à la page 463](#) sélectionnés pour la personnalité sont utilisés pour les transmissions d'urgence.

Groupe de conversation d'annulation

Le groupe d'annulation sélectionné pour cette personnalité est utilisé pour les transmissions d'urgences.

Cette sélection est accessible seulement lorsque la radio a la capacité d'appareil portatif d'abonné (PSU) DVRS.

**AVERTISSEMENT :**

Cette sélection est uniquement valide lorsque le Système conventionnel défini est de type **DVRS** avec un profil d'urgence conventionnel sélectionné, et le champ [Groupe à la page 474](#) est **Activé**.

10.34.5.10

Zone d'annulation d'urgence

Ce champ permet de sélectionner la zone à utiliser pendant une transmission en mode d'urgence.

Cette sélection s'applique à la personnalité conventionnelle courante.

**REMARQUE :**

Une fois la zone sélectionnée, le [Canal d'annulation d'urgence à la page 463](#) peut alors être sélectionné.

Les zones et leurs canaux doivent d'abord avoir été définis dans la fenêtre Attribution du canal de zone.

**AVERTISSEMENT :**

Seules les zones non dynamiques (zones pour lesquelles l'option Activation zone dynamique est **désactivée**) peuvent être sélectionnées; sinon, ce champ devient non valide.

Accès seulement : lorsque le champ [Type d'annulation d'urgence à la page 462](#) est réglé à **Canal de redirection** et (lorsque le champ [Type voix/signal Tx à la page 434](#) est réglé à **ASTRO**, et lorsqu'un Système conventionnel de type ASTRO avec un Profil d'urgence conventionnel défini a été sélectionné) ou (lorsque le champ Type voix/signal Tx est réglé à **Non-ASTRO**, et lorsque le champ Type d'émission de signaux non-ASTRO est réglé à **MDC**, et quand un système conventionnel défini avec un type MDC ayant un profil d'urgence conventionnel défini a été sélectionné).

10.34.5.11

Canal d'annulation d'urgence

Ce champ permet de sélectionner un canal conventionnel désigné à utiliser pendant une transmission en mode d'urgence.

Cette sélection s'applique à la personnalité conventionnelle courante.

REMARQUE :

Le [Zone d'annulation d'urgence à la page 463](#) doit être sélectionné avant de sélectionner ce canal.

Les zones et leurs canaux doivent d'abord avoir été définis dans la fenêtre Attribution du canal de zone.

AVERTISSEMENT :

Pour qu'un canal ADF puisse être sélectionné comme canal de rétablissement d'urgence, la fonction étendue **Annulation d'urgence multiple** doit apparaître dans le champ Nom de fonction étendue.

La sélection Canal de redirection d'urgence est considérée comme étant valide uniquement lorsque le champ Groupe ADF pour la personnalité ou le canal ADF sélectionné n'est pas réglé à **DYN** ou **ATG**, que le champ [Personnalité réception seulement à la page 430](#) pour la personnalité ou le canal conventionnel sélectionné est réglé à **Désactivé**, que le champ ID de groupe ASTRO pour la personnalité ou le canal conventionnel sélectionné n'est pas réglé à **DYN** ou **ATG**, et lorsque le champ Mode de transmission n'est pas réglé à **TG/AG Désactivé (écoute seulement)** et que le champ Sélection du profil d'urgence pour le canal sélectionné n'est pas réglé à **Urgence Tx Désactivé**.

Accès seulement : Lorsque le champ [Type d'annulation d'urgence à la page 462](#) est réglé à **Canal de redirection**, et lorsque le champ Zone d'annulation n'est pas réglé à Zone dynamique, et (lorsque le champ [Type voix/signal Tx à la page 434](#) est réglé à **ASTRO**, et lorsqu'un Système conventionnel de type ASTRO avec un Profil d'urgence conventionnel défini a été sélectionné) ou (lorsque le champ Type voix/signal Tx est réglé à **Non-ASTRO**, et lorsque le champ Type d'émission de signaux non-ASTRO est réglé à **MDC**, et quand un système conventionnel défini avec un type MDC ayant un profil d'urgence conventionnel défini a été sélectionné).

10.34.5.12

Liste de composition de tonalité

Ce champ permet de sélectionner la liste de composition de tonalité à utiliser pour la personnalité conventionnelle courante.

REMARQUE :

La fonctionnalité Liste de composition de tonalité est définie à la page Liste de composition de tonalité.

Accès seulement : Lorsque la Liste de composition de tonalité est réglée à **Composition de tonalité désactivée**, ou lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **Non-ASTRO**, et lorsque le Type de signalisation est réglé à **Appel rapide II**, ou lorsque le champ Type voix/signal Rx est réglé à **Mode mixte** et lorsque le champ [Type voix/signal Tx à la page 434](#) est réglé à **Non-ASTRO**, et lorsque le Type de signalisation est réglé à **Appel rapide II** ou lorsque le champ Type voix/signal Rx n'est pas réglé à **Non-ASTRO**, ou lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

- Composition de tonalité désactivée
- Listes de composition de tonalité disponibles

10.34.6

Appel autre que ASTRO

Cette section vous permet d'afficher ou de définir des caractéristiques liées aux signaux de mode non ASTRO ou analogique, notamment : MDC, DTMF, Appel rapide II et Tonalité unique.

**REMARQUE :**

Les systèmes conventionnels définis comme ayant un type de système **MDC, DTMF, Appel rapide II** ou **Tonalité unique** peuvent être sélectionnés à partir du champ Système Non ASTRO de la personnalité conventionnelle, ce qui permet d'établir des communications de ce type de système spécifique.

Après avoir défini de façon unique les fonctions des personnalités conventionnelles, chaque personnalité peut être assignée à la position désirée du sélecteur de canaux de la radio. Cette opération est effectuée à partir de la page Canaux, dans la fenêtre Attribution du canal de zone.

10.34.6.1

Rx/Tx d'appel sélectif

Ce champ permet de sélectionner si les appels sélectifs non-ASTRO (MDC, DTMF et Appel rapide II) peuvent être transmis ou reçus (ou les deux) pour la personnalité conventionnelle courante.

**AVERTISSEMENT :**

Lorsque le champ Plage d'ID MDC étendue est **activé**, ce champ doit être réglé à **Désactivé**; sinon, il est considéré comme étant non valide par le module RadioCentral. Ces deux fonctions sont incompatibles.

Lorsque le champ Type d'émission de signaux Non ASTRO est réglé à **Appel rapide II** et lorsque le champ Activer le matériel DVRS est réglé à **Activé**, et que le profil DVRS référencé de la personnalité conventionnelle actuelle a le champ Activation DVRS à distance réglé à **Par alerte d'appel**, cette fonction doit être réglée à **Désactivé** pour ne pas être considérée comme non valide par le module RadioCentral. Ces deux fonctions sont incompatibles.

Lorsque le champ Type d'émission de signaux Non ASTRO contient la valeur **Appel rapide II**, cette fonction et **Rx/Tx d'avis d'appel à la page 466** s'excluent mutuellement; par conséquent, une de ces fonctions doit être réglée à **Désactivé**, sinon les deux fonctions sont considérées comme non valides.

**REMARQUE :**

Vous pouvez activer un appel sélectif (transmission) en appuyant sur la touche Appel sélectif/privé ou en utilisant la sélection de menu Appel sélectif/privé.

Accès seulement : Lorsque le champ **Rx (type voix/signal) à la page 430** est **Non-ASTRO** ou **Mode mixte** et lorsque le champ Type d'émission de signaux Non-ASTRO est **MDC, DTMF** ou **Appel rapide II** et lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Désactivé;

La personnalité courante interdit toutes les alertes d'appel.

Décoder

Il est uniquement possible de recevoir (décoder) des appels sélectifs.

Encoder

Il est uniquement possible de transmettre (encoder) des appels sélectifs.

**AVERTISSEMENT :**

Lorsque le champ Type d'émission de signaux Non ASTRO est réglé à **Appel rapide II**, cette sélection est non valide.

Décoder et encoder

Il est possible de transmettre et de recevoir des appels sélectifs.

AVERTISSEMENT :

Lorsque le champ Type d'émission de signaux Non ASTRO est réglé à **Appel rapide II**, cette sélection est non valide.

10.34.6.2

Type de désactivation de la sourdine

Ce champ permet de sélectionner la règle de désactivation de la sourdine pour la personnalité conventionnelle autre que ASTRO (MDC, DTMF ou Appel rapide II).

Cette règle s'applique uniquement à la détection des appels sélectifs.

Accès seulement : Lorsque le champ **Rx (type voix/signal) à la page 430** est **Non-ASTRO** ou **Mode mixte** et lorsque le champ Type d'émission de signaux Non-ASTRO est **MDC, DTMF** ou **Appel rapide II** et lorsque le champ **Rx/Tx d'appel sélectif à la page 465** est réglé à **Décoder** ou **Décoder et encoder**, et lorsque le modèle ou les options de la radio le permettent.

Les sélections suivantes sont prises en charge :

Et

Le type de désactivation ou d'activation de la règle [Type de désactivation/activation de la sourdine à la page 431](#) pour la personnalité courante et la détection d'un appel sélectif doivent être respectés pour que la sourdine soit désactivée.

ou

Le type de désactivation ou d'activation de la sourdine sélectionné pour la personnalité courante ou la détection d'un appel sélectif désactive la sourdine du haut-parleur de la radio.

10.34.6.3

Rx/Tx d'avis d'appel

Ce champ permet d'indiquer si des alertes d'appel non-ASTRO (MDC, DTMF, Appel rapide II et Tonalité unique) peuvent être transmises ou reçues (ou les deux) pour la personnalité conventionnelle courante.

AVERTISSEMENT :

Lorsque le champ Plage d'ID MDC étendue est **activé**, ce champ doit être réglé à **Désactivé**; sinon, il est considéré comme étant non valide par le module RadioCentral. Ces deux fonctions sont incompatibles.

Lorsque le champ Type d'émission de signaux non-ASTRO est réglé à **Appel rapide II**, cette fonction et [Rx/Tx d'appel sélectif à la page 465](#) s'excluent mutuellement; par conséquent, l'une de ces fonctions doit être réglée à **Désactivé**; autrement, les deux fonctions sont considérées comme non valides par le module RadioCentral.

REMARQUE :

L'utilisateur peut activer une alerte d'appel à l'aide de la fonction Avis d'appel ou de la commande de menu Notification (Avis d'appel).

Accès seulement : (Lorsque le modèle ou les options de la radio le permettent, et lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est **non-ASTRO** ou **Mode mixte** et lorsque le champ Type d'émission de signaux Non-ASTRO est **MDC, DTMF**, ou **Appel rapide II** pour la personnalité actuelle), et (lorsque le champ Activer matériel DVRS est **Désactivé**) ou (lorsque le champ Activer matériel DVRS est **Activé**, et lorsque la personnalité courante du Profil DVRS défini a son champ Activation DVRS à distance réglé à **Désactivé**.)

Les sélections suivantes sont prises en charge :

Désactivé;

La personnalité courante interdit toutes les alertes d'appel.

Décoder

Il est uniquement possible de recevoir (décoder) des alertes d'appel.

Encoder

Il est uniquement possible de transmettre (encoder) des alertes d'appel.

**AVERTISSEMENT :**

Lorsque le champ Type d'émission de signaux Non ASTRO est réglé à **Appel rapide II**, cette sélection est non valide.

Décoder et encoder

Il est possible de transmettre et de recevoir des alertes d'appel.

**AVERTISSEMENT :**

Lorsque le champ Type d'émission de signaux Non ASTRO est réglé à **Appel rapide II**, cette sélection est non valide.

10.34.6.4

MDC\Accès de touche RTT

Ce champ permet de sélectionner le mode de demande de conversation (RTT) pour la personnalité conventionnelle courante.

Lorsque le champ est réglé à **Manuel** (touche RTT MDC ou commande de menu [Demande de conversation](#)) ou à **Auto** (touche PTT), la radio envoie un paquet de signaux RTT au répartiteur pour demander la capacité de transmettre des signaux vocaux sur le canal. Le microphone de la radio commence immédiatement à émettre pendant deux ou trois secondes pour vous laisser le temps de prendre le microphone et de commencer la transmission vocale. À partir de ce moment, la radio dispose d'un accès vocal « normal » à ce canal.

**REMARQUE :**

Cette fonction permet au répartiteur de gérer le trafic de communications vocales sur le canal. Cette fonction s'applique au mode Système MDC et à la personnalité conventionnelle courante.

**AVERTISSEMENT :**

Si le champ [Type d'accès](#) est réglé à **Auto**, ce champ ne peut pas être réglé à **Auto**. Ces deux réglages sont incompatibles.

Accès seulement : Lorsque le champ [Type voix/signal Tx à la page 434](#) est réglé à **Non-ASTRO** et lorsque le type d'émission de signaux Non-ASTRO de la personnalité courante est réglé à **MDC**.

Les sélections suivantes sont prises en charge :

Aucun

La fonction est désactivée.

Manuelle

Chaque fois que vous utilisez la touche RTT ou la sélection de menu RTT, la radio envoie un paquet de signaux RTT au répartiteur ou à la console pour demander la capacité de transmettre des signaux vocaux.

**AVERTISSEMENT :**

Cette sélection est uniquement valide lorsque [Personnalité réception seulement à la page 430](#) est **Désactivé**, et lorsque [Accès au répéteur](#) est **Activé**.

Auto

Chaque fois que vous utilisez la touche PTT, la radio envoie un paquet de signaux RTT au répartiteur ou à la console pour demander la capacité de transmettre des signaux vocaux.

**AVERTISSEMENT :**

Cette sélection est uniquement valide lorsque la case Personnalité réception seulement est **Désactivé**, Accès au répéteur est **Activé**, et lorsque le **Type d'accès** n'est pas réglé à **Auto**.

10.34.6.5

MDC\Transmission d'appel de sélection automatique

Si ce champ est activé, une fois que vous avez choisi de faire un appel sélectif MDC et sélectionné un destinataire dans la liste courte d'appels non-ASTRO, un paquet de données d'appel sélectif est transmis chaque fois que vous appuyez sur la touche PTT de la radio.

Cette fonction s'applique au mode Système MDC et à la personnalité conventionnelle courante.

Si la case n'est pas cochée, un paquet de données d'appel sélectif MDC est transmis uniquement lorsque l'utilisateur radio fait un appel sélectif. Autrement dit, un seul paquet de données d'appel sélectif est transmis lorsque vous choisissez de faire un appel sélectif, que vous sélectionnez un destinataire dans la liste d'appels, puis que vous appuyez sur la touche PTT. Toute utilisation subséquente de la touche PTT ne provoque pas l'envoi d'un autre paquet de données.

Accès seulement : Lorsque le champ **Rx (type voix/signal) à la page 430** est **Non-ASTRO** ou **Mode mixte** et lorsque le champ Type d'émission de signaux Non-ASTRO pour la personnalité courante est réglé à **MDC**, et lorsque le champ **Rx/Tx d'appel sélectif à la page 465** est réglé à **Décoder** ou **Décoder et encoder**, et lorsque le modèle ou l'option de la radio le permet.

10.34.6.6

MDC\Appels illimités

Ce champ vous permet d'entrer manuellement l'ID d'une radio cible pour un appel sélectif ou une alerte d'appel; c'est ce qu'on appelle une « entrée directe ».

Une fois que le type d'appel a été sélectionné et que la liste courte d'appels MDC est affichée à l'écran de la radio, l'entrée directe d'un ID de radio MDC (au moyen d'un clavier) est possible. Appuyer sur le bouton PPT permet alors de transmettre l'appel à la radio cible portant l'ID entrée. Cette fonction s'applique au mode Système MDC et à la personnalité conventionnelle courante.

Accès seulement : Lorsque le champ **Rx/Tx d'appel sélectif à la page 465** est réglé à **Encoder** ou **Décoder et encoder**, ou lorsque le champ **Rx/Tx d'avis d'appel à la page 466** est réglé à **Encoder** ou **Décoder et encoder**, et lorsque le champ **Rx (type voix/signal) à la page 430** est réglé à **Non-ASTRO** ou **Mode mixte** et lorsque le champ Type d'émission de signaux Non-Astro est réglé à **MDC**, et lorsque le modèle ou l'option de la radio le permet.

10.34.6.7

Liste privilégiée d'appels non ASTRO

Ce champ permet de sélectionner la liste courte d'appels non ASTRO (MDC, DTMF ou Appel rapide II) à utiliser pour la personnalité conventionnelle courante.

Vous pouvez ensuite sélectionner les membres de la liste courte d'appel individuels en mode de communication conventionnelle. Ces membres servent à transmettre des appels sélectifs ou des alertes d'appel à une radio ou à des groupes de radios.

Accès seulement : Lorsque le champ **Rx (type voix/signal) à la page 430** est **Non ASTRO** ou **Mode mixte** et lorsque le champ Type d'émission de signaux Non ASTRO n'est pas égal à **Aucun**.

10.34.6.8

Activer l'alerte utilisateur en appel

Ce champ fait en sorte que la radio demeure en sourdine pour les appels de répartition normaux lorsque vous activez la fonction de mise en sourdine de la voix.

Par contre, les alertes d'appel individuelles ou de groupe désactivent la sourdine pour que la tonalité d'alerte soit entendue. La sourdine est également désactivée pendant les appels de radio à radio tels que les appels sélectifs et les appels d'interconnexion (mode téléphone). Cette fonction est très utile si vous préférez ne pas entendre les communications de répartition normales, mais que vous devez quand même garder le contact radio. Cette fonction s'applique au mode Système non ASTRO (MDC, DTMF et QCII) et à la personnalité conventionnelle courante.

Lorsque cette fonction est désactivée, vous ne pouvez pas l'activer pour la personnalité conventionnelle courante.

**REMARQUE :**

La touche Mettre la voix en sourdine ou la sélection de menu Mettre la voix en sourdine vous permet d'activer et de désactiver la mise en sourdine de la voix pour les canaux dont la fonction Alerte utilisateur en appel est activée.

**AVERTISSEMENT :**

Le champ Alerte utilisateur en appel Non ASTRO doit être **Activé** lorsque le champ **Rx (type voix/signal)** à la page 430 est réglé à **Mode mixte** et lorsque le type d'émission de signaux est réglé à **MDC**, **DTMF** ou **Appel rapide II**.

**IMPORTANT :**

Lorsque la mise en sourdine de la voix est activée, les alertes d'appel individuelles ou de groupe décodées par la radio désactivent la sourdine pendant la période d'arrêt du silencieux. Cette période est définie par la valeur du champ Sélection d'appel/Réinitialisation durant l'appel de la personnalité dans le système ASTRO. Lorsqu'une alerte d'appel (envoyée sous forme d'appel individuel ou de groupe) désactive la sourdine de la radio, un appel vocal subséquent peut constituer un appel de groupe diffusé par le haut-parleur de la radio, mais seulement jusqu'à la fin de la période d'arrêt du silencieux.

Si le canal de la radio est changé, celle-ci désactive la mise en sourdine de la voix; il faut donc réactiver cette fonction au besoin après avoir syntonisé de nouveau le canal d'origine.

Si vous appuyez sur la touche PTT, que vous passez en mode d'urgence ou mettez la radio hors tension, puis sous tension, la radio désactive la mise en sourdine de la voix.

La fonction de blocage de la radio par MDC peut être utilisée.

Le mode Balayage et le mode Écoute en permanence ne sont pas disponibles.

Les autres indications (qui proviennent des appels de groupe) telles que les voyants DEL et l'ID de PTT fonctionnent normalement (si elles sont activées).

Accès seulement : Lorsque le champ **Rx/Tx d'avis d'appel** à la page 466 est réglé à **Décoder** ou à **Décoder et encoder**, lorsque le champ **Rx (type voix/signal)** à la page 430 est réglé à **Non-ASTRO** ou à **Mode mixte** et lorsque le champ **Autre que ASTRO\Type d'émission de signaux** à la page 461 est réglé à **MDC**, à **Appel rapide II** ou à **DTMF**.

10.34.7

Appel ASTRO

Cette section permet d'afficher ou de définir des réglages d'alerte d'appel et d'appel sélectif ASTRO ou DVRS pour des personnalités conventionnelles individuelles.

REMARQUE :

On peut sélectionner des systèmes conventionnels de type « ASTRO » ou « DVRS » à partir du champ Système ASTRO de la personnalité conventionnelle, ce qui permet aux systèmes ASTRO de communiquer.

Après avoir défini de façon unique les fonctions des personnalités conventionnelles, chaque personnalité peut être assignée à la position désirée du sélecteur de canaux de la radio. Cette opération est effectuée à partir de la page Canaux, dans la fenêtre Attribution du canal de zone.

10.34.7.1

Rx/Tx d'appel sélectif

Ce champ permet de déterminer si un appel ASTRO/DVRS peuvent être transmis, reçus ou les deux.

Cette fonction s'applique au mode Système ASTRO ou DVRS et à la personnalité conventionnelle courante.

IMPORTANT :

Lorsque le système conventionnel en référence est un type de système « ASTRO », cette fonction permet d'activer la fonctionnalité Appel sélectif conventionnel.

Lorsque le système conventionnel en référence est de type DVRS, cette fonction permet d'activer la fonctionnalité Appel privé ADF.

REMARQUE :

Vous pouvez activer un appel sélectif ou privé en appuyant sur une touche Appel sélectif/privé ou en utilisant la sélection de menu Appel sélectif/privé.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet. et que la personnalité n'est pas créée automatiquement par la fonction de clonage de zone, et

((lorsque le champ Rx (type voix/signal) à la page 430 est réglé à **Mode mixte**) ou (lorsque le champ Type voix/signal Rx est réglé à **ASTRO**, et lorsque le champ Système d'interface du site distant dans le système conventionnel est **Désactivé**)).

Les sélections suivantes sont prises en charge :

Désactivé;

Aucun appel sélectif/privé n'est possible sur la Personnalité courante.

Décoder

Il est uniquement possible de recevoir (décoder) des appels sélectifs/privés.

Encoder

Il est uniquement possible de transmettre (encoder) des appels sélectifs/privés.

Décoder et encoder

Il est possible de transmettre et de recevoir des appels sélectifs/privés.

10.34.7.2

Transmission automatique d'appel sélectif

Si la case est cochée, une fois que vous avez choisi de faire un appel sélectif MDC et sélectionné un destinataire dans la liste courte d'appels ASTRO, un paquet de données d'appel sélectif est transmis chaque fois que vous appuyez sur la touche PTT de la radio.

Cette fonction s'applique au mode Système ASTRO et à la personnalité conventionnelle courante.

Si ce n'est pas activé, un paquet de données d'appel sélectif est transmis uniquement lorsque vous faites un appel sélectif. Autrement dit, lorsque vous choisissez de faire un appel sélectif, que vous sélectionnez un destinataire dans la liste courte d'appels, puis que vous appuyez sur la touche PTT, un seul paquet de données d'appel sélectif est transmis. Toute utilisation subséquente de la touche PTT ne provoque pas l'envoi d'un autre paquet de données.

REMARQUE :

Vous pouvez activer un appel sélectif en appuyant sur la touche Appel sélectif/privé ou en utilisant la sélection de menu Appel sélectif/privé.

Accès seulement : (lorsque le modèle ou les options de la radio le permettent, et lorsque le champ [Rx/Tx d'appel sélectif à la page 470](#) est réglé à **Encoder** ou **Décoder et encoder**, et lorsque le système conventionnel défini sélectionné dans le champ Système ASTRO n'est pas de type **DVRS**) et ((lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **Mode mixte**), ou (lorsque le champ Type voix/signal Rx est réglé à **ASTRO**, et lorsque le Système d'interface de site distant du Système conventionnel défini est **Désactivé**)).

10.34.7.3

Rx/Tx d'avis d'appel

Ce champ permet de déterminer si les alertes d'appel (également appelées « téléavertissements ») peuvent être transmises ou reçues (ou les deux).

Cette fonction s'applique au mode Système ASTRO et à la personnalité conventionnelle courante.

REMARQUE :

Vous pouvez activer une alerte d'appel à l'aide de la fonction Avis d'appel ou de la sélection de menu Notification (Avis d'appel).

Accès seulement : Lorsque le modèle et les options de la radio le permettent et ((lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **Mode mixte**) ou (lorsque le champ Type voix/signal Rx est réglé à **ASTRO**, et lorsque le champ Système d'interface de site distant du système conventionnel défini est **Désactivé**) et ((lorsque le champ Activer matériel DVRS est **Désactivé**) ou (lorsque le champ Activer matériel DVRS est **Activé**, et lorsque le profil DVRS de la personnalité courante défini a son champ Activation à distance du DVRS réglé à **Désactivé**)).

Les sélections suivantes sont prises en charge :

Désactivé;

La personnalité courante interdit toutes les alertes d'appel.

Décoder

Il est uniquement possible de recevoir (décoder) des alertes d'appel.

Encoder

Il est uniquement possible de transmettre (encoder) des alertes d'appel.

Décoder et encoder

Il est possible de transmettre et de recevoir des alertes d'appel.

10.34.7.4

Appels illimités ASTRO

Ce champ vous permet d'entrer manuellement l'ID d'une radio cible pour un appel sélectif, une alerte d'appel ou pour des services tactiques. L'action est appelée « entrée directe ».

Une fois que le type d'appel a été sélectionné et que la liste courte d'appels ASTRO est affichée à l'écran de la radio, l'entrée directe d'un ID de radio ASTRO (au moyen d'un clavier) est possible. Pour un appel sélectif et une alerte d'appel, appuyer sur la touche **PTT** transmet l'appel à une ou plusieurs radios cibles ayant l'ID saisi. Pour les services tactiques, appuyer sur la touche programmable **Envoyer** du menu transmet la commande de services tactiques à une ou plusieurs radios cibles de l'ID saisi.

Cette fonction s'applique au mode Système ASTRO ou DVRS et à la personnalité conventionnelle courante.

IMPORTANT :

Lorsque le système conventionnel en référence est de type DVRS, cette fonction permet d'activer la fonctionnalité Appel privé ADF.

Accès seulement : Ce champ est disponible lorsque le modèle ou l'option de la radio le permet et lorsque l'une des conditions suivantes est remplie :

- Le champ **Rx (type voix/signal) à la page 430** est réglé sur **Mode mixte**.
- Le champ Type voix/signal Rx est réglé sur **ASTRO** et le champ Système d'interface de site distant du système conventionnel associée est **Désactivé**.
- Le champ **Rx/Tx d'appel sélectif à la page 470** ou le champ **Rx/Tx d'avis d'appel à la page 471** est réglé sur **Encoder** ou **Décoder et encoder**.
- Le champ Arrêter le fonctionnement ou le champ Interrompre le fonctionnement est réglé sur **Encoder** ou **Décoder et encoder**.
- Le champ Opérations des services tactiques est réglé à **Encoder** ou **Décoder et encoder**.

10.34.7.5

Liste courte d'appels ASTRO

Ce champ permet de sélectionner la liste courte conventionnelle du système ASTRO à utiliser pour la personnalité conventionnelle courante.

Vous pouvez ensuite sélectionner les membres de la liste d'appel individuels lors du fonctionnement en mode de communications conventionnelles. Les membres de la liste d'appels permettent de communiquer les appels sélectifs, les alertes d'appel ou les services tactiques à une ou plusieurs radios. Cette fonction s'applique au mode Système ASTRO et à la personnalité conventionnelle courante.

Accès seulement : Ce champ est disponible lorsque le modèle ou l'option de la radio le permet et lorsque l'une des conditions suivantes est remplie :

- Le champ **Rx (type voix/signal) à la page 430** est réglé sur **Mode mixte**.
- Le champ Type voix/signal Rx est réglé sur **ASTRO** et lorsque le champ Système d'interface de site distant du Système conventionnel associée est **Désactivé**.

10.34.7.6

Activer l'alerte utilisateur en appel

Ce champ fait en sorte que la radio demeure en sourdine pour les appels de répartition normaux lorsque vous activez la fonction de mise en sourdine de la voix.

Par contre, les alertes d'appel individuelles ou de groupe désactivent la sourdine pour que la tonalité d'alerte soit entendue. La sourdine est également désactivée pendant les appels de radio à radio tels que les appels sélectifs et les appels d'interconnexion et de Composition de tonalité (mode Téléphone). Cette fonction est très utile si vous préférez ne pas entendre les communications de répartition normales, mais que vous devez quand même garder le contact radio. Cette fonction s'applique au mode Système ASTRO et à la personnalité conventionnelle courante.

Lorsque cette fonction est désactivée, vous ne pouvez pas l'activer pour la personnalité conventionnelle courante.

REMARQUE :

La touche Mettre la voix en sourdine et la sélection de menu Mettre la voix en sourdine vous permettent d'activer et de désactiver la mise en sourdine de la voix pour les canaux dont la fonction Alerte utilisateur en appel est activée.

AVERTISSEMENT :

Le champ Alerte utilisateur en appel Non ASTRO doit être **activé** lorsque le champ Rx (type voix/signal) à la page 430 est réglé à **Mode mixte** et lorsque le type d'émission de signaux est réglé à **MDC**, **DTMF** ou **Appel rapide II**.

IMPORTANT :

Lorsque la mise en sourdine de la voix est activée, les alertes d'appel individuelles ou de groupe décodées par la radio désactivent la sourdine pendant la période d'arrêt du silencieux. Cette période est définie par la valeur du champ Sélection d'appel/Réinitialisation durant l'appel de la personnalité dans le système ASTRO. Lorsqu'une alerte d'appel (envoyée sous forme d'appel individuel ou de groupe) désactive la sourdine de la radio, un appel vocal subséquent peut constituer un appel de groupe diffusé par le haut-parleur de la radio, mais seulement jusqu'à la fin de la période d'arrêt du silencieux.

Si le canal de la radio est changé et si la mise en sourdine de la voix est désactivée par la radio, il faut réactiver cette fonction au besoin après avoir syntonisé de nouveau le canal d'origine.

Si vous appuyez sur la touche PTT, que vous passez en mode d'urgence ou que vous mettez la radio hors tension, puis sous tension, la radio désactive la mise en sourdine de la voix.

La fonction de blocage de la radio par ASTRO peut être utilisée.

Le mode Balayage et le mode Écoute en permanence ne sont pas disponibles.

Les autres indications (qui proviennent des appels de groupe) telles que les voyants DEL et l'ID de PTT fonctionnent normalement (si elles sont activées).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet, et (lorsque le champ Rx/Tx d'avis d'appel à la page 471 est **Décoder** ou **Décoder et encoder**, et lorsque le champ Rx (type voix/signal) à la page 430 est réglé à **Mode mixte**) ou (lorsque le Rx/Tx d'avis d'appel est **Décoder** ou de **Décoder et encoder**, et lorsque le champ Type voix/signal Rx est réglé à **ASTRO**, et lorsque le champ Système d'interface de site distant du système conventionnel défini est **Désactivé**) ou (lorsque le champ Type voix/signal Rx n'est pas réglé à **Non-ASTRO**, et lorsque le champ Liste de composition de tonalité courante de la personnalité conventionnelle courante définie comprend au moins une rangée/un enregistrement dont la fonction Réactivation du son activée est **activée**).

10.34.8

Talkgroup ASTRO

Cette section vous permet d'afficher ou de définir la fonctionnalité de la liste de groupes du système ASTRO pour les personnalités conventionnelles individuelles.

REMARQUE :

Les systèmes conventionnels définis comme ayant le type de système **ASTRO** peuvent être sélectionnés dans le champ Système ASTRO de la personnalité conventionnelle, ce qui permet aux systèmes ASTRO de communiquer.

Une fois que les caractéristiques des personnalités conventionnelles ont été définies de manière unique, chaque personnalité peut ensuite être affectée à la position souhaitée du sélecteur de canaux de la radio. Cette opération est effectuée à partir de la page Canaux, dans la fenêtre Attribution du canal de zone.

10.34.8.1

Groupe

Ce champ permet d'utiliser les groupes avec le mode Système ASTRO et la personnalité conventionnelle courante.

REMARQUE :

Pour chaque personnalité conventionnelle, le système ASTRO est sélectionné dans le champ Système ASTRO.

AVERTISSEMENT :

La valeur du champ [Rx \(type voix/signal\) à la page 430](#) doit être réglée à **ASTRO** ou à **Mode mixte** pour la personnalité courante, sinon la valeur de ce champ sera non valide.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet et (lorsque le champ Système d'interface de site distant dans le système conventionnel défini est **désactivé**. S'il est **activé**, alors le champ Type voix/signal Rx doit être réglé à **ASTRO**, et cette sélection de groupe doit être **désactivée**; sinon, ce champ devient non valide).

10.34.8.2

Type de sélection

Ce champ vous permet de choisir un groupe de discussion à partir de la liste de groupes de discussion ASTRO sélectionnée, ou de ne pas vous donner la possibilité de modifier le groupe de discussion.

La Liste de groupes est sélectionnée dans le champ [Liste de groupes de conversation à la page 474](#) de la même page. Cette sélection s'applique lors du fonctionnement en mode Système ASTRO et pour la personnalité conventionnelle courante.

Accès seulement : lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **ASTRO** ou à **Mode mixte** et lorsque le champ [Groupe à la page 474](#) est **activé**, et lorsque la personnalité n'est pas créée automatiquement par le clonage de zone.

Les sélections suivantes sont prises en charge :

Câblé

Le groupe sélectionné dans le champ ID de groupe ASTRO est relié à la personnalité conventionnelle courante et ne peut pas être changé.

Sélectionnable

Vous pouvez remplacer l'ID de groupe prédéfini par un autre ID de groupe tiré de la Liste de groupes de la personnalité conventionnelle, sélectionnée dans cette même page.

Vous pouvez uniquement changer de groupe en appuyant sur une touche Groupe ou en utilisant la sélection de menu Groupe.

10.34.8.3

Liste de groupes de conversation

Ce champ permet de sélectionner une liste de groupes ASTRO à utiliser pour le fonctionnement en mode Système ASTRO et pour la personnalité conventionnelle courante.

AVERTISSEMENT :

Lorsque le champ [ASTRO OTAR à la page 491](#) est réglé à **Activé** pour la personnalité conventionnelle courante, seules les listes de groupes ASTRO qui renvoient au même profil KMF sécurisé, tiré du champ l'index de profil KMF, auquel la personnalité conventionnelle courante renvoie (tiré du champ de la personnalité), peuvent être sélectionnées.

Si le champ ASTRO OTAR est **désactivé** pour la personnalité conventionnelle courante, on peut sélectionner n'importe quelle liste de groupes.

Accès seulement : Lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **ASTRO** ou à **Mode mixte** et lorsque le champ [Groupe à la page 474](#) est **activé**, et lorsque la personnalité n'est pas créée automatiquement par le clonage de zone.

10.34.9

Fonctions

Cette section permet d'afficher ou de régler diverses fonctions de communication conventionnelle.

REMARQUE :

Après avoir défini de façon unique les fonctions des personnalités conventionnelles, chaque personnalité peut être assignée à la position désirée du sélecteur de canaux de la radio. Cette opération est effectuée à partir de la page Canaux, dans la fenêtre Attribution du canal de zone.

10.34.9.1

Messagerie OTACR/OTACS

Permet d'activer la messagerie OTACR (Réaffectation de canal par liaison radio) et la messagerie OTACS (Syntonisation de canal par liaison radio).

AVERTISSEMENT :

Cette fonction n'est pas offerte pour le moment.

Cette fonction s'applique lors du fonctionnement sur la [Personnalité conventionnelle à la page 428](#) courante

AVERTISSEMENT :

Lorsque le [Système conventionnel à la page 415](#) associé (sélectionné dans le champ [Système ASTRO à la page 459](#)) a un [Profil de données](#) défini de [Type de profil de données à la page 376](#) **Conventionnel et large bande** ou **Large bande uniquement**, ce champ doit être réglé à **Désactivé**, autrement, cette fonction est considérée non valide.

Accès seulement : lorsque le [Rx \(type voix/signal\) à la page 430](#) est **ASTRO** ou **Mode mixte**, et lorsque la [Fonction OTACR](#) est **Activée** ou la [Fonction OTACS](#) est **Activée**, et lorsque le [Système conventionnel à la page 415](#) défini sélectionné dans le champ [Système ASTRO à la page 459](#) n'est pas de [Type de système à la page 416](#) DVRS, et lorsque le modèle et les options de la radios le permettent.

10.34.9.2

Activer la nouvelle attribution de clés tactiques

Ce champ permet à la radio de recevoir des commandes de nouvelle attribution de clés envoyées par d'autres radios ou appareils d'abonné plutôt que par l'équipement de réseau fixe (FNE) ou une fonction de gestion des clés (KMF).

Par « nouvelle attribution de clés », on entend le processus de changement des clés de chiffrement sécurisé actuelles de la radio. Ces clés assurent la sécurité des communications.

REMARQUE :

Si vous voulez utiliser la radio en tant que modem RF pour transmettre des commandes de nouvelle attribution de clés tactiques, veuillez vous reporter au champ Données de terminal.

Accès seulement : lorsque le champ Fonctionnement sécurisé est **Matériel informatique** et lorsque le [Rx \(type voix/signal\) à la page 430](#) est **ASTRO** ou **Mode mixte** et lorsque le champ [Type voix/signal Tx à la page 434](#) est **ASTRO**, et lorsqu'un Système conventionnel de type ASTRO défini ayant un Profil de données valide a été sélectionné, et lorsque le Type de profil de données est **Conventionnel** dans ce profil de données défini, et lorsque le modèle ou les options de la radio le permettent.

10.34.9.3

Clavier activé

Ce champ permet à l'utilisateur d'entrer des numéros de téléphone à l'aide du clavier de la radio, même si celle-ci n'est pas en mode Téléphone.

Pour passer en mode clavier activé, il suffit de maintenir la touche PTT enfoncée, tout en appuyant sur les chiffres voulus. Cette fonction s'applique à la personnalité conventionnelle courante.

Accès seulement : Lorsque le [Personnalité réception seulement à la page 430](#) champ est **Désactivé**, et que l'option H-composition de tonalité est présente, et lorsque le modèle ou les options de la radio le permettent.

10.34.9.4

Activer mic DTMF

Ce champ vous permet de transmettre des tonalités DTMF à l'aide du clavier de la radio, même si celle-ci n'est pas en mode téléphone.

Pour activer le microphone DTMF, vous devez maintenir enfoncée la touche située sur le dessus, le côté ou la tête de commande, pendant que le numéro DTMF voulu sur le clavier est entré. Cette sélection s'applique pendant le fonctionnement selon la personnalité conventionnelle courante.

Accès seulement : Lorsque le [Personnalité réception seulement à la page 430](#) champ est **Désactivé**, et que l'option H-composition de tonalité est présente, et lorsque le modèle ou les options de la radio le permettent.

10.34.9.5

Fin de Tx en l'absence de voix

Ce champ permet à la radio, pendant une transmission de voix conventionnelle, d'effectuer automatiquement le relâchement de la touche lorsque son processeur de signal numérique (DSP) intégré détecte l'absence de voix provenant du microphone au-delà de la durée définie pour la minuterie d'absence de voix.

Cette sélection s'applique pendant le fonctionnement selon la personnalité conventionnelle courante.

AVERTISSEMENT :

La fonction ne fonctionne pas lorsqu'une radio sur le terrain :

- fonctionne en **Urgence de microphone branché** ou que le la fonction (**Urgence par audio silencieux** est actuellement active (voir aussi Mode de transmission automatique d'urgence), ou encore,
- est surveillée à distance (voir aussi Mode radio à distance et Activer la surveillance à distance d'urgence).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.34.9.6

de Sélection de la liste de balayage

Ce champ permet de sélectionner la liste de balayage qu'utilisera la radio en mode balayage pour la personnalité conventionnelle courante.

Cette liste de balayage détermine les appelants que la radio recherche (écoute activement) et pour lesquels elle désactive la sourdine sur le canal conventionnel courant.

AVERTISSEMENT :

Lorsque le champ Audio analogique uniforme est **activé**, ce champ doit être réglé à **Aucun**; autrement, il devient non valide. Ces deux fonctions ne peuvent donc pas être activées pour la même personnalité.

Lorsque le champ [Activer le balayage de vote en mode mixte à la page 478](#) est réglé à **Activé** pour la Personnalité courante, ce champ doit être réglé à un [Type de balayage à la page 682](#) **Conventionnel**; sinon, il devient non valide.

Lorsque le Système conventionnel défini sélectionné dans le champ [Système ASTRO à la page 459](#) est de type **DVRS**, ce champ doit être réglé à **Aucun**; sinon, il devient non valide.

Le module RadioCentral considère cette sélection non valide lorsque le LTE large bande de cette personnalité est activé et que cette liste de balayage sélectionnée comprend des canaux de membre de liste de balayage ayant les conditions suivantes :

- le champ [Interférence de fréquence LTE présente à la page 437](#) de leur personnalité conventionnelle est réglé à **Activé**, ou
- le champ Fréq. d'interférence LTE présente de son système ADF est réglé à **Vrai** ou
- le champ Type de couverture du système ADF est réglé à **Itinérance inter-WACN**.

REMARQUE :

Le LTE est activé sur un canal conventionnel lorsqu'un profil de données avec un type de profil de données associé équivaut à **Conventionnel et large bande** ou **Large bande uniquement** est associé au système conventionnel – ASTRO associé à la personnalité et lorsque le champ Source large bande du profil de données est réglé à **Modem LTE interne**.

Le module RadioCentral considère cette sélection non valide lorsque le champ Fréq. d'interférence LTE présente de la personnalité conventionnelle actuelle est réglé à **Activée**, et cette sélection de la liste de balayage est associée à une liste de balayage avec un canal LTE large bande activé pour le membre de données désignées.

REMARQUE :

Le LTE est activé sur un canal conventionnel lorsqu'un profil de données avec un type de profil de données associé équivaut à **Conventionnel et large bande** ou **Large bande seulement** est associé au système conventionnel – ASTRO associé à la personnalité et lorsque le champ LTE activé est réglé à **Activé**.

REMARQUE :

Les réglages de la liste de balayage et de ses membres sont définis dans la fenêtre Liste de balayage.

Seules les listes de balayage dont le champ Type de balayage est réglé à **Conventionnel** ou à **Groupe** sont des sélections valides pour la personnalité conventionnelle actuelle.

Seules les listes de balayage dont le champ Type de balayage est réglé à **Priorité intelligente** sont des sélections de liste de balayage valides pour la personnalité conventionnelle sans système DVRS.

Vous pouvez modifier une liste de balayage au moyen d'un commutateur Programmation de la liste de balayage, d'une sélection de menu Liste de balayage ou d'une longue pression sur une touche Balayer.

Le balayage de vote est une sélection non valide sur une personnalité clonable.

Accès seulement : Lorsque le champ Système d'interface de site à distance qui est **associé** au système conventionnel est désactivé;

si **Activé**, alors, le champ [Rx \(type voix/signal\) à la page 430](#) doit être réglé à **ASTRO**, et cette sélection de liste de balayage doit être réglée à **Aucun**; sinon, ce champ devient non valide.

10.34.9.7

Balayage automatique

Fait en sorte que la radio passe automatiquement en mode de balayage lorsque vous sélectionnez (à l'aide du sélecteur de canaux) la personnalité conventionnelle courante.

Le balayage automatique est également activé lorsque la personnalité est déjà sélectionnée à la mise sous tension de la radio.

Lorsque ce champ est désactivé, vous pouvez en mode balayage au moyen de la touche Balayer, du commutateur Balayer ou de la sélection de menu Balayer, pendant le fonctionnement selon la Personnalité conventionnelle courante.

Accès seulement : Lorsque le champ [de Sélection de la liste de balayage à la page 476](#) n'est pas réglé à **Aucun**.

10.34.9.8

Activer le balayage de vote en mode mixte

Ce champ permet d'activer le balayage de vote mixte conventionnel pour la personnalité conventionnelle courante.

Si ce champ est **activé**, toutes les Options de fréquence (enregistrements/rangées) dans la personnalité actuelle sont utilisées pour former la liste de balayage de vote.

IMPORTANT :

En outre, si le champ est activé, le nombre maximum d'options de fréquence est limité à 15.

REMARQUE :

Les profils d'options de fréquence peuvent être sélectionnés aux fins d'une utilisation dans la page Canaux de la section Attribution du canal de zone. Tout d'abord, l'option Personnalité est sélectionnée dans le champ Personnalité, puis le profil d'options de fréquence est sélectionné dans le champ Options de fréquence.

Accès seulement : Lorsque le modèle et les options de la radio le permettent. et que la personnalité n'est pas créée automatiquement par la fonction de clonage de zone, et

(lorsque le champ Système d'interface de site distant dans le système conventionnel référencé est **désactivé**. S'il est **activé**, alors le champ [Rx \(type voix/signal\) à la page 430](#) doit être réglé à **ASTRO**, et cette sélection Activer le balayage de mode mixte doit être **désactivée**; sinon, ce champ devient non valide).

10.34.9.9

Guidage de Tx du balayage de vote en mode mixte

Ce champ permet aux profils Options de fréquence de la personnalité conventionnelle courante de varier quand le balayage de vote mixte conventionnel pour cette personnalité est activé.

Voir le champ [Activer le balayage de vote en mode mixte à la page 478](#). Lorsque cette fonction est désactivée, toutes les Options de fréquence Tx et les Options de fréquence Rx spécifiques pour la personnalité conventionnelle actuelle doivent être les mêmes.

Accès seulement : Quand le champ Activer le balayage de vote en mode mixte est réglé à **Activé**.

10.34.9.10

Type de PTT intelligent

Ce champ vous permet de sélectionner une règle de verrouillage de canal qui empêche la radio d'émettre lorsque la condition **Blocage de transmission activé** choisie est respectée.

Cette sélection s'applique pendant le fonctionnement selon la personnalité conventionnelle courante.

**IMPORTANT :**

Le champ [Annuler touche rapide à la page 480](#) se rapporte aux sélections **Blocage de transmission activé**. Cette fonction d'annulation vous permet d'émettre peu importe la règle **Blocage activé** actuellement sélectionnée.

**REMARQUE :**

Si vous tentez (en appuyant sur la touche PTT) de faire une transmission interdite par la règle **Blocage de transmission activé** sélectionnée, la radio procède de l'une des façons suivantes :

- Si la condition **Blocage de transmission activé** sélectionnée est respectée, mais que la radio est présentement en sourdine, une tonalité d'alerte continue se fait entendre jusqu'à ce que le bouton PTT soit relâché. Par exemple, il se peut que le répéteur soit occupé par une conversation chiffrée, mais que la radio demeure en sourdine en raison du manque de soutien sécurisé (**Blocage activé Symboles d'état**).
- Si la radio reçoit une transmission vocale pendant laquelle la sourdine est désactivée et que l'utilisateur appuie sur le bouton PTT, une brève tonalité d'alerte retentit parce que la radio diffuse la voix de priorité plus élevée après un court intervalle.

Accès seulement : Lorsque le champ [Personnalité réception seulement à la page 430](#) est **désactivé**, et lorsque le système conventionnel référencé n'est pas de type système DVRS, et (si le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **ASTRO**, alors, le champ Système d'interface du site distant dans le système conventionnel référencé doit être **désactivé**).

Le type de PTT intelligent prend en charge les sélections suivantes :

Désactivé;

Permet à la radio d'émettre lorsque n'importe quelle transmission est détectée sur le canal courant.

Blocage activé PL incorrect

Pour les appels vocaux (Non-ASTRO) analogiques : Empêche la radio d'émettre lorsqu'un silencieux de porteuse dont le code (PL) ne correspond pas à la personnalité ou au canal courant est détecté; si le code de ligne privée du canal occupé correspond à la personnalité courante, les transmissions radio sont permises.

Pour les appels vocaux (Non-ASTRO) numériques : empêche la radio d'émettre lorsqu'elle demeure en sourdine à cause de la réception d'un ID de groupe qui ne correspond pas à l'ID de groupe de la personnalité ou du canal courant. Si le groupe du canal occupé correspond à l'ID de groupe de la personnalité ou du canal courant, les transmissions radio sont autorisées.

**REMARQUE :**

Les groupes permis sont déterminés dans la Liste de groupe ASTRO associée à la personnalité.

Blocage activé onde porteuse

Empêche la radio d'émettre lorsqu'un silencieux de porteuse est détecté sur le canal courant.

Blocage activé NAC correct

Empêche la radio d'émettre pendant qu'elle reçoit un appel vocal (ASTRO) numérique dont le code d'accès au réseau (NAC) correspond au canal courant (voir [ID du réseau Rx à la page 442](#)).

Blocage activé Symboles d'état

Empêche la radio d'émettre pendant qu'elle reçoit un appel vocal (ASTRO) numérique et que le dernier bit d'état de signal enregistré était **entrant occupé** ou **inconnu**.

REMARQUE :

La réception de signaux analogiques est uniquement possible lorsque le champ ID du réseau Rx/TA est réglé à **Non ASTRO** ou **Mode mixte**, et un type de système MDC ou QCII a été sélectionné dans le champ Type d'émission de signaux Non ASTRO et que le système Non ASTRO a été sélectionné pour la personnalité conventionnelle actuelle.

La réception de signaux numériques est possible uniquement lorsque le champ Type voix/signal Rx est réglé à **Mode ASTRO** ou à **Mode mixte**, et qu'un système conventionnel - ASTRO a été sélectionné dans le champ [Système ASTRO à la page 459](#).

10.34.9.11

Annuler touche rapide

Ce champ vous permet d'annuler la règle Blocage activé sélectionnée dans le champ **Type de PTT** intelligent de la RM afin de pouvoir envoyer une transmission sur un canal occupé de façon impolie.

Pour ce faire, vous devez faire une pression rapide sur la touche PTT. Une pression rapide c'est lorsque l'on appuie sur la touche PTT, qu'on la relâche et que l'on appuie à nouveau dessus rapidement, en respectant la durée dans le champ de la minuterie de touche rapide PTT intelligent. Cette fonction s'applique à la personnalité conventionnelle courante.

Accès seulement : Lorsque le champ [Personnalité réception seulement à la page 430](#) est **désactivé**, et lorsque le champ [Type de PTT intelligent à la page 479](#) n'est pas **désactivé**, et lorsque le système conventionnel référencé n'est pas du type système DVRS, et (si le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **ASTRO**, alors, le champ Système d'interface du site distant dans le système conventionnel référencé doit être **désactivé**).

10.34.9.12

Type d'émission de signaux d'incident

Ce champ permet de sélectionner le type de signalisation pour la Localisation du personnel ou la Sécurité publique tactique (TPS) pour la personnalité conventionnelle en cours.

REMARQUE :

Aucune de ces sélections n'influe sur la fonction [Activer UI de la sécurité publique tactique à la page 482](#).

Accès seulement : Lorsque la personnalité n'est pas créée automatiquement par la fonction de clonage de zone, et lorsque le modèle ou les options de la radio le permettent.

Les sélections suivantes sont prises en charge :

Désactivé;

Aucune émission de signaux Localisation du personnel ou de TPS n'est disponible pour la radio.

Localisation du personnel

Active l'émission de signaux Localisation du personnel pour la personnalité conventionnelle courante.

AVERTISSEMENT :

Cette sélection n'est valide que lorsque [Fonctionnement du téléphone](#) est réglé à **Aucun** et lorsque [Type voix/signal Tx à la page 434](#) est réglé à **ASTRO** et

lorsque la référence du système conventionnel n'est pas réglée à « DVRS » (Type de système) et

lorsque le profil de données défini dans le système conventionnel comprend le champ **Conventionnel et large bande** ou **Large bande seulement**.

Localisation du personnel avec MDC

Active la fonction Localisation du personnel avec MDC pour la personnalité conventionnelle actuelle

AVERTISSEMENT :

Cette sélection n'est valide que lorsque [Fonctionnement du téléphone](#) est réglé à **Aucun** et lorsque [Type voix/signal Tx à la page 434](#) est réglé à **ASTRO** et

lorsque la valeur du champ Type voix/signal Rx est **Mode mixte** et

lorsque le champ Type de voix Tx de localisation du personnel est réglé à **Analogique** et

lorsque le champ Type d'émission de signaux non ASTRO est réglé à **MDC** et

lorsque l'option RAC/accès au répéteur est désactivée et

lorsque le système conventionnel sélectionné est réglé à Type de système ASTRO et

lorsque le profil de données défini dans le système conventionnel comprend le champ **Conventionnel et large bande** ou **Large bande seulement**.

Sécurité publique tactique

Active l'émission de signaux TPS pour la personnalité conventionnelle courante.

AVERTISSEMENT :

Cette sélection n'est valide que lorsque [Rx \(type voix/signal\) à la page 430](#) est réglé à **Mode mixte** et

lorsque le champ Type voix/signal Tx est réglé à **ASTRO** et

lorsque le champ Type d'émission de signaux non ASTRO est réglé à **Aucun** et

Lorsque le champ [Groupe à la page 474](#) est **désactivé**, et

lorsque le champ [Rx/Tx d'appel sélectif à la page 470](#) est réglé à **Désactivé** ou **Décoder** et

lorsque la référence du système conventionnel n'est pas réglée à « DVRS » (Type de système) et

lorsque le profil de données défini pour ce système conventionnel comprend le champ **Conventionnel et large bande** ou **Large bande seulement**,

et

(lorsque le champ Fonctionnement sécurisé est **désactivé**),

ou

(lorsque le champ Fonctionnement sécurisé est réglé à **Matériel informatique** ou à **Confidentialité numérique avancée**, et lorsque [Effectuer/Terminer la connexion vocale à la page 486](#) est réglé à **Non chiffré**.)

10.34.9.13

Inscription de Localisation du personnel

Ce champ permet d'inscrire la radio avec le terminal de commandes d'incident (ICT) Localisation du personnel (PA).

L'inscription s'effectue en émettant des paquets d'inscription PA à l'ICT, puis en recevant un accusé de réception de

l'ICT attestant la réussite de la transmission de l'inscription. Si le terminal de commande n'accuse pas réception de la transmission des paquets d'enregistrement, la radio continue d'effectuer le nombre de tentatives de transmission des paquets définies dans le champ Toutes les ADF, [Tentatives de Tx max. à la page 510](#). Cette fonction s'applique à la personnalité conventionnelle courante.

REMARQUE :

Le champ Toute la radio, Répondre aux sondages détermine l'intervalle (en minutes) entre les tentatives d'enregistrement.

Accès seulement : lorsque le champ [Type d'émission de signaux d'incident à la page 480](#) est réglé à **Localisation du personnel** ou à **Localisation du personnel avec MDC**, et lorsque le champ Inscription de données CAI dans le système conventionnel référencé de la personnalité conventionnelle courante est **désactivé**, et lorsque le profil de données référencé de ce système conventionnel a son champ Mode ARS réglé à **Désactivé**, et lorsque le modèle ou l'option de la radio le permet.

10.34.9.14

Type de voix Tx

Ce champ permet de sélectionner le mode de transmission (Tx) de la voix qui est utilisé durant l'opération Localisation du personnel pour la personnalité conventionnelle en cours.

Accès seulement : Lorsque le champ [Type d'émission de signaux d'incident à la page 480](#) est réglé à **Localisation du personnel** ou à **Localisation du personnel avec MDC**, et lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Numérique

Le mode numérique ASTRO est utilisé pour la transmission de la voix durant l'opération Imputabilité du personnel. Le mode numérique ASTRO n'est pas valide pour la localisation du personnel avec MDC.

Analogique

Le mode analogique non-ASTRO est utilisé pour transmettre la voix pendant le fonctionnement en mode Localisation du personnel ou .

AVERTISSEMENT :

Cette sélection est uniquement valide pour une personnalité conventionnelle lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **Mode mixte**, et lorsque le champ [Groupe à la page 474](#) est **désactivé**, et lorsque le champ [Rx/Tx d'appel sélectif à la page 470](#) n'est pas réglé à **Encoder** ou **Décoder et encoder**.

10.34.9.15

Activer UI de la sécurité publique tactique

Ce champ permet d'activer plusieurs caractéristiques de Sécurité publique tactique (TPS) qui sont reliées au fonctionnement en mode d'urgence pour la personnalité conventionnelle courante.

Ces caractéristiques comprennent Toute la radio, Sécurité publique tactique : Balise de détresse sonore, acheminement audible de balise d'urgence, Tonalité auxiliaire de touche de relâchement d'appel d'urgence et Délai entre les tentatives d'alarme d'urgence.

IMPORTANT :

Cette fonction s'applique à la personnalité conventionnelle courante, indépendamment de la sélection [Type d'émission de signaux d'incident à la page 480](#) de cette personnalité.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.34.9.16

Personnalité du mode Zone de danger

Ce champ vous permet d'activer le mode Zone de danger en utilisant l'interrupteur concentrique pendant le fonctionnement avec la personnalité conventionnelle courante.

REMARQUE :

Ce champ ne s'applique qu'à la radio APX NEXT XN.

IMPORTANT :

Lorsque le mode Zone de danger est **activé**, les conditions suivantes doivent être remplies. Le champ Système ASTRO de la personnalité conventionnelle est réglé à un système ASTRO avec les paramètres suivants :

- Le champ Sélection du profil d'urgence est connecté à un profil d'urgence conventionnel.
- Le champ Sélection du profil d'urgence n'est pas réglé à **Tx d'urgence désactivée**.
- Le champ Indicateur Rx d'alarme d'urgence est **activé**.

Le champ Type voix/signal Tx et Type voix/signal Rx est réglé à **ASTRO** ou le champ Type de signalement d'incident n'est pas réglé à **Désactivé**.

Lorsque la case Personnalité du mode Zone de danger est cochée, le champ Type d'annulation d'urgence est réglé à **Canal sélectionné** ou à un autre canal associé à une personnalité du mode Zone de danger.

Accès seulement : Lorsque la radio est le plus récent modèle des normes en matière de service d'incendie.

10.34.9.17

Demande polie de PTT entrant DVRS

Ce champ active le PTT poli pour le mode DVRS conventionnel. Les demandes d'accès vocal poli sont envoyées à l'aide d'une nouvelle tentative rapide plutôt que d'une patience limitée.

Accès seulement : ce champ s'applique lorsque le système ASTRO est associé à un système DVRS.

10.34.10

Téléphone

Cette section permet d'afficher ou de définir des réglages de système téléphonique ou de composition pour des personnalités conventionnelles.

Ces réglages s'appliquent lors du fonctionnement en mode Téléphone.

REMARQUE :

Après avoir défini de façon unique les fonctions des personnalités conventionnelles, chaque personnalité peut être assignée à la position désirée du sélecteur de canaux de la radio. Cette opération est effectuée à partir de la page Canaux, dans la fenêtre Attribution du canal de zone.

Vous pouvez activer le mode Téléphone en utilisant une touche Réponse à l'appel ou Téléphone, ou la sélection de menu Téléphone.

Les champs suivants sont pris en charge :

10.34.10.1

Sélection du minutage DTMF

Ce champ permet de sélectionner un ensemble prédéfini de paramètres de minutage DTMF tiré de la page Minutage DTMF de la fenêtre Tous les téléphones.

Chaque ensemble permet de définir les paramètres des trois champs suivants : Retard initial, Durée du chiffre et Retard entre les chiffres. Cette sélection s'applique au mode téléphone et à la personnalité conventionnelle courante.

Accès seulement : (lorsque le modèle ou les options de la radio le permettent, et lorsque le champ [Personnalité réception seulement à la page 430](#) est **Désactivé**, et lorsque le champ [Fonctionnement du téléphone](#) est réglé à **Liste seulement** ou **Illimité**, et lorsque le système conventionnel défini sélectionné dans le champ Système ASTRO n'est pas un type de système DVRS) et (si le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **ASTRO**, alors le Système d'interface de site distant du système conventionnel défini doit être **Désactivé**).

10.34.10.2

Sélection de code d'accès automatique

Ce champ permet de sélectionner un ensemble prédéfini de codes d'accès et de retrait d'accès DTMF à utiliser en mode téléphone pour communiquer avec un système téléphonique.

Ces codes sont groupés par paires dont le nom figure dans le champ Codes DTMF. Cette sélection s'applique au mode téléphone et à la personnalité conventionnelle courante.

Accès seulement : (lorsque le modèle ou les options de la radio le permettent, et lorsque le champ [Personnalité réception seulement à la page 430](#) est **Désactivé**, et lorsque le champ [Fonctionnement du téléphone](#) est réglé à **Liste seulement** ou **Illimité**, et lorsque le système conventionnel défini sélectionné dans le champ Système ASTRO n'est pas un type de système DVRS) et (si le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **ASTRO**, alors le Système d'interface de site distant du système conventionnel défini doit être **Désactivé**).

10.34.11

Sécurisé

Cette section permet d'afficher ou de définir la fonctionnalité de sécurité pour la transmission et la réception de communications encodées sécurisées.

Cette fonctionnalité peut être personnalisée pour chaque personnalité conventionnelle.

REMARQUE :

Après avoir défini de façon unique les fonctions des personnalités conventionnelles, chaque personnalité peut être assignée à la position désirée du sélecteur de canaux de la radio. Cette opération est effectuée à partir de la page Canaux, dans la fenêtre Attribution du canal de zone.

10.34.11.1

Type voix/signal sécurisé

Ce champ permet de sélectionner le mode d'émission de signaux vocaux chiffrés sécurisés pour la personnalité conventionnelle courante.

AVERTISSEMENT :

Lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **ASTRO** ou à **Mode mixte**, ASTRO devient le mode Type voix/signal sécurisé valide.

Lorsque le champ Type voix/signal Rx est réglé à **Non ASTRO**, SecureNet devient le mode Type voix/signal sécurisé valide.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique**, ou (lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel**, et lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **ASTRO** ou à **Mode mixte**).

Les sélections suivantes sont prises en charge :

ASTRO

Lorsque le champ Type voix/signal Rx est réglé à **ASTRO** ou à **Mode mixte**.

SecureNet

Lorsque le champ Type voix/signal Rx est réglé à **Non ASTRO**.

10.34.11.2

Transmission XL

Ce champ permet d'activer la fonction Norme de chiffrement de données - Portée accrue (DES-XL) analogique/SecureNet™ pour la personnalité conventionnelle courante.

DES XL est une norme de chiffrement de type 3 (niveau intermédiaire).

La désactivation de ce champ entraîne l'application de la fonction analogique ou de la fonction DES (Norme de chiffrement des données) SecureNet à la personnalité conventionnelle courante.

REMARQUE :

Il n'est pas nécessaire de configurer les communications émanant de la puce sécurisée XL puisque le déchiffrement des flux de données XL et non XL s'effectue automatiquement.

Accès seulement : Lorsque le champ Fonctionnement sécurisé est réglé à **Matériel informatique**, et lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est **Non-ASTRO**, et lorsque le champ [Effectuer/Terminer la connexion vocale à la page 486](#) est **Non chiffré**, et lorsque le champ [Type voix/signal sécurisé à la page 484](#) est **Securenet** et lorsque le modèle ou les options de la radio le permettent.

10.34.11.3

DES-XL Tx par défaut

Ce champ permet d'activer l'algorithme DES-XL (Norme de chiffrement de données – Portée étendue) numérique en tant que valeur par défaut pour toutes les transmissions chiffrées de voix ou de données pour la personnalité conventionnelle courante.

Toutefois, cette valeur par défaut s'applique uniquement lorsque vous ne commencez pas à émettre pendant le délai indiqué dans le champ ID de touche\Délai Rx. DES XL est une norme de chiffrement de type 3 (niveau intermédiaire).

Si la case n'est pas cochée, l'algorithme DES-OFB (Norme de chiffrement de données – Rebouclage par la sortie) numérique s'applique à la personnalité conventionnelle courante.

IMPORTANT :

Cette fonction s'applique uniquement si la radio est équipée d'un module de chiffrement à deux algorithmes (DES-XL et DES-OFB).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet, et lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **ASTRO** ou à **Mode mixte**, et lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique**, et (lorsque le champ [Type voix/signal sécurisé à la page 484](#) est réglé à **ASTRO**, et lorsque le champ [Groupe à la page 474](#) ASTRO est réglé à **Activé**, ou lorsque le champ [Effectuer/Terminer la connexion vocale à la page 486](#) est réglé à **Sélection** ou à **Sécurisé**, ou (lorsqu'un système conventionnel référencé du type **ASTRO** a un profil de données référencé valide sélectionné, et lorsque le champ Données de terminal dans ce profil de données est réglé à **Activé**), et lorsque le champ [Données par paquet\Effectuer/enlever les connexions à la page 487](#) est réglé à **Sélection** ou à **Sécurisé**.

10.34.11.4

Effectuer/Terminer la connexion vocale

Ce champ permet de sélectionner le mode de transmission à chiffrement sécuritaire pour la personnalité conventionnelle courante.

**AVERTISSEMENT :**

Lorsque le champ Audio analogique uniforme est **activé**, ce champ doit être réglé à **Non chiffré**; sinon, il devient non valide. Ces deux fonctions ne peuvent donc pas être activées pour la même personnalité.

(Lorsque la bande de fréquences primaire est **900 MHz**), ou (lorsque le champ Permettre les fréquences non valides est **Activé**, et lorsque 900 MHz utilisé dans la codeplug est **Activé**), et (lorsque le champ Fonctionnement sécurisé est réglé à **Matériel informatique**, et lorsque le **Rx (type voix/signal) à la page 430** est réglé à **Non-ASTRO**, et lorsque le **Écart Tx/Séparation des canaux à la page 441** pour l'un des profils Options de fréquence courants (enregistrements/rangées) est réglé à **2,5 kHz/12,5 kHz**), ce champ doit être réglé à **Non chiffré**; sinon, il devient non valide.

Accès seulement : (Lorsque le champ **Fonctionnement sécurisé à la page 301** est réglé à **Matériel informatique** ou à **Logiciel**, et lorsque le champ **Groupe à la page 474** est activé, et lorsque la personnalité n'est pas créée automatiquement par la fonction de clonage de zone, et

(lorsque le champ **Rx (type voix/signal) à la page 430** est réglé à **Mode mixte** ou à **ASTRO**, et lorsque le champ Système d'interface du site distant dans le système conventionnel référencé est désactivé)),

ou

(lorsque le champ **Fonctionnement sécurisé à la page 301** est réglé à **Matériel informatique** et lorsque le champ **Rx (type voix/signal) à la page 430** est réglé à **Non-ASTRO**).

Les sélections suivantes sont prises en charge :

Sélectionner

Vous permet d'activer ou de désactiver le chiffrement sécurisé des communications.

La touche Sélection de Tx sécurisée, le commutateur Sélection de Tx sécurisée ou la sélection de menu Sécurisé vous permet de basculer entre les communications sécurisées et non chiffrées pour ce canal.

Effacer

Permet au canal de transmettre uniquement des communications conventionnelles normales (non sécurisées).

Sécurisé

Permet au canal de transmettre uniquement des communications chiffrées.

10.34.11.5

Voix\Connexion de touche

Ce champ permet d'indiquer si vous pouvez ou non sélectionner la clé de chiffrement vocal pour la personnalité conventionnelle courante.

Accès seulement : Lorsque le champ **Effectuer/Terminer la connexion vocale à la page 486** s'applique et qu'il n'est pas réglé à **Non chiffré** et lorsque le modèle ou les options de la radio le permettent.

Les sélections suivantes sont prises en charge :

Sélectionner

Permet de sélectionner la clé de chiffrement sécurisé appropriée.

Câblé

La clé sélectionnée dans le champ [Voix\Sélection de touche à la page 487](#) est définitivement associée à la Personnalité conventionnelle courante.

AVERTISSEMENT :

La sélection de menu Clé doit être sélectionnée pour que vous puissiez choisir les clés associées à la personnalité conventionnelle courante.

10.34.11.6

Voix\Sélection de touche

Ce champ permet de sélectionner la clé de chiffrement vocal qui s'applique pendant le fonctionnement avec la personnalité conventionnelle courante.

Ces clés sont programmées dans la liste des clés de chiffrement sécurisées.

IMPORTANT :

Lorsque le champ [ASTRO OTAR à la page 491](#) est réglé à **Activé** pour la Personnalité conventionnelle courante, la clé est choisie dans la liste de références de clés de chiffrement de matériel sécurisées qui est associée au Profil KMF sécurisé sélectionné dans le champ Index de profil KMF de la Personnalité conventionnelle courante.

AVERTISSEMENT :

Veillez noter que l'application renvoie aux clés de la liste des clés de chiffrement pour cette sélection; la liste de références de clés de chiffrement de matériel sécurisées renvoie à la liste des clés de chiffrement du champ Référence de clé de chiffrement. Par conséquent, toute clé sélectionnée lorsque le champ ASTRO OTAR est défini à **Activé** doit tout d'abord être définie dans la liste de références de clés de chiffrement de matériel sécurisées.

Lorsque le champ ASTRO OTAR est réglé à **Désactivé** pour la personnalité conventionnelle courante, la clé est choisie directement dans la liste des clés de chiffrement de la fenêtre Toute la sécurité.

Accès seulement : Lorsque le champ [Effectuer/Terminer la connexion vocale à la page 486](#) s'applique et qu'il n'est pas réglé à **Non chiffré** et lorsque le modèle ou les options de la radio le permettent.

10.34.11.7

Ignorer Rx de voix non chiffrée

Ce champ fait en sorte que la radio ignore toutes les communications vocales Non chiffrées (sans chiffrement sécurisé) pendant le fonctionnement avec la personnalité conventionnelle courante.

Accès seulement : lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**.

(Si le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **ASTRO**, ALORS, le champ Système d'interface de site distant du système conventionnel référencé doit être désactivé).

10.34.11.8

Données par paquet\Effectuer/enlever les connexions

Ce champ permet de sélectionner le mode de transmission des paquets de données APCO (Association des agents des communications en sécurité publique) pour la personnalité conventionnelle courante.

Accès seulement : (Lorsque le modèle ou l'option de la radio le permet, et lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **Mode ASTRO** ou à **Mode mixte**, et lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique** ou à **Logiciel**, et lorsque

le système conventionnel référencé n'est pas du type DVRS, et lorsque la personnalité n'est pas automatiquement créée par la fonction de clonage de zone),

Et

(lorsque le champ Activer (inhibition tactique) est activé, ou lorsque le système conventionnel référencé a un [Profils de données à la page 375](#) référencé valide sélectionné, et lorsque le champ [Données de terminal à la page 380](#) dans ce profil de données est activé.)

Les sélections suivantes sont prises en charge :

Effacer

La radio transmet les paquets de données APCO en mode non sécuritaire.

Sécurisé

La radio transmet les paquets de données APCO en mode de chiffrement sécuritaire.

10.34.11.9

Données par paquet\Sélection de touche

Ce champ permet de sélectionner la clé de chiffrement à utiliser pour les transmissions de paquets de données APCO (Association des agents des communications en sécurité publique).

Cette sélection s'applique à la personnalité conventionnelle courante.

IMPORTANT :

Lorsque le champ [ASTRO OTAR à la page 491](#) est réglé à **Activé** pour la personnalité conventionnelle courante, cette valeur de clé est choisie dans la liste de références de clés de chiffrement de matériel sécurisées qui est associée au profil KMF sécurisé sélectionné dans le champ [Index de profil ASTRO OTAR à la page 491](#) pour la personnalité conventionnelle courante.

AVERTISSEMENT :

Veillez noter que l'application renvoie aux clés de la liste des clés de chiffrement pour cette sélection; la liste de références de clés de chiffrement de matériel sécurisées renvoie à la liste des clés de chiffrement du champ Référence de clé de chiffrement. Par conséquent, toute clé sélectionnée lorsque le champ ASTRO OTAR est défini à **Activé** doit tout d'abord être définie dans la liste de références de clés de chiffrement de matériel sécurisées.

Lorsque le champ ASTRO OTAR est réglé à **Désactivé** pour la personnalité conventionnelle courante, la clé est choisie directement dans la liste des clés de chiffrement de la fenêtre Toute la sécurité.

Accès seulement : (lorsque le modèle ou les options de la radio le permettent, et lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **Mode ASTRO** ou à **Mode mixte**, et lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique**, et lorsque le système conventionnel référencé n'est pas du type de système DVRS), et ((lorsque le champ Activer Inhibition tactique est réglé à **Activé**) ou (lorsque le système conventionnel référencé comprend un profil de données référencé valide sélectionné, et lorsque le champ Données de terminal de ce profil de données est réglé à **Activé**.)

10.34.11.10

Ignorer Rx de paquets de données non chiffrés

Ce champ fait en sorte que la radio ne tienne pas compte des communications par paquets de données de système ASTRO conventionnel non chiffrés tout en fonctionnant avec la personnalité conventionnelle.

**REMARQUE :**

Pour de plus amples renseignements sur les paquets de données de système ASTRO conventionnel, consulter la fenêtre Profil de données et le système conventionnel. ASTRO, champ Sélection de profil de données.

Accès seulement : (Lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **Mode ASTRO** ou à **Mode mixte**, et lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique** ou à **Logiciel**, et lorsque le champ [Données par paquet\Effectuer/enlever les connexions à la page 487](#) est réglé à **Sécurisé**, et lorsque le modèle ou l'option de la radio le permet),

Et

(lorsque le système conventionnel référencé n'est pas du type système DVRS, et

lorsque ce système conventionnel référencé a un profil de données référencé valide sélectionné, et

lorsque le champ [Données de terminal à la page 380](#) dans ce profil de données est réglé activé).

10.34.11.11

Détection d'un code approprié

Ce champ permet d'activer le son du haut-parleur seulement pour les données SecureNet chiffrées au moyen de la clé de sécurité appropriée.

La clé de sécurité chiffrée est résidente dans la radio grâce à un circuit intégré de chiffrement interne ou à un dispositif de chargement de clé (KVL). Cette fonction s'applique à la personnalité conventionnelle courante.

Accès seulement : Lorsque le champ Fonctionnement sécurisé est réglé à **Matériel informatique** et lorsque le champ [Type voix/signal sécurisé à la page 484](#) est **Securenet**, et lorsque le modèle ou les options de la radio le permettent.

10.34.11.12

Tx OTAR

Ce champ permet à la radio d'assurer les transmissions ASTRO et MDC OTAR (changement de clé par onde radio) pour la personnalité conventionnelle courante.

Les transmissions OTAR comprennent : Demandes de nouvelle attribution de clé, Confirmations différées et Confirmations de mise sous tension.

**AVERTISSEMENT :**

Votre capacité d'effectuer une demande de nouvelle attribution de clé doit être programmée.

**REMARQUE :**

Demande de nouvelle attribution de clé : Lorsque le champ [ASTRO OTAR à la page 491](#) est activé pour le canal courant, et que les modes ASTRO et MDC sont disponibles sur ce canal (voir [Rx \(type voix/signal\) à la page 430 Mode mixte](#)), vos demandes de nouvelle attribution de clé sont toujours transmises en mode ASTRO OTAR. La radio répondra toutefois à une transmission OTAR par une transmission OTAR de même type.

Réglage du mode mixte ASTRO et MDC : Lorsque le champ Type voix/signal Rx est réglé à **Mode mixte**, un type de système conventionnel de type ASTRO doit être sélectionné dans le champ [Système ASTRO à la page 459](#), et la valeur **MDC** doit être sélectionnée dans le champ Type d'émission de signaux Non ASTRO, ce qui permet la sélection d'un système conventionnel de type MDC dans le champ Système non ASTRO.

Le système conventionnel n'est pas un système de type DVRS

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique** ou à **Logiciel**, et lorsque le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est activé, et

lorsque le champ [Activer OTAR à la page 303](#) est activé; et

lorsque le champ [Personnalité réception seulement à la page 430](#) est désactivé et que le modèle ou l'option de la radio le permet.

Et

(lorsque le champ [Activer ASTRO OTAR à la page 304](#) est activé; et

lorsque le champ [Activer MDC OTAR à la page 307](#) est activé),

ou

(lorsque le champ [Activer ASTRO OTAR](#) est activé, et

lorsque le champ [Activer MDC OTAR](#) est désactivé, et

lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **ASTRO** ou à **Mode mixte**,

ou

(lorsque le champ [Activer ASTRO OTAR](#) est désactivé, et

lorsque le champ [Activer MDC OTAR](#) est activé, et

lorsque le champ [Type voix/signal Rx](#) est réglé à **Non-ASTRO** ou à **Mode mixte**,

et lorsque le champ [Autre que ASTRO\Type d'émission de signaux à la page 461](#) est réglé à **MDC**).

Système conventionnel de type Système DVRS

Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique** ou à **Logiciel**, et lorsque le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est activé, et

lorsque le champ [Activer OTAR à la page 303](#) est activé; et

lorsque le champ [Personnalité réception seulement à la page 430](#) est désactivé et que le modèle ou l'option de la radio le permet.

Et

(lorsque le champ [Activer ASTRO OTAR à la page 304](#) est activé; et

lorsque le champ [Activer MDC OTAR à la page 307](#) est activé; et

lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **Mode mixte**, et

et lorsque le champ [Autre que ASTRO\Type d'émission de signaux à la page 461](#) est réglé à **MDC**).

ou

(lorsque le champ [Activer ASTRO OTAR](#) est activé, et

lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **Non ASTRO**.

10.34.11.13

ASTRO OTAR

Ce champ permet à la radio de recevoir des transmissions ASTRO OTAR (changement de clé par onde radio) ou MDC OTAR pour la personnalité conventionnelle courante.

**REMARQUE :**

Pour que les modes ASTRO OTAR et MDC OTAR puissent être utilisés sur le même canal, le champ [Rx \(type voix/signal\) à la page 430](#) doit être réglé à **Mode mixte**. Les transmissions ASTRO OTAR ont préséance sur les transmissions MDC OTAR; toutefois, si une transmission MDC OTAR est reçue, la radio essaiera d'abord de répondre en mode MDC OTAR.

**IMPORTANT :**

Lorsque le champ [Activer ASTRO OTAR à la page 304](#) est réglé à **Activé** pour la personnalité conventionnelle courante, les valeurs de sélection de clés de matériel pour cette personnalité utilisent le [Liste de références de clés de chiffrement de matériel sécurisées à la page 322](#) du profil KMF sécurisé sélectionné dans le champ Index de profil KMF de la personnalité conventionnelle courante.

**AVERTISSEMENT :**

Il est important de noter que RadioCentral pointe vers les clés de la [Liste des clés de chiffrement à la page 317](#) applicable à cette sélection; les clés figurant dans la liste de clés de référence de chiffrement de matériel sécurisées correspondent aux clés de la liste de clés de chiffrement sélectionnée dans le champ [Référence de clé de chiffrement à la page 323](#). Par conséquent, les clés sélectionnées lorsque le champ ASTRO OTAR est activé doivent d'abord être définies dans la liste de références de clés de chiffrement de matériel sécurisées.

Lorsque le champ [Activer ASTRO OTAR à la page 304](#) est réglé à **Désactivé** pour la personnalité conventionnelle courante, les valeurs de sélection de clés de matériel sont choisies directement dans la liste des clés de chiffrement de la fenêtre Toute la sécurité.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique** ou à **Logiciel**, et lorsque le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est activé, et

Lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **Mode ASTRO** ou à **Mode mixte**, et lorsque le champ [Activer OTAR à la page 303](#) est réglé à **Activé**, et

lorsque le champ [Activer ASTRO OTAR à la page 304](#) est réglé à **Activé**, et

Lorsque la personnalité n'est pas créée automatiquement par la fonction de clonage de zone, et lorsque le modèle ou l'option de la radio le permet.

10.34.11.14

Index de profil ASTRO OTAR

Ce champ permet de sélectionner le profil du dispositif de gestion des clés (KMF) à utiliser en mode ASTRO OTAR (changement de clé par onde radio).

Cette sélection s'applique pendant le fonctionnement selon la personnalité conventionnelle courante.

REMARQUE :

Tous les paramètres ASTRO OTAR précisés dans le profil KMF s'appliquent par la suite à la personnalité conventionnelle courante.

AVERTISSEMENT :

ce champ est non valide lorsque cette personnalité renvoie à un système conventionnel (ayant un Type de système **ASTRO**), qui renvoie à un Profil de données (ayant un Type de profil de **Conventionnel et large bande** ou **Large bande uniquement**), et lorsque le champ Adresse IP KMF est réglé à 0.0.0.0.

IMPORTANT :

Lorsque le champ **ASTRO OTAR à la page 491** est réglé à **Activé** pour la personnalité conventionnelle courante, les valeurs de sélection de clés de matériel pour cette personnalité utilisent la liste de références de clés de chiffrement de matériel sécurisées du profil KMF sécurisé sélectionné dans le champ Index du profil KMF pour la personnalité conventionnelle courante.

AVERTISSEMENT :

Veillez noter que l'application renvoie aux clés de la liste des clés de chiffrement pour cette sélection; la liste de références de clés de chiffrement de matériel sécurisées renvoie à la liste des clés de chiffrement du champ Référence de clé de chiffrement. Par conséquent, toute clé sélectionnée lorsque le champ ASTRO OTAR est défini à **Activé** doit tout d'abord être définie dans la liste de références de clés de chiffrement de matériel sécurisées.

Lorsque le champ ASTRO OTAR est réglé à **Désactivé** pour la personnalité conventionnelle courante, les valeurs de sélection de clés de matériel proviennent directement de la liste des clés de chiffrement de la fenêtre Toute la sécurité.

Accès seulement : Lorsque le champ **Fonctionnement sécurisé à la page 301** est réglé à **Matériel informatique** ou à **Logiciel**, et lorsque le champ **Norme de chiffrement avancée (AES256) à la page 302** est activé, et

Lorsque le champ ASTRO OTAR est réglé à **Activé** et qu'il est applicable, et

Lorsque le champ **Rx (type voix/signal) à la page 430** est réglé à **ASTRO** ou à **Mode mixte**, et

lorsque le champ **Activer ASTRO OTAR à la page 304** est activé; et

lorsque le champ **Activer OTAR à la page 303** est activé; et

lorsque le champ Activer la nouvelle attribution de clés tactiques est réglé à désactivé, et

lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

- Désactivé;
- Profils KMF sécurisés offerts

10.34.11.15

Temps de mise en sourdine de l'écho

Ce champ permet de sélectionner la durée pendant laquelle la sourdine du haut-parleur de la radio demeure activée immédiatement après une transmission chiffrée.

En ce qui concerne les répéteurs dont le délai de transfert de données est élevé, il se peut que la fin d'une transmission vocale chiffrée soit entendue de nouveau une fois que vous cessez d'émettre. L'entrée d'une valeur dans ce champ permet de tenir compte de ce délai, et donc d'annuler ce possible effet d'écho. Le temps commence à être compté dès que l'utilisateur relâche la touche PTT. Cette sélection s'applique à la personnalité conventionnelle courante.

Accès seulement : (Lorsque le champ [Groupe à la page 474](#) ASTRO est réglé à **Activé**, ou lorsque le champ Groupe ASTRO est réglé à **Désactivé**, et lorsque le champ [Effectuer/Terminer la connexion vocale à la page 486](#) est réglé à **Sélection** ou à **Sécurisé**), et

(lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique** ou à **Logiciel**, et lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **ASTRO** ou à **Mode mixte**).

Tableau 217 : Portée

Minimum	Maximum	Incréments
0 ms	1500 ms	50 ms

10.34.11.16

Sélection du balayage

Ce champ permet de déterminer la période d'attente de la radio, en mode Balayage activé, pour la détection d'une transmission encodée SecureNet (non ASTRO).

Cette période d'attente commence après la détection du silencieux de porteuse. Cette fonction s'applique à la [de Sélection de la liste de balayage à la page 476](#) sélectionnée pour la personnalité conventionnelle courante et seulement au balayage d'un canal encodé faisant partie de la liste de balayage SecureNet.

Accès seulement : Lorsque le champ Fonctionnement sécurisé est réglé à **Matériel informatique**, et lorsque le champ [Transmission XL à la page 485](#) est **Désactivé**, et lorsque le champ [Type voix/signal sécurisé à la page 484](#) est **Securenet**, et lorsque le modèle ou les options de la radio le permettent.

Les sélections suivantes sont prises en charge :

Autres que XL

La radio attend le temps indiqué dans le champ Durée désactivation silencieux balayage non XL lorsqu'un canal faisant partie de la liste de balayage est réglé à SecureNet Autres que XL.

XL et autre que XL

La radio attend le temps indiqué dans le champ Durée désactivation silencieux balayage XL lorsqu'un canal faisant partie de la liste de balayage est réglé à SecureNet XL et autre que XL.

REMARQUE :

La valeur XL exige une période d'attente plus longue.

10.34.11.17

Connexion de retardement du balayage

Ce champ permet de sélectionner l'optimisation de l'algorithme d'activation du son lié au balayage des appels encodés SecureNet (non-ASTRO).

L'algorithme est également fondé sur le réglage [Type de désactivation de la sourdine à la page 466](#) pour la personnalité conventionnelle courante. Cette fonctionnalité s'applique lorsque l'on tente d'activer le son des canaux membres de la liste de balayage (mode de communication conventionnel seulement). Cette sélection s'applique à la personnalité conventionnelle courante.

Accès seulement : Lorsque le champ Fonctionnement sécurisé est réglé à **Matériel informatique** et lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **Non ASTRO**, et lorsque le modèle ou les options de la radio le permettent.

Les sélections suivantes sont prises en charge :

Les deux

Cette sélection se révèle la moins efficace, car le système doit tenir compte de tous les types possibles de balayage.

Non chiffré seulement

Les paramètres radio internes s'appliquent au silencieux de porteuse et à l'émission de signaux d'une ligne privée ou d'une ligne privée multiple.

Sécurisé seulement

Utilise la durée de désactivation du silencieux selon le type de balayage (XL ou non XL) sélectionnée dans le champ [Sélection du balayage à la page 493](#).

10.34.11.18

ID de clé

Ce champ permet de sélectionner la méthode d'ID de clé à utiliser lors du fonctionnement avec la personnalité conventionnelle courante.

Accès seulement : Lorsque le champ Fonctionnement sécurisé est réglé à **Matériel informatique**, et lorsque le champ Type d'émission de signaux Non ASTRO est **MDC**, et lorsque le champ est **Securenet**, et lorsque le modèle ou les options de la radio le permettent.

Les sélections suivantes sont prises en charge :

Transmission seulement (Transmettre)

Sert à transmettre l'ID de clé au début de chaque transmission.

Réception seulement (Recevoir)

Sert à remplacer l'ID de clé par celle qui est précisée au début de chaque message reçu. Si le message reçu ne comporte pas d'ID de clé, la radio utilise son ID de clé actuelle.

Tx et Rx (Recevoir/transmettre)

Sert à sélectionner les deux méthodes ci-dessus.

Aucun

Sert à désactiver les deux méthodes ci-dessus.

10.34.11.19

Retard XL après ID de clé

Ce champ permet de déterminer le temps d'attente de la radio suivant la communication d'un ID de clé avant la transmission d'un signal audio chiffré XL (portée accrue).

Cette sélection s'applique pendant le fonctionnement selon la personnalité conventionnelle courante.

Accès seulement : Lorsque le champ Fonctionnement sécurisé est réglé à **Matériel informatique**, et lorsque le [Rx \(type voix/signal\) à la page 430](#) est réglé à **Non ASTRO**, et lorsque le champ Type d'émission de signaux Non-ASTRO est réglé à **MDC**, et lorsque le champ [Effectuer/Terminer la connexion vocale à la page 486](#) n'est pas réglé à **Non chiffré**, et lorsque le champ [Transmission XL à la page 485](#) est réglé à **Activé**, et lorsque le champ [Type voix/signal sécurisé à la page 484](#) est réglé à **Securenet**, et lorsque le champ [ID de clé à la page 494](#) est réglé à **Tx seulement** ou à **Tx et Rx**, et lorsque le modèle ou les options de la radio le permettent.

Tableau 218 : Portée

Minimum	Maximum
0	200

10.34.11.20

Large bande ASTRO OTAR

Si ce champ est activé, vous pouvez utiliser OTAR (changement de clé par onde radio) sur large bande sur des canaux analogiques.

Accès seulement : Lorsque les conditions suivantes sont réunies.

- Le modèle et les options de la radio le permettent.
- Le champ Fonctionnement sécurisé est réglé à **Matériel** ou à **Logiciel** et la fonction Activer la norme de chiffrement avancé (AES) est activée.
- Le champ Activer ASTRO OTAR est activé.
- Le champ Personnalité conventionnelle, Type de voix/signal Rx est réglé à **Non-ASTRO**.
- Le champ Personnalité réception seulement est désactivé.

10.34.12

Avancé

Cette section permet d'afficher ou de définir des réglages divers et parfois complexes pour des personnalités conventionnelles.

REMARQUE :

Après avoir défini de façon unique les fonctions des personnalités conventionnelles, chaque personnalité peut être assignée à la position désirée du sélecteur de canaux de la radio. Cette opération est effectuée à partir de la page Canaux, dans la fenêtre Attribution du canal de zone.

10.34.12.1

AGC RF avancé

Ce champ permet de sélectionner le type de commande automatique du gain (AGC) de la fréquence de réception (RF) qui s'applique à la personnalité conventionnelle courante.

Les sélections suivantes sont prises en charge :

Désactivé;

Même lorsque la valeur du champ est **Désactivé**, une commande automatique du gain de base, qui est intégrée au récepteur de la radio, est utilisée. Cette protection intégrée contribue à éviter l'écrêtage du signal et la saturation du récepteur, qui risquent d'endommager les composants de la radio.

Standard

Cette valeur permet d'activer une forme évoluée de commande automatique du gain qui offre une protection contre l'interférence d'intermodulation (IM) en détectant et en supprimant toute interférence provenant de sources externes.

Amélioré

Cette valeur permet à la radio d'utiliser d'autres techniques de réduction de l'interférence d'IM, qui permettent de nettoyer le signal.

Intelligente

Cette valeur permet à la radio d'utiliser une technique unique pour améliorer l'immunité aux interférences à proximité des stations de base Linear Simulcast et APCO phase 2. L'option intelligente s'exclut mutuellement avec la case à cocher Protection large bande.

IMPORTANT :

Il se peut que les formes standard et améliorée de la commande automatique du gain diminuent la performance sur les **canaux** qui ne subissent **aucune** interférence d'IM. Par conséquent, cette fonction doit être activée uniquement sur les canaux qui sont soumis à ce type d'interférence.

10.34.13

Une touche

Cette section vous permet d'afficher ou de définir des sélections spécifiques **Fonction** et **Index** pour un maximum de quatre commandes une touche ou sélections de menu une touche.

La fonction une touche sert à créer des raccourcis de navigation dans les menus ou des touches de raccourci. Ces raccourcis peuvent accélérer grandement votre implication pour l'activation des fonctions de la radio. En appuyant sur un bouton Une touche ou en sélectionnant une commande de menu Une touche, l'utilisateur peut lancer en une seule étape une fonction de la radio, processus qui nécessite normalement plusieurs étapes de navigation dans les menus. Ces sélections s'appliquent à la personnalité conventionnelle courante.

**REMARQUE :**

Après avoir défini de façon unique les fonctions des personnalités conventionnelles, chaque personnalité peut être assignée à la position désirée du sélecteur de canaux de la radio. Cette opération est effectuée à partir de la page Canaux, dans la fenêtre Attribution du canal de zone.

10.34.13.1

Touche

Affiche le nom affecté en lecture seule à un appui sur Une touche ou la sélection de menu Une touche.

**REMARQUE :**

Les systèmes ADF individuels sont référencés dans une personnalité ADF. Les paramètres de ce système ADF sont ainsi activés pour tous les types de canaux contenus dans cette personnalité ADF.

10.34.13.2

Fonction Une touche

Ce champ permet de sélectionner la fonction Une touche associée au bouton Une touche ou à la sélection de menu Une touche.

Cette sélection s'applique à l'enregistrement/rangée courant, lequel s'applique pour le système ADF courant.

**IMPORTANT :**

Le bouton 1 conventionnel (autrement dit, la première rangée ou le premier enregistrement) correspond à la touche Une touche 1 ou à la commande de menu (TCH1 ou SIG1) et ainsi de suite.

**REMARQUE :**

Lorsque l'un des types de fonctions Une touche est sélectionnée, une sélection d'Index/Membre de liste [Index Une touche à la page 497](#) est également requise pour la personnalité courante : Téléphone, Appel sélectif, Avis d'appel, État ou Message.

Les sélections de la fonction de touche Une touche dépendent du modèle et des options.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet, et (lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est **ASTRO**, alors le champ [Système d'interface du site distant](#) dans le système conventionnel défini doit être **Désactivé**).

Les sélections suivantes sont prises en charge :

Désactivé;

L'option Une touche n'est pas activée pour le bouton sélectionné.

Téléphone

La fonction [Fonctionnement du téléphone à la page 573](#) est activée pour la personnalité courante.

Sélectionner un appel

La fonction [Rx/Tx d'appel sélectif à la page 465](#) est réglée à **Décoder et encoder** ou **Encoder**.

**IMPORTANT :**

Lorsque le système conventionnel défini est de type système « DVRS », alors cette fonction associe l'appel privé ADF à la touche Une touche ou à la sélection de menu [Une touche \(SIG1-SIG4/DISP\)](#).

Alerte d'appel

Le champ [Alerte d'appel/Notification à la page 570](#) est réglé à **Liste seulement** ou **Illimité** pour la personnalité ADF en référence.

État

La fonction [État à la page 419](#) du système conventionnel défini (pour la personnalité courante) est **Activée**.

Message

La fonction [Message](#) du système conventionnel défini (pour la personnalité courante) est **Activée**.

RAB1 (Bouton d'accès au répéteur)

La fonction [Accès au répéteur](#) est activée pour la personnalité courante. Lorsque le champ [Type d'accès](#) est réglé à **Auto**, cette sélection n'est pas valide. Lorsque le champ Type d'accès est réglé à **Manuel**, le type de code 1 pour RAB1 s'applique à cette touche.

RAB2

La fonction Accès au répéteur est activée pour la personnalité courante. Lorsque le champ Type d'accès est réglé à **Auto** ou que le champ Type de code 2 pour RAB2 est réglé à **Aucun**, cette sélection n'est pas valide.

RTT (Demande de conversation)

La fonction Accès au répéteur est activée et le champ Type d'accès est réglé à **Manuel** pour la personnalité courante.

10.34.13.3

Index Une touche

Ce champ permet de sélectionner l'Index Une touche/membre de la liste pour votre bouton Une touche ou votre sélection de menu Une touche, relativement à la fonction Une touche sélectionnée.

L'index désigne la rangée ou l'enregistrement courant de la liste déterminé par la fonction Une touche sélectionnée. Cette sélection s'applique à la personnalité conventionnelle courante.

IMPORTANT :

La touche Une touche 1 conventionnel (la première rangée ou le premier enregistrement) correspond à la touche Une touche 1 ou à la commande de menu (TCH1 ou SIG1).

Accès seulement : Lorsque le champ [Fonction Une touche à la page 496](#) n'est pas **Désactivé**, **RAB1**, **RAB2** ou **RTT**,

et lorsque le champ [Rx \(type voix/signal\) à la page 430](#) est réglé à **ASTRO**, alors le champ [Système d'interface du site distant](#) du système conventionnel en référence doit être désactivé.

Les sélections suivantes sont prises en charge :

Sélectionner un appel

Le numéro de l'index correspond au numéro de la rangée de la liste privilégiée d'appels.

Disponible lorsque [Rx/Tx d'appel sélectif à la page 465](#) est réglé à **Décoder et encoder** ou **Encoder** pour la personnalité courante.

IMPORTANT :

Les champs Sélection liste courte permettent de sélectionner la liste à utiliser pour la personnalité courante.

Alerte d'appel

Le numéro de l'index correspond au numéro de la rangée de la liste privilégiée d'appels.

Disponible lorsque [Rx/Tx d'avis d'appel à la page 466](#) est réglé à Décoder et encoder ou Encoder pour la personnalité courante.

IMPORTANT :

Les champs Sélection liste courte permettent de sélectionner la liste à utiliser pour la personnalité courante.

Téléphone

Le numéro de l'index correspond au numéro de la rangée de la liste privilégiée d'appels.

Disponible lorsque la fonction [Fonctionnement du téléphone](#) est activée pour la personnalité courante.

État

Le numéro de l'index correspond au numéro de la rangée de la liste d'alias état.

Disponible lorsque la fonction [État à la page 419](#) du [Système conventionnel à la page 415](#) référencé est activée (pour la personnalité courante).

Message

Le numéro de l'index correspond au numéro de la rangée de la liste d'alias message.

Disponible lorsque la fonction [Message](#) du [Système conventionnel à la page 415](#) référencé est activée (pour la personnalité courante).

10.35

Totalité des ADF

Cette section vous permet d'afficher ou de définir les fonctionnalités qui peuvent être appliquées à tous les systèmes ADF et, par le fait même, à toutes les personnalités ADF.

10.35.1

Général

Cette section permet d'afficher ou de définir les fonctionnalités de base qui peuvent être appliquées à tous les systèmes ADF et, par le fait même, à toutes les personnalités ADF.

10.35.1.1

Durée maximale de la sonnerie par appel

Ce champ permet de sélectionner la durée maximale de la sonnerie de l'appareil de l'abonné à la réception d'une demande d'appel.

IMPORTANT :

Les appels comprennent les appels téléphoniques et les appels entre unités. Si vous répondez à l'appel avant la fin de la durée indiquée, la minuterie et la sonnerie s'arrêtent. Cette sélection s'applique à tous les systèmes ADF et, par le fait même, à toutes les personnalités ADF. La durée est exprimée en secondes.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

Lorsque le champ est réglé à **Infini**, la durée de sonnerie est illimitée.

Tableau 219 : Portée

Minimum	Maximum	Incréments
61 s	120 s	1 s

10.35.1.2

Durée maximale de la sonnerie pour appel privé

Ce champ permet de sélectionner la durée maximale de la sonnerie de l'appareil de l'abonné après la réception d'une demande d'appel entre unités.

**IMPORTANT :**

Les appels téléphoniques ne sont pas inclus. Si la durée de la minuterie s'écoule avant que l'on réponde à l'appel radio, la tentative d'appel est abandonnée. La minuterie et la sonnerie s'arrêtent lorsque l'utilisateur de l'unité visée répond à l'appel avant la fin de la durée indiquée. Cette sélection s'applique à tous les systèmes ADF et, par le fait même, à toutes les personnalités ADF. La durée est exprimée en secondes.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

**REMARQUE :**

Lorsque le champ est réglé à **Infini**, la durée de sonnerie est illimitée.

Tableau 220 : Portée

Minimum	Maximum	Incréments
1 s	255 s	1 s

10.35.1.3

Retardement de la composition automatique du téléphone

Ce champ permet de sélectionner la période d'attente maximale de la radio après que l'accès au canal vocal numérique a été accordé au système téléphonique.

Une fois cette minuterie expirée, les numéros de la liste privilégiée d'appel de type II, prédéfinis (composition abrégée) ou entrés en mode **Clavier activé (DTMF)** à la page 576 sont alors transmis.

**IMPORTANT :**

Cette sélection ne s'applique qu'aux téléphones numériques des systèmes à ressources ADF de Type II et, par conséquent, à toutes les personnalités ADF de Type II. Voir aussi le champ **Système ADF, Type de système**. La durée est exprimée en millisecondes.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 221 : Portée

Minimum	Maximum	Incréments
0 ms	6 375 ms	25 ms

10.35.1.4

Blocage d'urgence en mode dégradé

Ce champ permet de faire en sorte que la radio ne tienne pas compte de toute tentative d'accéder au mode d'urgence des communications ADF pendant que le réseau est en mode dégradé.

Cette sélection s'applique à tous les systèmes ADF et, par le fait même, à toutes les personnalités ADF.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.35.1.5

Désact. CAF

Ce champ désactive l'algorithme CAF (commande automatique de fréquence) de la radio.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

La fonction CAF corrige automatiquement les décalages de l'oscillateur de référence de la radio en déterminant la fréquence du signal RF reçu et en réacheminant un signal d'erreur proportionnel au niveau de décalage, ce qui permet de réduire l'erreur de décalage. Cependant, il peut être préférable de désactiver la fonction CAF dans les environnements bruyants, où le signal d'erreur pourrait suivre une fréquence parasite plutôt que la fréquence attribuée.

IMPORTANT :

Lorsque la fonction CAF est **désactivée**, l'oscillateur de référence doit être réglé avec précision. Cette sélection s'applique à tous les systèmes ADF et, par le fait même, à toutes les personnalités ADF.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.35.1.6

Contournement de la touche rapide d'accès au canal de voix

Lorsque ce champ est activé, la fonction Touche rapide est désactivée (contournée) pour les appels vocaux de groupe.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Par conséquent, lors de la réception d'une autorisation d'accéder au canal de voix pour une demande de canal vocal de répartition et que la touche PTT n'est plus pressé, la radio met fin à la séquence de demande et revient au repos. Cette sélection s'applique à tous les systèmes ADF et, par le fait même, à toutes les personnalités ADF.

Lorsque cette case est cochée, la fonction Touche rapide est activée durant les appels vocaux de groupe.

IMPORTANT :

Puisque, particulièrement dans une condition occupée, un temps considérable peut s'écouler entre le moment où l'on appuie sur la touche PTT la première fois pour envoyer une demande de voix de répartition au système ADF et la réception de l'autorisation d'accès vocal qui attribue un canal vocal à la demande de la radio, vous pouvez décider de relâcher la touche de la radio plutôt que d'attendre l'expiration du [Minuterie de délai d'attente à la page 434](#). Lorsque l'autorisation d'accéder au canal vocal est finalement reçue, la radio fait entendre une [Tonalité d'autorisation de parler à la page 575](#), et la fonction Touche rapide fait en sorte qu'elle commence à émettre un signal audio silencieux pendant trois secondes, même si la touche PTT est relâchée. Si vous appuyez sur la touche PTT avant l'expiration de la minuterie de la touche rapide, la radio continue la transmission, mais avec un microphone actif. Dans le cas contraire, la radio arrête d'émettre.

La fonction Touche rapide est toujours activée pour les appels privés et le mode téléphone.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

Il s'agit d'un paramètre avancé qui est disponible uniquement dans l'Affichage Expert (voir Affichage Codeplug).

10.35.1.7

Laisser le seuil RSSI LMR

Lorsque la radio détecte que l'intensité du signal RSSI filtré de tous les sites LMR est inférieure au seuil Laisser le seuil LMR RSSI, la radio passe automatiquement du fonctionnement LMR au fonctionnement à large bande, si cela est disponible.

Tableau 222 : Portée

Par défaut	Minimum	Maximum	Incréments
34 (hex)	0	FF (hex)	1

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.35.2

Constantes de filtre

Cette section permet d'afficher ou de définir la fonctionnalité SmartZone qui peut s'appliquer à tous les systèmes ADF et, par conséquent, à toutes les personnalités ADF.

Les constantes de filtre RSSI (indicateur d'intensité du signal reçu) SmartZone permettent à la radio d'interpréter les communications SmartZone reçues en fonction de la configuration et des règles de fonctionnement de système ADF SmartZone. Dans un système SmartZone, les constantes K1, K2 et K3 permettent de réduire l'amortissement du filtre à mesure qu'augmente le temps écoulé entre les échantillons RSSI.

10.35.2.1

Constante de filtre K1

Ce champ permet de sélectionner la valeur de la constante de filtre K1, qui est utilisée lorsqu'il s'écoule moins de huit secondes entre les échantillons de l'indicateur d'intensité du signal reçu (RSSI).

La valeur de la constante de filtre K1 sélectionnée est utilisée par la [Constante de seuil de filtre T1 à la page 503](#). Cette sélection peut s'appliquer à tous les systèmes ADF et, par le fait même, à toutes les personnalités ADF.

**AVERTISSEMENT :**

La modification des constantes de filtre ne devrait être effectuée que par un technicien de Motorola Solutions.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 223 : Portée

Minimum	Maximum
0	9

REMARQUE :

La valeur caractéristique du filtre RSSI est : $= (\text{Valeur du filtre } *K + \text{Lecture courante } * (10 - K)) / 10$, où le domaine de K est {K: K = K1, K2, K3} et 0 (aucun filtre) $\leq K3 \leq K2 \leq K1 \leq 9$ (filtre très amorti).

Dans un système SmartZone, les constantes K1, K2 et K3 permettent de réduire l'amortissement du filtre à mesure qu'augmente le délai entre les échantillons.

- La constante K1 est utilisée lorsque l'intervalle entre les échantillons RSSI est inférieur à 8 secondes.
- La [Constante de filtre K2 à la page 502](#) est utilisée lorsque l'intervalle entre les échantillons RSSI se situe entre 8 et 16 secondes.
- La [Constante de filtre K3 à la page 503](#) est utilisée lorsque l'intervalle entre les échantillons RSSI est supérieur à 16 secondes.

10.35.2.2

Constante de filtre K2

Ce champ permet de sélectionner la valeur de la constante de filtre K2, qui est utilisée lorsque l'intervalle entre les échantillons de l'indicateur d'intensité du signal reçu (RSSI) se situe entre 8 et 16 secondes.

La valeur de la constante de filtre K2 sélectionnée est utilisée par la [Constante de seuil de filtre T2 à la page 504](#). Cette sélection peut s'appliquer à tous les systèmes ADF et, par le fait même, à toutes les personnalités ADF.

AVERTISSEMENT :

La modification des constantes de filtre ne devrait être effectuée que par un technicien de Motorola Solutions.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 224 : Portée

Minimum	Maximum
0	9

REMARQUE :

La valeur caractéristique du filtre RSSI est : $= (\text{Valeur du filtre } *K + \text{Lecture courante } * (10 - K)) / 10$, où le domaine de K est {K: K = K1, K2, K3} et 0 (aucun filtre) $\leq K3 \leq K2 \leq K1 \leq 9$ (filtre très amorti).

Dans un système SmartZone, les constantes K1, K2 et K3 permettent de réduire l'amortissement du filtre à mesure qu'augmente le délai entre les échantillons.

- La [Constante de filtre K1 à la page 501](#) est utilisée lorsque l'intervalle entre les échantillons RSSI est inférieur à 8 secondes.
- La constante K2 est utilisée lorsque l'intervalle entre les échantillons RSSI se situe entre 8 et 16 secondes.
- La [Constante de filtre K3 à la page 503](#) est utilisée lorsque l'intervalle entre les échantillons RSSI est supérieur à 16 secondes.

10.35.2.3

Constante de filtre K3

Ce champ permet de sélectionner la valeur de la constante de filtre K3, qui est utilisée lorsque l'intervalle entre les échantillons de l'indicateur d'intensité du signal reçu (RSSI) se situe entre 8 et 16 secondes.

La valeur de la constante de filtre K3 sélectionnée est utilisée par la [Constante de seuil de filtre T3 à la page 505](#). Cette sélection peut s'appliquer à tous les systèmes ADF et, par le fait même, à toutes les personnalités ADF.

**AVERTISSEMENT :**

La modification des constantes de filtre ne devrait être effectuée que par un technicien de Motorola Solutions.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 225 : Portée

Minimum	Maximum
0	9

**REMARQUE :**

La valeur caractéristique du filtre RSSI est : $= (\text{Valeur du filtre} * K + \text{Lecture courante} * (10 - K)) / 10$, où le domaine de K est $\{K: K = K1, K2, K3\}$ et 0 (aucun filtre) $\leq K3 \leq K2 \leq K1 \leq 9$ (filtre très amorti).

Dans un système SmartZone, les constantes K1, K2 et K3 permettent de réduire l'amortissement du filtre à mesure qu'augmente le délai entre les échantillons.

- La [Constante de filtre K1 à la page 501](#) est utilisée lorsque l'intervalle entre les échantillons RSSI est inférieur à 8 secondes.
- La [Constante de filtre K2 à la page 502](#) est utilisée lorsque l'intervalle entre les échantillons RSSI se situe entre 8 et 16 secondes.
- La constante K3 est utilisée lorsque l'intervalle entre les échantillons RSSI est supérieur à 16 secondes.

10.35.2.4

Constante de seuil de filtre T1

Ce champ permet de sélectionner une valeur qui crée une fenêtre à l'intérieur de laquelle les échantillons RSS (intensité du signal reçu) doivent se situer pour être valides.

Cette fenêtre est centrée sur la valeur de l'indicateur d'intensité du signal reçu (RSSI) [Constante de filtre K1 à la page 501](#). La taille de la fenêtre correspond au double de la valeur de la constante de seuil. Cette constante T1 est utilisée lorsque le délai est inférieur à 8 secondes entre les échantillons RSSI. Cette sélection peut s'appliquer à tous les systèmes ADF et, par le fait même, à toutes les personnalités ADF.

**AVERTISSEMENT :**

La modification des constantes de filtre ne devrait être effectuée que par un technicien de Motorola Solutions.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 226 : Portée

Minimum	Maximum
0 (hex)	FF (hex)

IMPORTANT :

Les constantes de seuil de filtre (T1, T2, T3) sont des nombres hexadécimaux compris entre 0 et FF et ne devraient être modifiées que conformément à la règle suivante : (00 <= T1 <= T2 <= T3 <= FF).

REMARQUE :

T1, T2 et T3 créent une fenêtre à l'intérieur de laquelle les échantillons RSS doivent se situer pour être valides. Cette fenêtre est centrée sur la valeur sélectionnée pour la constante de filtre RSSI ([Constante de filtre K1 à la page 501](#), [Constante de filtre K2 à la page 502](#), ou [Constante de filtre K3 à la page 503](#)). La taille de la fenêtre correspond au double de la valeur de la constante de seuil.

- La constante T1 est utilisée lorsque l'intervalle entre les échantillons RSSI est inférieur à 8 secondes.
- La [Constante de seuil de filtre T2 à la page 504](#) est utilisée lorsque l'intervalle entre les échantillons RSSI se situe entre 8 et 16 secondes.
- La [Constante de seuil de filtre T3 à la page 505](#) est utilisée lorsque l'intervalle entre les échantillons RSSI est supérieur à 16 secondes.

10.35.2.5

Constante de seuil de filtre T2

Ce champ permet de sélectionner une valeur qui crée une fenêtre à l'intérieur de laquelle les échantillons RSS (intensité du signal reçu) doivent se situer pour être valides.

Cette fenêtre est centrée sur la valeur de l'indicateur d'intensité du signal reçu (RSSI) [Constante de filtre K2 à la page 502](#). La taille de la fenêtre correspond au double de la valeur de la constante de seuil. La constante T2 est utilisée lorsque l'intervalle entre les échantillons RSSI se situe entre 8 et 16 secondes. Cette sélection peut s'appliquer à tous les systèmes ADF et, par le fait même, à toutes les personnalités ADF.

AVERTISSEMENT :

La modification des constantes de filtre ne devrait être effectuée que par un technicien de Motorola Solutions.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 227 : Portée

Minimum	Maximum
0 (hex)	FF (hex)

**IMPORTANT :**

Les constantes de seuil de filtre (T1, T2, T3) sont des nombres hexadécimaux compris entre 0 et FF et ne devraient être modifiées que conformément à la règle suivante : (00 <= T1 <= T2 <= T3 <= FF).

**REMARQUE :**

T1, T2 et T3 créent une fenêtre à l'intérieur de laquelle les échantillons RSS doivent se situer pour être valides. Cette fenêtre est centrée sur la valeur sélectionnée pour la constante de filtre RSSI ([Constante de filtre K1 à la page 501](#), [Constante de filtre K2 à la page 502](#) ou [Constante de filtre K3 à la page 503](#)). La taille de la fenêtre correspond au double de la valeur de la constante de seuil.

- La [Constante de seuil de filtre T1 à la page 503](#) est utilisée lorsque l'intervalle entre les échantillons RSSI est inférieur à 8 secondes.
- La constante T2 est utilisée lorsque l'intervalle entre les échantillons RSSI se situe entre 8 et 16 secondes.
- La [Constante de seuil de filtre T3 à la page 505](#) est utilisée lorsque l'intervalle entre les échantillons RSSI est supérieur à 16 secondes.

10.35.2.6

Constante de seuil de filtre T3

Ce champ permet de sélectionner une valeur qui crée une fenêtre à l'intérieur de laquelle les échantillons RSS (intensité du signal reçu) doivent se situer pour être valides.

Cette fenêtre est centrée sur la valeur de l'indicateur d'intensité du signal reçu (RSSI) [Constante de filtre K3 à la page 503](#). La taille de la fenêtre correspond au double de la valeur de la constante de seuil. La constante T3 est utilisée lorsque l'intervalle entre les échantillons RSSI est supérieur à 16 secondes. Cette sélection peut s'appliquer à tous les systèmes ADF et, par le fait même, à toutes les personnalités ADF.

**AVERTISSEMENT :**

La modification des constantes de filtre ne devrait être effectuée que par un technicien de Motorola Solutions.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 228 : Portée

Minimum	Maximum
0 (hex)	FF (hex)

IMPORTANT :

Les constantes de seuil de filtre (T1, T2, T3) sont des nombres hexadécimaux compris entre 0 et FF et ne devraient être modifiées que conformément à la règle suivante : (00 <= T1 <= T2 <= T3 <= FF).

REMARQUE :

T1, T2 et T3 créent une fenêtre à l'intérieur de laquelle les échantillons RSSI doivent se situer pour être valides. Cette fenêtre est centrée sur la valeur sélectionnée pour la constante de filtre RSSI ([Constante de filtre K1 à la page 501](#), [Constante de filtre K2 à la page 502](#), ou [Constante de filtre K3 à la page 503](#)). La taille de la fenêtre correspond au double de la valeur de la constante de seuil.

- La [Constante de seuil de filtre T1 à la page 503](#) est utilisée lorsque l'intervalle entre les échantillons RSSI est inférieur à 8 secondes.
- La [Constante de seuil de filtre T2 à la page 504](#) est utilisée lorsque l'intervalle entre les échantillons RSSI se situe entre 8 et 16 secondes.
- La constante T3 est utilisée lorsque l'intervalle entre les échantillons RSSI est supérieur à 16 secondes.

10.35.3

Seuils RSSI

Cette section permet d'afficher ou de définir la fonction des indicateurs d'intensité du signal reçu (RSSI) qui peuvent s'appliquer à tous les systèmes ADF et, par le fait même, à toutes les personnalités ADF.

La fonction des seuils RSSI permet à la radio d'interpréter les communications SmartZone reçues selon la configuration et les règles de fonctionnement des systèmes ADF SmartZone.

10.35.3.1

Compteur RSSI OSW

Ce champ permet de sélectionner le nombre d'intervalles d'OSW (mots-indicateurs sortants) RSSI ASTRO 25 (23 ms) pendant lesquels la radio doit demeurer inactive sur le canal de contrôle avant qu'un ensemble d'échantillons RSSI ne soit prélevé.

Une fois ce nombre atteint, les échantillons RSSI permettent de mesurer l'intensité du signal entrant courant. Cette sélection peut s'appliquer à tous les systèmes ADF et, par le fait même, à toutes les personnalités ADF.

AVERTISSEMENT :

Ne tentez pas de modifier ce paramètre RSSI si vos connaissances sont limitées quant au fonctionnement de cette fonction. Une erreur de configuration pourrait rendre impossible toute communication entre votre radio et l'équipement de réseau fixe (FNE).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 229 : Portée

Minimum	Maximum
60	255

10.35.3.2

Compteur RSSI OSP

Ce champ permet de sélectionner le nombre d'OSP (paquets de signaux sortants) RSSI ASTRO 25 définissant la période pendant laquelle la radio doit demeurer inactive sur le canal de contrôle avant qu'un ensemble d'échantillons RSSI ne soit prélevé.

Cette valeur doit être déterminée sur la base du format du canal correspondant à un bloc d'émission de signaux ADF (TSBK), soit 1 OSP = 37,5 ms. Si le format du canal correspond plutôt à deux fois ou à trois fois le format TSBK, la valeur de la fiche code sera modifiée proportionnellement, de sorte que la période d'inactivité de la radio corresponde à : Compteur RSSI OSP * 37,5 ms. Cette sélection peut s'appliquer à tous les systèmes ADF et, par le fait même, à toutes les personnalités ADF.

**AVERTISSEMENT :**

Ne tentez pas de modifier ce paramètre RSSI si vos connaissances sont limitées quant au fonctionnement de cette fonction. Une erreur de configuration pourrait rendre impossible toute communication entre votre radio et l'équipement de réseau fixe (FNE).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 230 : Portée

Minimum	Maximum
40	255

10.35.3.3

Minuterie de désensibilisation

Ce champ permet de sélectionner la durée pendant laquelle la radio continuera à balayer le site après avoir perdu sa sensibilité aux signaux.

La radio est insensible aux signaux lorsqu'un fort signal RF inhibe le canal de contrôle. Cela peut survenir si une autre radio à grande puissance émet à proximité, sans nécessairement utiliser la même fréquence. La radio redevient sensible aux signaux lorsqu'elle trouve un canal de contrôle valide à la station d'accueil ou fonctionne en mode dégradé. Si la durée de la minuterie est écoulée et que la radio est toujours insensible aux signaux, la radio tentera de trouver un canal de contrôle valide sur un site adjacent, le cas échéant. Cette sélection peut s'appliquer à tous les systèmes ADF et, par le fait même, à toutes les personnalités ADF. La durée est exprimée en secondes.

**AVERTISSEMENT :**

Ne tentez pas de modifier ce paramètre RSSI si vos connaissances sont limitées quant au fonctionnement de cette fonction. Une erreur de configuration pourrait rendre impossible toute communication entre votre radio et l'équipement de réseau fixe (FNE).

**IMPORTANT :**

La valeur de ce champ ne peut pas être copiée en exécutant l'action « glisser-déposer » entre les bandes de fréquences (p. ex., 700/800 à UHF).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

**REMARQUE :**

lorsque réglé à **Désactivé**, la minuterie est désactivée (0 s).

Tableau 231 : Portée

Minimum	Maximum	Incréments
1 s	30 s	1 s

10.35.3.4

Seuil RSSI acceptable

Ce champ permet de sélectionner l'intensité associée aux seuils mauvais et acceptable de réception du signal SmartZone.

Le système ADF SmartZone utilise alors cette information pour déterminer la priorité des signaux. L'indicateur d'intensité du signal reçu (RSSI) est une mesure de l'intensité du signal entrant. Cette sélection peut s'appliquer à tous les systèmes ADF et, par le fait même, à toutes les personnalités ADF.

AVERTISSEMENT :

Ne tentez pas de modifier ce paramètre RSSI si vos connaissances sont limitées quant à l'utilisation de cette fonction. Une erreur de configuration pourrait rendre impossible toute communication entre votre radio et l'équipement de réseau fixe (FNE).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 232 : Portée

Minimum	Maximum
0 (hex)	FF (hex)

10.35.3.5

Bon seuil RSSI

Ce champ permet de sélectionner l'intensité associée aux seuils mauvais et acceptable de réception du signal SmartZone.

Le système ADF SmartZone utilise alors cette information pour déterminer la priorité des signaux. L'indicateur d'intensité du signal reçu (RSSI) est une mesure de l'intensité du signal entrant. Cette sélection peut s'appliquer à tous les systèmes ADF et, par le fait même, à toutes les personnalités ADF.

AVERTISSEMENT :

Ne tentez pas de modifier ce paramètre RSSI si vos connaissances sont limitées quant au fonctionnement de cette fonction. Une erreur de configuration pourrait rendre impossible toute communication entre votre radio et l'équipement de réseau fixe (FNE).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 233 : Portée

Minimum	Maximum
0 (hex)	FF (hex)

10.35.3.6

Très bon seuil RSSI

Ce champ permet de sélectionner l'intensité associée aux seuils bon/très bon de réception du signal SmartZone.

Le système ADF SmartZone utilise alors cette information pour déterminer la priorité des signaux. L'indicateur d'intensité du signal reçu (RSSI) est une mesure de l'intensité du signal entrant. Cette

sélection peut s'appliquer à tous les systèmes ADF et, par le fait même, à toutes les personnalités ADF.

AVERTISSEMENT :

Ne tentez pas de modifier ce paramètre RSSI si vos connaissances sont limitées quant au fonctionnement de cette fonction. Une erreur de configuration pourrait rendre impossible toute communication entre votre radio et l'équipement de réseau fixe (FNE).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 234 : Portée

Minimum	Maximum
0 (hex)	FF (hex)

10.35.3.7

Excellent seuil RSSI

Ce champ permet de sélectionner l'intensité associée aux seuils « très bon » et « excellent » de réception du signal SmartZone.

Le système ADF SmartZone utilise alors cette information pour déterminer la priorité des signaux. L'indicateur d'intensité du signal reçu (RSSI) est une mesure de l'intensité du signal entrant. Cette sélection peut s'appliquer à tous les systèmes ADF et, par le fait même, à toutes les personnalités ADF.

AVERTISSEMENT :

Ne tentez pas de modifier ce paramètre RSSI si vos connaissances sont limitées quant au fonctionnement de cette fonction. Une erreur de configuration pourrait rendre impossible toute communication entre votre radio et l'équipement de réseau fixe (FNE).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 235 : Portée

Minimum	Maximum
0 (hex)	FF (hex)

10.35.3.8

Signal puissant en itinérance

L'activation de ce champ permet de recevoir des indicateurs d'intensité du signal reçu (RSSI) supplémentaires.

Les seuils sont dérivés à intervalles réguliers à des valeurs supérieures à celles actuellement définies pour les seuils « très bon » et « excellents ». Cela permet d'augmenter le nombre de commutations entre les sites dont les signaux sont de forte intensité. Deux niveaux d'amélioration sont requis pour qu'une commutation soit possible afin d'éviter un nombre de commutations excessif.

Lorsque cette case est décochée, les commutations entre sites RSSI n'ont lieu que lorsqu'elles permettent d'améliorer le RSSI afin qu'il corresponde au seuil « excellent ».

Cette sélection s'applique à tous les systèmes ADF et, par le fait même, à toutes les personnalités ADF.

10.35.3.9

Retour au seuil RSSI LMR

La fonction de retour au seuil RSSI LMR définit l'intensité du signal utilisée par la radio pour déterminer si un site LMR a récupéré suffisamment pour passer du fonctionnement à large bande au fonctionnement LMR.

Tableau 236 : Portée

Par défaut	Minimum	Maximum	Incréments
41 (hex)	0	FF (hex)	1

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.35.4

Données CAI

La section **Données d'interface radio commune (CAI)** permet d'afficher ou de définir des paramètres qui déterminent la fonctionnalité ou les règles propres aux paquets de données transmis au moyen du protocole CAI.

Ces sélections peuvent s'appliquer à tous les systèmes à ressources ADF et, par le fait même, à toutes les personnalités ADF.

10.35.4.1

Tentatives de Tx max.

Ce champ permet de sélectionner le nombre maximal de tentatives d'envoi d'un paquet de données par l'interface radio commune (CAI).

La radio essaie de transmettre le paquet jusqu'à ce qu'elle reçoive un accusé confirmant la réussite de l'opération ou jusqu'à ce qu'elle atteigne le nombre maximal de tentatives. Cette sélection s'applique lorsque l'on utilise la CAI pour tous les systèmes ADF et personnalités ADF.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 237 : Portée

Minimum	Maximum
2	10

10.35.4.2

Minuterie de réponse

Ce champ permet de sélectionner la période minimale d'attente de la radio pour la réception d'un accusé confirmant la transmission des données par l'interface radio commune et avant le renvoi d'un autre paquet de données CAI.

Cette sélection s'applique lorsque l'on utilise la CAI pour tous les systèmes ADF et personnalités ADF. La durée est exprimée en millisecondes.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 238 : Portée

Minimum	Maximum	Incréments
100 ms	5000 ms	100 ms

10.35.4.3

Minuterie de réponse min.

Ce champ permet de sélectionner la période minimale d'attente de la radio pour l'envoi, sur l'ensemble du canal, d'un accusé confirmant la transmission de données par l'interface radio commune.

La valeur de ce paramètre doit être légèrement supérieure à celle du délai relatif au débit de données entre le contrôleur de réseau de radiocommunication et la radio. Cette sélection s'applique lorsque l'on utilise la CAI pour tous les systèmes ADF et personnalités ADF. La durée est exprimée en millisecondes.

**AVERTISSEMENT :**

Ne tentez pas de modifier ce paramètre avant d'avoir vérifié le débit de votre système.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 239 : Portée

Minimum	Maximum	Incréments
50 ms	2000 ms	50 ms

10.35.4.4

Période de recherche synchronisation image

Ce champ permet de sélectionner la période pendant laquelle la radio recherche une séquence de synchronisation de trames (FSS).

La présence d'une FSS sur un canal indique que des signaux vocaux ou des données sont en cours de transmission. Si aucune FSS n'est détectée durant cette période, la radio considère que le canal est inactif et envoie le paquet de données CAI (interface radio commune) suivant qui était dans la file d'attente de transmission. Cette sélection s'applique lorsque l'on utilise la CAI pour tous les systèmes ADF et personnalités ADF. La durée est exprimée en millisecondes.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 240 : Portée

Minimum	Maximum	Incréments
0 ms	5000 ms	50 ms

10.35.4.5

Tx plage aléatoire courte

Ce champ permet de sélectionner la période maximale pendant laquelle la radio doit attendre pour transmettre des données après la réception d'une première séquence de synchronisation des trames (FSS) indiquant que le canal n'est pas occupé.

La radio vérifie de manière aléatoire l'état d'accès d'un canal en fonction de cette période d'attente maximale. Cette sélection s'applique lorsque l'on utilise l'interface radio commune (CAI) pour tous les systèmes ADF et personnalités ADF. La durée est exprimée en millisecondes.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 241 : Portée

Minimum	Maximum	Incréments
50 ms	500 ms	50 ms

10.35.4.6

Plage aléatoire longue Tx

Ce champ permet de sélectionner la limite supérieure de la plage aléatoire uniforme.

Lorsque la radio détecte un canal occupé, elle recourt à un processus de sélection d'un intervalle aléatoire à l'intérieur de cette plage (appelé « délai d'interruption ») pour déterminer à quel moment elle doit tenter de retransmettre le message CAI (interface radio commune). Cette sélection s'applique lorsque l'on utilise la CAI pour tous les systèmes ADF et personnalités ADF. La durée est exprimée en millisecondes.

IMPORTANT :

La valeur minimale de la plage est automatiquement réglée à 50 ms, et l'incrément est de 50 ms.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 242 : Portée

Minimum	Maximum	Incréments
50 ms	5000 ms	50 ms

10.35.4.7

Tx plage aléatoire réponse

Ce champ permet de sélectionner la limite supérieure de la plage aléatoire uniforme.

Lorsque la radio détecte un canal occupé, elle recourt à un processus de sélection d'un intervalle aléatoire à l'intérieur de cette plage (appelé « délai d'interruption ») pour déterminer à quel moment elle doit tenter de retransmettre le message CAI (interface radio commune). Cette réponse constitue habituellement un accusé de réception (ACK) d'un message envoyé à partir du système. Cette sélection s'applique lorsque l'on utilise la CAI pour tous les systèmes ADF et les toutes les personnalités ADF. La valeur est exprimée en millisecondes.

IMPORTANT :

La valeur minimale de la plage est automatiquement réglée à 50 ms, et l'incrément est de 50 ms.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 243 : Portée

Minimum	Maximum	Incréments
50 ms	1000 ms	50 ms

10.35.4.8

Patience limitée pour Tx

Ce champ permet de sélectionner la durée maximale de tentative de transmission d'un paquet de données par l'interface radio commune (CAI).

Une fois cette durée échu, la radio cesse ses tentatives de transmission. Cette sélection s'applique lorsque l'on utilise la CAI pour tous les systèmes ADF et personnalités ADF. La durée est exprimée en secondes.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

Lorsque réglé à **Infini**, aucune minuterie n'est utilisée; par conséquent, il n'y a pas de limite de temps de transmission.

Tableau 244 : Portée

Minimum	Maximum	Incréments
1 s	255 s	1 s

10.35.5

Avancé

Cette section permet d'afficher ou de définir la fonctionnalité SmartZone qui peut s'appliquer à tous les systèmes ADF et, par conséquent, à toutes les personnalités ADF.

IMPORTANT :

Le système SmartZone est sélectionné pour chaque système ADF dans le champ Type de couverture.

10.35.5.1

Inactivité en mode dégradé SmartZone

Ce champ permet de sélectionner la durée d'inactivité du mode dégradé, qui détermine à quel moment la radio tente de chercher un canal de contrôle valide et actif.

La minuterie se met en marche lorsque toutes les communications en mode dégradé entrantes et sortantes ont cessé; si le délai expire avant qu'une communication en mode dégradé se produise, la radio commence à chercher un canal de contrôle. Si une communication est effectuée avant l'expiration du délai, la minuterie est réinitialisée. Cette sélection s'applique lorsque la radio est utilisée en mode SmartZone pour tous les systèmes ADF et les personnalités ADF. La durée est exprimée en secondes.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 245 : Portée

Minimum	Maximum
0 s	255 s

10.35.5.2

SMARTZone\Suspendre l'affiliation

Ce champ permet de sélectionner la durée d'attente de la radio avant de se connecter à un nouveau site ADF.

La minuterie se met en marche dès que la radio quitte le site courant en raison d'un échec de connexion au canal de contrôle. La radio utilise la durée choisie en tant que moyenne aléatoire. Cette sélection s'applique uniquement au fonctionnement SmartZone pour les systèmes ADF de Type II et, par le fait même, à toutes les personnalités ADF de Type II.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

- 1 s
- 3 s
- 7 s
- 15 s
- 31 s
- 63 s
- 127 s
- 255 s

10.35.5.3

SMARTZone\Balayage complet de canaux de contrôle

Ce champ permet à la radio d'effectuer automatiquement un balayage complet de canal de contrôle lorsqu'elle se retrouve hors de portée de toutes ses informations de contrôleur actuellement programmées.

La radio recherche alors toutes les définitions de canal dans sa codeplug, puis réalise un balayage de chaque canal trouvé afin de détecter toute activité de canal de contrôle valide. Cette sélection s'applique lorsque la radio est utilisée en mode SmartZone pour tous les systèmes ADF et les personnalités ADF.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.35.5.4

SMARTZone\Minuterie de balayage complet de canaux de contrôle

Ce champ permet de sélectionner le délai accordé à la radio pour la réalisation d'un balayage complet de canal de contrôle.

À l'expiration du délai, la radio reprend l'utilisation normale du canal de contrôle. Cette sélection s'applique lorsque la radio est utilisée en mode SmartZone pour tous les systèmes ADF et les personnalités ADF. La durée est exprimée en secondes.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 246 : Portée

Minimum	Maximum
5 s	31 s

10.35.5.5

SMARTZone\Retardement de la radio interne

Ce champ permet de sélectionner le temps de retardement aléatoire interne de la radio, c'est-à-dire la durée pendant laquelle la radio attend avant de s'inscrire auprès d'un nouveau site lorsqu'elle quitte un site qui vient de subir une panne ou qu'elle retourne à un site qui vient de se rétablir après une panne.

La radio calcule alors une valeur aléatoire située entre 0 et le temps de retardement aléatoire; cette valeur correspond au temps d'attente de la radio avant son inscription après une panne ou une reprise. Le temps de retardement aléatoire (IRHOT) n'est utilisé que si le [SMARTZone\Délai de retardement à la page 515](#) expire sans que la radio n'ait reçu par liaison radio un paquet indiquant la période de retardement. Cette sélection s'applique au mode SmartZone, mais uniquement aux systèmes ADF et aux personnalités ADF APCO. La durée est exprimée en minutes.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 247 : Portée

Minimum	Maximum
0 min	60 min

10.35.5.6

SMARTZone\Délai de retardement

Ce champ permet de sélectionner la durée pendant laquelle la radio attend avant de déclencher une minuterie de retardement pour l'inscription ou l'affiliation.

Pendant ce temps, la radio attend de recevoir par liaison radio un paquet qui indique la période de retardement. Si aucun paquet n'est reçu avant l'expiration du délai de retardement, la durée du **SMARTZone\Retardement de la radio interne à la page 514** est utilisée. Cette sélection s'applique au mode SmartZone, mais uniquement aux systèmes ADF et aux personnalités ADF APCO. La durée est exprimée en secondes.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 248 : Portée

Minimum	Maximum
5 s	60 s

10.35.5.7

Réglage de la fenêtre ISW

Ce champ permet de sélectionner une valeur (en format décimal ou hexadécimal) qui règle la fenêtre des mots-indicateurs entrants (ISW) aux fins d'amélioration de la performance du système à ressources ADF.

Cette fenêtre correspond à un intervalle qui est synchronisé sur la radio et le contrôleur central. Elle sert à synchroniser la transmission des ISW avec l'heure de réception prévue des ISW par le contrôleur central. Cette sélection s'applique uniquement aux systèmes ADF de Type II et, par conséquent, à toutes les personnalités ADF de Type II.

**AVERTISSEMENT :**

Ne modifiez pas ce champ à moins d'être un technicien de terrain de Motorola Solutions. Un réglage inadéquat risque de réduire la performance du système ADF.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 249 : Portée

Minimum	Maximum
0 (hexadécimal)	FFFF (hex)

10.35.5.8

ViQi : Minuterie d'inactivité d'appel du Partenaire virtuel (s)

Ce champ vous permet de sélectionner la durée pendant laquelle vous pouvez demeurer actif dans le canal du partenaire virtuel avant de revenir au groupe sélectionné.

**REMARQUE :**

Ce champ ne s'applique qu'aux radios APX NEXT et APX N70.

Tableau 250 : Portée

Valeur par défaut	Valeur minimum	Valeur maximum	Incréments
5 s	5 s	30 s	1 s

10.36

Système ADF de type II

La fenêtre **Système ADF de type II** permet à l'utilisateur de créer et de supprimer des systèmes ADF, ainsi que de définir leur fonctionnalité sur une base individuelle. Les systèmes ADF de la RM constituent des configurations virtuelles qui sont le miroir des configurations et des fonctionnalités des systèmes ADF réels (sur le terrain). La définition du système RadioCentral permet à la radio de communiquer avec les systèmes courants.

AVERTISSEMENT :

Si la valeur du champ Type de système d'un système ADF est changée, toutes les Personnalités ADF associées à ce système devront être réaffectées à un autre système de type approprié. Sinon, une erreur de codeplug se produira lors de l'écriture de la codeplug dans la radio. La structure d'adressage des systèmes ADF est soit **Type II**, soit **ASTRO 25**.

REMARQUE :

Les systèmes ADF sont référencés à une personnalité ADF. Les paramètres de ces systèmes sont ainsi activés pour tous les types de canaux – ADF.

10.36.1

Général (Système ADF type II)

La section **Général** de l'ensemble Système ADF type II permet à l'utilisateur d'afficher ou de définir les fonctionnalités de base pour des systèmes ADF.

REMARQUE :

Les systèmes ADF individuels sont référencés dans une personnalité ADF. Une fois utilisés comme référence, les paramètres de ce système sont ainsi activés pour tous les types de canaux contenus dans la personnalité ADF.

10.36.1.1

Nom de système ADF

Ce champ vous permet de créer un nom reconnaissable pour le système ADF courant.

REMARQUE :

Chaque système ADF est associé à une personnalité ADF par le biais du champ Système en sélectionnant ce nom. Les paramètres de ce système ADF sont ainsi activés pour tous les types de canaux contenus dans cette personnalité ADF.

Lorsque le champ Type de balayage est réglé à **Surv. Prioritaire** pour les canaux membres de la liste de balayage, ce nom de système ADF doit être sélectionné pour la liste en cours en utilisant le champ Enregistrement du système ADF.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

Exemples : EMT-001, #500, Électrique1, # A5

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

À l'écran de la radio, les traits de soulignement remplacent les espaces vides apparaissant au début.

Les points figurant au début n'apparaîtront pas dans l'affichage de la radio.

10.36.1.2

Type de clé de système

Ce champ permet d'afficher en lecture seule le type de clé de système sélectionnée pour le système ADF courant, soit **Clé du système** ou **Clé WACN**.

Lorsque le champ [Type de couverture à la page 517](#) est réglé à **Itinérance Intra-WACN**, le type de clé de système est **Clé WACN**; sinon, il est **Clé du système**.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.36.1.3

Clé du système présente

L'application récupère et affiche les informations en lecture seule si un fichier de clé système du logiciel ou de clé (matérielle) avancée est chargé dans le module et que ce fichier correspond à l'ID sélectionné dans le champ ID système ou ID WACN d'accueil pour le système ADF courant.

Voir aussi [Type de clé de système à la page 517](#).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.36.1.4

Autoriser la clé logicielle existante

L'option Autoriser la clé logicielle existante permet à l'utilisateur de désactiver temporairement l'obligation d'utiliser les ASK lors de la programmation d'une radio.

Accès seulement : Lorsque l'option H pour l'application des clés ou des demandes de matériel est activée et qu'une DEMANDE d'utilisation illimitée correspondant à l'ID du propriétaire ou du système d'accueil de la radio est chargée.

10.36.1.5

Type de couverture

Ce champ permet de sélectionner le type de couverture géographique de la radio et, par conséquent, les méthodes de communication directe entre radios dans les systèmes ADF.

La fonction Type de couverture s'applique au système ADF courant.

Accès seulement : Lorsque le modèle et les options de la radio le permettent, et si un fichier de clé système logicielle ou une clé de système avancée avec accès est sélectionnée dans le champ ID du système, ou une clé WACN avancée avec accès est sélectionnée dans le champ ID WACN d'accueil.

**REMARQUE :**

Ces sélections dépendent du modèle et des options de la radio.

Les sélections suivantes sont prises en charge :

Désactivé = SmartNet

Lorsque le modèle et les options de la radio permettent la prise en charge de SmartZone, désactiver ce champ fait en sorte que le système ADF utilise SmartNet.

**REMARQUE :**

SmartNet se résume à l'utilisation d'un système SmartZone à un seul site.

SmartZone

SmartZone permet de déterminer, grâce aux résultats d'interrogation obtenus à l'aide des indicateurs d'intensité du signal reçu (RSSI), le meilleur site ADF pour l'activation des canaux ADF du système SmartZone.

REMARQUE :

Pour les systèmes ASTRO 25 : Le fonctionnement est limité aux sites dans une même zone d'un système ADF unique.

Pour les systèmes Type II : Le fonctionnement est limité aux sites dans un même système ADF.

SmartZone et OmniLink

Permet aux radios compatibles SmartZone de passer d'une zone SmartZone à une autre dans le même système OmniLink. OmniLink s'applique aux canaux ADF pris en charge par OmniLink.

REMARQUE :

Pour les systèmes ASTRO 25 : Le fonctionnement est limité aux sites et aux zones dans un même système OmniLink.

Pour les systèmes Type II : Le fonctionnement est limité aux sites dans un ensemble de systèmes ADF interconnectés.

Itinérance intra-WACN

L'itinérance intra-WACN offre aux radios compatibles Project 25 une capacité d'itinérance automatique entre tous les ID de système d'un même réseau de communication étendu, sans aucune intervention de votre part. Voir aussi ID WACN d'accueil.

REMARQUE :

Pour les systèmes ASTRO 25 : Le fonctionnement est limité aux systèmes ADF dans un seul WACN.

AVERTISSEMENT :

L'itinérance intra-WACN est non valide dans les cas suivants :
lorsque le Type de système est Type II, ou

lorsque la case Activer le matériel DVRS est **cochée**, ou

lorsque le champ Radio double - Sélection de radio est réglé à **Radio secondaire** et lorsque le champ Activer la transmission sur radio secondaire est **désactivé**.

Itinérance inter-WACN

L'itinérance inter-WACN offre aux radios compatibles Project 25 des groupes sélectionnés une capacité d'itinérance automatique entre tous les réseaux de communication étendus (WACN), sans aucune intervention de votre part.

AVERTISSEMENT :

L'itinérance inter-WACN est non valide dans les cas suivants :
lorsque le Type de système est Type II, ou

lorsque la case Activer le matériel DVRS est **cochée**, ou

lorsque le champ Radio double - Sélection de radio est réglé à **Radio secondaire** et lorsque le champ Activer la transmission sur radio secondaire est **désactivé**, ou

lorsque le LTE large bande du système est **activé**.

Le LTE est activé sur un système ADF lorsqu'un profil de données avec un type de profil de données associé équivaut à **ADF et large bande** ou **Large bande uniquement** et lorsque le champ Source large bande a la valeur **Modem LTE interne**.

Les systèmes compatibles SmartZone et Project 25 sont également configurés dans les champs SmartZone - Tous les ADF et les champs Constantes de filtre - Tous les ADF.

10.36.1.6

ID système

Ce champ vous permet d'afficher l'ID du système ASTRO 25 sur le terrain et l'ID du système de type II pour le système ADF courant.

Le champ Nom du système permet de sélectionner le système ADF désiré pour la rangée ou l'enregistrement courant. Cette valeur s'applique à l'ensemble d'identification de l'appel (rangée ou enregistrement) du contact courant dans la liste d'appel unifiée. Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 664](#) (ASTRO 25) [ID d'appel à la page 665](#) (Type II).

Accès seulement : Lorsque le champ Nom du système n'est pas réglé à **Personnalisé** et lorsque le modèle ou l'option de la radio le permet.

10.36.1.7

Bande de fréquences de type II

Ce champ permet de sélectionner la bande de fréquences de fonctionnement du système ADF courant de type II.

IMPORTANT :

Les systèmes ADF de type II ne peuvent fonctionner que sur une seule bande de fréquences. Cette sélection s'applique au système ADF courant.

Accès seulement : Lorsque le champ Type de protocole est réglé à **Type II** et lorsque le modèle ou l'option de la radio le permet.

La sélection suivante est prise en charge : VHF, UHF1, UHF2, 700/800 MHz, 900 MHz

10.36.1.8

Tonalité de connexion

Ce champ permet de sélectionner la fréquence de la tonalité de connexion pour le système ADF de type II courant.

Pour vérifier la présence d'une transmission radio, cette sélection doit correspondre à la tonalité prévue sur le canal de trafic par le contrôleur central du système ADF. La fréquence est exprimée en hertz (Hz).

Accès seulement : lors de la sélection d'une clé de système du logiciel ou d'une clé de système avancée avec accès dans le champ ID du système. Lorsque le champ Type de protocole est réglé à **Type II** et lorsque le modèle ou l'option de la radio le permet.

10.36.1.9

Tonalité de connexion Failsoft

Ce champ permet de sélectionner la fréquence de la tonalité de connexion en mode dégradé pour le système ADF courant.

Accès seulement : Lorsque le champ Type de protocole est réglé à **Type II** et lorsque le modèle ou l'option de la radio le permet.

La sélection suivante est prise en charge :

Par défaut

Lorsque le Type de couverture du système est réglé à **SmartZone**, la valeur par défaut est 105,88 Hz.

Lorsque le champ Type de couverture est réglé à **Désactivé**, la sélection « par défaut » utilise la [Tonalité de connexion à la page 519](#) comme tonalité de connexion en mode dégradé.

10.36.1.10

ID réseau

L'application récupère et permet d'afficher (aux formats décimal et hexadécimal) l'ID réseau de type II du système ADF courant.

Accès seulement : Lorsque le champ Type de protocole est réglé à **Type II** et lorsque le modèle ou l'option de la radio le permet.

10.36.1.11

Recherche de sites non adjacents

Ce champ permet à la radio de rechercher dans sa liste programmée de canaux de contrôle un site dont le signal est plus fort.

Ainsi, la radio peut effectuer un déplacement vers ce site et l'utiliser, même s'il n'est pas considéré comme un FNE (équipement de réseau fixe) adjacent au site d'accueil courant de la radio, mais que l'intensité de son signal est acceptable ou élevée.

REMARQUE :

Cela est vrai uniquement si le site d'accueil courant et ses sites adjacents FNE s'inscrivent tous à un certain niveau se situant sous le seuil RSSI acceptable défini par RSSI. Cette fonction s'applique au système ADF courant.

IMPORTANT :

Lors du fonctionnement dans une zone de faible couverture, cette fonction permet à la radio de faire une recherche, toutes les deux minutes environ, dans la liste définie de canaux de contrôle. Durant ce temps de recherche, la radio ne surveille pas le canal de contrôle de la station d'accueil et, par conséquent, risque de rater certains signaux audio. Le temps de recherche peut durer jusqu'à quatre secondes selon le nombre de canaux de contrôle se trouvant dans la liste de canaux du système ADF.

Accès seulement : lorsque le champ [Type de couverture à la page 517](#) n'est pas réglé à **Désactivé** et que le modèle ou l'option de la radio le permet.

10.36.2

Affectation du canal OBТ

La page **Affectation du canal ADF autre bande (OBТ)** permet d'afficher ou de définir des paramètres relatifs aux fréquences pour les communications OBТ de Type II.

IMPORTANT :

La section Affectation du canal OBТ peut être consultée uniquement lorsque la radio fonctionne dans une bande de fréquences UHF ou VHF.

REMARQUE :

Ces paramètres sont utilisés pour valider toutes les fréquences OBТ de Type II entrées pour les canaux de contrôle et le mode Fréquence de mode dégradé. Ces réglages s'appliquent à des systèmes ADF individuels.

Une fois que les paramètres propres aux affectations de canaux OBТ ont été définis, il est possible de préciser les fréquences de canal de contrôle du système ADF et les fréquences de mode dégradé de la personnalité ADF

Les systèmes ADF sont référencés à une personnalité ADF. Les paramètres de ces systèmes sont ainsi activés pour tous les types de canaux partagés.

Accès seulement : Lorsque le champ Type de système est réglé à **Type II** et lorsque le champ Bande de fréquences de type II est réglé à une bande de fréquences VHF/UHF.

10.36.2.1

Activer Rx

Ce champ permet d'activer une plage de fréquences pour la gamme de canaux de réception (Rx) OBT courante.

Cette sélection s'applique aux [Système ADF de type II à la page 516](#) courants.

**AVERTISSEMENT :**

La première rangée ou le premier enregistrement de la page Attribution du canal OBT doit être activé pour être considéré comme valide.

Ce paramètre doit être identique au paramètre correspondant du contrôleur central pour que les communications par système ADF soient possibles.

Accès seulement : lorsque le champ Type de système est réglé à **Type II**, et lorsque le champ [Bande de fréquences de type II à la page 519](#) est réglé à **VHF**, **UHF1** ou **UHF2** OBT - bande de fréquence, et lorsque le modèle ou l'option de la radio le permet.

10.36.2.2

Espacement Rx

Ce champ permet de sélectionner l'espacement (en kHz) entre les fréquences de réception (Tx) de la gamme de canaux OBT courante.

**IMPORTANT :**

La [Fréquence Rx de départ à la page 521](#) et la [Fréquence Rx de fin à la page 522](#) définissent la plage de fréquences de réception. Cette sélection s'applique au système ADF courant.

**REMARQUE :**

La valeur de la plage de fréquences ([Fréquence Rx de fin à la page 522](#) - [Fréquence Rx de départ à la page 521](#)) doit être divisible également selon la séparation des canaux. La plage peut ainsi être divisée par un nombre entier, ce qui permet d'assigner un numéro de canal de contrôle.

**AVERTISSEMENT :**

Ce paramètre doit être identique au paramètre correspondant du contrôleur central pour que les communications par système ADF soient possibles.

Accès seulement : lorsque le champ Type de système est réglé à **Type II**, et lorsque le champ [Bande de fréquences de type II à la page 519](#) est réglé à **VHF**, **UHF1** ou **UHF2** OBT - bande de fréquence, et lorsque le modèle ou l'option de la radio le permet.

10.36.2.3

Fréquence Rx de départ

Permet d'entrer la première fréquence (en MHz) de la plage de fréquences de réception (Rx) associée à la gamme de canaux OBT courante.

**IMPORTANT :**

La valeur du champ Fréquence Rx de départ doit être supérieure ou égale à celle du champ [Fréquence Rx de fin à la page 522](#). Cette sélection s'applique au système ADF courant.

**AVERTISSEMENT :**

Ce paramètre doit être identique au paramètre correspondant du contrôleur central pour que les communications par système ADF soient possibles.

Accès seulement : lorsque le champ Type de système est réglé à **Type II**, et lorsque le champ [Bande de fréquences de type II à la page 519](#) est réglé à **VHF**, **UHF1** ou **UHF2** OBT - bande de fréquence, et lorsque le modèle ou l'option de la radio le permet.

10.36.2.4

Fréquence Rx de fin

Ce champ permet d'entrer la première fréquence (en MHz) de la plage de fréquences de réception (Tx) associée à la gamme de canaux OBT courante.

IMPORTANT :

La valeur du champ Fréquence Rx de fin doit être supérieure ou égale à celle du champ [Espaceur Rx à la page 521](#). Cette sélection s'applique au système ADF courant.

AVERTISSEMENT :

Ce paramètre doit être identique au paramètre correspondant du contrôleur central pour que les communications par système ADF soient possibles.

Accès seulement : lorsque le champ Type de système est réglé à **Type II**, et lorsque le champ [Bande de fréquences de type II à la page 519](#) est réglé à **VHF, UHF1** ou **UHF2** OBT - bande de fréquence, et lorsque le modèle ou l'option de la radio le permet.

10.36.2.5

Activer Tx

Ce champ permet d'activer une plage de fréquences pour la gamme de canaux de réception (Rx) OBT courante.

Cette sélection s'applique aux [Système ADF de type II à la page 516](#) courants.

AVERTISSEMENT :

La première rangée ou le premier enregistrement de la page Attribution du canal OBT doit être activé pour être considéré comme valide.

Ce paramètre doit être identique au paramètre correspondant du contrôleur central pour que les communications par système ADF soient possibles.

Accès seulement : lorsque le champ Type de système est réglé à **Type II**, et lorsque le champ [Bande de fréquences de type II à la page 519](#) est réglé à **VHF, UHF1** ou **UHF2** OBT - bande de fréquence, et lorsque le modèle ou l'option de la radio le permet.

10.36.2.6

Espaceur Tx

Ce champ permet de sélectionner l'espaceur (en kHz) entre les fréquences de réception (Tx) de la gamme de canaux OBT courante.

IMPORTANT :

La [Fréquence Tx de départ à la page 523](#) et la [Fréquence Tx de fin à la page 523](#) définissent la plage de fréquences de réception. Cette sélection s'applique au système ADF courant.

REMARQUE :

La valeur de la plage de fréquences ([Fréquence Tx de fin à la page 523](#) - [Fréquence Tx de départ à la page 523](#)) doit être divisible également selon la séparation des canaux. La plage peut ainsi être divisée par un nombre entier, ce qui permet d'assigner un numéro de canal de contrôle.

AVERTISSEMENT :

Ce paramètre doit être identique au paramètre correspondant du contrôleur central pour que les communications par système ADF soient possibles.

Accès seulement : lorsque le champ Type de système est réglé à **Type II**, et lorsque le champ [Bande de fréquences de type II à la page 519](#) est réglé à **VHF, UHF1** ou **UHF2** OBT - bande de fréquence, et lorsque le modèle ou l'option de la radio le permet.

10.36.2.7

Fréquence Tx de départ

Ce champ permet de sélectionner l'espacement (en kHz) entre les fréquences de réception (Tx) de la gamme de canaux OBT courante.

**IMPORTANT :**

La [Fréquence Tx de départ à la page 523](#) et la [Fréquence Tx de fin à la page 523](#) définissent la plage de fréquences de réception. Cette sélection s'applique au système ADF courant.

**REMARQUE :**

La valeur de la plage de fréquences ([Fréquence Tx de fin à la page 523](#) - [Fréquence Tx de départ à la page 523](#)) doit être divisible également selon la séparation des canaux. La plage peut ainsi être divisée par un nombre entier, ce qui permet d'assigner un numéro de canal de contrôle.

**AVERTISSEMENT :**

Ce paramètre doit être identique au paramètre correspondant du contrôleur central pour que les communications par système ADF soient possibles.

Accès seulement : lorsque le champ Type de système est réglé à **Type II**, et lorsque le champ [Bande de fréquences de type II à la page 519](#) est réglé à **VHF**, **UHF1** ou **UHF2** OBT - bande de fréquence, et lorsque le modèle ou l'option de la radio le permet.

10.36.2.8

Fréquence Tx de fin

Ce champ permet d'entrer la première fréquence (en MHz) de la plage de fréquences de réception (Tx) associée à la gamme de canaux OBT courante.

**IMPORTANT :**

La valeur du champ Fréquence Tx de fin doit être supérieure ou égale à celle du champ [Espacement Tx à la page 522](#). Cette sélection s'applique au système ADF courant.

**AVERTISSEMENT :**

Ce paramètre doit être identique au paramètre correspondant du contrôleur central pour que les communications par système ADF soient possibles.

Accès seulement : lorsque le champ Type de système est réglé à **Type II**, et lorsque le champ [Bande de fréquences de type II à la page 519](#) est réglé à **VHF**, **UHF1** ou **UHF2** OBT - bande de fréquence, et lorsque le modèle ou l'option de la radio le permet.

10.36.3

Canaux de contrôle (système à commutation automatique de canaux de type II)

La section **Canaux de contrôle** de l'ensemble système à Commutation Automatique de Canaux de type II permet à l'utilisateur de visualiser ou de définir les fréquences de réception et d'émission pour

les Canaux de Commande. Un maximum de 250 canaux de contrôle peut être créé sur un système ADF individuel, selon les besoins.

REMARQUE :

Pour les modèles de radio contenant un micrologiciel dont la version est antérieure à la version R12.01.00, le nombre maximum de canaux de contrôle est de 128.

IMPORTANT :

Les systèmes ADF individuels sont référencés dans une personnalité ADF. Une fois utilisés comme référence, les paramètres de ce système sont ainsi activés pour tous les types de canaux contenus dans la personnalité ADF.

Il est avantageux de trier les fréquences de canal de contrôle par ordre croissant dans un système SmartZone! Lorsqu'elle doit passer en mode dégradé, la radio utilise le premier canal de contrôle en tant que canal de mode dégradé. En triant les canaux par ordre croissant (ou au moins dans un ordre qui facilite le recours au mode Failsoft), on peut éviter les problèmes tels que la syntonisation de canaux Failsoft différents par de multiples radios.

10.36.3.1

Fréquence Rx

Ce champ vous permet d'entrer une fréquence Rx (réception) de canal de contrôle pour le système ADF courant.

AVERTISSEMENT :

Les contraintes de fréquence ADF qui sont appliquées à cette sélection sont déterminées par la bande de fréquences de ce système.

Accès seulement : Lorsqu'un fichier de clé du système logicielle ou une clé de système avancée avec accès est sélectionnée dans le champ ID du système, ou qu'une clé WACN avancée avec accès est sélectionnée dans le champ ID WACN d'accueil et que le modèle ou l'option de la radio le permet.

10.36.3.2

Fréquence Tx

Ce champ permet de sélectionner une fréquence Tx (transmission) de canal de contrôle pour le système ADF courant.

AVERTISSEMENT :

Les contraintes de fréquence ADF qui sont appliquées à cette sélection sont déterminées par le type et la bande de fréquences de ce système. Pour les systèmes ADF de Type II, ce champ est en lecture seule uniquement lorsque [Bande de fréquences de type II à la page 519](#) est de 700/800 MHz ou 900 MHz.

Accès seulement : Lors de la sélection d'un fichier de clé de système du logiciel ou d'une clé de système avancée avec accès dans le champ ID du système ou d'une clé SACN avancée avec accès dans le champ ID WACN d'accueil, lorsque le champ Type de système est réglé à **Type II** et que le champ [Bande de fréquences de type II à la page 519](#) n'est pas réglé à **700/800** ou à **900** MHz, et lorsque le modèle ou l'option de la radio le permet.

10.36.4

Fonctionnalités (Système ADF de type II)

La section **Fonctionnalités** de l'ensemble Système ADF de type II permet à l'utilisateur de visualiser ou de modifier les paramètres de chaque système à commutation automatique de canaux.

REMARQUE :

Les systèmes ADF individuels sont référencés dans une personnalité ADF. Les paramètres de ce système ADF sont ainsi activés pour tous les types de canaux contenus dans cette personnalité ADF.

10.36.4.1

Blocage de la radio

Ce champ permet à la radio de recevoir une commande de blocage à distance et d'y répondre lorsqu'elle fonctionne selon le système ADF courant.

C'est le répartiteur qui envoie cette commande. Une fois que la radio l'a reçue, elle transmet un avis à l'équipement de répartition, puis passe à l'état dormant. Pendant le blocage, le récepteur audio se met en sourdine et la voie de transmission est bloquée, toutes les commandes sont désactivées, le mode balayage cesse de fonctionner sur le canal de réception de la commande et tous les voyants DEL de la radio s'éteignent.

**AVERTISSEMENT :**

Lorsque le champ Type de système est réglé à **ASTRO 25** et lorsque le champ **Index de profil ASTRO OTAR** est activé (pour le système ADF courant) et lorsque le champ Configuration sécurisée, **Blocage de la radio par ASTRO OTAR** est activé, ce champ peut être désactivé. Le blocage de la radio est alors effectué par la fonction « ASTRO OTAR ».

Lorsque le champ Type de système est réglé à **ASTRO 25** et lorsque le champ Index de profil ASTRO OTAR est désactivé (pour le système ADF courant), ce champ doit être activé. La radio peut ainsi être bloquée par l'intermédiaire du système ADF **ASTRO 25**.

Lorsque le champ Type de système est réglé à **Type II** et lorsque la valeur du champ ID du système, Système ADF, correspond à l'**ID de clé** d'un des fichiers de clé de système du logiciel ou de clé de système avancée (voir le rapport de la clé du système), ce champ peut être désactivé. Dans ce cas, les commandes de blocage de la radio reçues sur ce système ADF sont ignorées, et la radio continue de fonctionner normalement.

Lorsque le champ Configuration sécurisée - **Blocage de la radio par Index de profil ASTRO OTAR** est activé, et lorsque le champ **Index de profil ASTRO OTAR** est activé (pour le système ADF courant), ce champ peut être désactivé. Le blocage de la radio est alors effectué par le biais de la fonction ASTRO OTAR.

Ce champ doit être activé lorsque le champ Index de profil ASTRO OTAR (pour le système ADF actuel) est désactivé. La radio peut ainsi être bloquée par l'intermédiaire du système ADF **ASTRO 25**.

**IMPORTANT :**

Pour annuler l'état dormant de la radio, il faut lui envoyer une commande de déblocage.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.36.4.2

Type d'alias radio OTA

Ce champ configure le chiffrement (émission) et le déchiffrement (réception) de la fonction d'alias radio par liaison radio (OTA).

**AVERTISSEMENT :**

La radio ne peut pas afficher l'alias radio si la radio reçoit des ID en double jusqu'à ce que le double soit retiré. L'écriture de la codeplug de l'application sur une radio fera en sorte que la liste d'appels retourne à son état d'origine et toutes les mises à jour d'alias OTA seront perdues.

**IMPORTANT :**

Si la mise à jour d'alias OTA ne s'est pas affichée à l'écran, vous devez mettre à jour la liste d'appel de la radio ou le gestionnaire de provisionnement.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Désactivé;

La radio ne transmet ni ne reçoit les données d'alias de la radio.

Décoder uniquement

Les données d'alias de la radio reçoivent les données sans aucune limite.

10.36.4.3

Niveau de puissance Tx

Ce champ permet de sélectionner le niveau de puissance de transmission de la radio pour le système ADF courant.

La touche Tx à faible tension, le commutateur Tx à faible tension et la fonction de menu Alimentation ont préséance sur ce réglage lorsque vous le sélectionnez.

**REMARQUE :**

En mode d'urgence, la radio transmet à puissance élevée.

Il est possible de réduire la puissance de transmission à 1 watt sur les modèles à 800 MHz, et à 2 watts sur les modèles VHF et UHF.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Faible

Niveau utilisé pour les communications effectuées à proximité, ce qui empêche la radio de transmettre des signaux à d'autres groupes géographiques se servant de la même fréquence.

Élevé

Niveau utilisé lorsqu'on a besoin d'un signal de plus forte intensité afin d'élargir la zone de transmission.

10.36.4.4

HearClear

Ce champ permet de sélectionner l'amélioration de la qualité audio en appliquant la suppression du bruit ou un algorithme de compression-extension aux signaux radio.

Cette fonction s'applique au système ADF courant.

**IMPORTANT :**

La compression-extension consiste à comprimer la plage dynamique des signaux audio transmis, puis à la décompresser jusqu'à son niveau d'origine dans les signaux audio reçus. Il est donc essentiel d'activer la compression-extension sur la radio émettrice et la radio réceptrice pour éviter la distorsion des signaux audio. Puisque l'algorithme de compression et d'extension est actif sur les deux radios, l'extension de signaux audio non comprimés ou la compression de signaux sans extension subséquente entraînera des sons non naturels. Les signaux audio transmis au répartiteur doivent aussi subir la compression-extension.

Accès seulement : lorsque le champ Type de système est réglé à **Type II**, et lorsque le champ Activer le matériel DVRS est désactivé.

Les sélections suivantes sont prises en charge :

Désactivé;

Aucune suppression de bruit ni compression-extension n'est appliquée aux signaux transmis ou aux signaux reçus.

Compression-extension seulement

La compression-extension est appliquée aux signaux audio transmis et aux signaux audio reçus. Voir la Note importante.

Suppression du bruit seulement

La suppression du bruit est appliquée aux signaux audio reçus.

Compression-extension et suppression du bruit

La compression-extension est appliquée aux signaux audio transmis et aux signaux audio reçus (voir la Note importante), et la suppression du bruit est appliquée aux signaux reçus.

**REMARQUE :**

Les paramètres **Suppression du bruit seulement** et **Compression-extension et suppression du bruit** ne peuvent s'appliquer que si toutes les fréquences sur la personnalité actuelle se situent dans la plage 900 MHz.

10.36.4.5

Surveillance à distance/Traceur radio\Activer

Ce champ permet à la radio de décoder une commande de surveillance à distance ou de traceur radio pour le système ADF courant.

**AVERTISSEMENT :**

Le **Traceur radio** s'applique seulement au système de **type II**. De plus, seulement pour un système de **type II**, et pour la **surveillance à distance** et le **traceur radio**, la radio s'active durant la période indiquée dans le champ Surveillance à distance/Traceur radio - Temps de base Tx.

**REMARQUE :**

Dans le cas d'un type de système **ASTRO 25**, le temps de transmission sur le terrain est défini par le répartiteur et est inclus dans la commande de **surveillance à distance** émise.

À la réception d'une commande de **surveillance à distance**, la radio se met en marche automatiquement et transmet le son capté par son microphone. Cela est particulièrement utile en cas d'appel de détresse.

La **surveillance à distance** est aussi appelée **surveillance radio**.

À la réception d'une commande de **traceur radio**, la radio se met automatiquement en marche et envoie une onde porteuse non modulée qui permet de trouver une radio volée ou perdue. Le **Traceur radio** s'applique seulement au système de **type II**.

Applicable seulement :

Pour APX 7000XE et APX 6000, cette fonction s'applique seulement lorsque l'option du système H43 est disponible pour la radio. De plus, la radio requière une version de micrologiciel R05.xx.xx ou ultérieure, et l'APX doit être de version R05.xx.xx ou supérieure.

Pour APX 6500, cette fonction s'applique seulement lorsque l'option du système G170 est disponible pour la radio. De plus, la radio requière une version de micrologiciel R05.xx.xx ou ultérieure, et l'APX doit être de version R05.xx.xx ou supérieure.

10.36.4.6

Surveillance à distance/Traceur radio - Temps de base Tx

Ce champ permet de sélectionner la période de transmission de la radio surveillée à distance après la réception d'une commande de surveillance à distance ou de traceur radio pour le système ADF courant.

**REMARQUE :**

Le paramètre de ce champ d'application n'est pas pris en charge pour les accessoires tiers. Tout changement aux paramètres doit être apporté le concepteur de votre accessoire.

Applicable seulement :

Pour APX 7000XE et APX 6000, cette fonction s'applique seulement lorsque l'option du système H43 est disponible pour la radio. De plus, la radio requiert une version de micrologiciel R05.xx.xx ou ultérieure, et l'APX doit être de version R05.xx.xx ou supérieure.

Pour APX 6500, cette fonction s'applique seulement lorsque l'option du système G170 est disponible pour la radio. De plus, la radio requiert une version de micrologiciel R05.xx.xx ou ultérieure, et l'APX doit être de version R05.xx.xx ou supérieure.

Accès seulement : lorsque le champ Type de système est réglé à **Type II**, et lorsque le champ Surveillance à distance/traceur radio est activé, et lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

- 15
- 30
- 45
- 60

10.36.4.7

Indicateur Rx d'alarme d'urgence

Ce champ permet d'activer sur la radio un indicateur audio ou visuel (ou les deux) qui se déclenche lorsqu'une alarme d'urgence est détectée en provenance d'une autre radio.

Le type d'indicateur est déterminé par la valeur du champ Type d'indicateur de réception d'alarme d'urgence. Cette fonction s'applique au système ADF courant.

IMPORTANT :

La durée de l'indicateur de réception d'alarme d'urgence est de 10 secondes. Pendant ces 10 secondes, vous pouvez désactiver l'indicateur en appuyant sur n'importe quelle touche, sauf celles du volume et des lumières (affichage).

Une fois que l'indicateur s'éteint ou est désactivé, les alarmes d'urgence retransmises par la même ID d'unité de système ADF ne sont pas acceptées au cours des 20 secondes suivantes.

Les alarmes d'urgence ne sont pas détectées lorsque la radio est en mode balayage.

Les alarmes d'urgence peuvent ne pas être détectées lorsque la radio n'est pas en train de surveiller ou de décoder le canal de contrôle (par exemple, activité sur un canal vocal ou de données, cueillette d'échantillons RSSI, etc.).

Accès seulement : Lorsque le champ Type d'indicateur de réception d'alarme d'urgence n'est pas réglé à **Aucune indication** et lorsque le modèle ou l'option de la radio le permet.

10.36.4.8

DEL sécuritaire

Ce champ permet de faire clignoter le voyant DEL d'occupation jaune chaque fois qu'un appel vocal sécurisé (chiffré) est reçu; ce voyant continue de clignoter tant et aussi longtemps que l'appel demeure sécurisé.

Il n'est pas nécessaire que la radio désactive la sourdine à la réception d'un signal vocal pour que le voyant clignote. La fonction DEL sécuritaire s'applique au système ADF courant.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.36.4.9

Activer le regroupement dynamique

Ce champ permet d'activer un groupe de regroupement dynamique pour une personnalité ADF ou un canal associé au système ADF courant.

**REMARQUE :**

Lorsque ce champ est activé, une [Regroupement dynamique/Zone à la page 530](#) et un [Regroupement dynamique\Canal à la page 530](#) doivent être sélectionnés pour ce système ADF.

**AVERTISSEMENT :**

Une configuration de Regroupement dynamique est valide uniquement lorsque l'une des personnalités ADF associées à un canal a son champ Groupe ADF réglé à **DYN** (regroupement dynamique), et que la zone et le canal sélectionnés de cette personnalité correspondent aux sélections des champs Zone de regroupement dynamique et Canal de regroupement dynamique dans le système ADF référencé des personnalités.

**IMPORTANT :**

Ainsi, un seul canal (au sein d'un système ADF donné) peut être le canal de regroupement dynamique.

Vous pouvez demander une nouvelle attribution de regroupement dynamique auprès du répartiteur au moyen du bouton Demande de reprogrammation ou utiliser l'option de menu Demande de reprogrammation. Les fonctions et les paramètres du groupe d'un regroupement dynamique sont définis et retransmis par le répartiteur.

Pour que le groupe de conversation d'un regroupement dynamique puisse transmettre en mode sécurisé, l'utilisateur doit pouvoir utiliser le bouton associé à la fonction Sélection de Tx sécurisée ou le commutateur Sélection de Tx sécurisée ou l'option de menu Sécurisé; sinon, le groupe de conversation devra transmettre en mode **non chiffré**.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.36.4.10

Regroupement dynamique/Zone

Ce champ permet de sélectionner la zone de la personnalité/canal ADF de regroupement dynamique qui renvoie au système ADF courant.

**AVERTISSEMENT :**

Les zones d'interface de site à distance (RSI) ne sont pas valides et ne peuvent pas être sélectionnées (zones pour lesquelles le mode RSI est activé).

**REMARQUE :**

Vous pouvez demander une nouvelle attribution de regroupement dynamique auprès du répartiteur au moyen du bouton Demande de reprogrammation ou utiliser l'option de menu Demande de reprogrammation. Les fonctions et les paramètres du groupe d'un regroupement dynamique sont définis et retransmis par le répartiteur.

Pour que le groupe de conversation d'un regroupement dynamique puisse transmettre en mode sécurisé, l'utilisateur doit pouvoir utiliser le bouton associé à la fonction Sélection de Tx sécurisée ou le commutateur Sélection de Tx sécurisée ou l'option de menu Sécurisé; sinon, le groupe de conversation devra transmettre en mode **non chiffré**.

Lorsque [Activer le regroupement dynamique à la page 529](#) est **activé**, une zone de regroupement dynamique et un [Regroupement dynamique\Canal à la page 530](#) doivent être sélectionnés pour le système ADF actuel.

**AVERTISSEMENT :**

Les Zones sélectionnées dans ce champ doivent avoir la fonction Activation zone dynamique désactivée; sinon, ce champ devient non valide.

Une configuration de Regroupement dynamique est valide uniquement lorsque l'une des personnalités ADF associées à un canal a son champ Groupe ADF réglé à **DYN** (regroupement dynamique), et que la zone et le canal sélectionnés de cette personnalité correspondent aux sélections des champs Zone de regroupement dynamique et Canal de regroupement dynamique dans le système ADF référencé des personnalités.

**IMPORTANT :**

Ainsi, un seul canal (au sein d'un système ADF donné) peut être le canal de regroupement dynamique.

Accès seulement : Lorsque le champ [Activer le regroupement dynamique à la page 529](#) est réglé à **Activé** et lorsque le modèle ou l'option de la radio le permet.

10.36.4.11

Regroupement dynamique\Canal

Ce champ permet de sélectionner une personnalité ADF ou un canal de regroupement dynamique associé au système ADF courant.

Voir également [Regroupement dynamique/Zone à la page 530](#).

REMARQUE :

Vous pouvez demander une nouvelle attribution de regroupement dynamique auprès du répartiteur au moyen du bouton Demande de reprogrammation ou utiliser l'option de menu Demande de reprogrammation. Les fonctions et les paramètres du groupe d'un regroupement dynamique sont définis et retransmis par le répartiteur.

Pour que le groupe de conversation d'un regroupement dynamique puisse transmettre en mode sécurisé, l'utilisateur doit pouvoir utiliser le bouton associé à la fonction Sélection de Tx sécurisée ou le commutateur Sélection de Tx sécurisée ou l'option de menu Sécurisé; sinon, le groupe de conversation devra transmettre en mode **non chiffré**.

Lorsque [Activer le regroupement dynamique à la page 529](#) est **activé**, une zone et un canal de regroupement dynamique doivent être sélectionnés pour ce système ADF.

AVERTISSEMENT :

Une configuration de Regroupement dynamique est valide uniquement lorsque l'une des personnalités ADF associées à un canal a son champ Groupe ADF réglé à **DYN** (regroupement dynamique), et que la zone et le canal sélectionnés de cette personnalité correspondent aux sélections des champs Zone de regroupement dynamique et Canal de regroupement dynamique dans le système ADF référencé des personnalités.

IMPORTANT :

Ainsi, un seul canal (au sein d'un système ADF donné) peut être le canal de regroupement dynamique.

AVERTISSEMENT :

Pour les codeplug de radios portatives APX™ 3000, seuls les 48 premiers canaux de la zone de regroupement dynamique sélectionnée sont considérés comme des sélections valides.

Accès seulement : Lorsque le champ [Activer le regroupement dynamique à la page 529](#) est **activé**, et lorsque le champ Zone de regroupement dynamique n'est pas une zone dynamique, et lorsque le modèle et les options de la radio le permettent.

10.36.4.12

Réinitialisation ICUA

Ce champ permet de sélectionner une exception différée ou manuelle de désactivation de la sourdine applicable aux alertes d'appel/notifications ADF lorsque le canal est réglé à « Activer l'alerte utilisateur en appel ».

La durée de l'exception (différée ou manuelle) est appelée période d'arrêt du silencieux. Pour les deux sélections différées présentées, le champ [Minuterie de réinitialisation ICUA automatique à la page 532](#) (du système ADF courant) détermine en partie la durée de la période d'arrêt du silencieux. Cette période commence lorsque la fonction Alerte utilisateur en appel pour la mise en sourdine de la voix est active et que la sourdine de la radio est désactivée. Cette sélection s'applique au système ADF courant.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Manuelle

Lorsque vous activez l'alerte utilisateur en appel, que vous appuyez sur la touche Mettre la voix en sourdine ou choisissez la commande de menu Mettre la voix en sourdine, cela désactive la mise en sourdine de la voix et met fin à la période d'arrêt du silencieux. La touche PTT permet de mettre fin à la période d'arrêt du silencieux.

Auto

Si la minuterie vient à échéance, que la sourdine soit activée ou non, la période d'arrêt du silencieux prend fin et les règles associées à la fonction Activer l'alerte utilisateur en appel pour la

mise en sourdine de la voix devront de nouveau être appliquées pour désactiver la sourdine lors de prochaines transmissions.

Auto avec porteuse

Si la sourdine de la radio est désactivée lorsque la minuterie vient à échéance (en raison d'un silencieux de porteuse), la sourdine demeure désactivée jusqu'à ce que l'onde porteuse ne soit plus utilisée. Lorsque l'onde porteuse n'est plus captée et que la radio est mise en sourdine, la minuterie est réinitialisée et redémarrée, ce qui a pour effet de prolonger la période d'arrêt du silencieux. Si, par la suite, la sourdine de la radio reste active pendant tout le temps prévu à la minuterie (sans remplacement de l'onde porteuse), la période d'arrêt du silencieux prendra fin et les règles associées à la fonction Activer l'alerte utilisateur en appel pour la mise en sourdine de la voix devront de nouveau être appliquées pour désactiver la sourdine lors de prochaines transmissions.

10.36.4.13

Minuterie de réinitialisation ICUA automatique

Ce champ permet de sélectionner la durée utilisée au cours de l'exception de désactivation de la sourdine s'appliquant aux alertes d'appel et aux notifications en ADF, pendant laquelle la voix est mise en sourdine sur le canal (case Activer l'alerte utilisateur en appel cochée).

Le temps de l'exception correspond à la période d'arrêt du silencieux. Ce temps s'applique seulement aux deux fonctions différées du champ Réinitialisation durant l'appel. Cette sélection s'applique au système ADF courant. La durée est exprimée en secondes.

Accès seulement : Lorsque le champ [Réinitialisation ICUA à la page 531](#) n'est pas réglé à **Manuel** et lorsque le modèle ou les options de la radio le permettent.

Tableau 251 : Portée

Minimum	Maximum	Incréments
0 s	255 s	1 s

10.36.4.14

Service de messagerie texte

Ce champ permet de sélectionner le mode de messagerie texte du système ADF courant.

REMARQUE :

Vous accédez à la messagerie texte en appuyant sur la touche Service de messagerie texte ou en utilisant la sélection de menu Service de messagerie texte.

Vous accédez à la fonction de messagerie texte rapide à l'aide de la touche Texte rapide TMS.

Vous accédez à la fonction de messagerie de requête à l'aide de la touche Requête TMS.

Accès seulement : lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le système ADF courant a un profil de données référencé, et la sélection du profil de données n'est pas réglée à **Données désactivées**.

Les sélections suivantes sont prises en charge :

Aucun

La fonction est désactivée.

Liste seulement

Permet de sélectionner uniquement les messages texte dans la liste des messages texte rapide.

Illimité

Permet de faire une sélection parmi les messages texte rapide et d'entrer vos propres messages texte à partir du clavier de la radio.

**AVERTISSEMENT :**

Cette sélection est seulement disponible sur les radios dotées d'un clavier ou d'un microphone à clavier.

**REMARQUE :**

Cette sélection ne s'applique pas à l'APX N70.

10.36.5

Alias message

Cette section permet d'afficher ou de définir la fonctionnalité Message pour des systèmes ADF individuels.

Vous pouvez alors sélectionner, puis transmettre ces messages. Les messages circulent d'une unité de répartiteur à une radio Portable ou Mobile, ou encore d'une radio Portable ou Mobile à une unité de répartiteur. Par contre, une radio portative ou mobile ne peut pas envoyer un message à une autre radio portative ou mobile.

**AVERTISSEMENT :**

Cette fonction s'applique uniquement lorsque le champ Activer le message de la [Personnalité ADF de type II à la page 554](#) qui renvoie à ce système ADF est activé.

Chaque alias message doit être identique (ou avoir la même signification) pour le répartiteur et les radios de modèle portatif ou mobile. Par exemple, l'alias du message 1 provenant du répartiteur doit être identique à l'alias du message 1 de la radio portable ou mobile.

**REMARQUE :**

Les messages rendent l'utilisation d'un canal plus efficace que les signaux vocaux.

Les messages s'appliquent uniquement aux modèles à écran.

Accès seulement : Lorsque le champ [Activer l'alias de message à la page 533](#) est réglé à Activé, que le champ Type de système est réglé à **Type II** et que le modèle ou l'option de la radio le permet.

10.36.5.1

Activer l'alias de message

Ce champ permet de définir des messages pour le système ADF courant.

**AVERTISSEMENT :**

Cette fonction s'applique uniquement lorsque le champ Activer le message de la [Personnalité ADF de type II à la page 554](#) qui renvoie à ce système ADF est activé.

Une fois que la fonction a été activée, vous devez définir chaque alias message de radio (champs Nom d'alias message et Numéro d'alias message du même enregistrement ou rangée) de façon à ce qu'il soit identique à l'alias message correspondant de l'unité de répartiteur (ou qu'il ait la même signification).

Une fois qu'elle est définie, vous pouvez accéder à la fonction Message en utilisant une touche [Message à la page 187](#), une touche Message direct ou une sélection de menu [Message à la page 219](#).

Accès seulement : Lorsque le champ Type de protocole est réglé à **Type II** et lorsque le modèle ou l'option de la radio le permet.

10.36.5.2

Numéro d'alias de message

Ce champ permet de sélectionner un numéro qui désigne le message courant.

Cette sélection s'applique au message courant (rangée ou enregistrement) pour le système ADF courant.

AVERTISSEMENT :

Cette fonction s'applique uniquement lorsque le champ [Activer le message à la page 575](#) de la personnalité ADF renvoyant à ce système ADF est activé.

Une fois qu'elle est définie, vous pouvez accéder à la fonction Message en utilisant une touche Message, une touche Message direct ou une sélection de menu Message.

Accès seulement : Lorsque le champ [Activer l'alias de message](#) est réglé à Activé, que le champ Type de système est réglé à **Type II** et que le modèle ou l'option de la radio le permet.

10.36.5.3

Texte d'alias message

Ce champ vous permet de définir des noms reconnaissables pour le message (enregistrement/rangée) courant.

Cette sélection s'applique au système ADF courant.

AVERTISSEMENT :

Cette fonction s'applique uniquement lorsque le champ [Activer le message à la page 575](#) de la personnalité ADF renvoyant à ce système ADF est activé.

Une fois qu'elle est définie, vous pouvez accéder à la fonction Message en utilisant une touche Message, une touche Message direct ou une sélection de menu Message.

REMARQUE :

Les alias de message doivent être identiques (ou avoir la même signification) pour le répartiteur et les unités portatives et mobiles. Par exemple, l'alias du message 1 provenant du répartiteur doit être identique à l'alias du message 1 de la radio portable ou mobile.

Accès seulement : Lorsque le champ [Activer l'alias de message](#) est réglé à Activé, que le champ Type de système est réglé à **Type II** et que le modèle ou l'option de la radio le permet.

REMARQUE :

Exemples : MESSAGE-01, Électrique1, N° 510

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Vous pouvez utiliser jusqu'à 14 caractères.

10.36.6

Configuration de canal Type II

Cette section vous permet d'afficher ou de définir des fonctions propres au système ADF de type II.

IMPORTANT :

Les systèmes ADF individuels sont référencés dans une personnalité ADF. Les paramètres de ce système ADF sont ainsi activés pour tous les types de canaux contenus dans cette [Personnalité ADF de type II à la page 554](#).

Accès seulement : Lorsque le champ Type de protocole est réglé à **Type II** et lorsque le modèle ou l'option de la radio le permet.

10.36.6.1

Canal fragmentaire

Ce champ permet d'activer les canaux fragmentaires pour les systèmes ADF de soutien qui servent de « systèmes fragmentaires » (800 MHz seulement).

**REMARQUE :**

Les fréquences de canal de contrôle et les fréquences en mode dégradé utilisent alors les canaux fragmentaires, qui se situent entre les fréquences « normales » de la bande de 800 MHz et qui sont donc décalés de 12,5 kHz vers le bas. La radio interprète ensuite les canaux dont elle reçoit le numéro par liaison radio comme des canaux fragmentaires. Cette fonction s'applique au système ADF courant.

Accès seulement : Lorsque la radio fonctionne dans la bande de fréquence 800 Mhz et lors de la sélection d'une clé de système du logiciel ou d'une clé de système avancée avec accès dans le champ ID du système, et lorsque le champ Type de système est réglé à **Type II**, et lorsque le modèle ou l'option de la radio le permet.

10.36.6.2

Système de transition conventionnel

Ce champ permet de limiter le système ADF courant au format de fréquence conventionnel afin qu'il soit compatible avec les systèmes de transition conventionnels.

**AVERTISSEMENT :**

NE MODIFIEZ PAS cette fonction, à moins que cela soit explicitement indiqué par un technicien de terrain de Motorola Solutions.

Accès seulement : Lorsque le champ Type de protocole est réglé à **Type II** et lorsque le modèle ou l'option de la radio le permet.

10.36.6.3

Bande passante du canal

Ce champ permet de sélectionner la bande passante du canal pour le système ADF courant.

Pour la configuration d'un système de ressources partagées domestique de 800 MHz, ce champ correspond à la bande passante 806. Autrement dit, la sélection détermine la bande passante de canal des fréquences allant de 806 MHz à 821 MHz.

**IMPORTANT :**

La bande passante des fréquences allant de 821 MHz à 824 MHz est réglée dans le champ [Bande passante du canal NPSPAC à la page 536](#).

Lorsque la valeur **12,5 kHz** est sélectionnée et que le champ Type voix/signal d'un groupe est réglé à **Analogique**, le champ [Effectuer/Terminer la connexion AG à la page 565](#) de la section Groupe d'annonce et les champs Connexion de groupe sécurisée/non chiffrée contiennent obligatoirement la valeur **Non chiffré**.

Accès seulement : Lorsque le champ Type de système est réglé à **Type II**, et lorsque la radio fonctionne dans la bande de fréquences de 900 Mhz, et lors de la sélection d'une clé de système avancée avec accès dans le champ ID du système, et lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

25,0 kHz**20,0 kHz****AVERTISSEMENT :****Les valeurs 20 kHz et 25 kHz ne sont pas valides dans les cas suivants :**

Lorsque le mandat de réduction de la largeur de bande à 12,5 kHz de la FCC s'applique à la codeplug courant, et

lorsque le système ADF [Bande de fréquences de type II à la page 519](#) est OBT (ADF sur autres bandes), et

lorsque, pour tout enregistrement ou toute rangée de la page Attribution du canal OBT, le champ : [Activer Tx à la page 522](#) est réglé à **Activé**, et [Fréquence Tx de départ à la page 523](#) OU [Fréquence Tx de fin à la page 523](#) se situe dans l'une des plages de l'exigence FCC.

12,5 kHz

Toujours accessible

10.36.6.4

Bande passante du canal NPSPAC

Ce champ permet de sélectionner la bande passante de canal NPSPAC (Comité consultatif national sur la planification de la sécurité publique) pour le système ADF courant.

Cette sélection détermine la bande passante des fréquences allant de 821 MHz à 824 MHz.

**REMARQUE :**

La bande passante des fréquences allant de 806 MHz à 821 MHz est réglée dans le champ [Bande passante du canal à la page 535](#).

Lorsque la valeur **12,5 kHz** est sélectionnée et que le champ Type voix/signal d'un groupe est réglé à **Analogique**, le champ [Effectuer/Terminer la connexion AG à la page 565](#) de la section Groupe d'annonce et les champs Connexion de groupe sécurisée/non chiffrée contiennent obligatoirement la valeur **Non chiffré**.

Accès seulement : lorsque le champ Type de système est réglé à **Type II**, que la radio fonctionne dans la bande de fréquences de 800 MHz et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

- 20,0 kHz
- 12,5 kHz

10.36.6.5

Type d'affectation du canal

Ce champ permet de sélectionner une légère variation dans la division de bande de fréquences (en MHz) et aussi de régler l'espacement entre les canaux (en kHz).

Cette sélection s'applique au système ADF courant.

Accès seulement : lorsque le champ Type de système est réglé à **Type II**, que la radio fonctionne dans la bande de fréquences de 800 MHz et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Domestique

Espacement entre les canaux de 25,0 kHz utilisé aux États-Unis.

International

Espacement entre les canaux de 12,5 kHz utilisé à l'extérieur des États-Unis.

10.36.7

Alias d'état (Système ADF type II)

La section **Alias d'état** de l'ensemble Système ADF type II permet à l'utilisateur d'afficher ou de définir la fonctionnalité Message des systèmes ADF. Les utilisateurs peuvent ensuite sélectionner, puis transmettre leur état actuel à un répartiteur (unité principale) à l'aide du bouton État, du bouton État direct ou de la sélection de menu État.

**REMARQUE :**

Les états rendent l'utilisation d'un canal plus efficace que les signaux vocaux.

Pour les modèles sans clavier, cette fonction peut être utilisée uniquement à l'aide de la fonction Une Touche.

**AVERTISSEMENT :**

Cette fonction s'applique uniquement lorsque le champ Activer l'état de la personnalité ADF renvoyant à ce système ADF est activé.

Chaque alias d'état doit être identique (ou avoir la même signification) pour le répartiteur et les radios portatives ou mobiles. Par exemple, l'alias d'état 1 provenant du répartiteur doit être identique à l'alias d'état 1 de la radio portative ou mobile (ou avoir la même signification).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.36.7.1

Activer l'alias d'état

Ce champ active la capacité de définir l'état pour le système ADF courant.

**AVERTISSEMENT :**

Cette fonction s'applique uniquement lorsque le champ Activer l'état de la personnalité ADF renvoyant à ce système ADF est activé.

Une fois cette fonction activée, vous devez définir chaque alias état de radio (champs Nom d'alias état et Numéro d'alias état du même enregistrement ou rangée) de façon à ce qu'il soit identique à l'alias état correspondant de l'unité de répartiteur (ou qu'il ait la même signification).

Une fois qu'elle est définie, vous pouvez accéder à la fonction État en utilisant une touche État, une touche État direct ou une sélection de menu État.

En ce qui concerne les modèles sans clavier, la fonction d'état peut être utilisée uniquement à l'aide de la fonction Une touche.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.36.7.2

Numéro de l'alias d'état

Ce champ permet de sélectionner un numéro qui désigne l'état courant.

Cette sélection s'applique à l'état (rangée ou enregistrement) courant du système ADF courant.

**AVERTISSEMENT :**

- Cette fonction s'applique uniquement lorsque le champ Activer l'état de la personnalité ADF renvoyant à ce système ADF est activé.
- Une fois qu'elle est définie, vous pouvez accéder à la fonction État en utilisant une touche État, une touche État direct ou une sélection de menu État.

**IMPORTANT :**

Les alias d'état doivent être identiques (ou avoir la même signification) pour le répartiteur et les radios portatives ou mobiles. Par exemple, l'alias d'état 1 provenant du répartiteur doit être identique à l'alias d'état 1 de la radio portative ou mobile (ou avoir la même signification).

Accès seulement : Lorsque le champ [Activer l'alias d'état à la page 537](#) est activé et que le modèle ou l'option de la radio le permet.

10.36.7.3

Texte de l'alias d'état

Ce champ vous permet de définir des noms reconnaissables pour l'état (enregistrement/rangée) courant.

Cette sélection s'applique au système ADF actuel.

REMARQUE :

- Cette fonction s'applique uniquement lorsque le champ Activer l'état de la personnalité ADF renvoyant à ce système ADF est activé.
- Une fois qu'elle est définie, vous pouvez accéder à la fonction État en utilisant une touche État, une touche État direct ou une sélection de menu État.

IMPORTANT :

Les alias d'état doivent être identiques (ou avoir la même signification) pour le répartiteur et les radios portatives ou mobiles. Par exemple, l'alias d'état 1 provenant du répartiteur doit être identique à l'alias d'état 1 de la radio portative ou mobile (ou avoir la même signification).

Accès seulement : Lorsque le champ [Activer l'alias d'état à la page 537](#) est activé et que le modèle ou l'option de la radio le permet.

REMARQUE :

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Vous pouvez utiliser jusqu'à 14 caractères.

Exemples : ÉTAT-01, Électrique1, N° 510

10.36.8

Alias de site (Système ADF type II)

La section **Alias de site** de l'ensemble Système ADF Type II permet à l'utilisateur d'afficher ou de définir des alias conviviaux pour identifier des systèmes ADF ou des sites individuels faisant partie de ces systèmes dans lesquels la radio peut se retrouver lorsqu'elle est en itinérance parmi divers sites et systèmes ADF, ou même, des réseaux de communication étendus (WACN). Les alias peuvent

également identifier les appels (à l'aide des ID de PTT) reçus à partir des radios situées à l'extérieur du système ADF sélectionné (accueil) de la radio.

IMPORTANT :

Seuls les alias de site définis dans le système ADF actuellement sélectionné par l'utilisateur sont accessibles.

REMARQUE :

Le Type d'alias du site détermine si le texte de l'alias du site doit être assigné au système ADF ou à un site à l'intérieur d'un système.

IMPORTANT :

Un système ADF est toujours défini par son numéro RAS WACN à domicile et son numéro de système, tandis qu'un site est défini par des combinaisons spécifiques de numéro RAS WACN à domicile, numéro de système, numéro d'alias RFSS et ID de site, selon le type de couverture et le type de système du système de ADF courant.

L'affichage de l'alias du site en cours et de son indicateur d'intensité du signal reçu (RSSI) ou le changement de site courant est activé par l'utilisateur en appuyant sur Aff./Rech. site. L'utilisation d'un bouton Verr./Déverr. site activé par l'utilisateur ou une sélection de menu Site permet d'afficher ou de modifier l'état de verrouillage du site actuel.

Les systèmes ADF individuels sont référencés dans une personnalité ADF. Les paramètres de ce système ADF sont ainsi activés pour tous les types de canaux contenus dans cette personnalité ADF.

10.36.8.1

Activer l'alias du site

Ce champ permet d'activer les champs de la section Alias du site correspondant à l'ID du site en cours (enregistrement/rangée), qui s'applique également au système ADF courant.

REMARQUE :

L'affichage de l'alias du site en cours et de son indicateur d'intensité du signal reçu (RSSI) ou le changement de site courant est activé par l'utilisateur en appuyant sur Aff./Rech. site.

L'utilisateur peut appuyer sur un bouton Verr./Déverr. site ou sur la sélection de menu Site pour afficher ou modifier l'état de verrouillage du site courant.

REMARQUE :

Ce produit ne prend pas en charge la sélection automatique de plusieurs sites (AMSS).

Accès seulement : Lorsque le champ Type de protocole est réglé à **Type II**, et lorsque le champ [Type de couverture à la page 517](#) est réglé à **Matériel** ou à Logiciel, et que le modèle ou l'option de la radio le permet,

Lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le type de couverture n'est pas réglé à **Désactivé**, et lorsque le champ est activé, et lorsque le modèle ou l'option de la radio le permet,

10.36.8.2

ID du site

Ce champ permet d'entrer (au format décimal ou hexadécimal) le numéro d'identification du site correspondant à la valeur (enregistrement/rangée) courante.

Pour prendre en charge l'itinérance entre les différents sites, chaque ID de site doit être unique dans un sous-système de fréquence radioélectrique (RFSS). Cette sélection s'applique également au système ADF courant.

Accès seulement : lorsque le champ [Activer l'alias du site à la page 539](#) est activé, et lorsque le champ Type de système est réglé à **Type II**, et lorsque le champ Type de couverture n'est pas réglé à **SmartZone**, et lorsque le modèle ou l'option de la radio le permet,

Ou encore, lorsque le champ [Activer l'alias du site à la page 539](#) est activé, et lorsque le champ [Type d'alias de site à la page 603](#) est réglé à **Site**, et lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le champ Type de couverture n'est pas réglé à **Désactivé**, et lorsque le modèle ou l'option de la radio le permet.

Tableau 252 : Portée

Minimum	Maximum
0 (hexadécimal)	FE (hex)

10.36.8.3

Texte de l'alias du site

Ce champ permet de définir des noms reconnaissables pour l'alias de site courant (enregistrement ou rangée), qui s'applique au système ADF courant.

Voir aussi [Type d'alias de site à la page 603](#). Vous pouvez activer le texte de l'alias site en utilisant la touche Aff./Rech. Site, la touche Verr./Déverr. site et les fonctions de sélection de menu Site.

Accès seulement : lorsque le champ [Activer l'alias du site à la page 539](#) est activé, et lorsque le champ Type de système est réglé à **Type II**, et lorsque le champ Type de couverture n'est pas réglé à **SmartZone**, et lorsque le modèle ou l'option de la radio le permet,

Ou encore, lorsque le champ [Activer l'alias du site à la page 539](#) est activé, et lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le champ Type de couverture n'est pas réglé à **Désactivé**, et lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Vous pouvez utiliser jusqu'à 14 caractères.

Exemples : EMT-001, N° 500, Électrique1, Alias du site 01

10.36.9

Une touche (système à commutation automatique de canaux de type II)

La section **Une touche** de l'ensemble du système à commutation automatique de canaux de type II permet à l'utilisateur de visualiser ou de définir des sélections Une touche spécifiques [Fonction Une touche à la page 541](#) et [Index Une touche à la page 541](#) pour un maximum de quatre (4) pressions sur des boutons Une touche ou sélections de menu Une touche.

La fonction Une touche permet à l'utilisateur de créer des raccourcis de navigation menu ou de touche pour l'utilisateur radio. Ces raccourcis facilitent grandement l'utilisation des fonctions de la radio. En appuyant sur un bouton Une touche ou en sélectionnant une commande de menu Une touche, l'utilisateur peut lancer en une seule étape une fonction de la radio, processus qui nécessite normalement plusieurs étapes de navigation dans les menus. Ces sélections s'appliquent au système ADF courant.

REMARQUE :

Les systèmes ADF individuels sont référencés dans une personnalité ADF. Les paramètres de ce système ADF sont ainsi activés pour tous les types de canaux contenus dans cette personnalité ADF.

10.36.9.1

Touche

Affiche le nom affecté en lecture seule à un appui sur Une touche ou la sélection de menu Une touche.

REMARQUE :

Les systèmes ADF individuels sont référencés dans une personnalité ADF. Les paramètres de ce système ADF sont ainsi activés pour tous les types de canaux contenus dans cette personnalité ADF.

10.36.9.2

Fonction Une touche

Ce champ permet de sélectionner la fonction Une touche associée au bouton Une touche ou à la sélection de menu Une touche.

Cette sélection s'applique à la rangée ou à l'enregistrement actuel du système ADF courant.

IMPORTANT :

Le bouton 1 ADF (autrement dit, la première rangée ou le premier enregistrement) correspond au bouton Une touche 1 ou à la sélection de menu (TCH1 ou SIG1) et ainsi de suite.

REMARQUE :

Lorsqu'on active cette fonction, il faut également définir l'index Une touche.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Désactivé;

L'option Une touche n'est pas activée pour le bouton sélectionné.

Téléphone

La fonction [Fonctionnement du téléphone à la page 573](#) est réglée à **Liste seulement** ou **Illimité** pour la personnalité d'ADF en référence.

Appel privé

La fonction [Type d'appel privé à la page 569](#) n'est pas **activée** et le champ [Opération appel privé à la page 570](#) est réglé à **Liste seulement** ou **Illimité** pour la personnalité ADF en référence.

Alerte d'appel

Le champ [Alerte d'appel/Notification à la page 570](#) est réglé à **Liste seulement** ou **Illimité** pour la personnalité ADF en référence.

État

La fonction [Activer l'alias d'état à la page 537](#) est activée pour le système ADF actuel.

Message

La fonction Message est activée pour le système ADF courant.

REMARQUE :

Les sélections de la fonction de touche Une touche dépendent du modèle et des options.

10.36.9.3

Index Une touche

Ce champ permet de sélectionner l'Index Une touche/membre de la liste pour votre bouton Une touche ou votre sélection de menu Une touche, relativement à la fonction Une touche sélectionnée.

L'index désigne la rangée ou l'enregistrement courant de la liste déterminé par la fonction Une touche sélectionnée. Cette sélection s'applique au système ADF courant.

**IMPORTANT :**

Le bouton 1 ADF (la première rangée ou le premier enregistrement) correspond à la touche Une touche 1 ou à la commande de menu (TCH1 ou SIG1).

Accès seulement : Lorsque le champ [Fonction Une touche à la page 541](#) n'est pas réglé à **Désactivé** et lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Appel privé

Le numéro de l'index correspond au numéro de la rangée de la liste d'appel privilégiée de type II ou ASTRO 25.

**IMPORTANT :**

Le champ [Liste d'appel privilégiée ADF à la page 571](#) permet de sélectionner la liste privilégiée à utiliser pour la personnalité ADF associée.

À votre disposition lorsque le [Type d'appel privé à la page 569](#) n'est pas **désactivé**, et que le champ [Opération appel privé à la page 570](#) est réglé à **Liste seulement** ou à **Illimité** pour la personnalité ADF associée.

Alerte d'appel

Le numéro de l'index correspond au numéro de la rangée de la liste d'appel privilégiée de type II ou ASTRO 25.

**IMPORTANT :**

Le champ Liste d'appel privilégiée ADF permet de sélectionner la liste à utiliser pour la personnalité ADF associée.

À votre disposition lorsque le champ [Alerte d'appel/Notification à la page 570](#) est réglé à **Liste seulement** ou à **Illimité** pour la personnalité ADF associée.

Téléphone

Le numéro de l'index correspond au numéro de la rangée de la liste privilégiée d'appels.

À votre disposition lorsque le champ [Fonctionnement du téléphone à la page 573](#) est réglé à **Liste seulement** ou à **Illimité** pour la personnalité ADF associée.

État

Le numéro de l'index correspond au numéro de rangée ou de position des membres de la liste d'alias d'état.

À votre disposition lorsque la fonction [Activer l'alias d'état à la page 537](#) est **activée** pour le système ADF courant.

Message

Le numéro de l'index correspond au numéro de rangée ou de position des membres de la liste d'alias de message.

À votre disposition lorsque la fonction Message est **activée** pour le système ADF courant.

10.36.10

Numérique (système à commutation automatique de canaux ASTRO 25)

La section **Numérique** de l'ensemble système à commutation automatique de canaux ASTRO 25 permet à l'utilisateur d'afficher ou de définir les fonctionnalités de communication numérique.

REMARQUE :

Les systèmes ADF individuels sont référencés dans une personnalité ADF. Les paramètres de ce système ADF sont ainsi activés pour tous les types de canaux contenus dans cette personnalité ADF.

10.36.10.1

Puissance adaptative

Ce champ permet à la radio d'adapter automatiquement le niveau de puissance de son émetteur sur le canal vocal, et non le canal de contrôle, en fonction de l'intensité du signal de la commande d'adaptation de puissance automatique (APA LC) reçue par liaison radio.

Si l'intensité du signal dépasse le seuil acceptable, la radio émet à puissance moyenne plutôt qu'à puissance élevée. Cette sélection s'applique au système ADF courant.

REMARQUE :

Si vous appuyez sur la touche PTT une deuxième fois dans les 30 secondes lorsque l'APA est activée pour le mode sécurisé F2 TDMA, la radio émet avec une puissance moyenne si le niveau de puissance courant est réglé à Élevé. Si le délai dépasse 30 secondes, alors le niveau de puissance actuel demeure élevé.

Accès seulement : Lorsque le champ [Niveau de puissance Tx à la page 526](#) n'est pas réglé à **Faible** et lorsque le modèle ou l'option de la radio le permet.

10.36.10.2

Longueur du préambule

Ce champ permet de sélectionner la durée d'envoi des paquets de synchronisation des bits au début de toutes les transmissions Canal vocal ASTRO 25 pour le système ADF courant.

Grâce à ces paquets, la radio émettrice et la radio réceptrice sont en mesure de se synchroniser avant une transmission ASTRO 25.

REMARQUE :

La durée du préambule équivaut à la valeur du champ Longueur du préambule, multipliée par 0,2083 ms.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 253 : Portée

Minimum	Maximum
0	255

10.36.10.3

Type de modulateur numérique

Ce champ permet de sélectionner le type de modulateur numérique du système ADF courant.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

C4FM (Par défaut d'origine pour ADF de Type II)

Modulation continue de fréquence porteuse à quatre niveaux prenant en charge la diffusion non simultanée.

CQPSK (Par défaut d'origine pour ADF ASTRO 25)

Modulation par déplacement de phase quadrivalente permettant la diffusion simultanée au moyen d'une bande étroite et la diffusion non simultanée.

**IMPORTANT :**

Cette option est uniquement offerte sur les modèles de radio équipés d'une interface hertzienne commune (CAI) numérique.

LARGE

Diffusion au moyen d'une large bande.

**IMPORTANT :**

Cette option ne peut pas être choisie si la bande passante de canal sélectionnée est de 12,5 kHz.

10.36.10.4

Seuil TDMA sync. trames BER

Ce champ permet de sélectionner le taux d'erreur de bits (BER) de l'accès multiple par répartition dans le temps (TDMA) maximal toléré par une radio utilisant un canal vocal TDMA X2 ou de phase 2.

**REMARQUE :**

Le taux d'erreur sur les bits TDMA est calculé au cours de la synchronisation de l'image pour une transmission de signaux vocaux par TDMA. Si un taux d'erreur supérieur à ce maximum est détecté, la radio tente de trouver un meilleur site. Cette sélection s'applique au système ADF courant.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le champ [À fonction vocale de phase 2 à la page 610](#) est réglé à **Activé** et que le modèle ou l'option de la radio le permet.

Tableau 254 : Portée

Minimum	Maximum	Incréments
Désactivé;	25,4%	0,1 %

10.36.10.5

Seuil FDMA Sync. trames/NID BER

Ce champ permet de sélectionner le taux d'erreur sur les bits (BER) pour la synchronisation des images et l'ID de réseau (NID) FDMA (accès multiple par répartition en fréquence) maximal toléré par une radio utilisant un site ADF.

Ce maximum s'applique à la fois au canal de contrôle et au canal vocal. Si un taux d'erreur supérieur à ce maximum est détecté, la radio tente de trouver un meilleur site. Cette sélection s'applique au système ADF courant.

Accès seulement : lorsque le champ [Type de couverture à la page 517](#) n'est pas réglé à **Désactivé** et que le modèle ou l'option de la radio le permet.

Tableau 255 : Portée

Minimum	Maximum	Incréments
Désactivé;	25,4%	0,1 %

10.36.11

Chiffré/Multiclé (Système ADF type II)

La section **Chiffré/Multiclé** de l'ensemble Système ADF ASTRO 25 permet à l'utilisateur d'afficher ou de définir les fonctions de sécurité et multiclé pour la transmission et la réception de communications encodées et sécurisées. Ces réglages peuvent être personnalisés pour chaque système ADF.

**REMARQUE :**

Les systèmes ADF individuels sont référencés dans une personnalité ADF. Les paramètres de ce système ADF sont ainsi activés pour tous les types de canaux contenus dans cette personnalité ADF.

10.36.11.1

DES-XL Tx/Rx par défaut

Ce champ active uniquement l'algorithme DES-XL (Norme de chiffrement de données – Portée étendue) numérique à utiliser pour tous les appels vocaux chiffrés.

DES XL est une norme de chiffrement de type 3 (niveau intermédiaire). Cette sélection s'applique au système ADF courant.

Si la case n'est pas cochée, seul l'algorithme DES-OFB (Norme de chiffrement de données – Rebouclage par la sortie) numérique est utilisé pour tous les appels vocaux chiffrés. DES OFB est une norme de chiffrement de type 3 (niveau intermédiaire).

**AVERTISSEMENT :**

Cette fonction s'applique uniquement si la radio est équipée d'un module de chiffrement à deux algorithmes (DES-XL et DES-OFB).

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** et lorsque le modèle ou l'option de la radio le permet.

10.36.11.2

Sélection de la clé de plage

Ce champ permet de sélectionner la clé de chiffrement sécurisé à utiliser pour les communications de groupes liés pendant le fonctionnement en mode chiffrement sécurisé.

Grâce à la liaison de groupes de conversation, un répartiteur peut regrouper plusieurs groupes de conversation ou utilisateurs afin qu'ils puissent communiquer comme s'ils ne formaient qu'un seul Groupe. Cette sélection s'applique au système ADF courant.

**IMPORTANT :**

Lorsque le champ [ASTRO OTAR à la page 615](#) est réglé à **Activé** pour le système ADF courant, cette valeur de sélection de clé est choisie dans la liste de références de clés de chiffrement de matériel sécurisées du Profil KMF sécurisé sélectionné dans le champ [Index de profil ASTRO OTAR à la page 616](#) du système ADF courant.

**AVERTISSEMENT :**

Veillez noter que cela renvoie en fait aux clés de la liste de clés de chiffrement applicable à cette sélection; les clés figurant dans la liste de clés de référence de chiffrement de matériel sécurisées correspondent aux clés de la liste de clés de chiffrement sélectionnée dans le champ Référence de clé de chiffrement. Par conséquent, les clés sélectionnées lorsque le champ ASTRO OTAR est activé doivent d'abord être définies dans la liste de références de clés de chiffrement de matériel sécurisées.

Lorsque le champ ASTRO OTAR est réglé à **Désactivé** pour le système ADF courant, les valeurs de sélection de clés de matériel proviennent directement de la liste des clés de chiffrement de la fenêtre Toute la sécurité.

Accès seulement : lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel**, et lorsque le modèle ou l'option de la radio le permet,

Ou encore, lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel**, et lorsque le champ Type de protocole est réglé à **ASTRO 25**, et lorsque le modèle ou l'option de la radio le permet.

10.36.11.3

Connexion du mode dégradé sécurisée/non chiffrée

Ce champ permet de sélectionner le type de connexion utilisé pour le mode dégradé.

Lorsque le modèle ou l'option de la radio le permet.

Sélectionner

Vous permet d'activer ou de désactiver le chiffrement sécurisé des communications.

REMARQUE :

La touche Sélection de Tx sécurisée, le commutateur Sélection de Tx sécurisée ou la sélection de menu Sélection de Tx sécurisée vous permet d'accéder aux communications chiffrées sécurisées.

Effacer

Permet au canal de transmettre uniquement des communications conventionnelles (non sécurisées).

Sécurisé

Permet au canal de transmettre uniquement des communications chiffrées.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**.

10.36.11.4

Sélection de clé en mode dégradé

Ce champ permet de sélectionner la clé de chiffrement sécurisé à utiliser pour le mode dégradé pendant le fonctionnement selon le mode chiffrement sécurisé.

Cette sélection s'applique au système ADF courant.

IMPORTANT :

Lorsque le champ [ASTRO OTAR à la page 615](#) est réglé à **Activé** pour le système ADF courant, cette valeur de sélection de clé est choisie dans la liste de références de clés de chiffrement de matériel sécurisées du Profil KMF sécurisé sélectionné dans le champ [Index de profil ASTRO OTAR à la page 616](#) du système ADF courant.

AVERTISSEMENT :

Veillez noter que cela renvoie en fait aux clés de la liste de clés de chiffrement applicable à cette sélection; les clés figurant dans la liste de clés de référence de chiffrement de matériel sécurisées correspondent aux clés de la liste de clés de chiffrement sélectionnée dans le champ Référence de clé de matériel. Par conséquent, les clés sélectionnées lorsque le champ ASTRO OTAR est activé doivent d'abord être définies dans la liste de références de clés de chiffrement de matériel sécurisées.

Lorsque le champ ASTRO OTAR est **désactivé** pour le système ADF courant, la clé provient directement de la liste des clés de chiffrement de la fenêtre Toute la sécurité.

Accès seulement : lorsque le modèle ou l'option de la radio le permet et que le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel**,

Ou encore, lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel**, et lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le champ Mode dégradé sécurisé Connexion chiffrée/claire n'est pas réglé à **Non chiffré**

10.36.11.5

Connexion d'appel individuel sécurisée/non chiffrée

Ce champ permet de sélectionner le type de connexion utilisé pour l'appel privé.

Lorsque le modèle ou l'option de la radio le permet.

Sélectionner

Vous permet d'activer ou de désactiver le chiffrement sécurisé des communications.

**REMARQUE :**

La touche Sélection de Tx sécurisée, le commutateur Sélection de Tx sécurisée ou la sélection de menu Sélection de Tx sécurisée vous permet d'accéder aux communications chiffrées sécurisées.

Effacer

Permet au canal de transmettre uniquement des communications conventionnelles (non sécurisées).

Sécurisé

Permet au canal de transmettre uniquement des communications chiffrées.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**.

10.36.11.6

Sélection de clé d'appel privée

Ce champ permet de sélectionner la clé de chiffrement sécurisé à utiliser pour les appels privé lors du fonctionnement en mode de chiffrement sécurisé.

Cette sélection s'applique au système ADF courant. Lorsque le champ Index de profil ASTRO OTAR pour le système ADF courant est réglé à **Activé**, la valeur de ce champ est sélectionnée dans la liste de références de clés de chiffrement sécurisé.

**IMPORTANT :**

L'application renvoie aux clés de la liste des clés de chiffrement pour cette sélection. Les clés individuelles de la liste de références de clés de chiffrement sécurisées font référence aux clés de la liste des clés de chiffrement du champ Référence de clé de chiffrement. Par conséquent, les clés doivent être définies dans la Liste de références de clés de chiffrement sécurisées avant de pouvoir les sélectionner. Les clés prises dans le profil OTAR avec le champ de liste des clés indépendante activé sont disponibles.

Lorsque le champ Index du profil ASTRO OTAR pour le système ADF courant est réglé à **Désactivé**, la valeur pour ce champ est sélectionnée dans la liste des clés de chiffrement de la fenêtre Toute la sécurité.

Accès seulement : lorsque le modèle ou l'option de la radio le permet et que le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel**,

Ou encore, lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel**, et lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le champ Privé Connexion chiffrée/claire n'est pas réglé à **Matériel informatique**

10.36.11.7

Connexion d'interconnexion sécurisée/non chiffrée

Ce champ permet de sélectionner le type de connexion utilisé pour l'interconnexion.

Lorsque le modèle ou l'option de la radio le permet.

Sélectionner

Vous permet d'activer ou de désactiver le chiffrement sécurisé des communications.

**REMARQUE :**

La touche Sélection de Tx sécurisée, le commutateur Sélection de Tx sécurisée ou la sélection de menu Sélection de Tx sécurisée vous permet d'accéder aux communications chiffrées sécurisées.

Effacer

Permet au canal de transmettre uniquement des communications conventionnelles (non sécurisées).

Sécurisé

Permet au canal de transmettre uniquement des communications chiffrées.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**.

10.36.11.8

Sélection de clé d'interconnexion

Ce champ permet de sélectionner la clé de chiffrement sécurisé à utiliser pour un appel d'interconnexion (mode téléphone) pendant le fonctionnement selon le mode chiffrement sécurisé.

Cette sélection s'applique au système ADF courant.

**IMPORTANT :**

Lorsque le champ Index de profil ASTRO OTAR est réglé à **Activé** pour le système ADF courant, cette valeur de sélection de clé est choisie dans la liste de références de clés de chiffrement sécurisé du profil ASTRO OTAR sélectionné dans le champ Index de profil ASTRO OTAR pour le système ADF courant.

**AVERTISSEMENT :**

Veuillez noter que cela renvoie en fait aux clés de la liste de clés de chiffrement applicable à cette sélection; les clés figurant dans la liste de clés de référence de chiffrement sécurisées correspondent aux clés de la liste de clés de chiffrement sélectionnée dans le champ Référence de clé de matériel. Par conséquent, toute clé sélectionnée lorsque l'Index de profil ASTRO OTAR est activé doit d'abord être définie dans la liste de références de clés de chiffrement sécurisé. Les clés prises dans le profil OTAR avec le champ de liste des clés indépendante activé sont disponibles.

L'application renvoie aux clés de la liste des clés de chiffrement pour cette sélection. Les clés individuelles de la liste de références de clés de chiffrement sécurisées font référence aux clés de la liste des clés de chiffrement du champ Référence de clé de chiffrement. Par conséquent, les clés doivent être définies dans la Liste de références de clés de chiffrement sécurisées avant de pouvoir les sélectionner.

Lorsque le champ Index du profil ASTRO OTAR pour le système ADF courant est réglé à **Désactivé**, la valeur pour ce champ est sélectionnée dans la liste des clés de chiffrement de la fenêtre Toute la sécurité.

Accès seulement : lorsque le modèle ou l'option de la radio le permet et que le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel**,

Ou encore, lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel**, et lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le champ Interconnexion chiffrée/claire n'est pas réglé à **Matériel informatique**

10.36.11.9

Connexion de regroupement dynamique sécurisée/non chiffrée

Ce champ permet de sélectionner le type de connexion utilisé pour le regroupement dynamique.

Lorsque le modèle ou l'option de la radio le permet.

10.36.11.10

Sélection de la clé de groupe dynamique

Ce champ permet de sélectionner la clé de chiffrement sécurisé à utiliser pour un regroupement dynamique (groupe dynamique) pendant le fonctionnement en mode chiffrement sécurisé.

Cette sélection s'applique au système ADF courant.

IMPORTANT :

Lorsque le champ [ASTRO OTAR à la page 615](#) est réglé à **Activé** pour le système ADF courant, cette valeur de sélection de clé est choisie dans la liste de références de clés de chiffrement de matériel sécurisées du Profil KMF sécurisé sélectionné dans le champ [Index de profil ASTRO OTAR à la page 616](#) du système ADF courant.

AVERTISSEMENT :

Veillez noter que cela renvoie en fait aux clés de la liste de clés de chiffrement applicable à cette sélection; les clés figurant dans la liste de clés de référence de chiffrement de matériel sécurisées correspondent aux clés de la liste de clés de chiffrement sélectionnée dans le champ Référence de clé de chiffrement. Par conséquent, les clés sélectionnées lorsque le champ ASTRO OTAR est activé doivent d'abord être définies dans la liste de références de clés de chiffrement de matériel sécurisées.

Lorsque le champ ASTRO OTAR est **désactivé** pour le système ADF courant, la clé provient directement de la liste des clés de chiffrement de la fenêtre Toute la sécurité.

Accès seulement : lorsque le modèle ou l'option de la radio est activé, lorsque le champ [Activer le regroupement dynamique à la page 529](#) est **Activé**, et lorsque le champ Fonctionnement sécurisé est réglé à **Matériel**,

Ou encore, lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel**, et lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le champ Regroupement dynamique Connexion chiffrée/claire n'est pas réglé à **Matériel informatique**

10.36.11.11

Sélection de clé AG dynamique

Ce champ permet de sélectionner la clé de chiffrement sécurisé à utiliser pour un groupe d'annonce dynamique pendant le fonctionnement en mode chiffrement sécurisé.

Cette sélection s'applique au système ADF courant.

IMPORTANT :

Lorsque le champ [ASTRO OTAR à la page 615](#) est **activé** pour le système ADF courant, cette valeur de sélection de clé est choisie à partir du [Liste de références de clés de chiffrement de matériel sécurisées à la page 322](#) de l'ensemble Profil KMF sécurisé sélectionné dans le champ [Index de profil ASTRO OTAR à la page 616](#) pour le système ADF courant.

AVERTISSEMENT :

Veillez noter que cela renvoie en fait aux clés de la [Liste des clés de chiffrement à la page 317](#) pour cette sélection; les clés individuelles figurant dans les [Liste de références de clés de chiffrement de matériel sécurisées à la page 322](#) renvoient aux clés de la liste des clés de chiffrements sélectionnée dans le champ [Référence de clé de chiffrement à la page 323](#). Par conséquent, les clés sélectionnées lorsque le champ ASTRO OTAR est activé doivent d'abord être définies dans les références de clés de chiffrement de matériel sécurisées.

Lorsque le champ ASTRO OTAR est **désactivé** pour le système ADF courant, la clé provient directement de la liste des clés de chiffrement de la fenêtre Toute la sécurité.

Accès seulement : Lorsque le champ [Activer le regroupement dynamique à la page 529](#) est activé, et lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique**, et lorsque le champ Type de système est réglé à **Type II**, et lorsque le champ Regroupement dynamique Connexion chiffrée/claire est réglé à **Type II**, et lorsque le modèle ou l'option de la radio le permet.

10.36.12

Groupe de conversation (Système ADF type II)

La section **Groupe de conversation** de l'ensemble Système ADF type II permet à l'utilisateur d'afficher ou de définir les fonctionnalités de base de groupe de conversation pour des systèmes ADF. Un « groupe de conversation » consiste en un groupe de radios créé dans RadioCentral dans le but d'échanger des communications fréquentes et régulières.

REMARQUE :

Les fréquences de groupe de conversation sont déterminées par le système ADF sur le terrain et ne sont pas définies dans RadioCentral.

REMARQUE :

Les fréquences en mode dégradé de la personnalité ADF doivent être définies dans RadioCentral.

Une fois qu'il a été défini, un groupe de conversation peut être attribué à un ou à plusieurs canaux du sélecteur de canaux de la radio à partir du champ Groupe ADF du [Affectation du canal de zone à la page 668](#) et de l'ensemble Liste de canaux.

Le champ suivant est pris en charge :

10.36.12.1

Nom du groupe

Ce champ vous permet de définir des noms reconnaissables pour le groupe courant (enregistrement/rangée).

Cette sélection s'applique à la personnalité ADF courante.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

Exemples : PerTG-001, n° 500, Électrique1, n° A5

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

À l'écran de la radio, les traits de soulignement remplacent les espaces vides apparaissant au début.

Les points figurant au début n'apparaîtront pas dans l'affichage de la radio.

10.36.12.2

ID de groupe

Ce champ permet d'entrer (au format décimal ou hexadécimal) le numéro qui désigne de façon exclusive le groupe (enregistrement/rangée) courant.

Cette sélection s'applique à la personnalité ADF courante.

Accès seulement : Lorsque le système ADF référencé a (un fichier de clé de système du logiciel ou une clé de système avancée avec accès sélectionnée dans le champ ID système) ou (une clé WACN avancée avec accès sélectionné dans le champ ID WACN d'accueil),

et lorsque le modèle ou l'option de la radio le permet.

Tableau 256 : Portée

Pour le type de protocole	Désactivé;	Minimum	Maximum
ASTRO 25	Aucun	0001 hex	FFFE hex
Type II	Aucun	001 hex	FFE hex

**IMPORTANT :**

La plage de sélection est modifiable par clé avancée au moyen du programme de gestion des clés de système avancées.

10.36.12.3

Type voix/signal Tx

Ce champ permet de sélectionner le mode de transmission de signaux du groupe (enregistrement/rangée) courant.

Cette sélection s'applique à la personnalité ADF courante.

Accès seulement : Numérique est accessible uniquement lorsque le champ **Type de protocole** est réglé à **Type II**, et lorsque la **Bande de fréquences de type II à la page 519** n'est pas réglée à **900 MHz**.

Les sélections suivantes sont prises en charge :

- Analogique
- Numérique

10.36.12.4

Connexion sécurisée/non chiffrée

Ce champ permet de sélectionner le mode de transmission et de réception relatif au chiffrement sécurisé à utiliser pour le groupe courant (rangée/enregistrement).

Cette sélection s'applique à la Personnalité ADF courante.

Accès seulement : Lorsque le système ADF référencé contient ((un fichier de clé de système du logiciel ou une clé de système avancée avec accès sélectionnée dans le champ **ID système à la page 519**) ou (une clé WACN avancée avec accès sélectionnée dans le champ **ID WACN d'accueil à la page 661**)), et lorsque le champ **Fonctionnement sécurisé à la page 301** est réglé à **Matériel informatique** ou **Logiciel**, et lorsque le champ **Type de protocole** est réglé à **ASTRO 25**, et lorsque le modèle et les options de la radio le permettent.

Les sélections suivantes sont prises en charge :

Effacer

Permet au canal de transmettre uniquement des communications normales (non sécurisées).

Sélectionner

Vous permet d'activer ou de désactiver le chiffrement sécurisé des communications. Pour activer ou désactiver le chiffrement sécurisé des communications, vous devez utiliser le commutateur **Sélection de Tx sécurisée à la page 206** ou la sélection de menu **Sécurisé**.

Sécurisé

Permet au canal de transmettre uniquement des communications chiffrées.

10.36.12.5

Sélectionner une clé

Ce champ permet de sélectionner la clé de chiffrement sécurisé à utiliser en mode Chiffrement sécurisé pour le groupe (enregistrement/rangée) courant.

Cette sélection s'applique au groupe courant de la personnalité ADF courante.

IMPORTANT :

Lorsque le champ [Index de profil ASTRO OTAR à la page 412](#) n'est pas désactivé pour la liste de groupes ASTRO courante, cette valeur de sélection de clé est sélectionnée dans [Liste de références de clés de chiffrement de matériel sécurisées à la page 322](#) le profil KMF sécurisé sélectionné dans le champ Index de profil KMF.

AVERTISSEMENT :

Veillez noter que RadioCentral renvoie en fait aux clés de la [Liste des clés de chiffrement à la page 317](#) à cette sélection; les clés individuelles figurant dans la liste de clés de référence de chiffrement de matériel sécurisées correspondent aux clés de la [Référence de clé de chiffrement à la page 323](#). Par conséquent, toute clé sélectionnée lorsque ASTRO OTAR est activé doit d'abord être définie dans la liste de références de clés de chiffrement de matériel sécurisées.

Lorsque le champ Index de profil KMF est désactivé ou non applicable (estompé) à la liste de groupes ASTRO courante, cette valeur de sélection de clé est choisie directement dans la liste des clés de chiffrement.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**, et lorsque le champ [Effectuer/Terminer la connexion vocale à la page 414](#) est réglé à **Sécurisé** ou à **Sélectionner**, et lorsque le modèle ou l'option de la radio le permet.

10.36.12.6

Groupe en mode dégradé

Ce champ permet d'activer le mode dégradé pour le groupe (rangée ou enregistrement) courant.

Cette sélection s'applique aux [Personnalité ADF](#) courants.

Accès seulement : Lorsque le système ADF référencé contient un fichier de clé de système du logiciel ou une clé de système avancée avec accès sélectionnée dans le champ [ID système à la page 519](#) ou une clé WACN avancée avec accès sélectionnée dans le champ [ID WACN d'accueil à la page 661](#), et lorsque le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe**, et lorsque le modèle et les options de la radio le permettent.

10.36.12.7

Fréquence Rx du mode dégradé

Ce champ permet d'entrer la fréquence de réception (Rx) du mode dégradé du groupe (enregistrement/rangée) courant.

Cette sélection s'applique à la Personnalité ADF courante.

AVERTISSEMENT :

Les contraintes de fréquence ADF appliquées à cette sélection sont déterminées par le réglage de cette personnalité et par la bande de fréquences du système ADF référencé.

Accès seulement : Lorsque le système ADF référencé contient un fichier de clé de système du logiciel ou une clé de système avancée avec accès sélectionnée dans le champ [ID système à la page 519](#) ou une clé WACN avancée avec accès sélectionnée dans le champ [ID WACN d'accueil à la page 661](#), et lorsque le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe**, et lorsque le champ [Groupe en mode dégradé à la page 552](#) est réglé à **Activé**, et lorsque le modèle et les options de la radio le permettent.

10.36.12.8

Fréquence Tx du mode dégradé

Ce champ permet d'entrer la fréquence de transmission (Tx) du mode dégradé du groupe (enregistrement/rangée) courant.

Cette sélection s'applique aux [Personnalité ADF](#) courants.

**AVERTISSEMENT :**

Les contraintes de fréquence ADF appliquées à cette sélection sont déterminées par le réglage de cette personnalité et par la bande de fréquences du système ADF référencé.

Accès seulement : Lorsque le système ADF référencé contient un fichier de clé de système du logiciel ou une clé de système avancée avec accès sélectionnée dans le champ [ID système à la page 519](#) ou une clé WACN avancée avec accès sélectionnée dans le champ ID WACN d'accueil, et lorsque le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe**, et lorsque le champ [Groupe en mode dégradé à la page 552](#) est réglé à **Activé**, et lorsque le modèle et les options de la radio le permettent.

10.36.12.9

Mode dégradé secondaire de groupe de conversation

Ce champ permet d'activer le mode dégradé secondaire pour le groupe (rangée ou enregistrement) courant.

Cette sélection s'applique à la personnalité ADF courante.

Accès seulement : Lorsque le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe**, et lorsque le champ [Groupe en mode dégradé à la page 552](#) est activé et lorsque le modèle ou les options de la radio le permettent.

10.36.12.10

Fréquence Rx du mode dégradé secondaire

Ce champ permet d'entrer la fréquence de réception (Rx) du mode dégradé secondaire pour le groupe (enregistrement/rangée) courant.

Cette sélection s'applique à la personnalité ADF courante.

**AVERTISSEMENT :**

Les contraintes de fréquence ADF appliquées à cette sélection sont déterminées par le réglage [Type de protocole](#) de cette personnalité et par la bande de fréquences du [Système ADF](#) référencé.

Accès seulement : Lorsque le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe**, et lorsque le champ [Groupe en mode dégradé à la page 552](#) est réglé à **Activé**, et lorsque le champ [Mode dégradé secondaire de groupe de conversation à la page 553](#) est réglé à **Activé**, et lorsque le modèle ou l'option de la radio le permet.

10.36.12.11

Fréquence Tx du mode dégradé secondaire

Ce champ permet d'entrer la fréquence de transmission (Tx) du mode dégradé secondaire pour le groupe (enregistrement/rangée) courant.

Cette sélection s'applique à la personnalité ADF courante.

**IMPORTANT :**

Les contraintes de fréquence ADF appliquées à cette sélection sont déterminées par le réglage du type de protocole de cette personnalité et par la bande de fréquences du [Système ADF](#) référencé.

Accès seulement : Lorsque le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe**, et lorsque le champ [Groupe en mode dégradé à la page 552](#) est réglé à **Activé**, et lorsque le champ [Mode dégradé secondaire de groupe de conversation à la page 553](#) est réglé à **Activé**, et lorsque le modèle ou l'option de la radio le permet.

10.37

Personnalité ADF de type II

L'option **Personnalité ADF de type II** permet à l'utilisateur de créer et de supprimer les personnalités ADF, ainsi que de les définir individuellement. Il existe deux modes de communication : ADF et Conventionnel.

REMARQUE :

Les systèmes ADF sont référencés à une personnalité ADF. Les paramètres de ces systèmes sont ainsi activés pour tous les types de canaux – ADF.

Une fois que les fonctions des personnalités ADF ont été définies de manière unique, chaque personnalité peut être assignée à la position désirée du sélecteur de canal de la radio au moyen de la fonction Attribution du canal de zone.

10.37.1

Général (Personnalité ADF type II)

La section **Général** de l'ensemble Personnalité ADF type II permet à l'utilisateur d'afficher ou de définir les fonctionnalités de base pour des systèmes ADF.

REMARQUE :

Une fois que les fonctions des personnalités ADF ont été définies de manière unique, chaque personnalité peut être affectée à la position désirée sur le sélecteur de canal de la radio au moyen de la fonction Affectation du canal de zone.

10.37.1.1

Nom de Personnalité ADF

Ce champ vous permet de définir réer un nom reconnaissable pour la personnalité ADF courante.

REMARQUE :

Une fois que les fonctions des personnalités ADF ont été définies de manière unique, chaque personnalité peut être assignée à la position désirée du sélecteur de canal de la radio au moyen de la fonction Attribution du canal de zone. Ce nom est utilisé afin de sélectionner la personnalité courante dans la page Canaux de cette fenêtre.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

Exemples : Personnalité-01, N° 500, Électrique 1, N° A5

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

À l'écran de la radio, les traits de soulignement remplacent les espaces vides apparaissant au début.

Les points figurant au début n'apparaîtront pas dans l'affichage de la radio.

10.37.1.2

Système

Ce champ permet de sélectionner le système ADF programmé pour la personnalité ADF courante.

**IMPORTANT :**

Seuls les systèmes ADF dont le Type de système correspond au Type de protocole des personnalités courantes doivent être sélectionnés.

Seuls les systèmes ADF dotés de fichiers de clé de système du logiciel ou de clés (matérielles) avancées dont les champs et les fonctions ne sont pas protégés (accès illimité) peuvent être sélectionnés; dans les autres cas, ce champ est non valide.

Lorsque la valeur de ce champ est non valide, tous les champs protégés au moyen d'une clé système dans la personnalité ADF courante s'affichent en lecture seule.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.37.1.3

Minuterie de délai d'attente

Ce champ permet de sélectionner la durée pendant laquelle la radio peut émettre de manière continue pour la personnalité ADF courante.

Lorsque le délai est sur le point d'expirer, la radio émet une tonalité d'alarme et interrompt automatiquement la transmission. La durée est exprimée en secondes.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

**REMARQUE :**

Lorsque le champ est réglé à **Infini** :

Aucune minuterie n'est utilisée pour les radios APX Next et APX N70. Par conséquent, le temps de conversation est illimité.

Tableau 257 : Portée

Type de radio	Minimum	Maximum	Incréments
Radios non-APX4000XH	15 s	465 s	15 s
Radios APX4000XH	15 s	60 s	15 s

Tableau 258 : Portée

Type de radio	Minimum	Maximum	Incréments
APX SUIVANT	0 s	465 s	15 s

10.37.1.4

AGC RF avancé

Ce champ permet de sélectionner le type de commande automatique du gain (AGC) de la fréquence de réception (RF) qui s'applique à la personnalité ADF courante.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Désactivé;

Lorsque **Désactivé** est sélectionné, la radio utilise une forme de base d'AGC intégrée au récepteur de la radio. Cette protection intégrée contribue à éviter l'écrêtage du signal et la saturation du récepteur, qui risquent d'endommager les composants de la radio.

Standard

Cette valeur permet d'activer une forme évoluée de commande automatique du gain qui offre une protection contre l'interférence d'intermodulation (IM) en détectant et en supprimant toute interférence provenant de sources externes.

Amélioré

Cette valeur permet à la radio d'utiliser d'autres techniques de réduction de l'interférence d'IM, qui permettent de nettoyer le signal.

Intelligente

Cette valeur permet à la radio d'utiliser une technique unique pour améliorer l'immunité aux interférences à proximité des stations de base Linear Simulcast et APCO phase 2. L'option intelligente s'exclut mutuellement avec la case à cocher Protection large bande.

**IMPORTANT :**

Il se peut que les formes standard et améliorée de la commande automatique du gain diminuent la performance sur les **canaux** qui ne subissent **aucune** interférence d'IM. Par conséquent, cette fonction doit être activée uniquement sur les canaux qui sont soumis à ce type d'interférence.

10.37.1.5

Protection large bande

Ce champ vous permet d'activer la protection large bande de la personnalité ADF courante.

La protection large bande améliore l'AGC RF avancé en ajoutant un filtre de large bande à haute sélectivité lors de la réception aux fréquences sélectionnées dans les bandes de 700 Mhz et 800 Mhz.

10.37.1.6

Type de conversation

Ce champ permet de sélectionner le mode de communication de la personnalité ADF courante.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Message

Le système assigne un canal de trafic pour la durée d'une seule transmission effectuée par une radio. Lorsque la radio cesse d'émettre, toutes les radios restent sur le canal de trafic jusqu'à ce que le délai fixé pour ce canal expire. Après l'expiration du délai, les radios syntonisent de nouveau le canal de contrôle. Toute radio qui participe à l'appel peut commencer à émettre pendant qu'elle utilise le canal de trafic sans retourner au canal de contrôle. Le partage de ressources par message est offert sur les systèmes à canal de contrôle de 3 600 bauds.

**AVERTISSEMENT :**

Le partage de ressources par message n'est pas compatible avec les systèmes ASTRO 25.

Émission

Le système assigne un canal de trafic pour la durée d'une seule transmission effectuée par une radio. Lorsque la radio cesse d'émettre, le canal de trafic est désassigné, et tous les abonnés qui participent à l'appel retournent au canal de contrôle. Toute demande subséquente de canal de trafic est envoyée sur le canal de contrôle par la radio demandeuse.

ID de PTT

Le système assigne un canal de trafic pour la durée de la conversation comme suit : Lorsqu'une radio cesse d'émettre, le canal vocal demeure actif, et les radios restent en attente sur ce canal pendant le délai fixé. Si une radio commence à émettre avant l'expiration de ce délai, sa radio syntonise d'abord le canal de contrôle pour envoyer un message contenant son ID de PTT (ID d'unité), ce qui signifie qu'elle veut transmettre des données vocales maintenant dans le cadre de

l'appel. Le système envoie alors un message qui dirige la radio de l'abonné vers le canal de trafic vocal d'origine.

10.37.1.7

Type de mode dégradé

Ce champ permet de sélectionner le type de mode dégradé de la personnalité ADF courante.

REMARQUE :

Le mode dégradé offre un fonctionnement conventionnel bidirectionnel en cas de défaillance du système ADF. La radio revient automatiquement en mode ADF une fois que le système ADF est rétabli.

Accès seulement : Lorsqu'un fichier de clé du système ou une clé du système figure dans le champ ID du système du système ADF référencé ou qu'une clé WACN avancée avec accès est sélectionnée dans le champ ID WACN d'accueil, et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Sélections	Définitions :	À votre disposition lorsque	
		Le type de protocole est	Le type de couverture est
Désactivé;	Aucun mode dégradé n'est utilisé	Tous	Tous
Personnalité	<p>Lorsque le champ Type de couverture à la page 517 est réglé à Désactivé, ce qui correspond à SmartNet, le mode dégradé utilise les fréquences de mode dégradé de personnalité pour tous les groupes au sein de cette personnalité ADF.</p> <p>Lorsque le champ Type de couverture est réglé à SmartZone, les fréquences de mode dégradé par personnalité ne sont pas utilisées; au lieu de cela :</p> <ul style="list-style-type: none"> • Lorsque le site est verrouillé, le mode dégradé utilise le dernier canal de contrôle actif. • Lorsque le site est déverrouillé, le mode dégradé utilise le dernier canal de contrôle actif. Si le mode dégradé n'est toujours pas détecté, la radio lance une recherche de mode dégradé dans la liste des canaux de contrôle. 	Type II	Tous
Groupe	<p>Lorsque le champ Type de couverture est réglé à Désactivé, ce qui correspond à SmartNet :</p> <ul style="list-style-type: none"> • Le mode dégradé utilise les fréquences de mode dégradé de groupe ou <p> AVERTISSEMENT : Le champ Groupe en mode dégradé doit être réglé à Activé.</p>	Tous	Tous

Sélections	Définitions :	À votre disposition lorsque	
		Le type de protocole est	Le type de couverture est
	<ul style="list-style-type: none"> Le mode dégradé peut utiliser les fréquences de mode dégradé du groupe d'annonce lorsqu'il est activé à partir d'un groupe d'annonce. <p> AVERTISSEMENT : Le champ Groupe d'annonce en mode dégradé à la page 567 doit être réglé à Activé.</p> <ul style="list-style-type: none"> Si aucun des champs mentionnés ci-dessus n'est Activé, la radio utilise le dernier canal de contrôle actif. <p>Lorsque le champ Type de couverture est réglé à SmartZone :</p> <ul style="list-style-type: none"> Lorsque le site de la radio est verrouillé et que champ Groupe en mode dégradé est réglé à Activé, le mode dégradé utilise les fréquences du groupe en mode dégradé; si le mode dégradé n'est toujours pas détecté, il utilise le dernier canal de contrôle actif. Si le champ Groupe en mode dégradé n'est pas réglé à Activé, le mode dégradé utilise le dernier canal de contrôle actif. Lorsque le site de la radio est déverrouillé et que le champ Groupe en mode dégradé est réglé à Activé, le mode dégradé utilise les fréquences du groupe de mode dégradé; si le mode dégradé n'est toujours pas détecté, il utilise le dernier canal de contrôle actif. Si le mode dégradé n'est toujours pas détecté, la radio recherche le système ADF référencé pour le mode dégradé dans la liste des canaux de contrôle. Si le champ Groupe en mode dégradé n'est pas réglé à Activé, le mode dégradé utilise le dernier canal de contrôle actif et, si nécessaire, peut effectuer une autre recherche dans la liste des canaux de contrôle. 		

10.37.1.8

Fréquence Rx en mode dégradé par personnalité

Ce champ permet de sélectionner la fréquence de réception (Rx) à utiliser en mode dégradé SmartNet pour la personnalité ADF courante.

Ce champ s'applique uniquement à la solution SmartNet (voir Type de couverture).

**IMPORTANT :**

Lorsque le champ Type de couverture est réglé à **SmartZone**, les fréquences de mode dégradé par personnalité ne sont pas utilisées. Le Mode dégradé est essayé sur les canaux de contrôle de la Liste de canaux de contrôle du système ADF défini.

Accès seulement :

Lorsque le système ADF défini a un fichier de clé de système logicielle ou une clé de système avancée avec accès sélectionnée dans le champ ID du système, et

Lorsque le champ Type de couverture du Système ADF référencé est réglé à **Désactivé**, que le champ Type de protocole est réglé à **Type II** et que le champ Type de mode dégradé est réglé à **Personnalité**, et que le modèle ou l'option de la radio le permet.

10.37.1.9

Fréquence Tx Failsoft par personnalité

Ce champ permet de sélectionner la fréquence de transmission (Tx) à utiliser en mode dégradé SmartNet pour la personnalité ADF courante.

Ce champ s'applique uniquement à la solution SmartNet (voir Type de couverture).

**IMPORTANT :**

Si le type de couverture est **SmartZone**, les fréquences de mode dégradé par personnalité ne sont pas utilisées, le mode dégradé s'emploie avec les canaux de contrôle qui figurent dans la liste des canaux de contrôle du système ADF défini.

Accès seulement :

Lorsque le système ADF défini a un fichier de clé de système logicielle ou une clé de système avancée avec accès sélectionnée dans le champ ID du système, et

Lorsque le champ Type de couverture du Système ADF référencé est réglé à **Désactivé**, que le champ Type de protocole est réglé à **Type II** et que le champ Type de mode dégradé est réglé à **Personnalité**, et que le modèle ou l'option de la radio le permet.

10.37.1.10

Failsoft secondaire par personnalité

Ce champ permet de sélectionner les fréquences de réception (Rx) et de transmission (Tx) secondaires à utiliser en mode dégradé SmartNet pour la personnalité ADF courante.

Cela s'applique uniquement au fonctionnement SmartNet (voir [Type de couverture à la page 517](#)).

**IMPORTANT :**

Lorsque le champ [Type de couverture à la page 517](#) est réglé à SmartZone, les fréquences de mode dégradé par personnalité ne sont pas utilisées. Le mode dégradé fait l'objet d'une tentative sur les canaux de contrôle de la liste des [Canaux de contrôle](#) du [système ADF](#) référencé.

Accès seulement : Lorsque le champ [Type de couverture à la page 517](#) du système ADF référencé est réglé à **Désactivé**, et lorsque le champ [Type de protocole](#) est réglé à **Type II**, et lorsque le champ Type de mode dégradé est réglé à **Personnalité**, et lorsque le modèle ou l'option de la radio le permet.

10.37.1.11

Fréquence Rx Failsoft secondaire par personnalité

Ce champ permet de sélectionner la fréquence de réception (Rx) secondaire à utiliser en mode dégradé SmartNet pour la personnalité ADF courante.

Ce champ s'applique uniquement à la solution SmartNet (voir Type de couverture).

**IMPORTANT :**

Lorsque le champ Type de couverture est réglé à SmartZone, les fréquences de Mode dégradé par personnalité ne sont pas utilisées. Le Mode dégradé est essayé sur les canaux de contrôle de la Liste de canaux de contrôle du système ADF défini.

Accès seulement : Lorsque le champ Type de couverture du Système ADF référencé est réglé à **Désactivé**, que le champ Type de protocole est réglé à **Type II** et que le champ Type de mode dégradé est réglé à **Personnalité**, et que le modèle ou l'option de la radio le permet.

10.37.1.12

Fréquence de mode dégradé Tx secondaire par personnalité

Ce champ permet de sélectionner la fréquence de transmission (Tx) secondaire à utiliser en mode dégradé SmartNet pour la personnalité ADF courante.

Cela s'applique uniquement au fonctionnement SmartNet (voir [Type de couverture à la page 517](#)).

IMPORTANT :

Lorsque le champ Type de couverture est réglé à SmartZone, les fréquences de Mode dégradé par personnalité ne sont pas utilisées. Le Mode dégradé est essayé sur les canaux de contrôle de la Liste de canaux de contrôle du système ADF défini.

Accès seulement : Lorsque le champ Type de couverture du Système ADF référencé est réglé à **Désactivé**, que le champ Type de protocole est réglé à **Type II** et que le champ Type de mode dégradé est réglé à **Personnalité**, et que le modèle ou l'option de la radio le permet.

10.37.1.13

Transmit Mode (Mode de transmission)

Ce champ permet d'indiquer si la personnalité ou le canal aura une fonctionnalité de transmission complète, ou s'il sera limité à transmettre des communications vocales de groupes (TG) et de groupes d'annonce (AG).

Cette sélection s'applique à la Personnalité ADF courante.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Sans restriction

Aucune limite n'est fixée pour la fonctionnalité de transmission.

Groupe/AG désactivé (Écoute seule)

La radio n'est pas en mesure de transmettre sur le groupe ou l'AG. Voir le champ Groupe ADF. La radio peut recevoir les transmissions vocales sur le mode de canal sélectionné.

AVERTISSEMENT :

Le Regroupement dynamique n'est pas compatible avec cette sélection.

Le [Sélection du profil d'urgence à la page 560](#) de cette personnalité doit être réglé à **Tx d'urgence désactivée** ou le profil sélectionné doit avoir son champ [Réponse d'urgence à la page 353](#) réglé à **Redirection**; autrement, la sélection du champ Profil d'urgence est considérée comme non valide.

La liste de balayage de cette personnalité ne doit pas avoir le champ [Type de membre de Tx vocale désigné à la page 689](#) réglé à **Canal sélectionné** (c.-à-d. ce canal); sinon, la [Sélection de la liste de balayage à la page 573](#) devient non valide.

La [Clavier activé \(DTMF\) à la page 576](#) n'est pas possible avec cette sélection.

10.37.1.14

Sélection du profil d'urgence

Ce champ permet de sélectionner le profil d'urgence ADF à utiliser pour la personnalité ADF courante.

Vous pouvez activer le mode d'urgence ou le lancer avec une radio programmée

AVERTISSEMENT :

Lorsque le champ [Transmit Mode \(Mode de transmission\) à la page 560](#) est réglé à **Groupe/AG désactivé** (mode Écoute seulement) pour la personnalité ADF courante, cette sélection de profil doit être réglée à **Tx d'urgence désactivée**, ou le profil sélectionné doit avoir son champ [Réponse d'urgence à la page 353](#) réglé à **Redirection**; sinon, cette sélection est considérée comme étant non valide.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

- Tx d'urgence désactivée
- Profils d'urgence des ADF disponibles

10.37.1.15

Type d'annulation d'urgence

Ce champ permet de sélectionner le type de redirection pour réponse d'urgence **Non tactique** à utiliser lors du fonctionnement en mode d'urgence pour la personnalité ADF courante.

Voir aussi [Réponse d'urgence à la page 353](#).

AVERTISSEMENT :

Vous pouvez passer à la fonctionnalité du mode d'urgence ou lancer ce mode avec une radio programmée.

Accès seulement : Lorsque la fonction étendue **Annulation d'urgence multiple** apparaît dans le champ Nom de fonction étendue, qu'un profil d'urgence ADF référencé est sélectionné pour la personnalité ADF courante, que le champ Groupe d'urgence du profil d'urgence ADF est réglé à **Redirection** et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Groupe d'annulation

La radio utilise l'ID du groupe d'annulation de réponse d'urgence définie pour la personnalité ADF courante afin de transmettre les alarmes d'urgence ou les appels d'urgence.

Annulation du système

La radio utilise le [Zone d'annulation du système d'urgence à la page 563](#) et le [Canal d'annulation du système d'urgence à la page 564](#) pour transmettre les alarmes d'urgence ou les appels d'urgence. Les transmissions d'urgence sont également envoyées à la console du répartiteur.

AVERTISSEMENT :

Le Regroupement dynamique n'est pas compatible avec cette sélection.

10.37.1.16

ID de groupe de redirection pour réponse d'urgence

Ce champ permet d'entrer, en format décimal ou hexadécimal, le numéro de groupe qui désigne de façon unique le groupe courant (enregistrement/rangée).

Cette sélection s'applique à la [Personnalité ADF](#) courante.

Accès seulement : Lorsque le système ADF référencé dispose d'un fichier de clé système logiciel ou d'une clé de système avancée avec accès sélectionnée dans le champ [ID système à la page 519](#), ou d'une clé WACN avancée avec accès sélectionnée dans le champ [ID WACN d'accueil à la page 661](#), et que le modèle ou les options de la radio le permettent.

Tableau 259 : Portée

Pour le type de protocole :	Désactivé;	Minimum	Maximum
ASTRO 25	Aucune	0001 (hexadécimal)	FFFE (hex)
Type II	Aucune	001 (hex)	FFE (hex)

IMPORTANT :

La plage de sélection est modifiable par clé avancée au moyen du programme de gestion des clés de système avancées.

10.37.1.17

Redirection pour réponse d'urgence Type voix/signal

Ce champ permet de sélectionner le mode de transmission d'émission de signaux à utiliser lors du fonctionnement en mode d'urgence pour le groupe de redirection pour réponse d'urgence.

Cette sélection s'applique à la Personnalité ADF courante.

Accès seulement : l'option **Numérique** est accessible uniquement lorsque le champ Type de protocole est réglé à **Type II**, et que la bande de fréquences de type II n'est pas **900 MHz**

Les sélections suivantes sont prises en charge :

Analogique

Impossible pour l'ADF ASTRO 25

Numérique

10.37.1.18

Annuler la réponse d'urgence\Effectuer/Terminer la connexion vocale

Ce champ permet de sélectionner le mode de transmission à utiliser lors du fonctionnement en mode d'urgence pour le groupe de redirection pour réponse d'urgence.

Cette sélection s'applique à la Personnalité ADF courante.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**, et lorsque le champ Type de protocole est réglé à **ASTRO 25**.

Les sélections suivantes sont prises en charge :

Effacer

Permet au groupe ou au canal de transmettre uniquement des communications en mode de fonctionnement ADF normal (non sécurisé).

Sélectionner

Permet d'activer ou de désactiver le chiffrement sécurisé pour le groupe courant. La touche Sélection de Tx sécurisée, le commutateur [Sélection de Tx sécurisée à la page 206](#) ou la sélection de menu Sécurisé vous permet d'activer ou de désactiver les communications chiffrées.

Sécurisé

Permet au groupe de transmettre uniquement des communications chiffrées.

10.37.1.19

Annuler la réponse d'urgence\Sélection de touche

Ce champ permet de sélectionner la clé de chiffrement sécurisée à utiliser en mode d'urgence pour le groupe de redirection pour réponse d'urgence.

Cette sélection s'applique à la Personnalité ADF courante.

IMPORTANT :

Lorsque le champ [Index de profil ASTRO OTAR à la page 616](#) est réglé à **Activé** pour le système ADF référencé, cette valeur de sélection de clé est choisie dans la liste de références de clés de chiffrement sécurisées du profil ASTRO OTAR sélectionné dans le champ Index de profil ASTRO OTAR du système ADF référencé.

AVERTISSEMENT :

Veillez noter que cela renvoie aux clés de la liste des clés de chiffrement pour cette sélection; les clés individuelles de la référence de la liste de références de clés de chiffrement de matériel sécurisées sont associées aux clés de la liste des clés de chiffrement du champ Référence de clé de chiffrement. Par conséquent, toute clé sélectionnée lorsque le champ Index de profil ASTRO OTAR est activé doit d'abord être définie dans la liste de références de clés de chiffrement sécurisé. Les clés prises dans le profil OTAR avec le champ de liste des clés indépendante activé sont disponibles.

Lorsque le champ Index de profil ASTRO OTAR est réglé à **Désactivé** pour le système ADF référencé, cette valeur de sélection de clé est choisie directement dans la liste des clés de chiffrement de la fenêtre Toute la sécurité.

AVERTISSEMENT :

Lorsque l'ID de groupe normal utilisé par d'autres radios est identique à l'ID de groupe d'annulation de réponse d'urgence associé à la radio courante et...

Lorsque la clé de groupe de conversation normale utilisée par d'autres radios n'est pas identique à la clé de groupe de conversation d'annulation de réponse d'urgence...

Les règles suivantes s'appliquent :

- Lorsque cette radio passe à son ID de groupe d'annulation de réponse d'urgence à l'aide de cette clé, la transmission d'urgence de la radio n'est pas entendue par les autres radios.
- Cependant, il est possible que la transmission d'urgence soit interceptée par un balayage, même en l'absence de correspondance entre les clés.

Accès seulement : Lorsque le champ Réponse d'urgence [Annuler la réponse d'urgence\Effectuer/Terminer la connexion vocale à la page 562](#) est réglé à **Sécurisé** ou à **Sélectionné**, et

Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**, et lorsque le champ Type de protocole est réglé à **ASTRO 25**, et lorsque le modèle ou l'option de la radio le permet.

10.37.1.20

Zone d'annulation du système d'urgence

Ce champ permet de sélectionner la zone à utiliser pour la durée de la transmission en mode d'urgence.

Cette sélection s'applique à la Personnalité ADF courante.

REMARQUE :

une fois cette zone sélectionnée, l'option [Canal d'annulation du système d'urgence à la page 564](#) peut être sélectionnée.

Les zones et leurs canaux doivent d'abord avoir été définis dans la fenêtre Attribution du canal de zone.

AVERTISSEMENT :

Seules les zones non dynamiques (zones pour lesquelles le champ Activation zone dynamique est réglé à **Désactivé**) peuvent être sélectionnées; sinon, ce champ devient non valide.

Accès seulement : Lorsque le champ Nom de fonction étendue est réglé à **Annulation d'urgence multiple**, qu'un profil d'urgence ADF référencé valide est sélectionné pour la personnalité ADF

courante, que le champ [Réponse d'urgence à la page 353](#) est réglé à **Redirection**, que le champ [Type d'annulation d'urgence à la page 561](#) est réglé à **Redirection du système** et que le modèle ou l'option de la radio le permet.

10.37.1.21

Canal d'annulation du système d'urgence

Ce champ permet de sélectionner un canal conventionnel ou ADF à utiliser pendant une transmission en mode d'urgence.

Cette sélection s'applique à la Personnalité ADF courante.

REMARQUE :

La valeur [Zone d'annulation du système d'urgence à la page 563](#) doit être sélectionnée avant de sélectionner ce canal.

Les zones et leurs canaux doivent d'abord avoir été définis dans la fenêtre Attribution du canal de zone.

AVERTISSEMENT :

Pour les codeplugs des radios portatives APX™ 3000, seuls les 48 premiers canaux de la [Zone d'annulation du système d'urgence à la page 563](#) sélectionnée sont considérés comme étant des sélections valides.

La sélection Canal de redirection du système d'urgence est considérée valide uniquement : lorsque le champ [Groupe de conversation ADF à la page 673](#) pour la personnalité/canal ADF sélectionné n'est pas réglé à **DYN** ou à **ATG**, que le champ [Personnalité réception seulement à la page 430](#) pour la personnalité/canal conventionnel sélectionné est réglé à **Désactivé**, que le champ ID de groupe ASTRO pour la personnalité/canal conventionnel sélectionné n'est pas réglé à **DYN** ou à **ATG**, que le champ [Transmit Mode \(Mode de transmission\) à la page 560](#) pour la personnalité/le canal ADF sélectionné n'est pas réglé à **TG/AG désactivé (écoute seulement)** et que le champ [Sélection du profil d'urgence à la page 560](#) pour le canal sélectionné n'est pas réglé à **Urgence Tx désactivée**.

Accès seulement : Lorsque la fonction étendue **Annulation d'urgence multiple** apparaît dans le champ Nom de fonction étendue et qu'un profil d'urgence ADF référencé est sélectionné pour la personnalité ADF courante, que le champ [Réponse d'urgence à la page 353](#) du Profil d'urgence ADF est réglé à **Redirection**, que le champ [Type d'annulation d'urgence à la page 561](#) est réglé à **Redirection du système**, que le champ [Zone d'annulation du système d'urgence à la page 563](#) n'est pas réglé à une zone dynamique et que le modèle ou l'option de la radio le permet.

10.37.2

Groupe d'annonce (Personnalité ADF Type II)

La section **Groupe d'annonce** de l'ensemble Personnalité ADF Type II permet à l'utilisateur d'afficher ou de définir les paramètres de Groupe d'annonce pour des personnalités ADF individuelles. Grâce aux groupes d'annonce, l'utilisateur peut communiquer sur un grand canal composé de tous les groupes de conversation définis pour la personnalité ADF courante.

REMARQUE :

Un Groupe d'annonce (ATG) doit être sélectionné pour cette personnalité ADF à partir du champ [Affectation du canal de zone à la page 668](#) et du jeu de listes de canaux et Groupes ADF. La sélection ATG sert à désigner le canal désigné du groupe d'annonce.

Une fois que les fonctions des personnalités ADF ont été définies de manière unique, chaque personnalité peut être affectée à la position désirée sur le sélecteur de canal de la radio au moyen de la fonction Affectation du canal de zone.

10.37.2.1

Groupe d'annonce

Ce champ permet d'entrer (au format décimal ou hexadécimal) l'ID qui désigne de façon exclusive le groupe d'annonce de la personnalité ADF courante.

**REMARQUE :**

Grâce aux groupes d'annonce, la radio peut effectuer des appels sur un grand canal de communication comprenant tous les groupes définis pour la personnalité ADF courante.

**AVERTISSEMENT :**

La valeur Groupe d'annonce (ATG) doit être sélectionnée pour cette personnalité ADF dans le champ [Groupe de conversation ADF à la page 673](#) de la page Canaux, Attribution du canal de zone. La sélection ATG sert à désigner le canal désigné du groupe d'annonce.

La personnalité est sélectionnée à partir du champ [Personnalité à la page 672](#) dans la page Attribution de canal de zone du Canal de zone.

Accès seulement : Lorsque le système ADF référencé dispose d'un fichier de clé système logiciel ou d'une clé de système avancée avec accès sélectionnée dans le champ [ID système à la page 519](#), ou d'une clé WACN avancée avec accès sélectionnée dans le champ [ID WACN d'accueil à la page 661](#), et que le modèle ou les options de la radio le permettent.

Tableau 260 : Portée

Pour Type de protocole	Désactivé;	Minimum	Maximum
ASTRO 25	Aucune	0001 (hexadécimal)	FFFE (hex)
Type II	Aucune	001 (hex)	FFE (hex)

**IMPORTANT :**

La plage de sélection est modifiable par clé avancée au moyen du programme de gestion des clés de système avancées.

10.37.2.2

Type de voix/signal AG

Ce champ permet de sélectionner le mode de transmission et de réception propre au groupe d'annonce de la personnalité ADF courante.

Grâce aux groupes d'annonce, la radio peut effectuer des appels sur un grand canal de communication comprenant tous les groupes définis pour la personnalité ADF courante.

Accès seulement : On accède à **Numérique** uniquement lorsque le champ Type de protocole est réglé à **Type II**, lorsque la Bande de fréquences de type II n'est pas **900 MHz**, et que le champ Groupe d'annonce n'est pas réglé n'est pas réglé à **Aucun**.

Les sélections suivantes sont prises en charge :

- Analogique
- Numérique

10.37.2.3

Effectuer/Terminer la connexion AG

Ce champ permet de sélectionner le mode de transmission et de réception du groupe d'annonce de la personnalité ADF courante.

Accès seulement : Lorsque le champ [Groupe d'annonce à la page 565](#) n'est pas réglé à **Aucun** et que le modèle ou l'option de la radio le permet,

Et

Lorsque le champ [Fonctionnement sécurisé à la page 301](#) doit être réglé à **Matériel**, et lorsque le champ [Type de voix/signal AG à la page 565](#) est réglé à **Numérique**, et lorsque la largeur de bande du système ADF référencé n'est pas réglée à **12,5 kHz**,

ou

Lorsque le champ Type de protocole est réglé à **ASTRO 25**, et lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**.

Les sélections suivantes sont prises en charge :

Effacer

Permet au canal de transmettre uniquement des communications ADF normales (non sécurisées).

Sélectionner

Vous permet d'activer ou de désactiver le chiffrement sécurisé des communications.

Vous devez utiliser la touche Sélection de Tx sécurisée, le commutateur [Sélection de Tx sécurisée à la page 206](#) ou la sélection de menu Sécurisé pour activer ou désactiver les communications chiffrées sécurisées.

Sécurisé

Permet au canal d'utiliser uniquement le mode de chiffrement sécurisé.

10.37.2.4

Sélectionner une clé AG

Ce champ permet de sélectionner la clé de chiffrement sécurisée à utiliser pour le groupe d'annonce de la personnalité ADF courante.

Cette sélection s'applique au mode de chiffrement sécurisé.

IMPORTANT :

Lorsque le champ [ASTRO OTAR à la page 615](#) est réglé à **Activé** pour le système ADF référencé, cette valeur de sélection de clé est choisie dans la Liste de références de clés de chiffrement sécurisées du Profil OTAR ASTRO OTAR sélectionné dans le champ [Index de profil ASTRO OTAR à la page 616](#) du système ADF référencé.

AVERTISSEMENT :

Veillez noter que cela renvoie en fait aux clés de la liste de clés de chiffrement applicable à cette sélection; les clés figurant dans la liste de clés de référence de chiffrement sécurisées correspondent aux clés de la liste de clés de chiffrement sélectionnée dans le champ [Référence de clé de chiffrement à la page 323](#). Par conséquent, toute clé sélectionnée lorsque le profil ASTRO OTAR est activé doit d'abord être définie dans la liste de références de clés de chiffrement sécurisé. Les clés prises dans le profil ASTRO OTAR avec le champ de liste des clés indépendante activé sont disponibles.

Lorsque le champ ASTRO OTAR est réglé à **Désactivé** pour le système ADF défini, cette valeur de sélection de clé est choisie directement dans la liste des clés de chiffrement de la fenêtre Toute la sécurité.

Accès seulement : Lorsque le champ [Effectuer/Terminer la connexion AG à la page 565](#) n'est pas réglé à **Conventionnel**, et lorsque le champ [Groupe d'annonce à la page 565](#) n'est pas réglé à **Aucun**, et lorsque le modèle ou l'option de la radio le permet,

Et

Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** et que le champ [Type de voix/signal AG à la page 565](#) est réglé à **Numérique**,

ou

Lorsque le champ Fonctionnement sécurisé est réglé à **Matériel**, et lorsque le champ Type voix/signal AG est réglé à **Analogique**, et lorsque la bande de fréquence de canal du système ADF n'est pas réglée à **12,5 kHz**,

ou

Lorsque le champ Type de protocole est réglé à **ASTRO 25**, et lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**.

10.37.2.5

Groupe d'annonce en mode dégradé

Ce champ permet d'activer le mode dégradé pour le groupe d'annonce de la personnalité ADF courante.

Accès seulement : Lorsque le système ADF associé contient un fichier de clé de système logicielle ou une clé de système avancée avec accès sélectionnée dans le champ ID du système ou une clé WACN avancée avec accès sélectionnée dans le champ ID WACN d'accueil, et lorsque le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe de conversation**, et lorsque le champ [Groupe d'annonce à la page 565](#) n'est pas réglé à **Aucun**, et lorsque le modèle et les options de la radio le permettent.

10.37.2.6

Fréquence Rx Failsoft AG

Ce champ permet d'entrer la fréquence de réception (Rx) à utiliser en mode dégradé pour le groupe d'annonce de la personnalité ADF courante.

AVERTISSEMENT :

Les contraintes de fréquence ADF appliquées à cette sélection sont déterminées par la valeur du champ Type de protocole de la personnalité courante et par la bande de fréquences du système ADF défini.

Accès seulement : Lorsque le système ADF référencé dispose d'une clé de système logicielle ou d'une clé de système avancée dont l'accès est sélectionné dans le champ ID du système, ou une clé WACN avancée dont l'accès est sélectionné dans le champ ID WACN d'accueil, que le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe**, que le champ [Groupe d'annonce à la page 565](#) n'est pas réglé à **Aucun**, que le champ [Groupe d'annonce en mode dégradé à la page 567](#) est réglé à **Activé** et que le modèle ou l'option de la radio le permet.

10.37.2.7

Fréquence Tx Failsoft AG

Ce champ vous permet d'entrer la fréquence de réception (Rx) à utiliser en mode dégradé pour le groupe d'annonce de la personnalité ADF courante.

AVERTISSEMENT :

Les contraintes de fréquence ADF appliquées à cette sélection sont déterminées par la valeur du champ Type de protocole de la personnalité courante et par la bande de fréquences du système ADF défini.

Accès seulement : Lorsque le système ADF référencé dispose d'une clé de système logicielle ou d'une clé de système avancée dont l'accès est sélectionné dans le champ ID du système, ou une clé WACN avancée dont l'accès est sélectionné dans le champ ID WACN d'accueil, que le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe**, que le champ [Groupe d'annonce à la page 565](#) n'est pas réglé à **Aucun**, que le champ [Groupe d'annonce en mode dégradé à la page 567](#) est réglé à **Activé** et que le modèle ou l'option de la radio le permet.

10.37.2.8

Mode dégradé secondaire AG

Ce champ permet d'activer le mode dégradé secondaire pour le groupe d'annonce de la personnalité ADF courante.

Accès seulement : lorsque le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe**, que le champ [Groupe d'annonce à la page 565](#) n'est pas réglé à **Aucun**, que le champ [Groupe d'annonce en mode dégradé à la page 567](#) est réglé à **Activé** et que le modèle ou l'option de la radio le permet.

10.37.2.9

Fréquence secondaire Rx AG F/S

Ce champ permet d'entrer la fréquence de réception (Rx) secondaire à utiliser en mode dégradé pour le groupe d'annonce de la personnalité ADF courante.

AVERTISSEMENT :

Les contraintes de fréquence ADF appliquées à cette sélection sont déterminées par la valeur du champ Type de protocole de la personnalité courante et par la bande de fréquences du système ADF défini.

Accès seulement : Lorsque le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe**, le champ [Groupe d'annonce à la page 565](#) n'est pas réglé à **Aucun**, le champ [Groupe d'annonce en mode dégradé à la page 567](#) est réglé à **Activé**, le champ [Mode dégradé secondaire AG à la page 568](#) est réglé à **Activé**, et lorsque le modèle ou l'option de la radio le permet.

10.37.2.10

Fréquence secondaire Tx AG F/S

Ce champ vous permet d'entrer la fréquence de transmission (Tx) secondaire à utiliser en mode dégradé pour le groupe d'annonce de la personnalité ADF courante.

AVERTISSEMENT :

Les contraintes de fréquence ADF appliquées à cette sélection sont déterminées par la valeur du champ Type de protocole de la personnalité courante et par la bande de fréquences du système ADF défini.

Accès seulement : Lorsque le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe**, le champ [Groupe d'annonce à la page 565](#) n'est pas réglé à **Aucun**, le champ [Groupe d'annonce en mode dégradé à la page 567](#) est réglé à **Activé**, le champ [Mode dégradé secondaire AG à la page 568](#) est réglé à **Activé**, et lorsque le modèle ou l'option de la radio le permet.

10.37.3

Groupe de conversation (Personnalité ADF type II)

La section **Groupe de conversation** de l'ensemble Personnalité ADF type II permet à l'utilisateur d'afficher ou de définir les fonctionnalités de base de groupe de conversation pour des systèmes ADF.

Un « groupe de conversation » consiste en un groupe de radios créé dans RadioCentral dans le but d'échanger des communications fréquentes et régulières.

REMARQUE :

Les fréquences de groupe de conversation sont déterminées par le système ADF sur le terrain et ne sont pas définies dans RadioCentral.

REMARQUE :

Les fréquences en mode dégradé de la personnalité ADF doivent être définies dans RadioCentral.

Une fois qu'il a été défini, un groupe de conversation peut être attribué à un ou à plusieurs canaux du sélecteur de canaux de la radio à partir du champ Groupe ADF du [Affectation du canal de zone à la page 668](#) et de l'ensemble Liste de canaux.

10.37.3.1

Groupe

Affiche le nom reconnaissable par l'utilisateur RadioCentral pour le groupe de conversation (rangée ou enregistrement) courant.

Cette sélection s'applique à la personnalité ADF ou Personnalité ADF ASTRO 25 courante.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.37.4

Appel/not. (Personnalité ADF Type II)

La section **Appel/not.** de l'ensemble Personnalité ADF Type II permet à l'utilisateur d'afficher ou de définir les paramètres d'appel privé et de page pour des personnalités ADF distinctes. Ces réglages peuvent s'appliquer à la liste d'appel privilégiée ADF.

REMARQUE :

Une fois que les fonctions des personnalités ADF ont été définies de manière unique, chaque personnalité peut être affectée à la position désirée sur le sélecteur de canal de la radio au moyen de la fonction Affectation du canal de zone.

10.37.4.1

Type d'appel privé

Ce champ permet de sélectionner le type d'appel privé de la personnalité ADF courante.

Vous pouvez lancer un appel sélectif ou privé en appuyant sur une touche Appel sélectif/privé ou en utilisant la sélection de menu [Appel sélectif/privé à la page 216](#). Pour répondre à un appel privé, l'utilisateur appuie sur la touche [Réponse à l'appel à la page 183](#).

Les sélections suivantes sont prises en charge :

Désactivé;

La fonction d'appel privé est désactivée.

Disponible lorsque le type de protocole est réglé à Type II ou à ASTRO 25

PC II

L'appel privé II autorise les appels entre deux radios individuelles, quel que soit le groupe de conversation, sans que la radio réceptrice ait à confirmer la réception de l'appel entrant.

Disponible lorsque le type de protocole est réglé à Type II ou à ASTRO 25

Amélioré d'unité à unité

L'appel privé amélioré ou l'appel privé d'unité à unité autorise les appels entre deux radios individuelles, quel que soit le groupe de conversation. La radio réceptrice sonne et doit confirmer la réception de l'appel entrant.

Disponible lorsque le type de protocole est réglé à Type II ou à ASTRO 25

PC avec CA

Appel privé amélioré ou d'unité à unité, suivi d'une alerte d'appel privé facultative. Voir [Alerte automatique des appels à la page 572](#).

Disponible lorsque le type de protocole est réglé à Type II ou à ASTRO 25

REMARQUE :

PC II est pris en charge en fonctionnement ADF analogique. Voir les champs [Type de voix/signal AG à la page 565](#) et [Groupe à la page 569](#) dans [Personnalité ADF de type II à la page 554](#).

La période d'attente est de 2 minutes pour l'appel privé PC II et amélioré traité par un système ADF 3600, et de 6 secondes pour l'appel privé traité par un système ADF 9600. Aucune indication n'est affichée pendant la durée du délai.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.37.4.2

Opération appel privé

Ce champ permet de sélectionner le mode de fonctionnement de la fonction d'appel privé pour la personnalité ADF courante.

Vous pouvez lancer un appel sélectif ou privé en appuyant sur une touche Appel sélectif/privé ou en utilisant la sélection de menu [Appel sélectif/privé à la page 216](#). Pour répondre à un appel privé, l'utilisateur appuie sur la touche [Réponse à l'appel à la page 183](#).

Accès seulement : Lorsque le champ [Type d'appel privé à la page 569](#) n'est pas réglé à **Désactivé** et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Réponse seulement (Rép. seulement)

Permet à la radio d'accepter les appels de notification uniquement.

Liste seulement

Vous permet de transmettre des notifications à partir de la liste d'appel courte. Pour les modèles sans clavier, cette sélection peut être utilisée uniquement à l'aide de la fonction Une touche. Cette fonction dépend du modèle et de l'option.

Illimité

Vous permet d'envoyer des notifications à partir de la liste courte d'appel et du clavier de la radio. Cette fonction dépend du modèle et de l'option.

AVERTISSEMENT :

Cette sélection n'est pas disponible pour les radios mobiles dotées uniquement d'un écran supérieur.

10.37.4.3

Alerte d'appel/Notification

Ce champ permet de sélectionner la fonctionnalité Alerte d'appel/Notification pour la personnalité ADF courante.

Vous pouvez activer le fonctionnement Avis d'appel/Notification avec une touche [Alerte d'appel à la page 183](#) ou une sélection de menu [Avis à la page 221](#).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet et lorsque le champ Activer le matériel DVRS est **Activé** ou lorsque le champ Activer le matériel DVRS est **Activé** et que le champ Activation à distance du DVRS du profil DVRS référencé dans la personnalité ADF courante est réglé à **Désactivé**.

Les sélections suivantes sont prises en charge :

Désactivé;

La fonction d'alerte d'appel (notification) est désactivée.

Réponse seulement (Rép. seulement)

Permet à la radio d'accepter les appels de notification uniquement.

Liste seulement

Vous permet de transmettre des notifications à partir de la liste d'appel courte. Pour les modèles sans clavier, cette sélection peut être utilisée uniquement à l'aide de la fonction Une touche. Cette fonction dépend du modèle et de l'option.

Illimité

Vous permet d'envoyer des notifications à partir de la liste courte d'appel et du clavier de la radio. Cette fonction dépend du modèle et de l'option.

AVERTISSEMENT :

Cette sélection n'est pas disponible pour les radios mobiles dotées uniquement d'un écran supérieur.

10.37.4.4

Liste d'appel privilégiée ADF

Ce champ permet de sélectionner la liste courte d'appel à utiliser pour la personnalité ADF courante.

La liste privilégiée d'appels utilisée dépend du réglage du champ Type de protocole à **Type II** ou **ASTRO 25** pour la personnalité ADF courante. L'utilisateur se sert de cette liste pour faire des appels privés et envoyer des notifications.

Accès seulement : Lorsque le champ [Opération appel privé à la page 570](#) est réglé à **Liste seulement** ou à **Illimité**, ou lorsque le champ [Alerte d'appel/Notification à la page 570](#) est réglé à **Liste seulement** ou à **Illimité**, et lorsque le modèle ou l'option de la radio le permet.

10.37.4.5

Activer l'alerte utilisateur en appel

Ce champ permet à la radio de demeurer en sourdine en cas d'appel des groupes affiliés pendant le fonctionnement sur la personnalité ADF courante.

Par contre, les pages individuelles ou de groupe désactivent la sourdine pour que la tonalité d'alerte soit entendue. La sourdine est également désactivée pendant les appels de radio à radio tels que les appels privés et les appels à composition de tonalité et les appels d'interconnexion (mode téléphone). Cette fonction est très utile si vous préférez ne pas entendre les communications de groupe associé, mais que vous devez garder le contact radio. La touche [Mettre la voix en sourdine à la page 195](#) ou la

sélection de menu [Mettre la voix en sourdine à la page 225](#) vous permet d'activer et de désactiver la mise en sourdine de la voix pour un canal dont la fonction d'alerte utilisateur en appel est activée.

AVERTISSEMENT :

Lorsque cette fonction est désactivée, vous ne pouvez pas l'activer pour la personnalité ADF courante.

IMPORTANT :

Par ailleurs, lorsque la mise en sourdine de la voix est activée :

Une notification individuelle ou de groupe reçue par la radio désactive la sourdine. Un appel vocal subséquent peut alors constituer un appel de groupe diffusé par le haut-parleur de la radio.

Si le canal de la radio est changé, celle-ci désactive la mise en sourdine de la voix; il faut donc réactiver cette fonction au besoin après avoir syntonisé de nouveau le canal d'origine.

Si vous appuyez sur la touche PTT, que vous passez en mode d'urgence ou que vous mettez la radio hors tension, puis sous tension, la radio désactive la mise en sourdine de la voix.

Les types d'appels suivants peuvent aussi être reçus :

- [Activer le regroupement dynamique à la page 529](#)
- [Blocage de la radio à la page 525](#)
- [Indicateur de zone hors de portée à la page 233](#)
- Mode dégradé
- [Indicateur ADF du site à la page 235](#)
 - La fonction Balayage n'est pas disponible.
 - Les autres indications (qui proviennent des appels de groupe) telles que les voyants DEL et l'ID de PTT fonctionnent normalement (si elles sont activées).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet et que le champ [Alerte d'appel/Notification à la page 570](#) n'est pas réglé à **Désactivé**,

Ou lorsque le champ Type de protocole est réglé à **ASTRO 25**, et lorsque le champ [Liste de composition de tonalité à la page 645](#) de la Personnalité ADF courante fait référence à une liste de composition de tonalité comportant au moins un enregistrement ou une rangée où l'option Réactivation du son activée est réglée à **Activé**.

10.37.4.6

Alerte automatique des appels

Ce champ permet à la radio de transmettre automatiquement une alerte d'appel privé lorsque le destinataire d'un appel privé amélioré ou d'unité à unité ne répond pas à cet appel dans le délai accordé.

Cette fonction s'applique à la personnalité ADF courante, ainsi qu'aux deux types de protocoles ASTRO 25 et Type II.

Accès seulement : Lorsque le champ [Type d'appel privé à la page 569](#) est réglé à **PC avec CA** et que le modèle ou l'option de la radio le permet.

10.37.5

Fonctions (Personnalité ADF type II)

La section **Fonctions** de l'ensemble Personnalité ADF type II permet à l'utilisateur d'afficher ou de modifier diverses fonctions Personnalités ADF pour la personnalité ADF courante.

**REMARQUE :**

Une fois que les fonctions des personnalités ADF ont été définies de manière unique, chaque personnalité peut être affectée à la position désirée sur le sélecteur de canal de la radio au moyen de la fonction Affectation du canal de zone.

10.37.5.1

Fonctionnement du téléphone

Ce champ permet de sélectionner la fonctionnalité du téléphone pour la personnalité ADF courante.

Vous pouvez activer la fonction Mode téléphonique en appuyant sur une touche Téléphone ou Réponse à l'appel, ou en utilisant une sélection de menu Téléphone.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Désactivé;

Le mode téléphone est désactivé.

Réponse seulement

La radio accepte les appels uniquement.

Liste seulement

Permet à l'utilisateur de passer des appels à partir de la Liste courte téléphonique de la radio.

**AVERTISSEMENT :**

Si le champ [Numéro de téléphone modifiable à la page 655](#) de la fenêtre Liste d'appel complète est réglé à **Activé**, vous pouvez modifier les numéros de téléphone qui figurent dans la Liste d'appel unifiée de la radio.

Illimité

Permet de passer des appels à partir de la liste de numéros de téléphone ou d'un clavier.

10.37.5.2

de Sélection de la liste de balayage

Ce champ permet de sélectionner la liste de balayage qu'utilisera la radio en mode Balayage pour la personnalité ADF courante.

Cette liste de balayage détermine les appelants que la radio recherche, écoute activement et pour lesquels elle désactive la sourdine sur le canal ADF courant.

REMARQUE :

Les réglages de la liste de balayage et de ses membres sont définis dans la fenêtre Liste de balayage.

Seules les listes de balayage dont le champ [Type de balayage à la page 682](#) est réglé à **Surv. prioritaire** ou à **Groupe multisystème** sont des sélections de liste de balayage valides pour la personnalité ADF courante.

Seules les listes de balayage dont le champ Type de balayage est réglé à **Priorité intelligente** sont des sélections de liste de balayage valides pour la personnalité conventionnelle sans système DVRS.

Vous pouvez modifier une liste de balayage au moyen d'un commutateur Programmation de la liste de balayage, d'une sélection de menu Liste de balayage ou d'une longue pression sur une touche Balayer.

AVERTISSEMENT :

Lorsque le champ [Transmit Mode \(Mode de transmission\) à la page 560](#) est réglé à **Groupe/AG désactivé (écoute seulement)** pour la personnalité ADF courante, la liste de balayage référencée de cette personnalité ne doit pas avoir son champ [Type de membre de Tx vocale désigné à la page 689](#) réglé à **Canal sélectionné** (c'est-à-dire, ce canal); sinon cette sélection est considérée comme étant non valide.

Lorsque le champ [Sélection de la liste d'alertes de site sélectionnables à la page 593](#) pour le système ADF référencé n'est pas réglé à **Désactivé**, alors, la liste de balayage référencée pour cette personnalité doit avoir un type de balayage **Groupe multisystème**; sinon, cette sélection est considérée comme étant non valide.

L'application considère cette sélection comme non valide lorsque le LTE large bande de cette personnalité est activé et que cette liste de balayage sélectionnée comprend des canaux de membre de liste de balayage ayant les dépendances suivantes :

- Le champ [Interférence de fréquence LTE présente à la page 437](#) de leur personnalité conventionnelle est réglé à **Activé**, ou
- Le champ [Interférence de fréquence LTE présente à la page 596](#) de leur Système ADF est **Vrai**, ou
- Le champ [Type de couverture à la page 517](#) du système ADF est réglé à **Itinérance Inter-WACN**.

Le LTE est activé sur un canal ADF lorsque le système ADF associé à la personnalité comporte un Profil de donnée référencé dont la sélection [Type de profil de données à la page 376](#) est égale à **ADF et large bande** ou à **Large bande seulement**, et lorsque la source de large bande du profil de données est réglée à **Modem LTE interne**.

Lorsque la sélection de la liste d'imputabilité du personnel du système ADF référencé n'est pas réglée à **Désactivé**, alors, la liste de balayage référencée pour cette personnalité ne doit pas avoir le type de balayage **Groupe multisystème**, sinon, cette sélection est considérée comme étant non valide.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.37.5.3

Balayage automatique

Ce champ fait passer la radio automatiquement en mode Balayage lorsque vous sélectionnez (à l'aide du sélecteur de canaux) la personnalité ADF courante.

Le balayage automatique est également activé lorsque le canal courant est déjà syntonisé à la mise sous tension de la radio.

Lorsqu'il est désactivé, vous pouvez passer en mode Balayage au moyen d'une touche Balayer, d'un commutateur Balayer ou d'une sélection de menu Balayer lors du fonctionnement sur la personnalité ADF courante.

Accès seulement : Lorsque le champ [de Sélection de la liste de balayage à la page 573](#) n'est pas réglé à **Aucun** et lorsque le modèle ou l'option de la radio le permet.

10.37.5.4

Activer l'état

Ce champ vous permet de sélectionner et de transmettre un état programmé pour la personnalité ADF courante.

Les états disponibles dépendent du système ADF référencé à la personnalité.

Vous pouvez lancer la fonction État à l'aide d'une touche État, d'une touche État direct ou d'une sélection de menu État.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.37.5.5

Activer le message

Ce champ vous permet de sélectionner et de transmettre un message défini pour la personnalité ADF courante.

Les messages mis à votre disposition dépendent du système ADF associé à la personnalité. Vous pouvez activer la fonction Message en appuyant sur une touche [Message à la page 187](#) ou une touche [Message direct](#), ou en utilisant la sélection de menu [Message à la page 219](#).

Accès seulement : Lorsque le champ Type de protocole est réglé à **Type II** et lorsque le modèle ou l'option de la radio le permet.

10.37.5.6

Tonalité d'autorisation de parler

Ce champ permet à la radio de générer une tonalité d'alerte lorsqu'une autorisation d'accès au canal de contrôle provenant d'un répéteur a été reçue.

Cette fonction s'applique à la personnalité ADF courante.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.37.5.7

Détection du code sécurisé approprié

Ce champ permet à la radio de désactiver la sourdine pour une communication chiffrée par SecureNet.

Cette fonction s'applique à la personnalité ADF courante.

Accès seulement : Lorsque le champ Type de protocole est réglé à **Type II**, et lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**, et que le modèle ou l'option de la radio le permet.

10.37.5.8

Ignorer Rx de voix non chiffrée

Ce champ fait en sorte que la radio ignore toutes les communications vocales **Non chiffrées** (sans chiffrement sécurisé) pendant le fonctionnement avec la personnalité ADF courante.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**.

10.37.5.9

Fin de Tx en l'absence de voix

Ce champ permet à la radio, pendant une transmission vocale ADF, d'effectuer automatiquement le relâchement de la touche lorsque son processeur de signal numérique (DSP) intégré détecte l'absence de voix provenant du microphone au-delà de la durée définie pour la minuterie d'absence de voix.

Cette sélection s'applique pendant le fonctionnement selon la personnalité ADF courante.

AVERTISSEMENT :

La fonction ne fonctionne pas lorsque :

- une radio sur le terrain fonctionne en mode Urgence et soit **Urgence de microphone branché**, soit **Urgence par audio silencieux** est actuellement activée (voir aussi Mode de transmission automatique d'urgence) ou
- La radio sur le terrain est actuellement surveillée à distance (voir aussi Surveillance à distance/Traceur radio\Activer).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.37.5.10

Clavier activé (DTMF)

Ce champ vous permet de transmettre des tonalités DTMF à l'aide du clavier de la radio, même si celle-ci n'est pas en mode téléphone.

Vous pouvez lancer le mode Clavier activé en maintenant la touche PTT enfoncée tout en composant les numéros DTMF voulus au clavier. Cette fonction s'applique à la personnalité ADF courante.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

AVERTISSEMENT :

Cette fonction n'est pas active lorsque le champ [Transmit Mode \(Mode de transmission\)](#) à la [page 560](#) est réglé au mode **TG/AG Désactivé (Écoute seulement)**.

10.37.5.11

Activer mic DTMF

Ce champ vous permet de transmettre des tonalités DTMF à l'aide du clavier de la radio, même si celle-ci n'est pas en mode téléphone.

Vous pouvez activer le microphone DTMF en maintenant enfoncée la touche supérieure ou latérale, ou la touche de la tête de commande pendant que vous entrez le numéro DTMF voulu au clavier.

Cette sélection s'applique également à la personnalité ADF en cours.

AVERTISSEMENT :

Cette fonction n'est pas active lorsque le champ [Transmit Mode \(Mode de transmission\)](#) à la [page 560](#) est réglé au mode **TG/AG Désactivé (Écoute seulement)**.

10.37.5.12

Minuterie de délai d'attente de répartition prioritaire

Ce champ permet de sélectionner le temps dont vous disposez pour appuyer sur la touche Répartition prioritaire avant la sortie de la répartition prioritaire. La durée est exprimée en secondes.

Tableau 261 : Portée

Minimum	Maximum	Incréments
1	255	1

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le champ Sélection du profil DVRS est réglé à **Désactivé**.

10.37.6

Sites préférés (Personnalité ADF Type II)

La section **Sites préférés** de l'ensemble Personnalité ADF type II permet à l'utilisateur d'afficher ou de définir les préférences du site ADF multi-site pour chaque personnalité ADF. Lorsqu'une radio se retrouve en itinérance dans une zone de chevauchement de couverture de sites multiples dans un système ADF ou un réseau de communication étendu (WACN), elle cherche un site privilégié sur le plan opérationnel en évaluant tous les autres sites disponibles sur une base prioritaire, en fonction de leur sélection État de préférence. Cette fonction permet de bénéficier d'une gestion et d'une conservation plus intelligentes des ressources de répéteur dans les zones de couverture qui se chevauchent.

IMPORTANT :

Le champ Type de couverture du système ADF référencé détermine la configuration à un seul site (SmartNet) ou multisite. Dans une configuration multisite, le fonctionnement SmartZone permet à la radio de déterminer, à partir d'échantillons d'interrogation RSSI, le meilleur site à utiliser pour les communications ADF.

Voir aussi les champs Toutes les ADF Avancé et Constantes de filtre du système ADF.

Une fois que les fonctions des personnalités ADF ont été définies de manière unique, chaque personnalité peut être assignée à la position désirée du sélecteur de canal de la radio au moyen de la fonction Attribution du canal de zone.

10.37.6.1

Ignorer les préférences en ressources du site

Ce champ fait en sorte que la radio ignore l'information sur les ressources de site reçue en mots-indicateurs sortants (OSW) en provenance du canal de contrôle adjacent, c'est-à-dire, si le site a des répéteurs ASTRO sécurisés de 12 Kbit ou analogiques.

Cette fonction s'applique à la personnalité ADF courante, uniquement en fonctionnement SmartZone.

Si elle est **désactivée**, la radio sélectionne les sites en fonction de l'information sur les ressources de ce site. Par exemple, si une radio a sélectionné un groupe de conversation ASTRO.

Accès seulement : Lorsque le champ [Type de couverture à la page 517](#) du système ADF référencé n'est pas réglé à **Désactivé**, et lorsque le modèle et les options de la radio le permettent.

10.37.6.2

Type de liste de sites

Ce champ permet de sélectionner le type de liste de sites pour la personnalité ADF.

Le type de liste de sites définit la façon dont la radio utilise les sites identifiés dans la liste de sites suivante. La préférence de site et l'accès mobile (itinérance) sont définis par le type de liste de sites.

Accès seulement : Lorsque le champ [Type de couverture à la page 517](#) du système ADF référencé n'est pas réglé à **Désactivé**, et lorsque le modèle et les options de la radio le permettent.

Les sélections suivantes sont prises en charge :

Liste préférée

Il s'agit de l'ancienne sélection par défaut. Il n'y a aucune restriction ou préférence d'accès pour les sites ne figurant pas dans la liste.

Liste autorisée

La radio est autorisée à accéder en itinérance uniquement aux sites figurant dans la liste, et les préférences définies seront appliquées. Le système peut toujours refuser l'accès à un site dans la

liste autorisée à la suite d'une tentative de « connexion » au système à partir du site. Si la radio n'est pas à portée d'au moins un des sites figurant dans la liste, elle restera hors de portée.

Liste bloquée

La radio n'est pas autorisée à accéder en itinérance aux autres sites figurant dans la liste. Tous les autres sites sont traités comme des sites autorisés, sans préférence définie.

10.37.6.3

ID du site

Ce champ permet d'entrer (en format décimal ou hexadécimal) le numéro d'identification désignant le site SmartZone courant (enregistrement ou rangée), qui s'applique à la personnalité ADF courante.

AVERTISSEMENT :

Pour prendre en charge l'itinérance entre les différents sites, chaque ID de site doit être unique dans un sous-système de fréquence radioélectrique (RFSS).

Accès seulement : Lorsque le champ [Type de couverture à la page 517](#) du système ADF référencé n'est pas réglé à **Désactivé**, et lorsque le modèle et les options de la radio le permettent.

Tableau 262 : Portée

Type de couverture	Minimum	Maximum
ASTRO 25	1	FE hex
Type II	1	40 hex

10.37.6.4

État préféré

Ce champ permet de sélectionner l'état préféré pour le site SmartZone lors de la détermination du meilleur site à utiliser pour les communications ADF (à l'aide des résultats d'interrogation RSSI).

Cette sélection s'applique au site courant (enregistrement ou rangée) de la personnalité ADF courante.

Accès seulement : Lorsque le champ [Type de couverture à la page 517](#) du système ADF référencé n'est pas réglé à **Désactivé**, et lorsque le modèle et les options de la radio le permettent.

Les sélections suivantes sont prises en charge :

Aucun

Aucune préférence n'est accordée à ce site.

IMPORTANT :

Si un site n'apparaît pas dans la liste, la radio ne lui attribue automatiquement aucune préférence.

Le moins préféré

Le site sera évité à moins qu'il ne soit le seul à être utilisable.

Préfééré

Le site sera utilisé en priorité sur tous ceux qui ne sont pas préférés. La radio quittera ce site lors du passage en mode ADF.

Toujours préféré

Le site sera utilisé en priorité sur tous ceux qui ne sont pas préférés, et ce, même s'il passe en mode ADF du site.

10.37.6.5

ID de RFSS

Ce champ permet à l'utilisateur d'entrer (en format décimal ou hexadécimal) l'ID du sous-système de fréquence radioélectrique (RFSS) du système ASTRO 25 correspondant à l'ID du site courant dans le site courant (enregistrement/rangée), qui s'applique à la personnalité ADF courante.

**AVERTISSEMENT :**

Pour prendre en charge l'itinérance entre les différents RFSS d'un système ADF, chaque RFSS doit posséder un numéro unique.

**REMARQUE :**

Un RFSS se compose d'un ou de plusieurs sites.

Accès seulement : Lorsque le système ADF référencé a son champ [Type de couverture à la page 517](#) réglé à **SmartZone et OmniLink** ou à **Itinérance intra-WACN** ou à **Itinérance inter-WACN**, et lorsque le champ Type de protocole est réglé à **Type II**, et lorsque le modèle ou l'option de la radio le permet.

Tableau 263 : Portée

Minimum	Maximum
1	FE hex

10.37.6.6

ID système

Ce champ permet d'entrer au format décimal ou hexadécimal l'ID de système Type II ou ASTRO 25 correspondant à l'ID du site courant (enregistrement/rangée), qui s'applique à la personnalité ADF courante.

**AVERTISSEMENT :**

Pour prendre en charge l'itinérance entre les différents systèmes ADF composant les réseaux de communication étendus (WACN), chaque système ADF doit posséder un ID système unique.

**REMARQUE :**

Un système ADF est constitué d'un ou de plusieurs sous-systèmes de fréquence radioélectrique (RFSS).

Accès seulement : Lorsque le champ Type de protocole est réglé à **ASTRO 25**, et lorsque le système ADF référencé a son champ [Type de couverture à la page 517](#) réglé à **Itinérance Inter-WACN** et que le modèle ou l'option de la radio le permet,

Lorsque le champ Type de protocole est réglé à **ASTRO 25**, et lorsque le système ADF référencé a son champ réglé à **Itinérance intra-WACN** ou à **Itinérance Inter-WACN** et que le modèle ou l'option de la radio le permet.

Tableau 264 : Portée

Type de couverture	Minimum	Maximum
ASTRO 25	0	0FFE hex
Type II	0	FFFE hex

10.37.6.7

ID de WACN RAS

Ce champ permet d'entrer (en format décimal ou hexadécimal) l'ID de réseau de communication étendu (WACN) du serveur d'accès distant (RAS) pour l'ID du site (enregistrement/rangée) courant.

AVERTISSEMENT :

Pour prendre en charge l'itinérance entre les différents WACN, chaque WACN doit posséder un numéro unique.

REMARQUE :

Un réseau de communication étendu se compose d'un ou de plusieurs systèmes ADF. Cette sélection s'applique également à la personnalité ADF en cours.

Accès seulement : Lorsque le champ Type de protocole est réglé à **ASTRO 25**, et lorsque le système ADF référencé a son champ [Type de couverture à la page 517](#) réglé à **Itinérance Inter-WACN** et que le modèle ou l'option de la radio le permet.

Tableau 265 : Portée

Minimum	Maximum
0	FFFFE hex

10.37.6.8

Caractère générique

Ce champ définit le type d'entrée dans la liste de sites. La sélection est un type de caractère générique qui déterminera quel site ou groupe de sites doit être **Préfér **, **Autoris ** ou **Bloqu **.

Acc s seulement : Lorsque le champ [Type de couverture à la page 517](#) du système ADF référenc  n'est pas régl  à **D sactiv **, et lorsque le mod le et les options de la radio le permettent.

Les s lections suivantes sont prises en charge :

Aucun caract re g n rique

Il s'agit de la s lection par d faut.

Tout site

Tous les sites dans un RFSS, un syst me et un WACN applicable en fonction de la s lection du champ Type de couverture

Tout RFSS

Tous les sites, RFSS dans un syst me et WACN applicables en fonction de la s lection du champ Type de couverture

Tout syst me

Tous les sites, RFSS et syst mes dans un WACN applicable en fonction de la s lection du champ Type de couverture

10.37.6.9

Autoriser les urgences au site bloqu 

Si ce champ est activ , la radio tente d'enregistrer le groupe s lectionn  sur un site d fini comme bloqu  dans le RadioCentral lorsque la radio est en mode d'urgence. Lorsque l'urgence est effac e, la radio continue de bloquer le groupe s lectionn .

Acc s seulement : Ce champ est uniquement disponible lorsque les conditions suivantes sont remplies :

- Le champ **Type de liste de sites** est régl  sur **Bloqu **.
- Le champ **Type de couverture** du syst me ADF associ  **n'est pas** régl  sur **D sactiv **.

10.38

Personnalité ADF ASTRO 25

L'ensemble **Système ADF ASTRO 25** permet à l'utilisateur de créer et de supprimer des systèmes ADF, ainsi que de définir la fonctionnalité de chaque système ADF. Les systèmes ADF sont des configurations virtuelles miroirs des configurations et de la fonctionnalité des systèmes ADF réels (sur le terrain); la définition des systèmes RadioCentral permet à la radio de communiquer avec les systèmes réels.

AVERTISSEMENT :

Si le champ Type de système d'un système ADF est modifié, toutes les personnalités ADF précédemment associées au système ADF en question devront être réaffectées à un autre système doté utilisant le Type de système approprié. Sinon, une erreur de codeplug se produira lors de l'écriture de la codeplug dans la radio. La structure d'adressage des systèmes ADF est soit Type II, soit ASTRO 25.

REMARQUE :

Les systèmes ADF sont référencés à une personnalité ADF. Les paramètres de ces systèmes sont ainsi activés pour tous les types de canaux partagés.

10.38.1

Général (Système ADF ASTRO 25)

La section **Général** de l'ensemble Système ADF ASTRO 25 permet à l'utilisateur d'afficher ou de définir les fonctionnalités de base pour des systèmes ADF.

REMARQUE :

Les systèmes ADF individuels sont référencés dans une personnalité ADF. Une fois utilisés comme référence, les paramètres de ce système sont ainsi activés pour tous les types de canaux contenus dans la personnalité ADF.

10.38.1.1

Nom de système ADF

Ce champ vous permet de créer un nom reconnaissable pour le système ADF courant.

REMARQUE :

Chaque système ADF est associé à une personnalité ADF par le biais du champ Système en sélectionnant ce nom. Les paramètres de ce système ADF sont ainsi activés pour tous les types de canaux contenus dans cette personnalité ADF.

Lorsque le champ Type de balayage est réglé à **Surv. Prioritaire** pour les canaux membres de la liste de balayage, ce nom de système ADF doit être sélectionné pour la liste en cours en utilisant le champ Enregistrement du système ADF.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

Exemples : EMT-001, #500, Électrique1, # A5

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

À l'écran de la radio, les traits de soulignement remplacent les espaces vides apparaissant au début.

Les points figurant au début n'apparaîtront pas dans l'affichage de la radio.

10.38.1.2

Type de clé de système

Ce champ permet d'afficher en lecture seule le type de clé de système sélectionnée pour le système ADF courant, soit **Clé du système** ou **Clé WACN**.

Lorsque le champ [Type de couverture à la page 517](#) est réglé à **Itinérance Intra-WACN**, le type de clé de système est **Clé WACN**; sinon, il est **Clé du système**.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.38.1.3

Clé du système présente

L'application récupère et affiche les informations en lecture seule si un fichier de clé système du logiciel ou de clé (matérielle) avancée est chargé dans le module et que ce fichier correspond à l'ID sélectionné dans le champ ID système ou ID WACN d'accueil pour le système ADF courant.

Voir aussi [Type de clé de système à la page 517](#).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.38.1.4

Type de couverture

Ce champ permet de sélectionner le type de couverture géographique de la radio et, par conséquent, les méthodes de communication directe entre radios dans les systèmes ADF.

La fonction Type de couverture s'applique au système ADF courant.

Accès seulement : Lorsque le modèle et les options de la radio le permettent, et si un fichier de clé système logicielle ou une clé de système avancée avec accès est sélectionnée dans le champ ID du système, ou une clé WACN avancée avec accès est sélectionnée dans le champ ID WACN d'accueil.

REMARQUE :

Ces sélections dépendent du modèle et des options de la radio.

Les sélections suivantes sont prises en charge :

Désactivé = SmartNet

Lorsque le modèle et les options de la radio permettent la prise en charge de SmartZone, désactiver ce champ fait en sorte que le système ADF utilise SmartNet.

REMARQUE :

SmartNet se résume à l'utilisation d'un système SmartZone à un seul site.

SmartZone

SmartZone permet de déterminer, grâce aux résultats d'interrogation obtenus à l'aide des indicateurs d'intensité du signal reçu (RSSI), le meilleur site ADF pour l'activation des canaux ADF du système SmartZone.

REMARQUE :

Pour les systèmes ASTRO 25 : Le fonctionnement est limité aux sites dans une même zone d'un système ADF unique.

Pour les systèmes Type II : Le fonctionnement est limité aux sites dans un même système ADF.

SmartZone et OmniLink

Permet aux radios compatibles SmartZone de passer d'une zone SmartZone à une autre dans le même système OmniLink. OmniLink s'applique aux canaux ADF pris en charge par OmniLink.

REMARQUE :

Pour les systèmes ASTRO 25 : Le fonctionnement est limité aux sites et aux zones dans un même système OmniLink.

Pour les systèmes Type II : Le fonctionnement est limité aux sites dans un ensemble de systèmes ADF interconnectés.

Itinérance intra-WACN

L'itinérance intra-WACN offre aux radios compatibles Project 25 une capacité d'itinérance automatique entre tous les ID de système d'un même réseau de communication étendu, sans aucune intervention de votre part. Voir aussi ID WACN d'accueil.

REMARQUE :

Pour les systèmes ASTRO 25 : Le fonctionnement est limité aux systèmes ADF dans un seul WACN.

AVERTISSEMENT :

L'itinérance intra-WACN est non valide dans les cas suivants :
lorsque le Type de système est Type II, ou

lorsque la case Activer le matériel DVRS est **cochée**, ou

lorsque le champ Radio double - Sélection de radio est réglé à **Radio secondaire** et lorsque le champ Activer la transmission sur radio secondaire est **désactivé**.

Itinérance inter-WACN

L'itinérance inter-WACN offre aux radios compatibles Project 25 des groupes sélectionnés une capacité d'itinérance automatique entre tous les réseaux de communication étendus (WACN), sans aucune intervention de votre part.

AVERTISSEMENT :

L'itinérance inter-WACN est non valide dans les cas suivants :
lorsque le Type de système est Type II, ou

lorsque la case Activer le matériel DVRS est **cochée**, ou

lorsque le champ Radio double - Sélection de radio est réglé à **Radio secondaire** et lorsque le champ Activer la transmission sur radio secondaire est **désactivé**, ou

lorsque le LTE large bande du système est **activé**.

Le LTE est activé sur un système ADF lorsqu'un profil de données avec un type de profil de données associé équivaut à **ADF et large bande** ou **Large bande uniquement** et lorsque le champ Source large bande a la valeur **Modem LTE interne**.

Les systèmes compatibles SmartZone et Project 25 sont également configurés dans les champs SmartZone - Tous les ADF et les champs Constantes de filtre - Tous les ADF.

10.38.1.5

ID de RFSS

Ce champ permet de sélectionner le numéro d'identification (en format décimal ou hexadécimal) du RFSS (sous-système de fréquence radioélectrique) ADF du système ASTRO 25.

REMARQUE :

Un RFSS se compose d'un ou de plusieurs sites. Cette sélection s'applique au système ADF courant.

Accès seulement : lors de la sélection d'un fichier de clé de système du logiciel ou d'une clé de système avancée avec accès dans le champ ID système, ou lors de la sélection d'une clé WACN avancée avec accès dans le champ ID WACN d'accueil, lorsque le champ Type de système est réglé

à **ASTRO 25**, et lorsque le champ [Type de couverture à la page 517](#) est réglé à **SmartZone** ou à **Désactivé**, et lorsque le modèle ou l'option de la radio le permet.

AVERTISSEMENT :

La plage de sélection est modifiable par clé avancée au moyen du programme de gestion des clés de système avancées.

Tableau 266 : Portée

Minimum	Maximum
01 (hexadécimal)	FE (hex)

10.38.1.6

ID du site

Permet de sélectionner le numéro d'identification (en format décimal ou hexadécimal) de l'état voulu des sites pour le système ADF courant de type ASTRO 25.

Accès seulement : lors de la sélection d'un fichier de clé de système du logiciel ou d'une clé de système avancée avec accès dans le champ ID système, ou lors de la sélection d'une clé WACN avancée avec accès dans le champ ID WACN d'accueil, lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le champ [Type de couverture à la page 517](#) est réglé à **Désactivé**, et lorsque le modèle ou l'option de la radio le permet.

AVERTISSEMENT :

La plage de sélection est modifiable par clé avancée au moyen de l'outil Gestionnaire de clés avancées.

Tableau 267 : Portée

Minimum	Maximum
01 (hexadécimal)	FE (hex)

10.38.1.7

Temps de réponse RFSS

Ce champ permet de sélectionner le temps de réponse RFSS (sous-système de fréquence radioélectrique).

Il s'agit de la durée de base (minimale) pendant laquelle la radio réceptrice (extrémité fixe) attend que l'équipement de réseau fixe (FNE) réponde à son paquet de signaux entrants avant d'effectuer un autre essai.

REMARQUE :

Une durée aléatoire est ajoutée à cette durée de base pour éviter que toutes les radios du système fassent un essai en même temps. Cette sélection s'applique au système ADF courant. La durée est exprimée en millisecondes.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 268 : Portée

Minimum	Maximum	Incréments
25 ms	6 375 ms	25 ms

10.38.1.8

Minuterie antirebond RFSS

Ce champ permet de sélectionner le temps minimal d'arrêt d'inscription de la minuterie antirebond RFSS (sous-système de fréquence radioélectrique) de la radio pendant le passage des signaux entre les différents sous-systèmes.

**REMARQUE :**

Lorsqu'une radio reconnaît un RFSS, aucune demande visant à passer à un autre RFSS ne sera transmise jusqu'à ce que le temps indiqué soit écoulé. Cette sélection s'applique au système ADF courant.

Accès seulement : Lorsque le champ [Type de couverture à la page 517](#) est réglé à **SmartZone et OmniLink** ou **Itinérance Intra-WACN** ou **Itinérance Inter-WACN**, et lorsque le modèle et les options de la radio le permettent.

Tableau 269 : Portée

Minimum	Maximum
1 s	10 s

10.38.1.9

Recherche de sites non adjacents

Ce champ permet à la radio de rechercher dans sa liste programmée de canaux de contrôle un site dont le signal est plus fort.

Ainsi, la radio peut effectuer un déplacement vers ce site et l'utiliser, même s'il n'est pas considéré comme un FNE (équipement de réseau fixe) adjacent au site d'accueil courant de la radio, mais que l'intensité de son signal est acceptable ou élevée.

**REMARQUE :**

Cela est vrai uniquement si le site d'accueil courant et ses sites adjacents FNE s'inscrivent tous à un certain niveau se situant sous le seuil RSSI acceptable défini par RSSI. Cette fonction s'applique au système ADF courant.

**IMPORTANT :**

Lors du fonctionnement dans une zone de faible couverture, cette fonction permet à la radio de faire une recherche, toutes les deux minutes environ, dans la liste définie de canaux de contrôle. Durant ce temps de recherche, la radio ne surveille pas le canal de contrôle de la station d'accueil et, par conséquent, risque de rater certains signaux audio. Le temps de recherche peut durer jusqu'à quatre secondes selon le nombre de canaux de contrôle se trouvant dans la liste de canaux du système ADF.

Accès seulement : lorsque le champ [Type de couverture à la page 517](#) n'est pas réglé à **Désactivé** et que le modèle ou l'option de la radio le permet.

10.38.1.10

Sélection du profil de données

Ce champ permet de sélectionner le profil de données à utiliser avec le système ADF courant de type ASTRO 25.

**AVERTISSEMENT :**

Lorsque le champ Radio Double - Sélection radio est réglé à **Radio secondaire** et que le champ Activer la transmission sur radio secondaire est **désactivé**, ce champ doit être réglé à **Données désactivées**; autrement, il est considéré comme non valide.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25** et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Données désactivées

Aucune capacité de données.

Profils de données disponibles

AVERTISSEMENT :

Un profil de données avec un réseau LTE large bande activé ne peut pas être sélectionné lorsque le [Type de couverture à la page 517](#) du système ADF courant est réglé à **Itinérance Inter-WACN**, ou lorsque le champ Interférence de fréquence LTE présente du système est réglé à **Vrai**.

Le LTE est activé sur un Profil de données pour un système ADF lorsque son type de profil de données est **ADF et Large bande** ou **Large bande uniquement**.

10.38.2

Canaux de Commande (système à Commutation Automatique de Canaux ASTRO 25)

La section **Canaux de Commande** de l'ensemble système à Commutation Automatique de Canaux ASTRO 25 permet à l'utilisateur de visualiser ou de définir les fréquences de réception et d'émission pour les Canaux de Commande. Un maximum de 250 canaux de contrôle peut être créé sur un système ADF individuel, selon les besoins.

REMARQUE :

Pour les modèles de radio contenant un micrologiciel dont la version est antérieure à la version R12.01.00, le nombre maximum de canaux de contrôle est de 128.

IMPORTANT :

Les systèmes ADF individuels sont référencés dans une personnalité ADF. Une fois utilisés comme référence, les paramètres de ce système sont ainsi activés pour tous les types de canaux contenus dans la personnalité ADF.

Il est avantageux de trier les fréquences de canal de contrôle par ordre croissant dans un système SmartZone! Lorsqu'elle doit passer en mode dégradé, la radio utilise le premier canal de contrôle en tant que canal de mode dégradé. En triant les canaux par ordre croissant (ou au moins dans un ordre qui facilite le recours au mode Failsoft), on peut éviter les problèmes tels que la syntonisation de canaux Failsoft différents par de multiples radios.

Les champs suivants sont pris en charge :

10.38.2.1

Fréquence Rx

Ce champ vous permet d'entrer une fréquence Rx (réception) de canal de contrôle pour le système ADF courant.

AVERTISSEMENT :

Les contraintes de fréquence ADF qui sont appliquées à cette sélection sont déterminées par la bande de fréquences de ce système.

Accès seulement : Lorsqu'un fichier de clé du système logicielle ou une clé de système avancée avec accès est sélectionnée dans le champ ID du système, ou qu'une clé WACN avancée avec accès est sélectionnée dans le champ ID WACN d'accueil et que le modèle ou l'option de la radio le permet.

10.38.2.2

Fréquence Tx

Ce champ permet de sélectionner une fréquence Tx (transmission) de canal de contrôle pour le système ADF courant.

**AVERTISSEMENT :**

Les contraintes de fréquence ADF qui sont appliquées à cette sélection sont déterminées par le type et la bande de fréquences de ce système. Pour les systèmes ADF de Type II, ce champ est en lecture seule uniquement lorsque [Bande de fréquences de type II à la page 519](#) est de 700/800 MHz ou 900 MHz.

Accès seulement : Lors de la sélection d'un fichier de clé de système du logiciel ou d'une clé de système avancée avec accès dans le champ ID du système ou d'une clé SACN avancée avec accès dans le champ ID WACN d'accueil, lorsque le champ Type de système est réglé à **Type II** et que le champ [Bande de fréquences de type II à la page 519](#) n'est pas réglé à **700/800** ou à **900** MHz, et lorsque le modèle ou l'option de la radio le permet.

10.38.3

ID de canal ASTRO 25

Cette section permet d'afficher ou de définir des réglages relatifs aux fréquences pour les communications ASTRO 25.

**AVERTISSEMENT :**

Ces paramètres sont utilisés pour valider toutes les fréquences de canal de contrôle et de mode dégradé ASTRO 25 pour ADF autre bande (OBT) ou 700/800/900 Mhz entrées Ces réglages s'appliquent à des systèmes ADF individuels.

**REMARQUE :**

Une fois que les réglages propres aux ID de canal ASTRO 25 ont été définis, il est possible de préciser les fréquences de canal de contrôle du système ADF et les fréquences de mode dégradé de la personnalité ADF.

Les systèmes ADF individuels sont référencés dans une personnalité ADF. Les paramètres de ce système ADF sont ainsi activés pour tous les types de canaux contenus dans cette personnalité ADF.

**AVERTISSEMENT :**

Chaque enregistrement de champs ID de canal contient des paramètres relatifs aux fréquences utilisées – règles de contrainte de fréquence ADF pour la validation de toutes les fréquences de canal de commande et de mode dégradé 25 OBT ou 700/800/900 MHz.

Accès seulement : lorsque le champ Type de système est réglé à **ASTRO 25**.

10.38.3.1

Activer l'identificateur

Ce champ permet d'activer les sélections d'identifiant de canal (ID) pour le même ID de canal (enregistrement/rangée).

Cette sélection s'applique au système ADF courant de type ASTRO 25.

AVERTISSEMENT :

Chaque enregistrement de sélections ID de canal contient des paramètres relatifs aux fréquences – règles de contrainte de fréquence ADF pour la validation de toutes les fréquences de canal de commande et de mode dégradé ASTRO 25 OBT ou 700/800/900 MHz.

REMARQUE :

Le premier enregistrement /rangée dans cette page ID de canal ASTRO 25 doit être activé pour être considéré comme valide.

Une fois les réglages des rangées ou des enregistrements associés à l'ID de canal ASTRO 25 définis, il est possible de préciser les fréquences de canal de contrôle du système ADF et les fréquences en mode dégradé de la personnalité ADF.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25**, et ([lors de la sélection d'un fichier de clé de système du logiciel ou d'une clé de système avancée avec accès dans le champ ID système] ou [lors de la sélection d'une clé WACN avancée avec accès dans le champ ID WACN d'accueil]), et lorsque le champ est activé pour l'ID de canal ASTRO 25 courant (enregistrement/rangée), et lorsque le modèle ou l'option de la radio le permet.

10.38.3.2

Type de canal

Ce champ permet de sélectionner le type de protocole pour canal de trafic à utiliser avec l'ID de canal ASTRO 25 (rangée ou enregistrement) courant, soit FDMA (accès multiple par répartition en fréquence) ou TDMA (accès multiple par répartition dans le temps).

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le champ [Activer l'identificateur à la page 587](#) est activé pour l'ID de canal ASTRO 25 courant (enregistrement/rangée), et lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

FDMA

Le système ADF prend en charge l'accès multiple par répartition en fréquence.

TDMA

Le système ADF prend en charge l'accès multiple par répartition dans le temps.

REMARQUE :

La sélection s'applique au canal vocal.

10.38.3.3

Signe de décalage de transmission

Ce champ permet de sélectionner le signe (plus ou moins) de décalage de transmission pour l'ID de canal ASTRO 25 (enregistrement/rangée) courant.

Cette sélection s'applique au système ADF courant de type ASTRO 25.

AVERTISSEMENT :

Chaque enregistrement de sélections ID de canal contient des paramètres relatifs aux fréquences – règles de contrainte de fréquence ADF pour la validation de toutes les fréquences de canal de commande et de mode dégradé ASTRO 25 OBT ou 700/800/900 MHz.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25**, et ([lors de la sélection d'un fichier de clé de système du logiciel ou d'une clé de système avancée avec accès dans le champ ID système] ou [lors de la sélection d'une clé WACN avancée avec accès dans le champ ID WACN d'accueil]), et lorsque le champ [Activer l'identificateur à la page 587](#) est activé pour l'ID de canal ASTRO 25 courant (enregistrement/rangée), et lorsque le modèle ou l'option de la radio le permet.

10.38.3.4

Décalage de transmission

Ce champ permet d'entrer le décalage de transmission (en MHz) associé à l'ID de canal ASTRO 25 (enregistrement/rangée) courant.

Cette sélection s'applique au système ADF courant de type ASTRO 25.

**AVERTISSEMENT :**

Chaque enregistrement de sélections ID de canal contient des paramètres relatifs aux fréquences – règles de contrainte de fréquence ADF pour la validation de toutes les fréquences de canal de commande et de mode dégradé ASTRO 25 OBT ou 700/800/900 MHz.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25**, et ([lors de la sélection d'un fichier de clé de système du logiciel ou d'une clé de système avancée avec accès dans le champ ID système] ou [lors de la sélection d'une clé WACN avancée avec accès dans le champ ID WACN d'accueil]), et lorsque le champ [Activer l'identificateur à la page 587](#) est activé pour l'ID de canal ASTRO 25 courant (enregistrement/rangée), et lorsque le modèle ou l'option de la radio le permet.

10.38.3.5

Séparation des canaux

Ce champ permet d'entrer la valeur de séparation des canaux associée à l'ID de canal ASTRO 25 (enregistrement/rangée) courant.

Cette sélection s'applique au système ADF courant de type ASTRO 25.

**AVERTISSEMENT :**

Chaque enregistrement de sélections ID de canal contient des paramètres relatifs aux fréquences – règles de contrainte de fréquence ADF pour la validation de toutes les fréquences de canal de commande et de mode dégradé ASTRO 25 OBT ou 700/800/900 MHz.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25**, et ([lors de la sélection d'un fichier de clé de système du logiciel ou d'une clé de système avancée avec accès dans le champ ID système] ou [lors de la sélection d'une clé WACN avancée avec accès dans le champ ID WACN d'accueil]), et lorsque le champ [Activer l'identificateur à la page 587](#) est activé pour l'ID de canal ASTRO 25 courant (enregistrement/rangée), et lorsque le modèle ou l'option de la radio le permet.

10.38.3.6

Fréquence de base

Ce champ vous permet d'entrer des fréquences dans la plage de bandes de fréquences de la radio comme la valeur de la fréquence de base pour l'ID de canal ASTRO 25 (enregistrement/rangée).

**AVERTISSEMENT :**

Chaque enregistrement de sélections ID de canal contient des paramètres relatifs aux fréquences – règles de contrainte de fréquence ADF pour la validation de toutes les fréquences de canal de commande et de mode dégradé ASTRO 25 OBT ou 700/800/900 MHz.

**IMPORTANT :**

Une fois les réglages des rangées ou des enregistrements associés à l'ID de canal ASTRO 25 définis, il est possible de préciser les fréquences de canal de contrôle du système ADF et les fréquences en mode dégradé de la personnalité ADF.

Pour que l'algorithme interne soit valide, la valeur de cette fréquence de base doit être égale ou inférieure aux fréquences du canal de contrôle et de la réception en mode dégradé.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25**, et ([lors de la sélection d'un fichier de clé de système du logiciel ou d'une clé de système avancée avec accès dans le champ ID système] ou [lors de la sélection d'une clé WACN avancée avec accès dans le champ ID WACN d'accueil]), et lorsque le champ [Activer l'identificateur à la page 587](#) est activé pour l'ID

de canal ASTRO 25 courant (enregistrement/rangée), et lorsque le modèle ou l'option de la radio le permet.

N'importe quelle fréquence comprise dans les bandes de fréquences de la radio.

10.38.4

Fonctions (Système ADF ASTRO 25)

La section **Fonctions** de l'ensemble Système ADF ASTRO 25 permet à l'utilisateur d'afficher ou de modifier les paramètres de chaque système ADF.

REMARQUE :

Les systèmes ADF individuels sont référencés dans une personnalité ADF. Les paramètres de ce système ADF sont ainsi activés pour tous les types de canaux contenus dans cette personnalité ADF.

10.38.4.1

Blocage de la radio

Ce champ permet à la radio de recevoir une commande de blocage à distance et d'y répondre lorsqu'elle fonctionne selon le système ADF courant.

C'est le répartiteur qui envoie cette commande. Une fois que la radio l'a reçue, elle transmet un avis à l'équipement de répartition, puis passe à l'état dormant. Pendant le blocage, le récepteur audio se met en sourdine et la voie de transmission est bloquée, toutes les commandes sont désactivées, le mode balayage cesse de fonctionner sur le canal de réception de la commande et tous les voyants DEL de la radio s'éteignent.

AVERTISSEMENT :

Lorsque le champ Type de système est réglé à **ASTRO 25** et lorsque le champ **Index de profil ASTRO OTAR** est activé (pour le système ADF courant) et lorsque le champ Configuration sécurisée, **Blocage de la radio par ASTRO OTAR** est activé, ce champ peut être désactivé. Le blocage de la radio est alors effectué par la fonction « ASTRO OTAR ».

Lorsque le champ Type de système est réglé à **ASTRO 25** et lorsque le champ Index de profil ASTRO OTAR est désactivé (pour le système ADF courant), ce champ doit être activé. La radio peut ainsi être bloquée par l'intermédiaire du système ADF **ASTRO 25**.

Lorsque le champ Type de système est réglé à **Type II** et lorsque la valeur du champ ID du système, Système ADF, correspond à l'**ID de clé** d'un des fichiers de clé de système du logiciel ou de clé de système avancée (voir le rapport de la clé du système), ce champ peut être désactivé. Dans ce cas, les commandes de blocage de la radio reçues sur ce système ADF sont ignorées, et la radio continue de fonctionner normalement.

Lorsque le champ Configuration sécurisée - **Blocage de la radio par Index de profil ASTRO OTAR** est activé, et lorsque le champ **Index de profil ASTRO OTAR** est activé (pour le système ADF courant), ce champ peut être désactivé. Le blocage de la radio est alors effectué par le biais de la fonction ASTRO OTAR.

Ce champ doit être activé lorsque le champ Index de profil ASTRO OTAR (pour le système ADF actuel) est désactivé. La radio peut ainsi être bloquée par l'intermédiaire du système ADF **ASTRO 25**.

IMPORTANT :

Pour annuler l'état dormant de la radio, il faut lui envoyer une commande de déblocage.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.38.4.2

Service de messagerie texte

Ce champ permet de sélectionner le mode de messagerie texte du système ADF courant.

**REMARQUE :**

Vous accédez à la messagerie texte en appuyant sur la touche Service de messagerie texte ou en utilisant la sélection de menu Service de messagerie texte.

Vous accédez à la fonction de messagerie texte rapide à l'aide de la touche Texte rapide TMS.

Vous accédez à la fonction de messagerie de requête à l'aide de la touche Requête TMS.

Accès seulement : lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le système ADF courant a un profil de données référencé, et la sélection du profil de données n'est pas réglée à **Données désactivées**.

Les sélections suivantes sont prises en charge :

Aucun

La fonction est désactivée.

Liste seulement

Permet de sélectionner uniquement les messages texte dans la liste des messages texte rapide.

Illimité

Permet de faire une sélection parmi les messages texte rapide et d'entrer vos propres messages texte à partir du clavier de la radio.

**AVERTISSEMENT :**

Cette sélection est seulement disponible sur les radios dotées d'un clavier ou d'un microphone à clavier.

**REMARQUE :**

Cette sélection ne s'applique pas à l'APX N70.

10.38.4.3

Niveau de puissance Tx

Ce champ permet de sélectionner le niveau de puissance de transmission de la radio pour le système ADF courant.

La touche Tx à faible tension, le commutateur Tx à faible tension et la fonction de menu Alimentation ont préséance sur ce réglage lorsque vous le sélectionnez.

**REMARQUE :**

En mode d'urgence, la radio transmet à puissance élevée.

Il est possible de réduire la puissance de transmission à 1 watt sur les modèles à 800 MHz, et à 2 watts sur les modèles VHF et UHF.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Faible

Niveau utilisé pour les communications effectuées à proximité, ce qui empêche la radio de transmettre des signaux à d'autres groupes géographiques se servant de la même fréquence.

Élevé

Niveau utilisé lorsqu'on a besoin d'un signal de plus forte intensité afin d'élargir la zone de transmission.

10.38.4.4

Surveillance à distance/Traceur radio\Activer

Ce champ permet à la radio de décoder une commande de surveillance à distance ou de traceur radio pour le système ADF courant.

AVERTISSEMENT :

Le **Traceur radio** s'applique seulement au système de **type II**. De plus, seulement pour un système de **type II**, et pour la **surveillance à distance** et le **traceur radio**, la radio s'active durant la période indiquée dans le champ Surveillance à distance/Traceur radio - Temps de base Tx.

REMARQUE :

Dans le cas d'un type de système **ASTRO 25**, le temps de transmission sur le terrain est défini par le répartiteur et est inclus dans la commande de **surveillance à distance** émise.

À la réception d'une commande de **surveillance à distance**, la radio se met en marche automatiquement et transmet le son capté par son microphone. Cela est particulièrement utile en cas d'appel de détresse.

La **surveillance à distance** est aussi appelée **surveillance radio**.

À la réception d'une commande de **traceur radio**, la radio se met automatiquement en marche et envoie une onde porteuse non modulée qui permet de trouver une radio volée ou perdue. Le **Traceur radio** s'applique seulement au système de **type II**.

Applicable seulement :

Pour APX 7000XE et APX 6000, cette fonction s'applique seulement lorsque l'option du système H43 est disponible pour la radio. De plus, la radio requière une version de micrologiciel R05.xx.xx ou ultérieure, et l'APX doit être de version R05.xx.xx ou supérieure.

Pour APX 6500, cette fonction s'applique seulement lorsque l'option du système G170 est disponible pour la radio. De plus, la radio requière une version de micrologiciel R05.xx.xx ou ultérieure, et l'APX doit être de version R05.xx.xx ou supérieure.

10.38.4.5

Indicateur Rx d'alarme d'urgence

Ce champ permet d'activer sur la radio un indicateur audio ou visuel (ou les deux) qui se déclenche lorsqu'une alarme d'urgence est détectée en provenance d'une autre radio.

Le type d'indicateur est déterminé par la valeur du champ Type d'indicateur de réception d'alarme d'urgence. Cette fonction s'applique au système ADF courant.

IMPORTANT :

La durée de l'indicateur de réception d'alarme d'urgence est de 10 secondes. Pendant ces 10 secondes, vous pouvez désactiver l'indicateur en appuyant sur n'importe quelle touche, sauf celles du volume et des lumières (affichage).

Une fois que l'indicateur s'éteint ou est désactivé, les alarmes d'urgence retransmises par la même ID d'unité de système ADF ne sont pas acceptées au cours des 20 secondes suivantes.

Les alarmes d'urgence ne sont pas détectées lorsque la radio est en mode balayage.

Les alarmes d'urgence peuvent ne pas être détectées lorsque la radio n'est pas en train de surveiller ou de décoder le canal de contrôle (par exemple, activité sur un canal vocal ou de données, cueillette d'échantillons RSSI, etc.).

Accès seulement : Lorsque le champ Type d'indicateur de réception d'alarme d'urgence n'est pas réglé à **Aucune indication** et lorsque le modèle ou l'option de la radio le permet.

10.38.4.6

DEL sécuritaire

Ce champ permet de faire clignoter le voyant DEL d'occupation jaune chaque fois qu'un appel vocal sécurisé (chiffré) est reçu; ce voyant continue de clignoter tant et aussi longtemps que l'appel demeure sécurisé.

Il n'est pas nécessaire que la radio désactive la sourdine à la réception d'un signal vocal pour que le voyant clignote. La fonction DEL sécuritaire s'applique au système ADF courant.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.38.4.7

Sélection de la liste d'alertes de site sélectionnables

Ce champ permet de sélectionner l'alerte de site sélectionnable à utiliser avec le système ADF ASTRO 25 courant.

REMARQUE :

La fonction de liste d'alertes de site sélectionnables dans la page Liste d'alertes de site sélectionnables.

Vous pouvez activer ou désactiver les alertes de site sélectionnables à l'aide de la sélection de menu Alerte de site sélectionnable. Il est possible de sélectionner un seul site ou tous les sites disponibles de la zone pour l'activation ou la désactivation d'une alerte de site sélectionnable.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25** et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

- Désactivé;
- Listes d'alertes de site sélectionnables disponibles

AVERTISSEMENT :

Les sélections de liste peuvent être effectuées uniquement lorsque le champ [Type de couverture à la page 517](#) est réglé à **Désactivé** ou que le champ Type de couverture n'est pas réglé à **Désactivé**, et que le champ [Activer l'alias du site à la page 539](#) est réglé à **Activé**. Autrement, une sélection de liste est considérée comme non valide.

10.38.4.8

Activer le regroupement dynamique

Ce champ permet d'activer un groupe de regroupement dynamique pour une personnalité ADF ou un canal associé au système ADF courant.

**REMARQUE :**

Lorsque ce champ est activé, une [Regroupement dynamique/Zone à la page 530](#) et un [Regroupement dynamique/Canal à la page 530](#) doivent être sélectionnés pour ce système ADF.

**AVERTISSEMENT :**

Une configuration de Regroupement dynamique est valide uniquement lorsque l'une des personnalités ADF associées à un canal a son champ Groupe ADF réglé à **DYN** (regroupement dynamique), et que la zone et le canal sélectionnés de cette personnalité correspondent aux sélections des champs Zone de regroupement dynamique et Canal de regroupement dynamique dans le système ADF référencé des personnalités.

**IMPORTANT :**

Ainsi, un seul canal (au sein d'un système ADF donné) peut être le canal de regroupement dynamique.

Vous pouvez demander une nouvelle attribution de regroupement dynamique auprès du répartiteur au moyen du bouton Demande de reprogrammation ou utiliser l'option de menu Demande de reprogrammation. Les fonctions et les paramètres du groupe d'un regroupement dynamique sont définis et retransmis par le répartiteur.

Pour que le groupe de conversation d'un regroupement dynamique puisse transmettre en mode sécurisé, l'utilisateur doit pouvoir utiliser le bouton associé à la fonction Sélection de Tx sécurisée ou le commutateur Sélection de Tx sécurisée ou l'option de menu Sécurisé; sinon, le groupe de conversation devra transmettre en mode **non chiffré**.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.38.4.9

Regroupement dynamique/Zone

Ce champ permet de sélectionner la zone de la personnalité/canal ADF de regroupement dynamique qui renvoie au système ADF courant.

**AVERTISSEMENT :**

Les zones d'interface de site à distance (RSI) ne sont pas valides et ne peuvent pas être sélectionnées (zones pour lesquelles le mode RSI est activé).

**REMARQUE :**

Vous pouvez demander une nouvelle attribution de regroupement dynamique auprès du répartiteur au moyen du bouton Demande de reprogrammation ou utiliser l'option de menu Demande de reprogrammation. Les fonctions et les paramètres du groupe d'un regroupement dynamique sont définis et retransmis par le répartiteur.

Pour que le groupe de conversation d'un regroupement dynamique puisse transmettre en mode sécurisé, l'utilisateur doit pouvoir utiliser le bouton associé à la fonction Sélection de Tx sécurisée ou le commutateur Sélection de Tx sécurisée ou l'option de menu Sécurisé; sinon, le groupe de conversation devra transmettre en mode **non chiffré**.

Lorsque [Activer le regroupement dynamique à la page 529](#) est **activé**, une zone de regroupement dynamique et un [Regroupement dynamique\Canal à la page 530](#) doivent être sélectionnés pour le système ADF actuel.

**AVERTISSEMENT :**

Les Zones sélectionnées dans ce champ doivent avoir la fonction Activation zone dynamique désactivée; sinon, ce champ devient non valide.

Une configuration de Regroupement dynamique est valide uniquement lorsque l'une des personnalités ADF associées à un canal a son champ Groupe ADF réglé à **DYN** (regroupement dynamique), et que la zone et le canal sélectionnés de cette personnalité correspondent aux sélections des champs Zone de regroupement dynamique et Canal de regroupement dynamique dans le système ADF référencé des personnalités.

**IMPORTANT :**

Ainsi, un seul canal (au sein d'un système ADF donné) peut être le canal de regroupement dynamique.

Accès seulement : Lorsque le champ [Activer le regroupement dynamique à la page 529](#) est réglé à **Activé** et lorsque le modèle ou l'option de la radio le permet.

10.38.4.10

Regroupement dynamique\Canal

Ce champ permet de sélectionner une personnalité ADF ou un canal de regroupement dynamique associé au système ADF courant.

Voir également [Regroupement dynamique/Zone à la page 530](#).

REMARQUE :

Vous pouvez demander une nouvelle attribution de regroupement dynamique auprès du répartiteur au moyen du bouton Demande de reprogrammation ou utiliser l'option de menu Demande de reprogrammation. Les fonctions et les paramètres du groupe d'un regroupement dynamique sont définis et retransmis par le répartiteur.

Pour que le groupe de conversation d'un regroupement dynamique puisse transmettre en mode sécurisé, l'utilisateur doit pouvoir utiliser le bouton associé à la fonction Sélection de Tx sécurisée ou le commutateur Sélection de Tx sécurisée ou l'option de menu Sécurisé; sinon, le groupe de conversation devra transmettre en mode **non chiffré**.

Lorsque [Activer le regroupement dynamique à la page 529](#) est **activé**, une zone et un canal de regroupement dynamique doivent être sélectionnés pour ce système ADF.

AVERTISSEMENT :

Une configuration de Regroupement dynamique est valide uniquement lorsque l'une des personnalités ADF associées à un canal a son champ Groupe ADF réglé à **DYN** (regroupement dynamique), et que la zone et le canal sélectionnés de cette personnalité correspondent aux sélections des champs Zone de regroupement dynamique et Canal de regroupement dynamique dans le système ADF référencé des personnalités.

IMPORTANT :

Ainsi, un seul canal (au sein d'un système ADF donné) peut être le canal de regroupement dynamique.

AVERTISSEMENT :

Pour les codeplug de radios portatives APX™ 3000, seuls les 48 premiers canaux de la zone de regroupement dynamique sélectionnée sont considérés comme des sélections valides.

Accès seulement : Lorsque le champ [Activer le regroupement dynamique à la page 529](#) est **activé**, et lorsque le champ Zone de regroupement dynamique n'est pas une zone dynamique, et lorsque le modèle et les options de la radio le permettent.

10.38.4.11

Service de messagerie texte de groupe

Ce champ permet de sélectionner le mode Service de messagerie texte de groupe pour le système ADF ASTRO 25 courant.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25** et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Désactivé;

Le message texte de groupe ne sera pas reçu.

Décodage intégral

Le message texte de groupe sera reçu.

10.38.4.12

Interférence de fréquence LTE présente

L'application permet d'afficher en lecture seule (Vrai ou Faux) lorsque la table ID de canal ASTRO 25 contient une fréquence de base de 700 MHz pouvant causer des interférences sur un canal LTE large bande.

Un profil de données défini dans un système ADF dont le type de profil de données est **Large bande** et dont la Source large bande est réglée à **Modem LTE interne** crée un canal ADF à fonction LTE large bande. Ainsi, lorsque la capacité LTE large bande est activée, et qu'une fréquence de base

dans la table contient une fréquence dans la bande 700 MHz, ce champ indique **Vrai** pour le potentiel d'interférence de fréquence. Cette fonction s'applique au système ADF de type ASTRO 25 actuel.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

IMPORTANT :

Cette fonction est uniquement disponible dans l'Affichage expert (voir Affichage codeplug)

10.38.4.13

de Sélection de la liste d'imputabilité du personnel

Ce champ vous permet de sélectionner une Liste de localisation du personnel à utiliser tout en utilisant un système ADF.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25** et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

- Désactivé;
- Localisation du personnel disponible

10.38.4.14

Emplacement sur PTT

Le système ASTRO 25 permet aux radios APX de transmettre la position GPS à l'infrastructure via les trames de voix, sur le canal vocal après avoir appuyé sur le PTT.

Ceci permet de voir la position de la radio émettrice sur l'application de cartographie.

AVERTISSEMENT :

Le mode ARS doit être réglé à **Serveur amélioré** dans le dossier du profil de données afin d'empêcher la génération de rapports sur les champs non valides.

Accès seulement : lorsque le modèle ou l'option de la radio le permet, et lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le mode ARS est réglé à **Serveur amélioré** dans son profil de données, et lorsque le champ [Activer l'emplacement à la page 119](#) est activé.

10.38.4.15

Mise à jour d'alias radio OTA activée

Permet au système courant de mettre à jour l'alias radio.

Accès seulement : Lorsque l'option Activer l'alias radio est activée, le type de système est **ASTRO 25**, lorsque le champ Type d'alias radio OTA n'est pas **Désactivé** et lorsque le modèle ou les options de la radio le permettent.

10.38.4.16

Type d'alias radio OTA

Configure le codage (émission) et le décodage (réception) de la fonction d'alias radio OTA (Over The Air).

AVERTISSEMENT :

La radio ne peut pas afficher l'alias radio si la radio reçoit des ID en double jusqu'à ce que le double soit retiré. L'écriture sur la radio fera en sorte que la liste d'appel retournera à son état d'origine et toutes les mises à jour d'alias OTA seront perdues.

IMPORTANT :

Si la mise à jour d'alias OTA ne s'est pas affichée à l'écran, l'utilisateur radio doit mettre à jour la liste d'appel de la radio dans RadioCentral ou dans le gestionnaire d'approvisionnement.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Désactivé;

La radio ne transmet ni ne reçoit les données d'alias de la radio.

Décoder uniquement

Les données d'alias de la radio reçoivent les données sans aucune limite.

10.38.4.17

Réinitialisation ICUA

Ce champ permet de sélectionner une exception différée ou manuelle de désactivation de la sourdine applicable aux alertes d'appel/notifications ADF lorsque le canal est réglé à « Activer l'alerte utilisateur en appel ».

La durée de l'exception (différée ou manuelle) est appelée période d'arrêt du silencieux. Pour les deux sélections différées présentées, le champ [Minuterie de réinitialisation ICUA automatique à la page 532](#) (du système ADF courant) détermine en partie la durée de la période d'arrêt du silencieux. Cette période commence lorsque la fonction Alerte utilisateur en appel pour la mise en sourdine de la voix est active et que la sourdine de la radio est désactivée. Cette sélection s'applique au système ADF courant.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Manuelle

Lorsque vous activez l'alerte utilisateur en appel, que vous appuyez sur la touche Mettre la voix en sourdine ou choisissez la commande de menu Mettre la voix en sourdine, cela désactive la mise en sourdine de la voix et met fin à la période d'arrêt du silencieux. La touche PTT permet de mettre fin à la période d'arrêt du silencieux.

Auto

Si la minuterie vient à échéance, que la sourdine soit activée ou non, la période d'arrêt du silencieux prend fin et les règles associées à la fonction Activer l'alerte utilisateur en appel pour la mise en sourdine de la voix devront de nouveau être appliquées pour désactiver la sourdine lors de prochaines transmissions.

Auto avec porteuse

Si la sourdine de la radio est désactivée lorsque la minuterie vient à échéance (en raison d'un silencieux de porteuse), la sourdine demeure désactivée jusqu'à ce que l'onde porteuse ne soit plus utilisée. Lorsque l'onde porteuse n'est plus captée et que la radio est mise en sourdine, la minuterie est réinitialisée et redémarrée, ce qui a pour effet de prolonger la période d'arrêt du silencieux. Si, par la suite, la sourdine de la radio reste active pendant tout le temps prévu à la minuterie (sans remplacement de l'onde porteuse), la période d'arrêt du silencieux prendra fin et les règles associées à la fonction Activer l'alerte utilisateur en appel pour la mise en sourdine de la voix devront de nouveau être appliquées pour désactiver la sourdine lors de prochaines transmissions.

10.38.4.18

Minuterie de réinitialisation ICUA automatique

Ce champ permet de sélectionner la durée utilisée au cours de l'exception de désactivation de la sourdine s'appliquant aux alertes d'appel et aux notifications en ADF, pendant laquelle la voix est mise en sourdine sur le canal (case Activer l'alerte utilisateur en appel cochée).

Le temps de l'exception correspond à la période d'arrêt du silencieux. Ce temps s'applique seulement aux deux fonctions différées du champ Réinitialisation durant l'appel. Cette sélection s'applique au système ADF courant. La durée est exprimée en secondes.

Accès seulement : Lorsque le champ [Réinitialisation ICUA à la page 531](#) n'est pas réglé à **Manuel** et lorsque le modèle ou les options de la radio le permettent.

Tableau 270 : Portée

Minimum	Maximum	Incréments
0 s	255 s	1 s

10.38.4.19

Voyant DEL d'occupation

Lorsque ce champ est activé, le voyant DEL jaune occupé clignote chaque fois qu'un appel vocal est reçu.

REMARQUE :

Le voyant DEL jaune occupé continue de clignoter tant que l'activité vocale actuelle est en cours.

10.38.5

Alias d'état (Système ADF ASTRO 25)

Les **Alias d'état** de l'ensemble Système ADF ASTRO 25 permet à l'utilisateur d'afficher ou de définir des états pour des systèmes ADF distincts. Les utilisateurs peuvent ensuite sélectionner, puis transmettre leur état actuel à un répartiteur (unité principale) à l'aide du bouton État, du bouton État direct ou de la sélection de menu État.

REMARQUE :

Les états rendent l'utilisation d'un canal plus efficace que les signaux vocaux.

Pour les modèles sans clavier, cette fonction peut être utilisée uniquement à l'aide de la fonction Une Touche.

AVERTISSEMENT :

Cette fonction s'applique uniquement lorsque le champ Activer l'état de la personnalité ADF renvoyant à ce système ADF est activé.

Chaque alias d'état doit être identique (ou avoir la même signification) pour le répartiteur et les radios portatives ou mobiles. Par exemple, l'alias d'état 1 provenant du répartiteur doit être identique à l'alias d'état 1 de la radio portative ou mobile (ou avoir la même signification).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.38.5.1

Activer l'alias d'état

Ce champ active la capacité de définir l'état pour le système ADF courant.

AVERTISSEMENT :

Cette fonction s'applique uniquement lorsque le champ Activer l'état de la personnalité ADF renvoyant à ce système ADF est activé.

Une fois cette fonction activée, vous devez définir chaque alias état de radio (champs Nom d'alias état et Numéro d'alias état du même enregistrement ou rangée) de façon à ce qu'il soit identique à l'alias état correspondant de l'unité de répartiteur (ou qu'il ait la même signification).

Une fois qu'elle est définie, vous pouvez accéder à la fonction État en utilisant une touche État, une touche État direct ou une sélection de menu État.

En ce qui concerne les modèles sans clavier, la fonction d'état peut être utilisée uniquement à l'aide de la fonction Une touche.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.38.5.2

Numéro de l'alias d'état

Ce champ permet de sélectionner un numéro qui désigne l'état courant.

Cette sélection s'applique à l'état (rangée ou enregistrement) courant du système ADF courant.

AVERTISSEMENT :

- Cette fonction s'applique uniquement lorsque le champ Activer l'état de la personnalité ADF renvoyant à ce système ADF est activé.
- Une fois qu'elle est définie, vous pouvez accéder à la fonction État en utilisant une touche État, une touche État direct ou une sélection de menu État.

IMPORTANT :

Les alias d'état doivent être identiques (ou avoir la même signification) pour le répartiteur et les radios portatives ou mobiles. Par exemple, l'alias d'état 1 provenant du répartiteur doit être identique à l'alias d'état 1 de la radio portative ou mobile (ou avoir la même signification).

Accès seulement : Lorsque le champ [Activer l'alias d'état à la page 537](#) est activé et que le modèle ou l'option de la radio le permet.

10.38.5.3

Texte de l'alias d'état

Ce champ vous permet de définir des noms reconnaissables pour l'état (enregistrement/rangée) courant.

Cette sélection s'applique au système ADF actuel.

REMARQUE :

- Cette fonction s'applique uniquement lorsque le champ Activer l'état de la personnalité ADF renvoyant à ce système ADF est activé.
- Une fois qu'elle est définie, vous pouvez accéder à la fonction État en utilisant une touche État, une touche État direct ou une sélection de menu État.

IMPORTANT :

Les alias d'état doivent être identiques (ou avoir la même signification) pour le répartiteur et les radios portatives ou mobiles. Par exemple, l'alias d'état 1 provenant du répartiteur doit être identique à l'alias d'état 1 de la radio portative ou mobile (ou avoir la même signification).

Accès seulement : Lorsque le champ [Activer l'alias d'état à la page 537](#) est activé et que le modèle ou l'option de la radio le permet.

REMARQUE :

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Vous pouvez utiliser jusqu'à 14 caractères.

Exemples : ÉTAT-01, Électrique1, N° 510

10.38.6

Alias de site (Système ADF ASTRO 25)

La section **Alias de site** de l'ensemble Système ADF ASTRO 25 permet à l'utilisateur d'afficher ou de définir des alias conviviaux pour identifier des systèmes ADF ou des sites individuels faisant partie de ces systèmes dans lesquels la radio peut se retrouver lorsqu'elle est en itinérance parmi divers sites et systèmes ADF, ou même, des réseaux de communication étendus (WACN). Les alias peuvent

également identifier les appels (à l'aide des ID de PTT) reçus à partir des radios situées à l'extérieur du système ADF sélectionné (accueil) de la radio.

IMPORTANT :

Seuls les alias de site définis dans le système ADF actuellement sélectionné par l'utilisateur sont accessibles.

REMARQUE :

Le Type d'alias du site détermine si le texte de l'alias du site doit être assigné au système ADF ou à un site à l'intérieur d'un système.

IMPORTANT :

Un système ADF est toujours défini par son numéro RAS WACN à domicile et son numéro de système, tandis qu'un site est défini par des combinaisons spécifiques de numéro RAS WACN à domicile, numéro de système, numéro d'alias RFSS et ID de site, selon le type de couverture et le type de système du système de ADF courant.

L'affichage de l'alias du site en cours et de son indicateur d'intensité du signal reçu (RSSI) ou le changement de site courant est activé par l'utilisateur en appuyant sur Aff./Rech. site. L'utilisation d'un bouton Verr./Déverr. site activé par l'utilisateur ou une sélection de menu Site permet d'afficher ou de modifier l'état de verrouillage du site actuel.

Les systèmes ADF individuels sont référencés dans une personnalité ADF. Les paramètres de ce système ADF sont ainsi activés pour tous les types de canaux contenus dans cette personnalité ADF.

10.38.6.1

Activer l'alias du site

Ce champ permet d'activer les champs de la section Alias du site correspondant à l'ID du site en cours (enregistrement/rangée), qui s'applique également au système ADF courant.

REMARQUE :

L'affichage de l'alias du site en cours et de son indicateur d'intensité du signal reçu (RSSI) ou le changement de site courant est activé par l'utilisateur en appuyant sur Aff./Rech. site.

L'utilisateur peut appuyer sur un bouton Verr./Déverr. site ou sur la sélection de menu Site pour afficher ou modifier l'état de verrouillage du site courant.

REMARQUE :

Ce produit ne prend pas en charge la sélection automatique de plusieurs sites (AMSS).

Accès seulement : Lorsque le champ Type de protocole est réglé à **Type II**, et lorsque le champ [Type de couverture](#) à la page 517 est réglé à **Matériel** ou à Logiciel, et que le modèle ou l'option de la radio le permet,

Lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le type de couverture n'est pas réglé à **Désactivé**, et lorsque le champ est activé, et lorsque le modèle ou l'option de la radio le permet,

10.38.6.2

Numéro d'alias RFSS

Ce champ permet d'entrer (au format décimal) l'ID RFSS (sous-système de fréquence radioélectrique) correspondant à l'ID du site en cours (enregistrement/rangée).

Pour prendre en charge l'itinérance entre les différents RFSS d'un système ADF, chaque RFSS doit posséder un numéro unique. Un RFSS se compose d'un ou de plusieurs sites. Cette sélection s'applique également au système ADF courant.

Accès seulement : lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le champ Type de couverture est réglé à **SmartZone et OmniLink** ou à **Itinérance intra-WACN** ou à **Itinérance**

inter-WACN, et lorsque le champ [Activer l'alias du site à la page 539](#) est activé, et lorsque le champ [Type d'alias de site à la page 603](#) est réglé à **Site**, et lorsque le modèle ou l'option de la radio le permet.

Tableau 271 : Portée

Minimum	Maximum
1	254

10.38.6.3

ID du site

Ce champ permet d'entrer (au format décimal ou hexadécimal) le numéro d'identification du site correspondant à la valeur (enregistrement/rangée) courante.

Pour prendre en charge l'itinérance entre les différents sites, chaque ID de site doit être unique dans un sous-système de fréquence radioélectrique (RFSS). Cette sélection s'applique également au système ADF courant.

Accès seulement : lorsque le champ [Activer l'alias du site à la page 539](#) est activé, et lorsque le champ Type de système est réglé à **Type II**, et lorsque le champ Type de couverture n'est pas réglé à **SmartZone**, et lorsque le modèle ou l'option de la radio le permet,

Ou encore, lorsque le champ [Activer l'alias du site à la page 539](#) est activé, et lorsque le champ [Type d'alias de site à la page 603](#) est réglé à **Site**, et lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le champ Type de couverture n'est pas réglé à **Désactivé**, et lorsque le modèle ou l'option de la radio le permet.

Tableau 272 : Portée

Minimum	Maximum
0 (hexadécimal)	FE (hex)

10.38.6.4

Texte de l'alias du site

Ce champ permet de définir des noms reconnaissables pour l'alias de site courant (enregistrement ou rangée), qui s'applique au système ADF courant.

Voir aussi [Type d'alias de site à la page 603](#). Vous pouvez activer le texte de l'alias site en utilisant la touche Aff./Rech. Site, la touche Verr./Déverr. site et les fonctions de sélection de menu Site.

Accès seulement : lorsque le champ [Activer l'alias du site à la page 539](#) est activé, et lorsque le champ Type de système est réglé à **Type II**, et lorsque le champ Type de couverture n'est pas réglé à **SmartZone**, et lorsque le modèle ou l'option de la radio le permet,

Ou encore, lorsque le champ [Activer l'alias du site à la page 539](#) est activé, et lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le champ Type de couverture n'est pas réglé à **Désactivé**, et lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Vous pouvez utiliser jusqu'à 14 caractères.

Exemples : EMT-001,N° 500, Électrique1, Alias du site 01

10.38.6.5

Type d'alias de site

Ce champ permet de sélectionner l'attribution du texte de l'alias du site, soit à un système ADF, soit à un site à l'intérieur d'un système.

Vous pouvez voir l'alias du site ou l'alias du système courant de la radio en appuyant sur le bouton Aff./ Rech. site. Cette sélection s'applique à l'alias du site courant (enregistrement ou rangée) du système ADF courant.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le type de couverture n'est pas réglé à **Désactivé**, et lorsque le champ [Activer l'alias du site à la page 539](#) est activé, et lorsque le modèle ou l'option de la radio le permet,

Les sélections suivantes sont prises en charge :

Site

Le site est utilisé comme « alias du site » pour le site actuellement enregistré de la radio. La sélection du type de couverture du système ADF détermine la façon dont le site doit être défini pour l'alias de site.

- Pour **SmartZone**, seul l'ID du site est nécessaire.
- Pour **SmartZone et OmniLink**, le numéro de l'alias RFSS et l'ID du site sont nécessaires.
- Pour **Itinérance intra-WACN**, le numéro de système, le numéro d'alias RFSS et l'ID du site sont nécessaires.
- Pour **Itinérance inter-WACN**, le numéro de système, le numéro d'alias RFSS, l'ID du site et le numéro RAS WACN à domicile sont nécessaires.

Système

Le [Texte de l'alias du site à la page 540](#) est utilisé comme alias de système pour le système ADF étranger actuellement enregistré de la radio. Les alias système sont définis par leur numéro RAS WACN à domicile et leur numéro de système. Seul le type de couverture de système ADF **Itinérance inter-WACN** est possible pour le type d'alias système. Les alias système sont utilisés pour créer un ID de PTT ou un alias du site :

- Lorsque la radio reçoit un appel à partir d'une radio étrangère et qu'aucun alias du site n'est défini pour le site dans le système ADF spécifié, l'alias système et l'ID d'unité sont affichés par la radio réceptrice pour identifier la radio de l'appelant. Si aucun alias de système n'est défini, l'ID complet de l'appareil abonné (SUID) de la radio étrangère s'affiche à l'écran de la radio réceptrice; la SUID est une combinaison de l'ID WACN d'accueil, l'ID du système et l'ID d'unité.
- Si la radio est en itinérance dans un système ADF étranger où aucun alias du site n'est disponible pour le site courant, l'ID de site et le niveau de son indicateur de puissance de signal reçu correspondant (RSSI) sont affichés sur l'écran de la radio lorsque vous appuyez sur la touche Aff./Rech. site. Si un alias de système n'est pas défini pour le système étranger actuellement enregistré, alors l'ID de site intégral (Numéro RAS WACN à domicile + Numéro de système + ID de site + niveau RSSI) est affiché sur l'écran de la radio.

10.38.6.6

Numéro du système

Ce champ permet d'entrer (au format décimal ou hexadécimal) l'ID du système qui correspond à l'ID du site (enregistrement/rangée) courant.

Pour prendre en charge l'itinérance entre les différents systèmes ADF qui composent des réseaux de communication étendus (WACN). Chaque système ADF doit avoir un ID de système unique. Un système ADF est constitué d'un ou plusieurs sous-systèmes de fréquence radioélectrique (RFSS). Cette sélection s'applique également au système ADF actuel.

Accès seulement : Lorsque le modèle ou les options de la radio le permettent, et lorsque le champ [Activer l'alias du site à la page 539](#) est activé, et lorsque le champ Type de système est réglé à **ASTRO 25**.

Et lorsque le champ Type de couverture est réglé à **Itinérance intra-WACN** ou **Itinérance inter-WACN**, et lorsque le champ [Type d'alias de site à la page 603](#) est réglé à **Site**.

Ou lorsque le champ Type de système n'est pas réglé à **Désactivé** et lorsque champ [Type d'alias de site à la page 603](#) est réglé à **Système**.

Tableau 273 : Portée

Minimum	Maximum
000 (hexadécimal)	FFE (hex)

**IMPORTANT :**

Lorsque la valeur est « 0 », la radio copie dans ce champ la valeur du champ ID du système pour le système ADF courant.

10.38.6.7

Numéro RAS WACN à domicile

Ce champ vous permet d'entrer (en format décimal ou hexadécimal) l'ID WACN (réseaux de communication étendus) RAS à domicile (serveur d'accès distant) correspondant à l'ID du site en cours (enregistrement/rangée).

Pour prendre en charge l'itinérance entre les différents WACN (voir aussi Itinérance inter-WACN), chaque WACN doit posséder un numéro unique. Un réseau de communication étendu se compose d'un ou de plusieurs systèmes ADF. Cette sélection s'applique également au système ADF courant.

Accès seulement : lorsque le modèle ou l'option de la radio le permet, et lorsque le champ [Activer l'alias du site à la page 539](#) est activé, lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le champ Type de système est réglé à **Itinérance Inter-WACN** et lorsque champ [Type d'alias de site à la page 603](#) est réglé à **Site**,

ou lorsque le champ Type de système n'est pas réglé à **Désactivé** et lorsque champ [Type d'alias de site à la page 603](#) est réglé à **Système**.

Tableau 274 : Portée

Minimum	Maximum
00000 (hexadécimal)	FFFFE (hex)

**IMPORTANT :**

Valeur par défaut = 1 Lorsque la valeur est « 0 », la radio copie dans ce champ la valeur du champ ID WACN d'accueil pour le système ADF courant.

10.38.7

Une touche

Cette section vous permet d'afficher ou de définir des sélections spécifiques **Fonction** et **Index** pour un maximum de quatre commandes une touche ou sélections de menu une touche.

La fonction une touche sert à créer des raccourcis de navigation dans les menus ou des touches de raccourci. Ces raccourcis peuvent accélérer grandement votre implication pour l'activation des fonctions de la radio.

En appuyant sur un bouton Une touche ou en sélectionnant une commande de menu Une touche, l'utilisateur peut lancer en une seule étape une fonction de la radio, processus qui nécessite normalement plusieurs étapes de navigation dans les menus. Ces sélections s'appliquent au système ADF courant.

REMARQUE :

Les systèmes ADF individuels sont référencés dans une personnalité ADF. Les paramètres de ce système ADF sont ainsi activés pour tous les types de canaux contenus dans cette personnalité ADF.

10.38.7.1

Touche

Affiche le nom affecté en lecture seule à un appui sur Une touche ou la sélection de menu Une touche.

REMARQUE :

Les systèmes ADF individuels sont référencés dans une personnalité ADF. Les paramètres de ce système ADF sont ainsi activés pour tous les types de canaux contenus dans cette personnalité ADF.

10.38.7.2

Fonction Une touche

Ce champ permet de sélectionner la fonction Une touche associée au bouton Une touche ou à la sélection de menu Une touche.

Cette sélection s'applique à la rangée ou à l'enregistrement actuel du système ADF courant.

IMPORTANT :

Le bouton 1 ADF (autrement dit, la première rangée ou le premier enregistrement) correspond au bouton Une touche 1 ou à la sélection de menu (TCH1 ou SIG1) et ainsi de suite.

REMARQUE :

Lorsqu'on active cette fonction, il faut également définir l'index Une touche.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Désactivé;

L'option Une touche n'est pas activée pour le bouton sélectionné.

Téléphone

La fonction [Fonctionnement du téléphone à la page 573](#) est réglée à **Liste seulement** ou **Illimité** pour la personnalité d'ADF en référence.

Appel privé

La fonction [Type d'appel privé à la page 569](#) n'est pas **activée** et le champ [Opération appel privé à la page 570](#) est réglé à **Liste seulement** ou **Illimité** pour la personnalité ADF en référence.

Alerte d'appel

Le champ [Alerte d'appel/Notification à la page 570](#) est réglé à **Liste seulement** ou **Illimité** pour la personnalité ADF en référence.

État

La fonction [Activer l'alias d'état à la page 537](#) est activée pour le système ADF actuel.

Message

La fonction Message est activée pour le système ADF courant.

REMARQUE :

Les sélections de la fonction de touche Une touche dépendent du modèle et des options.

10.38.7.3

Index Une touche

Ce champ permet de sélectionner l'Index Une touche/membre de la liste pour votre bouton Une touche ou votre sélection de menu Une touche, relativement à la fonction Une touche sélectionnée.

L'index désigne la rangée ou l'enregistrement courant de la liste déterminé par la fonction Une touche sélectionnée. Cette sélection s'applique au système ADF courant.

**IMPORTANT :**

Le bouton 1 ADF (la première rangée ou le premier enregistrement) correspond à la touche Une touche 1 ou à la commande de menu (TCH1 ou SIG1).

Accès seulement : Lorsque le champ [Fonction Une touche à la page 541](#) n'est pas réglé à **Désactivé** et lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Appel privé

Le numéro de l'index correspond au numéro de la rangée de la liste d'appel privilégiée de type II ou ASTRO 25.

**IMPORTANT :**

Le champ [Liste d'appel privilégiée ADF à la page 571](#) permet de sélectionner la liste privilégiée à utiliser pour la personnalité ADF associée.

À votre disposition lorsque le [Type d'appel privé à la page 569](#) n'est pas **désactivé**, et que le champ [Opération appel privé à la page 570](#) est réglé à **Liste seulement** ou à **Illimité** pour la personnalité ADF associée.

Alerte d'appel

Le numéro de l'index correspond au numéro de la rangée de la liste d'appel privilégiée de type II ou ASTRO 25.

**IMPORTANT :**

Le champ Liste d'appel privilégiée ADF permet de sélectionner la liste à utiliser pour la personnalité ADF associée.

À votre disposition lorsque le champ [Alerte d'appel/Notification à la page 570](#) est réglé à **Liste seulement** ou à **Illimité** pour la personnalité ADF associée.

Téléphone

Le numéro de l'index correspond au numéro de la rangée de la liste privilégiée d'appels.

À votre disposition lorsque le champ [Fonctionnement du téléphone à la page 573](#) est réglé à **Liste seulement** ou à **Illimité** pour la personnalité ADF associée.

État

Le numéro de l'index correspond au numéro de rangée ou de position des membres de la liste d'alias d'état.

À votre disposition lorsque la fonction [Activer l'alias d'état à la page 537](#) est **activée** pour le système ADF courant.

Message

Le numéro de l'index correspond au numéro de rangée ou de position des membres de la liste d'alias de message.

À votre disposition lorsque la fonction Message est **activée** pour le système ADF courant.

10.38.8

ASTRO 25

Cette section permet d'afficher ou de modifier les fonctionnalités de base pour le fonctionnement en mode ASTRO 25.

Ces réglages s'appliquent à des systèmes ADF individuels.

REMARQUE :

Les systèmes ADF individuels sont référencés dans une personnalité ADF. Les paramètres de ce système ADF sont ainsi activés pour tous les types de canaux contenus dans cette personnalité ADF.

10.38.8.1

Caractéristiques propriétaires de Motorola

Ce champ permet à la radio de transmettre des paquets de signaux entrants (ISP) exclusifs à Motorola.

Cette fonction s'applique au système ADF courant.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25** et que le modèle ou l'option de la radio le permet.

10.38.8.2

Longueur de séquence ISP

Ce champ permet de sélectionner la durée maximale autorisée par site d'une séquence d'essai ISP (paquet de signaux entrants).

La radio effectue des essais jusqu'à l'expiration de ce délai (maximum de cinq essais). Cette sélection s'applique au système ADF courant. La durée est exprimée en secondes.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25** et que le modèle ou l'option de la radio le permet.

REMARQUE :

Lorsque réglée à **Infini**, la minuterie ne s'arrête pas.

Tableau 275 : Portée

Minimum	Maximum	Incréments
10 (seconde)	255 secondes	1 seconde

10.38.8.3

Taille maximale de l'intervalle

Ce champ permet de sélectionner la durée d'intervalle ISP (paquet de signaux entrants) maximale pouvant être utilisée par la radio.

IMPORTANT :

Cette valeur ne peut pas être supérieure à la durée d'intervalle permise par le système.

REMARQUE :

Elle sert à accélérer le processus de recherche d'intervalle exécuté par le micrologiciel de la radio. Cette sélection s'applique au système ADF courant. La durée est exprimée en millisecondes.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25** et que le modèle ou l'option de la radio le permet.

REMARQUE :

Lorsque réglé à **Illimité**, la taille de l'intervalle est illimitée.

Tableau 276 : Portée

Minimum	Maximum	Incréments
37,5 (millisecondes)	142,550 (millisecondes)	7,5 (millisecondes)

10.38.8.4

Temps réactivation du son forcée

Ce champ permet de sélectionner la durée maximale pendant laquelle la radio laisse les signaux audio entrants en sourdine pour tenir compte du temps de transfert de données du système.

La minuterie se met en marche dès que la radio a effectué une transmission. Cette durée n'est pas prise en compte si le micrologiciel de la radio confirme par un autre moyen que les signaux audio entrants ne sont pas les siens. Cette sélection s'applique au système ADF courant. La durée est exprimée en millisecondes.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25** et que le modèle ou l'option de la radio le permet.

REMARQUE :

Lorsque cette fonction est réglée à **Immédiat**, ce qui signifie 0 (aucun délai), il n'y a pas de temps de mise en sourdine après la transmission.

Tableau 277 : Portée

Minimum	Maximum	Incréments
250 (ms)	6 375 (ms)	25 (ms)

10.38.8.5

Protection contre fondu rapide

Ce champ permet de sélectionner la durée pendant laquelle la radio demeure sur le canal de contrôle en attendant de faire une tentative de resynchronisation après la perte de synchronisation.

La radio a ainsi le temps de récupérer le signal sans avoir à resynchroniser entièrement le canal. Cette sélection s'applique au système ADF courant. La durée est exprimée en millisecondes.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25** et que le modèle ou l'option de la radio le permet.

Tableau 278 : Portée

Minimum	Maximum	Incréments
200 ms	6 375 ms	25 ms

10.38.8.6

Temps d'avertissement PTT

Ce champ permet de sélectionner la période pendant laquelle la radio attend avant de faire retentir une tonalité d'interdiction de parler afin de vous avertir qu'une demande PTT est en cours de traitement et que vous devez relâcher la touche PTT.

Cette sélection s'applique au système ADF courant. La durée est exprimée en millisecondes.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25** et que le modèle ou l'option de la radio le permet.

REMARQUE :

Lorsque réglé à **Désactivé**, aucun avertissement n'est émis.

Tableau 279 : Portée

Minimum	Maximum	Incréments
0 ms	6 375 ms	25 ms

10.38.8.7

Temps occupé pour mise à jour

Ce champ permet de sélectionner la durée pendant laquelle la radio attend, à l'état occupé, de recevoir une autorisation, un refus ou une autre mise à jour venant de l'équipement de réseau fixe (FNE).

Si ce délai expire, la radio cesse d'attendre une réponse du FNE et essaie de nouveau de procéder à la transmission. Cette sélection s'applique au système ADF courant. La durée est exprimée en secondes.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25** et que le modèle ou l'option de la radio le permet.

REMARQUE :

Lorsque réglé à **Infini**, la radio attend indéfiniment une réponse.

Tableau 280 : Portée

Minimum	Maximum	Incréments
150 (secondes)	945 secondes	15 secondes

10.38.8.8

Temps en attente de réponse

Ce champ permet de sélectionner la période pendant laquelle la radio attend de recevoir une réponse à une demande de la part de l'équipement de réseau fixe (FNE).

Une telle situation se présente lorsque le FNE avise la radio que sa demande est en cours de traitement et qu'une réponse suivra sous peu. Si ce délai expire, la radio cesse d'attendre une réponse du FNE et retourne en mode d'attente. Cette sélection s'applique au système ADF courant. La durée est exprimée en secondes.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25** et que le modèle ou l'option de la radio le permet.

REMARQUE :

Lorsque réglée à **Infini**, la radio attend indéfiniment une réponse du FNE.

Tableau 281 : Portée

Minimum	Maximum	Incréments
10 (seconde)	255 secondes	1 seconde

10.38.8.9

ID RCM par défaut

Ce champ permet de sélectionner l'adresse de gestionnaire de commandes radio (RCM) utilisée comme adresse cible pour la transmission de paquets de signaux entrants destinés à l'équipement de réseau fixe (par exemple, les états et les messages).

Cette sélection s'applique au système ADF courant.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25** et que le modèle ou l'option de la radio le permet.

Tableau 282 : Portée

Minimum	Maximum
000000 (hex)	FFFFFF (hex)

10.38.8.10

À fonction vocale de phase 2

Ce champ permet à la radio d'effectuer des transmissions dans un système ADF qui prend en charge les communications vocales TDMA (accès multiple par répartition dans le temps) de phase 2 de la norme Project 25.

REMARQUE :

TDMA de phase 2 utilise un protocole TDMA à deux phases sur un canal 12,5 kHz, qui permet de doubler la capacité vocale par rapport au protocole FDMA (accès multiple par répartition en fréquence) de phase 1. Cette sélection s'applique au système ADF courant.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25** et que le modèle ou l'option de la radio le permet.

10.38.8.11

Terminer transmission TDMA de phase 2 lorsque hors de portée

Ce champ permet à la radio d'arrêter une transmission Phase 2 TDMA en cours (accès multiple par répartition dans le temps).

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Cette fonction vous alerte également si, lors de la transmission, la radio s'est retrouvée en dehors de la couverture de l'équipement de réseau fixe (FNE). Une tonalité d'alerte se fait entendre tant et aussi longtemps que l'utilisateur maintient la touche PTT enfoncée. Cette sélection s'applique au système ADF courant.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25** et Lorsque le champ [À fonction vocale de phase 2 à la page 610](#) est **Activé**.

10.38.8.12

Valider NAC avec l'ID système

Ce champ fait en sorte que la radio valide les 8 premiers bits de l'ID système à 16 bits en fonction des 8 premiers bits du code d'accès au réseau (NAC) à 12 bits reçu sur le canal de contrôle du système ADF.

Si les deux séries de bits ne sont pas identiques, la radio ne tente pas de s'inscrire auprès du site ADF. Donc l'activation de ce champ permet à la radio de valider rapidement un code NAC du site avec

son ID de système et de rejeter les canaux de contrôle du système ADF. Cette sélection s'applique au système ADF courant.

AVERTISSEMENT :

Si un site du système ADF n'est pas configuré de cette façon, ce champ doit être désactivé.

Lorsque désactivée, la radio ne tente pas de valider les 8 premiers bits de l'ID système à 16 bits en fonction des 8 premiers bits du NAC à 12 bits. Ceci permet à la radio d'utiliser des canaux de contrôle dont le NAC diffère de l'ID système du système ADF. La radio risque toutefois de prendre plus de temps pour rejeter les canaux de contrôle du système ADF. Cette sélection s'applique au système ADF courant.

AVERTISSEMENT :

Lorsque le champ [Type de couverture à la page 517](#) est réglé à **Itinérance inter-WACN**, cette sélection doit être désactivée; sinon, cette sélection est considérée comme étant non valide.

Lorsque le champ [Type de couverture à la page 517](#) est réglé à **Itinérance intra-WACN**, et que le champ Activer le matériel DVRS est activé, cette sélection doit être désactivée; sinon, elle est considérée comme étant non valide.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25** et que le modèle ou l'option de la radio le permet.

10.38.8.13

Prise en charge de la validité de la WUID

Ce champ fait en sorte que la radio revalide périodiquement son ID d'unité en fonction (WUID) avec l'équipement de réseau fixe (FNE).

Une WUID est assignée à une radio durant l'inscription/affiliation FNE initiale; toute demande de paquets de signaux entrants (ISP) au FNE contenant la WUID de la radio la validera à nouveau avec son système ADF courant sur le terrain.

IMPORTANT :

Cette sélection est seulement requise pour un FNE qui utilise la radio pour assurer le suivi des périodes d'activité et revalider son WUID avant qu'elle expire. Cette sélection s'applique au système ADF courant.

Lorsque cette fonction est désactivée, la radio ne revalide pas automatiquement sa WUID parce qu'elle attend le type de FNE qui envoie une requête à la radio après une période d'inactivité avant d'inscrire à nouveau et de supprimer la WUID du système ADF.

AVERTISSEMENT :

Lorsque le champ [Type de couverture à la page 517](#) est réglé à **Itinérance inter-WACN**, cette sélection doit être désactivée; sinon, cette sélection est considérée comme étant non valide.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25** et que le modèle ou l'option de la radio le permet.

10.38.9

Numérique (système à commutation automatique de canaux ASTRO 25)

La section **Numérique** de l'ensemble système à commutation automatique de canaux ASTRO 25 permet à l'utilisateur d'afficher ou de définir les fonctionnalités de communication numérique.

REMARQUE :

Les systèmes ADF individuels sont référencés dans une personnalité ADF. Les paramètres de ce système ADF sont ainsi activés pour tous les types de canaux contenus dans cette personnalité ADF.

10.38.9.1

Puissance adaptative

Ce champ permet à la radio d'adapter automatiquement le niveau de puissance de son émetteur sur le canal vocal, et non le canal de contrôle, en fonction de l'intensité du signal de la commande d'adaptation de puissance automatique (APA LC) reçue par liaison radio.

Si l'intensité du signal dépasse le seuil acceptable, la radio émet à puissance moyenne plutôt qu'à puissance élevée. Cette sélection s'applique au système ADF courant.

REMARQUE :

Si vous appuyez sur la touche PTT une deuxième fois dans les 30 secondes lorsque l'APA est activée pour le mode sécurisé F2 TDMA, la radio émet avec une puissance moyenne si le niveau de puissance courant est réglé à Élevé. Si le délai dépasse 30 secondes, alors le niveau de puissance actuel demeure élevé.

Accès seulement : Lorsque le champ [Niveau de puissance Tx à la page 526](#) n'est pas réglé à **Faible** et lorsque le modèle ou l'option de la radio le permet.

10.38.9.2

Longueur du préambule

Ce champ permet de sélectionner la durée d'envoi des paquets de synchronisation des bits au début de toutes les transmissions Canal vocal ASTRO 25 pour le système ADF courant.

Grâce à ces paquets, la radio émettrice et la radio réceptrice sont en mesure de se synchroniser avant une transmission ASTRO 25.

REMARQUE :

La durée du préambule équivaut à la valeur du champ Longueur du préambule, multipliée par 0,2083 ms.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 283 : Portée

Minimum	Maximum
0	255

10.38.9.3

Tx grand écart

Ce champ permet à la radio de transmettre des signaux vocaux ou des données ASTRO selon un écart accentué.

Un écart de transmission élevé est nécessaire seulement si la radio est utilisée dans des véhicules dont la vitesse dépasse 160 mi/h (environ 257 km/h). Cette fonction s'applique au système ADF courant.

AVERTISSEMENT :

N'activez pas ce champ si le système radio matériel n'a pas été configuré de façon similaire et si un écart de transmission accentué n'est pas nécessaire. L'activation inutile de ce paramètre pourrait réduire grandement le rendement de la radio.

Accès seulement : Lorsque le champ Type de protocole est réglé à **Type II** et lorsque le modèle ou l'option de la radio le permet.

10.38.9.4

Type de modulateur numérique

Ce champ permet de sélectionner le type de modulateur numérique du système ADF courant.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

C4FM (Par défaut d'origine pour ADF de Type II)

Modulation continue de fréquence porteuse à quatre niveaux prenant en charge la diffusion non simultanée.

CQPSK (Par défaut d'origine pour ADF ASTRO 25)

Modulation par déplacement de phase quadrivalente permettant la diffusion simultanée au moyen d'une bande étroite et la diffusion non simultanée.

**IMPORTANT :**

Cette option est uniquement offerte sur les modèles de radio équipés d'une interface hertzienne commune (CAI) numérique.

LARGE

Diffusion au moyen d'une large bande.

**IMPORTANT :**

Cette option ne peut pas être choisie si la bande passante de canal sélectionnée est de 12,5 kHz.

10.38.9.5

Seuil TDMA sync. trames BER

Ce champ permet de sélectionner le taux d'erreur de bits (BER) de l'accès multiple par répartition dans le temps (TDMA) maximal toléré par une radio utilisant un canal vocal TDMA X2 ou de phase 2.

**REMARQUE :**

Le taux d'erreur sur les bits TDMA est calculé au cours de la synchronisation de l'image pour une transmission de signaux vocaux par TDMA. Si un taux d'erreur supérieur à ce maximum est détecté, la radio tente de trouver un meilleur site. Cette sélection s'applique au système ADF courant.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le champ [fonction vocale de phase 2 à la page 610](#) est réglé à **Activé** et que le modèle ou l'option de la radio le permet.

Tableau 284 : Portée

Minimum	Maximum	Incréments
Désactivé;	25,4%	0,1 %

10.38.9.6

Seuil FDMA Sync. trames/NID BER

Ce champ permet de sélectionner le taux d'erreur sur les bits (BER) pour la synchronisation des images et l'ID de réseau (NID) FDMA (accès multiple par répartition en fréquence) maximal toléré par une radio utilisant un site ADF.

Ce maximum s'applique à la fois au canal de contrôle et au canal vocal. Si un taux d'erreur supérieur à ce maximum est détecté, la radio tente de trouver un meilleur site. Cette sélection s'applique au système ADF courant.

Accès seulement : lorsque le champ [Type de couverture à la page 517](#) n'est pas réglé à **Désactivé** et que le modèle ou l'option de la radio le permet.

Tableau 285 : Portée

Minimum	Maximum	Incréments
Désactivé;	25,4%	0,1 %

10.38.10

Chiffré/Multitouche (Système à Commutation Automatique de Canaux ASTRO 25)

La section **Chiffré/Multitouche** de l'ensemble système à commutation automatique de canaux ASTRO 25 permet à l'utilisateur d'afficher ou de définir les fonctions de sécurité et multitouche pour la transmission et la réception de communications encodées et sécurisées. Ces réglages peuvent être personnalisés pour chaque système ADF.

REMARQUE :

Les systèmes ADF individuels sont référencés dans une personnalité ADF. Les paramètres de ce système ADF sont ainsi activés pour tous les types de canaux contenus dans cette personnalité ADF.

10.38.10.1

DES-XL Tx/Rx par défaut

Ce champ active uniquement l'algorithme DES-XL (Norme de chiffrement de données – Portée étendue) numérique à utiliser pour tous les appels vocaux chiffrés.

DES XL est une norme de chiffrement de type 3 (niveau intermédiaire). Cette sélection s'applique au système ADF courant.

Si la case n'est pas cochée, seul l'algorithme DES-OFB (Norme de chiffrement de données – Rebouclage par la sortie) numérique est utilisé pour tous les appels vocaux chiffrés. DES OFB est une norme de chiffrement de type 3 (niveau intermédiaire).

AVERTISSEMENT :

Cette fonction s'applique uniquement si la radio est équipée d'un module de chiffrement à deux algorithmes (DES-XL et DES-OFB).

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** et lorsque le modèle ou l'option de la radio le permet.

10.38.10.2

ASTRO OTAR

Permet à la radio de recevoir des communications ASTRO 25 OTAR (changement de clé par onde radio) pour le système ADF courant.

**IMPORTANT :**

Lorsque le champ ASTRO OTAR est **Activé** pour le système ADF courant, les valeurs Sélection de clé matérielle sont choisies dans la liste de références de clés de chiffrement de matériel sécurisées qui est associée au profil KMF sécurisé sélectionné dans le champ [Index de profil ASTRO OTAR à la page 616](#) du système ADF courant.

**AVERTISSEMENT :**

Veillez noter que le module RadioCentral renvoie en fait aux clés de la liste de clés de chiffrement applicable à cette sélection; les clés figurant dans la liste de clés de référence de chiffrement de matériel sécurisées correspondent aux clés de la liste de clés de chiffrement sélectionnée dans le champ Référence de clé de matériel. Par conséquent, les clés sélectionnées lorsque le champ ASTRO OTAR est activé doivent d'abord être définies dans la liste de références de clés de chiffrement de matériel sécurisées.

Lorsque le champ ASTRO OTAR est réglé à **Désactivé** pour le système ADF courant, les valeurs de sélection de clés de matériel proviennent directement de la liste des clés de chiffrement de la fenêtre Toute la sécurité.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**, et lorsque le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est activé, et lorsque le champ [Activer OTAR à la page 303](#) est activé; et lorsque le champ [Activer ASTRO OTAR à la page 304](#) est activé; et lorsque le champ ASTRO OTAR est activé, et lorsque le système ADF courant a un profil de données référencé, et lorsque le modèle ou l'option de la radio le permet.

10.38.10.3

Tx OTAR

Ce champ permet à la radio d'effectuer des transmissions ASTRO OTAR (changement de clé par onde radio) pour le système ADF courant.

Les transmissions OTAR comprennent : Demandes de réattribution de clé et Confirmations différées.

**AVERTISSEMENT :**

Votre capacité d'effectuer une demande de nouvelle attribution de clé doit être programmée.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**, et lorsque le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est activé, et lorsque le champ Fonctionnement OTAR est réglé à **ASTRO seulement** ou **ASTRO et MDC**, et lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le champ Index de profil ASTRO OTAR est activé, et lorsque le système ADF courant a un profil de données référencé, et lorsque le modèle ou l'option de la radio le permet.

10.38.10.4

Index de profil ASTRO OTAR

Ce champ permet de sélectionner le dispositif de gestion des clés (KMF) sécurisé à utiliser en mode ASTRO OTAR.

Cette sélection s'applique au système ADF courant.

REMARQUE :

Tous les paramètres ASTRO OTAR précisés dans le profil KMF s'appliquent par la suite au système ADF courant.

AVERTISSEMENT :

Ce champ n'est pas valide lorsque ce système est associé à un profil de données dont le type de profil de données est **ADF**, **ADF et large bande** ou **Large bande Seulement**, et lorsque le champ Adresse IP KMF est réglé à 0.0.0.0.

IMPORTANT :

Lorsque le champ [ASTRO OTAR à la page 615](#) est réglé à **Désactivé** pour le système ADF courant, les valeurs de sélection de clés de matériel proviennent directement de la liste des clés de chiffrement de la fenêtre Toute la sécurité.

Lorsque le champ ASTRO OTAR est réglé à **Activé** pour le système ADF courant, les valeurs de sélection de clés de matériel sont tirées de la liste de références de clés de chiffrement de matériel sécurisées qui est associée au profil KMF sécurisé sélectionné dans le champ [Index de profil ASTRO OTAR à la page 616](#) du système ADF courant.

AVERTISSEMENT :

Veillez noter que cela renvoie en fait aux clés de la liste de clés de chiffrement applicable à cette sélection; les clés figurant dans la liste de clés de référence de chiffrement de matériel sécurisées correspondent aux clés de la liste de clés de chiffrement sélectionnée dans le champ Référence de clé de matériel. Par conséquent, les clés sélectionnées lorsque le champ ASTRO OTAR est activé doivent d'abord être définies dans la liste de références de clés de chiffrement de matériel sécurisées.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**, et lorsque le champ [Norme de chiffrement avancée \(AES256\) à la page 302](#) est activé, et lorsque le champ Fonctionnement OTAR est réglé à **ASTRO seulement** ou **ASTRO et MDC**, et lorsque le type de système est réglé à **ASTRO 25**, et lorsque le système ADF courant contient un profil de données référencé, et lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Désactivé;

Profils ASTRO OTAR

10.38.10.5

Sélection de la clé de plage

Ce champ permet de sélectionner la clé de chiffrement sécurisé à utiliser pour les communications de groupes liés pendant le fonctionnement en mode chiffrement sécurisé.

Grâce à la liaison de groupes de conversation, un répartiteur peut regrouper plusieurs groupes de conversation ou utilisateurs afin qu'ils puissent communiquer comme s'ils ne formaient qu'un seul Groupe. Cette sélection s'applique au système ADF courant.

IMPORTANT :

Lorsque le champ [ASTRO OTAR à la page 615](#) est réglé à **Activé** pour le système ADF courant, cette valeur de sélection de clé est choisie dans la liste de références de clés de chiffrement de matériel sécurisées du Profil KMF sécurisé sélectionné dans le champ [Index de profil ASTRO OTAR à la page 616](#) du système ADF courant.

AVERTISSEMENT :

Veillez noter que cela renvoie en fait aux clés de la liste de clés de chiffrement applicable à cette sélection; les clés figurant dans la liste de clés de référence de chiffrement de matériel sécurisées correspondent aux clés de la liste de clés de chiffrement sélectionnée dans le champ Référence de clé de chiffrement. Par conséquent, les clés sélectionnées lorsque le champ ASTRO OTAR est activé doivent d'abord être définies dans la liste de références de clés de chiffrement de matériel sécurisées.

Lorsque le champ ASTRO OTAR est réglé à **Désactivé** pour le système ADF courant, les valeurs de sélection de clés de matériel proviennent directement de la liste des clés de chiffrement de la fenêtre Toute la sécurité.

Accès seulement : lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel**, et lorsque le modèle ou l'option de la radio le permet,

Ou encore, lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel**, et lorsque le champ Type de protocole est réglé à **ASTRO 25**, et lorsque le modèle ou l'option de la radio le permet.

10.38.10.6

Connexion du mode dégradé sécurisée/non chiffrée

Ce champ permet de sélectionner le type de connexion utilisé pour le mode dégradé.

Lorsque le modèle ou l'option de la radio le permet.

Sélectionner

Vous permet d'activer ou de désactiver le chiffrement sécurisé des communications.

REMARQUE :

La touche Sélection de Tx sécurisée, le commutateur Sélection de Tx sécurisée ou la sélection de menu Sélection de Tx sécurisée vous permet d'accéder aux communications chiffrées sécurisées.

Effacer

Permet au canal de transmettre uniquement des communications conventionnelles (non sécurisées).

Sécurisé

Permet au canal de transmettre uniquement des communications chiffrées.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**.

10.38.10.7

Sélection de clé en mode dégradé

Ce champ permet de sélectionner la clé de chiffrement sécurisé à utiliser pour le mode dégradé pendant le fonctionnement selon le mode chiffrement sécurisé.

Cette sélection s'applique au système ADF courant.

IMPORTANT :

Lorsque le champ [ASTRO OTAR à la page 615](#) est réglé à **Activé** pour le système ADF courant, cette valeur de sélection de clé est choisie dans la liste de références de clés de chiffrement de matériel sécurisées du Profil KMF sécurisé sélectionné dans le champ [Index de profil ASTRO OTAR à la page 616](#) du système ADF courant.

AVERTISSEMENT :

Veuillez noter que cela renvoie en fait aux clés de la liste de clés de chiffrement applicable à cette sélection; les clés figurant dans la liste de clés de référence de chiffrement de matériel sécurisées correspondent aux clés de la liste de clés de chiffrement sélectionnée dans le champ Référence de clé de matériel. Par conséquent, les clés sélectionnées lorsque le champ ASTRO OTAR est activé doivent d'abord être définies dans la liste de références de clés de chiffrement de matériel sécurisées.

Lorsque le champ ASTRO OTAR est **désactivé** pour le système ADF courant, la clé provient directement de la liste des clés de chiffrement de la fenêtre Toute la sécurité.

Accès seulement : lorsque le modèle ou l'option de la radio le permet et que le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel**,

Ou encore, lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel**, et lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le champ Mode dégradé sécurisé Connexion chiffrée/claire n'est pas réglé à **Non chiffré**

10.38.10.8

Connexion d'appel individuel sécurisée/non chiffrée

Ce champ permet de sélectionner le type de connexion utilisé pour l'appel privé.

Lorsque le modèle ou l'option de la radio le permet.

Sélectionner

Vous permet d'activer ou de désactiver le chiffrement sécurisé des communications.

REMARQUE :

La touche Sélection de Tx sécurisée, le commutateur Sélection de Tx sécurisée ou la sélection de menu Sélection de Tx sécurisée vous permet d'accéder aux communications chiffrées sécurisées.

Effacer

Permet au canal de transmettre uniquement des communications conventionnelles (non sécurisées).

Sécurisé

Permet au canal de transmettre uniquement des communications chiffrées.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**.

10.38.10.9

Sélection de clé d'appel privée

Ce champ permet de sélectionner la clé de chiffrement sécurisé à utiliser pour les appels privé lors du fonctionnement en mode de chiffrement sécurisé.

Cette sélection s'applique au système ADF courant. Lorsque le champ Index de profil ASTRO OTAR pour le système ADF courant est réglé à **Activé**, la valeur de ce champ est sélectionnée dans la liste de références de clés de chiffrement sécurisé.

IMPORTANT :

L'application renvoie aux clés de la liste des clés de chiffrement pour cette sélection. Les clés individuelles de la liste de références de clés de chiffrement sécurisées font référence aux clés de la liste des clés de chiffrement du champ Référence de clé de chiffrement. Par conséquent, les clés doivent être définies dans la Liste de références de clés de chiffrement sécurisées avant de pouvoir les sélectionner. Les clés prises dans le profil OTAR avec le champ de liste des clés indépendante activé sont disponibles.

Lorsque le champ Index du profil ASTRO OTAR pour le système ADF courant est réglé à **Désactivé**, la valeur pour ce champ est sélectionnée dans la liste des clés de chiffrement de la fenêtre Toute la sécurité.

Accès seulement : lorsque le modèle ou l'option de la radio le permet et que le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel**,

Ou encore, lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel**, et lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le champ Privé Connexion chiffrée/claire n'est pas réglé à **Matériel informatique**

10.38.10.10

Connexion d'interconnexion sécurisée/non chiffrée

Ce champ permet de sélectionner le type de connexion utilisé pour l'interconnexion.

Lorsque le modèle ou l'option de la radio le permet.

Sélectionner

Vous permet d'activer ou de désactiver le chiffrement sécurisé des communications.

REMARQUE :

La touche Sélection de Tx sécurisée, le commutateur Sélection de Tx sécurisée ou la sélection de menu Sélection de Tx sécurisée vous permet d'accéder aux communications chiffrées sécurisées.

Effacer

Permet au canal de transmettre uniquement des communications conventionnelles (non sécurisées).

Sécurisé

Permet au canal de transmettre uniquement des communications chiffrées.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**.

10.38.10.11

Sélection de clé d'interconnexion

Ce champ permet de sélectionner la clé de chiffrement sécurisé à utiliser pour un appel d'interconnexion (mode téléphone) pendant le fonctionnement selon le mode chiffrement sécurisé.

Cette sélection s'applique au système ADF courant.

**IMPORTANT :**

Lorsque le champ Index de profil ASTRO OTAR est réglé à **Activé** pour le système ADF courant, cette valeur de sélection de clé est choisie dans la liste de références de clés de chiffrement sécurisé du profil ASTRO OTAR sélectionné dans le champ Index de profil ASTRO OTAR pour le système ADF courant.

**AVERTISSEMENT :**

Veillez noter que cela renvoie en fait aux clés de la liste de clés de chiffrement applicable à cette sélection; les clés figurant dans la liste de clés de référence de chiffrement sécurisées correspondent aux clés de la liste de clés de chiffrement sélectionnée dans le champ Référence de clé de matériel. Par conséquent, toute clé sélectionnée lorsque l'Index de profil ASTRO OTAR est activé doit d'abord être définie dans la liste de références de clés de chiffrement sécurisé. Les clés prises dans le profil OTAR avec le champ de liste des clés indépendante activé sont disponibles.

L'application renvoie aux clés de la liste des clés de chiffrement pour cette sélection. Les clés individuelles de la liste de références de clés de chiffrement sécurisées font référence aux clés de la liste des clés de chiffrement du champ Référence de clé de chiffrement. Par conséquent, les clés doivent être définies dans la Liste de références de clés de chiffrement sécurisées avant de pouvoir les sélectionner.

Lorsque le champ Index du profil ASTRO OTAR pour le système ADF courant est réglé à **Désactivé**, la valeur pour ce champ est sélectionnée dans la liste des clés de chiffrement de la fenêtre Toute la sécurité.

Accès seulement : lorsque le modèle ou l'option de la radio le permet et que le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel**,

Ou encore, lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel**, et lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le champ Interconnexion chiffrée/claire n'est pas réglé à **Matériel informatique**

10.38.10.12

Connexion de regroupement dynamique sécurisée/non chiffrée

Ce champ permet de sélectionner le type de connexion utilisé pour le regroupement dynamique.

Lorsque le modèle ou l'option de la radio le permet.

10.38.10.13

Sélection de la clé de groupe dynamique

Ce champ permet de sélectionner la clé de chiffrement sécurisé à utiliser pour un regroupement dynamique (groupe dynamique) pendant le fonctionnement en mode chiffrement sécurisé.

Cette sélection s'applique au système ADF courant.

IMPORTANT :

Lorsque le champ [ASTRO OTAR à la page 615](#) est réglé à **Activé** pour le système ADF courant, cette valeur de sélection de clé est choisie dans la liste de références de clés de chiffrement de matériel sécurisées du Profil KMF sécurisé sélectionné dans le champ [Index de profil ASTRO OTAR à la page 616](#) du système ADF courant.

AVERTISSEMENT :

Veillez noter que cela renvoie en fait aux clés de la liste de clés de chiffrement applicable à cette sélection; les clés figurant dans la liste de clés de référence de chiffrement de matériel sécurisées correspondent aux clés de la liste de clés de chiffrement sélectionnée dans le champ Référence de clé de chiffrement. Par conséquent, les clés sélectionnées lorsque le champ ASTRO OTAR est activé doivent d'abord être définies dans la liste de références de clés de chiffrement de matériel sécurisées.

Lorsque le champ ASTRO OTAR est **désactivé** pour le système ADF courant, la clé provient directement de la liste des clés de chiffrement de la fenêtre Toute la sécurité.

Accès seulement : lorsque le modèle ou l'option de la radio est activé, lorsque le champ [Activer le regroupement dynamique à la page 529](#) est **Activé**, et lorsque le champ Fonctionnement sécurisé est réglé à **Matériel**,

Ou encore, lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel**, et lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le champ Regroupement dynamique Connexion chiffrée/claire n'est pas réglé à **Matériel informatique**

10.38.10.14

ViQi : Connexion de partenaire virtuel sécurisée/non chiffrée

Ce champ vous permet de sélectionner le type de connexion utilisé pour le partenaire virtuel ViQi : Partenaire virtuel

Ceci s'applique également au fonctionnement LMR.

Effacer

Permet au canal de transmettre uniquement des communications conventionnelles (non sécurisées). Il s'agit de la valeur par défaut.

Sélectionner

Permet à l'utilisateur d'activer ou de désactiver le chiffrement sécurisé des communications.

REMARQUE :

L'utilisateur accède aux communications chiffrées au moyen de la touche Sélection de Tx sécurisée ou du commutateur Sélection de Tx sécurisée ou de la sélection de menu Sécurisée.

Sécurisé

Permet au canal de transmettre uniquement des communications chiffrées.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel** et que le modèle ou l'option de la radio le permet.

10.38.10.15

ViQi : Sélection de clé de partenaire virtuel

Ce champ permet de sélectionner la clé de chiffrement sécurisé à utiliser pour ViQi : Partenaire virtuel lors du fonctionnement en mode de chiffrement sécurisé.

Cette sélection s'applique au système ADF courant.

IMPORTANT :

Lorsque le champ [ASTRO OTAR à la page 615](#) est réglé à **Activé** pour le système ADF courant, cette valeur de sélection de clé est choisie dans la liste de références de clés de chiffrement de matériel sécurisées du Profil KMF sécurisé sélectionné dans le champ [Index de profil ASTRO OTAR à la page 616](#) du système ADF courant. Ceci s'applique également au fonctionnement LMR.

AVERTISSEMENT :

Veillez noter que le programme renvoie aux clés de la liste des clés de chiffrement pour cette sélection; la liste de références de clés de chiffrement de matériel sécurisées renvoie à la liste des clés de chiffrement du champ Référence de clé de matériel. Par conséquent, les clés sélectionnées lorsque le champ ASTRO OTAR est activé doivent d'abord être définies dans la Liste de références de clés de chiffrement de matériel sécurisées.

Lorsque le champ ASTRO OTAR est **désactivé** pour le système ADF courant, la clé provient directement de la liste des clés de chiffrement de la fenêtre Toute la sécurité.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet, et lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Logiciel** pour un [Personnalité ADF ASTRO 25 à la page 581](#).

10.38.10.16

ID de clé auto Rx

Ce champ permet à la radio de désactiver la sourdine de l'ID de clé (KID) et de l'ID d'algorithme (ALGID) reçues par liaison radio (OTA) et de répondre par liaison radio en utilisant la KID et l'ALGID pendant le délai d'attente d'ID de clé Rx ou Tx configurée dans la codeplug.

REMARQUE :

La réception d'un autre appel à l'aide d'une clé non concordante durant le délai d'attente d'ID de [ID de touche\Délai Rx à la page 316](#) ou [ID de touche\Délai Tx à la page 316](#) entraîne le remplacement de la clé non concordante précédente par la nouvelle clé.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Désactivé**, et lorsque le champ Type de système est réglé à « ASTRO 25 », et lorsque le modèle ou l'option de la radio le permet.

10.38.11

Groupe de conversation (système ADF ASTRO 25)

La section **Groupe de conversation** de l'ensemble Système ADF ASTRO permet à l'utilisateur d'afficher ou de définir la fonctionnalité Groupe de chaque système ADF. Un « groupe de conversation » consiste en un groupe de radios créé dans RadioCentral dans le but d'échanger des communications fréquentes et régulières.

REMARQUE :

Les fréquences de groupe de conversation sont déterminées par le système ADF sur le terrain et ne sont pas définies dans RadioCentral.

REMARQUE :

Les fréquences en mode dégradé de la personnalité ADF doivent être définies dans RadioCentral.

Une fois qu'il a été défini, un groupe de conversation peut être attribué à un ou à plusieurs canaux du sélecteur de canaux de la radio à partir du champ Groupe ADF du [Affectation du canal de zone à la page 668](#) et de l'ensemble Liste de canaux.

10.38.11.1

Nom du groupe

Ce champ vous permet de définir des noms reconnaissables pour le groupe courant (enregistrement/rangée).

Cette sélection s'applique à la personnalité ADF courante.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

**REMARQUE :**

Exemples : PerTG-001, n° 500, Électrique1, n° A5

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

À l'écran de la radio, les traits de soulignement remplacent les espaces vides apparaissant au début.

Les points figurant au début n'apparaîtront pas dans l'affichage de la radio.

10.38.11.2

ID de groupe

Ce champ permet d'entrer (au format décimal ou hexadécimal) le numéro qui désigne de façon exclusive le groupe (enregistrement/rangée) courant.

Cette sélection s'applique à la personnalité ADF courante.

Accès seulement : Lorsque le système ADF référencé a (un fichier de clé de système du logiciel ou une clé de système avancée avec accès sélectionnée dans le champ ID système) ou (une clé WACN avancée avec accès sélectionné dans le champ ID WACN d'accueil),

et lorsque le modèle ou l'option de la radio le permet.

Tableau 286 : Portée

Pour le type de protocole	Désactivé;	Minimum	Maximum
ASTRO 25	Aucun	0001 hex	FFFE hex
Type II	Aucun	001 hex	FFE hex

**IMPORTANT :**

La plage de sélection est modifiable par clé avancée au moyen du programme de gestion des clés de système avancées.

10.38.11.3

Groupe prioritaire

Ce champ vous permet d'appeler le répartiteur lors de l'enfoncement de la touche Répartition prioritaire, suivi de l'enfoncement du bouton PTT.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25** et lorsque le champ Profil DVRS est réglé à **Désactivé**.

La sélection suivante est prise en charge :

Aucun

Valeur par défaut. S'applique à tous les groupes créés à partir du réglage de personnalité actuel.

10.38.11.4

Connexion sécurisée/non chiffrée

Ce champ permet de sélectionner le mode de transmission et de réception relatif au chiffrement sécurisé à utiliser pour le groupe courant (rangée/enregistrement).

Cette sélection s'applique à la Personnalité ADF courante.

Accès seulement : Lorsque le système ADF référencé contient ((un fichier de clé de système du logiciel ou une clé de système avancée avec accès sélectionnée dans le champ [ID système à la page 519](#)) ou (une clé WACN avancée avec accès sélectionnée dans le champ [ID WACN d'accueil à la page 661](#))), et lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel informatique** ou **Logiciel**, et lorsque le champ [Type de protocole](#) est réglé à **ASTRO 25**, et lorsque le modèle et les options de la radio le permettent.

Les sélections suivantes sont prises en charge :

Effacer

Permet au canal de transmettre uniquement des communications normales (non sécurisées).

Sélectionner

Vous permet d'activer ou de désactiver le chiffrement sécurisé des communications. Pour activer ou désactiver le chiffrement sécurisé des communications, vous devez utiliser le commutateur [Sélection de Tx sécurisée à la page 206](#) ou la sélection de menu Sécurisé.

Sécurisé

Permet au canal de transmettre uniquement des communications chiffrées.

10.38.11.5

Sélectionner une clé

Ce champ permet de sélectionner la clé de chiffrement sécurisé à utiliser en mode Chiffrement sécurisé pour le groupe (enregistrement/rangée) courant.

Cette sélection s'applique au groupe courant de la personnalité ADF courante.

IMPORTANT :

Lorsque le champ [Index de profil ASTRO OTAR à la page 412](#) n'est pas désactivé pour la liste de groupes ASTRO courante, cette valeur de sélection de clé est sélectionnée dans [Liste de références de clés de chiffrement de matériel sécurisées à la page 322](#) le profil KMF sécurisé sélectionné dans le champ Index de profil KMF.

AVERTISSEMENT :

Veillez noter que RadioCentral renvoie en fait aux clés de la [Liste des clés de chiffrement à la page 317](#) à cette sélection; les clés individuelles figurant dans la liste de clés de référence de chiffrement de matériel sécurisées correspondent aux clés de [Référence de clé de chiffrement à la page 323](#) . Par conséquent, toute clé sélectionnée lorsque ASTRO OTAR est activé doit d'abord être définie dans la liste de références de clés de chiffrement de matériel sécurisées.

Lorsque le champ Index de profil KMF est désactivé ou non applicable (estompé) à la liste de groupes ASTRO courante, cette valeur de sélection de clé est choisie directement dans la liste des clés de chiffrement.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**, et lorsque le champ [Effectuer/Terminer la connexion vocale à la page 414](#) est réglé à **Sécurisé** ou à **Sélectionner**, et lorsque le modèle ou l'option de la radio le permet.

10.38.11.6

Groupe en mode dégradé

Ce champ permet d'activer le mode dégradé pour le groupe (rangée ou enregistrement) courant.

Cette sélection s'applique aux [Personnalité ADF](#) courants.

Accès seulement : Lorsque le système ADF référencé contient un fichier de clé de système du logiciel ou une clé de système avancée avec accès sélectionnée dans le champ [ID système à la page 519](#) ou une clé WACN avancée avec accès sélectionnée dans le champ [ID WACN d'accueil à la page 661](#), et lorsque le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe**, et lorsque le modèle et les options de la radio le permettent.

10.38.11.7

Fréquence Rx du mode dégradé

Ce champ permet d'entrer la fréquence de réception (Rx) du mode dégradé du groupe (enregistrement/rangée) courant.

Cette sélection s'applique à la Personnalité ADF courante.

AVERTISSEMENT :

Les contraintes de fréquence ADF appliquées à cette sélection sont déterminées par le réglage de cette personnalité et par la bande de fréquences du système ADF référencé.

Accès seulement : Lorsque le système ADF référencé contient un fichier de clé de système du logiciel ou une clé de système avancée avec accès sélectionnée dans le champ [ID système à la page 519](#) ou une clé WACN avancée avec accès sélectionnée dans le champ [ID WACN d'accueil à la page 661](#), et lorsque le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe**, et lorsque le champ [Groupe en mode dégradé à la page 552](#) est réglé à **Activé**, et lorsque le modèle et les options de la radio le permettent.

10.38.11.8

Fréquence Tx du mode dégradé

Ce champ permet d'entrer la fréquence de transmission (Tx) du mode dégradé du groupe (enregistrement/rangée) courant.

Cette sélection s'applique aux [Personnalité ADF](#) courants.

AVERTISSEMENT :

Les contraintes de fréquence ADF appliquées à cette sélection sont déterminées par le réglage de cette personnalité et par la bande de fréquences du système ADF référencé.

Accès seulement : Lorsque le système ADF référencé contient un fichier de clé de système du logiciel ou une clé de système avancée avec accès sélectionnée dans le champ [ID système à la page 519](#) ou une clé WACN avancée avec accès sélectionnée dans le champ [ID WACN d'accueil](#), et lorsque le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe**, et lorsque le champ [Groupe en mode dégradé à la page 552](#) est réglé à **Activé**, et lorsque le modèle et les options de la radio le permettent.

10.38.11.9

Mode dégradé secondaire de groupe de conversation

Ce champ permet d'activer le mode dégradé secondaire pour le groupe (rangée ou enregistrement) courant.

Cette sélection s'applique à la personnalité ADF courante.

Accès seulement : Lorsque le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe**, et lorsque le champ [Groupe en mode dégradé à la page 552](#) est activé et lorsque le modèle ou les options de la radio le permettent.

10.38.11.10

Fréquence Rx du mode dégradé secondaire

Ce champ permet d'entrer la fréquence de réception (Rx) du mode dégradé secondaire pour le groupe (enregistrement/rangée) courant.

Cette sélection s'applique à la personnalité ADF courante.

AVERTISSEMENT :

Les contraintes de fréquence ADF appliquées à cette sélection sont déterminées par le réglage [Type de protocole](#) de cette personnalité et par la bande de fréquences du [Système ADF](#) référencé.

Accès seulement : Lorsque le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe**, et lorsque le champ [Groupe en mode dégradé à la page 552](#) est réglé à **Activé**, et lorsque le champ [Mode dégradé secondaire de groupe de conversation à la page 553](#) est réglé à **Activé**, et lorsque le modèle ou l'option de la radio le permet.

10.38.11.11

Fréquence Tx du mode dégradé secondaire

Ce champ permet d'entrer la fréquence de transmission (Tx) du mode dégradé secondaire pour le groupe (enregistrement/rangée) courant.

Cette sélection s'applique à la personnalité ADF courante.

IMPORTANT :

Les contraintes de fréquence ADF appliquées à cette sélection sont déterminées par le réglage du type de protocole de cette personnalité et par la bande de fréquences du [Système ADF](#) référencé.

Accès seulement : Lorsque le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe**, et lorsque le champ [Groupe en mode dégradé à la page 552](#) est réglé à **Activé**, et lorsque le champ [Mode dégradé secondaire de groupe de conversation à la page 553](#) est réglé à **Activé**, et lorsque le modèle ou l'option de la radio le permet.

10.38.11.12

ID du système TG

Ce champ permet à l'utilisateur d'entrer (au format décimal ou hexadécimal) l'ID à trois chiffres du système du groupe (système ADF) nécessaire lorsque le [Type de couverture à la page 517](#) sélectionné pour le système ADF référencé est Itinérance intra-WACN ou Itinérance inter-WACN.

Cette sélection s'applique au groupe courant (enregistrement/rangée) applicable à la [Personnalité ADF](#) courante.

Accès seulement : Lorsque le champ [Type de protocole](#) est réglé à **ASTRO 25**, et lorsque le système ADF référencé a son champ [Type de couverture à la page 517](#) réglé à **Itinérance intra-WACN** ou à **Itinérance inter-WACN**, et lorsque le modèle ou l'option de la radio le permet.

Tableau 287 : Portée

Minimum	Maximum
000 (hexadécimal)	FFE (hex)

IMPORTANT :

Valeur par défaut = 1 Lorsque la valeur est « 0 », la radio copie la valeur du champ [ID système à la page 519](#) pour le [Système ADF](#) actuellement référencé dans ce champ.

10.38.11.13

ID de WACN TG

Ce champ vous permet d'entrer (en format décimal ou hexadécimal) l'ID WACN (réseau de communication étendu) **Groupe** à cinq chiffres nécessaire lorsque le **Type de couverture à la page 517** sélectionné pour le système ADF référencé est Itinérance inter-WACN.

Cette sélection s'applique à la **Groupe** courante (enregistrement/rangée) applicable à la **Personnalité ADF** courante.

Accès seulement : Lorsque le champ **Type de protocole** est réglé à **ASTRO 25**, et lorsque le système ADF référencé a son champ **Type de couverture à la page 517** réglé à **Itinérance inter-WACN** et que le modèle ou les options de la radio le permettent.

Tableau 288 : Portée

Minimum	Maximum
00000 (hexadécimal)	FFFFE (hex)

**IMPORTANT :**

Valeur par défaut = 1 Lorsque la valeur est « 0 », la radio copie la valeur du champ **ID WACN d'accueil à la page 661** pour le **Système ADF** actuellement référencé dans ce champ.

10.39

Personnalité ADF ASTRO 25

La fenêtre **Personnalité ADF ASTRO 25** permet à l'utilisateur de créer et de supprimer des personnalités ADF, ainsi que de définir des personnalités ADF individuelles. Il existe deux modes de communication : ADF et conventionnel.

**REMARQUE :**

Les systèmes ADF sont référencés à une personnalité ADF. Les paramètres de système ADF peuvent être activés pour tous les types de canaux ADF.

Une fois que les fonctions des personnalités ADF ont été définies de manière unique, chaque personnalité peut être assignée à la position désirée du sélecteur de canal de la radio au moyen de la fonction Attribution du canal de zone.

10.39.1

Général (Personnalité ADF ASTRO 25)

La section **Général** de l'ensemble Personnalité ADF ASTRO 25 permet à l'utilisateur d'afficher ou de définir les fonctionnalités de base pour des personnalités ADF.

**REMARQUE :**

Une fois que les fonctions des personnalités ADF ont été définies de manière unique, chaque personnalité peut être affectée à la position désirée sur le sélecteur de canal de la radio au moyen de la fonction Affectation du canal de zone.

10.39.1.1

Nom de Personnalité ADF

Ce champ vous permet de définir réer un nom reconnaissable pour la personnalité ADF courante.

REMARQUE :

Une fois que les fonctions des personnalités ADF ont été définies de manière unique, chaque personnalité peut être assignée à la position désirée du sélecteur de canal de la radio au moyen de la fonction Attribution du canal de zone. Ce nom est utilisé afin de sélectionner la personnalité courante dans la page Canaux de cette fenêtre.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

Exemples : Personnalité-01, N° 500, Électrique 1, N° A5

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

À l'écran de la radio, les traits de soulignement remplacent les espaces vides apparaissant au début.

Les points figurant au début n'apparaîtront pas dans l'affichage de la radio.

10.39.1.2

Système

Ce champ permet de sélectionner le système ADF programmé pour la personnalité ADF courante.

IMPORTANT :

Seuls les systèmes ADF dont le Type de système correspond au Type de protocole des personnalités courantes doivent être sélectionnés.

Seuls les systèmes ADF dotés de fichiers de clé de système du logiciel ou de clés (matérielles) avancées dont les champs et les fonctions ne sont pas protégés (accès illimité) peuvent être sélectionnés; dans les autres cas, ce champ est non valide.

Lorsque la valeur de ce champ est non valide, tous les champs protégés au moyen d'une clé système dans la personnalité ADF courante s'affichent en lecture seule.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.39.1.3

Minuterie de délai d'attente

Ce champ permet de sélectionner la durée pendant laquelle la radio peut émettre de manière continue pour la personnalité ADF courante.

Lorsque le délai est sur le point d'expirer, la radio émet une tonalité d'alarme et interrompt automatiquement la transmission. La durée est exprimée en secondes.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

Lorsque le champ est réglé à **Infini** :

Aucune minuterie n'est utilisée pour les radios APX Next et APX N70. Par conséquent, le temps de conversation est illimité.

Tableau 289 : Portée

Type de radio	Minimum	Maximum	Incréments
Radios non-APX4000XH	15 s	465 s	15 s

Type de radio	Minimum	Maximum	Incréments
Radios APX4000XH	15 s	60 s	15 s

Tableau 290 : Portée

Type de radio	Minimum	Maximum	Incréments
APX SUIVANT	0 s	465 s	15 s

10.39.1.4

AGC RF avancé

Ce champ permet de sélectionner le type de commande automatique du gain (AGC) de la fréquence de réception (RF) qui s'applique à la personnalité ADF courante.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Désactivé;

Lorsque **Désactivé** est sélectionné, la radio utilise une forme de base d'AGC intégrée au récepteur de la radio. Cette protection intégrée contribue à éviter l'écrêtage du signal et la saturation du récepteur, qui risquent d'endommager les composants de la radio.

Standard

Cette valeur permet d'activer une forme évoluée de commande automatique du gain qui offre une protection contre l'interférence d'intermodulation (IM) en détectant et en supprimant toute interférence provenant de sources externes.

Amélioré

Cette valeur permet à la radio d'utiliser d'autres techniques de réduction de l'interférence d'IM, qui permettent de nettoyer le signal.

Intelligente

Cette valeur permet à la radio d'utiliser une technique unique pour améliorer l'immunité aux interférences à proximité des stations de base Linear Simulcast et APCO phase 2. L'option intelligente s'exclut mutuellement avec la case à cocher Protection large bande.

**IMPORTANT :**

Il se peut que les formes standard et améliorée de la commande automatique du gain diminuent la performance sur les **canaux** qui ne subissent **aucune** interférence d'IM. Par conséquent, cette fonction doit être activée uniquement sur les canaux qui sont soumis à ce type d'interférence.

10.39.1.5

Protection large bande

Ce champ vous permet d'activer la protection large bande de la personnalité ADF courante.

La protection large bande améliore l'AGC RF avancé en ajoutant un filtre de large bande à haute sélectivité lors de la réception aux fréquences sélectionnées dans les bandes de 700 Mhz et 800 Mhz.

10.39.1.6

Type de conversation

Ce champ permet de sélectionner le mode de communication de la personnalité ADF courante.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Message

Le système assigne un canal de trafic pour la durée d'une seule transmission effectuée par une radio. Lorsque la radio cesse d'émettre, toutes les radios restent sur le canal de trafic jusqu'à ce que le délai fixé pour ce canal expire. Après l'expiration du délai, les radios syntonisent de nouveau le canal de contrôle. Toute radio qui participe à l'appel peut commencer à émettre pendant qu'elle utilise le canal de trafic sans retourner au canal de contrôle. Le partage de ressources par message est offert sur les systèmes à canal de contrôle de 3 600 bauds.

AVERTISSEMENT :

Le partage de ressources par message n'est pas compatible avec les systèmes ASTRO 25.

Émission

Le système assigne un canal de trafic pour la durée d'une seule transmission effectuée par une radio. Lorsque la radio cesse d'émettre, le canal de trafic est désassigné, et tous les abonnés qui participent à l'appel retournent au canal de contrôle. Toute demande subséquente de canal de trafic est envoyée sur le canal de contrôle par la radio demandeuse.

ID de PTT

Le système assigne un canal de trafic pour la durée de la conversation comme suit : Lorsqu'une radio cesse d'émettre, le canal vocal demeure actif, et les radios restent en attente sur ce canal pendant le délai fixé. Si une radio commence à émettre avant l'expiration de ce délai, sa radio syntonise d'abord le canal de contrôle pour envoyer un message contenant son ID de PTT (ID d'unité), ce qui signifie qu'elle veut transmettre des données vocales maintenant dans le cadre de l'appel. Le système envoie alors un message qui dirige la radio de l'abonné vers le canal de trafic vocal d'origine.

10.39.1.7

Type de mode dégradé

Ce champ permet de sélectionner le type de mode dégradé de la personnalité ADF courante.

REMARQUE :

Le mode dégradé offre un fonctionnement conventionnel bidirectionnel en cas de défaillance du système ADF. La radio revient automatiquement en mode ADF une fois que le système ADF est rétabli.

Accès seulement : Lorsqu'un fichier de clé du système ou une clé du système figure dans le champ ID du système du système ADF référencé ou qu'une clé WACN avancée avec accès est sélectionnée dans le champ ID WACN d'accueil, et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Sélections	Définitions :	À votre disposition lorsque	
		Le type de protocole est	Le type de couverture est
Désactivé;	Aucun mode dégradé n'est utilisé	Tous	Tous
Personnalité	Lorsque le champ Type de couverture à la page 517 est réglé à Désactivé , ce qui correspond à SmartNet, le mode dégradé utilise les fréquences de mode dégradé de personnalité pour tous les groupes au sein de cette personnalité ADF. Lorsque le champ Type de couverture est réglé à SmartZone , les fréquences de mode dégradé par personnalité ne sont pas utilisées; au lieu de cela :	Type II	Tous

Sélections	Définitions :	À votre disposition lorsque	
		Le type de protocole est	Le type de couverture est
	<ul style="list-style-type: none"> Lorsque le site est verrouillé, le mode dégradé utilise le dernier canal de contrôle actif. Si le mode dégradé n'est toujours pas détecté, la radio recherche le système ADF référencé pour le mode dégradé dans la liste des canaux de contrôle. Si le champ 	Tous	Tous

Sélections	Définitions :	À votre disposition lorsque	
		Le type de protocole est	Le type de couverture est
	Groupe en mode dégradé n'est pas réglé à Activé , le mode dégradé utilise le dernier canal de contrôle actif et, si nécessaire, peut effectuer une autre recherche dans la liste des canaux de contrôle.		

10.39.1.8

Transmit Mode (Mode de transmission)

Ce champ permet d'indiquer si la personnalité ou le canal aura une fonctionnalité de transmission complète, ou s'il sera limité à transmettre des communications vocales de groupes (TG) et de groupes d'annonce (AG).

Cette sélection s'applique à la Personnalité ADF courante.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Sans restriction

Aucune limite n'est fixée pour la fonctionnalité de transmission.

Groupe/AG désactivé (Écoute seule)

La radio n'est pas en mesure de transmettre sur le groupe ou l'AG. Voir le champ Groupe ADF. La radio peut recevoir les transmissions vocales sur le mode de canal sélectionné.

**AVERTISSEMENT :**

Le Regroupement dynamique n'est pas compatible avec cette sélection.

Le [Sélection du profil d'urgence à la page 560](#) de cette personnalité doit être réglé à **Tx d'urgence désactivée** ou le profil sélectionné doit avoir son champ [Réponse d'urgence à la page 353](#) réglé à **Redirection**; autrement, la sélection du champ Profil d'urgence est considérée comme non valide.

La liste de balayage de cette personnalité ne doit pas avoir le champ [Type de membre de Tx vocale désigné à la page 689](#) réglé à **Canal sélectionné** (c.-à-d. ce canal); sinon, la [Sélection de la liste de balayage à la page 573](#) devient non valide.

La [Clavier activé \(DTMF\) à la page 576](#) n'est pas possible avec cette sélection.

10.39.1.9

Sélection du profil d'urgence

Ce champ permet de sélectionner le profil d'urgence ADF à utiliser pour la personnalité ADF courante.

Vous pouvez activer le mode d'urgence ou le lancer avec une radio programmée

**AVERTISSEMENT :**

Lorsque le champ [Transmit Mode \(Mode de transmission\) à la page 560](#) est réglé à **Groupe/AG désactivé** (mode Écoute seulement) pour la personnalité ADF courante, cette sélection de profil doit être réglée à **Tx d'urgence désactivée**, ou le profil sélectionné doit avoir son champ [Réponse d'urgence à la page 353](#) réglé à **Redirection**; sinon, cette sélection est considérée comme étant non valide.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

- Tx d'urgence désactivée
- Profils d'urgence des ADF disponibles

10.39.1.10

Type d'annulation d'urgence

Ce champ permet de sélectionner le type de redirection pour réponse d'urgence **Non tactique** à utiliser lors du fonctionnement en mode d'urgence pour la personnalité ADF courante.

Voir aussi [Réponse d'urgence à la page 353](#).

AVERTISSEMENT :

Vous pouvez passer à la fonctionnalité du mode d'urgence ou lancer ce mode avec une radio programmée.

Accès seulement : Lorsque la fonction étendue **Annulation d'urgence multiple** apparaît dans le champ Nom de fonction étendue, qu'un profil d'urgence ADF référencé est sélectionné pour la personnalité ADF courante, que le champ Groupe d'urgence du profil d'urgence ADF est réglé à **Redirection** et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Groupe d'annulation

La radio utilise l'ID du groupe d'annulation de réponse d'urgence définie pour la personnalité ADF courante afin de transmettre les alarmes d'urgence ou les appels d'urgence.

Annulation du système

La radio utilise le [Zone d'annulation du système d'urgence à la page 563](#) et le [Canal d'annulation du système d'urgence à la page 564](#) pour transmettre les alarmes d'urgence ou les appels d'urgence. Les transmissions d'urgence sont également envoyées à la console du répartiteur.

AVERTISSEMENT :

Le Regroupement dynamique n'est pas compatible avec cette sélection.

10.39.1.11

ID de groupe de redirection pour réponse d'urgence

Ce champ permet d'entrer, en format décimal ou hexadécimal, le numéro de groupe qui désigne de façon unique le groupe courant (enregistrement/rangée).

Cette sélection s'applique à la [Personnalité ADF](#) courante.

Accès seulement : Lorsque le système ADF référencé dispose d'un fichier de clé système logiciel ou d'une clé de système avancée avec accès sélectionnée dans le champ [ID système à la page 519](#), ou d'une clé WACN avancée avec accès sélectionnée dans le champ [ID WACN d'accueil à la page 661](#), et que le modèle ou les options de la radio le permettent.

Tableau 291 : Portée

Pour le type de protocole :	Désactivé;	Minimum	Maximum
ASTRO 25	Aucune	0001 (hexadécimal)	FFFE (hex)
Type II	Aucune	001 (hex)	FFE (hex)

IMPORTANT :

La plage de sélection est modifiable par clé avancée au moyen du programme de gestion des clés de système avancées.

10.39.1.12

Annuler la réponse d'urgence\Effectuer/Terminer la connexion vocale

Ce champ permet de sélectionner le mode de transmission à utiliser lors du fonctionnement en mode d'urgence pour le groupe de redirection pour réponse d'urgence.

Cette sélection s'applique à la Personnalité ADF courante.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**, et lorsque le champ Type de protocole est réglé à **ASTRO 25**.

Les sélections suivantes sont prises en charge :

Effacer

Permet au groupe ou au canal de transmettre uniquement des communications en mode de fonctionnement ADF normal (non sécurisé).

Sélectionner

Permet d'activer ou de désactiver le chiffrement sécurisé pour le groupe courant. La touche Sélection de Tx sécurisée, le commutateur [Sélection de Tx sécurisée à la page 206](#) ou la sélection de menu Sécurisé vous permet d'activer ou de désactiver les communications chiffrées sécurisées.

Sécurisé

Permet au groupe de transmettre uniquement des communications chiffrées.

10.39.1.13

Annuler la réponse d'urgence\Sélection de touche

Ce champ permet de sélectionner la clé de chiffrement sécurisée à utiliser en mode d'urgence pour le groupe de redirection pour réponse d'urgence.

Cette sélection s'applique à la Personnalité ADF courante.

IMPORTANT :

Lorsque le champ [Index de profil ASTRO OTAR à la page 616](#) est réglé à **Activé** pour le système ADF référencé, cette valeur de sélection de clé est choisie dans la liste de références de clés de chiffrement sécurisées du profil ASTRO OTAR sélectionné dans le champ Index de profil ASTRO OTAR du système ADF référencé.

AVERTISSEMENT :

Veillez noter que cela renvoie aux clés de la liste des clés de chiffrement pour cette sélection; les clés individuelles de la référence de la liste de références de clés de chiffrement de matériel sécurisées sont associées aux clés de la liste des clés de chiffrement du champ Référence de clé de chiffrement. Par conséquent, toute clé sélectionnée lorsque le champ Index de profil ASTRO OTAR est activé doit d'abord être définie dans la liste de références de clés de chiffrement sécurisé. Les clés prises dans le profil OTAR avec le champ de liste des clés indépendante activé sont disponibles.

Lorsque le champ Index de profil ASTRO OTAR est réglé à **Désactivé** pour le système ADF référencé, cette valeur de sélection de clé est choisie directement dans la liste des clés de chiffrement de la fenêtre Toute la sécurité.

AVERTISSEMENT :

Lorsque l'ID de groupe normal utilisé par d'autres radios est identique à l'ID de groupe d'annulation de réponse d'urgence associé à la radio courante et...

Lorsque la clé de groupe de conversation normale utilisée par d'autres radios n'est pas identique à la clé de groupe de conversation d'annulation de réponse d'urgence...

Les règles suivantes s'appliquent :

- Lorsque cette radio passe à son ID de groupe d'annulation de réponse d'urgence à l'aide de cette clé, la transmission d'urgence de la radio n'est pas entendue par les autres radios.
- Cependant, il est possible que la transmission d'urgence soit interceptée par un balayage, même en l'absence de correspondance entre les clés.

Accès seulement : Lorsque le champ Réponse d'urgence [Annuler la réponse d'urgence\Effectuer/Terminer la connexion vocale à la page 562](#) est réglé à **Sécurisé** ou à **Sélectionné**, et

Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**, et lorsque le champ Type de protocole est réglé à **ASTRO 25**, et lorsque le modèle ou l'option de la radio le permet.

10.39.1.14

Zone d'annulation du système d'urgence

Ce champ permet de sélectionner la zone à utiliser pour la durée de la transmission en mode d'urgence.

Cette sélection s'applique à la Personnalité ADF courante.

REMARQUE :

une fois cette zone sélectionnée, l'option [Canal d'annulation du système d'urgence à la page 564](#) peut être sélectionnée.

Les zones et leurs canaux doivent d'abord avoir été définis dans la fenêtre Attribution du canal de zone.

AVERTISSEMENT :

Seules les zones non dynamiques (zones pour lesquelles le champ Activation zone dynamique est réglé à **Désactivé**) peuvent être sélectionnées; sinon, ce champ devient non valide.

Accès seulement : Lorsque le champ Nom de fonction étendue est réglé à **Annulation d'urgence multiple**, qu'un profil d'urgence ADF référencé valide est sélectionné pour la personnalité ADF

courante, que le champ [Réponse d'urgence à la page 353](#) est réglé à **Redirection**, que le champ [Type d'annulation d'urgence à la page 561](#) est réglé à **Redirection du système** et que le modèle ou l'option de la radio le permet.

10.39.1.15

Canal d'annulation du système d'urgence

Ce champ permet de sélectionner un canal conventionnel ou ADF à utiliser pendant une transmission en mode d'urgence.

Cette sélection s'applique à la Personnalité ADF courante.

REMARQUE :

La valeur [Zone d'annulation du système d'urgence à la page 563](#) doit être sélectionnée avant de sélectionner ce canal.

Les zones et leurs canaux doivent d'abord avoir été définis dans la fenêtre Attribution du canal de zone.

AVERTISSEMENT :

Pour les codeplugs des radios portatives APX™ 3000, seuls les 48 premiers canaux de la [Zone d'annulation du système d'urgence à la page 563](#) sélectionnée sont considérés comme étant des sélections valides.

La sélection Canal de redirection du système d'urgence est considérée valide uniquement : lorsque le champ [Groupe de conversation ADF à la page 673](#) pour la personnalité/canal ADF sélectionné n'est pas réglé à **DYN** ou à **ATG**, que le champ [Personnalité réception seulement à la page 430](#) pour la personnalité/canal conventionnel sélectionné est réglé à **Désactivé**, que le champ ID de groupe ASTRO pour la personnalité/canal conventionnel sélectionné n'est pas réglé à **DYN** ou à **ATG**, que le champ [Transmit Mode \(Mode de transmission\) à la page 560](#) pour la personnalité/le canal ADF sélectionné n'est pas réglé à **TG/AG désactivé (écoute seulement)** et que le champ [Sélection du profil d'urgence à la page 560](#) pour le canal sélectionné n'est pas réglé à **Urgence Tx désactivée**.

Accès seulement : Lorsque la fonction étendue **Annulation d'urgence multiple** apparaît dans le champ Nom de fonction étendue et qu'un profil d'urgence ADF référencé est sélectionné pour la personnalité ADF courante, que le champ [Réponse d'urgence à la page 353](#) du Profil d'urgence ADF est réglé à **Redirection**, que le champ [Type d'annulation d'urgence à la page 561](#) est réglé à **Redirection du système**, que le champ [Zone d'annulation du système d'urgence à la page 563](#) n'est pas réglé à une zone dynamique et que le modèle ou l'option de la radio le permet.

10.39.2

Groupe d'annonce (Personnalité ADF ASTRO 25)

La section **Groupe d'annonce** de l'ensemble Personnalité ADF ASTRO 25 permet à l'utilisateur d'afficher ou de définir les paramètres de Groupe d'annonce pour des personnalités ADF individuelles. Grâce aux groupes d'annonce, l'utilisateur peut communiquer sur un grand canal composé de tous les groupes de conversation définis pour la personnalité ADF courante.

REMARQUE :

Un Groupe d'annonce (ATG) doit être sélectionné pour cette personnalité ADF à partir du champ [Affectation du canal de zone à la page 668](#) et du jeu de listes de canaux et Groupes ADF. La sélection ATG sert à désigner le canal désigné du groupe d'annonce.

Une fois que les fonctions des personnalités ADF ont été définies de manière unique, chaque personnalité peut être affectée à la position désirée sur le sélecteur de canal de la radio au moyen de la fonction Affectation du canal de zone.

10.39.2.1

Groupe d'annonce

Ce champ permet d'entrer (au format décimal ou hexadécimal) l'ID qui désigne de façon exclusive le groupe d'annonce de la personnalité ADF courante.

**REMARQUE :**

Grâce aux groupes d'annonce, la radio peut effectuer des appels sur un grand canal de communication comprenant tous les groupes définis pour la personnalité ADF courante.

**AVERTISSEMENT :**

La valeur Groupe d'annonce (ATG) doit être sélectionnée pour cette personnalité ADF dans le champ [Groupe de conversation ADF à la page 673](#) de la page Canaux, Attribution du canal de zone. La sélection ATG sert à désigner le canal désigné du groupe d'annonce.

La personnalité est sélectionnée à partir du champ [Personnalité à la page 672](#) dans la page Attribution de canal de zone du Canal de zone.

Accès seulement : Lorsque le système ADF référencé dispose d'un fichier de clé système logiciel ou d'une clé de système avancée avec accès sélectionnée dans le champ [ID système à la page 519](#), ou d'une clé WACN avancée avec accès sélectionnée dans le champ [ID WACN d'accueil à la page 661](#), et que le modèle ou les options de la radio le permettent.

Tableau 292 : Portée

Pour Type de protocole	Désactivé;	Minimum	Maximum
ASTRO 25	Aucune	0001 (hexadécimal)	FFFE (hex)
Type II	Aucune	001 (hex)	FFE (hex)

**IMPORTANT :**

La plage de sélection est modifiable par clé avancée au moyen du programme de gestion des clés de système avancées.

10.39.2.2

Effectuer/Terminer la connexion AG

Ce champ permet de sélectionner le mode de transmission et de réception du groupe d'annonce de la personnalité ADF courante.

Accès seulement : Lorsque le champ [Groupe d'annonce à la page 565](#) n'est pas réglé à **Aucun** et que le modèle ou l'option de la radio le permet,

Et

Lorsque le champ [Fonctionnement sécurisé à la page 301](#) doit être réglé à **Matériel**, et lorsque le champ [Type de voix/signal AG à la page 565](#) est réglé à **Numérique**, et lorsque la largeur de bande du système ADF référencé n'est pas réglée à **12,5 kHz**,

ou

Lorsque le champ Type de protocole est réglé à **ASTRO 25**, et lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**.

Les sélections suivantes sont prises en charge :

Effacer

Permet au canal de transmettre uniquement des communications ADF normales (non sécurisées).

Sélectionner

Vous permet d'activer ou de désactiver le chiffrement sécurisé des communications.

Vous devez utiliser la touche Sélection de Tx sécurisée, le commutateur [Sélection de Tx sécurisée à la page 206](#) ou la sélection de menu Sécurisé pour activer ou désactiver les communications chiffrées sécurisées.

Sécurisé

Permet au canal d'utiliser uniquement le mode de chiffrement sécurisé.

10.39.2.3

Sélectionner une clé AG

Ce champ permet de sélectionner la clé de chiffrement sécurisée à utiliser pour le groupe d'annonce de la personnalité ADF courante.

Cette sélection s'applique au mode de chiffrement sécurisé.

IMPORTANT :

Lorsque le champ [ASTRO OTAR à la page 615](#) est réglé à **Activé** pour le système ADF référencé, cette valeur de sélection de clé est choisie dans la Liste de références de clés de chiffrement sécurisées du Profil OTAR ASTRO OTAR sélectionné dans le champ [Index de profil ASTRO OTAR à la page 616](#) du système ADF référencé.

AVERTISSEMENT :

Veuillez noter que cela renvoie en fait aux clés de la liste de clés de chiffrement applicable à cette sélection; les clés figurant dans la liste de clés de référence de chiffrement sécurisées correspondent aux clés de la liste de clés de chiffrement sélectionnée dans le champ [Référence de clé de chiffrement à la page 323](#). Par conséquent, toute clé sélectionnée lorsque le profil ASTRO OTAR est activé doit d'abord être définie dans la liste de références de clés de chiffrement sécurisé. Les clés prises dans le profil ASTRO OTAR avec le champ de liste des clés indépendante activé sont disponibles.

Lorsque le champ ASTRO OTAR est réglé à **Désactivé** pour le système ADF défini, cette valeur de sélection de clé est choisie directement dans la liste des clés de chiffrement de la fenêtre Toute la sécurité.

Accès seulement : Lorsque le champ [Effectuer/Terminer la connexion AG à la page 565](#) n'est pas réglé à **Conventionnel**, et lorsque le champ [Groupe d'annonce à la page 565](#) n'est pas réglé à **Aucun**, et lorsque le modèle ou l'option de la radio le permet,

Et

Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** et que le champ [Type de voix/signal AG à la page 565](#) est réglé à **Numérique**,

ou

Lorsque le champ Fonctionnement sécurisé est réglé à **Matériel**, et lorsque le champ Type voix/signal AG est réglé à **Analogique**, et lorsque la bande de fréquence de canal du système ADF n'est pas réglée à **12,5 kHz**,

ou

Lorsque le champ Type de protocole est réglé à **ASTRO 25**, et lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**.

10.39.2.4

Groupe d'annonce en mode dégradé

Ce champ permet d'activer le mode dégradé pour le groupe d'annonce de la personnalité ADF courante.

Accès seulement : Lorsque le système ADF associé contient un fichier de clé de système logicielle ou une clé de système avancée avec accès sélectionnée dans le champ ID du système ou une clé

WACN avancée avec accès sélectionnée dans le champ ID WACN d'accueil, et lorsque le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe de conversation**, et lorsque le champ [Groupe d'annonce à la page 565](#) n'est pas réglé à **Aucun**, et lorsque le modèle et les options de la radio le permettent.

10.39.2.5

Fréquence Rx Failssoft AG

Ce champ permet d'entrer la fréquence de réception (Rx) à utiliser en mode dégradé pour le groupe d'annonce de la personnalité ADF courante.

AVERTISSEMENT :

Les contraintes de fréquence ADF appliquées à cette sélection sont déterminées par la valeur du champ Type de protocole de la personnalité courante et par la bande de fréquences du système ADF défini.

Accès seulement : Lorsque le système ADF référencé dispose d'une clé de système logicielle ou d'une clé de système avancée dont l'accès est sélectionné dans le champ ID du système, ou une clé WACN avancée dont l'accès est sélectionné dans le champ ID WACN d'accueil, que le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe**, que le champ [Groupe d'annonce à la page 565](#) n'est pas réglé à **Aucun**, que le champ [Groupe d'annonce en mode dégradé à la page 567](#) est réglé à **Activé** et que le modèle ou l'option de la radio le permet.

10.39.2.6

Fréquence Tx Failssoft AG

Ce champ vous permet d'entrer la fréquence de réception (Rx) à utiliser en mode dégradé pour le groupe d'annonce de la personnalité ADF courante.

AVERTISSEMENT :

Les contraintes de fréquence ADF appliquées à cette sélection sont déterminées par la valeur du champ Type de protocole de la personnalité courante et par la bande de fréquences du système ADF défini.

Accès seulement : Lorsque le système ADF référencé dispose d'une clé de système logicielle ou d'une clé de système avancée dont l'accès est sélectionné dans le champ ID du système, ou une clé WACN avancée dont l'accès est sélectionné dans le champ ID WACN d'accueil, que le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe**, que le champ [Groupe d'annonce à la page 565](#) n'est pas réglé à **Aucun**, que le champ [Groupe d'annonce en mode dégradé à la page 567](#) est réglé à **Activé** et que le modèle ou l'option de la radio le permet.

10.39.2.7

Mode dégradé secondaire AG

Ce champ permet d'activer le mode dégradé secondaire pour le groupe d'annonce de la personnalité ADF courante.

Accès seulement : lorsque le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe**, que le champ [Groupe d'annonce à la page 565](#) n'est pas réglé à **Aucun**, que le champ [Groupe d'annonce en mode dégradé à la page 567](#) est réglé à **Activé** et que le modèle ou l'option de la radio le permet.

10.39.2.8

Fréquence secondaire Rx AG F/S

Ce champ permet d'entrer la fréquence de réception (Rx) secondaire à utiliser en mode dégradé pour le groupe d'annonce de la personnalité ADF courante.

AVERTISSEMENT :

Les contraintes de fréquence ADF appliquées à cette sélection sont déterminées par la valeur du champ Type de protocole de la personnalité courante et par la bande de fréquences du système ADF défini.

Accès seulement : Lorsque le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe**, le champ [Groupe d'annonce à la page 565](#) n'est pas réglé à **Aucun**, le champ [Groupe d'annonce en mode dégradé à la page 567](#) est réglé à **Activé**, le champ [Mode dégradé secondaire AG à la page 568](#) est réglé à **Activé**, et lorsque le modèle ou l'option de la radio le permet.

10.39.2.9

Fréquence secondaire Tx AG F/S

Ce champ vous permet d'entrer la fréquence de transmission (Tx) secondaire à utiliser en mode dégradé pour le groupe d'annonce de la personnalité ADF courante.

AVERTISSEMENT :

Les contraintes de fréquence ADF appliquées à cette sélection sont déterminées par la valeur du champ Type de protocole de la personnalité courante et par la bande de fréquences du système ADF défini.

Accès seulement : Lorsque le champ [Type de mode dégradé à la page 557](#) est réglé à **Groupe**, le champ [Groupe d'annonce à la page 565](#) n'est pas réglé à **Aucun**, le champ [Groupe d'annonce en mode dégradé à la page 567](#) est réglé à **Activé**, le champ [Mode dégradé secondaire AG à la page 568](#) est réglé à **Activé**, et lorsque le modèle ou l'option de la radio le permet.

10.39.2.10

ID du système AG

Ce champ vous permet d'entrer (au format décimal ou hexadécimal) l'ID à trois chiffres du système (système ADF) de groupe d'annonce nécessaire lorsque le type de couverture sélectionné pour le système ADF référencé est Itinérance inter-WACN.

Cette sélection s'applique à la personnalité ADF courante.

Accès seulement : Lorsque le champ Type de système du système ADF référencé est réglé à **ASTRO 25**, et lorsque le champ [Type de couverture à la page 517](#) est réglé à **Itinérance inter-WACN** et que le modèle ou l'option de la radio le permet.

Tableau 293 : Portée

Minimum	Maximum
000 hex	FFE hex

10.39.2.11

ID de WACN AG

Ce champ permet d'entrer (en format décimal ou hexadécimal) l'ID WACN (réseau de communication étendu) à cinq chiffres du groupe d'annonce nécessaire lorsque le type de couverture sélectionné pour le système ADF référencé est Itinérance inter-WACN.

L'ID de WACN AG s'applique à la personnalité ADF courante.

Accès seulement : Lorsque le champ Type de système du système ADF référencé est réglé à **ASTRO 25**, et lorsque le champ [Type de couverture à la page 517](#) est réglé à **Itinérance inter-WACN** et que le modèle ou l'option de la radio le permet.

Tableau 294 : Portée

Minimum	Maximum
00000 (hexadécimal)	FFFFE (hex)

10.39.3

Groupe de conversation (Personnalité ADF ASTRO 25)

La section **Groupe de conversation** de l'ensemble Personnalité ADF ASTRO 25 permet à l'utilisateur d'afficher ou de définir la fonctionnalité Groupe de chaque personnalité ADF. Un « groupe de conversation » consiste en un groupe de radios créé dans RadioCentral dans le but d'échanger des communications fréquentes et régulières.

REMARQUE :

Les fréquences de groupe de conversation sont déterminées par le système ADF sur le terrain et ne sont pas définies dans RadioCentral.

REMARQUE :

Les fréquences en mode dégradé de la personnalité ADF doivent être définies dans RadioCentral.

Une fois qu'il a été défini, un groupe de conversation peut être attribué à un ou à plusieurs canaux du sélecteur de canaux de la radio à partir du champ Groupe ADF du [Affectation du canal de zone à la page 668](#) et de l'ensemble Liste de canaux.

10.39.3.1

Groupe

Affiche le nom reconnaissable par l'utilisateur RadioCentral pour le groupe de conversation (rangée ou enregistrement) courant.

Cette sélection s'applique à la personnalité ADF ou Personnalité ADF ASTRO 25 courante.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.39.3.2

Sélectionner une clé

Ce champ permet de sélectionner la clé de chiffrement sécurisée à utiliser pour le groupe courant (enregistrement/rangée).

Cette sélection s'applique à la Personnalité ADF courante.

IMPORTANT :

Lorsque le champ [ASTRO OTAR à la page 615](#) est réglé à **Activé** pour le [Système ADF](#) référencé, cette valeur de sélection de clé est choisie dans la Liste de références de clés de chiffrement sécurisées du profil ASTRO OTAR sélectionné dans le champ [Index de profil ASTRO OTAR à la page 616](#) du système ADF référencé.

AVERTISSEMENT :

Veillez noter que cela renvoie en fait aux clés de la [Liste des clés de chiffrement à la page 317](#) applicable à cette sélection; les clés figurant dans la liste de clés de référence de chiffrement de matériel sécurisées correspondent aux clés de la liste de clés de chiffrement sélectionnée dans le champ [Référence de clé de chiffrement à la page 323](#). Par conséquent, toute clé sélectionnée lorsque l'Index de profil ASTRO OTAR est activé doit d'abord être définie dans la liste de références de clés de chiffrement sécurisé. Les clés prises dans le profil OTAR avec le champ de liste des clés indépendante activé sont disponibles.

Accès seulement : Lorsque le système ADF référencé a (un fichier de clé de système du logiciel ou une clé de système avancée avec accès sélectionnée dans le champ ID système) ou (une clé WACN avancée avec accès sélectionnée dans le champ ID WACN d'accueil), et

lorsque le champ [Connexion sécurisée/non chiffrée à la page 551](#) pour la rangée ou le groupe courant (de ce tableau) n'est pas réglé à **Non chiffré**.

Et

lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**, et lorsque le champ Type de protocole est réglé à **ASTRO 25**, et lorsque le modèle ou l'option de la radio le permet.

10.39.3.3

Groupe prioritaire

Ce champ vous permet d'appeler le répartiteur lors de l'enfoncement de la touche Répartition prioritaire, suivi de l'enfoncement du bouton PTT.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25** et lorsque le champ Profil DVRS est réglé à **Désactivé**.

La sélection suivante est prise en charge :

Aucun

Valeur par défaut. S'applique à tous les groupes créés à partir du réglage de personnalité actuel.

10.39.4

Appel/not. (Personnalité ADF ASTRO 25)

La section **Appel/not.** de l'ensemble Personnalité ADF ASTRO 25 permet à l'utilisateur d'afficher ou de définir les paramètres d'appel privé et de page pour des personnalités ADF distinctes. Ces réglages peuvent s'appliquer à la liste d'appel privilégiée ADF.

REMARQUE :

Une fois que les fonctions des personnalités ADF ont été définies de manière unique, chaque personnalité peut être affectée à la position désirée sur le sélecteur de canal de la radio au moyen de la fonction Affectation du canal de zone.

10.39.4.1

Type d'appel privé

Ce champ permet de sélectionner le type d'appel privé de la personnalité ADF courante.

Vous pouvez lancer un appel sélectif ou privé en appuyant sur une touche Appel sélectif/privé ou en utilisant la sélection de menu [Appel sélectif/privé à la page 216](#). Pour répondre à un appel privé, l'utilisateur appuie sur la touche [Réponse à l'appel à la page 183](#).

Les sélections suivantes sont prises en charge :

Désactivé;

La fonction d'appel privé est désactivée.

Disponible lorsque le type de protocole est réglé à Type II ou à ASTRO 25

PC II

L'appel privé II autorise les appels entre deux radios individuelles, quel que soit le groupe de conversation, sans que la radio réceptrice ait à confirmer la réception de l'appel entrant.

Disponible lorsque le type de protocole est réglé à Type II ou à ASTRO 25

Amélioré d'unité à unité

L'appel privé amélioré ou l'appel privé d'unité à unité autorise les appels entre deux radios individuelles, quel que soit le groupe de conversation. La radio réceptrice sonne et doit confirmer la réception de l'appel entrant.

Disponible lorsque le type de protocole est réglé à Type II ou à ASTRO 25

PC avec CA

Appel privé amélioré ou d'unité à unité, suivi d'une alerte d'appel privé facultative. Voir [Alerte automatique des appels à la page 572](#).

Disponible lorsque le type de protocole est réglé à Type II ou à ASTRO 25

REMARQUE :

PC II est pris en charge en fonctionnement ADF analogique. Voir les champs [Type de voix/signal AG à la page 565](#) et [Groupe à la page 569](#) dans [Personnalité ADF de type II à la page 554](#).

La période d'attente est de 2 minutes pour l'appel privé PC II et amélioré traité par un système ADF 3600, et de 6 secondes pour l'appel privé traité par un système ADF 9600. Aucune indication n'est affichée pendant la durée du délai.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.39.4.2

Opération appel privé

Ce champ permet de sélectionner le mode de fonctionnement de la fonction d'appel privé pour la personnalité ADF courante.

Vous pouvez lancer un appel sélectif ou privé en appuyant sur une touche Appel sélectif/privé ou en utilisant la sélection de menu [Appel sélectif/privé à la page 216](#). Pour répondre à un appel privé, l'utilisateur appuie sur la touche [Réponse à l'appel à la page 183](#).

Accès seulement : Lorsque le champ [Type d'appel privé à la page 569](#) n'est pas réglé à **Désactivé** et que le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Réponse seulement (Rép. seulement)

Permet à la radio d'accepter les appels de notification uniquement.

Liste seulement

Vous permet de transmettre des notifications à partir de la liste d'appel courte. Pour les modèles sans clavier, cette sélection peut être utilisée uniquement à l'aide de la fonction Une touche. Cette fonction dépend du modèle et de l'option.

Illimité

Vous permet d'envoyer des notifications à partir de la liste courte d'appel et du clavier de la radio. Cette fonction dépend du modèle et de l'option.

**AVERTISSEMENT :**

Cette sélection n'est pas disponible pour les radios mobiles dotées uniquement d'un écran supérieur.

10.39.4.3

Alerte d'appel/Notification

Ce champ permet de sélectionner la fonctionnalité Alerte d'appel/Notification pour la personnalité ADF courante.

Vous pouvez activer le fonctionnement Avis d'appel/Notification avec une touche [Alerte d'appel à la page 183](#) ou une sélection de menu [Avis à la page 221](#).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet et lorsque le champ Activer le matériel DVRS est **Activé** ou lorsque le champ Activer le matériel DVRS est **Activé** et que le champ Activation à distance du DVRS du profil DVRS référencé dans la personnalité ADF courante est réglé à **Désactivé**.

Les sélections suivantes sont prises en charge :

Désactivé;

La fonction d'alerte d'appel (notification) est désactivée.

Réponse seulement (Rép. seulement)

Permet à la radio d'accepter les appels de notification uniquement.

Liste seulement

Vous permet de transmettre des notifications à partir de la liste d'appel courte. Pour les modèles sans clavier, cette sélection peut être utilisée uniquement à l'aide de la fonction Une touche. Cette fonction dépend du modèle et de l'option.

Illimité

Vous permet d'envoyer des notifications à partir de la liste courte d'appel et du clavier de la radio. Cette fonction dépend du modèle et de l'option.

**AVERTISSEMENT :**

Cette sélection n'est pas disponible pour les radios mobiles dotées uniquement d'un écran supérieur.

10.39.4.4

Liste d'appel privilégiée ADF

Ce champ permet de sélectionner la liste courte d'appel à utiliser pour la personnalité ADF courante.

La liste privilégiée d'appels utilisée dépend du réglage du champ Type de protocole à **Type II** ou **ASTRO 25** pour la personnalité ADF courante. L'utilisateur se sert de cette liste pour faire des appels privés et envoyer des notifications.

Accès seulement : Lorsque le champ [Opération appel privé à la page 570](#) est réglé à **Liste seulement** ou à **Illimité**, ou lorsque le champ [Alerte d'appel/Notification à la page 570](#) est réglé à **Liste seulement** ou à **Illimité**, et lorsque le modèle ou l'option de la radio le permet.

10.39.4.5

Alerte automatique des appels

Ce champ permet à la radio de transmettre automatiquement une alerte d'appel privé lorsque le destinataire d'un appel privé amélioré ou d'unité à unité ne répond pas à cet appel dans le délai accordé.

Cette fonction s'applique à la personnalité ADF courante, ainsi qu'aux deux types de protocoles ASTRO 25 et Type II.

Accès seulement : Lorsque le champ [Type d'appel privé à la page 569](#) est réglé à **PC avec CA** et que le modèle ou l'option de la radio le permet.

10.39.4.6

Liste de composition de tonalité

Ce champ permet de sélectionner une liste de composition de tonalité à utiliser en mode ASTRO 25 et avec la personnalité ADF courante.

REMARQUE :

La fonctionnalité Liste de composition de tonalité est définie à la page Liste de composition de tonalité.

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le modèle ou l'option de la radio le permet.

AVERTISSEMENT :

Le type de liste de tonalités dans la liste de composition de tonalité doit être réglé à **Appel rapide II**

Les sélections suivantes sont prises en charge :

- Composition de tonalité désactivée
- Liste de composition de tonalité disponible

10.39.4.7

Activer l'alerte utilisateur en appel

Ce champ permet à la radio de demeurer en sourdine en cas d'appel des groupes affiliés pendant le fonctionnement sur la personnalité ADF courante.

Par contre, les pages individuelles ou de groupe désactivent la sourdine pour que la tonalité d'alerte soit entendue. La sourdine est également désactivée pendant les appels de radio à radio tels que les appels privés et les appels à composition de tonalité et les appels d'interconnexion (mode téléphone). Cette fonction est très utile si vous préférez ne pas entendre les communications de groupe associé, mais que vous devez garder le contact radio. La touche [Mettre la voix en sourdine à la page 195](#) ou la

sélection de menu [Mettre la voix en sourdine à la page 225](#) vous permet d'activer et de désactiver la mise en sourdine de la voix pour un canal dont la fonction d'alerte utilisateur en appel est activée.

AVERTISSEMENT :

Lorsque cette fonction est désactivée, vous ne pouvez pas l'activer pour la personnalité ADF courante.

IMPORTANT :

Par ailleurs, lorsque la mise en sourdine de la voix est activée :

Une notification individuelle ou de groupe reçue par la radio désactive la sourdine. Un appel vocal subséquent peut alors constituer un appel de groupe diffusé par le haut-parleur de la radio.

Si le canal de la radio est changé, celle-ci désactive la mise en sourdine de la voix; il faut donc réactiver cette fonction au besoin après avoir syntonisé de nouveau le canal d'origine.

Si vous appuyez sur la touche PTT, que vous passez en mode d'urgence ou que vous mettez la radio hors tension, puis sous tension, la radio désactive la mise en sourdine de la voix.

Les types d'appels suivants peuvent aussi être reçus :

- [Activer le regroupement dynamique à la page 529](#)
- [Blocage de la radio à la page 525](#)
- [Indicateur de zone hors de portée à la page 233](#)
- Mode dégradé
- [Indicateur ADF du site à la page 235](#)
 - La fonction Balayage n'est pas disponible.
 - Les autres indications (qui proviennent des appels de groupe) telles que les voyants DEL et l'ID de PTT fonctionnent normalement (si elles sont activées).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet et que le champ [Alerte d'appel/Notification à la page 570](#) n'est pas réglé à **Désactivé**,

Ou lorsque le champ Type de protocole est réglé à **ASTRO 25**, et lorsque le champ [Liste de composition de tonalité à la page 645](#) de la Personnalité ADF courante fait référence à une liste de composition de tonalité comportant au moins un enregistrement ou une rangée où l'option Réactivation du son activée est réglée à **Activé**.

10.39.5

Fonctions (Personnalité ADF ASTRO 25)

La section **Fonctionnalités** de l'ensemble Personnalité ADF ASTRO 25 permet à l'utilisateur d'afficher ou de modifier diverses fonctions Personnalités ADF pour la personnalité ADF actuelle.

REMARQUE :

Une fois que les fonctions des personnalités ADF ont été définies de manière unique, chaque personnalité peut être affectée à la position désirée sur le sélecteur de canal de la radio au moyen de la fonction Affectation du canal de zone.

10.39.5.1

de Sélection de la liste de balayage

Ce champ permet de sélectionner la liste de balayage qu'utilisera la radio en mode Balayage pour la personnalité ADF courante.

Cette liste de balayage détermine les appelants que la radio recherche, écoute activement et pour lesquels elle désactive la sourdine sur le canal ADF courant.

REMARQUE :

Les réglages de la liste de balayage et de ses membres sont définis dans la fenêtre Liste de balayage.

Seules les listes de balayage dont le champ [Type de balayage à la page 682](#) est réglé à **Surv. prioritaire** ou à **Groupe multisystème** sont des sélections de liste de balayage valides pour la personnalité ADF courante.

Seules les listes de balayage dont le champ Type de balayage est réglé à **Priorité intelligente** sont des sélections de liste de balayage valides pour la personnalité conventionnelle sans système DVRS.

Vous pouvez modifier une liste de balayage au moyen d'un commutateur Programmation de la liste de balayage, d'une sélection de menu Liste de balayage ou d'une longue pression sur une touche Balayer.

AVERTISSEMENT :

Lorsque le champ [Transmit Mode \(Mode de transmission\) à la page 560](#) est réglé à **Groupe/AG désactivé (écoute seulement)** pour la personnalité ADF courante, la liste de balayage référencée de cette personnalité ne doit pas avoir son champ [Type de membre de Tx vocale désigné à la page 689](#) réglé à **Canal sélectionné** (c'est-à-dire, ce canal); sinon cette sélection est considérée comme étant non valide.

Lorsque le champ [Sélection de la liste d'alertes de site sélectionnables à la page 593](#) pour le système ADF référencé n'est pas réglé à **Désactivé**, alors, la liste de balayage référencée pour cette personnalité doit avoir un type de balayage **Groupe multisystème**; sinon, cette sélection est considérée comme étant non valide.

L'application considère cette sélection comme non valide lorsque le LTE large bande de cette personnalité est activé et que cette liste de balayage sélectionnée comprend des canaux de membre de liste de balayage ayant les dépendances suivantes :

- Le champ [Interférence de fréquence LTE présente à la page 437](#) de leur personnalité conventionnelle est réglé à **Activé**, ou
- Le champ [Interférence de fréquence LTE présente à la page 596](#) de leur Système ADF est **Vrai**, ou
- Le champ [Type de couverture à la page 517](#) du système ADF est réglé à **Itinérance Inter-WACN**.

Le LTE est activé sur un canal ADF lorsque le système ADF associé à la personnalité comporte un Profil de donnée référencé dont la sélection [Type de profil de données à la page 376](#) est égale à **ADF et large bande** ou à **Large bande seulement**, et lorsque la source de large bande du profil de données est réglée à **Modem LTE interne**.

Lorsque la sélection de la liste d'imputabilité du personnel du système ADF référencé n'est pas réglée à **Désactivé**, alors, la liste de balayage référencée pour cette personnalité ne doit pas avoir le type de balayage **Groupe multisystème**, sinon, cette sélection est considérée comme étant non valide.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.39.5.2

Balayage automatique

Ce champ fait passer la radio automatiquement en mode Balayage lorsque vous sélectionnez (à l'aide du sélecteur de canaux) la personnalité ADF courante.

Le balayage automatique est également activé lorsque le canal courant est déjà syntonisé à la mise sous tension de la radio.

Lorsqu'il est désactivé, vous pouvez passer en mode Balayage au moyen d'une touche Balayer, d'un commutateur Balayer ou d'une sélection de menu Balayer lors du fonctionnement sur la personnalité ADF courante.

Accès seulement : Lorsque le champ [de Sélection de la liste de balayage à la page 573](#) n'est pas réglé à **Aucun** et lorsque le modèle ou l'option de la radio le permet.

10.39.5.3

Activer l'état

Ce champ vous permet de sélectionner et de transmettre un état programmé pour la personnalité ADF courante.

Les états disponibles dépendent du système ADF référencé à la personnalité.

Vous pouvez lancer la fonction État à l'aide d'une touche État, d'une touche État direct ou d'une sélection de menu État.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.39.5.4

Tonalité d'autorisation de parler

Ce champ permet à la radio de générer une tonalité d'alerte lorsqu'une autorisation d'accès au canal de contrôle provenant d'un répéteur a été reçue.

Cette fonction s'applique à la personnalité ADF courante.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.39.5.5

Ignorer Rx de voix non chiffrée

Ce champ fait en sorte que la radio ignore toutes les communications vocales **Non chiffrées** (sans chiffrement sécurisé) pendant le fonctionnement avec la personnalité ADF courante.

Accès seulement : Lorsque le champ [Fonctionnement sécurisé à la page 301](#) est réglé à **Matériel** ou à **Logiciel**.

10.39.5.6

Fin de Tx en l'absence de voix

Ce champ permet à la radio, pendant une transmission vocale ADF, d'effectuer automatiquement le relâchement de la touche lorsque son processeur de signal numérique (DSP) intégré détecte l'absence de voix provenant du microphone au-delà de la durée définie pour la minuterie d'absence de voix.

Cette sélection s'applique pendant le fonctionnement selon la personnalité ADF courante.

AVERTISSEMENT :

La fonction ne fonctionne pas lorsque :

- une radio sur le terrain fonctionne en mode Urgence et soit **Urgence de microphone branché**, soit **Urgence par audio silencieux** est actuellement activée (voir aussi Mode de transmission automatique d'urgence) ou
- La radio sur le terrain est actuellement surveillée à distance (voir aussi Surveillance à distance/Traceur radio\Activer).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.39.5.7

Minuterie de délai d'attente de répartition prioritaire

Ce champ permet de sélectionner le temps dont vous disposez pour appuyer sur la touche Répartition prioritaire avant la sortie de la répartition prioritaire. La durée est exprimée en secondes.

Tableau 295 : Portée

Minimum	Maximum	Incréments
1	255	1

Accès seulement : Lorsque le champ Type de système est réglé à **ASTRO 25**, et lorsque le champ Sélection du profil DVRS est réglé à **Désactivé**.

10.39.5.8

Personnalité du mode Zone de danger

Ce champ vous permet d'activer le mode Zone de danger en utilisant l'interrupteur concentrique pendant le fonctionnement avec la personnalité ADF courante.

**REMARQUE :**

Ce champ ne s'applique qu'à la radio APX NEXT XN.

**IMPORTANT :**

Lorsque le mode Zone de danger est **activé**, les conditions suivantes doivent être remplies : Le système sélectionné pour la personnalité ADF courante est réglé à un système ASTRO25 et le champ Indicateur Rx d'alarme d'urgence est activé dans le système sélectionné.

Le champ Sélection du profil d'urgence ADF est connecté à un profil d'urgence ADF et n'est pas réglé à **Tx d'urgence désactivée**.

Si le champ Type d'annulation d'urgence est réglé sur **Annulation du système**, le canal d'annulation doit correspondre à la personnalité du mode Zone de danger lorsque le champ de personnalité du mode de zone de danger est coché.

Accès seulement : Lorsque la radio est le plus récent modèle des normes en matière de service d'incendie.

10.39.5.9

Fonctionnement SmartConnect

Active la fonction SmartConnect pour la personnalité ADF actuelle.

Le type de protocole pour la personnalité doit être réglé à « ASTRO 25 ».

Les sélections suivantes sont prises en charge :

LMR

Les groupes de conversation contenus dans la personnalité actuelle fonctionnent en mode LMR seulement.

LMR préféré

Les groupes de conversation contenus dans la personnalité actuelle alterneront automatiquement entre LMR et Large bande en fonction de la configuration de [Laisser le seuil RSSI LMR à la page 501](#). Les groupes de conversation contenus dans la personnalité actuelle alterneront automatiquement entre Large bande et LMR en fonction de la configuration de [Retour au seuil RSSI LMR à la page 510](#). LMR préféré et Large bande préféré sont des sélections valides lorsque la personnalité ADF courante renvoie à un système ADF ASTRO 25. La sélection du profil de données doit renvoyer à un profil de données valide dans lequel le nom d'hôte de la passerelle SmartConnect et le numéro de port TLS de la passerelle SmartConnect sont configurés.

Large bande uniquement

Les groupes contenus dans la personnalité actuelle fonctionneront en mode large bande seulement.

Accès seulement : Lorsque le Type de protocole est réglé à « ASTRO 25 » et lorsque le modèle ou l'option de la radio le permet.

10.39.5.10

Activer UI de la sécurité publique tactique

Ce champ permet d'activer plusieurs fonctions de Sécurité publique tactique (TPS) qui sont reliées au fonctionnement en mode d'urgence pour la personnalité ADF ASTRO 25 courante.

Ces caractéristiques comprennent Toute la radio, Sécurité publique tactique : balise d'urgence audible, acheminement de balise d'urgence audible et tonalité auxiliaire de touche de relâchement d'appel d'urgence.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.39.6

Sites préférés (Personnalité ADF ASTRO 25)

La section **Sites préférés** de l'ensemble Personnalité ADF ASTRO 25 permet à l'utilisateur d'afficher ou de définir les préférences du site ADF multi-site pour chaque personnalité ADF. Lorsqu'une radio se retrouve en itinérance dans une zone de chevauchement de couverture de sites multiples dans un système ADF ou un réseau de communication étendu (WACN), elle cherche un site privilégié sur le plan opérationnel en évaluant tous les autres sites disponibles sur une base prioritaire, en fonction de leur sélection État de préférence. Cette fonction permet de bénéficier d'une gestion et d'une conservation plus intelligentes des ressources de répéteur dans les zones de couverture qui se chevauchent.

**IMPORTANT :**

Le champ Type de couverture du système ADF référencé détermine la configuration à un seul site (SmartNet) ou multisite. Dans une configuration multisite, le fonctionnement SmartZone permet à la radio de déterminer, à partir d'échantillons d'interrogation RSSI, le meilleur site à utiliser pour les communications ADF.

Voir aussi les champs Toutes les ADF Avancé et Constantes de filtre du système ADF.

Une fois que les fonctions des personnalités ADF ont été définies de manière unique, chaque personnalité peut être assignée à la position désirée du sélecteur de canal de la radio au moyen de la fonction Attribution du canal de zone.

10.39.6.1

Ignorer les préférences en ressources du site

Ce champ fait en sorte que la radio ignore l'information sur les ressources de site reçue en mots-indicateurs sortants (OSW) en provenance du canal de contrôle adjacent, c'est-à-dire, si le site a des répéteurs ASTRO sécurisés de 12 Kbit ou analogiques.

Cette fonction s'applique à la personnalité ADF courante, uniquement en fonctionnement SmartZone.

Si elle est **désactivée**, la radio sélectionne les sites en fonction de l'information sur les ressources de ce site. Par exemple, si une radio a sélectionné un groupe de conversation ASTRO.

Accès seulement : Lorsque le champ [Type de couverture à la page 517](#) du système ADF référencé n'est pas réglé à **Désactivé**, et lorsque le modèle et les options de la radio le permettent.

10.39.6.2

Type de liste de sites

Ce champ permet de sélectionner le type de liste de sites pour la personnalité ADF.

Le type de liste de sites définit la façon dont la radio utilise les sites identifiés dans la liste de sites suivante. La préférence de site et l'accès mobile (itinérance) sont définis par le type de liste de sites.

Accès seulement : Lorsque le champ [Type de couverture à la page 517](#) du système ADF référencé n'est pas réglé à **Désactivé**, et lorsque le modèle et les options de la radio le permettent.

Les sélections suivantes sont prises en charge :

Liste préférée

Il s'agit de l'ancienne sélection par défaut. Il n'y a aucune restriction ou préférence d'accès pour les sites ne figurant pas dans la liste.

Liste autorisée

La radio est autorisée à accéder en itinérance uniquement aux sites figurant dans la liste, et les préférences définies seront appliquées. Le système peut toujours refuser l'accès à un site dans la liste autorisée à la suite d'une tentative de « connexion » au système à partir du site. Si la radio n'est pas à portée d'au moins un des sites figurant dans la liste, elle restera hors de portée.

Liste bloquée

La radio n'est pas autorisée à accéder en itinérance aux autres sites figurant dans la liste. Tous les autres sites sont traités comme des sites autorisés, sans préférence définie.

10.39.6.3

ID du site

Ce champ permet d'entrer (en format décimal ou hexadécimal) le numéro d'identification désignant le site SmartZone courant (enregistrement ou rangée), qui s'applique à la personnalité ADF courante.

**AVERTISSEMENT :**

Pour prendre en charge l'itinérance entre les différents sites, chaque ID de site doit être unique dans un sous-système de fréquence radioélectrique (RFSS).

Accès seulement : Lorsque le champ [Type de couverture à la page 517](#) du système ADF référencé n'est pas réglé à **Désactivé**, et lorsque le modèle et les options de la radio le permettent.

Tableau 296 : Portée

Type de couverture	Minimum	Maximum
ASTRO 25	1	FE hex
Type II	1	40 hex

10.39.6.4

État préféré

Ce champ permet de sélectionner l'état préféré pour le site SmartZone lors de la détermination du meilleur site à utiliser pour les communications ADF (à l'aide des résultats d'interrogation RSSI).

Cette sélection s'applique au site courant (enregistrement ou rangée) de la personnalité ADF courante.

Accès seulement : Lorsque le champ [Type de couverture à la page 517](#) du système ADF référencé n'est pas réglé à **Désactivé**, et lorsque le modèle et les options de la radio le permettent.

Les sélections suivantes sont prises en charge :

Aucun

Aucune préférence n'est accordée à ce site.

IMPORTANT :

Si un site n'apparaît pas dans la liste, la radio ne lui attribue automatiquement aucune préférence.

Le moins préféré

Le site sera évité à moins qu'il ne soit le seul à être utilisable.

Préfééré

Le site sera utilisé en priorité sur tous ceux qui ne sont pas préférés. La radio quittera ce site lors du passage en mode ADF.

Toujours préféré

Le site sera utilisé en priorité sur tous ceux qui ne sont pas préférés, et ce, même s'il passe en mode ADF du site.

10.39.6.5

ID de RFSS

Ce champ permet à l'utilisateur d'entrer (en format décimal ou hexadécimal) l'ID du sous-système de fréquence radioélectrique (RFSS) du système ASTRO 25 correspondant à l'ID du site courant dans le site courant (enregistrement/rangée), qui s'applique à la personnalité ADF courante.

AVERTISSEMENT :

Pour prendre en charge l'itinérance entre les différents RFSS d'un système ADF, chaque RFSS doit posséder un numéro unique.

REMARQUE :

Un RFSS se compose d'un ou de plusieurs sites.

Accès seulement : Lorsque le système ADF référencé a son champ [Type de couverture à la page 517](#) réglé à **SmartZone et OmniLink** ou à **Itinérance intra-WACN** ou à **Itinérance inter-WACN**, et lorsque le champ Type de protocole est réglé à **Type II**, et lorsque le modèle ou l'option de la radio le permet.

Tableau 297 : Portée

Minimum	Maximum
1	FE hex

10.39.6.6

ID système

Ce champ permet d'entrer au format décimal ou hexadécimal l'ID de système Type II ou ASTRO 25 correspondant à l'ID du site courant (enregistrement/rangée), qui s'applique à la personnalité ADF courante.

AVERTISSEMENT :

Pour prendre en charge l'itinérance entre les différents systèmes ADF composant les réseaux de communication étendus (WACN), chaque système ADF doit posséder un ID système unique.

REMARQUE :

Un système ADF est constitué d'un ou de plusieurs sous-systèmes de fréquence radioélectrique (RFSS).

Accès seulement : Lorsque le champ Type de protocole est réglé à **ASTRO 25**, et lorsque le système ADF référencé a son champ [Type de couverture à la page 517](#) réglé à **Itinérance Inter-WACN** et que le modèle ou l'option de la radio le permet,

Lorsque le champ Type de protocole est réglé à **ASTRO 25**, et lorsque le système ADF référencé a son champ réglé à **Itinérance intra-WACN** ou à **Itinérance Inter-WACN** et que le modèle ou l'option de la radio le permet.

Tableau 298 : Portée

Type de couverture	Minimum	Maximum
ASTRO 25	0	0FFE hex
Type II	0	FFFE hex

10.39.6.7

ID de WACN RAS

Ce champ permet d'entrer (en format décimal ou hexadécimal) l'ID de réseau de communication étendu (WACN) du serveur d'accès distant (RAS) pour l'ID du site (enregistrement/rangée) courant.

**AVERTISSEMENT :**

Pour prendre en charge l'itinérance entre les différents WACN, chaque WACN doit posséder un numéro unique.

**REMARQUE :**

Un réseau de communication étendu se compose d'un ou de plusieurs systèmes ADF. Cette sélection s'applique également à la personnalité ADF en cours.

Accès seulement : Lorsque le champ Type de protocole est réglé à **ASTRO 25**, et lorsque le système ADF référencé a son champ [Type de couverture à la page 517](#) réglé à **Itinérance Inter-WACN** et que le modèle ou l'option de la radio le permet.

Tableau 299 : Portée

Minimum	Maximum
0	FFFFE hex

10.39.6.8

Caractère générique

Ce champ définit le type d'entrée dans la liste de sites. La sélection est un type de caractère générique qui déterminera quel site ou groupe de sites doit être **Préfér **, **Autoris ** ou **Bloqu **.

Acc s seulement : Lorsque le champ [Type de couverture à la page 517](#) du système ADF référenc  n'est pas régl  à **D sactiv **, et lorsque le mod le et les options de la radio le permettent.

Les s lections suivantes sont prises en charge :

Aucun caract re g n rique

Il s'agit de la s lection par d faut.

Tout site

Tous les sites dans un RFSS, un syst me et un WACN applicable en fonction de la s lection du champ Type de couverture

Tout RFSS

Tous les sites, RFSS dans un syst me et WACN applicables en fonction de la s lection du champ Type de couverture

Tout système

Tous les sites, RFSS et systèmes dans un WACN applicable en fonction de la sélection du champ Type de couverture

10.39.6.9

Autoriser les urgences au site bloqué

Si ce champ est activé, la radio tente d'enregistrer le groupe sélectionné sur un site défini comme bloqué dans le RadioCentral lorsque la radio est en mode d'urgence. Lorsque l'urgence est effacée, la radio continue de bloquer le groupe sélectionné.

Accès seulement : Ce champ est uniquement disponible lorsque les conditions suivantes sont remplies :

- Le champ **Type de liste de sites** est réglé sur **Bloqué**.
- Le champ **Type de couverture** du système ADF associé **n'est pas** réglé sur **Désactivé**.

10.40

Liste d'appel complète

La section **Liste d'appel complète** vous permet d'activer de façon sélective la possibilité, pour l'utilisateur de la radio, de modifier les renseignements sur les contacts.

10.40.1

UCL modifiable

Ce champ vous permet de créer des contacts dans l'UCL (liste d'appel unifiée) de la radio.

REMARQUE :

L'UCL complète est enregistrée dans la radio avec l'ensemble des fonctions de la codeplug prédéfinies.

Vous pouvez créer des contacts en appuyant sur la touche Contacts ou en utilisant la sélection de menu Contacts.

IMPORTANT :

L'activation de ce champ entraîne également l'activation du champ [Modifiable dans la liste courte à la page 654](#); toutefois, la désactivation de ce champ ne désactive pas le champ Modifiable dans la liste courte.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.40.2

Modifiable dans la liste courte

Ce champ vous permet de créer, supprimer ou modifier les coordonnées des membres figurant dans une liste courte d'appel individuel de la radio.

REMARQUE :

La liste courte individuelle est programmée par canal, à l'exception de la [Liste privilégiée de numéros de téléphone](#), qui s'applique à toute la radio.

L'utilisateur peut accéder au mode de modification de liste courte en appuyant sur la touche Contacts ou en utilisant la sélection de menu Contacts.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.40.3

Numéro de téléphone modifiable

Ce champ vous permet de modifier les numéros de téléphone dans l'UCL (liste d'appel unifiée) de la radio.

REMARQUE :

L'UCL complète est enregistrée dans la radio avec l'ensemble des fonctions de la codeplug prédéfinies.

L'utilisateur peut accéder aux numéros de téléphone en appuyant sur la touche Contacts ou en choisissant la sélection de menu Contacts.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet et que le champ [UCL modifiable à la page 654](#) est réglé à **Activé**.

10.40.4

ID de la radio modifiable

Ce champ vous permet de modifier les ID d'appel dans les listes courtes d'appel programmées dans la radio.

L'accès à l'ID d'appel de l'utilisateur est lancé en appuyant sur la touche Contacts ou à partir de la sélection de menu Contacts.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet et que le champ [UCL modifiable à la page 654](#) est réglé à **Activé**.

10.40.5

Indicateur de l'ordre des données sur les contacts

Ce champ permet de préciser l'ordre dans lequel les ID d'appel de l'UCL (liste d'appel unifiée) pour les entrées de contact individuelles apparaissent à l'écran de la radio.

Pour changer l'ordre, sélectionnez un élément à l'aide de la souris et glissez-le vers une nouvelle position dans la liste.

Vous pouvez afficher ou modifier les entrées de contact à l'aide de la touche Contacts ou de la sélection de menu Contacts. Cette sélection s'applique à toute la radio.

REMARQUE :

L'UCL complète est enregistrée dans la radio avec l'ensemble des fonctions de la codeplug prédéfinies.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.41

Liste d'appel unifiée

La section **Liste d'appel unifiée** permet d'afficher ou de modifier des contacts individuels dans la liste d'appel.

Chaque contact peut contenir de l'information relativement aux différents types d'émission de signaux conventionnels, aux types de couvertures pour les communications ADF et aux paramètres de connectivité téléphonique.

REMARQUE :

Une fois définis, les contacts et les ID d'appel peuvent être sélectionnés à partir de chaque liste courte. Ces sélections de contact et d'ID d'appel vous permettent de créer des listes courtes individuelles.

Si la radio reçoit des ID en double, le doublon doit être supprimé pour permettre l'affichage de l'alias.

L'écriture du codeplug dans une radio a pour effet de ramener la liste d'appel à son état initial et de supprimer définitivement toutes les mises à jour d'alias OTA.

10.41.1

Contact

La section Contact permet à l'utilisateur de configurer les noms et ID de système pour ID ADF ASTRO 25, ID ADF Type II, ID conventionnel ASTRO, ID conventionnel MDC et Numéro de téléphone.

10.41.1.1

Nom du contact

Ce champ permet de définir des noms reconnaissables pour le contact de la liste d'appel unifiée courante.

Plusieurs numéros de téléphone et identifications d'appel des communications conventionnel et ADF peuvent ainsi être définis pour le contact. Une fois définis, les contacts et les ID d'appel peuvent être sélectionnés à partir de chaque liste courte.

REMARQUE :

Exemples : EMT001, n° 500, Électrique1

Vous pouvez utiliser des lettres, des chiffres et des espaces.

Vous pouvez utiliser jusqu'à 14 caractères.

10.41.1.2

ID ADF de type II

La section ID ADF de type II de la section Contact vous permet d'afficher ou de modifier des ID d'appel ADF de type II pour chaque contact.

10.41.1.2.1

Nom du système

Ce champ permet de sélectionner le système ADF de type II souhaité ou de créer un jeu d'ID personnalisé.

La sélection d'un système ADF entraîne automatiquement la sélection de la valeur [ID système à la page 519](#). Cette sélection s'applique au jeu d'ID d'appel courant (enregistrement/rangée) du [contact](#) courant dans [Liste d'appel unifiée à la page 655](#). Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 665](#).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Non affecté

Aucune sélection.

Personnalisées

Permet d'entrer un [ID du système personnalisé à la page 657](#) pour l'enregistrement/rangée courant. Ces ID s'appliquent pour un système ADF de type II non défini dans la codeplug actuelle. Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 665](#).

Parcourir

Sélectionnez un ensemble à partir du [Système ADF de type II à la page 516](#) disponible.

10.41.1.2.2

ID système

Ce champ vous permet d'afficher l'ID du système ASTRO 25 sur le terrain et l'ID du système de type II pour le système ADF courant.

Le champ Nom du système permet de sélectionner le système ADF désiré pour la rangée ou l'enregistrement courant. Cette valeur s'applique à l'ensemble d'identification de l'appel (rangée ou enregistrement) du contact courant dans la liste d'appel unifiée. Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 664](#) (ASTRO 25) [ID d'appel à la page 665](#) (Type II).

Accès seulement : Lorsque le champ Nom du système n'est pas réglé à **Personnalisé** et lorsque le modèle ou l'option de la radio le permet.

10.41.1.2.3

ID du système personnalisé

Ce champ vous permet de définir un ID de système de type II pour un système ADF non défini dans la codeplug courante.

Cette sélection s'applique seulement si le champ [Nom du système à la page 656](#) est réglé à **Personnalisé** pour la rangée ou l'enregistrement courant. Par conséquent, cette sélection correspond à un [Système ADF](#) sur le terrain. Cette sélection s'applique au jeu d'ID d'appel courant (enregistrement/rangée) du [contact](#) courant dans [Liste d'appel unifiée à la page 655](#). Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 665](#).

Accès seulement : lorsque le champ [Nom du système à la page 656](#) est réglé à **Personnalisé** et lorsque le modèle ou les options de la radio le permettent.

REMARQUE :

Les sélections sont établies en fonction des fichiers des clés de système du logiciel ou des clés avancées disponibles pour l'application. Le rapport de la clé du système permet d'afficher les clés actuellement disponibles.

Tableau 300 : Portée

Minimum	Maximum	Incrément
1	65535	1

10.41.1.2.4

Unit ID (ID de l'unité)

Ce champ permet de sélectionner l'ID d'unité de type II de la radio cible fonctionnant en mode de communication ADF de type II.

Cet ID correspond à l'[Unit ID \(ID de l'unité\)](#) du même [Système ADF](#), qui a été défini dans la radio cible. Cette sélection s'applique au jeu d'ID d'appel courant (enregistrement/rangée) du [contact](#) courant dans [Liste d'appel unifiée à la page 655](#). Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 665](#).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

AVERTISSEMENT :

La plage de sélection est modifiable par clé (matérielle) avancée au moyen du programme de gestion des clés avancées.

Tableau 301 : Portée

Minimum	Maximum
000001	16777215

10.41.1.3

ID conventionnel MDC

La section ID conventionnel de MDC de la section Contact permet à l'utilisateur d'afficher ou de modifier les ensembles d'ID conventionnel de MDC pour des contacts individuels.

10.41.1.3.1

Nom du système

Ce champ permet de sélectionner le système conventionnel MDC souhaité ou de créer un jeu d'ID personnalisé.

La sélection d'un système conventionnel MDC entraîne automatiquement la sélection de la valeur [Numéro de groupe du système](#). Cette sélection s'applique au jeu d'ID d'appel courant (enregistrement/rangée) du [contact](#) courant dans [Liste d'appel unifiée à la page 655](#). Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 668](#).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Non affecté

Aucune sélection.

Personnalisées

Permet d'entrer un [Numéro de groupe personnalisé à la page 659](#) pour l'enregistrement/rangée courant. Ces ID s'appliquent pour un système [Système conventionnel à la page 415](#) MDC conventionnel non défini dans la codeplug courante. Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 668](#).

Systèmes conventionnels possibles

Permet de sélectionner un système ADF programmé à partir de la codeplug courante.

10.41.1.3.2

Numéro de groupe du système

Permet d'afficher en lecture seule le numéro de groupe du système MDC Conventional courant. Le champ Nom du système permet de sélectionner le système ASTRO désiré pour la rangée ou l'enregistrement actuel.

Cette valeur s'applique à l'ensemble d'identification de l'appel (rangée ou enregistrement) du contact courant dans la liste d'appel unifiée. Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 668](#).

Accès seulement : Lorsque le champ Type de système est réglé à **Personnalisé** ou lorsque le modèle ou l'option de la radio le permet.

10.41.1.3.3

Numéro de groupe personnalisé

Ce champ permet de définir un numéro de groupe du système pour un système conventionnel MDC non défini dans la codeplug courante.

Cette sélection s'applique seulement si le champ [Nom du système à la page 658](#) est réglé à **Personnalisé** pour l'enregistrement/rangée courant. La sélection correspond alors à un système conventionnel MDC « sur le terrain ». Cette sélection s'applique au jeu d'ID d'appel courant (enregistrement/rangée) du [contact](#) courant dans [Liste d'appel unifiée à la page 655](#). Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 668](#).

Accès seulement : lorsque le champ [Nom du système à la page 659](#) est réglé à **Personnalisé** et lorsque le modèle ou les options de la radio le permettent.

10.41.1.3.4

ID principal

Ce champ permet de sélectionner l'ID principal de la radio cible fonctionnant en mode conventionnel MDC.

Cet ID correspond à l'[ID principal MDC](#) du même système conventionnel, qui a été défini dans la radio cible. Cette sélection s'applique au jeu d'ID d'appel courant (enregistrement/rangée) du [contact](#) courant dans [Liste d'appel unifiée à la page 655](#). Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 668](#).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Tableau 302 : Portée

Minimum	Maximum	Incrément
0 (Hex)	FFFFFFFF (Hex)	1

10.41.1.4

ID conventionnel ASTRO

La section ID du système ASTRO conventionnel de la section Contact vous permet d'afficher ou de modifier des ID d'appel du système ASTRO conventionnel pour chaque contact.

10.41.1.4.1

Nom du système

Ce champ permet de sélectionner le système conventionnel ASTRO souhaité ou de créer un jeu d'ID personnalisé.

La sélection d'un système conventionnel entraîne automatiquement la sélection de la valeur [Numéro de groupe du système](#). Cette sélection s'applique au jeu d'ID d'appel courant (enregistrement/rangée) du [contact](#) courant dans [Liste d'appel unifiée à la page 655](#). Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 667](#).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Non affecté

Aucune sélection.

Personnalisées

Permet d'entrer un [Numéro de groupe personnalisé](#) pour l'enregistrement/rangée courant. Ces ID s'appliquent pour un système [Système conventionnel à la page 415](#) ASTRO conventionnel non défini dans la codeplug courante. Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 667](#).

Systèmes conventionnels possibles

Permet de sélectionner un système ADF programmé à partir de la codeplug courante.

10.41.1.4.2

Numéro de groupe du système

Permet d'afficher en lecture seule le numéro de groupe du système ASTRO pour le système Conventional courant. Le champ Nom du système permet de sélectionner le système ASTRO désiré pour la rangée ou l'enregistrement actuel.

Cette valeur s'applique à l'ensemble d'identification de l'appel (rangée ou enregistrement) du contact courant dans la liste d'appel unifiée. Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 667](#).

Accès seulement : Lorsque le champ Type de système est réglé à **Personnalisé** ou lorsque le modèle ou l'option de la radio le permet.

10.41.1.4.3

Numéro de groupe du système

Ce champ vous permet de définir un numéro de groupe de système pour un système conventionnel ASTRO non défini dans la codeplug courante.

Le numéro de groupe du système permet de regrouper logiquement dans la codeplug les systèmes conventionnels qui forment un système de liaison radio.

IMPORTANT :

Cette sélection s'applique seulement si le champ Nom du système est réglé à **Personnalisé** pour la rangée ou l'enregistrement actuel. La sélection correspond alors à un système conventionnel ASTRO « sur le terrain ». Cette sélection s'applique à l'ensemble d'identification d'appel actuel (rangée ou enregistrement) du contact actuel dans la liste d'appel unifiée. Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 667](#).

Accès seulement : Lorsque le champ Type de système est réglé à **Personnalisé** ou le modèle ou l'option de la radio le permet.

10.41.1.4.4

ID individuel

Ce champ permet de sélectionner l'ID individuel de la radio cible fonctionnant en mode conventionnel ASTRO.

Cet ID correspond à l'ID individuel de la radio cible. L'ID individuel doit également correspondre au système conventionnel ([Numéro de groupe du système](#)) sélectionné dans le champ [Nom du système à la page 659](#) pour le même enregistrement ou la même rangée. Cette sélection s'applique au jeu d'ID d'appel courant (enregistrement/rangée) du [contact](#) courant dans [Liste d'appel unifiée à la page 655](#). Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 667](#).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Tableau 303 : Portée

Minimum	Maximum	Incrément
1	16777215	1

10.41.1.4.5

Type d'appel

Ce champ permet de sélectionner le type d'appel de la radio cible fonctionnant en mode conventionnel ASTRO.

Cette sélection s'applique au jeu d'ID d'appel courant (enregistrement/rangée) du [contact](#) courant dans [Liste d'appel unifiée à la page 655](#). Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 667](#).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Individuel(le)

Lorsque l'ensemble ID l'appel courant sera ciblé pour un appel individuel.

Groupe

Lorsque l'ensemble ID l'appel courant sera ciblé pour un appel de groupe.

10.41.1.5

ID ADF ASTRO 25

La section ID du système ASTRO 25 ADF de la section Contact vous permet d'afficher ou de modifier des ID d'appel du système ASTRO 25 ADF pour chaque contact.

10.41.1.5.1

Nom du système

Ce champ permet de sélectionner le système ADF souhaité ou de créer un jeu d'ID personnalisé.

La sélection d'un système ADF entraîne automatiquement la sélection des valeurs l'[ID WACN RAS/accueil](#) et [ID système à la page 519](#). Cette sélection s'applique à l'ensemble d'identification d'appel (rangée ou enregistrement) du contact actuel dans la liste d'appel unifiée. Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 664](#).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Non affecté

Aucune sélection.

Personnalisées

Permet d'entrer un ID WACN personnalisé, un ID de système personnalisé et un ID individuel pour l'enregistrement/rangée courant. Ces ID s'appliquent pour un système ADF non défini dans la codeplug actuelle. Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ.

Parcourir

Sélectionnez un ensemble à partir du [Personnalité ADF ASTRO 25 à la page 581](#) disponible.

10.41.1.5.2

ID WACN d'accueil

Ce champ vous permet d'afficher l'ID WACN RAS (accueil) ASTRO 25 pour le système ADF actuellement sélectionné.

Le champ [Nom du système à la page 661](#) permet de sélectionner le système ADF voulu pour la rangée ou l'enregistrement courant. Cette valeur s'applique à l'ensemble d'identification de l'appel (rangée ou enregistrement) du contact courant dans la liste d'appel unifiée. L'ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 664](#).

Accès seulement : Lorsque le champ [Nom du système à la page 661](#) n'est pas réglé à **Personnalisé** et lorsque le modèle ou les options de la radio le permettent.

10.41.1.5.3

ID système

Ce champ vous permet d'afficher l'ID du système ASTRO 25 sur le terrain et l'ID du système de type II pour le système ADF courant.

Le champ Nom du système permet de sélectionner le système ADF désiré pour la rangée ou l'enregistrement courant. Cette valeur s'applique à l'ensemble d'identification de l'appel (rangée ou enregistrement) du contact courant dans la liste d'appel unifiée. Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 664](#) (ASTRO 25) [ID d'appel à la page 665](#) (Type II).

Accès seulement : Lorsque le champ Nom du système n'est pas réglé à **Personnalisé** et lorsque le modèle ou l'option de la radio le permet.

10.41.1.5.4

Unit ID (ID de l'unité)

Ce champ permet de sélectionner l'ID d'unité ASTRO 25 de la radio cible en mode de communication ADF ASTRO 25.

Cet ID correspond à l'ID de l'unité de la radio cible. L'ID d'unité doit également correspondre au système ADF ([ID système à la page 519](#) et [ID WACN d'accueil à la page 661](#)) sélectionné dans le champ [Nom du système à la page 661](#) pour le même enregistrement ou la même rangée. Cette sélection s'applique au jeu d'ID d'appel courant (enregistrement/rangée) du [contact](#) courant dans [Liste d'appel unifiée à la page 655](#). Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 664](#).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

AVERTISSEMENT :

La plage de sélection est modifiable par clé (matérielle) avancée au moyen du programme de gestion des clés avancées.

Tableau 304 : Portée

Minimum	Maximum
000001	16777215

10.41.1.5.5

ID du système personnalisé

Ce champ vous permet de définir un ID de système ASTRO 25 (au format décimal ou hexadécimal) pour un système ADF qui n'est pas défini dans la codeplug courante.

Cette sélection s'applique seulement lorsque le [Nom du système à la page 661](#) ADF est réglé à **Personnalisé** pour la rangée ou l'enregistrement courant et qu'il correspond au [Système ADF](#) sur le terrain. Cette sélection s'applique au jeu d'ID d'appel courant (enregistrement/rangée) du [contact](#) courant dans [Liste d'appel unifiée à la page 655](#). Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 664](#).

Accès seulement : lorsque le champ [Nom du système à la page 661](#) est réglé à **Personnalisé** et lorsque le modèle ou les options de la radio le permettent.

REMARQUE :

Les sélections sont établies en fonction des fichiers des clés de système du logiciel ou des clés avancées (de matériel) disponibles pour l'application. Le rapport de la clé du système permet d'afficher les clés de système actuellement disponibles.

Deux valeurs distinctes déterminent la plage.

Tableau 305 : Première valeur

Minimum	Maximum	Incrément
1	65535	1

Tableau 306 : Seconde valeur

Minimum	Maximum	Incrément
1	FFFF	1

10.41.1.5.6

ID de WACN personnalisé

Ce champ vous permet de définir un ID de système ASTRO 25 (au format décimal ou hexadécimal) pour un système ADF qui n'est pas défini dans la codeplug courante.

Cette sélection s'applique seulement si le champ [Nom du système à la page 661](#) est réglé à **Personnalisé** pour la rangée ou l'enregistrement courant. La sélection correspond alors à un système ADF « sur le terrain ». Cette sélection s'applique au jeu d'ID d'appel courant (enregistrement/rangée) du [contact](#) courant dans [Liste d'appel unifiée à la page 655](#). Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 664](#).

Accès seulement : lorsque le champ [Nom du système à la page 661](#) est réglé à **Personnalisé** et lorsque le modèle ou les options de la radio le permettent.

Deux valeurs distinctes déterminent la plage.

Tableau 307 : Première valeur

1	1048574	1

Tableau 308 : Seconde valeur

Minimum	Maximum	Incrément
1	FFFFE	1

10.42

Liste courte ADF du système ASTRO 25

Ceci vous permet d'afficher ou de définir des listes courtes d'appel individuelles pour les communications ADF ASTRO 25.

Vous pouvez ensuite sélectionner les membres de la liste d'appel individuels en mode de communication ADF. Ceux-ci permettent différents types d'appels comme les appels privés et les notifications vers une radio unique ou un groupe de radios.

La liste d'appel privilégiée ADF permet également « l'identification de l'appelant ».

**REMARQUE :**

Les [contacts](#) doivent être préalablement définis dans la [liste d'appels unifiée \(UCL\)](#) pour pouvoir être sélectionnés pour une liste courte d'appel ADF ASTRO 25.

Des jeux d'ID d'appel doivent également être définis dans la page [ID ADF d'appel ASTRO 25](#) pour pouvoir être sélectionnés pour une liste courte d'appel ADF ASTRO 25.

Les listes courtes individuelles peuvent alors être sélectionnées par [Personnalité ADF](#) au moyen du champ [Liste d'appel privilégiée ADF à la page 571](#).

Vous pouvez activer le mode de modification de la liste courte en appuyant sur une touche [Contacts à la page 184](#) ou en utilisant la sélection de menu [Contacts à la page 217](#).

10.42.1

Alias de la liste courte

Ce champ vous permet de définir un nom reconnaissable pour la liste courte ADF du système ASTRO 25 courante.

Une fois définies, les listes d'appel courtes ASTRO 25 individuelles peuvent alors être sélectionnées par [Personnalité ADF](#) au moyen du champ [Liste d'appel privilégiée ADF à la page 571](#).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

**REMARQUE :**

Exemples : EMT-001, no 500, Électrique1, # A5.

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux. Pour les caractères Unicode non identifiés, comme les émoticônes, l'écran de la radio affiche des « carrés » pour ces caractères.

Vous pouvez utiliser jusqu'à 14 caractères.

10.42.2

Contact

Ce champ permet de sélectionner le jeu d'ID d'appel pour l'enregistrement/rangée courant dans la liste courte conventionnelle ADF ASTRO 25 courante.

Les [contacts](#) doivent d'abord être définis dans la [liste d'appel unifiée \(UCL\)](#). Une fois que ce contact a été sélectionné, le jeu d'ID d'appel (défini dans la [page ID ADF ASTRO 25](#)) de l'UCL peut être sélectionné à partir du champ [ID d'appel à la page 664](#) de ce même enregistrement/rangée.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.42.3

ID d'appel

Ce champ permet de sélectionner le jeu d'ID d'appel pour l'enregistrement/rangée courant dans la liste courte conventionnelle ADF ASTRO 25 courante.

Ce jeu d'ID d'appel est défini dans '[Liste d'appel unifiée - page ID ADF ASTRO 25](#)'. Le [Contact à la page 664](#) pour l'enregistrement courant ou la rangée courante doit être sélectionné au préalable.

Accès seulement : Lorsque le champ [Contact à la page 664](#) pour l'enregistrement courant ou la rangée courante n'est pas réglé à **Non assigné** et que le modèle ou l'option de la radio le permet.

10.43

Liste courte ADF de type II

Cette section vous permet d'afficher ou de définir des listes courtes d'appel pour les communications ADF de type II.

Vous pouvez ensuite sélectionner les membres de la liste d'appel individuels en mode de communication ADF. Ceux-ci permettent différents types d'appels comme les appels privés et les notifications vers une radio unique ou un groupe de radios.

La liste d'appel privilégiée ADF permet également « l'identification de l'appelant ».

**REMARQUE :**

Les [contacts](#) doivent être déjà définis dans la [liste d'appel unifiée \(UCL\)](#) pour permettre leur sélection dans une liste courte ADF de type II.

Les jeux d'ID d'appel doivent également être définis dans la [page ID ADF de type II](#) avant de pouvoir être sélectionnés pour figurer dans la liste courte d'appel ADF de type II.

Les listes courtes individuelles peuvent alors être sélectionnées par [Personnalité ADF](#) au moyen du champ [Liste d'appel privilégiée ADF à la page 571](#).

Vous pouvez activer le mode de modification de la liste courte en appuyant sur une touche [Contacts à la page 184](#) ou en utilisant la sélection de menu [Contacts à la page 217](#).

10.43.1

Alias de la liste courte

Ce champ vous permet de définir des noms reconnaissables pour la liste courte ADF de type II courante.

Une fois définies, les listes courtes d'appel de type II individuelles peuvent être sélectionnées par [Personnalité ADF](#) à partir du champ [Liste d'appel privilégiée ADF à la page 571](#).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

**REMARQUE :**

Exemples : EMT-001, no 500, Électricité1, # A5.

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux. Pour les caractères Unicode non identifiés, comme les émoticônes, l'écran de la radio affiche des « carrés » pour ces caractères.

Vous pouvez utiliser jusqu'à 14 caractères.

10.43.2

Contact

Ce champ permet de sélectionner le jeu d'ID d'appel pour l'enregistrement/rangée courant dans la liste courte conventionnelle ADF ASTRO 25 courante.

Le contact doit d'abord avoir été défini dans le champ [Contact](#) de la [Liste d'appel unifiée à la page 655](#). Une fois que le contact a été sélectionné, le jeu d'ID (défini dans la page [ID ADF de type II](#) de l'UCL) peut être sélectionné dans le champ [ID d'appel à la page 665](#) du même enregistrement/rangée.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.43.3

ID d'appel

Ce champ permet de sélectionner le jeu d'ID d'appel pour l'enregistrement/rangée courant dans la liste courte conventionnelle ADF ASTRO 25 courante.

Le contact pour l'enregistrement courant ou la rangée courante doit être sélectionné au préalable.

Accès seulement : Lorsque le champ [Contact à la page 665](#) pour l'enregistrement courant ou la rangée courante n'est pas réglé à **Non assigné** et que le modèle ou l'option de la radio le permet.

10.44

Liste courte conventionnelle ASTRO

Cette section vous permet d'afficher ou de définir des listes courtes d'appel pour les communications conventionnelles.

Vous pouvez ensuite sélectionner les membres de la liste d'appel individuels lors du fonctionnement en mode de communications conventionnelles. Ceux-ci permettent différents types d'appels comme les appels sélectifs et les avis d'appel vers une radio unique ou un groupe de radios.

La liste courte d'appels de ASTRO permet également l'identification de l'appelant.

REMARQUE :

Les [contacts](#) doivent d'abord être définis dans la [liste d'appel unifiée \(UCL\)](#) pour pouvoir être sélectionnés pour une liste courte d'appel ASTRO.

Des jeux d'ID d'appel doivent également être définis dans la [ID conventionnel ASTRO](#) de l'UCL avant de pouvoir être sélectionnés pour une liste courte d'appel ASTRO.

Les listes courtes individuelles peuvent alors être sélectionnées par [Personnalité conventionnelle à la page 428](#) au moyen du champ [Liste courte d'appels ASTRO à la page 472](#).

Vous pouvez activer le mode de modification de la liste courte en appuyant sur une touche [Contacts à la page 184](#) ou en utilisant la sélection de menu [Contacts à la page 217](#).

10.44.1

Alias de la liste courte

Ce champ vous permet de définir un nom reconnaissable pour la liste courte conventionnelle ASTRO courante.

Une fois définies, les listes d'appel privilégiées ASTRO individuelles peuvent alors être sélectionnées par [Personnalité conventionnelle à la page 428](#) au moyen du champ [Liste courte d'appels ASTRO à la page 472](#).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

Exemples : EMT-001, no 500, Électricité1, # A5.

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux. Pour les caractères Unicode non identifiés, comme les émoticônes, l'écran de la radio affiche des « carrés » pour ces caractères.

Vous pouvez utiliser jusqu'à 14 caractères.

10.44.2

Contact

Ce champ permet de sélectionner le jeu d'ID d'appel pour l'enregistrement/rangée courante dans la liste courte conventionnelle ADF ASTRO 25 courante.

Le contact doit d'abord avoir été défini dans le champ [Contacts](#) de la [liste d'appels unifiée \(UCL\)](#). Une fois que ce contact a été sélectionné, le jeu d'ID d'appel (défini dans la [page ID conventionnel ASTRO 25](#)) de l'UCL peut être sélectionné à partir du champ [ID d'appel à la page 667](#) de ce même enregistrement/rangée.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.44.3

ID d'appel

Ce champ permet de sélectionner le jeu d'ID d'appel pour l'enregistrement/rangée courante dans la liste courte conventionnelle ADF ASTRO 25 courante.

L'ensemble ID d'appel est défini à la page ID du système ASTRO conventionnel de la Liste d'appel unifiée. Le contact pour l'enregistrement courant ou la rangée courante doit être sélectionné au préalable.

Accès seulement : Lorsque le champ [Contact à la page 666](#) pour l'enregistrement courant ou la rangée courante n'est pas réglé à **Non assigné** et que le modèle ou l'option de la radio le permet.

10.45

Liste courte conventionnelle MDC

Cette section vous permet d'afficher ou de définir des listes courtes pour les communications conventionnelles MDC.

Vous pouvez sélectionner les membres de la liste d'appel en mode conventionnel. Ceux-ci permettent différents types d'appels comme les appels sélectifs et les avis d'appel vers une radio unique ou un groupe de radios.

La liste courte d'appels de MDC permet également l'identification de l'appelant.

REMARQUE :

Les [contacts](#) doivent d'abord avoir été définis dans la [liste d'appel unifiée \(UCL\)](#) pour pouvoir figurer dans une liste courte d'appels MDC.

Des jeux d'ID d'appel doivent également être définis dans la page [ID conventionnel MDC](#) de l'UCL avant de pouvoir être sélectionnés pour figurer dans une liste courte d'appels MDC.

Les listes courtes individuelles peuvent alors être sélectionnées par [Personnalité conventionnelle à la page 428](#) au moyen du champ [Liste privilégiée d'appels non ASTRO à la page 468](#).

Vous pouvez activer le mode de modification de la liste courte en appuyant sur la touche [Contacts à la page 184](#) ou en utilisant la sélection de menu [Contacts à la page 217](#).

10.45.1

Alias de la liste courte

Ce champ vous permet de définir des noms reconnaissables pour la liste courte conventionnelle MDC courante.

Une fois définies, les listes d'appel privilégiées MDC individuelles peuvent alors être sélectionnées par [Personnalité conventionnelle à la page 428](#) au moyen du champ [Liste privilégiée d'appels non ASTRO à la page 468](#).

REMARQUE :

Exemples : EMT-001, no 500, Électrique1, # A5.

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux. Pour les caractères Unicode non identifiés, comme les émoticônes, l'écran de la radio affiche des « carrés » pour ces caractères.

Vous pouvez utiliser jusqu'à 14 caractères.

10.45.2

Contact

Ce champ permet de sélectionner le jeu d'ID d'appel pour l'enregistrement/rangée courant dans la liste courte conventionnelle ADF MDC 25 courante.

Le contact doit d'abord avoir été défini dans le champ [Contact](#) de la [Liste d'appel unifiée à la page 655](#). Une fois que le contact a été sélectionné, l'ensemble d'ID d'appel (défini dans la section ID conventionnel MDC de l'UCL [contact]) peut être sélectionné dans le champ [ID d'appel à la page 668](#) de la même rangée ou du même enregistrement.

Accès seulement : Lorsque ce champ de l'enregistrement courant ou la rangée courante n'est pas réglé à **Non assigné** et que le modèle ou l'option de la radio le permet.

10.45.3

ID d'appel

Ce champ permet de sélectionner le jeu d'ID d'appel pour l'enregistrement/rangée courant dans la liste courte conventionnelle ADF MDC 25 courante.

Ce jeu d'ID est défini dans la page [ID conventionnel MDC](#) de la [liste d'appel unifiée](#). L'[Contact à la page 668](#) pour la rangée ou l'enregistrement courant doit être sélectionné au préalable.

Accès seulement : Lorsque ce champ [Contact à la page 666](#) pour l'enregistrement/rangée courant n'est pas réglé à **Non affecté** et que le modèle ou l'option de la radio le permet.

10.45.4

ID principal

Ce champ permet de sélectionner l'ID principal de la radio cible fonctionnant en mode conventionnel MDC.

Cet ID correspond à l'[ID principal MDC](#) du même système conventionnel, qui a été défini dans la radio cible. Cette sélection s'applique au jeu d'ID d'appel courant (enregistrement/rangée) du [contact](#) courant dans [Liste d'appel unifiée à la page 655](#). Cet ensemble d'identification d'appel peut ensuite être sélectionné dans le champ [ID d'appel à la page 668](#).

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Tableau 309 : Portée

Minimum	Maximum	Incrément
0 (Hex)	FFFFFFFF (Hex)	1

10.46

Affectation du canal de zone

Le champ **Affectation du canal de zone** permet de concevoir et de créer des configurations de zone et de canal.

La sélection de personnalités conventionnelles pour les canaux conventionnels et de groupes ADF pour les canaux ADF crée les positions voulues sur le sélecteur de canal de la radio pour chaque zone.

REMARQUE :

Vous pouvez sélectionner des zones à l'aide d'un commutateur ou d'une sélection de menu Sélectionner la zone.

10.46.1

Zone

Cette section vous permet de créer ou de modifier des noms reconnaissables pour chaque zone.

**REMARQUE :**

Les positions des zones sont déterminées par l'ordre dans lequel elles sont créées dans l'application.

**REMARQUE :**

La sélection de personnalités conventionnelles pour les canaux conventionnels et de groupes ADF pour les canaux ADF crée les positions voulues sur le sélecteur de canal de la radio pour chaque zone.

Vous pouvez sélectionner des zones à l'aide d'un commutateur ou d'une sélection de menu Sélectionner la zone.

10.46.1.1

Noms de zone

Ce champ vous permet de définir des noms reconnaissables pour la zone courante.

**IMPORTANT :**

Pour les radios portatives, ce nom apparaît dans l'écran principal, non pas dans l'écran du dessus.

Accès seulement : Lorsque la valeur du champ [Taille du texte de la zone à la page 231](#) est supérieure à 0.

**REMARQUE :**

Exemples : EMT-001, no 500, Électricité1, # A5.

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux. Pour les caractères Unicode non identifiés, comme les émoticônes, l'écran de la radio affiche des « carrés » pour ces caractères.

Le nombre de caractères que comporte le nom de la zone figurant dans l'écran principal de la radio est déterminé par le champ **Taille du texte de la zone**. Les entrées dont la longueur excède cette valeur sont considérées comme étant non valides.

Le nom de la zone apparaît au-dessus du nom du canal dans l'écran principal de la radio.

10.46.1.2

Nom de la zone dans l'écran du dessus

Ce champ vous permet de définir des noms d'écran du haut reconnaissables pour la zone courante.

Ce nom apparaît uniquement dans l'affichage du haut de la radio et il s'affiche également dans l'écran du microphone haut parleur à distance (DRSM), en option. Cette sélection s'applique à la zone courante.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

Exemples : EMT-001, no 500, Électrique1, # A5.

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Le nombre de caractères que comporte le Nom de zone figurant à l'écran de la radio est déterminé par le champ [Taille du texte de la zone du haut](#). Les entrées dont la longueur excède cette valeur sont considérées comme étant non valides.

Lorsque le nombre total de caractères des champs [Taille du texte de la zone du haut](#) et [Taille du texte du canal du haut](#) est inférieur à 8, alors, le nom de cette [Nom de la zone dans l'écran du dessus à la page 669](#) et le nom de [Taille du texte de la zone du haut](#) s'affichent tous deux dans l'écran du dessus. Le nom de la zone s'affiche à la gauche du nom du canal.

Lorsque le nombre total de caractères des champs [Taille du texte de la zone du haut](#) et [Taille du texte du canal du haut](#) est supérieur à 8, alors, le nom de cette [Nom de la zone dans l'écran du dessus à la page 669](#) et le nom de [Taille du texte de la zone du haut](#) s'affichent en alternance dans l'écran du dessus.

10.46.1.3

Annnonce de zone

Ce champ permet de sélectionner le fichier d'annonce vocale de Motorola (.MVA) à utiliser pour l'annonce vocale de la zone courante.

Lorsque vous faites passer la radio à cette zone, un message-guide vocal se fait entendre. Le message-guide vocal associé à l'[annonce du canal](#) peut également se faire entendre, le cas échéant. Si l'option de synthèse texte-paroles (TTS) est sélectionnée, le texte dans le champ de commande vocale correspondant est converti en parole et lu en tant que contenu audio. Voir le champ [Priorité des annonces vocales à la page 278](#).

REMARQUE :

La page [Liste d'annonces vocales à la page 298](#) permet de charger les fichiers d'annonce vocale de Motorola (.MVA) dans la codeplug courante.

Les sélections suivantes sont prises en charge :

Aucun

La zone courante ne nécessite aucun message-guide vocal.

TTS

Lorsque la fonction Commande vocale est activée, le texte qui apparaît dans le champ Commande vocale pour le mode Annonce de zone est lu comme un contenu audio.

Fichier d'annonce vocale de Motorola (.MVA)

Présente la liste de tous les fichiers vocaux possibles définis dans la page [Liste d'annonces vocales à la page 298](#).

10.46.1.4

Nom de commande vocale de la zone/Annonce TTS

Un mot couramment prononcé pour la référence à cette zone aux fins de commande vocale et d'annonce de synthèse texte-parole (TTS).

Lorsqu'on appuie sur la « touche de lecture » , RadioCentral convertit le texte affiché dans le champ Commande vocale en parole et le transmet dans le haut-parleur.

IMPORTANT :

Ce champ doit être défini pour changer de zone en utilisant la commande vocale. Assurez-vous d'utiliser des mots uniques et de ne pas définir deux commandes vocales de zone phonétiquement similaires pour éviter que les deux commandes soient considérées comme étant non valides.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

Configuré par zone.

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.46.2

Canaux

Cette section vous permet d'afficher ou de modifier des configurations de canaux particulières dans la zone désirée.

REMARQUE :

La sélection de [personnalité conventionnelle](#) pour les canaux conventionnels et de groupes de ressources ADF pour les canaux ADF crée sur le sélecteur de canaux, pour chaque zone, les emplacements de canal désirés.

Vous pouvez sélectionner les canaux en utilisant une touche [Sélection de canal](#), un commutateur [Sélection de canal à la page 204](#) ou la sélection de menu [Sélection de canal à la page 216](#).

Accès seulement : Lorsque le champ [Activation de zone dynamique](#) est réglé à **Désactivé**.

10.46.2.1

Nom du canal

Ce champ vous permet de définir des noms reconnaissables pour le canal courant (enregistrement/rangée).

IMPORTANT :

Pour les radios portatives, ce nom apparaît dans l'écran principal, non pas dans l'[écran du dessus](#).

Cette sélection s'applique à la zone courante.

Accès seulement : Lorsque le champ [Activation de zone dynamique](#) est Désactivé.

REMARQUE :

Exemples : EMT-001, no 500, Électrique1, # A5.

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux. Pour les caractères Unicode non identifiés, comme les émoticônes, l'écran de la radio affiche des « carrés » pour ces caractères.

Le nombre de caractères que comporte le nom de canal figurant dans l'écran principal de la radio est déterminé par le champ **Taille du texte du canal**. Les entrées dont la longueur excède cette valeur sont considérées comme étant non valides.

Le nom de la zone apparaît au-dessus du nom du canal dans l'écran principal de la radio.

10.46.2.2

Nom du canal dans l'écran du dessus

Ce champ vous permet de définir un nom d'écran du haut reconnaissable pour le canal courant (enregistrement/rangée).

Ce nom apparaît uniquement dans l'affichage du haut de la radio et il s'affiche également dans l'écran du microphone haut-parleur à distance (DRSM), en option. Cette sélection s'applique à la zone courante.

Accès seulement : Lorsque le champ [Activation de zone dynamique](#) est désactivé et que le modèle ou l'option de la radio le permet.

**REMARQUE :**

Exemples : EMT-001, no 500, Électrique1, # A5.

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Le nombre de caractères que comporte le Nom de canal figurant à l'écran de la radio est déterminé par le champ [Taille du texte du canal du haut](#). Les entrées dont la longueur excède cette valeur sont considérées comme étant non valides.

Lorsque le nombre total de caractères des champs [Taille du texte de la zone du haut](#) et [Taille du texte du canal du haut](#) est inférieur à 8, alors, le nom de la [Nom de la zone dans l'écran du dessus à la page 669](#) et le nom du canal de l'écran du dessus [Taille du texte de la zone du haut](#) s'affichent tous deux dans l'écran du dessus. Le nom de la zone s'affiche à la gauche du nom du canal.

Lorsque le nombre total de caractères des champs [Taille du texte de la zone du haut](#) et [Taille du texte du canal du haut](#) est inférieur à 8, alors, le nom de la [Nom de la zone dans l'écran du dessus à la page 669](#) et le nom du canal de l'écran du dessus s'affichent en alternance tous deux dans l'écran du dessus.

10.46.2.3

Type de canal

Ce champ permet de sélectionner le type de communications radio, conventionnel ou ADF, pour le canal courant (enregistrement ou rangée).

Cette sélection s'applique à la zone courante.

**REMARQUE :**

Après cette sélection, la valeur du champ [Personnalité à la page 672](#) peut être sélectionnée.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet, et lorsque le champ [Activation de zone dynamique](#) est désactivé, et lorsque le champ [Activer le clonage](#) est désactivé.

Les sélections suivantes sont prises en charge :

Trk

ADF

Cnv

Conventionnel

10.46.2.4

Personnalité

Ce champ permet de sélectionner la personnalité conventionnelle ou ADF voulue pour le canal courant (enregistrement/rangée).

Cette sélection s'applique à la zone courante.

IMPORTANT :

La valeur du champ [Type de canal à la page 672](#) détermine le type de communication de la personnalité qu'on pourra sélectionner dans ce champ.

Pour être sélectionnées dans ce champ, les personnalités doivent d'abord avoir été créées et définies.

Accès seulement : Lorsque le champ [Activation de zone dynamique](#) et le champ [Activer le clonage](#) sont désactivés.

10.46.2.5

Groupe de conversation ADF

Ce champ permet de sélectionner le groupe ou le type de groupe à utiliser pour le canal (enregistrement/rangée) courant.

Cette sélection s'applique à la zone courante.

Accès seulement : Lorsque le champ [Activation de zone dynamique](#) est **désactivé**, que le champ [Type de canal à la page 672](#) est réglé à **Trk** (ADF) que le modèle ou les options de la radio le permettent.

Les sélections suivantes sont prises en charge :

Sélection de groupe de conversation

Les groupes affichés aux fins de sélection sont basés sur la [Personnalité ADF](#) sélectionnée dans le champ [Personnalité à la page 672](#) de ce canal.

Un groupe consiste en un regroupement programmé de radios créé dans le but d'effectuer des communications pratiques et fréquentes entre elles.

REMARQUE :

Les groupes sont définis dans la page [Groupe](#) de la personnalité.

DYN (Regroupement dynamique)

AVERTISSEMENT :

Cette sélection est valide uniquement lorsque le champ [Transmit Mode \(Mode de transmission\) à la page 560](#) pour la personnalité ADF sélectionnée dans le champ [Personnalité à la page 672](#) de ce canal n'est pas réglé à **TG/AG désactivé** (écoute seule).

Une configuration de Regroupement dynamique est valide uniquement lorsqu'une personnalité ADF référencée à un canal a ce champ réglé à **DYN**, et que la zone et le canal sélectionnés pour cette personnalité correspondent aux sélections [Regroupement dynamique/Zone à la page 530](#) et [Regroupement dynamique\Canal à la page 530](#) dans le système ADF référencé de la personnalité.

IMPORTANT :

On ne peut définir qu'un seul canal de regroupement dynamique par Système ADF associé.

Vous pouvez demander une nouvelle attribution de regroupement dynamique auprès du répartiteur en utilisant la touche [Demande de reprogrammation à la page 191](#) ou la sélection de menu [Demande de reprogrammation](#) . Les fonctions et les paramètres du groupe d'un regroupement dynamique sont définis et retransmis par le répartiteur.

Pour que le groupe d'un regroupement dynamique puisse transmettre en mode sécurisé, vous devez utiliser la touche [Sélection de Tx sécurisée](#), le commutateur [Sélection de Tx sécurisée à la page 206](#) ou la sélection de menu [Sécurisé](#); sinon, les transmissions du groupe sont reliées afin d'être transmise en mode **Non chiffré**.

ATG (Groupe d'annonce)

Cette sélection est valide uniquement lorsque le champ [Groupe d'annonce à la page 565](#) pour la personnalité ADF sélectionnée dans le champ [Personnalité à la page 672](#) de ce canal n'est pas réglé à **Aucun**.

Les groupes d'annonce vous permettent d'effectuer des appels sur un grand canal de communication englobant tous les [groupes](#) définis pour la personnalité ADF courante.

10.46.2.6

Option de fréquence conventionnelle

Ce champ permet de sélectionner le profil des Options de fréquence conventionnelle pour le canal courant (enregistrement/rangée).

Cette sélection s'applique à la zone courante.

REMARQUE :

La personnalité conventionnelle doit d'abord être sélectionnée dans le champ [Personnalité à la page 672](#).

Pour être sélectionnés dans ce champ, les profils d'options de fréquence doivent d'abord avoir été créés et définis.

Accès seulement : Lorsque le champ [Activation de zone dynamique](#) est désactivé, et lorsque le champ [Type de canal à la page 672](#) est réglé à **Cnv** (conventionnel).

10.46.2.7

Sélection de profil radio

Ce champ permet de sélectionner le profil radio pour le canal courant (enregistrement ou rangée).

Les profils radio servent à créer des groupes de paramètres audio pour des canaux précis ou des scénarios particuliers d'utilisation sur le terrain.

Vous pouvez sélectionner des profils radio (par canal) en appuyant sur la touche [Profils de radio à la page 190](#) ou en utilisant la sélection de menu [Profils de radio à la page 222](#).

Cette sélection s'applique à la zone courante.

Accès seulement : Lorsque le champ [Activation de zone dynamique](#) est Désactivé.

Les sélections suivantes sont prises en charge :

Dernier élément sélectionné

Le premier enregistrement/rangée dans les [Profils de radio à la page 695](#) (peu importe le nom de profil) est utilisé jusqu'à ce que l'utilisateur radio passe à un autre profil. Après cela, votre sélection de profil courante est verrouillée sur le canal jusqu'à ce qu'elle soit modifiée de nouveau.

Autres noms de profil

Trois profils radio prénommés vous sont fournis : **Par défaut**, **Surveillance**, et **Audio puissant**. Ces profils peuvent être renommés et, s'il est nécessaire d'en créer d'autres, ils devraient être définis en fonction de vos besoins.

10.46.2.8

Annonce du canal

Ce champ permet de sélectionner le fichier d'annonce vocale de Motorola (.MVA) à utiliser pour l'annonce vocale du canal ou du mode courant.

Lorsque vous faites passer la radio sur ce canal, un message-guide vocal se fait entendre. La touche [Annonce du canal à la page 184](#) vous permet d'entendre l'enregistrement vocal du canal courant de la radio, au besoin. Voir aussi le champ [Priorité des annonces vocales](#). Si l'option de synthèse

texte-paroles (TTS) est sélectionnée, le texte dans le champ de commande vocale correspondant est converti en parole et lu en tant que contenu audio.

Cette sélection s'applique à la zone courante.

REMARQUE :

La page [Liste d'annonces vocales à la page 298](#) permet de charger les fichiers d'annonce vocale de Motorola (.MVA) dans la codeplug courante.

Accès seulement :

- Le champ [Activation de zone dynamique](#) est désactivé.
- Le champ [Mode RSI](#) est désactivé pour la zone courante.

Les sélections suivantes sont prises en charge :

Aucun

Le canal courant ne nécessite aucun message-guide vocal.

TTS

Lorsque la fonction Commande vocale est activée, le texte qui apparaît dans le champ Commande vocale pour le mode Annonce de canal est lu comme un contenu audio.

Fichier d'annonce vocale de Motorola (*.MVA)

Présente la liste de tous les fichiers vocaux possibles définis dans la page [Liste d'annonces vocales à la page 298](#).

10.46.2.9

Nom de commande vocale du canal/Annonce TTS

Un mot couramment prononcé pour la référence à ce canal aux fins de commande vocale. Il peut aussi être utilisé pour définir l'annonce de canal pour ce texte si l'annonce de canal est réglée à Synthèse vocale (TTS).

Lorsqu'on appuie sur la « touche de lecture » , RadioCentral convertit le texte affiché dans le champ Commande vocale en parole et le transmet dans le haut-parleur.

IMPORTANT :

Ce champ doit être défini pour changer de canal en utilisant la commande vocale. Assurez-vous d'utiliser des mots uniques et de ne pas définir deux commandes vocales de canal phonétiquement similaires à l'intérieur d'une zone donnée pour éviter que les deux commandes soient considérées comme étant non valides.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

REMARQUE :

Configuré par canal.

La valeur par défaut est vierge.

Caractères Unicode.

Caractères alphanumériques uniquement, un maximum de 35 caractères.

10.46.2.10

ID secteur de localisation du personnel

Ce champ permet de sélectionner le numéro qui identifie l'emplacement courant du secteur de localisation du personnel pour le canal courant.

Cette sélection s'applique à la zone courante.

IMPORTANT :

Lorsque vous-même ou une radio entrez dans un nouveau secteur, il vous incombe de changer le canal de la radio pour le canal approprié pour l'emplacement du nouveau secteur.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet, et lorsque le champ [Type de canal](#) à la page 672 est réglé à **Cnv** (conventionnel), et lorsque la [Personnalité conventionnelle](#) à la page 428 référencée dans le canal conventionnel courant a son champ [Type d'émission de signaux d'incident](#) à la page 480 réglé à **Localisation du personnel** ou **Localisation du personnel avec MDC**.

Tableau 310 : Portée

Minimum	Maximum	Incréments
0 (hex)	FF (hex)	1

REMARQUE :

Chaque valeur doit être unique pour chaque canal. Autrement dit, chaque valeur ne peut être utilisée qu'une seule fois par radio.

La valeur **0** (réglée par défaut en usine) sert à désigner les canaux qui ne sont pas de type Imputabilité du personnel. Cette valeur peut donc être réutilisée au besoin.

10.46.2.11

Zone de reprise

Ce champ décrit la zone sur laquelle la radio doit être mise en marche lorsque le retour de canal se produit.

Si le champ Canal de reprise est désactivé, le retour de canal ne pourra pas être activé sur le canal sélectionné.

Accès seulement : Lorsque le champ Canal de reprise est activé.

10.46.2.12

Canal de reprise

Ce champ permet de sélectionner le canal dans la zone de reprise sélectionnée auquel la radio doit passer lorsque le retour de canal se produit. Si ce champ est désactivé, alors le retour de canal ne peut pas être activé sur le canal sélectionné.

Accès seulement : Lorsque le champ **Activer le retour de canal** est activé.

10.46.2.13

Sélection du rétroéclairage de couleur de canal

Ce champ vous permet de sélectionner la couleur du rétroéclairage du canal courant (enregistrement/rangée).

REMARQUE :

Cette sélection s'applique seulement pour la zone courante.

Accès seulement : Lorsque le champ [Rétroéclairage couleur du canal](#) est réglé à **Activé**, et que la sélection du profil radio n'est pas réglée à un profil ayant son champ [Activer les lunettes de vision de nuit](#) ou [Désactiver les lumières](#) à la page 697 réglé à **Activé**.

Les sélections suivantes sont prises en charge :

- Blanc

- Rouge
- Vert
- Orange

10.47

Tout le balayage

La section **Tout le balayage** permet d'afficher ou de définir les réglages relatifs au balayage qui s'appliquent aux modes de communication conventionnel et ADF.

La fonction Tout le balayage peut s'appliquer pour toute la radio à toutes les [Liste de balayage à la page 681](#).

Lors d'un balayage, une liste de balayage permet d'utiliser de nombreux canaux de réception.

REMARQUE :

Des listes de balayage distinctes peuvent être associées à chaque personnalité [conventionnelle](#) et [ADF](#) dans le champ Sélection de la liste de balayage.

10.47.1

Général

La section **Général** permet d'afficher ou de définir la fonctionnalité de balayage associée aux modes de communication conventionnel et ADF.

Cette fonction s'applique à toutes les listes de balayage de la radio. Lors d'un balayage, une liste de balayage permet d'utiliser de nombreux canaux de réception.

REMARQUE :

Des listes de balayage distinctes peuvent être affectées aux personnalités [Personnalité conventionnelle à la page 428](#) et [Personnalité ADF ASTRO 25 à la page 627](#) à partir de leur champ Sélection de la liste de balayage de chaque personnalité.

10.47.1.1

Alerte de balayage prioritaire

Ce champ permet à la radio de vous alerter de façon audible.

Cette fonction est activée lorsqu'un [Membre prioritaire 1 à la page 687](#) ou un [Membre prioritaire 2 à la page 688](#) d'un canal [membre de la liste de balayage](#) est trouvé pendant le balayage.

La détection d'un canal de priorité 1 aussi bien que de priorité 2 entraîne l'émission d'un bip. Cette fonction s'applique à tous les [types de balayage](#).

Accès seulement : Lorsque le champ Tonalités d'alerte est réglé à **Activé**, et lorsque le modèle ou les options de la radio le permettent.

10.47.1.2

Temps d'arrêt de Rx Tx de la voix

Ce champ permet de sélectionner la durée pendant laquelle, en mode de détection, la radio demeure en attente d'activité pour un membre de la liste de balayage avant de retourner en mode de balayage actif.

La minuterie se met en marche dès que toutes les communications vocales entrantes et sortantes sont terminées. Cette fonction s'applique à tous les [types de balayage](#) lorsque la radio fonctionne en mode de balayage. La durée est exprimée en secondes.

Tableau 311 : Portée

Minimum	Maximum
0 seconde	255 secondes

10.47.1.3

Temps d'arrêt de Rx Tx de données

Ce champ permet de sélectionner la durée pendant laquelle, en mode de détection, la radio demeure en attente d'activité pour un membre de la liste de balayage avant de retourner en mode de balayage actif.

La minuterie se met en marche dès que toutes les communications de données entrantes et sortantes sont terminées. Cette fonction s'applique pour une [Liste de balayage à la page 681](#) dont le champ [Type de balayage à la page 682](#) est réglé à **Conventionnel**, et lors du fonctionnement en mode Balayage. La durée est exprimée en secondes.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 312 : Portée

Minimum	Maximum
0 s	255 s

10.47.2

Conventionnel

Cette section vous permet d'afficher ou de définir la fonctionnalité pour tout ce qui comporte une sélection de groupe **Conventionnel** ou **Multisystème**.

REMARQUE :

Des listes de balayage distinctes peuvent être affectées aux personnalités [Personnalité conventionnelle à la page 428](#) et [Personnalité ADF ASTRO 25 à la page 627](#) à partir de leur champ Sélection de la liste de balayage de chaque personnalité.

10.47.2.1

Détection de l'onde porteuse requise

Ce champ permet à la radio de détecter le silencieux de porteuse, mais d'activer le son seulement si elle détecte un membre prioritaire de la liste de balayage ou un code de ligne privée (PL) approprié.

Cela s'applique lors du balayage actif d'un canal membre de la liste de balayage conventionnel, en mode balayage.

10.47.2.2

Marquage des canaux prioritaires

Ce champ améliore le rendement du balayage des canaux prioritaires en « marquant » les membres de la liste de balayage qui ne sont pas prioritaires, et en les retirant temporairement de la liste de balayage.

Cette fonction est particulièrement utile lorsque la radio transmet en mode de balayage sur un membre non prioritaire de la liste de balayage, et lorsque la sourdine s'active brièvement à des [intervalles spécifiques](#) pour que la radio tente de détecter de l'activité pour les [Membre prioritaire 1 à la page 687](#) et [Membre prioritaire 2 à la page 688](#).

Cette suppression temporaire de certains membres de la liste de balayage réduit la période d'activation de la sourdine et, par conséquent, la période d'interruption de l'appel courant. Cette

fonction s'applique seulement aux canaux de la liste de balayage qui appartiennent au mode de communication conventionnel.

IMPORTANT :

Un canal prioritaire analogique est marqué lorsque le balayage échoue en raison de l'absence d'un code TPL/DPL (PL) alors qu'un code PL code était requis, ou en raison d'une erreur dans le code PL.

Un canal prioritaire numérique (système ASTRO) est marqué lorsque le balayage échoue en raison de l'absence d'un code d'accès au réseau (NAC) lorsque ce type de code est requis, ou en raison d'une erreur dans ce code.

Lorsque le bouton PTT est enfoncé, ou que le balayage détecte que la porteuse a été interrompue pour un canal prioritaire marqué, ou que le canal marqué contient le code PL/NAC approprié, l'état « marqué » est supprimé pour ce canal prioritaire et le balayage prioritaire se poursuit normalement.

REMARQUE :

Les canaux analogiques et numériques sont déterminés par la valeur du champ [Rx \(type voix/signal\)](#) à la page 430 de chaque canal.

10.47.2.3

Temps d'arrêt du moniteur

Ce champ permet de sélectionner la durée pendant laquelle la radio demeure en attente d'activité sur le canal de la liste de balayage courant.

La minuterie se met en marche lorsque vous relâchez la touche [Moniteur à la page 187](#). Cette sélection s'applique seulement aux canaux de la liste de balayage qui appartiennent au mode de communication conventionnel. La durée est exprimée en secondes.

REMARQUE :

L'utilisation du bouton Moniteur peut également servir à interrompre le balayage en cours. Lorsque le temps prévu est écoulé, la radio poursuit son fonctionnement normal en mode balayage.

Tableau 313 : Portée

Minimum	Maximum
0 seconde	255 secondes

10.47.2.4

Intervalle entre les échantillons prioritaires

Ce champ permet de déterminer le temps d'attente de la radio avant de prendre un échantillon.

Des échantillons sont pris pour vérifier l'activité du canal entrant [Membre prioritaire 1 à la page 687](#) ou [Membre prioritaire 2 à la page 688](#).

Cette vérification est nécessaire lorsque la radio est en mode de détection et qu'elle transmet un canal non prioritaire, ou encore qu'elle transmet un canal de priorité 2 et qu'elle doit vérifier si des transmissions sont en cours sur des canaux de priorité 1. Lors de la vérification, la sourdine s'active brièvement, ce qui peut interrompre temporairement la réception audio de la radio. Cette sélection s'applique seulement aux canaux de la liste de balayage qui appartiennent au mode de communication conventionnel. La durée est exprimée en millisecondes.

REMARQUE :

Voir aussi [Marquage des canaux prioritaires à la page 678](#).

Tableau 314 : Portée

Minimum	Maximum	Incréments
250 ms	6 375 ms	25 ms

10.47.2.5

Seuil de vote RSSI

Ce champ permet de sélectionner le seuil d'indicateur d'intensité du signal reçu (RSSI) nécessaire à la désactivation de la sourdine pour un canal membre de la liste de balayage.

Cette fonction ne s'applique que lorsque la radio permet le balayage de vote conventionnel. Lors du balayage de vote dans un système de communication conventionnel, plusieurs répéteurs transmettent simultanément le même message sur des fréquences différentes; la radio sélectionne alors le meilleur signal. Par conséquent, ce paramètre de seuil définit la puissance minimale requise pour que la sourdine du haut-parleur soit désactivée. Si aucun membre de la liste pour le balayage de vote n'atteint ce seuil, le canal dont la valeur RSSI est la plus élevée est transmis par le haut-parleur. Cette sélection s'applique seulement aux canaux de la liste de balayage qui appartiennent au mode de communication conventionnel.

AVERTISSEMENT :

Cette fonction n'est disponible que si : Lorsque le champ [Type de balayage à la page 682](#) d'une [Liste de balayage à la page 681](#) est réglé à **Balayage de vote**, et lorsqu'aucun canal [Membre de la liste de balayage](#) dans cette liste n'a son champ [Balayage automatique à la page 478](#) réglé à **Activé**, et lorsque tous les canaux membres de la liste de balayage utilisent des répéteurs à l'intérieur d'un réseau étendu de balayage de vote conventionnel.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 315 : Portée

Minimum	Maximum
00 (hexadécimal)	FF (hex)

10.47.3

ADF

Cette section vous permet d'afficher ou de définir les fonctions pour toutes les listes dont le type de balayage est réglé à **Groupe multisystème**.

REMARQUE :

Des listes de balayage distinctes peuvent être affectées aux personnalités [Personnalité conventionnelle à la page 428](#) et [Personnalité ADF ASTRO 25 à la page 627](#) à partir de leur champ Sélection de la liste de balayage de chaque personnalité.

10.47.3.1

Temps d'arrêt du mode dégradé

Ce champ permet de sélectionner la durée pendant laquelle la sourdine de la radio demeure désactivée pour un membre de la liste de balayage détecté (mode ADF seulement) après un passage au mode dégradé.

Pendant cette période, la sourdine de la radio est désactivée pour le canal de mode dégradé, à l'écoute d'une onde porteuse ou d'une transmission vocale en mode dégradé. Une fois la période expirée, la radio reprend son balayage actif. Cette sélection s'applique uniquement aux listes

de balayage pour lesquelles le **groupe multisystème** est le [Type de balayage à la page 682](#) sélectionné.

REMARQUE :

Seule une liste de balayage de type **groupe multisystème** accepte les canaux ADF associés à plusieurs [systèmes ADF](#). Par conséquent, lorsqu'un canal passe en mode dégradé et que le temps d'arrêt de mode dégradé expire, d'autres canaux actifs peuvent être balayés.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 316 : Portée

Minimum	Maximum
0 seconde	255 secondes

10.47.3.2

Temps de recherche système

Ce champ permet de sélectionner la période durant laquelle la sourdine de la radio est activée pour un canal de contrôle détecté, lors d'un balayage visant les membres de la liste de balayage.

Pendant cette période, la radio tente de décoder les signaux transmis par les canaux des systèmes ADF qui sont membres de sa liste de balayage ADF. Lorsque la période expire sans qu'un canal ait été détecté, la radio entreprend de balayer le membre suivant de sa liste de balayage conventionnelle, ou retourne au canal sélectionné courant.

AVERTISSEMENT :

Ces fonctions s'appliquent seulement aux [listes de balayage](#) pour lesquelles la valeur du champ **Groupe multisystème** est le [Type de balayage à la page 682](#) sélectionné.

IMPORTANT :

Lors du balayage d'un système ADF à partir d'un canal conventionnel, la radio n'écoute pas le canal conventionnel sélectionné courant. Par conséquent, plus la période de la minuterie est longue, plus longue sera la mise en sourdine du canal sélectionné courant. Par conséquent, cette période devrait être aussi courte que possible sauf pour le balayage d'un canal de contrôle d'un système occupé.

Seule une [Liste de balayage à la page 681](#) ayant le type de système réglé à **Groupe multisystème** et [Type de balayage à la page 682](#) accepte les canaux ADF associés à plusieurs [systèmes ADF](#). Par conséquent, cette minuterie de recherche permet le balayage d'autres systèmes.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Tableau 317 : Portée

Minimum	Maximum
1 seconde	255 secondes

10.48

Liste de balayage

Cette section permet de créer et de supprimer les listes de balayage ainsi que de définir les fonctions de chaque liste de balayage.

Une liste de balayage contient des regroupements désirés de canaux de type conventionnel ou ADF, lesquels sont sélectionnés pour chaque liste dans la section Membres de liste de balayage.

Lorsque la radio est en mode balayage, il devient possible de vérifier les canaux sélectionnés, un à un, pour détecter s'il y a des transmissions en cours. Ainsi, il est possible de recevoir plusieurs canaux. La radio balaie uniquement la liste de balayage affectée au canal actuellement en opération.

**REMARQUE :**

Des listes de balayage distinctes peuvent être associées à chaque personnalité conventionnelle et ADF dans le champ Sélection de la liste de balayage.

Vous pouvez activer le mode de balayage automatiquement en utilisant la fonction Balayage automatique, activée au moyen d'une touche, d'un commutateur de balayage ou de la sélection de menu Balayer.

10.48.1

Général

Cette section permet d'afficher ou de définir la fonctionnalité qui s'applique aux listes de balayage individuelles.

**REMARQUE :**

Les types de listes de balayage qui autorisent les canaux de membre de liste de balayage ADF dépendant d'un ou de plusieurs [Personnalité ADF ASTRO 25 à la page 581](#). Par conséquent, il est nécessaire de définir le système ADF avant de configurer les fonctions de la liste de balayage.

Des listes de balayage distinctes peuvent être affectées aux personnalités [Personnalité conventionnelle à la page 428](#) et [Personnalité ADF ASTRO 25 à la page 627](#) à partir de leur champ Sélection de la liste de balayage de chaque personnalité.

10.48.1.1

Alias de la liste de balayage

Ce champ vous permet de définir des noms reconnaissables pour la liste de balayage courante.

**REMARQUE :**

Exemples : Balayage 05, Électrique1, N° 510

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Vous pouvez utiliser jusqu'à 14 caractères.

10.48.1.2

Type de balayage

Ce champ permet de choisir les membres de la liste de balayage qui peuvent être sélectionnés dans la liste de balayage courante.

Ces [membres de la liste de balayage](#), qu'ils soient des canaux conventionnels ou ADF (ou les deux), sont par la suite balayés dans le but de détecter si des transmissions y sont en cours, pendant que la radio fonctionne en mode de balayage.

**IMPORTANT :**

Les types de balayage qui permettent l'utilisation de personnalités/canaux membres de la liste de balayage ADF peuvent nécessiter certains [systèmes ADF](#) sélectionnés. Par conséquent, le système ADF doit être défini pour ces personnalités ADF avant que certaines fonctions de la liste de balayage relatives à ce système ne soient configurées. Les systèmes ADF sont référencés à une personnalité ADF au moyen du champ [Système à la page 555](#) de la personnalité ADF.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

Les sélections suivantes sont prises en charge :

Conventionnel

Seuls les canaux conventionnels peuvent être sélectionnés pour ce type de liste de balayage; notamment, les personnalités conventionnelles configurées pour le balayage de vote mixte conventionnel dont le champ [Activer le balayage de vote en mode mixte à la page 478](#) est **activé**.

Jusqu'à 30 [Canal à la page 694](#) par liste de balayage est possible dans les conditions ci-dessous :

- Lorsque le champ Activer le balayage de vote mixte de la personnalité conventionnelle est **activé**, chaque option de fréquence (enregistrement/rangée) de la personnalité compte dans le maximum de 30 membres par liste de balayage.
- Un maximum de trois personnalités conventionnelles avec la case Balayage de vote mixte cochée par Liste de balayage peuvent servir de canaux des membres de la liste de balayage.

Validité des personnalités de balayage de vote mixte :

AVERTISSEMENT :

Lorsque le champ [Guidage de Tx du balayage de vote en mode mixte à la page 478](#) est **désactivé** pour cette liste de balayage, n'importe quel canal de membres de liste de balayage (choisi pour la liste courante) doit avoir les paramètres de Tx dans les Options de fréquences réglés selon les règles suivantes :

La valeur du champ [Fréquence Tx à la page 439](#) doit être la même pour tous les canaux de la liste de balayage.

La valeur du champ [Écart Tx/Séparation des canaux à la page 441](#) doit être la même pour tous les canaux de la liste de balayage.

La valeur du champ [ID du réseau Tx à la page 443](#) doit être la même pour tous les canaux de la liste de balayage.

ou

La valeur du champ Fréquence Tx doit être la même pour tous les canaux de la liste de balayage.

La valeur du champ Écart Tx/Séparation des canaux doit être la même pour tous les canaux de la liste de balayage.

Le champ **Sélectionnable par l'utilisateur PL (MPL)** doit être désactivé pour tous les canaux de la liste de balayage.

La valeur du champ [Type de silencieux Tx à la page 453](#) doit être la même pour tous les canaux de la liste de balayage. Si le champ Type de silencieux Tx est réglé à **PL**, alors [Code Tx PL à la page 455](#) doit être correspondant pour tous les canaux de la Liste de balayage, ou s'il est réglé sur **DPL**, alors [Code Tx DPL à la page 456](#) et [Inverser Tx DPL à la page 458](#) doivent correspondre à tous les canaux de la Liste de balayage.

Surveillance de la priorité

Uniquement offerte lorsque le modèle ou les options de la radio le permettent.

Seuls les canaux ADF peuvent être sélectionnés pour ce type de liste de balayage.

Le balayage de la radio réglé à Surv. prioritaire permet de balayer jusqu'à 50 membres par liste de balayage.

Il n'est pas nécessaire que la valeur du champ Groupe ADF des canaux de membres de liste de balayage ADF sélectionnés pour la liste de balayage courante soit **DYN** ou **ATG**.

Le système figurant dans le champ Enregistrement de système ADF (pour la liste de balayage actuelle) doit correspondre à la valeur du champ Système ADF associé à tous les canaux de membres de liste de balayage ADF sélectionnés pour la liste de balayage courante.

Si le champ [Type de couverture à la page 517](#) de la sélection du Système ADF du champ Enregistrement du système ADF (pour la liste de balayage en cours) est réglé à **Itinérance inter-WACN**, alors cet ID WACN d'accueil et cet ID du système doivent correspondre à l'ID de

WACN TG et à l'ID du système TG du groupe ADF pour chacun des canaux membres de la liste de balayage sélectionnés dans la liste de balayage courante.

Groupe multisystème

Uniquement offerte lorsque le modèle ou les options de la radio le permettent.

Les deux types de canaux, conventionnel et ADF, peuvent être sélectionnés pour ce type de liste de balayage.

Le balayage de la radio réglé à « Groupe multisystème » est limité à cinq systèmes ADF par liste de balayage, avec un maximum de 50 canaux membres de liste de balayage par système ADF, et peut comporter jusqu'à 10 canaux conventionnels. Cependant, le nombre maximum de membres par liste de balayage est 250.

Parmi les membres de liste de balayage sélectionnés, un maximum de 50 peuvent être associés au même système ADF.

Il n'est pas nécessaire que la valeur du champ Groupe ADF des canaux de membres de liste de balayage ADF sélectionnés pour la liste de balayage courante soit **DYN** ou **ATG**.

Le champ Activer le balayage de vote mixte de la personnalité conventionnelle doit être **désactivé** pour tous les membres sélectionnés pour ce type de liste de balayage.

AVERTISSEMENT :

Les opérations de données d'interface hertzienne commune (CAI) ne sont pas prises en charge dans ce Type de balayage. Le balayage de vote permet seulement un maximum de dix (10) membres par liste de balayage. Un système de balayage de vote fonctionne uniquement si tous les membres de la liste de balayage (sélectionnés pour la liste de balayage courante) utilisent des répéteurs au sein d'un réseau étendu de balayage de vote conventionnel.

Balayage de vote

Uniquement offerte lorsque le modèle ou les options de la radio le permettent.

Seuls les canaux conventionnels peuvent être sélectionnés pour ce type de liste de balayage.

Le Balayage de vote ne permet que 10 membres de liste de balayage par canaux de Liste de balayage.

AVERTISSEMENT :

Un système à balayage de vote fonctionne seulement lorsque tous les membres de la liste de balayage (sélectionnés pour la liste de balayage courante) utilisent des répéteurs au sein d'un réseau étendu de balayage de vote conventionnel.

REMARQUE :

Dans un système à balayage de vote, plusieurs répéteurs transmettent simultanément le même message sur des fréquences différentes; la radio peut alors sélectionner le meilleur signal. Le paramètre Seuil de vote RSSI définit la puissance minimum du signal requise pour que la sourdine du haut-parleur soit désactivée. Si aucun canal n'atteint ce seuil, le canal dont la valeur RSSI est la plus élevée est transmis par le haut-parleur.

Validité pour un canal de la liste de balayage :

Le champ **Activer le balayage de vote mixte** de la personnalité conventionnelle doit être désactivé pour tous les membres sélectionnés de la liste de balayage courante.

Le champ [Balayage automatique à la page 478](#) doit être **désactivé** pour tous les membres sélectionnés de la liste de balayage courante.

Que le champ Guidage de Tx soit **activé** ou **désactivé** pour cette liste de balayage n'a aucune importance pour tout canal membre de la liste de balayage (sélectionné pour la liste de balayage courante) dont le champ **Personnalité réception seulement à la page 430** est **activé**.

AVERTISSEMENT :

Cependant, si le champ **Guidage de Tx** est désactivé pour cette liste de balayage, les paramètres de transmission (Tx) de tout membre de la liste de balayage (sélectionné pour la liste de balayage courante) dont le champ **Personnalité réception seulement** est désactivé doivent également suivre les règles suivantes :

Lorsque tous les canaux membres de la liste de balayage pour la liste de balayage courante ont leur champ **Type voix/signal Tx à la page 434** réglé à **ASTRO**, les règles suivantes doivent être respectées :

La valeur du champ **Fréquence Tx** doit être la même pour tous les canaux de la liste de balayage.

La valeur du champ **Écart Tx/Séparation des canaux** doit être la même pour tous les canaux de la liste de balayage.

La valeur du champ **ID du réseau Tx** doit être la même pour tous les canaux de la liste de balayage.

ou

La valeur du champ **Fréquence Tx** doit être la même pour tous les canaux de la liste de balayage.

La valeur du champ **Écart Tx/Séparation des canaux** doit être la même pour tous les canaux de la liste de balayage.

Le champ **Sélectionnable par l'utilisateur PL (MPL)** doit être désactivé pour tous les canaux de la liste de balayage.

La valeur du champ **Type de silencieux Tx** doit être la même pour tous les canaux de la liste de balayage. Si le champ **Type de silencieux Tx** est réglé à **PL**, alors le **Code Tx PL** doit être correspondant pour tous les canaux de la Liste de balayage, ou s'il est réglé sur **DPL**, alors **Code Tx DPL** et **Inverser Tx DPL** doivent correspondre à tous les canaux de la Liste de balayage.

AVERTISSEMENT :

Il faut également noter : une liste de balayage dans un système à balayage de vote ne peut pas comprendre à la fois des canaux pour lesquels la valeur du champ **Type voix/signal Tx** est **Non-Astro** et d'autres dont la valeur du champ **Type voix/signal Tx** est **ASTRO**. Par conséquent, tous les canaux de Membre de liste de balayage **Balayage de vote** doivent avoir le même **Type voix/signal Tx**.

Priorité intelligente

Les deux types de canaux, conventionnel et ADF, peuvent être sélectionnés pour ce type de liste de balayage.

Ce type de balayage est basé sur le balayage de groupe multisystème, prenant en charge les limites de ce type de balayage. Ce type de balayage offre la possibilité de configurer un membre de balayage de priorité 1 et priorité 2.

REMARQUE :

L'activité de balayage prioritaire est reçue lorsque la radio procède au balayage du même système en tant que membre de balayage prioritaire. L'activité de balayage prioritaire n'est pas reçue lorsque la radio est désactivée pour un membre de balayage non prioritaire, y compris le canal sélectionné à partir d'un autre système conventionnel ou ADF.

10.48.1.3

système Trunking\Enregistr.

Ce champ permet de sélectionner un système ADF à l'aide de son nom programmé.

Ce système ADF est par la suite utilisé pour les communications en mode de balayage pour la [Liste de balayage à la page 681](#) courante.

IMPORTANT :

Lorsque le champ [Type de balayage à la page 682](#) est réglé à **Surv. prioritaire**, ce système ADF sélectionné doit être le même (correspondance) pour tous les canaux membres de la liste de balayage sélectionnés pour la liste de balayage courante.

Lorsque des [personnalités ADF/canaux](#) sont sélectionnés pour une liste de balayage, ces systèmes ADF correspondants sont référencés à une personnalité ADF à l'aide du champ [Système à la page 555](#) de la personnalité ADF.

Accès seulement : lorsque le champ [Type de balayage à la page 682](#) est réglé sur **Surveillance prioritaire** et lorsque le modèle ou les options de la radio le permettent.

10.48.1.4

Priorité dynamique

Ce champ vous permet de définir comme nouveau Membre prioritaire 2 le dernier canal détecté par le mode balayage et ayant servi à la transmission.

Ce canal demeure le membre prioritaire 2 jusqu'à ce que la radio émette sur un autre canal ou que le mode balayage soit désactivé. Cette fonction s'applique à la liste de balayage courante.

IMPORTANT :

Activez la priorité dynamique en utilisant une touche [Priorité dynamique à la page 185](#) ou la sélection de menu [Priorité dynamique à la page 217](#).

Le canal [Membre prioritaire 1 à la page 687](#) n'est pas touché.

Accès seulement : Lorsque le champ [Type de balayage à la page 682](#) est réglé à **Conventionnel**.

10.48.1.5

Priorité 1 – Type

Ce champ permet de sélectionner le type de balayage Membre priorité 1 utilisé pour la liste de balayage courante.

Voir aussi [Canal prioritaire PTT à la page 189](#).

Accès seulement : Lorsque le champ [Type de balayage à la page 682](#) est réglé à **Conventionnel**, **Surv. prioritaire** ou à **Priorité intelligente**.

Les sélections suivantes sont prises en charge :

Désactivé;

Le canal [Membre prioritaire 1 à la page 687](#) est désactivé.

Fixe

Le canal de priorité 1 est sélectionné dans le champ [Membre prioritaire 1 à la page 687](#) et ne peut pas être modifié par l'utilisateur.

Canal sélectionné

La radio utilise le canal courant (sélectionné à l'aide du sélecteur de canaux) comme membre prioritaire 1.

Sélection de l'opérateur

Utilise la sélection [Membre prioritaire 1 à la page 687](#). Cependant, vous pouvez modifier ce choix à l'aide de la sélection de menu [Liste de balayage à la page 223](#).

REMARQUE :

les valeurs des champs **Priorité 1 – Type** et [Priorité 2 – Type à la page 687](#) ne peuvent pas être toutes deux réglées à **Canal sélectionné**; l'un des deux champs doit contenir une valeur différente.

10.48.1.6

Membre prioritaire 1

Ce champ permet de sélectionner un membre de priorité 1 pour la liste de balayage courante.

On sélectionne ce canal membre de la liste de balayage à l'aide de son numéro d'enregistrement programmé pour la liste de balayage courante. Lors du balayage des membres d'une liste, 50 % des canaux balayés visent des canaux de priorité 1. Voir aussi [Canal prioritaire PTT à la page 189](#).

Exemple : si le membre prioritaire 1 est représenté par « P1 », le membre prioritaire 2, par « P2 », et les membres non prioritaires, par « Nn », la séquence de balayage sera la suivante : P1 N1, P1 N2, P1 N3, P1 N4, P1 N5, etc.

IMPORTANT :

Lorsque la sourdine du haut-parleur est désactivée pour un appel non prioritaire (canal détecté), ou pour un [Membre prioritaire 2 à la page 688](#) (le cas échéant), la radio continue de balayer le canal Membre prioritaire 1 pour détecter s'il y a des transmissions en cours. Si la radio détecte une transmission de priorité 1 valide, elle délaisse la transmission courante pour diffuser l'appel de priorité 1. Voir aussi [Marquage des canaux prioritaires à la page 678](#) et [Intervalle entre les échantillons prioritaires à la page 679](#).

Lorsque la radio est en mode de détection de canal pour un appel de type « Membre prioritaire 1 », la vérification du membre prioritaire n'est pas nécessaire.

Accès seulement : Lorsque le champ [Type de balayage à la page 682](#) est réglé à **Conventionnel**, **Surveillance de la priorité**, ou **Priorité intelligente**, et lorsque [Priorité 1 – Type à la page 686](#) n'est pas réglé à **Canal sélectionné** ou **Désactivé**.

10.48.1.7

Priorité 2 – Type

Ce champ permet de sélectionner le type de balayage Membre priorité 2 utilisé pour la liste de balayage courante.

Accès seulement : Lorsque le champ [Type de balayage à la page 682](#) est réglé à **Surv. prioritaire** ou à **Priorité intelligente**, ou (lorsque le champ [Type de balayage à la page 682](#) est réglé à **Conventionnel**, et lorsque le champ [Priorité dynamique à la page 686](#) est réglé à **Désactivé**).

Les sélections suivantes sont prises en charge :

Désactivé;

Le canal [Membre prioritaire 1 à la page 687](#) est désactivé.

Fixe

Le canal de priorité 2 est sélectionné dans le champ [Membre prioritaire 2 à la page 688](#) et ne peut pas être modifié par l'utilisateur.

Canal sélectionné

La radio utilise le canal courant (sélectionné à l'aide du sélecteur de canaux) comme membre prioritaire 2.

Sélection de l'opérateur

Utilise la sélection [Membre prioritaire 2 à la page 688](#). Cependant, vous pouvez modifier ce choix à l'aide de la sélection de menu [Liste de balayage à la page 223](#).

REMARQUE :

Les champs [Priorité 1 – Type à la page 686](#) et [Priorité 2 – Type](#) ne peuvent pas être tous deux réglés à **Canal sélectionné**; l'un des deux champs doit contenir une valeur différente.

10.48.1.8

Membre prioritaire 2

Ce champ permet de sélectionner un membre de priorité 2 pour la liste de balayage courante.

On sélectionne ce canal membre de la liste de balayage à l'aide de son numéro d'enregistrement programmé. Lors du balayage des membres d'une liste, 33,33% des canaux balayés visent des canaux de priorité 2. Lorsqu'il existe un Membre prioritaire 2, la proportion de [Membre prioritaire 1 à la page 687](#) passe de 50 % à 33,33 %.

Exemple : si le membre prioritaire 1 est représenté par « P1 », le membre prioritaire 2, par « P2 », et les membres non prioritaires, par « Nn », la séquence de balayage sera la suivante : N1 P1 P2, N2 P1 P2, N3 P1 P2, etc.

IMPORTANT :

Lorsque la sourdine du haut-parleur est désactivée pour un appel non prioritaire (canal détecté), la radio continue de balayer le canal Membre prioritaire 2 pour détecter s'il y a des transmissions en cours. Si la radio détecte une transmission de priorité 2 valide, elle délaisse la transmission courante pour diffuser l'appel de priorité 2. Voir aussi [Marquage des canaux prioritaires à la page 678](#) et [Intervalle entre les échantillons prioritaires à la page 679](#).

Si la radio a arrêté son balayage à un canal diffusant un appel de priorité 2 et qu'elle détecte une transmission de priorité 1 valide, elle délaisse la transmission de priorité 2 pour diffuser l'appel de priorité 1.

Lorsque le champ [Priorité 2 – Type à la page 687](#) est réglé à **Sélection de l'opérateur** ou à **Fixe**, et (lorsque le champ [Type de balayage à la page 682](#) est réglé à **Surv. prioritaire** ou à **Priorité intelligente**, ou lorsque le champ [Type de balayage à la page 682](#) est réglé à **Conventionnel**, et lorsque le champ [Priorité dynamique à la page 686](#) est réglé à **Désactivé**).

10.48.1.9

Membres non prioritaires

Ce champ permet de sélectionner si l'état d'un membre de liste de balayage prioritaire peut être changé à non prioritaire.

Cette fonction s'applique à la liste de balayage courante.

Accès seulement : lorsque le champ [Type de balayage à la page 682](#) n'est pas réglé sur **Balayage de vote**.

Les sélections suivantes sont prises en charge :

Fixe

Les membres de la liste de balayage qui sont programmés avec l'état membre de la liste de balayage [Membre prioritaire 1 à la page 687](#) ou [Membre prioritaire 2 à la page 688](#) ne peuvent pas être modifiés.

Sélection de l'opérateur

Les membres de la liste de balayage qui sont programmés avec l'état de membre de liste de balayage prioritaire 1 ou 2 peuvent prendre l'état non prioritaire avec la sélection de menu [Liste de balayage à la page 223](#).

10.48.1.10

Type de membre de Tx vocale désigné

Ce champ permet de sélectionner le type (fixe ou variable) de canal de transmission de la voix détecté pour la liste de balayage courante.

Cette sélection s'applique lorsque la radio est en mode balayage, après qu'un membre de la liste de balayage a été détecté.

**IMPORTANT :**

Ce champ n'est pas disponible lorsque la valeur du champ [Type de balayage à la page 682](#) est réglée à **Balayage de vote** et que le champ [Guidage de Tx](#) est **activé**, puisque la radio doit utiliser la réponse comme guidage de transmission.

Accès seulement : Lorsque le champ [Type de balayage à la page 682](#) n'est pas réglé à **Balayage de vote** ou lorsque le champ [Guidage de Tx](#) est **désactivé**.

Les sélections suivantes sont prises en charge :

Fixe

Permet de sélectionner le canal désigné (fixe) pour la transmission de la voix, dans la liste de balayage courante.

La sélection de canal doit alors être faite à partir du champ [Membre de Tx vocale désigné à la page 689](#).

**AVERTISSEMENT :**

L'option Fixe pour les membres de Tx de voix fonctionne uniquement lorsque le champ [Type de balayage à la page 682](#) est réglé à **Conventionnel** ou à **Balayage de vote**; elle ne fonctionne pas lorsque réglé à **Surv. prioritaire** ou à **Groupe multisystème**.

L'option Fixe pour les membres de Tx de voix ne fonctionne pas si le champ [Personnalité réception seulement à la page 430](#) est **désactivé**.

Canal sélectionné

Sélectionne, pour la transmission de la voix, le canal ou le mode (communications conventionnelles ou ADF) courant.

**AVERTISSEMENT :**

Ne fonctionne pas si le canal personnalité courant de la radio a son champ [Personnalité réception seulement à la page 430](#) réglé à **Désactivé**.

Ne fonctionne pas si le champ [Transmit Mode \(Mode de transmission\) à la page 560](#) du canal ADF courant est réglé sur **TG/AG Désactivé (écoute seulement)**.

TalkBack (réponse)

Fait en sorte que la radio transmet la voix sur le canal/mode [Membre de la liste de balayage](#) actuellement détecté par la radio (communications conventionnelles ou ADF).

10.48.1.11

Membre de Tx vocale désigné

Ce champ permet de sélectionner le canal de transmission de la voix détecté.

**REMARQUE :**

Les membres de la liste de balayage sont sélectionnés dans la liste de balayage courante. Cette sélection s'applique lorsque la radio est en mode de balayage pour la liste de balayage courante et une fois qu'un canal [membre de la liste de balayage](#) a été détecté.

Accès seulement : Lorsque le champ [Type de membre de Tx vocale désigné à la page 689](#) est réglé à **Fixe**, et (lorsque le champ [Type de balayage à la page 682](#) n'est pas réglé à **Balayage de vote**, ou lorsque le champ [Guidage de Tx](#) est réglé à **Désactivé**).

AVERTISSEMENT :

Ce champ n'est pas disponible lorsque la valeur du champ [Type de balayage à la page 682](#) est réglée à **Balayage de vote** et que le champ [Guidage de Tx](#) est **activé**, puisque la radio doit utiliser la réponse comme guidage de transmission.

AVERTISSEMENT :

L'option Fixe pour les membres de Tx de voix fonctionne uniquement lorsque le champ [Type de balayage à la page 682](#) est réglé à **Conventionnel** ou à **Balayage de vote**; elle ne fonctionne pas lorsque réglé à **Surv. prioritaire** ou à **Groupe multisystème**.

L'option Fixe pour les membres de Tx de voix ne fonctionne pas si le champ [Personnalité réception seulement à la page 430](#) est **désactivé**.

Les membres de transmission vocale « fixes » ne fonctionnent pas si la zone et le canal sélectionnés sont Canal dynamique.

10.48.1.12

Type de Rx/Tx de données désignées

Ce champ permet de sélectionner le type de canal de données de transmission détecté de l'interface radio commune (CAI) pour le balayage (fixe ou variable).

REMARQUE :

Les [Membres de la liste de balayage à la page 693](#) sont sélectionnés dans la liste de balayage courante. Cette sélection s'applique lorsque la radio est en mode balayage, après qu'un membre de la liste de balayage a été détecté.

Accès seulement : Lorsque le champ [Type de balayage à la page 682](#) est réglé à **Conventionnel**.

Les sélections suivantes sont prises en charge :

Aucun

Le balayage des données est désactivé.

Fixe

Permet de sélectionner le canal désigné (fixe) pour la transmission des données, dans la liste de balayage courante.

La sélection du canal de données doit alors être faite à partir du champ [Membre de données désignées à la page 691](#).

AVERTISSEMENT :

L'option Fixe pour les membres de Tx de données fonctionne uniquement lorsque le champ [Type de balayage à la page 682](#) est réglé à **Conventionnel**.

L'option Fixe pour les membres de Tx de données fonctionne uniquement si une personnalité conventionnelle renvoyant à une liste de balayage **fixe** a son champ [Personnalité réception seulement à la page 430](#) réglé à **Activé**.

Canal sélectionné

Sélectionne, pour la transmission de la voix, le canal ou le mode (communications conventionnelles ou ADF) courant.

AVERTISSEMENT :

Si les fonctions de [données](#) ne peuvent pas être utilisées sur ce canal, le balayage des données est impossible.

10.48.1.13

Membre de données désignées

Ce champ détermine le canal de données de transmission de l'interface hertzienne commune (CAI) du balayage à terre.

**REMARQUE :**

Ce membre de la liste de balayage est sélectionné dans la liste de balayage courante. Cette sélection s'applique en mode Acquisition et lorsque le canal Membre de la liste d'acquisitions est lancé.

**AVERTISSEMENT :**

S'applique uniquement lorsque cette liste de balayage est référencée à une personnalité conventionnelle qui présente les conditions suivantes : Le champ **Rx (type voix/signal)** à la page 430 est réglé sur **Mode mixte** ou sur **ASTRO**, et a un système conventionnel référencé avec un Profil de données dont le champ Données de terminal est réglé sur **Activé**, et le champ Index de profil ASTRO OTAR est réglé sur **Activé** et non grisé.

Accès seulement : Lorsque le champ **Type de balayage** à la page 682 est réglé sur **Conventionnel**, et lorsque le champ **Type de Rx/Tx de données désignées** à la page 690 est réglé sur **Fixe**, et lorsqu'il ne s'agit pas d'une Zone ou d'un Canal dynamique et lorsque le modèle et les options de la radio le permettent.

10.48.2

Avancé

Cette section permet d'afficher ou de définir de multiples fonctions et paramètres applicables par liste de balayage.

**REMARQUE :**

Des listes de balayage distinctes peuvent être affectées aux personnalités **Personnalité conventionnelle** à la page 428 et **Personnalité ADF ASTRO 25** à la page 627 à partir de leur champ Sélection de la liste de balayage de chaque personnalité.

10.48.2.1

Minuterie de patience limitée pour Tx de données

Ce champ permet de définir le délai d'attente de la radio avant la transmission de données, en mode balayage.

Après ce délai, les données sont supprimées. Cette sélection s'applique à la liste de balayage courante. La valeur de ce champ est exprimée en secondes.

**REMARQUE :**

Accès seulement : lorsque le champ **Type de balayage** à la page 682 est réglé à **Conventionnel**, et lorsque le champ **Type de Rx/Tx de données désignées** à la page 690 n'est pas réglé sur **Aucun**, et lorsque le modèle et les options de la radio le permettent.

Lorsque réglé à **infini**, le temps d'attente de transfert de données de la radio est illimité.

Tableau 318 : Portée

Minimum	Maximum	Incréments
1 s	255 s	1 s

10.48.2.2

Minuterie de balayage de vote

Ce champ permet de sélectionner la durée d'attente de la radio avant de voter/sélectionner tout en balayant activement en mode **Balayage de vote** ou **Balayage de vote mixte conventionnel**.

Voir le champ [Activer le balayage de vote en mode mixte à la page 478](#).

Voir aussi les sélections **Conventionnel** et **Balayage de vote** dans le champ [Type de balayage à la page 682](#).

Pour le balayage de vote ou le balayage de vote mixte conventionnel, plusieurs répéteurs retransmettent simultanément la même transmission sur différentes fréquences. La radio a alors la capacité de sélectionner le signal le plus fort ou le plus clair. Cette sélection s'applique à la liste de balayage courante.

REMARQUE :

Accès seulement : Lorsque le champ [Type de balayage à la page 682](#) est réglé à **Conventionnel** ou à **Balayage de vote** et lorsque le modèle ou les options de la radio le permettent.

Tableau 319 : Portée

Minimum	Maximum	Incréments
0 ms	255 ms	5 ms

10.48.2.3

Afficher le canal ayant remporté le plus de votes

Ce champ permet l'affichage du canal de balayage de vote détecté à l'écran de la radio.

Dans un système de balayage de vote, plusieurs répéteurs retransmettent simultanément la même transmission sur différentes fréquences. La radio peut ensuite sélectionner le signal le plus fort ou le plus clair en mode balayage. Le canal qui a remporté le plus grand nombre de votes lors du balayage est déterminé à l'aide de l'indicateur d'intensité du signal reçu RSSI (indicateur d'intensité du signal reçu). Voir aussi les sélections en mode **Conventionnel** et **Balayage de vote** dans les champs [Seuil de vote RSSI à la page 680](#) et [Type de balayage à la page 682](#). Cette fonction s'applique à la liste de balayage courante.

REMARQUE :

Accès seulement : Lorsque le champ [Type de balayage à la page 682](#) est réglé à **Conventionnel** ou à **Balayage de vote** et lorsque le modèle ou les options de la radio le permettent.

10.48.2.4

Minuterie d'inactivité du balayage de vote conventionnel en mode mixte (min)

Ce champ permet de sélectionner la durée d'attente de la radio, lorsqu'elle balaie activement en mode Balayage de vote mixte conventionnel, avant qu'elle commence le balayage de fréquences/canaux additionnels lorsqu'aucune activité qualifiée n'a été trouvée dans les deux fréquences les plus fortes dans la Liste de balayage courante.

La valeur de ce champ est exprimée en minutes.

REMARQUE :

Accès seulement : Lorsque le champ [Type de balayage à la page 682](#) est réglé à **Conventionnel**.

Tableau 320 : Portée

Minimum	Maximum	Incréments
1 m	255 m	1 m

10.48.3

Membres de la liste de balayage

Cette section permet de sélectionner les canaux de communications conventionnels ou ADF à partir de zones spécifiques pour la liste de balayage courante.

Bien que la radio fonctionne en mode Balayage, ces canaux sélectionnés peuvent ensuite être balayés (un à la fois) pour l'activité de transmission, ce qui permet la réception de canaux multiples. Le balayage des membres de la liste de balayage prioritaire peut être programmé.

**REMARQUE :**

La radio balaie uniquement la liste de balayage affectée au canal actuellement en opération.

Les canaux de communications de type conventionnel ou ADF de liste de balayage doivent être définis dans le fenêtre [Affectation du canal de zone à la page 668](#) avant de créer la liste de balayage.

Des listes de balayage distinctes peuvent être affectées aux personnalités [Personnalité conventionnelle à la page 428](#) et [Personnalité ADF ASTRO 25 à la page 627](#) à partir de leur champ Sélection de la liste de balayage de chaque personnalité.

Vous pouvez activer le mode de balayage automatiquement en utilisant la fonction Balayage automatique, activée au moyen d'une touche [Balayage à la page 192](#), d'un commutateur [Balayage à la page 206](#) ou de la sélection de menu [Balayage à la page 223](#).

**AVERTISSEMENT :**

Lorsqu'une liste de balayage contient 250 membres de liste de balayage ou plus (enregistrement/rangées) et 5 [Personnalité ADF ASTRO 25 à la page 581](#) ou plus (dans ces canaux), le rendement de la radio en mode Balayage peut être réduit considérablement.

Pour connaître les critères de validité relatifs à la sélection des membres de la liste de balayage, reportez-vous aux sélections [Type de balayage à la page 682](#).

10.48.3.1

Position

Ce champ en lecture seule est attribué par RadioCentral et identifie l'ordre de l'élément dans une liste.

**REMARQUE :**

Accès seulement : Lorsque la radio dépend d'un modèle ou d'une option.

10.48.3.2

Zone

Ce champ permet de sélectionner une zone pour le membre de la liste de balayage courant (enregistrement/rangée) dans la liste de balayage courante.

Quand vous sélectionnez cette zone, il faut choisir un canal de cette zone pour le même enregistrement ou la même rangée. Voir aussi la fenêtre [Affectation du canal de zone à la page 668](#).

AVERTISSEMENT :

Si la « **Fonction de balayage de zone dynamique** » n'est pas disponible, les Zones dynamiques sont non valides et ne peuvent pas être sélectionnées (zones dont la [Activation de zone dynamique](#) est activée). Dans le cas contraire, les Zones dynamiques peuvent être sélectionnées.

Les zones d'interface de site à distance (RSI) ne sont pas valides et ne peuvent pas être sélectionnées (zones pour lesquelles le [Mode RSI](#) est activé).

10.48.3.3

Canal

Ce champ permet de sélectionner un canal pour le membre de la liste de balayage courant (enregistrement/rangée) dans la liste de balayage courante.

Pour qu'il soit possible de sélectionner ce canal, le champ Membre de la liste de balayage doit contenir le même enregistrement ou la même rangée.

AVERTISSEMENT :

Pour connaître les critères de validité relatifs à la sélection des canaux pour les différents types de listes de balayage, reportez-vous aux sélections [Type de balayage à la page 682](#).

Lorsque le champ [Type de couverture à la page 517](#) pour le système ADF référencé est réglé à **Itinérance Inter-WACN** et que le type de balayage est **Groupe multisystème**, alors, l'[ID de WACN TG à la page 627](#) et l'[ID du système TG à la page 626](#) du [Groupe de conversation ADF à la page 673](#) affecté à cette sélection de canal doivent correspondre à l'ID WACN d'accueil et à l'ID du système du système ADF. Sinon, l'application considère cette sélection de canal comme non valide.

L'application considère cette sélection de canal non valide lorsque le champ [Membre de données désignées à la page 691](#) renvoie à un canal conventionnel LTE large bande, et un autre canal membre de la liste de balayage (de la même liste de balayage) renvoie à un canal conventionnel dont le champ [Interférence de fréquence LTE présente à la page 437](#) est réglé à **Activé**, ou à un canal ADF dont le champ [Interférence de fréquence LTE présente à la page 596](#) est réglé à **Vrai**. Le LTE est activé sur un canal conventionnel lorsque le système conventionnel ASTRO référencé de la personnalité a un profil de données référencé dont le [Type de profil de données à la page 376](#) correspond à **Conventionnel et large bande** ou à **Large bande uniquement**, et lorsque la [Source large bande](#) de ce profil de données est réglée à **Modem LTE interne**.

Lorsque « Fonction de balayage de zone dynamique » est disponible, et que le canal est un canal dynamique :

- Si le [Type de balayage à la page 682](#) est réglé à **Balayage de vote**, le canal dynamique n'est pas valide.
- Si le [Type de balayage à la page 682](#) est réglé à **Conventionnel, Surv. prioritaire** ou **Groupe multisystème**, le canal dynamique sans affectation est valide.
- Si le [Type de balayage à la page 682](#) est réglé à **Conventionnel, Surv. prioritaire**, **Groupe multisystème** ou **Priorité intelligente**, le canal dynamique avec une affectation est considéré comme d'autres canaux normaux.

REMARQUE :

Accès seulement :

- Le champ [Zone à la page 693](#) n'est pas réglé sur **Non associé** et que la zone n'est pas une zone dynamique.
- Le champ [Zone à la page 693](#) n'est pas réglé à **Non associé**.
- La zone est une zone dynamique avec la disponibilité de la **fonction de balayage de zone dynamique**.

10.49

Profils de radio

La section **Profils radio** permet d'afficher ou de définir des profils radio individuels. Les profils radio servent à créer des groupes de réglages d'indicateurs pour des canaux radio ou des scénarios d'usage sur le terrain particuliers.

REMARQUE :

Les profils radio sont sélectionnés pour une utilisation par canal à partir du champ Profil radio de l'attribution du canal de zone.

Vous pouvez modifier l'affectation de profil radio d'un canal en utilisant la touche Profils radio ou la sélection de menu Profils radio.

10.49.1

Général

Cette section vous permet d'afficher ou de modifier les réglages de données pour chaque profil de radio.

REMARQUE :

Les profils radio sont sélectionnés pour une utilisation par canal à partir du champ Profil radio de l'attribution du canal de zone.

Vous pouvez modifier l'affectation de profil radio d'un canal en utilisant la touche Profils radio ou la sélection de menu Profils radio.

10.49.1.1

Nom du profil de radio

Ce champ vous permet d'afficher ou de définir des noms reconnaissables pour le profil radio courant.

Les profils radio sont sélectionnés pour une utilisation par canal à partir du champ Profil radio de l'attribution du canal de zone.

REMARQUE :

Trois profils radio prénommés vous sont fournis : **Par défaut**, **Surveillance**, et **Audio puissant**. Vous pouvez renommer tous les noms suggérés. Définissez ces profils selon vos besoins et créez-en d'autres si cela est nécessaire.

REMARQUE :

Exemples : PROFILE-001, no 500, Électrique1, # A5.

Vous pouvez utiliser des lettres, des chiffres, des espaces et des caractères spéciaux.

Vous pouvez utiliser jusqu'à 14 caractères.

Le nom du profil radio s'affiche à l'écran avant.

10.49.1.2

Rétroéclairage permanent de l'écran avant

Ce champ permet d'allumer en permanence le rétroéclairage de l'écran avant de la radio.

Cette sélection s'applique au profil radio courant.

IMPORTANT :

L'activation de ce champ réduit d'environ 20 minutes l'autonomie de la batterie au cours d'un cycle d'utilisation normal.

Lorsque le champ Désactiver les lumières est activé, cette fonction ne s'applique pas.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.49.1.3

Rétroéclairage permanent de l'écran supérieur

Si activé, ce champ permet d'allumer en permanence le rétroéclairage de l'écran supérieur de la radio.

Cette sélection s'applique au profil radio courant.

IMPORTANT :

L'activation de ce champ réduit d'environ 20 minutes l'autonomie de la batterie au cours d'un cycle d'utilisation normal.

Lorsque le champ Désactiver les lumières est activé, cette fonction ne s'applique pas.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.49.1.4

Contrôle de volume à détection de bruit

Si ce champ est activé, la radio règle automatiquement le volume du haut-parleur à un niveau adapté à l'environnement d'écoute.

Cette fonction n'est pas prise en charge par les haut-parleurs sans fil ou les microphones haut-parleurs avec fil.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.49.1.5

Acheminement audio au haut-parleur

Ce champ permet de sélectionner l'option d'acheminement du son aux haut-parleurs internes de la radio.

Cette sélection s'applique au profil radio courant.

**IMPORTANT :**

La radio portable à deux écrans comporte deux haut-parleurs internes, un de chaque côté de la radio. Si vous utilisez ce modèle, vous pouvez acheminer le son à l'un des haut-parleurs (ou aux deux).

La radio portable dotée d'un écran sur le dessus ne comporte qu'un seul haut-parleur. Si vous utilisez ce modèle, vous pouvez activer ou désactiver le son dans le haut-parleur.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.49.1.6

Désactiver les lumières

Ce champ permet de désactiver tous les voyants DEL et le rétroéclairage de la radio et de ses accessoires, comme le microphone haut-parleur à distance (DRSM) pour le profil radio courant.

Cette fonction est utile durant les opérations secrètes ou de surveillance.

**IMPORTANT :**

Lorsque les lumières sont désactivées, les radios utilisant le chiffrement de type 1 ne fonctionnent pas. Le chiffrement de type 1 exige que vous puissiez distinguer (d'après les couleurs des voyants DEL) un appel chiffré entrant ou sortant de type 1.

Sur la tête de commande O9 pour radio mobile, la fonction Désactiver les lumières/DEL du mode furtif remplace cette option chaque fois que le mode furtif est ACTIVÉ. Dès que le mode furtif est DÉSACTIVÉ, les paramètres du profil radio actuel s'appliquent.

10.49.1.7

Désactiver les tonalités

Ce champ permet de désactiver toutes les tonalités d'alerte, les tonalités auxiliaires et les tonalités du clavier dans le profil radio courant.

Cette sélection est utile durant les opérations secrètes ou de surveillance.

**REMARQUE :**

Sur la tête de commande O9 pour radio mobile, la fonction Désactiver les tonalités du mode furtif remplace cette option chaque fois que le mode furtif est ACTIVÉ. Dès que le mode furtif est DÉSACTIVÉ, les paramètres du profil radio actuel s'appliquent.

10.49.1.8

Désactiver les notifications d'urgence

Ce champ permet de désactiver l'éclairage intelligent associé au mode d'urgence.

Cette sélection s'applique au profil radio courant.

REMARQUE :

Lorsque le champ Désactiver les lumières est activé, le rétroéclairage en couleur ne s'allume pas.

10.49.1.9

Désactiver les notifications critiques

Ce champ permet de désactiver l'autodiagnostic et la détection des défaillances de l'éclairage intelligent. Cela s'applique lorsque la radio fait partie des plus récents modèles des normes en matière de service d'incendie et avec le canal qui n'est pas en mode Zone de danger.

Cette sélection s'applique au profil radio courant.

REMARQUE :

Lorsque le champ Désactiver les lumières est activé, le rétroéclairage en couleur est désactivé.

10.49.1.10

Désactiver les notifications d'appel

Ce champ permet de désactiver l'éclairage intelligent associé aux appels reçus.

Cette sélection s'applique au profil radio courant.

IMPORTANT :

Lorsque le champ [Désactiver les lumières à la page 697](#) est activé, le rétroéclairage en couleur ne s'allume pas.

10.49.2

Paramètres Audio - Non APX3000 (Profils Radio)

La section **Paramètres Audio - Non APX3000** de l'ensemble des profils radio permet à l'utilisateur d'afficher ou de modifier divers paramètres de microphone et audio, les paramètres de volume de la tonalité d'alerte et les paramètres de microphone et audio personnalisés qui s'appliquent aux profils radio non APX3000.

REMARQUE :

Les profils radio sont sélectionnés pour une utilisation par canal à partir du champ Profil radio de l'attribution du canal de zone.

L'utilisateur radio peut appuyer sur la touche associée à la fonction Profils radio ou utiliser la sélection de menu Profils radio pour modifier l'affectation du profil radio d'un canal.

10.49.2.1

Réglages du groupe de réduction du bruit

Ce champ prédéfinit un ensemble de valeurs pour les champs de la section Réduction du bruit, sous Groupe, Réglages du microphone/TX.

Lorsque la valeur Réglage de groupe est réglée à autre chose que **Personnalisé**, la valeur des champs qui se trouvent dans cette section est modifiée conformément. Lorsque le paramètre du groupe n'est pas sur **Personnalisé**, alors tous les champs ne s'affichent qu'en lecture seule.

La liste ci-dessous montre les sélections et les définitions des Réglages du groupe de réduction du bruit (radio).

Désactivée

La valeur des champs suivants est réglée à : Réduction du bruit personnalisée sur **Désactivé**, Niveau de réduction du bruit de fond sur **Désactivé**, Niveau de réduction du bruit du vent sur **Désactivé**, Alarme PASS sur **Désactivé**, Sélection du profil de réduction du bruit sur **RB radio 1**, Mode de réduction du bruit de fond sur **Activé/Appliqué**, Mode de réduction du bruit du vent sur **Activé/Actif**, Mode source sur **Entièrement automatique** Mode de directivité sur **Activé/Adaptation**.

Normal

La valeur des champs suivants est réglée à : Réduction du bruit personnalisée sur **Désactivé**, Niveau de réduction du bruit de fond sur **Normal**, Niveau de réduction du bruit du vent sur **Normal**, Alarme PASS sur **Désactivé**, Sélection du profil de réduction du bruit sur **RB radio 1**, Mode de réduction du bruit de fond sur **Activé/Appliqué**, Mode de réduction du bruit du vent sur **Activé/Actif**, Mode source sur **Entièrement automatique** Mode de directivité sur **Activé/Adaptation**.

Rapide

La valeur des champs suivants est réglée à : Réduction du bruit personnalisée sur **Désactivé**, Niveau de réduction du bruit de fond sur **Normal**, Niveau de réduction du bruit du vent sur **Normal**, Alarme PASS sur **Désactivé**, Sélection du profil de réduction du bruit sur **RB radio 1**, Mode de réduction du bruit de fond sur **Activé/Appliqué**, Mode de réduction du bruit du vent sur **Activé/Actif**, Mode source sur **Entièrement automatique** Mode de directivité sur **Activé/Adaptation**.

Extrême

La valeur des champs suivants est réglée à : Réduction du bruit personnalisée sur **Désactivé**, Niveau de réduction du bruit de fond sur **Xtreme 1_Sided**, Niveau de réduction du bruit du vent sur **Désactivé**, Alarme PASS sur **Désactivé**, Sélection du profil de réduction du bruit sur **RB radio 1**, Mode de réduction du bruit de fond sur **Activé/Appliqué**, Mode de réduction du bruit du vent sur **Activé/Actif**, Mode source sur **Entièrement automatique** Mode de directivité sur **Activé/Adaptation**.

Auto

La valeur des champs suivants est réglée à : Réduction du bruit personnalisée sur **Désactivé**, Niveau de réduction du bruit de fond sur **Auto**, Niveau de réduction du bruit du vent sur **Normal** et Alarme sur **Activé**. Active le profil auto-agressivité de réduction sonore. Cette sélection ne s'applique que lorsque le modèle ou les options de la radio le permettent.

La liste ci-dessous montre les sélections et les définitions des Réglages du groupe de réduction du bruit (accessoire).

Désactivée

La valeur des champs suivants est réglée à : Réduction du bruit personnalisée sur **Désactivé**, Niveau de réduction du bruit de fond sur **Désactivé**, Niveau de réduction du bruit du vent sur **Désactivé**, Alarme PASS sur **Désactivé**, Sélection du profil de réduction du bruit sur **RB acc. 1**, Mode de réduction du bruit de fond sur **Marche/appliqué**, Mode de réduction du bruit du vent sur **Marche/actif**, Mode source sur **Micro 1** et Mode de directivité sur **Marche/adaptif**.

Normal

La valeur des champs suivants est réglée à : Réduction du bruit personnalisée sur **Désactivé**, Niveau de réduction du bruit de fond sur **Normal**, Niveau de réduction du bruit du vent sur **Désactivé**, Alarme PASS sur **Désactivé**, Sélection du profil de réduction du bruit sur **RB acc. 1**, Mode de réduction du bruit de fond sur **Activé/Appliqué**, Mode de réduction du bruit du vent sur **Activé/Actif**, Mode source sur **Entièrement automatique** et Mode de directivité sur **Activé/Adaptation**.

Rapide

La valeur des champs suivants est réglée à : Réduction du bruit personnalisée sur **Désactivé**, Niveau de réduction du bruit de fond sur **Normal**, Niveau de réduction du bruit du vent sur **Désactivé**, Alarme PASS sur **Désactivé**, Sélection du profil de réduction du bruit sur **RB acc. 1**, Mode de réduction du bruit de fond sur **Activé/Appliqué**, Mode de réduction du bruit du vent

sur **Activé/Actif**, Mode source sur **Entièrement automatique** et Mode de directivité sur **Activé/Adaptation**.

Extrême

La valeur des champs suivants est réglée à : Réduction du bruit personnalisée sur **Désactivé**, Niveau de réduction du bruit de fond sur **Xtreme 1_Sided**, Niveau de réduction du bruit du vent sur **Normal**, Alarme PASS sur **Activé**, Sélection du profil de réduction du bruit sur **RB acc. 1**, Mode de réduction du bruit de fond sur **Activé/Appliqué**, Mode de réduction du bruit du vent sur **Activé/Actif**, Mode source sur **Entièrement automatique** et Mode de directivité sur **Activé/Adaptation**.

Auto

La valeur des champs suivants est réglée à : Réduction du bruit personnalisée sur **Désactivé**, Niveau de réduction du bruit de fond sur **Auto**, Niveau de réduction du bruit du vent sur **Normal** et Alarme sur **Activé**. Active le profil auto-agressivité de réduction sonore. Cette sélection ne s'applique que lorsque le modèle ou les options de la radio le permettent.

Accès seulement : Il s'agit d'un paramètre avancé qui est disponible uniquement dans l'Affichage Intégral (voir Affichage codeplug).

10.49.2.2

Réglage du groupe (accessoire)

Les Réglages du groupe de réduction du bruit servent à définir un ensemble de valeurs pour les champs de la Section réduction du bruit dans Microphone/Groupe de paramètres Tx.

Lorsque la valeur Réglage de groupe est réglée à autre chose que **Personnalisé**, la valeur des champs qui se trouvent dans cette section est modifiée conformément. Lorsque le paramètre du groupe n'est pas sur **Personnalisé**, alors tous les champs ne s'affichent qu'en lecture seule.

REMARQUE :

Pour le réglage **Personnalisé**, il est fortement recommandé de posséder une connaissance approfondie des différents réglages de réduction du bruit avant de procéder à des réglages individuels.

La liste ci-dessous montre les sélections et les définitions des Réglages du groupe de réduction du bruit (accessoire).

Désactivée

La valeur des champs suivants est réglée à : Réduction du bruit personnalisée sur **Désactivé**, Niveau de réduction du bruit de fond sur **Désactivé**, Niveau de réduction du bruit du vent sur **Désactivé**, Alarme PASS sur **Désactivé**, Sélection du profil de réduction du bruit sur **RB acc. 1**, Mode de réduction du bruit de fond sur **Activé/Appliqué**, Mode de réduction du bruit du vent sur **Activé/Actif**, Mode source sur **Micro 1** et Mode de directivité sur **Activé/Adaptatif**.

Normal

La valeur des champs suivants est réglée à : Réduction du bruit personnalisée sur **Désactivé**, Niveau de réduction du bruit de fond sur **Normal**, Niveau de réduction du bruit du vent sur **Désactivé**, Alarme PASS sur **Désactivé**, Sélection du profil de réduction du bruit sur **RB acc. 1**, Mode de réduction du bruit de fond sur **Activé/Appliqué**, Mode de réduction du bruit du vent sur **Activé/Actif**, Mode source sur **Entièrement automatique** et Mode de directivité sur **Activé/Adaptation**.

Rapide

La valeur des champs suivants est réglée à : Réduction du bruit personnalisée sur **Désactivé**, Niveau de réduction du bruit de fond sur **Agressif**, Niveau de réduction du bruit du vent sur **Normal**, Alarme PASS sur **Désactivé**, Sélection du profil de réduction du bruit sur **RB acc. 1**, Mode de réduction du bruit de fond sur **Activé/Appliqué**, Mode de réduction du bruit du vent sur **Activé/Actif**, Mode source sur **Micro 1** et Mode de directivité sur **Activé/Adaptation**.

Extrême

La valeur des champs suivants est réglée à : Réduction du bruit personnalisée sur **Désactivé**, Niveau de réduction du bruit de fond sur **Extreme_1 sided**, Niveau de réduction du bruit du vent sur **Normal**, Alarme PASS sur **Activé**, Sélection du profil de réduction du bruit sur **RB acc. 1**, Mode de réduction du bruit de fond sur **Activé/Appliqué**, Mode de réduction du bruit du vent sur **Activé/Actif**, Mode source sur **Entièrement automatique** et Mode de directivité sur **Activé/Adaptation**.

Auto

La valeur des champs suivants est réglée à : Réduction du bruit personnalisée sur **Désactivé**, Niveau de réduction du bruit de fond sur **Auto**, Niveau de réduction du bruit du vent sur **Normal** et Alarme sur **Activé**. Active le profil auto-agressivité de réduction sonore. Cette sélection ne s'applique que lorsque le modèle ou les options de la radio le permettent.

Personnalisé

Utilisez l'option personnalisée pour définir individuellement un réglage unique de gain d'égalisation audio pour le haut-parleur qui n'est pas pris en charge par les autres options du menu Réglage de groupe. Il est hautement recommandé d'éviter les réglages maximum pour les mêmes bandes de fréquences entre les égalisations du microphone et du haut-parleur.

10.49.2.3

Réduction du bruit personnalisée

Ce champ permet au microphone de la radio ou de l'accessoire d'utiliser un profil de réduction du bruit de radio ou d'accessoire personnalisé qui cible des conditions de bruit spécifiques.

**AVERTISSEMENT :**

La modification des paramètres de la réduction du bruit personnalisée ne doit être effectuée que par un personnel qualifié. Une configuration inappropriée pourrait grandement compromettre la suppression des bruits du micro et, par conséquent, la qualité de la voix transmise.

Les réglages de réduction du bruit de la radio et de l'accessoire sont recommandés pour la plupart des environnements bruyants.

**REMARQUE :**

La réduction du bruit atténue les bruits de fond, ce qui améliore la qualité de la voix. La réduction du bruit s'effectue dans la radio émettrice avant la transmission (en mode analogique) et avant l'encodage de la voix (en mode numérique). Non seulement la réduction du bruit de fond améliore-t-elle la qualité de la voix dans les communications en mode analogique, mais elle permet également l'entrée d'un signal vocal plus clair dans l'encodeur numérique de signaux vocaux, ce qui se traduit par une augmentation de la qualité du signal reçu et décodé dans la radio réceptrice.

10.49.2.4

Mode de réduction du bruit personnalisée (accessoire)

Permet au microphone de la radio ou de l'accessoire d'utiliser un profil de réduction du bruit de radio ou d'accessoire personnalisé qui cible des conditions de bruit spécifiques.

**AVERTISSEMENT :**

La modification des paramètres de la réduction du bruit personnalisée ne doit être effectuée que par un personnel qualifié. Une configuration inappropriée pourrait grandement compromettre la suppression des bruits du micro et, par conséquent, la qualité de la voix transmise.

Les réglages de réduction du bruit de la radio et de l'accessoire sont recommandés pour la plupart des environnements bruyants.

**REMARQUE :**

La réduction du bruit atténue les bruits de fond, ce qui améliore la qualité de la voix. La réduction du bruit s'effectue dans la radio émettrice avant la transmission (en mode analogique) et avant l'encodage de la voix (en mode numérique). Non seulement la réduction du bruit de fond améliore-t-elle la qualité de la voix dans les communications en mode analogique, mais elle permet également l'entrée d'un signal vocal plus clair dans l'encodeur numérique de signaux vocaux, ce qui se traduit par une augmentation de la qualité du signal reçu et décodé dans la radio réceptrice.

10.49.2.5

Niveau de réduction du bruit de fond (radio)

Permet de sélectionner le niveau de réduction du bruit de fond à appliquer aux deux microphones internes et au microphone externe.

**AVERTISSEMENT :**

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Cette sélection s'applique au profil radio courant.

**REMARQUE :**

La réduction du bruit atténue les bruits de fond, ce qui améliore la qualité de la voix. La réduction du bruit s'effectue dans la radio émettrice avant la transmission (en mode analogique) et avant l'encodage de la voix (en mode numérique). Non seulement la réduction du bruit de fond améliore-t-elle la qualité de la voix dans les communications en mode analogique, mais elle permet également l'entrée d'un signal vocal plus clair dans l'encodeur numérique de signaux vocaux, ce qui se traduit par une augmentation de la qualité du signal reçu et décodé dans la radio réceptrice.

Accès seulement : lorsque la case Réduction du bruit personnalisée n'est pas cochée.

La liste suivante répertorie les sélections et les définitions des Niveau de réduction du bruit de fond (radio).

Désactivée

Désactive la fonction de réduction du bruit de fond des deux microphones. Les deux microphones demeurent actifs et l'utilisateur radio peut parler de l'un ou l'autre côté de la radio, mais le bruit de fond n'est pas réduit.

Normal

Les deux microphones sont actifs et adaptent continuellement leur captation du signal vocal pour une vaste gamme de bruits de fond afin d'optimiser la clarté de la transmission. Il s'agit du réglage recommandé pour la plupart des environnements.

Rapide

Un niveau supérieur de réduction du bruit de fond est activé. Ce réglage est recommandé pour les environnements TRÈS bruyants.

Xtreme 1_Sided

Le niveau maximum de réduction du bruit de fond est activé. Ce réglage est recommandé pour les environnements EXTRÊMEMENT bruyants, par exemple : Alarme PASS (système de sécurité personnel d'alerte) de pompier, alertes de quantité d'air basse, camion de pompage, ventilateur de gaz, scie.

**REMARQUE :**

Lorsque ce paramètre est sélectionné, l'utilisateur radio doit parler dans le haut-parleur situé sur le côté de la radio. Cette sélection ne s'applique que lorsque le modèle ou les options de la radio le permettent.

Auto

Active le profil auto-agressivité de réduction sonore.

**REMARQUE :**

Cette sélection ne s'applique que lorsque le modèle ou les options de la radio le permettent.

La liste suivante répertorie les sélections et les définitions des Niveau de réduction du bruit de fond (accessoire).

Désactivée

Désactive la fonction de réduction du bruit de fond. Le microphone externe demeure actif, mais le bruit de fond n'est pas réduit.

Normal

Le microphone externe adapte continuellement sa captation du signal vocal pour une vaste gamme de bruits de fond afin d'optimiser la clarté de la transmission. Il s'agit du réglage recommandé pour la plupart des environnements.

Xtreme 1_Sided

Le niveau maximum de réduction du bruit de fond est activé. Ce réglage est recommandé pour les environnements EXTRÊMEMENT bruyants, par exemple : Alarme PASS de pompier, alertes de quantité d'air basse, camion de pompage, ventilateur de gaz, scie.

**REMARQUE :**

Lorsque ce paramètre est sélectionné, l'utilisateur radio doit parler dans le haut-parleur situé sur le côté de la radio. Cette sélection ne s'applique que lorsque le modèle ou les options de la radio le permettent.

Auto

Active le profil auto-agressivité de réduction sonore.

**REMARQUE :**

Cette sélection ne s'applique que lorsque le modèle ou les options de la radio le permettent.

10.49.2.6**Niveau de réduction du bruit de fond (accessoire)**

Permet de sélectionner le niveau de réduction du bruit de fond à appliquer aux deux microphones internes et au microphone externe.

**AVERTISSEMENT :**

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Cette sélection s'applique au profil radio courant.

**REMARQUE :**

La réduction du bruit atténue les bruits de fond, ce qui améliore la qualité de la voix. La réduction du bruit s'effectue dans la radio émettrice avant la transmission (en mode analogique) et avant l'encodage de la voix (en mode numérique). Non seulement la réduction du bruit de fond améliore-t-elle la qualité de la voix dans les communications en mode analogique, mais elle permet également l'entrée d'un signal vocal plus clair dans l'encodeur numérique de signaux vocaux, ce qui se traduit par une augmentation de la qualité du signal reçu et décodé dans la radio réceptrice.

Accès seulement : lorsque la case Réduction du bruit personnalisée n'est pas cochée.

La liste suivante répertorie les sélections et les définitions des Niveau de réduction du bruit de fond (radio).

Désactivée

Désactive la fonction de réduction du bruit de fond des deux microphones. Les deux microphones demeurent actifs et l'utilisateur radio peut parler de l'un ou l'autre côté de la radio, mais le bruit de fond n'est pas réduit.

Normal

Les deux microphones sont actifs et adaptent continuellement leur captation du signal vocal pour une vaste gamme de bruits de fond afin d'optimiser la clarté de la transmission. Il s'agit du réglage recommandé pour la plupart des environnements.

Rapide

Un niveau supérieur de réduction du bruit de fond est activé. Ce réglage est recommandé pour les environnements TRÈS bruyants.

Xtreme 1_Sided

Le niveau maximum de réduction du bruit de fond est activé. Ce réglage est recommandé pour les environnements EXTRÊMEMENT bruyants, par exemple : Alarme PASS (système de sécurité personnel d'alerte) de pompier, alertes de quantité d'air basse, camion de pompage, ventilateur de gaz, scie.

**REMARQUE :**

Lorsque ce paramètre est sélectionné, l'utilisateur radio doit parler dans le haut-parleur situé sur le côté de la radio. Cette sélection ne s'applique que lorsque le modèle ou les options de la radio le permettent.

Auto

Active le profil auto-agressivité de réduction sonore.

**REMARQUE :**

Cette sélection ne s'applique que lorsque le modèle ou les options de la radio le permettent.

La liste suivante répertorie les sélections et les définitions des Niveau de réduction du bruit de fond (accessoire).

Désactivée

Désactive la fonction de réduction du bruit de fond. Le microphone externe demeure actif, mais le bruit de fond n'est pas réduit.

Normal

Le microphone externe adapte continuellement sa captation du signal vocal pour une vaste gamme de bruits de fond afin d'optimiser la clarté de la transmission. Il s'agit du réglage recommandé pour la plupart des environnements.

Rapide

Un niveau supérieur de réduction du bruit de fond est activé. Ce réglage est recommandé pour les environnements TRÈS bruyants.

Xtreme 1_Sided

Le niveau maximum de réduction du bruit de fond est activé. Ce réglage est recommandé pour les environnements EXTRÊMEMENT bruyants, par exemple : Alarme PASS de pompier, alertes de quantité d'air basse, camion de pompage, ventilateur de gaz, scie.

**REMARQUE :**

Lorsque ce paramètre est sélectionné, l'utilisateur radio doit parler dans le haut-parleur situé sur le côté de la radio. Cette sélection ne s'applique que lorsque le modèle ou les options de la radio le permettent.

Auto

Active le profil auto-agressivité de réduction sonore.

**REMARQUE :**

Cette sélection ne s'applique que lorsque le modèle ou les options de la radio le permettent.

10.49.2.7

Niveau de réduction du bruit du vent (radio)

Permet de sélectionner le niveau de réduction du bruit du vent à appliquer aux deux microphones internes et au microphone externe.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Cette sélection s'applique au profil radio courant.

REMARQUE :

La réduction du bruit atténue les bruits de fond, ce qui améliore la qualité de la voix. La réduction du bruit s'effectue dans la radio émettrice avant la transmission (en mode analogique) et avant l'encodage de la voix (en mode numérique). Non seulement la réduction du bruit de fond améliore-t-elle la qualité de la voix dans les communications en mode analogique, mais elle permet également l'entrée d'un signal vocal plus clair dans l'encodeur numérique de signaux vocaux, ce qui se traduit par une augmentation de la qualité du signal reçu et décodé dans la radio réceptrice.

Accès seulement : lorsque la case Réduction du bruit personnalisée n'est pas cochée.

La liste suivante répertorie les sélections et les définitions des Réglages de réduction du bruit du vent (radio).

Désactivée

Désactive la fonction de réduction du bruit du vent des deux microphones. Les deux microphones demeurent actifs et l'utilisateur radio peut parler de l'un ou l'autre côté de la radio, mais le bruit du vent n'est pas réduit.

Normal

Les deux microphones sont actifs et adaptent continuellement leur captation du signal vocal pour une vaste gamme de bruits afin d'optimiser la clarté de la transmission.

REMARQUE :

Il s'agit du réglage recommandé pour la plupart des environnements.

Rapide

Un niveau supérieur de réduction du bruit du vent est activé.

REMARQUE :

Ce réglage est recommandé pour les environnements très bruyants.

10.49.2.8

Niveau de réduction du bruit du vent (accessoire)

Le tableau suivant répertorie les sélections et les définitions du niveau de réduction du bruit de fond (accessoire).

REMARQUE :

Ce champ non configurable est réglé par défaut à **Désactivé**.

Désactivée

Désactive la fonction de réduction du bruit du vent. Le microphone externe demeure actif, mais le bruit du vent n'est pas réduit.

10.49.2.9

Filtre d'alarme PASS (radio)

Le filtre d'alarme (radio) PASS (système de sécurité d'alerte personnelle) permet la réduction du bruit de fond pour le microphone interne de la radio chaque fois qu'elle émet en présence d'une alarme PASS active.

**AVERTISSEMENT :**

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Le filtre d'alarme PASS (accessoire) permet la réduction du bruit de fond pour le microphone externe de la radio chaque fois qu'elle émet en la présence d'une alarme PASS active. Cette sélection s'applique au profil radio courant.

Les sélections prises en charge sont **Désactivé** et **Activé**.

**REMARQUE :**

La réduction du bruit atténue les bruits de fond, ce qui améliore la qualité de la voix. La réduction du bruit s'effectue dans la radio émettrice avant la transmission (en mode analogique) et avant l'encodage de la voix (en mode numérique). Non seulement la réduction du bruit de fond améliore-t-elle la qualité de la voix dans les communications en mode analogique, mais elle permet également l'entrée d'un signal vocal plus clair dans l'encodeur numérique de signaux vocaux, ce qui se traduit par une augmentation de la qualité du signal reçu et décodé dans la radio réceptrice.

Accès seulement :

lorsque la case Activer la réduction du bruit personnalisée n'est pas cochée,

(Lorsque le champ Niveau de réduction du bruit de fond n'est pas réglé à **Désactivé**, et lorsque champ Niveau de réduction du bruit du vent n'est pas réglé à **Désactivé**).

10.49.2.10

Filtre d'alarme PASS (accessoire)

Le filtre d'alarme PASS (système de sécurité d'alerte personnelle) permet la réduction du bruit de fond pour le microphone interne de la radio chaque fois qu'elle émet en présence d'une alarme PASS active.

**AVERTISSEMENT :**

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Le filtre d'alarme PASS (accessoire) permet la réduction du bruit de fond pour le microphone externe de la radio chaque fois qu'elle émet en la présence d'une alarme PASS active. Cette sélection s'applique au profil radio courant.

Les sélections prises en charge sont **Activé** et **Désactivé**.

**REMARQUE :**

La réduction du bruit atténue les bruits de fond, ce qui améliore la qualité de la voix. La réduction du bruit s'effectue dans la radio émettrice avant la transmission (en mode analogique) et avant l'encodage de la voix (en mode numérique). Non seulement la réduction du bruit de fond améliore-t-elle la qualité de la voix dans les communications en mode analogique, mais elle permet également l'entrée d'un signal vocal plus clair dans l'encodeur numérique de signaux vocaux, ce qui se traduit par une augmentation de la qualité du signal reçu et décodé dans la radio réceptrice.

Accès seulement :

lorsque la case Activer la réduction du bruit personnalisée n'est pas cochée,

(Lorsque le champ Niveau de réduction du bruit de fond n'est pas réglé à **Désactivé**, et lorsque champ Niveau de réduction du bruit du vent n'est pas réglé à **Désactivé**).

10.49.2.11

Sélection du profil de réduction du bruit

Ces paramètres personnalisés ne s'appliquent que si le champ Réduction du bruit personnalisée est sélectionné dans le profil radio indiqué.

**AVERTISSEMENT :**

Ne modifiez pas les paramètres de la réduction du bruit personnalisée, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

Les profils radio sont associés à un canal précis à l'aide du champ **Sélection de profil radio** de la page Canal, Attribution du canal de zone.

10.49.2.12

Sélection du profil de réduction du bruit (accessoire)

Permet au microphone de la radio ou de l'accessoire d'utiliser un profil de réduction du bruit de radio ou d'accessoire personnalisé qui cible des conditions de bruit spécifiques.

**AVERTISSEMENT :**

La modification des paramètres de la réduction du bruit personnalisée ne doit être effectuée que par un personnel qualifié. Une configuration inappropriée pourrait grandement compromettre la suppression des bruits du micro et, par conséquent, la qualité de la voix transmise.

Les réglages de réduction du bruit de la radio et de l'accessoire sont recommandés pour la plupart des environnements bruyants.

**REMARQUE :**

La réduction du bruit atténue les bruits de fond, ce qui améliore la qualité de la voix. La réduction du bruit s'effectue dans la radio émettrice avant la transmission (en mode analogique) et avant l'encodage de la voix (en mode numérique). Non seulement la réduction du bruit de fond améliore-t-elle la qualité de la voix dans les communications en mode analogique, mais elle permet également l'entrée d'un signal vocal plus clair dans l'encodeur numérique de signaux vocaux, ce qui se traduit par une augmentation de la qualité du signal reçu et décodé dans la radio réceptrice.

10.49.2.13

Mode de réduction du bruit de fond (radio)

Ces paramètres personnalisés ne s'appliquent que si le champ Réduction du bruit personnalisée est sélectionné dans le profil radio indiqué.

**AVERTISSEMENT :**

Ne modifiez pas les paramètres de réduction du bruit personnalisée, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

Les profils radio sont associés à un canal précis à l'aide du champ **Sélection de profil radio** de la page Canal, Attribution du canal de zone.

10.49.2.14

Mode de réduction du bruit de fond (accessoire)

Ces paramètres personnalisés ne s'appliquent que si le champ Réduction du bruit personnalisée est sélectionné dans le profil radio indiqué.

AVERTISSEMENT :

Ne modifiez pas les paramètres de réduction du bruit personnalisée, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

Les profils radio sont associés à un canal précis à l'aide du champ **Sélection de profil radio** de la page Canal, Attribution du canal de zone.

10.49.2.15

Mode de réduction du bruit du vent (radio)

Ces paramètres personnalisés ne s'appliquent que si le champ Réduction du bruit personnalisée est sélectionné dans le profil radio indiqué.

AVERTISSEMENT :

Ne modifiez pas les paramètres de réduction du bruit personnalisée, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

Les profils radio sont associés à un canal précis à l'aide du champ **Sélection de profil radio** de la page Canal, Attribution du canal de zone.

10.49.2.16

Niveau de réduction du bruit du vent (accessoire)

Ces paramètres personnalisés ne s'appliquent que si le champ Réduction du bruit personnalisée est sélectionné dans le profil radio indiqué.

AVERTISSEMENT :

Ne modifiez pas les paramètres de réduction du bruit personnalisée, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

Les profils radio sont associés à un canal précis à l'aide du champ **Sélection de profil radio** de la page Canal, Attribution du canal de zone.

10.49.2.17

Mode source (radio)

Ces paramètres personnalisés ne s'appliquent que si le champ Réduction du bruit personnalisée est sélectionné dans le profil radio indiqué.

AVERTISSEMENT :

Ne modifiez pas les paramètres de réduction du bruit personnalisée, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

Les profils radio sont associés à un canal précis à l'aide du champ Sélection de profil radio de la page Canal, Attribution du canal de zone.

Les sélections suivantes sont prises en charge :

- Faisceau 1
- Faisceau 2
- Entièrement automatique

- Mic 1
- Mic 1 et Mic 2
- Mic 2
- Mic 3
- Désactivée
- Proximité - Mic 1
- Proximité - Mic 2

10.49.2.18

Mode source (accessoire)

Ces paramètres personnalisés ne s'appliquent que si le champ Réduction du bruit personnalisée est sélectionné dans le profil radio indiqué.

AVERTISSEMENT :

Ne modifiez pas les paramètres de réduction du bruit personnalisée, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

10.49.2.19

Mode de directivité (radio)

Ces paramètres personnalisés ne s'appliquent que si le champ Réduction du bruit personnalisée est sélectionné dans le profil radio indiqué.

AVERTISSEMENT :

Ne modifiez pas les paramètres de réduction du bruit personnalisée, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

Les profils radio sont associés à un canal précis à l'aide du champ **Sélection de profil radio** de la page Canal, Attribution du canal de zone.

10.49.2.20

Mode de directivité (accessoire)

Ces paramètres personnalisés ne s'appliquent que si le champ Réduction du bruit personnalisée est sélectionné dans le profil radio indiqué.

AVERTISSEMENT :

Ne modifiez pas les paramètres de réduction du bruit personnalisée, à moins de faire partie du personnel qualifié. Des paramètres incorrects peuvent entraîner la transmission d'un fort bruit de fond avec la voix, ce qui pourrait causer l'échec des communications.

10.49.2.21

Mode SAM

Haut-parleur-comme-microphone (SAM) est une source audio alternative.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Le rendement audio est amélioré dans le vent lorsque vous utilisez le mode SAM.

Les sélections disponibles sont **Désactivé**, **Activé** et **Vent activé**.

Lorsque cette fonction est réglée à **Wind_On**, les fonctions d'entrée audio SAM ne fonctionnent que dans des conditions de vent.

Accès seulement : lorsque le modèle ou l'option de la radio le permet, et lorsque le champ [Réduction du bruit personnalisée à la page 701](#) est **activé**.

10.49.2.22

Mode automatique du microphone de la radio

Le Mode automatique de microphone de radio correspond au réglage automatique de l'agressivité de la suppression du bruit pour la radio.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Les sélections disponibles sont **Désactivé** et **Activé**.

Accès seulement : lorsque le modèle ou l'option de la radio le permet, et lorsque le champ [Réduction du bruit personnalisée à la page 701](#) est **activé**.

10.49.2.23

Mode automatique du microphone d'accessoire

Le Mode automatique de microphone d'accessoire correspond au réglage automatique du niveau d'agressivité de la suppression du bruit pour l'accessoire.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Les sélections disponibles sont **Désactivé** et **Activé**.

Accès seulement : lorsque le modèle ou l'option de la radio le permet, et lorsque le champ [Mode de réduction du bruit personnalisée \(accessoire\) à la page 701](#) est **activé**.

10.49.2.24

Comp. en surcharge (radio)

Ce champ permet la compensation automatique en cas de surcharge du microphone pour améliorer le rendement de la réduction du bruit dans des conditions très bruyantes.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Les sélections sont **Désactivé** et **Activé**.

Accès seulement : lorsque le modèle ou l'option de la radio le permet, et lorsque le champ [Réduction du bruit personnalisée à la page 701](#) est **activé**.

10.49.2.25

Réglage de groupe (radio)

Ce champ prédéfinit un jeu de valeurs pour les champs Section de sensibilité du gain dans Microphone/Groupe de paramètres Tx.

Lorsque la valeur Réglage de groupe est changée à autre chose que **Personnalisé**, la valeur des champs qui se trouvent dans cette section est modifiée conformément. Lorsque le paramètre du groupe n'est pas sur **Personnalisé**, alors tous les champs ne s'affichent qu'en lecture seule.

Le tableau suivant répertorie les sélections et les définitions pour les Paramètres du groupe sensibilité du gain (radio) et les mêmes pour l'accessoire.

Normal

La valeur des champs suivants est réglée à : L'AGC analogique est réglé à **Activé**, l'AGC numérique est réglé à **Activé**, l'AGC SecureNet est réglé à **Activé**, le Gain fixe analogique est réglé à **0**, le Gain fixe numérique est réglé à **0**, le Gain fixe SecureNet est réglé à **0**, la Sortie de commande du gain est réglée à **0**, le Total de commande du gain est réglé à **6** et Équilibre analogique/numérique est réglé à **Désactivé**.

Optimisation du bruit

La valeur des champs suivants est réglée à : L'AGC analogique est réglé à **Désactivé**, l'AGC numérique est réglé à **Désactivé**, l'AGC SecureNet est réglé à **Désactivé**, le Gain fixe analogique est réglé à **-6**, le Gain fixe numérique est réglé à **-6**, le Gain fixe SecureNet est réglé à **-6**, la Sortie de commande du gain est réglée à **0**, le Total de commande du gain est réglé à **6** et Équilibre analogique/numérique est réglé à **Activé**.

Sortie forte

La valeur des champs suivants est réglée à : L'AGC analogique est réglé à **Activé**, l'AGC numérique est réglé à **Activé**, l'AGC SecureNet est réglé à **Activé**, le Gain fixe analogique est réglé à **0**, le Gain fixe numérique est réglé à **0**, le Gain fixe SecureNet est réglé à **0**, la Sortie de commande du gain est réglée à **0**, le Total de commande du gain est réglé à **9** et Équilibre analogique/numérique est réglé à **Désactivé**.

Réduire rétroaction

La valeur des champs suivants est réglée à : L'AGC analogique est réglé à **Désactivé**, l'AGC numérique est réglé à **Désactivé**, l'AGC SecureNet est réglé à **Désactivé**, le Gain fixe analogique est réglé à **-9**, le Gain fixe numérique est réglé à **-9**, le Gain fixe SecureNet est réglé à **-9**, la Sortie de commande du gain est réglée à **0**, le Total de commande du gain est réglé à **6** et Équilibre analogique/numérique est réglé à **Activé**.

10.49.2.26**Réglage du groupe (accessoire)**

L'objectif de ce champ est de définir un ensemble de valeurs pour le champ Section de sensibilité du gain dans Microphone / Groupe de paramètres Tx.

Lorsque la valeur Réglage de groupe est changée à autre chose que **Personnalisé**, la valeur des champs qui se trouvent dans cette section est modifiée conformément. Lorsque le paramètre du groupe n'est pas sur **Personnalisé**, alors tous les champs ne s'affichent qu'en lecture seule.

Le tableau suivant répertorie les sélections et les définitions pour les Paramètres du groupe sensibilité du gain (radio) et les mêmes pour l'accessoire.

Normal

La valeur des champs suivants est réglée à : L'AGC analogique est réglé à **Activé**, l'AGC numérique est réglé à **Activé**, l'AGC SecureNet est réglé à **Activé**, le Gain fixe analogique est réglé à **0**, le Gain fixe numérique est réglé à **0**, le Gain fixe SecureNet est réglé à **0**, la Sortie de commande du gain est réglée à **0**, le Total de commande du gain est réglé à **6** et Équilibre analogique/numérique est réglé à **Désactivé**.

Optimisation du bruit

La valeur des champs suivants est réglée à : L'AGC analogique est réglé à **Désactivé**, l'AGC numérique est réglé à **Désactivé**, l'AGC SecureNet est réglé à **Désactivé**, le Gain fixe analogique est réglé à **-6**, le Gain fixe numérique est réglé à **-6**, le Gain fixe SecureNet est réglé à **-6**, la Sortie de commande du gain est réglée à **0**, le Total de commande du gain est réglé à **6** et Équilibre analogique/numérique est réglé à **Activé**.

Sortie forte

La valeur des champs suivants est réglée à : L'AGC analogique est réglé à **Activé**, l'AGC numérique est réglé à **Activé**, l'AGC SecureNet est réglé à **Activé**, le Gain fixe analogique est réglé à **0**, le Gain fixe numérique est réglé à **0**, le Gain fixe SecureNet est réglé à **0**, la Sortie

de commande du gain est réglée à **0**, le Total de commande du gain est réglé à **9** et Équilibre analogique/numérique est réglé à **Désactivé**.

Réduire rétroaction

La valeur des champs suivants est réglée à : L'AGC analogique est réglé à **Désactivé**, l'AGC numérique est réglé à **Désactivé**, l'AGC SecureNet est réglé à **Désactivé**, le Gain fixe analogique est réglé à **-9**, le Gain fixe numérique est réglé à **-9**, le Gain fixe SecureNet est réglé à **-9**, la Sortie de commande du gain est réglée à **0**, le Total de commande du gain est réglé à **6** et Équilibre analogique/numérique est réglé à **Activé**.

Personnalisé

Utilisez l'option personnalisée pour définir individuellement un réglage unique de gain d'égalisation audio pour le haut-parleur qui n'est pas pris en charge par les autres options du menu Réglage de groupe. Il est hautement recommandé d'éviter les réglages maximum pour les mêmes bandes de fréquences entre les égalisations du microphone et du haut-parleur.

10.49.2.27

ACG analogique

Ce champ permet d'activer la commande automatique de gain (AGC) pour le microphone interne ou externe de la radio.

Cette sélection ne s'applique que lorsque la radio émet en mode analogique. L'AGC permet de compenser les différences relativement au volume de la voix et au style de fonctionnement. Il en résulte que les messages ont le même niveau audio (décibels) à leur émission et à leur réception. Cette sélection s'applique au profil radio courant.

AVERTISSEMENT :

(Si vous réglez le champ Niveau de configuration audio à **De base**.) Lorsqu'il est activé, le champ Équilibre Tx numérique/analogique s'appliquant à toute la radio ne doit pas être réglé à **Toute la radio** et Équilibre Tx numérique/analogique du même enregistrement ou de la même rangée du profil radio doit être **Désactivé**. Autrement, cette sélection de liste est considérée comme non valide.

(Si vous réglez le champ Niveau de configuration audio à **Amélioré**) Lorsqu'il est activé, le champ Équilibre Tx numérique/analogique s'appliquant à toute la radio ne doit pas être réglé à **Toute la radio** et le champ Équilibre Tx numérique/analogique de l'enregistrement/la rangée du même profil de la radio doit être réglé à **Désactivé**; sinon, cette sélection sera considérée comme non valide.

IMPORTANT :

Le niveau réglé dans le champ Total de commande du gain TX (également appelé « gain net ») est appliqué avant l'exécution de la commande automatique du gain. Pour les entrées de microphone inférieures au niveau nominal : sortie microphone réelle = entrée microphone + total de commande du gain TX.

Le niveau réglé dans le champ Sortie de commande du gain TX est appliqué après l'exécution de la commande automatique du gain. Lorsque la voix captée par le microphone est au-dessus du niveau nominal, le champ Sortie de commande du gain TX applique un ratio infini de 1 dB. Ainsi, lorsque la voix captée par le microphone est supérieure au niveau nominal, le niveau de la sortie ne sera jamais supérieur au niveau réglé à l'aide de ce paramètre.

10.49.2.28

AGC analogique (accessoire)

Permet l'utilisation de la commande automatique du gain (AGC) pour le microphone interne ou externe de la radio. Cette sélection ne s'applique que lorsque la radio émet en mode analogique.

**AVERTISSEMENT :**

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

L'AGC permet de compenser les différences relativement au volume de la voix et au style de fonctionnement. Il en résulte que les messages ont le même niveau audio (décibels) à leur émission et à leur réception. Cette sélection s'applique au profil radio courant.

**AVERTISSEMENT :**

(Si l'utilisateur règle le champ Niveau de configuration audio sur **De base**.) Lorsqu'il est activé, le champ Équilibre Tx numérique/analogique s'appliquant à toute la radio ne doit pas être réglé à **Toute la radio** et Équilibre Tx numérique/analogique du même enregistrement ou de la même rangée du profil radio doit être **Désactivé**. Autrement, cette sélection de liste est considérée comme non valide.

(Si l'utilisateur règle le champ Niveau de configuration audio sur **De base**.) Lorsqu'il est activé, le champ Équilibre Tx numérique/analogique s'appliquant à toute la radio ne doit pas être réglé à **Toute la radio** et Équilibre Tx numérique/analogique du même enregistrement ou de la même rangée du profil radio doit être **Désactivé**. Autrement, cette sélection de liste est considérée comme non valide.

**IMPORTANT :**

Le niveau réglé dans le champ Total de commande du gain TX (également appelé « gain net ») est appliqué avant l'exécution de la commande automatique du gain. Pour les entrées de microphone inférieures au niveau nominal : sortie microphone réelle = entrée microphone + total de commande du gain TX.

Le niveau réglé dans le champ Sortie de commande du gain TX est appliqué après l'exécution de la commande automatique du gain. Lorsque la voix captée par le microphone est au-dessus du niveau nominal, le champ Sortie de commande du gain TX applique un ratio infini de 1 dB. Ainsi, lorsque la voix captée par le microphone est inférieure au niveau nominal, le niveau de la sortie ne sera jamais supérieur au niveau réglé à l'aide de ce paramètre.

10.49.2.29

AGC numérique

Ce champ permet d'activer la commande automatique de gain (AGC) pour le microphone interne ou externe de la radio.

Cette sélection ne s'applique que lorsque la radio émet en mode numérique. L'AGC permet de compenser les différences relativement au volume de la voix et au style de fonctionnement. Il en

résulte que les messages ont le même niveau audio (décibels) à leur émission et à leur réception. Cette sélection s'applique au profil radio courant.

**REMARQUE :**

(Si l'utilisateur règle le champ Niveau de configuration audio sur **De base.**) Lorsqu'il est activé, le champ Équilibre Tx numérique/analogique s'appliquant à toute la radio ne doit pas être réglé à **Toute la radio** et Équilibre Tx numérique/analogique du même enregistrement ou de la même rangée du profil radio doit être **Désactivé**. Autrement, cette sélection de liste est considérée comme non valide.

(Si l'utilisateur règle le champ Niveau de configuration audio sur **De base.**) Lorsqu'il est activé, le champ Équilibre Tx numérique/analogique s'appliquant à toute la radio ne doit pas être réglé à **Toute la radio** et Équilibre Tx numérique/analogique du même enregistrement ou de la même rangée du profil radio doit être **Désactivé**. Autrement, cette sélection de liste est considérée comme non valide.

**REMARQUE :**

Le niveau réglé dans le champ Total de commande du gain TX (également appelé « gain net ») est appliqué avant l'exécution de la commande automatique du gain. Pour les entrées de microphone inférieures au niveau nominal : sortie microphone réelle = entrée microphone + total de commande du gain TX.

Le niveau réglé dans le champ Sortie de commande du gain TX est appliqué après l'exécution de la commande automatique du gain. Lorsque la voix captée par le microphone est au-dessus du niveau nominal, le champ Sortie de commande du gain TX applique un ratio infini de 1 dB. Ainsi, lorsque la voix captée par le microphone est supérieure au niveau nominal, le niveau de la sortie ne sera jamais supérieur au niveau réglé à l'aide de ce paramètre.

10.49.2.30**AGC numérique (accessoire)**

Permet l'utilisation de la commande automatique du gain (AGC) pour le microphone interne ou externe de la radio.

**AVERTISSEMENT :**

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Cette sélection ne s'applique que lorsque la radio émet en mode numérique. L'AGC permet de compenser les différences relativement au volume de la voix et au style de fonctionnement. Il en

résulte que les messages ont le même niveau audio (décibels) à leur émission et à leur réception. Cette sélection s'applique au profil radio courant.

AVERTISSEMENT :

(Si l'utilisateur règle le champ Niveau de configuration audio sur **De base**.) Lorsqu'il est activé, le champ Équilibre Tx numérique/analogique s'appliquant à toute la radio ne doit pas être réglé à **Toute la radio** et Équilibre Tx numérique/analogique du même enregistrement ou de la même rangée du profil radio doit être **Désactivé**. Autrement, cette sélection de liste est considérée comme non valide.

(Si l'utilisateur règle le champ Niveau de configuration audio sur **De base**.) Lorsqu'il est activé, le champ Équilibre Tx numérique/analogique s'appliquant à toute la radio ne doit pas être réglé à **Toute la radio** et Équilibre Tx numérique/analogique du même enregistrement ou de la même rangée du profil radio doit être **Désactivé**. Autrement, cette sélection de liste est considérée comme non valide.

REMARQUE :

Le niveau réglé dans le champ Total de commande du gain TX (également appelé « gain net ») est appliqué avant l'exécution de la commande automatique du gain. Pour les entrées de microphone inférieures au niveau nominal : sortie microphone réelle = entrée microphone + total de commande du gain TX.

Le niveau réglé dans le champ Sortie de commande du gain TX est appliqué après l'exécution de la commande automatique du gain. Lorsque la voix captée par le microphone est au-dessus du niveau nominal, le champ Sortie de commande du gain TX applique un ratio infini de 1 dB. Ainsi, lorsque la voix captée par le microphone est supérieure au niveau nominal, le niveau de la sortie ne sera jamais supérieur au niveau réglé à l'aide de ce paramètre.

10.49.2.31

Securenet AGC

Ce champ vous permet d'activer la commande automatique de gain (AGC) pour le microphone interne ou externe de la radio.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Cette sélection ne s'applique que lorsque la radio émet en mode SecureNet. L'AGC permet de compenser les différences relativement au volume de la voix et au style de fonctionnement. Il en résulte que les messages ont le même niveau audio (décibels) à leur émission et à leur réception. Cette sélection s'applique au profil radio courant.

IMPORTANT :

Le niveau réglé dans le champ Total de commande du gain TX (également appelé « gain net ») est appliqué avant l'exécution de la commande automatique du gain. Pour les entrées de microphone inférieures au niveau nominal : sortie microphone réelle = entrée microphone + total de commande du gain TX.

Le niveau réglé dans le champ Sortie de commande du gain TX est appliqué après l'exécution de la commande automatique du gain. Lorsque la voix captée par le microphone est au-dessus du niveau nominal, le champ Sortie de commande du gain TX applique un ratio infini de 1 dB. Ainsi, lorsque la voix captée par le microphone est supérieure au niveau nominal, le niveau de la sortie ne sera jamais supérieur au niveau réglé à l'aide de ce paramètre.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.49.2.32

AGC Securenet (Accessoire)

Permet l'utilisation de la commande automatique du gain (AGC) pour le microphone interne ou externe de la radio.

**AVERTISSEMENT :**

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Cette sélection ne s'applique que lorsque la radio émet en mode SecureNet. L'AGC permet de compenser les différences relativement au volume de la voix et au style de fonctionnement. Il en résulte que les messages ont le même niveau audio (décibels) à leur émission et à leur réception. Cette sélection s'applique au profil radio courant.

**REMARQUE :**

Le niveau réglé dans le champ Total de commande du gain TX (également appelé « gain net ») est appliqué avant l'exécution de la commande automatique du gain. Pour les entrées de microphone inférieures au niveau nominal : sortie microphone réelle = entrée microphone + total de commande du gain TX.

Le niveau réglé dans le champ Sortie de commande du gain TX est appliqué après l'exécution de la commande automatique du gain. Lorsque la voix captée par le microphone est au-dessus du niveau nominal, le champ Sortie de commande du gain TX applique un ratio infini de 1 dB. Ainsi, lorsque la voix captée par le microphone est supérieure au niveau nominal, le niveau de la sortie ne sera jamais supérieur au niveau réglé à l'aide de ce paramètre.

Accès seulement : Lorsque le modèle ou l'option de la radio le permet.

10.49.2.33

Sortie de commande du gain AGC (radio)

Permet de sélectionner le gain de la radio afin que le volume émis soit supérieur (valeurs positives), inférieur (valeurs négatives) ou égal (0) au volume des appels reçus.

**AVERTISSEMENT :**

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Le niveau réglé dans le champ Sortie de commande du gain AGC est appliqué après l'exécution de la commande automatique du gain (AGC). Lorsque la voix captée par le microphone est au-dessus du niveau nominal, le champ Sortie de commande du gain AGC applique un ratio infini de 1 dB. Ainsi, lorsque la voix captée par le microphone est supérieure au niveau nominal, le niveau de la sortie ne sera jamais supérieur au niveau réglé à l'aide de ce paramètre. Cette sélection s'applique au profil radio courant.

**REMARQUE :**

Si l'utilisateur règle le Niveau de configuration audio à **De base**, alors le champ Sortie de commande du gain AGC (accessoire) est en lecture seule (sauf pour les radios APX3000).

Pour les radios non-APX3000, la valeur totale de commande du gain AGC (accessoire) est synchronisée à partir de la sortie de commande du gain AGC (radio).

Pour les radios APX3000, la valeur totale de commande du gain AGC (accessoire) est synchronisée avec la sortie de commande du gain AGC (radio).

La sortie de commande du gain AGC est appliquée à tous les champs activés dans RadioCentral.

Accès seulement :

(Si l'utilisateur règle le Niveau de configuration audio à **De base**) Quand un des champs AGC est activé, ce champ est activé; ou

(Si l'utilisateur règle le Niveau de configuration audio à **Amélioré**) Quand un champ AGC (radio) est activé, le champ Sortie de commande du gain AGC (radio) est activé. Lorsque n'importe quel des champ AGC (accessoire) est activé, le champ de sortie de commande du gain AGC (accessoire) est activé.

Tableau 321 : Portée

Minimum	Maximum	Incréments
-12 décibels	12 décibels	3 décibels

10.49.2.34

Sortie de commande du gain AGC (Accessoire)

Permet de sélectionner le gain de la radio afin que le volume émis soit supérieur (valeurs positives), inférieur (valeurs négatives) ou égal (« 0 ») au volume des appels reçus.

**AVERTISSEMENT :**

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Le niveau réglé dans le champ Sortie de commande du gain AGC est appliqué après l'exécution de la commande automatique du gain (AGC). Lorsque la voix captée par le microphone est au-dessus du niveau nominal, le champ Sortie de commande du gain AGC applique un ratio infini de 1 dB. Ainsi, lorsque la voix captée par le microphone est supérieure au niveau nominal, le niveau de la sortie ne sera jamais supérieur au niveau réglé à l'aide de ce paramètre. Cette sélection s'applique au profil radio courant.

**REMARQUE :**

Si l'utilisateur règle le Niveau de configuration audio à **De base**, alors le champ Sortie de commande du gain AGC (accessoire) est en lecture seule (sauf pour les radios APX3000).

Pour les radios non-APX3000, la valeur totale de commande du gain AGC (accessoire) est synchronisée à partir de la sortie de commande du gain AGC (radio).

Pour les radios APX3000, la valeur totale de commande du gain AGC (accessoire) est synchronisée avec la sortie de commande du gain AGC (radio).

La sortie de commande du gain AGC est appliquée à tous les champs activés dans RadioCentral.

Accès seulement :

(Si l'utilisateur règle le Niveau de configuration audio à **De base**) Quand un des champs AGC est activé, ce champ est activé; ou

(Si l'utilisateur règle le Niveau de configuration audio à **Amélioré**) Quand un champ AGC (radio) est activé, le champ Sortie de commande du gain AGC (radio) est activé. Lorsque n'importe quel des champ AGC (accessoire) est activé, le champ de sortie de commande du gain AGC (accessoire) est activé.

Tableau 322 : Portée

Minimum	Maximum	Incréments
-12 décibels	12 décibels	3 décibels

10.49.2.35

Total de commande du gain AGC (Radio)

Permet de sélectionner le gain de la radio afin que le volume émis soit supérieur (valeurs positives), inférieur (valeurs négatives) ou égal (0) au volume des appels reçus pour le profil radio courant.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Le niveau réglé dans le champ Total de commande du gain AGC (également appelé « gain net ») est appliqué avant l'exécution de la commande automatique du gain (AGC). Pour les entrées de microphone inférieures au niveau nominal : sortie de microphone réelle = entrée de microphone + total de commande du gain AGC.

REMARQUE :

Si l'utilisateur règle le Niveau de configuration audio à **De base**, alors le champ Total de commande du gain AGC (accessoire) est en lecture seule (sauf pour les radios APX3000).

Pour les radios non-APX3000, la valeur du total de commande du gain AGC (accessoire) est synchronisée à partir du total de commande du gain AGC (radio).

Pour les radios APX3000, la valeur du total de commande du gain (accessoire) est synchronisée avec le total de commande du gain AGC (radio).

Des valeurs distinctes de total de commande du gain AGC sont appliquées dans chacun des champs AGC activés dans RadioCentral.

Accès seulement :

(Si l'utilisateur règle le Niveau de configuration audio à **De base**) Quand un des champs AGC est activé, ce champ est activé; ou

(Si l'utilisateur règle le Niveau de configuration audio à **Amélioré**) Quand un champ AGC (radio) est activé, le champ Total de commande du gain AGC (radio) est activée. Quand n'importe quel des champs AGC (accessoire) est activé, le champ Total de commande du gain AGC (accessoire) est activé.

Le tableau suivant répertorie les valeurs maximale et minimale de la sortie de commande du gain AGC ainsi que des exemples de clips audio correspondant aux valeurs spécifiques saisies.

Tableau 323 : Portée

Minimum	Maximum	Incréments
-12 décibels	12 décibels	3 décibels

10.49.2.36

Total de commande du gain AGC (Accessoire)

Permet de sélectionner le gain de la radio afin que le volume émis soit supérieur (valeurs positives), inférieur (valeurs négatives) ou égal (0) au volume des appels reçus pour le profil radio courant.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Le niveau réglé dans le champ Total de commande du gain AGC (également appelé « gain net ») est appliqué avant l'exécution de la commande automatique du gain (AGC). Pour les entrées de

microphone inférieures au niveau nominal : sortie de microphone réelle = entrée de microphone + total de commande du gain AGC.

REMARQUE :

Si l'utilisateur règle le Niveau de configuration audio à **De base**, alors le champ Total de commande du gain AGC (accessoire) est en lecture seule (sauf pour les radios APX3000).

Pour les radios non-APX3000, la valeur du total de commande du gain AGC (accessoire) est synchronisée à partir du total de commande du gain AGC (radio).

Pour les radios APX3000, la valeur du total de commande du gain (accessoire) est synchronisée avec le total de commande du gain AGC (radio).

Des valeurs distinctes de total de commande du gain AGC sont appliquées dans chacun des champs AGC activés dans RadioCentral.

Accès seulement :

(Si l'utilisateur règle le Niveau de configuration audio à **De base**) Quand un des champs AGC est activé, ce champ est activé; ou

(Si l'utilisateur règle le Niveau de configuration audio à **Amélioré**) Quand un champ AGC (radio) est activé, le champ Total de commande du gain AGC (radio) est activée. Quand n'importe quel des champs AGC (accessoire) est activé, le champ Total de commande du gain AGC (accessoire) est activé.

Les sélections suivantes sont prises en charge :

Tableau 324 : Portée

Minimum	Maximum	Incréments
-12 décibels	12 décibels	3 décibels

10.49.2.37

Analogique (gain fixe du microphone interne)

Ce champ permet de sélectionner la valeur du gain audio fixe (également appelé « linéaire ») à utiliser pour le microphone interne ou externe de la radio.

Cette sélection ne s'applique que lorsque la radio émet en mode analogique. Le gain linéaire permet d'ajouter un gain net au signal. Cette sélection s'applique au profil radio courant.

Accès seulement : Lorsque la case AGC analogique est décochée.

Les sélections suivantes sont prises en charge :

Tableau 325 : Portée

Minimum	Maximum	Incréments
-12 décibels	12 décibels	3 décibels

10.49.2.38

Gain fixe analogique (accessoire)

Permet de sélectionner la valeur du gain audio fixe (également appelé « linéaire ») à utiliser pour le microphone interne ou externe de la radio.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Cette sélection ne s'applique que lorsque la radio émet en mode analogique. Le gain linéaire permet d'ajouter un gain net au signal. Cette sélection s'applique au profil radio courant.

Accès seulement : Lorsque la case AGC analogique est décochée.

Les sélections suivantes sont prises en charge :

Tableau 326 : Portée

Minimum	Maximum	Incréments
-12 décibels	12 décibels	3 décibels

10.49.2.39

Numérique (gain fixe)

Ce champ permet de sélectionner la valeur du gain audio fixe (également appelé « linéaire ») à utiliser pour le microphone interne ou externe de la radio.

Cette sélection ne s'applique que lorsque la radio émet en mode numérique. Le gain linéaire permet d'ajouter un gain net au signal. Cette sélection s'applique au profil radio courant.

Accès seulement : Lorsque le champ [AGC numérique à la page 713](#) est Désactivé.

Tableau 327 : Portée

Minimum	Maximum	Incréments
-12 décibels	12 décibels	3 décibels

10.49.2.40

Gain fixe numérique (accessoire)

Permet de sélectionner la valeur du gain audio fixe (également appelé « linéaire ») à utiliser pour le microphone interne ou externe de la radio.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Cette sélection ne s'applique que lorsque la radio émet en mode SecureNet. Le gain linéaire permet d'ajouter un gain net au signal. Cette sélection s'applique au profil radio courant.

Accès seulement : Lorsque le champ [AGC Securenet \(Accessoire\) à la page 716](#) est désactivé et que le modèle ou l'option de la radio le permet.

Tableau 328 : Portée

Minimum	Maximum	Incréments
-12 décibels	12 décibels	3 décibels

10.49.2.41

Gain fixe Securenet (radio)

Permet de sélectionner la valeur du gain audio fixe (également appelé « linéaire ») à utiliser pour le microphone interne ou externe de la radio.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Cette sélection ne s'applique que lorsque la radio émet en mode SecureNet. Le gain linéaire permet d'ajouter un gain net au signal. Cette sélection s'applique au profil radio courant.

Accès seulement : Lorsque le champ [Securenet AGC à la page 715](#) est désactivé et que le modèle ou l'option de la radio le permet.

Tableau 329 : Portée

Minimum	Maximum	Incréments
-12 décibels	12 décibels	3 décibels

10.49.2.42

Gain fixe Securenet (accessoire)

Permet de sélectionner la valeur du gain audio fixe (également appelé « linéaire ») à utiliser pour le microphone interne ou externe de la radio.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Cette sélection ne s'applique que lorsque la radio émet en mode SecureNet. Le gain linéaire permet d'ajouter un gain net au signal. Cette sélection s'applique au profil radio courant.

Accès seulement : lorsque le champ AGC SecureNet est activé et que le modèle ou l'option de la radio le permet.

Tableau 330 : Portée

Minimum	Maximum	Incréments
-12 décibels	12 décibels	3 décibels

10.49.2.43

Équilibre numérique/analogique

Ce champ permet d'égaliser ou d'équilibrer le niveau audio des transmissions lors du passage du mode analogique au mode numérique, et inversement, par profil.

Le tableau suivant répertorie les sélections effectuées ainsi que l'échantillon de clip audio pour l'équilibre numérique/analogique.

La sélection est soit **désactivé**, soit **activé**.

AVERTISSEMENT :

(Si vous réglez le Niveau de configuration audio à **De base**.) Lorsque ce champ est activé, l'AGC numérique (radio et accessoire), l'AGC analogique (radio et accessoire) dans le même enregistrement/rangée de profil radio doivent tous être **désactivés**, sans quoi cette sélection est considérée non valide.

(Si vous réglez le Niveau de configuration audio à **Amélioré**.) Lorsque le champ Équilibre numérique/analogique est activé, l'AGC numérique (radio), l'AGC analogique (radio) dans le même enregistrement ou la même rangée du profil radio doivent tous être **désactivés**, sans quoi cette sélection est considérée non valide.

(Si vous réglez le Niveau de configuration audio à **Amélioré**.) Lorsque le champ Équilibre numérique/analogique (accessoire) est activé, l'AGC numérique (accessoire) et l'AGC analogique (accessoire) dans le même enregistrement/rangée du profil radio doivent tous être **désactivés**, sans quoi cette sélection est considérée non valide.

REMARQUE :

Si vous réglez le Niveau de configuration audio à **De base**, le champ Équilibre numérique/analogique (accessoire) est en lecture seule (sauf et uniquement pour les radios APX3000).

Pour les radios non-APX3000, la valeur de l'équilibre numérique/analogique (accessoire) est synchronisée à partir de l'équilibre numérique/analogique (radio).

Pour les radios APX3000, la valeur de l'équilibre numérique/analogique (accessoire) est synchronisée avec l'équilibre numérique/analogique (radio).

Le total de commande du gain AGC est appliqué à tous les champs AGC activés dans RadioCentral.

Accès seulement :

(Si le Niveau de configuration audio est réglé à **De base**.) Lorsque n'importe lequel des champs AGC est activé, les champs Équilibre numérique/analogique sont activés; ou

(Si le Niveau de configuration audio est réglé à **Amélioré**.) Lorsque n'importe lequel des champs AGC (radio) est activé, les champs Équilibre numérique/analogique sont activés. Lorsque n'importe quel des champs AGC (accessoire) est activé, le champ Équilibre numérique/analogique (accessoire) est activé; ou

Lorsque le champ Toute la radio - Équilibre numérique/analogique est réglé à **Par profil**.

10.49.2.44

Équilibre numérique/analogique (accessoire)

Permet d'égaliser ou d'équilibrer le niveau audio des transmissions lors du passage du mode analogique au mode numérique, et inversement, par profil.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

La sélection est soit **désactivé**, soit **activé**.

AVERTISSEMENT :

(Si l'utilisateur définit le champ Niveau de configuration audio à **De base**.) Lorsque ce champ est activé, l'AGC numérique (radio et accessoire), l'AGC analogique (radio et accessoire) du même enregistrement ou de la même rangée de Profil radio doivent tous être réglés à **Désactivé**, faute quoi cette sélection est considérée non valide.

(Si l'utilisateur définit le Niveau de configuration audio à **Amélioré**.) Lorsque le champ Équilibre numérique/analogique est activé, l'AGC numérique (radio), l'AGC analogique (radio) du même enregistrement ou de la même rangée du Profil radio doivent tous être réglés à **Désactivé**, faute quoi cette sélection est considérée non valide.

(Si l'utilisateur définit le Niveau de configuration audio à **Amélioré**.) Lorsque le champ Équilibre numérique/analogique (accessoire) est activé, l'AGC numérique (accessoire), l'AGC analogique (accessoire) du même enregistrement ou de la même rangée du Profil radio doivent tous être réglés à **Désactivé**, faute quoi cette sélection est considérée non valide.

REMARQUE :

Si l'utilisateur règle le Niveau de configuration audio à **De base**, alors le champ de la sortie de commande du gain AGC (accessoire) champ est en lecture seule (sauf et uniquement pour les radios APX3000).

Pour les radios non-APX3000, la valeur de l'équilibre numérique/analogique (accessoire) est synchronisée à partir de l'équilibre numérique/analogique (radio).

Pour les radios APX3000, la valeur de l'équilibre numérique/analogique (accessoire) est synchronisée avec l'équilibre numérique/analogique (radio).

Le total de commande du gain AGC est appliqué à tous les champs AGC activés dans RadioCentral.

Accès seulement :

(Si le Niveau de configuration audio est réglé à **De base**.) Lorsque n'importe lequel des champs AGC est activé, les champs Équilibre numérique/analogique sont activés; ou

(Si le Niveau de configuration audio est réglé à **Amélioré**.) Lorsque n'importe lequel des champs AGC (radio) est activé, les champs Équilibre numérique/analogique sont activés. Lorsque n'importe quel des champs d'activation AGC (accessoire) est activé, le champ Équilibre numérique/analogique (accessoire) est activé. Ou

Lorsque le champ Équilibre numérique/analogique de la fenêtre Toute la radio est réglé à **Par profil**.

10.49.2.45

Réglages de groupe (radio)

L'objectif de ce champ est de définir un ensemble de valeurs pour les champs Section égalisation audio dans Microphone/Groupe de paramètres Tx.

Lorsque la valeur Réglage de groupe est réglée à autre chose que **Personnalisé**, la valeur des champs qui se trouvent dans cette section est modifiée conformément. Tous les champs doivent devenir non modifiables lorsque le réglage de groupe n'est pas réglé à **Personnalisé**.

REMARQUE :

Pour le réglage **Personnalisé**, il est hautement recommandé d'éviter les réglages maximum pour les mêmes bandes de fréquences entre les égalisations du microphone et du haut-parleur.

La liste suivante répertorie les sélections et les définitions pour les paramètres du groupe égalisation audio (radio) et les mêmes pour l'accessoire sous Haut-parleur/Groupe de paramètres RX.

Normal

Bande de fréquences graves est **0**, Bande de fréquences moyennes est **0** et Bande de fréquences aiguës est **0**.

Amplification des aigus

Bande de fréquences graves est **0**, Bande de fréquences moyennes est **0** et Bande de fréquences aigües est **6**.

Coupe-bas

Bande de fréquences graves est **-9**, Bande de fréquences moyennes est **0** et Bande de fréquences aigües est **0**.

XTS

Bande de fréquences graves est **-3**, Bande de fréquences moyennes est **0** et Bande de fréquences aigües est **6**.

Personnalisé

Utilisez l'option personnalisée pour définir individuellement un réglage unique de gain d'égalisation audio pour le haut-parleur qui n'est pas pris en charge par les autres options du menu Réglage de groupe. Il est hautement recommandé d'éviter les réglages maximum pour les mêmes bandes de fréquences entre les égalisations du microphone et du haut-parleur.

10.49.2.46

Réglage du groupe (accessoire)

L'objectif de ce champ est de définir un ensemble de valeurs pour les champs Section égalisation audio dans Microphone/Groupe de paramètres Tx.

Lorsque la valeur Réglage de groupe est réglée à autre chose que **Personnalisé**, la valeur des champs qui se trouvent dans cette section est modifiée conformément. Tous les champs doivent devenir non modifiables lorsque le réglage de groupe n'est pas réglé à **Personnalisé**.

**REMARQUE :**

Pour le réglage **Personnalisé**, il est hautement recommandé d'éviter les réglages maximum pour les mêmes bandes de fréquences entre les égalisations du microphone et du haut-parleur.

La liste suivante répertorie les sélections et les définitions pour les paramètres du groupe égalisation audio (radio) et les mêmes pour l'accessoire sous Haut-parleur/Groupe de paramètres RX.

Normal

La bande de fréquences graves est **0**, la bande de fréquences moyennes est **0** et la bande de fréquences aigües est **0**.

Amplification des aigus

Bande de fréquences graves est **0**, Bande de fréquences moyennes est **0** et Bande de fréquences aigües est **6**.

Coupe-bas

Bande de fréquences graves est **-9**, Bande de fréquences moyennes est **0** et Bande de fréquences aigües est **0**.

XTS

Bande de fréquences graves est **-3**, Bande de fréquences moyennes est **0** et Bande de fréquences aigües est **6**.

Personnalisé

Utilisez l'option personnalisée pour définir individuellement un réglage unique de gain d'égalisation audio pour le haut-parleur qui n'est pas pris en charge par les autres options du menu Réglage de groupe. Il est hautement recommandé d'éviter les réglages maximum pour les mêmes bandes de fréquences entre les égalisations du microphone et du haut-parleur.

10.49.2.47

Bande basse fréquence

Permet de sélectionner le niveau sonore des appels émis dans un environnement analogique/numérique/Securenet.

Cette sélection s'applique au profil radio courant.

Tableau 331 : Portée

Minimum	Maximum
-12	12

10.49.2.48

Bande basse fréquence (accessoire)

Permet de sélectionner le niveau sonore des appels émis dans un environnement analogique/numérique/Securenet.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Cette sélection s'applique au profil radio courant.

Tableau 332 : Portée

Minimum	Maximum
-12	12

10.49.2.49

Bande fréquence moyenne

Permet de sélectionner le niveau sonore des appels émis dans un environnement analogique/numérique/Securenet.

Cette sélection s'applique au profil radio courant.

Tableau 333 : Portée

Minimum	Maximum
-12	12

10.49.2.50

Bande fréquence moyenne (Accessoire)

Permet de sélectionner le niveau sonore des appels émis dans un environnement analogique/numérique/Securenet.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Cette sélection s'applique au profil radio courant.

Tableau 334 : Portée

Minimum	Maximum
-12	12

10.49.2.51

Bande haute fréquence (radio)

Permet de sélectionner le niveau sonore des appels émis dans un environnement analogique/numérique/Securenet.

Cette sélection s'applique au profil radio courant.

Les sélections suivantes sont prises en charge :

Tableau 335 : Portée

Minimum	Maximum
-12	12

10.49.2.52

Bande fréquences aiguës (accessoire)

Permet de sélectionner le niveau sonore des appels émis dans un environnement analogique/numérique/Securenet.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Cette sélection s'applique au profil radio courant.

Les sélections suivantes sont prises en charge :

Tableau 336 : Portée

Minimum	Maximum
-12	12

10.49.2.53

Réglage du volume : Volume maximal

Permet de sélectionner le niveau du volume le plus élevé pour les appels vocaux reçus.

Le volume de réception des appels vocaux ne dépasse jamais le niveau sélectionné.

REMARQUE :

Voir aussi le réglage Compensation de la tonalité de réglage du volume. Cette sélection s'applique au profil radio courant.

AVERTISSEMENT :

La valeur de ce champ doit être supérieure à celle du champ Volume minimal, autrement les deux champs seront non valides.

RENSEIGNEMENTS IMPORTANTS AU SUJET DE LA CONFIGURATION DES ÉCOUTEURS INTÉGRÉS AUX CASQUES DE MOTOCYCLETTES : ATTENTION: si la radio est utilisée avec des écouteurs intégrés à un casque de motocyclette, ne réglez pas son volume de réception des appels vocaux au niveau le plus élevé. Pour éviter tout dommage auditif, l'utilisateur doit réduire le volume de réception des appels vocaux à 130 ou moins.

RENSEIGNEMENTS IMPORTANTS LORS DE L'UTILISATION DES ENSEMBLES DE SURVEILLANCE IMPRES : RLN5882, RLN5883, RLN5886, RLN6483, RLN6484, PMLN5111, PMLN5112, PMLN6123, PMLN6124, PMLN6129, PMLN6130 ainsi que L'ENSEMBLE POUR ENVIRONNEMENTS À FAIBLE NIVEAU SONORE RLN5886 : ATTENTION: si la radio APX est utilisée avec les accessoires mentionnés ci-dessus, ne réglez pas son volume de réception des appels au niveau le plus élevé. Pour éviter tout dommage auditif, l'utilisateur doit réduire le volume de réception des appels vocaux à 160 ou moins.

IMPORTANT :

Pour que le volume maximal de la tonalité d'alerte de la radio reste à un niveau constant plus haut ou plus bas que le volume maximal de réception des appels vocaux de la radio (défini dans ce champ), il faut utiliser la fonction Compensation du volume (dB).

Lorsque la fonction Compensation du volume (dB) est réglée à « 0 » (zéro), la radio utilise toujours la valeur du champ Volume audio maximal comme volume maximal, quel que soit le réglage du champ Volume maximal de la tonalité d'alerte.

Les sélections suivantes sont prises en charge :

Tableau 337 : Portée

Minimum	Maximum
1	255

REMARQUE :

5 = 1 décibel (dB)

10.49.2.54

Réglage du volume : Volume minimal

Permet de sélectionner le niveau du volume minimum pour la réception des appels vocaux.

Le volume de la radio ne sera jamais inférieur à ce niveau, même si l'utilisateur radio règle la commande de volume de la radio à **0** (zéro). Voir aussi le réglage Compensation de la tonalité de réglage du volume. Cette sélection s'applique au profil radio courant.

**AVERTISSEMENT :**

La valeur de ce champ doit être inférieure à celle du champ Volume maximal, sinon les deux champs seront non valides.

**IMPORTANT :**

Pour que le volume minimum de la tonalité d'alerte de la radio reste à un niveau constant plus haut ou plus bas que le volume minimum de réception des appels vocaux de la radio (défini dans ce champ), il faut utiliser la fonction Compensation du volume (dB).

Lorsque la fonction Compensation du volume (dB) est réglée à **0** (zéro), la radio utilise toujours la valeur du champ Volume audio minimal pour ce volume minimal, quel que soit le réglage du champ Volume minimal.

10.49.2.55**Compensation du volume de la tonalité d'alerte (dB)**

Permet de sélectionner la valeur, en décibels (dB), de l'augmentation ou de la diminution du volume d'une tonalité d'alerte, comparativement à la valeur sélectionnée par l'utilisateur radio.

Voir aussi le réglage Compensation de la tonalité de réglage du volume. Cette sélection s'applique au profil radio courant.

Si vous désirez augmenter ou diminuer le volume : Réglez les champs Volume maximal et Volume audio maximal à la même valeur, et réglez les champs Volume minimal et Volume audio minimal à la même valeur, puis utilisez ce paramètre Compensation du volume de la tonalité d'alerte pour que les tonalités d'alerte de la radio soient à un niveau constant supérieur ou inférieur au volume de réception de la voix de la radio.

**IMPORTANT :**

Lorsque le champ Compensation du volume de la tonalité d'alerte est réglé à **0** (zéro) :
La radio utilise toujours le paramètre du champ Volume maximal comme volume maximal quel que soit le réglage du champ Volume maximal de la tonalité d'alerte.

La radio utilise toujours le paramètre du champ Volume minimal comme volume minimal quel que soit le réglage du champ Volume minimal de la tonalité d'alerte.

Accès seulement : Lorsque le champ Tonalités d'alerte est **activé**.

Les sélections suivantes sont prises en charge :

Tableau 338 : Portée

Minimum	Maximum	Incréments
-26 décibels	25 décibels	1 décibel

10.49.2.56**Volume minimal de la tonalité d'alerte**

Permet de sélectionner le niveau minimal des tonalités d'alerte, peu importe l'intensité du volume réglée par l'utilisateur radio.

Voir aussi le réglage Compensation de la tonalité de réglage du volume. Cette sélection s'applique au profil radio courant.

AVERTISSEMENT :

La valeur de ce champ doit être inférieure à celle du champ Volume maximal, sinon les deux champs seront non valides.

IMPORTANT :

Pour que le volume minimum de la tonalité d'alerte de la radio (défini dans ce champ) reste à un niveau constant plus haut ou plus bas que le volume de réception des appels vocaux minimum de la radio (défini dans le champ Volume minimum) il faut utiliser la fonction Compensation du volume (dB).

Lorsque la fonction Compensation du volume (dB) est réglée à « 0 » (zéro), la radio utilise toujours la valeur du champ Volume audio minimal pour ce volume minimal, quel que soit le réglage du champ Volume minimal.

Accès seulement : Lorsque le champ Tonalités d'alerte est **activé**.

Les sélections suivantes sont prises en charge :

Tableau 339 : Portée

Minimum	Maximum
0	200

10.49.2.57

Volume maximal de la tonalité d'alerte

Permet de sélectionner le niveau du volume des tonalités d'alerte le plus élevé. Le champ Compensation du volume (dB) peut avoir priorité sur ce réglage.

Voir aussi le réglage Compensation de la tonalité de réglage du volume. Cette sélection s'applique au profil radio courant.

AVERTISSEMENT :

La valeur de ce champ doit être supérieure à celle du champ Volume minimal, autrement les deux champs seront non valides.

REMARQUE :

Pour que le volume maximum de la tonalité d'alerte de la radio (défini dans ce champ) reste à un niveau constant plus haut ou plus bas que le volume de réception des appels vocaux maximum de la radio (défini dans le champ Volume maximum) il faut utiliser la fonction Compensation du volume (dB).

Lorsque la fonction Compensation du volume (dB) est réglée à **0** (zéro), la radio utilise toujours la valeur du champ Volume audio maximal pour ce volume maximal, quel que soit le réglage du champ Volume maximal.

Les sélections suivantes sont prises en charge :

Tableau 340 : Portée

Minimum	Maximum
0	255

REMARQUE :

5 = 1 décibel (dB)

10.49.2.58

Réglages de groupe (radio)

L'objectif de ce champ est de définir un ensemble de valeurs pour les champs Section égalisation audio dans Haut-parleur/Groupe de paramètres Tx.

Lorsque la valeur Réglage de groupe est réglée à autre chose que **Personnalisé**, la valeur des champs qui se trouvent dans cette section est modifiée conformément. Lorsque le paramètre du groupe n'est pas sur **Personnalisé**, alors tous les champs ne s'affichent qu'en lecture seule.

Les sélections suivantes répertorient les sélections et les définitions pour les paramètres du groupe égalisation audio (radio) et les mêmes pour l'accessoire sous Haut-parleur/Groupe de paramètres RX.

Normal

La valeur des champs suivants est réglée à : [Bande fréquences graves analogiques \(accessoire\) à la page 732](#) est **0**, [Bande fréquences moyennes analogiques \(accessoire\) à la page 732](#) est **0**, [Bande fréquences aiguës analogiques \(accessoire\) à la page 733](#) est **0**, Bande de fréquences graves numérique est **0**, Bande de fréquences moyennes numérique est **0**, Bande de fréquences aiguës numérique est **0**, Bande de fréquences graves Securenet est **0**, Bande de fréquences moyennes Securenet est **0** et Bande de fréquences aiguës Securenet est **0**.

Amplification des aigus

La valeur des champs suivants est réglée à : [Bande fréquences graves analogiques \(accessoire\) à la page 732](#) est **0**, [Bande fréquences moyennes analogiques \(accessoire\) à la page 732](#) est **0**, [Bande fréquences aiguës analogiques \(accessoire\) à la page 733](#) est **6**, Bande de fréquences graves numérique est **0**, Bande de fréquences moyennes numérique est **0**, Bande de fréquences aiguës numérique est **6**, Bande de fréquences graves Securenet est **0**, Bande de fréquences moyennes Securenet est **0** et Bande de fréquences aiguës Securenet est **6**.

Coupe-bas

La valeur des champs suivants est réglée à : [Bande fréquences graves analogiques \(accessoire\) à la page 732](#) est **-9**, [Bande fréquences moyennes analogiques \(accessoire\) à la page 732](#) est **0**, [Bande fréquences aiguës analogiques \(accessoire\) à la page 733](#) est **0**, Bande de fréquences graves numérique est **-9**, Bande de fréquences moyennes numérique est **0**, Bande de fréquences aiguës numérique est **0**, Bande de fréquences graves Securenet est **-9**, Bande de fréquences moyennes Securenet est **0** et Bande de fréquences aiguës Securenet est **0**.

Réduire rétroaction

La valeur des champs suivants est réglée à : [Bande fréquences graves analogiques \(accessoire\) à la page 732](#) est **-6**, [Bande fréquences moyennes analogiques \(accessoire\) à la page 732](#) est **0**, [Bande fréquences aiguës analogiques \(accessoire\) à la page 733](#) est **-6**, Bande de fréquences graves numérique est **-6**, Bande de fréquences moyennes numérique est **0**, Bande de fréquences aiguës numérique est **-6**, Bande de fréquences graves Securenet est **-6**, Bande de fréquences moyennes Securenet est **0** et Bande de fréquences aiguës Securenet est **-6**.

Personnalisé

Utilisez l'option personnalisée pour définir individuellement un réglage unique de gain d'égalisation audio pour le haut-parleur qui n'est pas pris en charge par les autres options du menu Réglage de groupe. Il est hautement recommandé d'éviter les réglages maximum pour les mêmes bandes de fréquences entre les égalisations du microphone et du haut-parleur.

10.49.2.59

Réglage du groupe (accessoire)

L'objectif de ce champ est de définir un ensemble de valeurs pour les champs Section égalisation audio dans Haut-parleur/Groupe de paramètres Tx.

Lorsque la valeur Réglage de groupe est réglée à autre chose que **Personnalisé**, la valeur des champs qui se trouvent dans cette section est modifiée conformément. Lorsque le paramètre du groupe n'est pas sur **Personnalisé**, alors tous les champs ne s'affichent qu'en lecture seule.

Les sélections suivantes répertorient les sélections et les définitions pour les paramètres du groupe égalisation audio (radio) et les mêmes pour l'accessoire sous Haut-parleur/Groupe de paramètres RX.

Normal

La valeur des champs suivants est réglée à : [Bande fréquences graves analogiques \(accessoire\) à la page 732](#) est **0**, [Bande fréquences moyennes analogiques \(accessoire\) à la page 732](#) est **0**, [Bande fréquences aiguës analogiques \(accessoire\) à la page 733](#) est **0**, [Bande fréquences graves numériques \(accessoire\) à la page 734](#) est **0**, [est Bande fréquences moyennes numériques \(Accessoires\) à la page 735](#) est **0**, [Bande fréquences aiguës numériques \(Accessoires\) à la page 735](#) est **0**, [Bande de fréquences graves Securenet](#) est **0**, [Bande de fréquences moyennes Securenet](#) est **0**, et [Bande fréquences aiguës Securenet \(radio\) à la page 737](#) est **0**.

Amplification des aigus

La valeur des champs suivants est réglée à : [Bande fréquences graves analogiques \(accessoire\) à la page 732](#) est **0**, [Bande fréquences moyennes analogiques \(accessoire\) à la page 732](#) est **0**, [Bande fréquences aiguës analogiques \(accessoire\) à la page 733](#) est **6**, [Bande fréquences graves numériques \(accessoire\) à la page 734](#) est **0**, [est Bande fréquences moyennes numériques \(Accessoires\) à la page 735](#) est **0**, [Bande fréquences aiguës numériques \(Accessoires\) à la page 735](#) est **6**, [Bande de fréquences graves Securenet](#) est **0**, [Bande de fréquences moyennes Securenet](#) est **0**, et [Bande fréquences aiguës Securenet \(radio\) à la page 737](#) est **6**.

Coupe-bas

La valeur des champs suivants est réglée à : [Bande fréquences graves analogiques \(accessoire\) à la page 732](#) est **-9**, [Bande fréquences moyennes analogiques \(accessoire\) à la page 732](#) est **0**, [Bande fréquences aiguës analogiques \(accessoire\) à la page 733](#) est **0**, [Bande de fréquences graves numérique](#) est **-9**, [Bande de fréquences moyennes numérique](#) est **0**, [Bande de fréquences aiguës numérique](#) est **0**, [Bande de fréquences graves Securenet](#) est **-9**, [Bande de fréquences moyennes Securenet](#) est **0** et [Bande de fréquences aiguës Securenet](#) est **0**.

Réduire rétroaction

La valeur des champs suivants est réglée à : [Bande fréquences graves analogiques \(accessoire\) à la page 732](#) est **-6**, [Bande fréquences moyennes analogiques \(accessoire\) à la page 732](#) est **0**, [Bande fréquences aiguës analogiques \(accessoire\) à la page 733](#) est **-6**, [Bande de fréquences graves numérique](#) est **-6**, [Bande de fréquences moyennes numérique](#) est **0**, [Bande de fréquences aiguës numérique](#) est **-6**, [Bande de fréquences graves Securenet](#) est **-6**, [Bande de fréquences moyennes Securenet](#) est **0** et [Bande de fréquences aiguës Securenet](#) est **-6**.

Personnalisé

Utilisez l'option personnalisée pour définir individuellement un réglage unique de gain d'égalisation audio pour le haut-parleur qui n'est pas pris en charge par les autres options du menu Réglage de groupe. Il est hautement recommandé d'éviter les réglages maximum pour les mêmes bandes de fréquences entre les égalisations du microphone et du haut-parleur.

10.49.2.60

Bande de fréquences graves analogiques (radio)

Permet de sélectionner le niveau sonore des appels reçus dans un environnement analogique.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Cette sélection s'applique au profil radio courant.

Tableau 341 : Portée

Personnalisé

Utilisez l'option personnalisée pour définir individuellement un réglage unique de gain d'égalisation audio pour le haut-parleur qui n'est pas pris en charge par les autres options du menu Réglage de groupe. Il est hautement recommandé d'éviter les réglages maximum pour les mêmes bandes de fréquences entre les égalisations du microphone et du haut-parleur.

10.49.2.80

Sortie de commande du gain AGC (radio)

Permet de sélectionner le gain de la radio afin que le volume émis soit supérieur (valeurs positives), inférieur (valeurs négatives) ou égal (0) au volume des appels reçus.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Le niveau réglé dans le champ Sortie de commande du gain AGC est appliqué après l'exécution de la commande automatique du gain (AGC). Lorsque la voix captée par le microphone est au-dessus du niveau nominal, le champ Sortie de commande du gain AGC applique un ratio infini de 1 dB. Ainsi, lorsque la voix captée par le microphone est supérieure au niveau nominal, le niveau de la sortie ne sera jamais supérieur au niveau réglé à l'aide de ce paramètre. Cette sélection s'applique au profil radio courant.

REMARQUE :

Si l'utilisateur règle le Niveau de configuration audio à **De base**, alors le champ Sortie de commande du gain AGC (accessoire) est en lecture seule (sauf pour les radios APX3000).

Pour les radios non-APX3000, la valeur totale de commande du gain AGC (accessoire) est synchronisée à partir de la sortie de commande du gain AGC (radio).

Pour les radios APX3000, la valeur totale de commande du gain AGC (accessoire) est synchronisée avec la sortie de commande du gain AGC (radio).

La sortie de commande du gain AGC est appliquée à tous les champs activés dans RadioCentral.

Accès seulement :

(Si l'utilisateur règle le Niveau de configuration audio à **De base**) Quand un des champs AGC est activé, ce champ est activé; ou

(Si l'utilisateur règle le Niveau de configuration audio à **Amélioré**) Quand un champ AGC (radio) est activé, le champ Sortie de commande du gain AGC (radio) est activé. Lorsque n'importe quel des

champ AGC (accessoire) est activé, le champ de sortie de commande du gain AGC (accessoire) est activé.

Tableau 359 : Portée

Minimum	Maximum	Incréments
-12 décibels	12 décibels	3 décibels

10.49.2.81

Sortie de commande du gain AGC (Accessoire)

Permet de sélectionner le gain de la radio afin que le volume émis soit supérieur (valeurs positives), inférieur (valeurs négatives) ou égal (« 0 ») au volume des appels reçus.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Le niveau réglé dans le champ Sortie de commande du gain AGC est appliqué après l'exécution de la commande automatique du gain (AGC). Lorsque la voix captée par le microphone est au-dessus du niveau nominal, le champ Sortie de commande du gain AGC applique un ratio infini de 1 dB. Ainsi, lorsque la voix captée par le microphone est supérieure au niveau nominal, le niveau de la sortie ne sera jamais supérieur au niveau réglé à l'aide de ce paramètre. Cette sélection s'applique au profil radio courant.

REMARQUE :

Si l'utilisateur règle le Niveau de configuration audio à **De base**, alors le champ Sortie de commande du gain AGC (accessoire) est en lecture seule (sauf pour les radios APX3000).

Pour les radios non-APX3000, la valeur totale de commande du gain AGC (accessoire) est synchronisée à partir de la sortie de commande du gain AGC (radio).

Pour les radios APX3000, la valeur totale de commande du gain AGC (accessoire) est synchronisée avec la sortie de commande du gain AGC (radio).

La sortie de commande du gain AGC est appliquée à tous les champs activés dans RadioCentral.

Accès seulement :

(Si l'utilisateur règle le Niveau de configuration audio à **De base**) Quand un des champs AGC est activé, ce champ est activé; ou

(Si l'utilisateur règle le Niveau de configuration audio à **Amélioré**) Quand un champ AGC (radio) est activé, le champ Sortie de commande du gain AGC (radio) est activé. Lorsque n'importe quel des champ AGC (accessoire) est activé, le champ de sortie de commande du gain AGC (accessoire) est activé.

Tableau 360 : Portée

Minimum	Maximum	Incréments
-12 décibels	12 décibels	3 décibels

10.49.2.82

Total de commande du gain AGC (Radio)

Permet de sélectionner le gain de la radio afin que le volume émis soit supérieur (valeurs positives), inférieur (valeurs négatives) ou égal (0) au volume des appels reçus pour le profil radio courant.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Le niveau réglé dans le champ Total de commande du gain AGC (également appelé « gain net ») est appliqué avant l'exécution de la commande automatique du gain (AGC). Pour les entrées de microphone inférieures au niveau nominal : sortie de microphone réelle = entrée de microphone + total de commande du gain AGC.

REMARQUE :

Si l'utilisateur règle le Niveau de configuration audio à **De base**, alors le champ Total de commande du gain AGC (accessoire) est en lecture seule (sauf pour les radios APX3000).

Pour les radios non-APX3000, la valeur du total de commande du gain AGC (accessoire) est synchronisée à partir du total de commande du gain AGC (radio).

Pour les radios APX3000, la valeur du total de commande du gain (accessoire) est synchronisée avec le total de commande du gain AGC (radio).

Des valeurs distinctes de total de commande du gain AGC sont appliquées dans chacun des champs AGC activés dans RadioCentral.

Accès seulement :

(Si l'utilisateur règle le Niveau de configuration audio à **De base**) Quand un des champs AGC est activé, ce champ est activé; ou

(Si l'utilisateur règle le Niveau de configuration audio à **Amélioré**) Quand un champ AGC (radio) est activé, le champ Total de commande du gain AGC (radio) est activée. Quand n'importe quel des champs AGC (accessoire) est activé, le champ Total de commande du gain AGC (accessoire) est activé.

Le tableau suivant répertorie les valeurs maximale et minimale de la sortie de commande du gain AGC ainsi que des exemples de clips audio correspondant aux valeurs spécifiques saisies.

Tableau 361 : Portée

Minimum	Maximum	Incréments
-12 décibels	12 décibels	3 décibels

10.49.2.83

Total de commande du gain AGC (Accessoire)

Permet de sélectionner le gain de la radio afin que le volume émis soit supérieur (valeurs positives), inférieur (valeurs négatives) ou égal (0) au volume des appels reçus pour le profil radio courant.

AVERTISSEMENT :

La valeur de ce champ doit uniquement être modifiée par le personnel de service qualifié. Des paramètres incorrects peuvent entraîner des résultats imprévisibles de la radio.

Le niveau réglé dans le champ Total de commande du gain AGC (également appelé « gain net ») est appliqué avant l'exécution de la commande automatique du gain (AGC). Pour les entrées de

microphone inférieures au niveau nominal : sortie de microphone réelle = entrée de microphone + total de commande du gain AGC.

REMARQUE :

Si l'utilisateur règle le Niveau de configuration audio à **De base**, alors le champ Total de commande du gain AGC (accessoire) est en lecture seule (sauf pour les radios APX3000).

Pour les radios non-APX3000, la valeur du total de commande du gain AGC (accessoire) est synchronisée à partir du total de commande du gain AGC (radio).

Pour les radios APX3000, la valeur du total de commande du gain (accessoire) est synchronisée avec le total de commande du gain AGC (radio).

Des valeurs distinctes de total de commande du gain AGC sont appliquées dans chacun des champs AGC activés dans RadioCentral.

Accès seulement :

(Si l'utilisateur règle le Niveau de configuration audio à **De base**) Quand un des champs AGC est activé, ce champ est activé; ou

(Si l'utilisateur règle le Niveau de configuration audio à **Amélioré**) Quand un champ AGC (radio) est activé, le champ Total de commande du gain AGC (radio) est activée. Quand n'importe quel des champs AGC (accessoire) est activé, le champ Total de commande du gain AGC (accessoire) est activé.

Les sélections suivantes sont prises en charge :

Tableau 362 : Portée

Minimum	Maximum	Incréments
-12 décibels	12 décibels	3 décibels

10.49.2.84

Suppression du retour acoustique

Lorsque cette fonction est activée, la suppression du retour acoustique supprime la retour ou le sifflement qui résulte d'un appel entre des radios à proximité les unes des autres.

Cette fonction est prise en charge par les modèles d'accessoires suivants des radios suivantes :

Tableau 363 : Modèles d'accessoires prenant la suppression du retour acoustique en charge

Radios	Modèles d'accessoires
APX SUIVANT	XV, XVP850, XVP830, XVE500, XVN500
APX N30	XVP730, XVP750, RM760, RM780
APX N50	
APX N70	

La suppression du retour acoustique n'est pas prise en charge par le mode d'émission de signaux SecureNet, les accessoires audio sans fil ou les deux.

Pour une performance optimale de la suppression du retour acoustique, il est recommandé de sélectionner **Normal** comme réglage du groupe pour l'égalisation audio du microphone et du haut-parleur. Appliquez le réglage du groupe recommandé, Normal, aux configurations de la radio et des accessoires. Ne sélectionnez pas le **Réglage personnalisé du groupe** pour la commande du gain sous Réglages du haut-parleur pour la configuration de l'accessoire.

Derechos de autor

Entre los productos Motorola Solutions que se describen en esta documentación, se pueden incluir programas informáticos de Motorola Solutions que están protegidos por derechos de autor. Las leyes de Estados Unidos y de otros países preservan para Motorola Solutions ciertos derechos exclusivos sobre los programas informáticos protegidos por derechos de autor. Del mismo modo, los programas informáticos protegidos por derechos de autor de Motorola Solutions incluidos en los productos de Motorola Solutions descritos en esta guía no se podrán copiar ni reproducir de ninguna forma sin el expreso consentimiento por escrito de Motorola Solutions.

Ninguna parte de este documento se puede reproducir, transmitir, almacenar en un sistema recuperable ni traducir a ningún idioma ni lenguaje informático, de ninguna forma ni por ningún medio, sin la autorización expresa por escrito de Motorola Solutions, Inc.

Marcas comerciales

MOTOROLA, MOTO, MOTOROLA SOLUTIONS y el logotipo de la M estilizada son marcas comerciales o marcas comerciales registradas de Motorola Trademark Holdings, LLC y se utilizan bajo licencia. Todas las demás marcas comerciales pertenecen a sus respectivos propietarios.

Derechos de licencia

No se considerará que la compra de productos Motorola Solutions otorgue, en forma directa, implícita, por exclusión ni de ningún otro modo, una licencia sobre los derechos de autor, las patentes o las solicitudes de patentes de Motorola Solutions, excepto la licencia normal, no exclusiva y libre de regalías de uso que surge por efecto de la ley de la venta de un producto.

Contenido de código abierto

Este producto puede contener un software de código abierto utilizado bajo licencia. Consulte los medios de instalación del producto para obtener el contenido completo de atribución y avisos legales de código abierto.

Directiva de Residuos de Aparatos Eléctricos y Electrónicos (RAEE) de la Unión Europea (UE) y el Reino Unido (RU)

En la directiva de RAEE de la Unión Europea y el Reino Unido, se exige que los productos que se venden en los países de la UE y en el Reino Unido tengan la etiqueta de un bote de basura tachado sobre el producto (o en el paquete en algunos casos). Como se define en la directiva de RAEE, esta etiqueta con un bote de basura tachado indica que los clientes y los usuarios finales en los países de la UE y el Reino Unido no deben desechar equipos ni accesorios eléctricos y electrónicos en la basura doméstica.

Los clientes o los usuarios finales en los países de la UE y en el Reino Unido deben comunicarse con su representante distribuidor de equipos o centro de servicio locales para obtener información acerca del sistema de recolección de residuos de su país.

Exención de responsabilidad

Tenga en cuenta que determinadas funciones, características y capacidades que se describen en este documento podrían no ser aplicables o no tener licencia para su uso en un sistema específico, o

bien pueden ser dependientes de las características de una unidad de suscriptor móvil específico o la configuración de ciertos parámetros. Comuníquese con un representante de Motorola Solutions para obtener más información.

Comuníquese con nosotros

El equipo de Operaciones centralizadas de soporte administrado (CMSO) es el principal contacto para solicitar la asistencia técnica incluida en el contrato de servicio de su organización con Motorola Solutions.

Los clientes con contrato de servicio deben llamar a CMSO en todas las situaciones que se mencionan en la sección “Responsabilidades del cliente” de su contrato, por ejemplo:

- Para confirmar los resultados y el análisis de la solución de problemas antes de tomar medidas.

Su organización recibió números telefónicos de asistencia y otros datos de contacto de acuerdo con su región geográfica y contrato de servicio. Use esa información de contacto para obtener una respuesta más eficaz. Sin embargo, si es necesario, también puede encontrar información de contacto de asistencia general en el sitio web de Motorola Solutions si sigue estos pasos:

- 1 Ingrese a motorolasolutions.com en su navegador.
- 2 Asegúrese de que el país o la región de su organización aparezcan en la página. Haga clic en el nombre de la región o presiónela para cambiarla.
- 3 Seleccione “Soporte” en la página motorolasolutions.com.

Comentarios

Envíe preguntas y comentarios acerca de la documentación del usuario a documentation@motorolasolutions.com.

Proporcione la siguiente información cuando informe sobre un error de documentación:

- El título del documento y el número de pieza.
- El número de página o el título de la sección que contiene el error.
- Una descripción del error.

Motorola Solutions ofrece diversos cursos diseñados para ayudar a conocer el sistema. Para obtener información, vaya a <https://learning.motorolasolutions.com> a fin de ver las ofertas de cursos actuales y las rutas tecnológicas.

Capítulo 1

Introducción a RadioCentral

RadioCentral proporciona funcionalidades de software para que los usuarios de APX NEXT™ y APX N70 administren las siguientes funciones en el dispositivo:

- Aprovisionamiento de todos los campos asociados
- Administración de las actualizaciones de firmware del software
- Activación de nuevas licencias en la función comprada

La base de datos de agencias de RadioCentral reside en una nube de Microsoft Azure. El cliente de seguridad pública de RadioCentral proporciona la capacidad de los usuarios de conectarse, iniciar sesión y acceder de forma segura a la base de datos de agencias seleccionadas.

La solución RadioCentral proporciona a los usuarios una opción de inicio de sesión seguro con cualquier conexión de red. El usuario puede utilizar RadioCentral para revisar y editar la configuración de ID del radio en una tabla fácil de usar, sin tener que abrir ni editar un archivo. El usuario puede aplicar los cambios de configuración o ajustes individuales mediante actualizaciones programadas a través de Wi-Fi y LTE.

Capítulo 2

Descripción general de la interfaz de usuario

En esta sección se describen las diferentes áreas de la interfaz de usuario de RadioCentral.

Las siguientes ventanas y funciones son compatibles en la descripción general de la interfaz de usuario:

[Íconos de menú y Selector de vista en la página 46](#)

[Panel de navegación en el cliente de configuración de RadioCentral en la página 46](#)

[Panel de programación en el cliente de configuración de RadioCentral en la página 47](#)

[Ventanas de información en el cliente de configuración de RadioCentral en la página 48](#)

2.1

Íconos de menú y Selector de vista

El usuario puede acceder a las funciones del menú principal y las vistas de cliente en la parte superior.

Mesa 1: Íconos de menú y Selector de vista

Ícono	Funcionalidad
	El menú Acciones contiene todas las funciones y operaciones que RadioCentral admite en una conveniente lista desplegable.
	El menú Programador está activado cuando se seleccionan uno o más radios en la ventana principal. El Programador permite leer, escribir o cambiar entre los trabajos a fin de que se programen para su ejecución inmediata o dentro de un período especificado.
	El Selector de vista cambia el conjunto de información que se muestra en las ventanas de programación.

2.2

Panel de navegación en el cliente de configuración de RadioCentral

El panel de navegación en el cliente de configuración de RadioCentral permite al usuario cambiar entre distintos elementos en las siguientes vistas:

- Vista de configuración
- Vista de explotación de datos
- Vista de licencias de radio
- Vista de recurso

Para ver las diferentes vistas, seleccione **Acciones**→**Administrar**.

Ocultar automáticamente la navegación

Para aumentar el área de programación a la derecha del panel de navegación, el usuario puede seleccionar el ícono de pin **Ocultar automáticamente**  en la sección de encabezado. Cuando se selecciona, el panel de navegación se desancla y se contrae a la izquierda. El nombre de la vista actual se muestra en dirección vertical. Cuando se selecciona el nombre de la vista vertical, se amplía el panel de navegación. Para fijar el panel de navegación en la aplicación, seleccione el ícono de fijación horizontal **Ocultar automáticamente**.

2.3

Panel de programación en el cliente de configuración de RadioCentral

El panel de programación en el cliente de configuración de RadioCentral es el área principal de la aplicación, en la que los usuarios seleccionan y configuran las funciones y propiedades del radio. La información está estructurada en un formato de tabla con encabezados de columna y filas para cada elemento.

2.3.1

Botones de funcionamiento en RadioCentral

Los botones de funcionamiento permiten que el usuario administre los datos del radio en la base de datos del servidor RadioCentral. Estos botones aparecen en las vistas principales, como Vista del radio, en las ventanas principales de un conjunto y también sobre las tablas de elemento de lista dentro de un conjunto.

NOTA:

Si un botón no está activado para la fila seleccionada, significa que la operación solicitada no es compatible. Algunas áreas en el panel de programación solo pueden permitir una única operación, como exportar.

Mesa 2: Botones operativos

Botón	Descripción
	El botón Editar se utiliza para modificar las propiedades de la fila seleccionada.
	El botón Agregar se utiliza para añadir elementos a la tabla.
	El botón Eliminar se utiliza para borrar el elemento seleccionado de la tabla.
	El botón Cuadrícula a archivo se utiliza para exportar los datos de las filas seleccionadas a un archivo CVS delimitado por comas.
	El botón Archivo a cuadrícula se utiliza para importar los datos de un archivo CVS delimitado por comas al servidor RadioCentral.

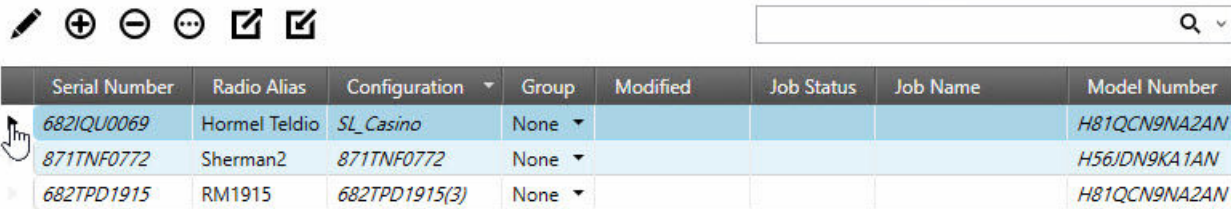

2.3.2

Selección de fila en RadioCentral

La selección de los elementos se realiza pasando el puntero a la izquierda de la fila pertinente y haciendo clic con el botón izquierdo del mouse.

Pasar el puntero sobre la primera columna en una fila cambia el puntero de uno estándar a uno de mano. Las teclas MAYÚS y CTRL se utilizan para seleccionar un rango de filas o filas específicas. Las filas seleccionadas quedan resaltadas.

Figura 1: Ejemplo de fila seleccionada

Serial Number	Radio Alias	Configuration	Group	Modified	Job Status	Job Name	Model Number
682IQU0069	Hornel Teldio	SL_Casino	None				H81QCN9NA2AN
871TNF0772	Sherman2	871TNF0772	None				H56JDN9KA1AN
682TPD1915	RM1915	682TPD1915(3)	None				H81QCN9NA2AN

2.3.3

Organizar y ocultar columnas en RadioCentral

Las columnas en el panel de programación se pueden organizar arrastrando cualquier columna por la sección de encabezado hacia una nueva ubicación.

Una vez que se selecciona y arrastra una columna, aparecen flechas encima y debajo de la sección de encabezado para indicar la nueva ubicación.

Las columnas que aparecen en el panel de programación se pueden ocultar para que muestren únicamente aquellas columnas de datos que sean relevantes. Para ocultar columnas, haga clic con el botón derecho en cualquier encabezado de columna para abrir la ventana **Selector de campo** y seleccione solo los campos relevantes que desee mostrar.

2.4

Ventanas de información en el cliente de configuración de RadioCentral

El cliente de configuración de RadioCentral proporciona ventanas de información en toda la parte inferior de la aplicación. De forma predeterminada, estas ventanas de información están ocultas, y solo los nombres se ven en pestañas.

Estas ventanas de información proporcionan al usuario detalles importantes y útiles sobre las operaciones que se realizan en la aplicación.

NOTA:

Las pestañas que aparecen dependen de la vista actual de la aplicación.

Se admiten las siguientes ventanas:

2.4.1

Ventana Analizar resultados

La ventana **Analizar resultados** muestra los errores o las advertencias que son el resultado de un trabajo de lectura o escritura programado. Cuando se programa un trabajo de lectura o escritura, el codeplug se compila, y se comprueban todas las validaciones y dependencias. Si se produce un error, el trabajo falla. Se deben realizar correcciones en la configuración. El usuario puede comprobar errores antes de programar un trabajo mediante el análisis del radio. Consulte [Análisis de la configuración del radio en la página 49](#).

Las siguientes columnas están disponibles en la tabla Analizar resultados:

Número de serie

Número de serie del radio seleccionado como parte del trabajo.

Configuración

Nombre de la configuración que se asigna al radio que se está analizando.

Ruta de elemento

Ruta dentro de la configuración hacia el campo que contiene el error. Haga doble clic en el mensaje de error, y RadioCentral automáticamente navega al campo, ya sea en la configuración o en el conjunto.

Descripción

Descripción de los errores (si hubiera).

Acciones

Acciones que se toman a partir de los errores (si hubiera).

Para reiniciar los radios en un lote, haga clic en el botón **Reiniciar todo en un radio**.

**NOTA:**

Todo el texto en la pestaña Analizar resultados es compatible con varios idiomas según la configuración de RadioCentral.

El resultado del análisis no se actualiza automáticamente, incluso si el usuario corrigió los errores o las advertencias. Realice nuevamente la operación de verificación de ortografía para confirmar si se reflejan o no los cambios realizados.

Si hay una operación en curso, RadioCentral no permite que el usuario realice otra operación de verificación de ortografía. Una operación de verificación de ortografía puede tener varios elementos.

El inicio de una operación nueva borrará los resultados de la operación anterior.

Si el conjunto al que se hace referencia no se agrega a la configuración, la ruta del elemento se identifica con una marca especial. Motorola Solutions recomienda agregar el conjunto mencionado a la configuración.

2.4.2

Análisis de la configuración del radio

La configuración del radio se puede analizar antes de que se programe un trabajo.

Procedimiento:

- 1 En **Vista del radio**, seleccione el o los radios relevantes.
- 2 Haga clic con el botón derecho sobre el radio seleccionado y seleccione **Analizar**.

**NOTA:**

La selección **Analizar** también se puede abrir seleccionando el acceso directo **Analizar** sobre el campo de búsqueda.

- 3 Expanda la ventana **Analizar resultados** haciendo clic en la pestaña **Analizar resultados** en la parte inferior.

Los radios sin errores muestran un ícono verde de verificación.

**NOTA:**

Cualquier error o advertencia se muestra bajo el botón de selección **Todo**. Para ver solo errores, seleccione el botón de selección **Errores**. Para ver solo advertencias, seleccione el botón de selección **Advertencias**.

El usuario puede iniciar la ayuda para elementos relacionados con errores seleccionando la fila con el error y presionando la tecla F1.

2.4.3

Ventana Tareas

En la ventana **Tareas**, se muestran los procesos en segundo plano que se realizan en RadioCentral. Cada vez que se realiza un proceso en segundo plano, como importar radios, o se lleva a cabo una eliminación por lotes en RadioCentral, se crea una tarea dentro del servidor RadioCentral y la información relacionada con la tarea se visualiza en la tabla Tareas.

El botón **Borrar** se utiliza para eliminar todas las tareas que aparecen en la tabla Tareas.

**NOTA:**

Cuando el usuario hace doble clic en cualquier fila, se visualizan detalles adicionales en la ventana **Vista de trabajo**.

El contenido de la ventana **tareas** se borra cuando el cliente de configuración de RadioCentral está cerrado.

Las siguientes columnas están disponibles en la tabla Tareas:

Nombre del trabajo

Todos los trabajos reciben un nombre predeterminado. Por ejemplo, la acción para convertir un radio desde modo de plantilla a configuración crea un `Convertir radio de modo de plantilla`. El cliente puede especificar el nombre de algunos trabajos, como trabajos de programación.

Hora de creación

La fecha y hora cuando se inició el trabajo.

Resumen

Esta columna muestra una barra de progreso mientras se procesa un trabajo. También contiene información con respecto a la cantidad de elementos dentro del trabajo.

Acciones

Mientras el trabajo está en proceso, la columna **Acciones** contiene un ícono **Cancelar**. Si se hace clic en el ícono **Cancelar**, se cancela el trabajo.

2.4.4

Comparar configuraciones

La función Comparar configuración permite al usuario comparar los valores del codeplug dentro de dos configuraciones.

La función Comparar configuración se puede realizar en **Vista del radio** y en **Vista de configuración**.

Vista del radio

En **Vista del radio**, las siguientes operaciones son compatibles:

Configuración asignada

Compara los valores de codeplug de las opciones de configuración asignadas actualmente.

Última programación

Compara los valores de codeplug de las últimas opciones de configuración programadas en el radio.

NOTA:

La comparación no se aplica en las siguientes situaciones:

- Cuando uno de los radios no se leyó en **Vista del radio**→**Comparar**→**Última programación...**
- Cuando uno de los radios no se asignó a una configuración en **Vista del radio**→**Comparar**→**Configuración asignada...**
- Cuando hay trabajos con errores en **Vista de detalles del radio**→**Historial de trabajos**→**Comparar** para el radio seleccionado.

2.4.4.1

Ventana Comparar resultados

La ventana **Comparar resultados** muestra las diferencias entre las configuraciones de radios, generadas por la función Comparar configuración.

NOTA:

La función Comparar configuración se puede realizar en **Vista del radio** o **Vista de configuración**.

La tabla de comparación muestra las siguientes columnas:

Ruta de navegación

Muestra la ruta de navegación al campo.

Nombre de campo

Muestra el nombre del campo.

Valor de origen

Muestra el valor en la configuración de origen.

Valor de destino

Muestra el valor en la configuración de destino.

NOTA:

La selección de cualquier valor vinculado en las columnas Origen o Destino redirige al usuario al conjunto que contiene el campo, y se focaliza en el campo. Con los valores que no son vínculos, use la ruta de navegación para localizar manualmente el campo dentro de la configuración.

Los botones de radio **Visto por** permiten al usuario mostrar lo siguiente:

Botón de radio	Descripción
Todos	Muestra todos los campos con diferencias, valores faltantes y cambios de campo MVO.
Diferente	Muestra los campos que contienen valores diferentes.
No detectado	Muestra los campos que existen en una configuración, pero no en la otra.
MVO	Muestra los campos MVO (modelo, versión, opción) del radio que han cambiado del valor predeterminado de MVO.

2.4.5

Ventana Resultados de validación

La ventana **Resultados de validación** muestra las condiciones de error en la configuración.

**NOTA:**

La ventana **Resultados de validación** solo aparece cuando se está editando una configuración.

Las siguientes columnas están disponibles en la tabla Resultados de validación:

Ruta

Ruta dentro de la configuración hacia el campo que contiene el error.

Código de error

Un código de error interno que identifica el error dentro del sistema.

Descripción

Una descripción que proporciona detalles al usuario en cuanto a la causa del error.

Acciones

Cuando aparece un ícono curvado (valor de restablecimiento) en la columna **Acciones**, el error de validación se puede resolver automáticamente haciendo clic sobre el ícono. El usuario se lleva al conjunto asociado con el error. El campo con el error se resalta en color rojo.

El botón **Restablecer todos (para el conjunto superior seleccionado)** permite que el usuario restablezca todos los errores de validación que se encontraron en el conjunto superior actualmente seleccionado.

2.4.6

Ventana Mensajes de advertencia

En la ventana **Mensajes de advertencia** se mostrarán las advertencias que se producen en la configuración.

**NOTA:**

La ventana **Mensajes de advertencia** solo aparece cuando se está editando una configuración.

2.4.7

Ventana Resultados de búsqueda

La ventana **Resultados de búsqueda** permite al usuario buscar campos o valores de campo cuando edita Configuraciones. Esta función de búsqueda permite al usuario ubicar rápidamente campos dentro de una configuración sin necesidad de conocer el conjunto.

Cuando se edita una configuración, el usuario introduce una palabra, frase o valor en el campo **Buscar**. La **x** a la derecha del campo **Buscar** se utiliza para borrar la entrada y los resultados de búsqueda. El ícono de búsqueda () se utiliza para iniciar la búsqueda. La flecha desplegable a la derecha del campo **Buscar** permite al usuario seleccionar entre las 10 últimas búsquedas.

Se utilizan las siguientes opciones para refinar la búsqueda:

Nombre

Cuando está seleccionado, el texto introducido en el campo **Buscar** se busca con el nombre de todos los campos.

Valor

Cuando está seleccionado, el número o texto introducido en el campo **Buscar** se busca con el valor de todos los campos.

Nombre y valor

Cuando está seleccionado, tanto el nombre como el valor del campo se buscan con la entrada en el campo **Buscar**.

Solo palabras completas

Cuando está marcado, la palabra, la frase o el valor exacto introducidos en el campo **Buscar** se utiliza para acotar los resultados de búsqueda.

Las siguientes columnas ofrecen detalles de la búsqueda:

Ruta

La ruta al campo dentro de la configuración en el formato Nombre del conjunto\Nombre del campo.

Valor

El valor actual para el campo.

**NOTA:**

Si se hace doble clic en cualquier fila en los resultados de búsqueda, se abre el conjunto pertinente y el campo queda en primera plana.

2.4.8

Roles del usuario

El rol de los usuarios aparece en la barra de estado de acuerdo con la opción seleccionada en el cuadro de diálogo **Seleccionar agencia**.

Rol	Acceso
Administrador	Todos los privilegios.
Técnico	Todos los privilegios, excepto el registro de licencias.
Lector	Solo puede ver los campos y las configuraciones del radio. No se puede agregar, modificar ni importar ningún elemento en el cliente.

2.4.9

Ventana Ayuda

La ventana **Ayuda** se utiliza con el fin de mostrar ayuda contextual para campos usados en configuraciones y conjuntos.

**NOTA:**

La ventana **Ayuda** solo aparece cuando se está editando una configuración.

Cuando un usuario está editando una configuración, el contenido de la ayuda se muestra en la ventana **Ayuda** cuando se selecciona un campo en el conjunto. Si se presiona la tecla F1, se abre todo el sistema de ayuda con el campo actual seleccionado en primer plano

Capítulo 3

Menú Acciones

El menú **Acciones** permite al usuario acceder rápidamente a las funciones más comunes que se utilizan para configurar un sistema RadioCentral.

Las selecciones disponibles en el menú **Acciones** dependen de la vista actual.

Las siguientes ventanas y funciones se admiten en el menú **Acciones**:

3.1

Selecciones de Importar

Las selecciones del menú **Importar** permiten al usuario importar datos archivados para ayudar con la configuración del sistema RadioCentral.

3.1.1

Importación de archivo a cuadrícula

Esta función permite al usuario importar datos de codeplug del radio desde un archivo ***.csv** delimitado por comas o un archivo ***.xlsx** de hoja de cálculo.

Los datos del codeplug que se exporten de RadioCentral (consulte [Ventana Exportar en la página 56](#)) pueden modificarse en un programa de hoja de cálculo y guardarse como un archivo **.csv** (usando el comando **Guardar como**).

NOTA:

Los archivos ***.csv** delimitados por comas o los archivos ***.xlsx** de hoja de cálculo solo se pueden importar en **Vista del radio**.

Procedimiento:

- 1 En **Vista del radio**, seleccione **Acciones**→**Importar**→**Archivo a cuadrícula**.

NOTA:

La ventana **Importar archivo a cuadrícula** también se puede abrir presionando CTRL+H.

- 2 En la ventana **Importar archivo a cuadrícula**, busque la ubicación de almacenamiento que contiene los archivos de codeplug y realice una de las siguientes opciones:
 - Para archivos CSV (delimitados por comas), seleccione **CSV (delimitado por comas) (*.csv)** de la lista desplegable de tipos de archivos.

NOTA:

De forma predeterminada, el archivo **CSV (delimitado por comas) (*.csv)** es el tipo seleccionado.

- 3 Seleccione el o los archivos relevantes.

NOTA:

Use la tecla CTRL (selectiva) o la tecla MAYÚS (rango) para seleccionar varios archivos.

- 4 Haga clic en **Open**.

3.1.2

Importación de configuraciones

Esta función permite que el usuario importe archivos de configuración desde la **Vista de configuración**.

Procedimiento:

- 1 En el menú **Acciones**, seleccione **Administrar**→**Configuraciones** para abrir la ventana **Vista de configuración**.
- 2 Seleccione **Acciones**→**Importar**→**Configuraciones**.

NOTA:

La ventana **Importar configuraciones** también se puede abrir con un clic en el botón **Importar**.

- 3 En la ventana **Importar configuraciones**, seleccione los archivos **.dbn**.
- 4 Haga clic en **Open**. Aparece el cuadro de diálogo **Importar configuración**.
- 5 Escriba un nombre relevante en el campo **Sufijo para conjuntos**.
- 6 Haga clic en **OK (Aceptar)**.

3.1.3

Importación de anuncios de voz

Esta función permite al usuario importar archivos de anuncios de voz desde la **Vista de recursos para anuncios de voz**.

Procedimiento:

- 1 En el menú **Acciones**, seleccione **Administrar**→**Anuncios de voz** para abrir la ventana **Vista de recursos para anuncios de voz**.
- 2 Seleccione **Acciones**→**Importar**→**Anuncios de voz**.

NOTA:

La ventana **Importar anuncios de voz** también se puede abrir haciendo clic en el botón **Importar**.

- 3 En la ventana **Importar anuncios de voz**, seleccione los archivos **.mva** o **.wav** relevantes.
- 4 Haga clic en **Open**.

3.1.4

Importación manual de certificados de CA

La función **Importar archivos de certificados de CA** permite que el usuario importe versiones nuevas de archivos de certificados de CA al servidor RadioCentral.

Cuándo y dónde se utilizan:

Utilice este procedimiento para importar archivos de certificados de CA.

Procedimiento:

- 1 En el menú **Acciones**, seleccione **Administrar**→**Certificados de CA** para abrir la ventana **Vista de recursos de certificados de CA**.
- 2 Haga clic en el botón **Importar**.
- 3 En la ventana **Importar certificados de CA**, seleccione el archivo **.*** correspondiente.

El tamaño del certificado de CA no debe exceder los 10K y debe tener formato de correo con privacidad mejorada (PEM). Los certificados de CA no se pueden importar de forma manual ni automática cuando existe una coincidencia de nombre de archivo en el servidor RadioCentral.

- 4 Haga clic en **Open**.

3.2

Ventana Exportar

Las selecciones del menú **Exportar** le permiten al usuario exportar datos del radio a diversos tipos de archivos.

3.2.1

Exportación de la configuración

Esta función permite al usuario exportar una o más configuraciones desde **Vista de configuración**.

Procedimiento:

- 1 En el menú **Acciones**, seleccione **Administrar**→**Configuraciones**.
- 2 Para exportar una sola configuración, realice las siguientes acciones:
 - a Seleccione la fila relevante.
 - b Haga clic con el botón derecho en la fila que desee y seleccione **Exportar configuración**.
 - c En la ventana **Exportar configuración**, busque y seleccione una carpeta.
 - d Escriba un nombre para el archivo de configuración.
 - e Haga clic en **Save (Guardar)**.
- 3 Para exportar varias configuraciones, realice las siguientes acciones:
 - a Seleccione la primera fila.
 - b Mantenga presionada la tecla **Ctrl**.

NOTA:

Para seleccionar filas consecutivas, mantenga presionada la tecla **SHIFT**.

- c Seleccione una o más filas adicionales.
- d Haga clic con el botón derecho en las filas que desee y seleccione **Exportar configuración**.
- e Busque y seleccione una ubicación de carpeta.

NOTA:

Debido a que los archivos de configuración seleccionados se guardarán en la ubicación de la carpeta seleccionada, se recomienda crear una nueva carpeta para organizar los archivos exportados.

- f Haga clic en **OK (Aceptar)**.

3.2.2

Exportación de cuadrícula a archivo

La selección **Crear cuadrículas en el archivo** permite al usuario exportar todos los radios seleccionados desde **Vista de radio** a un archivo delimitado por comas (*.csv), que puede visualizarse mediante una aplicación de hoja de cálculo. El archivo CSV exportado contiene los mismos datos que se representan en **Vista de radio**.

Procedimiento:

- 1 Seleccione uno o más radios desde la tabla.

- 2 En la **Vista del radio**, seleccione **Acciones**→**Exportar**→**Cuadrícula a archivo** para abrir la ventana **Exportar cuadrícula a archivo**.
O bien ingrese `Ctrl+Shift+S`.
- 3 En la ventana **Exportar cuadrícula a archivo**, busque y seleccione la ubicación de un archivo.
- 4 Escriba un nombre para el archivo **.csv**.
- 5 Haga clic en **Save (Guardar)**. Aparece el cuadro de diálogo **Exportar cuadrícula a archivo**.
El archivo **.csv** se exporta correctamente.
- 6 Haga clic en **Aceptar**.

3.3

Administrar configuraciones

La función de administración de configuraciones permite que el usuario defina las configuraciones que se crearán y almacenarán en el servidor RadioCentral.

La **vista de configuración** se inicia desde el menú **Acciones**, seleccionando **Administrar**→**Configuraciones**.

NOTA:

Las configuraciones que se asignan a un dispositivo no se pueden eliminar del servidor RadioCentral. Primero, el usuario debe seleccionar una configuración diferente para el dispositivo en la Vista del radio antes de poder eliminarla del servidor RadioCentral.

En la **vista de configuración**, el usuario puede realizar las siguientes operaciones básicas:

-  **Editar**
-  **Agregar**
-  **Eliminar**
-  **Importar**
-  **Exportar**

NOTA:

El ícono **Eliminar** permite borrar las configuraciones de la base de datos del servidor RadioCentral que no están asignadas a un dispositivo.

Administración de la configuración

Mesa 3: Columnas de la tabla Vista de configuración

Columna	Descripción
Nombre	Permite que el usuario vea y modifique el nombre de la configuración. Una configuración debe tener un nombre único. El nombre de una configuración modificada aparece en todas las tablas donde se usa.
Fecha de última modificación	Muestra la fecha y hora reales en que se modificó la configuración por última vez.
Radios	Muestra la cantidad de radios asignados a la configuración.

Columna	Descripción
Comentarios	Permite que el usuario agregue un comentario para la configuración.

Opción en el menú del botón derecho

Las siguientes selecciones de menú del botón derecho están disponibles cuando se selecciona una configuración y el usuario hace clic con el botón derecho en la configuración seleccionada:

Mesa 4: Selecciones del botón derecho de la vista de configuración

Columna	Descripción
Editar	Esta selección permite al usuario editar todos los conjuntos que están asignados a la configuración.
Eliminar	Esta selección solo está disponible cuando la configuración seleccionada no está asignada a un radio.
Configuración de copia	Esta selección abre la ventana Configuración de copia y permite que el usuario duplique la configuración seleccionada. En la ventana Configuración de copia , el usuario puede cambiar el nombre de la configuración y agregar un sufijo que se anexe a cada conjunto en la configuración.
Mostrar radios relacionados	Esta selección abre la ventana Radios relacionados y muestra todos los radios almacenados en el servidor RadioCentral que actualmente están usando la configuración seleccionada.  NOTA: En la ventana Radios relacionados , se muestran solo los radios que tienen el permiso de visualización asignado. Los usuarios con la función Administrador de RM no tienen restricciones.
Exportar configuraciones	Esta selección permite que el usuario exporte la configuración a una unidad local o unidad de red como archivo de datos binarios (*.dbn).

3.4

Administrar la explotación de datos

La función Explotación de datos en RadioCentral permite al usuario ubicar campos específicos con valores que se usan dentro de configuraciones y radios.

El usuario puede crear consultas simples o avanzadas que ayudan a identificar dónde se utilizan ciertos campos. La explotación de datos se inicia en el menú **Acciones** seleccionando **Administrar**→**Explotación de datos**.

Desde la vista principal de explotación de datos, el usuario puede **Agregar** , **Editar** ,

Eliminar  o **Exportar**  consultas. Las consultas se exportan a un archivo CSV delimitado por comas.

Mesa 5: Tabla de explotación de datos

Columna	Descripción
Nombre de la consulta	Muestra los nombres de consultas creadas para la explotación de datos.

Columna	Descripción
Buscar	Muestra el objeto en el que se enfoca la búsqueda de la consulta. Los objetos disponibles son configuración, radio y conjunto.
Consulta de grupo	Recopilación de consultas únicas. Útil para ordenar las consultas.
Fecha de última modificación	Muestra la fecha y hora en que se modificó la consulta por última vez.
Comentarios	Permite al usuario ingresar un comentario para identificar el propósito de la consulta.

NOTA:

La funcionalidad Explotación de datos solo está disponible para los usuarios con la función Administrador de RM.

3.4.1

Ventana de consulta de explotación de datos

La ventana **Consulta** permite a los usuarios crear consultas simples y avanzadas que se pueden ejecutar y compartir dentro de un sistema RM. El usuario agrega nuevas consultas a la ventana Explotación de datos cuando hace clic en el botón **Agregar**.

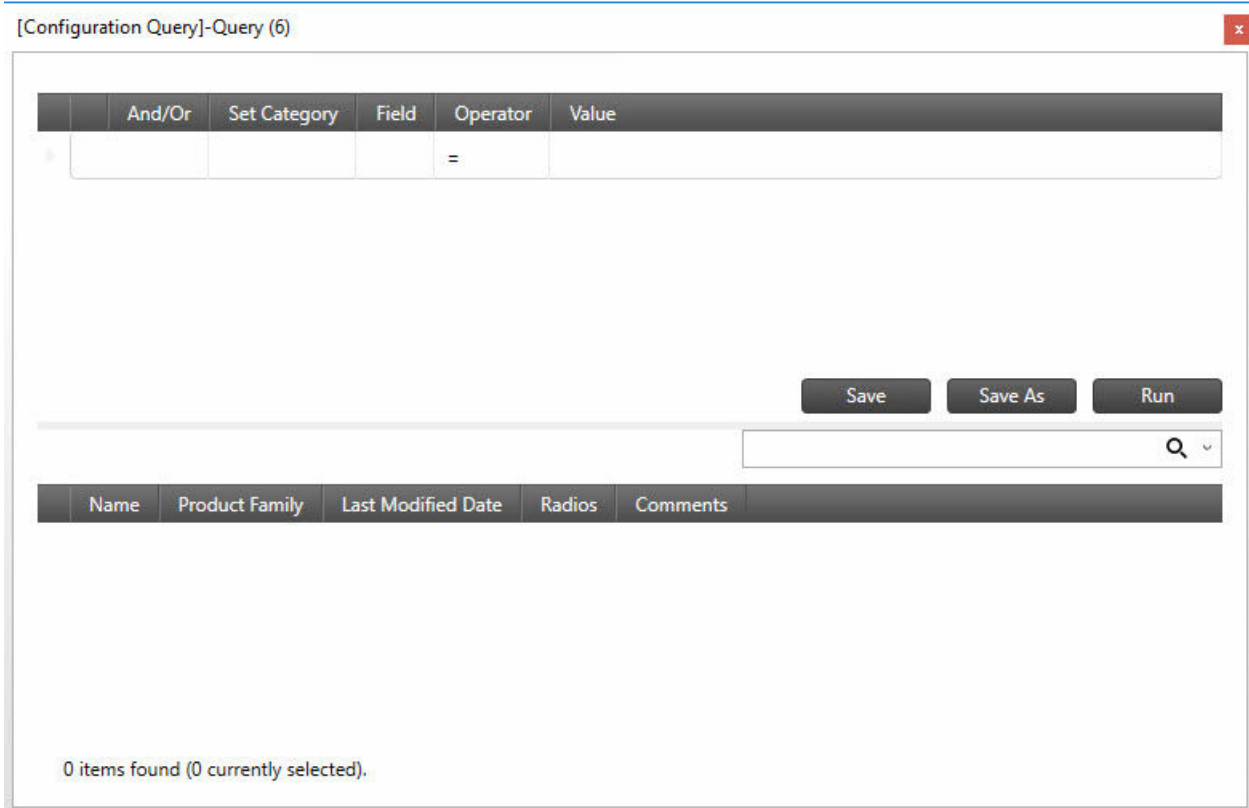

Figura 2: Ventana de nueva consulta

La ventana **Nueva consulta** permite al usuario buscar campos utilizados en una **Configuración**, un **Radio** o un **Conjunto**.

Después de seleccionar el tipo de consulta **Buscar**, se abre la ventana principal **Consulta**. El encabezado de la ventana de la consulta principal muestra el tipo de consulta seleccionado.

Figura 3: Ventana de consulta principal

Las columnas ubicadas en la mitad superior de la ventana se utilizan para crear las cláusulas de la consulta.

Mesa 6: Columnas de cláusula de consulta

Columna	Función
O	Los operadores Y/O se utilizan para filtrar los resultados de una o más cláusulas. El operador Y muestra un resultado cuando las condiciones para todas las cláusulas son verdaderas. El operador O muestra un resultado cuando al menos una de las cláusulas es verdadera. Estos operadores son válidos solo para consultas con más de una cláusula.
Categoría de conjunto	Esta lista desplegable se utiliza para seleccionar una categoría de conjunto. Set Categories es una agrupación de campos.
Campo	Esta lista desplegable se utiliza para elegir un campo contenido dentro de la categoría de conjunto seleccionada.
Operador	Esta lista desplegable se utiliza para seleccionar un operador de consulta de búsqueda. Se admiten los siguientes operadores: <ul style="list-style-type: none"> • Contiene • <= • < • >= • >

Columna	Función
	<ul style="list-style-type: none"> • No contiene • < > La lista de operadores disponibles depende del campo seleccionado.
Valor	Este campo define el valor que se utiliza en la expresión de la consulta para el campo seleccionado. El valor puede ser verdadero/falso, numérico o una selección de menú desplegable.

Las columnas ubicadas en la mitad inferior de la ventana se utilizan para mostrar los resultados de la consulta ejecutada. Las columnas que se muestran dependen del tipo de consulta seleccionado. Los resultados se pueden organizar mediante un clic en el encabezado de columna.

Mesa 7: Columnas de resultados de consulta

Tipo de consulta	Columnas que se muestran
Configuración	Nombre/Familia de productos/Fecha de última modificación/Radios/Comentarios
Radio	Número de serie/Alias de radio/Número de modelo/Comentarios
Conjunto	Nombre del conjunto/Fecha de última modificación/Comentarios

3.4.2

Adición de una consulta para Explotación de datos

Las consultas permiten al usuario identificar cuándo se usa un parámetro que contiene un valor específico. Las consultas se crean agregando una o más expresiones de cláusulas. Se pueden crear consultas simples para ubicar un solo parámetro. Las consultas más avanzadas se pueden crear para ubicar varios parámetros.

Cuándo y dónde se utilizan:

Use este procedimiento para crear consultas y buscar parámetros dentro de Configuraciones, Conjuntos o Radios.

Una vez que se crean consultas, el usuario puede realizar las siguientes operaciones:

- [Agrupación de cláusulas de consulta en la página 62](#)
- [Eliminación de una cláusula de consulta en la página 63](#)

Procedimiento:

- 1 Haga clic en el menú **Acciones** y seleccione **Administrar**→**Explotación de datos**.
- 2 Desde la vista **Explotación de datos**, haga clic en el botón **Agregar**.
- 3 Desde la ventana **Nueva consulta**, seleccione **Configuración**, **Radio**, o **Conjunto** en la lista desplegable **Buscar**.
- 4 Haga clic en **OK (Aceptar)**.
- 5 En la ventana **Consulta**, cree una consulta como se indica a continuación:

Si...	Entonces...
Si está creando una consulta	realice las siguientes acciones:

Si...	Entonces...
para una sola cláusula,	<p>a Haga clic en la columna Categoría de conjunto y seleccione el Conjunto pertinente.</p> <p>b Haga clic en la columna Campo y seleccione un parámetro para la categoría de conjunto seleccionada.</p> <p>c Seleccione un Operador. Consulte Mesa 6: Columnas de cláusula de consulta en la página 60 para obtener un listado de los operadores.</p> <p>d Introduzca o seleccione un Valor para el Campo seleccionado.</p>
Si está creando una consulta para varias cláusulas,	<p>realice las siguientes acciones:</p> <p>a Después de crear la primera cláusula, haga clic con el botón derecho en cualquier lugar en la mitad superior y seleccione Agregar nueva cláusula. De forma predeterminada, la nueva cláusula es Y en relación con la cláusula anterior.</p> <p>b En la lista desplegable Y/O, seleccione el operador pertinente.</p> <p>c Seleccione una Categoría de conjunto.</p> <p>d Seleccione un Campo para la categoría de conjunto seleccionada.</p> <p>e Seleccione un Operador.</p> <p>f Introduzca o seleccione un Valor para el Campo seleccionado.</p>

- 6 Haga clic en **Guardar** o **Guardar como** para asignar un nombre a la consulta.
- 7 Haga clic en **Ejecutar** para iniciar la búsqueda de consultas.

Si la consulta no produce resultados, aparece `Explotación de datos completa, pero no hay datos coincidentes` a la derecha del botón **Guardar**. De lo contrario, las coincidencias resultantes aparecen en la mitad inferior de la ventana.

3.4.2.1

Agrupación de cláusulas de consulta

La agrupación de cláusulas permite al usuario combinar varias cláusulas en una sola expresión. Las expresiones de cláusulas se pueden agrupar cuando la consulta se crea por primera vez o editando una consulta existente.

Cuándo y dónde se utilizan:

Use este procedimiento para agrupar expresiones de cláusulas en una consulta.

NOTA:

La selección de consultas y expresiones de cláusulas se realiza pasando el cursor a la izquierda de la fila pertinente y haciendo clic con el botón izquierdo del mouse.

Procedimiento:

- 1 Seleccione una consulta desde la vista **Explotación de datos** y haga clic en el botón **Editar**.
- 2 Seleccione la primera cláusula de la consulta para agrupar.
La fila de cláusulas se resalta cuando se selecciona.
- 3 Mantenga presionada la tecla **CTRL** y seleccione la segunda cláusula.
- 4 Haga clic con el botón derecho del mouse sobre las cláusulas seleccionadas y seleccione **Agrupar cláusulas**.

Aparecerá un paréntesis vertical a la izquierda de la cláusula agrupada.

NOTA:

Para borrar una agrupación, seleccione todas las cláusulas del grupo, haga clic con el botón derecho y seleccione **Desagrupar cláusulas**.

3.4.2.2

Eliminación de una cláusula de consulta

La eliminación de una expresión de cláusula dentro de una consulta de explotación de datos se puede realizar mientras se crea la consulta o se modifican las consultas existentes.

Cuándo y dónde se utilizan:

Use este procedimiento para borrar una expresión de cláusula en una consulta.

NOTA:

La selección de consultas y expresiones de cláusulas se realiza pasando el cursor a la izquierda de la fila pertinente y haciendo clic con el botón izquierdo del mouse.

Procedimiento:

- 1 Haga clic en el menú **Acciones** y seleccione **Administrar**→**Explotación de datos**.
- 2 Seleccione la consulta pertinente y haga clic en el botón **Editar**.
El usuario también puede hacer clic con el botón derecho del mouse sobre la consulta y seleccionar **Editar consulta**.
- 3 Seleccione la expresión de cláusula, luego haga clic con el botón derecho y seleccione **Eliminar cláusulas**.
- 4 Desde la vista **Explotación de datos**, haga clic en el botón **Agregar**.
- 5 Si corresponde, realice otras modificaciones a la consulta, guárdela o ejecútela.

3.4.3

Eliminar una consulta desde Explotación de datos

La eliminación de una consulta desde Explotación de datos permite al usuario mantener actualizadas las consultas que se utilizan para Explotación de datos.

Cuándo y dónde se utilizan:

Use este procedimiento para eliminar consultas desde Explotación de datos.

NOTA:

La selección de las consultas se realiza pasando el cursor a la izquierda de la fila pertinente y haciendo clic con el botón izquierdo del mouse. Pasar el cursor sobre la primera columna de la tabla cambia el cursor de un puntero estándar a un puntero de mano.

Procedimiento:

- 1 Haga clic en el menú **Acciones** y seleccione **Administrar**→**Explotación de datos**.
- 2 Desde la vista **Explotación de datos**, seleccione una o más consultas de la tabla.

NOTA:

Los botones **Editar** y **Eliminar** estarán atenuados hasta que se seleccione una consulta.

- 3 Haga clic en el botón **Eliminar**.
- 4 Haga clic en **Sí** para eliminar la consulta o en **No** para cancelar la operación.

NOTA:

Una vez que la operación de eliminación se lleva a cabo, no se puede deshacer.

3.4.4

Agrupación de consultas en Explotación de datos

La agrupación de consultas permite al usuario organizar las consultas en conjuntos únicos. Se deben crear los grupos de consultas antes de que se puedan asignar a las consultas.

Cuándo y dónde se utilizan:

Use este procedimiento para agrupar una o más consultas en un conjunto único.

NOTA:

La selección de las consultas se realiza pasando el cursor a la izquierda de la fila pertinente y haciendo clic con el botón izquierdo del mouse. Pasar el cursor sobre la primera columna de la tabla cambia el cursor de un puntero estándar a un puntero de mano.

Procedimiento:

- 1 Haga clic en el menú **Acciones** y seleccione **Administrar**→**Explotación de datos**.
- 2 En la vista **Explotación de datos**, haga clic con el botón derecho en el panel de navegación y seleccione **Nuevos grupos de consulta**.
- 3 Cambie el nombre del nuevo grupo de consultas. Realice las siguientes acciones:
 - a Seleccione el grupo de consultas.
 - b Haga clic con el botón derecho y seleccione **Renombrar**.
 - c Ingrese un nombre nuevo para el grupo de consultas y presione ENTER.

NOTA:

También se puede cambiar el nombre de los grupos de consultas haciendo doble clic en el grupo e ingresando el nombre nuevo.

- 4 Haga clic en **Todos los grupos de consultas** para ver todas las consultas existentes a la derecha del panel de navegación.
- 5 En la columna **Grupo de consultas**, seleccione la lista desplegable y elija un grupo de consultas.
- 6 Repita el paso 5 hasta que todas las consultas se hayan agregado al grupo.

NOTA:

Si selecciona el grupo de consultas en el panel de navegación, solo se muestran las consultas que se agregaron al grupo. Si selecciona **Todos los grupos de consultas** en cualquier momento, se muestran todas las consultas en el sistema.

3.5

Administrar licencia

La función Administrar licencia permite al usuario agregar radios adicionales al sistema de RM.

El usuario puede comprar la función RM a través del sitio web Motorola Solutions Online (MOL). Si la compra se realiza correctamente, se proporciona un ID de titularidad. Con esta función, el usuario especifica la cantidad de radios que desea administrar. El número de radios asociado con cada EID se divide entre varias instancias del servidor RM.

Administrar licencia se inicia en el menú **Acciones** si se selecciona **Administrar**→**Licencias**.

Desde cada vista Licencias, el usuario puede **Agregar** , **Editar**  o **Eliminar**  radios.

Los siguientes tipos de licencia se pueden administrar en Administrador de radio:

3.5.1

Vista Administrar licencias de radio

La función Administrar licencias permite que el usuario agregue más radios al sistema RadioCentral. El usuario puede comprar la función RadioCentral en el sitio web de Motorola Online (MOL). Si la compra se realiza correctamente, se proporciona un ID de titularidad. Con esta función, el usuario puede especificar el número de radios que desea administrar. El recuento de radios asociado con cada EID se divide en varias instancias del servidor RadioCentral. La vista Licencia de radio se inicia en el menú **Acciones** si selecciona **Administrar**→**Licencias**→**Licencias de radio**.

Mesa 8: Licencias de radio

Columna	Descripción
Número de serie	Permite al usuario solo ver el número de serie del radio para todas las funciones con licencia. Los números de serie se leen desde los codeplugs.
Alias del radio	Permite al usuario solo ver el nombre reconocible del usuario del radio para todas las funciones con licencia. Este campo solo puede modificarse en la Vista del radio .
Número de modelo	Permite al usuario solo ver el número de modelo del radio para todas las funciones con licencia. Los números de modelo se leen desde los codeplugs.
Región	Permite al usuario solo ver la región del radio para todas las funciones con licencia.
Nombre de la función	Permite al usuario solo ver el nombre de la función. En este caso, el nombre de la función se lee desde la licencia real.
Estado	Permite al usuario solo ver el estado de todas las licencias de radio.
Comentarios	El usuario puede agregar una descripción breve acerca de esta fila de licencia de radio.

Mesa 9: Licencias de radio

Columna	Descripciones
Número de serie	Permite al usuario solo ver el número de serie del radio para todas las funciones con licencia. Los números de serie se leen desde los codeplugs.
Alias del radio	Permite al usuario solo ver el nombre reconocible del usuario del radio para todas las funciones con licencia. Este campo solo puede modificarse en la Vista del radio .
Número de modelo	Permite al usuario ver solo el número del modelo.
Número FLASHcode	Permite al usuario solo ver el FLASHcode comprado en el radio conectado actual.
Nombre de la función	Permite al usuario solo ver el nombre de la función.
Estado	Permite al usuario solo ver el estado de todas las licencias de radio.

Columna	Descripciones										
Mesa 10: Columnas en la vista Licencias de radio											
	<table border="1"> <thead> <tr> <th>Posibles estados</th> <th>Explicación del estado</th> </tr> </thead> <tbody> <tr> <td>Registrado</td> <td>La función está registrada para el radio y se descartan los cambios que se activan al registrar la función. El usuario puede utilizar el menú que aparece al hacer clic con el botón derecho para restaurarla en Listo para activación.</td> </tr> <tr> <td>Disponible para registro</td> <td>La función no está registrada para el dispositivo, el usuario puede registrar la función para el radio.</td> </tr> <tr> <td>Listo para activación</td> <td>La función está registrada para el dispositivo y está pendiente de activación para el radio.</td> </tr> <tr> <td>Activado - Adquirido</td> <td>Esta función se compra y activa para el radio.</td> </tr> </tbody> </table>	Posibles estados	Explicación del estado	Registrado	La función está registrada para el radio y se descartan los cambios que se activan al registrar la función. El usuario puede utilizar el menú que aparece al hacer clic con el botón derecho para restaurarla en Listo para activación .	Disponible para registro	La función no está registrada para el dispositivo, el usuario puede registrar la función para el radio.	Listo para activación	La función está registrada para el dispositivo y está pendiente de activación para el radio.	Activado - Adquirido	Esta función se compra y activa para el radio.
Posibles estados	Explicación del estado										
Registrado	La función está registrada para el radio y se descartan los cambios que se activan al registrar la función. El usuario puede utilizar el menú que aparece al hacer clic con el botón derecho para restaurarla en Listo para activación .										
Disponible para registro	La función no está registrada para el dispositivo, el usuario puede registrar la función para el radio.										
Listo para activación	La función está registrada para el dispositivo y está pendiente de activación para el radio.										
Activado - Adquirido	Esta función se compra y activa para el radio.										
Comentarios	El usuario puede agregar una descripción breve acerca de esta fila de licencia de radio.										

NOTA:

En todas las vistas que indican radios (funciones, radios, detalles de las funciones), el usuario solo puede ver radios con el permiso de visualización asignado. La columna Recuento de radios solo refleja los radios con permisos de visualización asignados para el usuario de RM actual.

Las funciones de registro solo son posibles para los dispositivos con permisos de visualización y modificación. Los usuarios con la función Administrador de RM no tienen restricciones.

3.5.1.1

Restauración de licencias registradas para radio

Esta sección cubre la capacidad para buscar licencias en la tabla Capacidad del dispositivo que están asociadas con un radio determinado, pero no se muestran en la vista Licencias de radio. Las licencias pueden terminar en este estado cuando los cambios en el dispositivo se descartan con licencias en el estado registrado (antes de activarse en el dispositivo a través de una operación de escritura).

Procedimiento:

- 1 Abra **Vista de licencias de radio**.
- 2 Cargue uno (o más) dispositivos de radio en la base de datos de RadioCentral.
- 3 Seleccione una o más filas en la vista Licencias de radio.
- 4 Haga clic con el botón derecho y seleccione **Restaurar licencias** o haga clic en CTR+O.

El Cliente de RadioCentral se comunica con el servidor RadioCentral para determinar si hay licencias asociadas con el dispositivo mediante un ID registrado. Las licencias restauradas se muestran en la vista Licencias de radio como en el estado *Listo para activación*.

3.5.1.2

Recuperación de licencias de radio

Esta función ayuda al usuario a recuperar la información de licencias perdida debido a la reinstalación del equipo del servidor RadioCentral. Comuníquese con el servicio de atención al cliente si se cambia el hardware del equipo. El usuario debe devolver la llamada al servidor de licencias para recuperar las licencias (en la forma de respuestas de capacidad) para todos los radios en RadioCentral.

Procedimiento:

- 1 Haga clic en  y luego en **Configuración**.
- 2 Seleccione la pestaña **Licencias**.
- 3 En la ventana **Recuperar licencias**, haga clic en el botón **Licencias de radio - Recuperar**.
- 4 Haga clic en **OK (Aceptar)**.

Se restauran las licencias existentes desde el servidor de licencias de Motorola.

3.5.1.3

Orden de la cuadrícula en la vista Licencias de radio

Los datos en la tabla se ordenan de forma ascendente, de acuerdo con el número de serie del radio.

Procedimiento:

- Haga clic en uno de los encabezados de columna en la cuadrícula.
- Ordene los datos en orden ascendente o descendente según la columna seleccionada.

3.5.1.4

Filtro de radios disponibles por grupos

Procedimiento:

- El usuario puede ordenar los datos del radio por cualquier columna haciendo clic en el encabezado de la columna.
- El usuario puede filtrar los radios disponibles por grupo.

3.5.2

Ventana Registrar licencias de radio

Esta ventana permite al usuario enviar asignación de licencia de software. La ventana Licencias del dispositivo presenta la siguiente interfaz de usuario:

- Campo de texto: un cuadro de campo para que el usuario ingrese el ID de titularidad (EID).
- Lista de radios disponibles: una lista que muestra todos los dispositivos que cumplen con los criterios de la licencia de EID.
- Lista de radios seleccionados: una lista para ver todos los dispositivos que el usuario desea asociar con la licencia.

Para acceder a la ventana Licencias de radio, haga clic en el botón  en la **Vista de licencia de radio**.

La siguiente tabla enumera las descripciones de las columnas en tabla Consultar EID.

Mesa 11: Licencias de radio

Columnas y botones	Descripción
Cuadro de texto de ID de titularidad	Para que el usuario escriba el EID que se va a consultar. Consulte Ejecución de una consulta de EID en la página 68 .
Consulta	Al hacer clic en este botón, se muestra la información del EID en la tabla.
Borrar todo	Al hacer clic en este botón se eliminan los EID consultados anteriormente.
ID de derecho	Permite al usuario solo ver la fila ID de titularidad para cada licencia única. Consulte Selección de varios elementos de línea en la tabla EID en la página 69 .
Nombre de la función	Permite al usuario solo ver el nombre de cada nueva función.
Disponible	Permite al usuario solo ver el número restante de las licencias de funciones que todavía se pueden registrar para un radio.
Adquirido	Permite al usuario solo ver el número de compra de licencias de funciones compradas originalmente.
Número de serie	Permite al usuario solo ver el número de serie del dispositivo.
Alias del radio	Permite al usuario solo ver el nombre reconocible del usuario del radio para todas las funciones con licencia. Este campo solo puede modificarse en la Vista del radio .
Agregar todos	Al hacer clic en este botón, se agregan todos los dispositivos seleccionados desde la tabla Radios disponibles a la tabla Radios seleccionados.
Agregar	Al hacer clic en este botón, se agrega el dispositivo seleccionado desde la tabla Radios disponibles a la tabla Radios seleccionados.
Eliminar	Al hacer clic en este botón, se elimina el dispositivo seleccionado de la tabla Radios seleccionados y se envía de vuelta a la tabla Radios disponibles.
Eliminar todos	Al hacer clic en este botón, se eliminan todos los dispositivos desde la tabla Radios seleccionados hasta la tabla Radios disponibles.
Registrarse	Haga clic en este botón para registrar las funciones seleccionadas en la tabla ID de consulta para los dispositivos en la tabla Radios seleccionados. Consulte Envío de la asignación de licencia del software en la página 69 .

3.5.2.1

Ejecución de una consulta de EID

Procedimiento:

- 1 Escriba el "ID de titularidad" en el cuadro de texto ID de titularidad.
- 2 Haga clic en el botón **Consulta**.
Para cancelar, haga clic en el botón **Borrar todo**.

3.5.2.2

Selección de varios elementos de línea en la tabla EID

Procedimiento:

- 1 Haga clic en la casilla de verificación en la primera columna de la fila que desee.
- 2 Para marcar o borrar todo, haga clic en la casilla de verificación en el encabezado de la columna de la tabla EID.
El cliente RadioCentral actualiza la tabla EID y aplica el filtro de las tablas Radios disponibles y Radios seleccionados.
- 3 Haga clic en **Aceptar** para borrar cualquier radio de la tabla Radios seleccionados y agregue manualmente los radios desde la tabla Radios disponibles.
El usuario puede omitir este paso si no hay radios que pueda borrar. Para cancelar, haga clic en el botón **Borrar todo**.
- 4 Haga clic en **OK (Aceptar)**. Los radios se filtran desde la tabla Radios seleccionados.

3.5.2.3

Envío de la asignación de licencia del software

Luego de seleccionar los radios a los que se le asignarán licencias, haga clic en el botón **Registrar** para confirmar estas asociaciones.

Requisitos:

- Abra la ventana **Licencia de radio**.
- La tabla EID debe contener, al menos, una fila completada en su totalidad, y que por lo menos una fila en la tabla EID esté marcada.
- La tabla Radios seleccionados se completa con, al menos, una fila completada en su totalidad.
- El número de radios en la tabla Radios seleccionados no debe exceder el número de licencias disponibles en ninguna de las filas marcadas en la tabla EID.
- El cliente RadioCentral tiene una conexión a Internet válida.

Procedimiento:

- 1 Haga clic en **Registrar** después de seleccionar los radios donde asignará las licencias.
- 2 Haga clic en **OK (Aceptar)**.

3.6

Administrar firmware

Con la función **Administrar firmware**, el usuario puede ver las versiones de firmware importadas automáticamente y almacenadas en el servidor RadioCentral.

Cada vez que se agrega un radio a RadioCentral, su versión de firmware se agrega automáticamente en caso de que no esté almacenada en RadioCentral. Los radios recién agregados luego quedan disponibles para otros radios administrados.

Administrar firmware se inicia en el menú **Acciones** si selecciona **Administrar**→**Firmware**.

Mesa 12: Firmware

Columna y botones	Descripción
Nombre	Permite al usuario ver solo el nombre de todas las versiones de firmware disponibles.
Versión	Permite al usuario ver solo el número de versión de todas las versiones de firmware disponibles.
Tamaño (KB)	Permite al usuario solo ver el tamaño del archivo de todas las versiones de firmware.
Fecha de importación	Permite al usuario solo ver la fecha y hora reales en que se importaron todas las versiones de firmware.
Codeplug	Permite al usuario ver solo el nombre de la versión del codeplug.
Radios en uso	Permite al usuario ver solamente la cantidad de radios que usa cada archivo de firmware.
Radios en uso (Modo de plantilla)	Muestra el número de plantillas que usa cada archivo de firmware en modo Plantilla.
Radios en uso (modo de configuración)	Muestra la cantidad de radios que usan cada archivo de firmware en el modo Configuración.
Comentarios	Permite al usuario agregar comentarios por cada archivo de firmware.

3.7

Administrar anuncios de voz

La función **Administrar anuncios de voz** permite que el usuario vea automáticamente archivos de anuncio de voz importados almacenados en el servidor RM e importe manualmente nuevos archivos de anuncio de voz en el servidor RM.

Administrar anuncio de voz se inicia en el menú **Acciones** si selecciona **Administrar**→**Anuncios de voz**.

El usuario puede **Agregar** , **Editar**  o **Eliminar**  paquetes de idiomas.

NOTA:

Los archivos de anuncio de voz no pueden importarse de forma manual o automática cuando existe una coincidencia de nombre de archivo en el servidor RM. Esta importación se aplica incluso si la duración y el contenido del archivo son diferentes.

NOTA:

La longitud de audio del archivo `.mva` no debe superar los 20 segundos.

Existen dos métodos para almacenar archivos de Anuncio de voz en el servidor de RM:

Importación automática

Cada vez que se agrega un radio al servidor RM, sus archivos de anuncio de voz se agregan automáticamente en caso de que no estén almacenados actualmente en el servidor RM. Los archivos de anuncio de voz luego quedan disponibles para otros radios administrados. Consulte [Adición de radios a Radio Management](#).

Importación manual

Uso de la opción Importar archivos de voz. Consulte [Importación de archivos de anuncio de voz manualmente](#).

Mesa 13: Administrar anuncios de voz

Columna y botones	Descripción
Nombre	Permite al usuario solo ver el nombre de cada archivo de anuncio de voz.
Tamaño (KB)	Permite al usuario solo ver el tamaño de archivo de cada archivo de anuncio de voz.
Fecha de importación	Permite al usuario solo ver la fecha y hora reales en las que se importaron los archivos de anuncio de voz.
Plantilla y radios en uso	Permite al usuario solo ver el número de plantillas y radios que usa cada archivo de anuncio de voz.
Plantillas en uso (Modo de plantilla)	Permite al usuario solo ver el número de plantillas que usa cada archivo de anuncio de voz en el modo Plantilla.
Radios en uso (modo de configuración)	Permite al usuario solo ver el número de radios que usa cada archivo de anuncio de voz.
Comentarios	Permite al usuario agregar comentarios por archivo de anuncio de voz.

3.8

Administración de certificados de CA

Con la función **Administrar certificados de CA**, el usuario puede ver de forma automática los certificados de CA importados que están almacenados en el servidor RadioCentral e importar manualmente nuevos certificados de CA al servidor RadioCentral.

Administrar certificados de CA se inicia en el menú **Acciones** si selecciona **Administrar**→**Certificados de CA**.

El usuario puede **Importar**  o **Eliminar**  certificados.

NOTA:

- Los certificados de CA no se pueden importar de forma manual ni automática cuando existe una coincidencia de nombre de archivo en el servidor RadioCentral.
- Solo los archivos de certificados de CA con formato de correo con privacidad mejorada (PEM) y que tienen 10K o menos de tamaño pueden importarse al servidor RadioCentral.

Existen dos métodos para almacenar archivos de certificados de CA en el servidor RadioCentral:

Importación automática

Cada vez que se agrega un radio al servidor RadioCentral, los archivos de certificados de CA se agregan automáticamente en caso de que no estén almacenados en el servidor RadioCentral. Posteriormente, los archivos de certificados de CA quedan disponibles para otros radios administrados.

Importación manual

Uso de la opción Importar archivos de certificados de CA. Consulte [Importación manual de certificados de CA en la página 55](#).

Mesa 14: Certificados

Columnas y botones incluidos	Definición
Nombre	Permite al usuario solo ver el nombre de todos los certificados disponibles.

Columnas y botones incluidos	Definición
Tamaño	Permite al usuario solo ver el tamaño de archivo de todos los certificados.
Fecha de importación	Permite al usuario solo ver la fecha y hora reales en que se importaron todos los certificados.
En uso (radios)	Permite al usuario solo ver el número de radios que usa cada archivo de certificados.
Comentarios	Permite al usuario agregar comentarios por archivo de certificados

3.9

Administrar claves de sistema

Con la función **Administrar claves de sistema**, el usuario puede ver las claves del sistema almacenadas en el servidor RadioCentral.

Claves de sistema se inicia en el menú **Acciones** si selecciona **Administrar**→**Administrar claves de sistema**.

El usuario puede **Agregar** , **Editar**  o **Eliminar**  claves de sistema.

Mesa 15: Administrar claves de sistema

Columna	Descripción
ID de sistema (Hex)	ID del sistema de troncalización asignado a la clave de sistema.
Tipo	Mostrar el tipo de clave del sistema ya sea como Clave avanzada de sistema o Clave de software.
Número de serie del iButton	El número de serie de los dispositivos de clave iButton que contiene las claves avanzadas (hardware) que se utilizaron para operaciones anteriores de programación que requerían una clave avanzada.
Nivel de acceso	<p>Acceso ilimitado Este tipo de acceso activa todos los campos protegidos para todas las características de troncalización en las categorías Sistema de troncalización y Personalidad de troncalización. La clave del sistema permite el acceso de lectura y escritura a todas las características de troncalización protegidas en el codeplug.</p> <p>Acceso ilimitado sin protección contra escritura Este tipo de acceso activa todos los campos protegidos para todas las características de troncalización en las categorías Sistema de troncalización y Personalidad de troncalización. Esta selección no permite que el radio tenga protección contra escritura.</p> <p>Limitado Este tipo de acceso permite que el administrador active selectivamente los campos protegidos para todas las características de troncalización en las categorías Sistema de troncalización y Personalidad de troncalización. El</p>

Columna	Descripción
	administrador también puede limitar el rango de los valores en los campos que admiten rangos. La clave del sistema permite el acceso al campo, pero limita el valor al rango especificado.
Protección de escritura activada	Protege contra la programación no autorizada de ciertos campos de clave protegida del Sistema de troncalización ASTRO y la Personalidad de troncalización.

3.10

Migración de codeplug

La función de migración de codeplug permite que el usuario convierta codeplugs portátiles de APX del Software de programación del cliente, formato `.mc`, a la configuración del radio, formato `.dbn`.

3.11

Ventana Configuración

La ventana **Configuración** permite al usuario ver o modificar comunicaciones entre el cliente de RadioCentral y la base de datos del servidor RadioCentral, y permite al usuario "recuperar" licencias de la aplicación y licencias del radio.

Seleccione **Acciones**→**Configuración** para abrir la ventana **Configuración**.

3.11.1

Configuración de licencias

En la ventana **Configuración de licencias**, el usuario puede recuperar las licencias de aplicaciones y radios en el servidor RadioCentral.

Configuración de licencias se inicia en el menú **Acciones** si selecciona **Configuración**→**Licencias**.

Mesa 16: Configuración de licencias

Columna	Descripción
Recuperar licencias de la aplicación	<p>Solo con el método "Desde EID" (ID de titularidad). Cuando el usuario debe volver a generar una imagen del disco duro del servidor RadioCentral o reformatearlo, Recuperar licencias de la aplicación permite al usuario recuperar todas las licencias de la aplicación del radio en el servidor RadioCentral:</p> <ol style="list-style-type: none"> 1 Verifique que el usuario tenga conexión a Internet. 2 "Ingrese el ID de titularidad" en el campo de entrada. 3 Seleccione el botón Recuperar licencias de la aplicación. 4 En la columna Acciones→Administrar→Licencias→Vista de licencia de la aplicación→Disponible, verifique que se haya recuperado la cantidad adecuada de licencias de Motorola Solutions para transferirlas al campo del servidor.
Recuperar licencias del radio	<p>Cuando el usuario debe volver a generar una imagen del disco duro del servidor RadioCentral o reformatearlo, Recuperar licencias del radio le permite recuperar todas las licencias del radio en el servidor RadioCentral:</p>

Columna	Descripción
	<ol style="list-style-type: none">1 Una vez que el radio se vuelve a RadioCentral, se puede ejecutar la opción Recuperar licencias del radio.2 Una vez que este proceso de recuperación se ha completado, el usuario también debe ejecutar la opción Recuperar licencias para cambiar las licencias del radio desde un estado de Registrada a Lista para activación. <p> NOTA:</p> <p>Para ejecutar Recuperar licencias del radio, vaya a Acciones→Administrar→Licencias→Vista de licencia del radio, haga clic con el botón secundario en el radio deseado y seleccione Recuperar licencias.</p>

3.11.2

Idioma

La ventana **Configuración de idioma** le permite seleccionar el idioma que se utiliza en la aplicación.

La aplicación admite los siguientes idiomas:

- Inglés
- Francés (Canadá)
- Español
- Portugués (Brasil)

NOTA:

Cuando se selecciona un idioma nuevo, RadioCentral se debe reiniciar antes de que se utilice dicho idioma.

El idioma de entrada depende de la selección de teclado que se haya configurado para el sistema operativo de la computadora y no de esta selección de idioma. Sin embargo, los números ingresados en un campo de texto siempre se muestran en el formato 0-9, independientemente de la selección de idioma.

3.12

Ver tareas

La ventana informativa **Tareas** permite al usuario ver los trabajos operativos.

La pestaña Tarea contiene un resumen de todos los trabajos operativos. Un trabajo operativo es una operación que se realiza en uno o más objetos de RadioCentral y que no involucra una operación de programación (lectura o escritura). Por ejemplo, si el usuario selecciona unos cien radios y escoge **Eliminar**, el usuario está realizando un trabajo operacional.

Cada vez que el usuario realiza una operación en una entidad de RadioCentral, aparece un trabajo en la ventana **Tareas**, en la que el trabajo más reciente se muestra en la parte superior. En la ventana Tarea, solo se muestran los trabajos que se produjeron durante la sesión actual del cliente RadioCentral.

La ventana informativa **Tareas** se inicia en el menú **Acciones** mediante la selección de **Ver tareas**.

Mesa 17: Tabla Ver tareas

Columna	Descripción
Nombre del trabajo	El nombre del trabajo operativo que se realizó en RadioCentral.
Hora de creación	La hora en que se creó el trabajo operativo en RadioCentral.
Resumen	Un resumen del trabajo realizado en RadioCentral.
Acciones	El tipo de trabajos operativos que realiza el servidor RadioCentral. Puede cancelar un trabajo antes de completarlo si hace clic en la X.

Capítulo 4

Programador

El menú **Programador** abre la ventana **Programar trabajo**. La ventana **Programar trabajo** permite al usuario programar uno o más radios para una operación de lectura, escritura o restablecimiento a los valores de fábrica. Los trabajos se pueden programar para que ocurran inmediatamente o dentro de un período específico. Consulte [Programación de trabajos en RadioCentral en la página 99](#).

NOTA:

El menú **Programador** se activa en **Vista del radio** cuando se seleccionan uno o más radios en el panel de programación, tienen datos y configuración de radio válidos y no esperan un proceso de trabajo.

La ventana **Programación del trabajo** contiene campos que permiten al usuario configurar los siguientes ajustes:

Mesa 18: Configuración de Programación del trabajo

Configuración	Función
Tipo de trabajo	<p>Son compatibles los siguientes tipos de trabajo:</p> <p>Escribir</p> <p>Los datos de configuración para todos los radios seleccionados se escriben en los radios. La casilla de verificación Forzar actualización inmediata está disponible para permitir la instalación inmediata de una actualización. Esto hará que el dispositivo de destino se reinicie inmediatamente después de la descarga sin la confirmación del usuario, y solo se permite en un radio a la vez.</p> <p> NOTA: Esta capacidad solo está disponible para trabajos en un dispositivo aprovisionado único. Si se requiere una actualización inmediata, y este texto aparece atenuado, el usuario tendrá que volver a la Vista del radio a fin de seleccionar solo un radio para actualizar.</p> <p>Confirmación de protección contra escritura</p> <p>Permite al Programador por lote POP25 (Programación sobre 25) proteger el radio contra escritura. Cuando habilita este campo, debe existir una coincidencia de la clave avanzada de ID de propietario (cargada y conectada) para cada radio de destino.</p> <p>Lectura</p> <p>Los radios seleccionados se leen y la información de configuración se actualiza en el servidor. La casilla de verificación Generar configuración está disponible para un trabajo de lectura y genera una configuración a partir de los datos del radio. Si la opción Aplicar al radio está marcada, la configuración se asigna al radio en RadioCentral.</p> <p>Restablecimiento a los valores de fábrica</p> <p>Se elimina la configuración de radio seleccionada. El radio se restaura a su configuración original.</p>
Nombre del trabajo	<p>Selecciona un nombre para el trabajo actual. Se recomienda ingresar un nombre con significado, como "Escritura por cable para estación de bomberos nro. 3" para poder identificar más fácilmente el trabajo en Vista de trabajos.</p>

Configuración	Función
Zona horaria	Selecciona la zona horaria en la cual se ejecuta el evento de trabajo actual en un programador de dispositivos de RadioCentral. Esta selección se aplica a los radios actuales o los seleccionados para este trabajo en la ventana Programar trabajo .
Comenzar después de	Selecciona la fecha (en formato día-mes-año) y la hora (en formato de 24 horas) para el comienzo del intervalo de trabajo. Este campo es opcional y, si no se especifica, el trabajo se ejecuta tan pronto como sea posible.
Terminar antes de	Selecciona la fecha (en formato día/mes/año) y la hora (en formato de 24 horas) para la finalización del intervalo de trabajo activo. Si un trabajo programado no ha comenzado para esta fecha, el trabajo expira y no se puede ejecutar. Este campo es opcional y si no se ingresa nada, el trabajo no caduca.

NOTA:

Cuando **Lectura** es el tipo de trabajo seleccionado, el programador de dispositivos de RadioCentral recupera el codeplug de cada radio asociado con el trabajo. Una vez que el codeplug se ha cargado en el servidor RadioCentral, se sobrescribe la asociación de la configuración anterior para el radio seleccionado.

Capítulo 5

Vista del radio

La **Vista de radio** proporciona información sobre los dispositivos que están en el sistema.

El número de serie se completa automáticamente. Motorola Solutions creó la agencia. El radio completado automáticamente tiene un codeplug predeterminado y personalizado, además de las funciones adquiridas.

La **Vista de radio** admite las siguientes operaciones:

- Editar y seleccionar configuraciones
- Programar y cancelar trabajos
- Agrupar radios
- Analizar una configuración del radio

Cuando se selecciona un radio de la lista, el panel de programación muestra los accesos directos a **Mostrar detalles**, **Editar configuración**, **Analizar** y **Programar trabajo**. Para obtener más información, consulte [Panel de programación en el cliente de configuración de RadioCentral en la página 47](#).

Tabla Vista del radio

Los campos del radio se pueden personalizar. De forma predeterminada, aparecen los campos más comunes. Campos como **Número de serie**, **Alias del radio**, **Configuración**, **Grupo**, **Modificado**, **Estado del trabajo**, etc. Consulte [Tabla Vista del radio en la página 84](#).

Mesa 19: Botones de funcionamiento en la Vista del radio

Botón	Descripción
	El botón Edición no es compatible. Las propiedades del radio son únicas para cada radio y no se pueden editar.
	El botón Crear cuadrículas en el archivo (exportar) se activa cuando se selecciona un radio y se utiliza para exportar los datos del radio para las filas seleccionadas a un archivo CVS delimitado por comas.
	El botón Archivo a cuadrícula (importar) se utiliza para importar datos del radio desde un archivo CVS delimitado por comas.

Haga clic con el botón derecho en Operaciones de radios

Las siguientes operaciones se pueden realizar en un radio seleccionado:

Mesa 20: Haga clic con el botón derecho en Operaciones de radios

Operación	Descripción
Mostrar detalles	Muestra Información del radio, Historial del trabajo y conjuntos de funciones para el radio seleccionado. Esta operación también está disponible como un acceso directo sobre el campo de búsqueda.
Eliminar	Elimina el radio seleccionado en la base de datos del servidor de RM.

Operación	Descripción
Seleccionar grupo	Permite que el usuario asigne el radio seleccionado a un grupo o subgrupo.
Editar configuración	Abre la Vista de configuración y muestra información del dispositivo, además de todos los conjuntos asignados a la configuración. En esta vista, el usuario puede modificar campos en todos los conjuntos relevantes.
Seleccionar configuración	Abre la ventana Seleccionar configuración que permite al usuario asignar una configuración al radio seleccionado.
Comparar	<p>Permite que el usuario compare las diferencias en los valores de codeplug dentro de dos configuraciones, asignadas a los radios, mediante la función de comparación de configuración. Se admiten las siguientes operaciones:</p> <p>Configuración asignada Compara los valores de codeplug de las opciones de configuración asignadas actualmente.</p> <p>Última programación Compara los valores de codeplug de las últimas opciones de configuración programadas en el radio.</p> <p> NOTA: Se puede acceder a estas selecciones cuando se seleccionan dos radios.</p>
Descartar cambios	<p>Descarta los cambios recientes realizados en el radio seleccionado. Esto se aplica a todos los cambios en los datos. Sin embargo, un cambio de grupo no se puede restaurar (consulte Grupos de radios en la página 81).</p> <p> ADVERTENCIA: Cualquier función pendiente agregada a través de FLASHport se perderá de forma permanente. FLASHkey ya se ha disminuido, y esta acción no se puede deshacer. Las funciones pendientes agregadas mediante Licencias de radio pueden recuperarse en la opción Configuraciones.</p> <p>Cuando una función se agrega a un radio a través de Licencias de radio (consulte Vista Administrar licencias de radio en la página 65) en lugar de FLASHport y, luego, se selecciona “Descartar cambios” antes de que estos cambios FLASHcode se escriban en el radio, se puede utilizar la función “Restaurar” (consulte Administrar licencias de radio), a fin de cambiar el “estado” de la ventana Administrar licencias de radio de “Registrado” a “Listo para activación”.</p>
Programar trabajo	Abre la ventana Programar trabajo que permite al usuario crear un trabajo de programación de lectura o escritura para el o los radios seleccionados.
Cancelar trabajo	Permite al usuario cancelar un trabajo para el radio actualmente seleccionado.
Completar trabajo	Permite al usuario mover manualmente el estado del radio seleccionado desde el estado transferido al estado finalizado. Esta acción solo está disponible cuando el radio está en el

Operación	Descripción
	estado transferido, lo que indica que el nuevo firmware ha sido transferido al radio por el aire y espera que el usuario final realice la instalación. Solo realice esta acción cuando esté seguro de que el usuario final ha aplicado los cambios o desea realizar la lectura de un radio, como mover manualmente el radio al estado finalizado; de lo contrario, Radio Management podría perder la sincronización con este radio.
Seleccionar MVO	Permite al usuario asignar un modelo, versión y opción (MVO) a un nuevo radio. Consulte Modelo, versión y opciones .
Actualizar datos del radio	Inicia la ventana Consultar/actualizar datos de radio, la cual permite al usuario modificar el tipo de clave avanzada del propietario del radio, o el ID de propietario, O activar o desactivar la protección contra escritura del radio.
Analizar	Permite al usuario analizar una configuración en busca de errores o advertencias antes de crear un trabajo. Consulte Análisis de la configuración del radio en la página 49 .
Informes	Abre páginas de informes de Resumen de canales y Documentos del cliente . Estos reportes se pueden imprimir o guardar en una ubicación del archivo local o de red.
Actualizar firmware	<p>Le permite al usuario actualizar el firmware del radio existente a la versión de firmware más reciente.</p> <p>La versión del codeplug se incrementa automáticamente, según la versión de firmware elegida. Las nuevas funciones estarán disponibles según la versión más reciente del codeplug.</p> <p>El usuario puede comprobar los firmware existentes en RadioCentral a través de la función Administrar firmware. Consulte Administrar firmware en la página 69.</p> <p>Para actualizar el firmware, en el menú Acciones, seleccione Actualizar→Actualizar firmware.</p>
Actualizar paquetes de idiomas	<p>Permite comparar las versiones de los paquetes de idiomas que actualmente se leen en el radio en relación con las que se almacenan en el servidor de RM. Si se detecta una versión más reciente del paquete de idiomas, este último se actualiza y la marca Paquetes de idiomas modificados se establece. Se debe programar un trabajo de escritura inalámbrico o con cable para actualizar los paquetes de idiomas del radio y borrar la marca Paquetes de idioma modificados.</p> <p> NOTA: La marca Paquetes de idioma modificados solo se establece cuando se detecta una versión de paquete de idioma más reciente en el servidor RM.</p> <p>Además, los trabajos de escritura para realizar modificaciones al codeplug se pueden programar por el aire, incluso si se estableció la marca Paquetes de idioma modificados. Los paquetes de idiomas solo se pueden escribir en el radio mediante una conexión inalámbrica o por cable.</p>

Operación	Descripción
Actualizar la versión del codeplug	Permite que el usuario actualice la versión del codeplug. El usuario puede mantener su selección de idioma después de la actualización de la versión.
Exportar radio	Permite que el usuario exporte el o los radios seleccionados a un formato de matriz de bytes de codeplug (*.xpb). Consulte Exportación del radio
Exportar DVRS	Permite al usuario exportar el registro/la fila actualmente destacados del radio a un formato de archivo (.XML). Consulte Exportación de datos DVRS
Exportar cuadrícula a archivo	Permite que el usuario exporte el o los radios seleccionados a un archivo delimitado por comas (*.csv). Consulte Exportación de cuadrícula a archivo en la página 56
Modificar contraseña del radio	Inicia la ventana Modificar contraseña de radio que permite al usuario anular la contraseña actual del codeplug para la configuración del radio.
Copiar identidad	Permite que el usuario copie los datos de identidad (como ID, alias, IP y más) de un radio a otro.
Pegar identidad	Permite que el usuario pegue los datos de identidad copiados (como ID, alias, IP y más) de un radio a otro.

 **NOTA:**
 Esta función se activa cuando se selecciona un radio y se copian sus datos de identidad.

5.1

Grupos de radios

La función de agrupación de radios dentro del cliente de configuración de RadioCentral permite que organice y administre su radio para el sistema RadioCentral dentro de una estructura de vista de árbol. Los grupos se usan con conjuntos y configuraciones compartidos para administrar de manera más eficaz el sistema de radio.

Desde la **Vista del radio**, el panel de navegación para **Grupos** permite que el usuario cree grupos y subgrupos usando las operaciones del botón derecho del mouse.

Se pueden realizar las siguientes operaciones en grupos o subgrupos:

- Crear un grupo o subgrupo
- Eliminar un grupo o subgrupo
- Cambiar el nombre de un grupo o subgrupo
- Arrastrar y soltar un grupo o subgrupo a una nueva ubicación
- Expandir o contraer los nodos de grupo dentro de la vista de árbol

Si selecciona **Todo**, se muestran todos los radios en el sistema RadioCentral, independientemente de su asignación de grupo. La asignación de radios a un grupo o subgrupo se realiza en la columna **Grupo** de la tabla. Se pueden seleccionar uno o más radios de la tabla y asignarlos a un grupo o subgrupo. Consulte [Creación y administración de grupos de radio](#).

Mesa 21: Funciones del botón derecho para los grupos de radio

Selección	Descripción
Nuevo grupo	Permite que el usuario cree un grupo o subgrupo.
Eliminar	Permite que el usuario elimine un grupo o subgrupo. Cuando se elimina un grupo que contiene radios o subgrupos, se abre una ventana de confirmación que advierte al usuario que se borrarán el grupo seleccionado y todos los subgrupos. Los radios asignados al grupo o subgrupo ya no estarán asignados a un grupo. La columna Grupo en la tabla para todos los radios eliminados de un grupo o subgrupo muestra <i>Ninguno</i> .
Renombrar	Permite que el usuario cambie el nombre de un grupo o subgrupo.

5.1.1

Creación y administración de grupos de radio

Los grupos y subgrupos de radio se crean y administran dentro del panel de navegación **Grupo**. Una vez que se crean grupos y subgrupos de radio, es posible cambiar su nombre, eliminarlos o moverlos dentro de la estructura de vista de árbol.

Procedimiento:

- 1 Haga clic en el ícono **Vista del radio** para ver la tabla Vista del radio.
- 2 Cree, administre o mueva un grupo o subgrupo. Realice una de las siguientes acciones:

Si...	Entonces...
Si va a crear un grupo,	realice las siguientes acciones: a Haga clic con el botón derecho en el panel de navegación y seleccione Nuevo grupo . b Ingrese un <code>name</code> para el nuevo grupo.
Si va a crear un subgrupo,	realice las siguientes acciones: a Haga clic con el botón derecho en el grupo o subgrupo correspondiente y seleccione Nuevo grupo . b Ingrese un <code>name</code> para el nuevo subgrupo.
Si va a eliminar un grupo o subgrupo,	realice las siguientes acciones: a Seleccione el grupo o subgrupo correspondiente. b Haga clic con el botón derecho y seleccione Eliminar .  NOTA: Se abre una ventana de confirmación que advierte al usuario que se borrarán el grupo seleccionado y todos los subgrupos. Los radios asignados al grupo o subgrupo ya no estarán asignados a un grupo.

Si...	Entonces...
Si va a cambiar el nombre de un grupo o subgrupo,	realice las siguientes acciones: a Seleccione el grupo o subgrupo correspondiente. b Haga clic con el botón derecho y seleccione Renombrar . c Ingrese un nuevo <code>name</code> para el grupo o subgrupo.
Si va a mover un grupo o subgrupo,	realice las siguientes acciones: a Seleccione el grupo o subgrupo correspondiente. b Usando la funcionalidad estándar de arrastrar y soltar, mueva el grupo o subgrupo a su nueva ubicación.  NOTA: Los grupos o subgrupos pueden moverse y colocarse sobre un grupo existente o entre grupos. Cualquier radio asignado al grupo o subgrupo se moverá con el grupo o subgrupo a la nueva ubicación.

3 Asigne radios a un grupo o subgrupo. Realice una de las siguientes acciones:

Si...	Entonces...
Si va a asignar solo un radio,	realice las siguientes acciones: a En el panel de navegación, seleccione Todo para mostrar todos los radios en el sistema RadioCentral. b Desde la tabla, seleccione la lista desplegable de la columna Grupo para buscar un radio, expanda los nodos si fuese necesario y seleccione el grupo o subgrupo correspondiente. c Repita el paso anterior hasta asignar todos los radios para el grupo o subgrupo.
Si va a asignar varios radios,	realice las siguientes acciones: a En el panel de navegación, seleccione Todo para mostrar todos los radios en el sistema RadioCentral. b Seleccione todos los radios correspondientes en la tabla con las funciones estándar de las teclas MAYÚS y CTRL. c Haga clic con el botón derecho en cualquier fila destacada y seleccione Seleccionar grupo .

Si...	Entonces...
	<p>d Desde la ventana Seleccionar grupo, expanda los nodos si fuese necesario y seleccione el grupo o subgrupo correspondiente.</p> <p>e Haga clic en OK (Aceptar).</p>

NOTA:

Solo se puede asignar un radio a un grupo o subgrupo.

Si **Ninguno** es el único valor en la lista desplegable **Grupo**, entonces no existen grupos de radio en el panel de navegación.

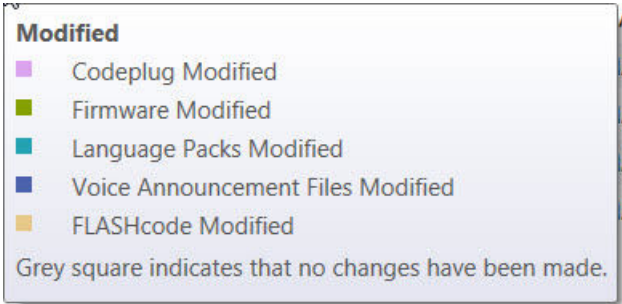

5.2

Tabla Vista del radio

La siguiente tabla define todos los campos de la columna que se admiten en **Vista del radio**.

Mesa 22:

Columna	Descripción	Notas
Número de serie	Muestra el número de serie del radio almacenado en servidor RadioCentral.	Solo lectura
Alias del radio	Muestra y permite editar directamente el nombre del radio.	Este campo se puede editar.
Configuración	Un archivo único que se encuentra en el servidor RadioCentral y que contiene todos los conjuntos asignados para el radio.	
Grupo	Consulte Grupos de radios en la página 81 .	
Modificado	Muestra los indicadores basados en colores que advierten al usuario sobre determinados estados modificados para el radio. El usuario puede pasar el mouse sobre la palabra "Modificado", en el encabezado de la columna, para ver la leyenda	

Columna	Descripción	Notas
	de colores: 	
Estado del trabajo	Muestra el estado del radio, que no se puede editar, y de cualquier trabajo actual que pueda estar asociado con el radio.	
Nombre del trabajo	Muestra el nombre, que no se puede editar, asignado al trabajo durante su creación. Una vez que se haya creado un trabajo, este valor no se puede editar.	
Número de modelo	Muestra el número de modelo del radio en un campo no editable.	
FLASHcode	El número del FLASHcode refleja la lista completa de funciones/opciones del sistema que puede utilizar un codeplug. Al situarse sobre un FLASHcode del radio, se muestra todo el conjunto de funciones de ese radio, que también puede verse desde la ventana Vista Administrar licencias de radio en la página 65 .	
Configurar contraseña por dispositivo	Muestra si se configuró o no una contraseña para el radio. La contraseña es necesaria para editar la configuración de un radio.	
Verificar contraseña	Muestra el acceso configurado (Leer o Lectura/escritura) para radios que son compatibles con la función Modificar contraseña de radio . Si no hay contraseña asignada al radio, entonces se visualiza Ninguno.	Solo lectura

Columna	Descripción	Notas
ID de OTAR	Muestra el ID de OTAR (Regeneración de clave por el aire) necesario para la comunicación por radio con la KMF (Facilidad de administración de claves).	
IP de OTAR fija	Muestra la dirección IP fija (FIP) de OTAR (por el aire) para todos los codeplugs (registro/filas) en la Vista del radio. Si se conoce la dirección IP del radio, se puede utilizar para el Programador de dispositivos directo, POP25/OTAP en las comunicaciones de radio, lo que permite prescindir de ARS, que también se conoce como el modo FIP.	
IP del suscriptor	Muestra la dirección IP del suscriptor de enlace 1 en serie de todos los codeplugs del radio (registros/filas) en la Vista del radio. Esta dirección IP se asigna al extremo Unidad de suscriptor (SU) del enlace 1 en serie.	
IP del par	Muestra la dirección IP del suscriptor de enlace 1 en serie de todos los codeplugs del radio (registros/filas) en la Vista del radio. Esta dirección IP se asigna al extremo de computadora móvil (MC) del enlace 1 en serie.	
IP del suscriptor para Bluetooth de acceso telefónico a redes (DUN)	Muestra la dirección IP del suscriptor de la Red de marcación (DUN) de Bluetooth de todos los codeplug del radio (registro/filas) en Vista del radio. Esta dirección IP se asigna al extremo Unidad de suscriptor (SU = radio) del enlace Bluetooth (BT).	
IP del par para Bluetooth de acceso telefónico a redes (DUN)	Muestra la dirección IP de par de Bluetooth DUN de todos los codeplug del radio (registro/filas) en Vista del radio. Esta dirección IP se asigna al extremo de la	

Columna	Descripción	Notas
Nombre descriptivo de Bluetooth	<p>MC (Computadora móvil) del enlace de Bluetooth (BT) y también se utiliza para acceder a la MC a través de datos por paquete por el aire.</p>	
Nombre de usuario	<p>Muestra el nombre de Bluetooth reconocible del usuario del radio de todos los codeplugs del radio (registros/ filas) en la Vista del radio. Este nombre identifica el radio con un dispositivo Bluetooth emparejado y conectado.</p>	
PIN de usuario	<p>Permite al usuario ingresar un servicio de registro automático o un nombre de usuario de inicio de sesión predeterminado de la autenticación de usuario para todos los codeplugs del radio (registros/filas) en la Vista del radio. Este nombre de usuario se puede aplicar a todos los perfiles de datos habilitados por el "Servidor" ARS. Cuando la función de ID de software está activada, este nombre de usuario también se utiliza para todos los canales habilitados por ASTRO de despacho convencional.</p>	
ID de unidad de inicio de sesión de usuario	<p>Permite que el usuario ingrese un Número de identificación personal (PIN) de inicio de sesión del Servicio de registro automático predeterminado o un PIN de Autenticación de usuario/contraseña para todos los codeplug del radio (registro/filas) en Vista del radio. Este PIN/contraseña puede corresponder a todos los perfiles de datos habilitados por el "Servidor" ARS (consulte Modo ARS). Se muestran asteriscos cuando se ingresa un PIN de usuario.</p>	
	<p>Muestra un ID de unidad de inicio de sesión predeterminado de la autenticación de usuario para</p>	

Columna	Descripción	Notas
	<p>todos los codeplugs del radio (registros/filas) en la Vista del radio. Este ID puede utilizarse para designar todos los usos del radio dentro de un vehículo o cuadrilla específicos. Este ID se aplica a todos los perfiles de datos habilitados por el "Servidor" ARS.</p>	
<p>Grupo de conversación de datos de grupo</p>	<p>Muestra el grupo de conversación utilizado en la sesión de datos de grupo para transmitir el firmware (y el paquete de idiomas opcional) por el aire a través del gateway de datos de grupo. Este valor no puede editarse y se actualiza una vez que el radio inicia la descarga del firmware.</p>	
<p>ASK requerida</p>	<p>Muestra el tipo de clave del sistema del propietario, el ID de sistema del propietario, la protección contra escritura y el estado de la Clave avanzada de sistema (ASK) requerido de todos los codeplug (registro/filas) en esta Vista del radio.</p> <p>Activar esta función asegura que solo se pueden cargar claves (hardware) avanzadas en RC y asignarlas para usar en sistemas de troncalización; los archivos de la clave de sistema de software no se pueden asignar.</p> <p>Cuando están desactivadas, las claves de software y de hardware cargadas en RC se pueden asignar para su uso en el campo de ID de sistema de un sistema de troncalización. Además, la desactivación de estas funciones le brinda al usuario la capacidad de desactivar el estado de protección contra escritura de un radio.</p>	
<p>Tipo de clave del sistema del propietario</p>	<p>Muestra el tipo de clave del sistema del propietario de</p>	<p>El "Tipo de clave" avanzada de propietario y su</p>

Columna	Descripción	Notas
	<p>todos los codeplugs (registros/ filas) en la Vista del radio.</p>	<p>correspondiente “ID del sistema de propietario” o “ID de WACN de propietario” se determinan inicialmente para el radio y sus codeplugs en el momento de la compra original del radio.</p>
<p>ID del sistema del propietario (Hex)</p>	<p>Muestra el ID del sistema del propietario de todos los codeplugs (registros/filas) en la Vista del radio.</p>	<p>El “Tipo de clave” avanzada de propietario y su correspondiente “ID del sistema de propietario” o “ID de WACN de propietario” se determinan inicialmente para el radio y sus codeplugs en el momento de la compra original del radio.</p>
<p>Protección contra escritura</p>	<p>Muestra la protección contra escritura de todos los codeplugs (registros/filas) en la Vista del radio.</p> <p>Cuando está activada, se utiliza para la Protección contra escritura del radio.</p> <p>Cuando está desactivada, se utiliza para desactivar la Protección contra escritura del radio.</p>	<p>Si se desactiva la ASK requerida también lo hará el estado de Protección contra escritura del radio.</p>
<p>Versión de firmware</p>	<p>Muestra la versión de firmware del radio que no se puede editar.</p>	<p>Por lo general, las versiones de firmware controlan las funciones que están disponibles en un radio. Normalmente, en comparación con una versión anterior, una versión de firmware más reciente admite funciones nuevas o mejoradas.</p>
<p>Paquete de idiomas</p>	<p>Muestra los paquetes de idiomas asignados actualmente al radio.</p>	
<p>Anuncios de voz</p>	<p>Muestra el número de anuncios de voz asignados actualmente para el radio.</p>	
<p>Versión del codeplug</p>	<p>Muestra la versión del codeplug del radio que no se puede editar.</p>	<p>Las versiones de codeplug describen el formato de la información de configuración que está programada en un radio, y generalmente están vinculadas a versiones de firmware específicas.</p>

Columna	Descripción	Notas
Comentarios	Parámetro que puede editarse y en el cual el usuario puede incluir cualquier nota o comentario sobre un radio. Por ejemplo, el usuario podría usar este campo para ingresar el nombre de un cliente. Debido a que la información ingresada aquí se puede buscar, ofrece una manera rápida de buscar todos los radios de un cliente específico.	
Aprovisionado	Muestra el estado de aprovisionamiento no editable del radio.	
Última hora de contacto	Muestra la hora y la fecha no editables del último contacto.	

5.3

Detalles del radio

La siguiente tabla define todos los campos de la columna que se admiten en **Detalles del radio**.

Definición de conceptos.

Operación	Descripción	Notas
Número de serie	Muestra el número alfanumérico único que identifica al dispositivo.	
Identificador de producto	Muestra el tipo de dispositivo que se va a agregar al servidor RM.	
Número de modelo	Muestra el número de modelo del tipo de dispositivo seleccionado.	
Nombre de perfil del MCIF	Muestra el nombre de perfil del Marco de interacción de misión crítica (MCIF) que utiliza el dispositivo.	El usuario debe importar manualmente el paquete de MCIF. El paquete de MCIF contiene los archivos <code>mcifconfig.xml</code> , <code>interactions.csv</code> y <code>manifest.xml</code> .
Versión de perfil del MCIF	Muestra la versión del perfil del Marco de interacción de misión crítica (MCIF) que utiliza el dispositivo.	
Última fecha programada	Muestra la fecha de los últimos trabajos programados.	
Comentarios	Parámetro que puede editarse y en el cual el usuario puede incluir cualquier nota o comentario sobre un radio. Por ejemplo,	

Operación	Descripción	Notas
Recuento de trabajos	el usuario podría usar este campo para ingresar el nombre de un cliente. Debido a que la información ingresada aquí se puede buscar, ofrece una manera rápida de buscar todos los radios de un cliente específico.	

Capítulo 6

Vista de sistemas de radio

La **Vista de sistemas de radio** muestra los ID de radio convencional o de troncalización específicos del radio para todos los radios dentro de la base de datos del servidor RadioCentral.

En la **Vista de sistemas de radio** se muestra información sobre el estado de la infraestructura de su radio. Cada fila de la tabla representa un sistema convencional o de troncalización.

La información que se muestra en la tabla puede tener una vista filtrada seleccionando **Todo**, **Radios** o **Sistemas**.

Se muestra la siguiente información del sistema de radio:

- Número de serie
- ID del radio
- Configuración
- Alias del radio
- Tipo de comunicación
- Tipo de subsistema
- ID del sistema
- Nombre del sistema

Capítulo 7

Vista de perfil de datos

En la **Vista de perfil de datos** se muestra información sobre la configuración del radio.

La estrategia de agrupación de radios diseñada en la Vista del radio determina el acceso a los datos en esta vista. Consulte [Grupos de radios en la página 81](#). Cada fila en la **Vista de perfil de datos** representa un perfil de datos creado en RadioCentral. Cuando existe más de un perfil de datos para un codeplug, varias filas representan el mismo codeplug.

La sección **Ver por** permite al usuario filtrar todos los trabajos por **Radios** o **Perfiles de datos**. La selección **Todo** es la vista predeterminada.

Los siguientes campos son compatibles en la tabla Vista de perfil de datos:

Columna	Descripción
Número de serie	Muestra el número de serie del radio almacenado en servidor RadioCentral.
Configuración	Un archivo único que se encuentra en el servidor RadioCentral y que contiene todos los conjuntos asignados para el radio.
Alias del radio	Muestra y permite editar directamente el nombre del radio.
Tipo de comunicación	Muestra Troncalización o Convencional.
Generar IP automáticamente	Es Verdadero cuando el campo Generar dirección IP automáticamente en el Perfiles de datos en la página 376 está activado.
IP del suscriptor	Muestra la dirección IP del extremo del enlace en serie 1 de la Unidad del suscriptor (SU).
IP del par	Muestra la dirección IP del par del vínculo 1 en serie de todos los perfiles de datos convencionales (registro/filas) en esta vista de perfil de datos. Esta dirección IP se asigna al extremo de Computadora móvil (MC) del vínculo 1 en serie y también se utiliza para acceder a la MC a través de datos por paquete por el aire.
IP del suscriptor para Bluetooth de acceso telefónico a redes (DUN)	Muestra la dirección IP del suscriptor de la Red de marcación (DUN) de Bluetooth de todos los codeplug del radio (registro/filas) en Vista del radio. Esta dirección IP se asigna al extremo Unidad de suscriptor (SU = radio) del enlace Bluetooth (BT).
IP del par para Bluetooth de acceso telefónico a redes (DUN)	Muestra la dirección IP de par de Bluetooth DUN de todos los codeplug del radio (registro/filas) en Vista del radio. Esta dirección IP se asigna al extremo de MC del vínculo de BT y también se utiliza para acceder a la MC a través de datos por paquete por el aire.

Columna	Descripción
IP del suscriptor de interfaz por aire	Muestra la dirección IP del suscriptor de interfaz por aire de todos los perfiles de datos convencionales (registro/filas) en esta vista de perfil de datos. Esta dirección IP es necesaria para la comunicación de datos por paquete por el aire con el radio.
Nombre del perfil de datos	Muestra el nombre del conjunto del perfil de datos seleccionado para el perfil de datos.

Capítulo 8

Job View (Vista de trabajos)

La **Vista de trabajo** muestra información histórica relacionada con todos los trabajos procesados y almacenados en el servidor RadioCentral.

La vista inicial muestra todos los trabajos realizados en el sistema. La sección **Ver por** permite al usuario filtrar todos los trabajos por **Trabajos de programación** o **Trabajos operativos**.

Trabajos de programación

Esta selección muestra los trabajos que se procesaron como trabajos de lectura o escritura en la ventana **Programar trabajo**.

Trabajos operativos

Esta selección muestra trabajos que son operaciones realizadas en RadioCentral, como la importación y exportación de radios, la programación de trabajos, la selección y eliminación de configuración, así como muchas otras.

La tabla Vista de trabajos admite los siguientes campos:

Columna	Descripción
Nombre del trabajo	El nombre asignado al trabajo cuando se programa en la ventana Programar trabajo .
Tipo	El tipo de trabajo configurado en la ventana Programar trabajo .
Hora de creación	La fecha y la hora en que se creó el trabajo en la ventana Programar trabajo .
Hora de inicio	La fecha y hora en que el trabajo está programado para comenzar, tal como se especifica en el campo Comenzar después de en la ventana Programar trabajo .
Hora de finalización	La fecha y hora en que el trabajo está programado para finalizar según lo ingresado en el campo Terminar antes de en la ventana Programar trabajo .
Total	Muestra el número de radios programados para el trabajo.
Finalizado	Muestra el número de radios completos en el trabajo programado.

Selección de nombre del trabajo

La columna **Nombre del trabajo** muestra todos los trabajos como enlaces seleccionables.

El enlace Nombre del trabajo proporciona la siguiente información:

Columna	Descripción
Elemento	El nombre del archivo seleccionado como parte del trabajo.
Estado	Se admiten los siguientes estados: Pendiente Un trabajo programado no se ha iniciado, porque no se ha detectado un radio en un programador de dispositivo o porque el procesador de trabajos está ocupado procesando otro trabajo. En ejecución El trabajo se ha iniciado y está en progreso.

Columna	Descripción
	<p>Cancelado El usuario ha cancelado el trabajo.</p> <p>Finalizado El trabajo se ha realizado correctamente.</p> <p>Error El trabajo falló. La razón de la falla se describe en la columna Razón.</p> <p>Vencido La Fecha de finalización pasó, y el trabajo no se realizó ni se ejecutó.</p>
Fecha de ejecución	Estas son la fecha y la hora reales en que se ejecutó el trabajo programado.
Razón	Este campo se deja en blanco cuando los trabajos del radio se completan correctamente. Si un trabajo falla, aparece una descripción con respecto a la causa de la falla.

Capítulo 9

Tareas comunes de RadioCentral

RadioCentral es compatible con un amplio rango de tareas que pueden realizar los usuarios y administradores de un sistema RadioCentral. Las tareas comunes permiten a los usuarios obtener rápidamente la información requerida para realizar la tarea.

9.1

Configuración de SmartConnect

Procedimiento:

- 1 Desde Establecer categorías, seleccione **Configuración de datos** → **Perfiles de datos**.
- 2 En **General**, establezca el campo **Tipo de perfil de datos** en **Troncalización**.
- 3 En la pestaña **Banda ancha**, establezca lo siguiente:
 - a Configure el **Nombre de host del gateway de SmartConnect** de acuerdo con el nombre de dominio completo (FQDN)/el nombre de host del gateway basado en la nube correcto. Consulte [Nombre de host del gateway de SmartConnect en la página 389](#).
 - b Establezca el **Número de puerto del gateway TLS de SmartConnect** en el valor predeterminado. Consulte [Número de puerto del gateway TLS de SmartConnect en la página 389](#).
- 4 En **Banda ancha**, deje vacío el campo **Número de puerto del gateway de SmartConnect**.
- 5 Seleccione **Configuración de troncalización** → **Troncalización en general común**.
- 6 Configure el **Umbral de repliegue RSSI SmartConnect** en **52**.

El valor predeterminado de [Umbral de salida RSSI de LMR en la página 502](#) y [Volver al umbral de RSSI de LMR en la página 511](#) puede no ser el mismo para cada usuario. El valor depende de la preferencia de duración.
- 7 Seleccione **Configuración de troncalización** → **Sistema de troncalización ASTRO 25**.
- 8 Seleccione el sistema que se utiliza con SmartConnect, haga clic con el botón derecho y seleccione **Editar**.
- 9 En la **Selección de perfil de datos**, seleccione el nombre del perfil de datos que se creó en el paso 1.
- 10 Seleccione **Configuración de troncalización** → **Personalidad de troncalización ASTRO 25**.
- 11 Seleccione el sistema que se creó en el paso 1, haga clic con el botón derecho y seleccione **Editar**.
- 12 Establezca **Operación de SmartConnect** en **Solo LMR** (predeterminado) o **LMR preferido**.
- 13 En el [Asignación de canal de zonas en la página 676](#), seleccione una zona existente o cree una zona para asignar la personalidad de troncalización que se creó en el paso 1 y los grupos de conversación.

9.2

Configurar radios

Procedimiento:

- 1 Inicie el cliente de RadioCentral e inicie sesión en la base de datos.

Los codeplugs predeterminados de fábrica de todos los radios están disponibles para el usuario en una aplicación en la nube segura. Si el usuario desea utilizar un codeplug APX existente, consulte [Conversión de codeplug APX en la página 98](#).

- 2 En **Vista del radio**, configure los conjuntos de RadioCentral. Realice las siguientes acciones:

- a En la tabla **Vista del radio**, seleccione el radio correspondiente.

- b Haga clic en  **Editar**.

Aparece una ventana de **Vista de configuración**.

- 3 Configure las funciones de los conjuntos de RadioCentral.

Consulte [RadioCentral versión 2.22.135](#) para obtener más información.

- 4 Para guardar la configuración, seleccione el icono **Vista del radio**.

- 5 En el cuadro de diálogo **Salir de la configuración**, haga clic en **Guardar esta configuración** y en **Aceptar** para guardar la configuración.

Si el usuario opta por no guardar los cambios actuales, haga clic en **Descartar cambios en esta configuración** y en **Aceptar**.

- 6 En el cuadro de diálogo **Guardar como nueva configuración**, ingrese el nombre de la configuración en el campo **Nombre**.

- 7 Si el usuario desea eliminar la configuración anterior, active la casilla de verificación **Eliminar configuración anterior si ningún radio la utiliza** y haga clic en **Aceptar**.

Esta configuración es predeterminada.

- 8 Si el usuario desea mantener la configuración anterior, desactive la casilla de verificación **Eliminar configuración anterior si ningún radio la utiliza** y haga clic en **Aceptar**.

Si la configuración se ha aplicado a cualquier radio, los radios afectados aparecen debajo de la sección **Número de serie**.

- 9 Programe un trabajo de escritura para el dispositivo a fin de que la configuración tenga efecto.

Consulte [Programación de trabajos en RadioCentral en la página 99](#).

9.3

Conversión de codeplug APX

Procedimiento:

- 1 Desde el menú **Acciones**, seleccione **Migración de codeplug**.
- 2 En el cuadro de diálogo **Migración de codeplug**, haga clic en **Buscar** y seleccione el archivo **.mc** correspondiente.
- 3 Seleccione el radio de destino en la sección **Seleccionar dispositivo de destino** y haga clic en **Aceptar**.

Comienza el proceso de conversión. Para supervisar el progreso de la conversión, vaya a **Vista de trabajo**→**Trabajos operativos**. Las columnas de **estado** cambiarán de **En ejecución** a **Realizado**.

9.4

Programación de trabajos en RadioCentral

La programación de trabajos se realiza dentro de la ventana **Programar trabajo** de **Vista del radio**. Los trabajos se pueden programar para que ocurran inmediatamente o dentro de un período específico.

PRECAUCIÓN:

Cuando se actualiza el firmware del radio y se modifica la configuración, mediante el método de conexión **Inalámbrica (LAN)**, se recomienda encarecidamente realizar dos trabajos de escritura separados. Si se realizan estas tareas en un solo trabajo de escritura, el radio se restablece dos veces.

En primer lugar, actualice el firmware del radio mediante la programación de un trabajo de escritura. Cuando el trabajo de escritura del firmware se haya completado, registre la nueva función, configure los ajustes del radio para la nueva función y, a continuación, programe un segundo trabajo de escritura.

Procedimiento:

- 1 En **Vista del radio**, seleccione el o los radios relevantes.
- 2 Seleccione el menú **Programador**.

NOTA:

La ventana **Programar trabajo** también se puede abrir haciendo clic con el botón derecho en los radios seleccionados y eligiendo **Programar trabajo** en el menú emergente o el acceso directo **Programar trabajo** sobre el campo de búsqueda.

- 3 En la sección **Tipo de trabajo**, realice una de las siguientes acciones:
 - Seleccione **Escritura** para programar un trabajo de escritura para uno o más radios.
 - 1 Seleccione **Forzar actualización inmediata** si es necesario (solo se selecciona un radio provisionado para la programación).
 - 2 Revise la advertencia de actualización inmediata y confirme si desea continuar.
 - Seleccione **Lectura** para programar un trabajo de lectura.
 - Seleccione **Restablecimiento a los valores de fábrica** para restaurar la configuración original del radio.
- 4 En el campo **Nombre del trabajo**, ingrese un nombre relevante para el trabajo.
- 5 En el campo **Zona horaria**, seleccione la zona horaria relevante de la lista desplegable.
- 6 **Opcional:** En el campo **Comenzar después de**, seleccione la fecha de inicio (en formato día-mes-año) y la hora de inicio (en formato de 24 horas).

NOTA:

Al hacer clic en el campo de fecha, se activa una flecha desplegable que permite al usuario seleccionar la fecha desde un calendario. La hora se puede introducirse o seleccionar manualmente, en incrementos de un minuto, mediante las flechas hacia arriba y hacia abajo.

- 7 En el campo **Finalizar después de**, seleccione la fecha de finalización (en formato día-mes-año) y la hora de finalización (en formato de 24 horas).
- 8 Haga clic en **OK (Aceptar)**.

Capítulo 10

Conjuntos de RadioCentral para radio

RadioCentral facilita la creación de una configuración de programación de radio extremadamente eficiente. RadioCentral permite al usuario administrar y programar varios radios a la vez. Los codeplug del radio se almacenan en un servidor central de base de datos que permite la configuración remota de datos y la programación remota de radios. Se puede usar un único codeplug como configuración, que luego se puede compartir entre varios radios. Luego, se puede editar la configuración y aplicarla fácilmente a todos los radios involucrados. Se pueden programar cambios en una configuración o en los parámetros de un radio individual como un trabajo de programación. Los trabajos de programación se pueden programar a través de LTE.

10.1

Información del radio

Esta sección le permite ver la información de identidad del radio que se utiliza cuando se programa o se solucionan problemas de un radio.

NOTA:

La Información del radio solo es visible cuando se edita una Configuración de radio.

10.1.1

General

Esta sección muestra información sobre el modelo, el número de serie y la versión del radio adjunto.

10.1.1.1

Número de modelo

La aplicación recopila y muestra el número de modelo del radio conectado de solo lectura.

El número de modelo identifica el tipo de radio. Esta información se almacena en el codeplug del radio.

10.1.1.2

Canales máximos

La aplicación recopila y muestra la cantidad máxima de canales de comunicaciones Convencionales y de troncalización de solo lectura que se permiten para el radio que está conectado actualmente.

Esta cantidad máxima de canales se aplica al definir zonas y canales en la ventana Asignación de canal de zona.

IMPORTANTE:

Esta cantidad máxima de canales está determinada por el modelo del radio y solo se puede cambiar mediante una actualización de FLASHport.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.1.1.3

Número de serie

La aplicación recupera y permite solo ver el número de serie de los dispositivos de clave que contienen Claves avanzadas (hardware) que se usaron para operaciones anteriores de programación que requerían una Clave avanzada.

Solo se almacena un Número de serie del dispositivo clave por operación. El Número de serie específico almacenado es el dispositivo clave que contiene el ID del sistema del propietario o la clave avanzada de ID de WACN del propietario. El codeplug retiene hasta 25 de los números de serie más recientes del dispositivo clave.

NOTA:

Las operaciones de programación que requieren una Clave avanzada incluyen: proteger contra escritura un radio, escribir en un radio protegida contra escritura y activar/desactivar el campo ASK requerido en un radio.

Cada vez que se realiza en el radio una operación que requiere una Clave avanzada, el nuevo número de serie del dispositivo de clave se agrega al historial de programación del radio y se puede revisar cuando se vuelve a leer el codeplug del radio, una vez que finalice la operación de escritura o clonación.

10.1.1.4

VHF Enable

Este campo especifica si la banda de VHF está activada o no en el radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.1.1.5

Activación de UHF 1

Este campo especifica si la banda de UHF1 está activada o no en el radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.1.1.6

Activación de UHF 2

Este campo especifica si la banda de UHF2 está activada o no en el radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.1.1.7

Activar 700 MHz

Este campo especifica si la banda de frecuencia de 700 MHz está activada o no en el radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.1.1.8

Activar 800 MHz

Este campo especifica si la banda de frecuencia de 800 MHz está activada o no en el radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.1.1.9

Gobierno regional

La aplicación recupera y muestra la función de solo lectura si el radio cumple con las normas y las regulaciones.

Las normas y los estándares a los que el radio puede adherir son de la Comisión Federal de Comunicaciones (FCC), la Asociación de la Industria de las Telecomunicaciones (TIA), la Directiva de Equipamiento Terminal de Radio y Telecomunicaciones (RTTE), el Instituto Europeo de Estándares de Telecomunicaciones (ETSI) o la Autoridad Australiana de Comunicaciones y Medios (ACMA).

**NOTA:**

Cuando este campo está configurado en **ACMA**, el radio/codeplug admite la función ampliada "Capacidad ampliada de rango 1 UHF" y el campo Utilizado en el codeplug se configura en **Habilitado permanentemente**. En este caso, el valor final de rango de UHF 1 se extiende a 472 MHz.

10.1.1.10

Versión del codeplug

La aplicación recopila y muestra el número de versión actual del codeplug del radio conectado en el modo de solo lectura.

Esto se almacena en el codeplug interno del radio.

10.1.1.11

Versión de firmware

La aplicación recopila y muestra la versión de firmware de solo lectura del radio conectado actualmente.

El firmware es un software que controla los componentes del hardware interno del radio. El firmware solo puede modificarse mediante una actualización de FLASHport.

Cuando la aplicación lee esta información desde un archivo de codeplug (no desde un radio), este campo muestra **Desconocido**.

10.1.1.12

Versión segura

La aplicación recupera y muestra el número de versión del hardware seguro actual del radio adjunto en el modo de solo lectura.

10.1.1.13

Tipo de hardware seguro

La aplicación recupera y muestra el tipo de hardware seguro actual del radio adjunto en el modo Solo de lectura.

10.1.1.14

Versión de hardware seguro

La aplicación recupera y muestra el número de versión del hardware seguro actual del radio adjunto en el modo de solo lectura.

10.1.1.15

Dirección MAC

La aplicación recopila y muestra la dirección de control de acceso a medios (MAC) de Ethernet única de 6 bytes. Esta información es de solo lectura.

Esta información se almacena en el codeplug del radio, que identifica el radio móvil a la red.

**NOTA:**

Si el campo Dirección MAC de Ethernet no está asignado, se aplica la dirección MAC de Wi-Fi. La conexión de Ethernet y Wi-Fi no se pueden utilizar en la misma red simultáneamente.

Se aplica solo: Cuando el radio es un radio móvil.

10.1.2

Rastreo

Esta sección muestra información con fecha y hora impresas y la versión del codeplug que resulta útil para la programación y la solución de problemas de configuración del radio.

10.1.2.1

Última hora y fecha programada

La aplicación recupera y permite ver solo la fecha y hora más reciente (en formato día-mes-año) en la cual se encuentra programada el radio actualmente adjunto.

En ocasiones, esta información es útil en la preparación del proceso de clonación. Esta información se almacena en el codeplug del radio.

10.1.2.2

Última fuente programada

La aplicación recupera y permite ver la fuente más reciente utilizada para programar el radio actualmente adjunto.

Esta información se almacena en el codeplug del radio.

Se muestran las siguientes fuentes:

CPS

Programado por un CPS estándar.

Fábrica

Programado en la fábrica.

Laboratorio

Programado mediante una versión de desarrollo especial.

Tecla FTR

Programado mediante una clave del sistema FTR.

10.1.2.3

Hora y fecha original programada

La aplicación recupera y permite ver solo la fecha y hora original (en formato día-mes-año) en la cual se programa el radio actualmente adjunto por primera vez.

En ocasiones, esta información es útil en la preparación del proceso de clonación. Esta información se almacena en el codeplug del radio.

10.1.2.4

Versión original de codeplug programado

La aplicación recupera y muestra el número de versión actual de codeplug de solo lectura del radio adjunto.

Esto se almacena en el codeplug interno del radio.

10.1.2.5

Fuente programada original

La aplicación recupera y permite ver la fuente original utilizada para programar el radio actualmente adjunto.

Esta información se almacena en el codeplug del radio.

Se muestran las siguientes fuentes:

CPS

Programado por un CPS estándar.

Fábrica

Programado en la fábrica.

Laboratorio

Programado mediante una versión de desarrollo especial.

Tecla FTR

Programado mediante una clave del sistema FTR.

Alojado

Programado mediante software de taller alojado.

10.1.3

FLASHport:

En esta sección se muestra información de solo lectura acerca del proceso de Actualización de FLASHport más reciente.

El proceso FLASHport (también conocido como FLASHing) permite que el programador actualice la capacidad del Paquete de sistema, las Opciones del sistema, el Firmware y el Encryption seguro del radio adjunto.

10.1.3.1

FLASHcode

La aplicación recopila y muestra el número de solo lectura que identifica el Conjunto de funciones para el FLASHcode adquirido en el radio conectado actualmente.

Esta información se almacena en el codeplug del radio.

IMPORTANTE:

En la familia de radios APX™ de Motorola Solutions, ciertas funciones/opciones que se pueden comprar en modelos de nivel básico e intermedio se incluyen en los modelos de alto nivel. Solo las funciones que se han adquirido aparecen en el FLASHcode.

10.1.3.2

Número de destellos

La aplicación recopila y muestra la cantidad total de veces que se actualizó el radio conectado en el modo de solo lectura.

Esta información se almacena en el codeplug del radio.

10.1.3.3

Botón I

La aplicación recopila y muestra el número de serie de solo lectura del Dispositivo de claves: FLASHkey o Clave Depot que se intercambió por última vez en el radio conectado actualmente.

Esta información se almacena en el codeplug del radio y se aplica solo cuando se ha actualizado el radio. Antes de realizar la actualización, el número de serie contiene todos ceros.

10.1.3.4

Última fuente de actualización

La aplicación recopila y muestra la fuente de actualización más reciente en el modo de solo lectura para el radio conectado actualmente.

Esta información se almacena en el codeplug del radio.

10.1.3.5

Última hora y fecha de parpadeo

La aplicación recupera y permite ver solo la fecha y hora más reciente (en formato día-mes-año) en la cual se actualizó el radio actualmente adjunto (también conocido como FLASHing).

Esta información se almacena en el codeplug del radio.

10.1.4

Información de clave avanzada de sistema

En esta sección, se muestra el historial de programación del radio de solo lectura para las operaciones que requieren una Clave avanzada.

Los datos de la historia de programación incluyen la fecha de la programación, y el número de serie del dispositivo clave (de la Clave avanzada) que permite que se ejecute la operación. Puede contener hasta 25 fechas de programación.

IMPORTANTE:

Las operaciones de programación que requieren una Clave avanzada incluyen: proteger contra escritura un radio, escribir en un radio protegida contra escritura y activar/desactivar el campo ASK requerido en un radio.

Las operaciones de programación que no requieren una clave avanzada no graban ningún dato.

Esta función es útil al mirar el historial de programación de un radio que pueda haber sido robada y luego recuperada. Esto es cierto siempre que el número de serie y la información de clave avanzada del dispositivo de clave utilizado para programar el radio se hayan registrado para fines de seguimiento.

10.1.4.1

Última hora y fecha programada

La aplicación muestra las horas/fechas (en formato día-mes-año) de programación de solo lectura del codeplug actual para operaciones que requieran una Clave avanzada.

El codeplug retiene hasta 25 fechas y horas de las programaciones más recientes.

**IMPORTANTE:**

- Las operaciones de programación que requieren una Clave avanzada incluyen: proteger contra escritura un radio, escribir en un radio protegida contra escritura y activar/desactivar el campo ASK requerido en un radio.
- Cada vez que se realiza en el radio una operación que requiere una clave avanzada, la nueva hora y fecha se agrega al historial de programación del radio y se puede revisar leyendo el codeplug de la radio, una vez que finalice la operación de escritura o clonación.

10.1.4.2**Número de serie**

La aplicación recupera y permite solo ver el número de serie de los dispositivos de clave que contienen Claves avanzadas (hardware) que se usaron para operaciones anteriores de programación que requerían una Clave avanzada.

Solo se guarda un Número de serie de dispositivo de claves por operación; el Número de serie específico que se guarda es el del Dispositivo de claves que contiene el ID del sistema del propietario o la Clave avanzada del ID de WACN del propietario.

Se guardan hasta 25 de los números de serie de dispositivos clave más recientes en el codeplug.

**IMPORTANTE:**

- Las operaciones de programación que requieren una Clave avanzada incluyen: proteger contra escritura un radio, escribir en un radio protegida contra escritura y activar/desactivar el campo ASK requerido en un radio.
- Cada vez que se realiza en el radio una operación que requiere una Clave avanzada, el nuevo número de serie del dispositivo de clave se agrega al historial de programación del radio y se puede revisar cuando se vuelve a leer el codeplug del radio, una vez que finalice la operación de escritura o clonación.

10.1.5**Labtool**

En esta sección, se muestra información de solo lectura para las funciones adquiridas.

10.1.5.1**Opción H ATAK**

Este campo indica si se adquiere la función ATAK.

10.1.5.2**QA08887: habilitación de hardware de LTE**

En este campo se indica si se adquiere la función de hardware de evolución a largo plazo (LTE).

10.1.5.3**QA08676: volumen de altavoz adaptable**

En este campo se indica si se adquiere la función Volumen de altavoz adaptativo.

La opción H disponible es QA08676 para Volumen de altavoz adaptativo.

10.1.5.4

QA09006: Supresión de ruido adaptable

En este campo se indica si se adquiere la función Reducción de ruido adaptativa.

10.2

Radio en general

Esta sección le permite ver o definir la funcionalidad de amplitud del radio que se aplica a los modos de comunicación convencional y de troncalización.

Todas las funciones no son comunes para ambos modos de comunicación.

10.2.1

Nombre del conjunto

En el campo **Establecer nombre** puede ingresar un nombre que identifique de forma única al conjunto dentro de una lista de conjuntos similares. Si intenta guardar un nombre de conjunto especificado por el usuario que ya está en uso, aparecerá un mensaje de error.

10.2.2

Fecha de última modificación

Este campo de solo lectura muestra la fecha y la hora en que se guardó el conjunto por última vez.

10.2.3

Comentarios

Este campo le permite ingresar un comentario en el conjunto que está en proceso de configuración. El comentario aparece en la lista inicial de los conjuntos para una categoría de conjunto determinada.

10.2.4

General

Esta sección permite ver o definir una funcionalidad básica del Radio en general.

10.2.4.1

Alias del codeplug

Este campo permite definir nombres reconocibles para el codeplug.

Además, el número de serie del radio aparece en la parte superior de la vista de árbol.

Este alias permanece con el codeplug incluso cuando el codeplug se clona a otra radio.

NOTA:

Se pueden usar caracteres, números, espacios y caracteres especiales. Para los caracteres unicode no identificados, como los emoji, la pantalla superior del radio muestra "cuadrados".

Es posible utilizar 31 caracteres en total.

10.2.4.2

Habilitación de llamadas de despacho de registro

Cuando este campo está activado, los ID que se reciben durante el Despacho o el Rastreo se registran en la lista de Llamadas recientes. Al estar desactivado, solo los ID recibidos a través de Llamadas privadas o Alerta de llamada se registran.

Esta función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.2.4.3

Filtro de frecuencia intermedia ultra angosto

En este campo se selecciona el valor de Ancho de banda del Filtro de frecuencia intermedia ultraangosto que se utiliza según la amplitud de radio.

Se admiten las siguientes selecciones:

7,8 kHz

Diseñado para radios que operan en canales con anchos de banda angostos en ambientes donde la interferencia del canal adyacente no es un problema importante.

5,76 kHz

Diseñado para proporcionar un mayor nivel de protección de interferencia de canales adyacentes a radios que operan en canales con ancho de banda angosto.

10.2.4.4

Región normativa de Wi-Fi

En este campo, se especifica la región normativa de Wi-Fi utilizada por el controlador Wi-Fi en el radio.

Los siguientes canales se utilizarán en el espectro de 2 GHz:

- Comisión Federal de Comunicaciones (FCC) = canales del 1 al 11
- Instituto Europeo de Estándares de Telecomunicaciones (ETSI) = canales del 1 al 13

10.2.4.5

Ruta de conexión

En este campo, se muestra que el radio solo puede ser programado por RadioCentral y CPS, o por CPS.

NOTA:

Este campo solo se aplica a radios APX NEXT y APX N70.

10.2.5

Tonos de alerta

Esta sección permite ver o definir la funcionalidad Tono de alerta que se aplica según la amplitud del radio.

10.2.5.1

Tonos de alerta

Este campo activa las capacidades de los Tonos de alerta del radio.

Esta función se aplica en base a la amplitud de radio.

10.2.5.2

Compensación de tono de ajuste de volumen

En este campo se activa el muestreo del nivel de volumen para los tonos de alerta del radio.

Cuando está activado, presione el botón Tono de ajuste de volumen para escuchar el nivel de volumen de los tonos de alerta del radio. El volumen del tono de alerta puede variar de la configuración de volumen actual del radio para las transmisiones entrantes en función de la configuración de Compensación de volumen (dB) general. Por lo tanto, cuando se oprime el botón

Tono de ajuste de volumen, se emite un tono al nivel actual de volumen para transmisiones entrantes más o menos la cantidad de Compensación de volumen de tono de alerta.

NOTA:

El Tono de ajuste de volumen sigue la cantidad de Compensación de volumen (dB), siempre y cuando el tono no disminuya por debajo de la configuración de Volumen mínimo.

Cuando está desactivado, presione el botón Tono de ajuste de volumen para escuchar el nivel de volumen actual del radio para transmisiones entrantes que activa el audio del altavoz del radio.

Solo se accede: Cuando el campo [Tonos de alerta en la página 108](#) está **Activado**.

10.2.5.3

Tono de alerta de autodiagnóstico en el encendido

En este campo se activa el Tono de alerta de autodiagnóstico del radio para emitir un pitido cuando se completa el autodiagnóstico y el radio está listo para transmitir o recibir.

Esta función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el campo [Tonos de alerta en la página 108](#) esté **Activado** y cuando el radio admite modelos y opciones diferentes.

10.2.5.4

Habilitación de tono de alerta de búsqueda

Este campo hace que el radio emita un tono de alerta cada vez que ingresa o sale del modo de rastreo presionando el botón Rastreo o el switch de alternación de Rastreo.

Este tono de alerta no se aplica para la selección del menú Rastreo. Esta función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el campo [Tonos de alerta en la página 108](#) está **Activado**.

10.2.5.5

Reinicio automático de tono de alerta de llamada

Este campo causa que el radio genere solo una secuencia del tono de Alerta de llamada.

Normalmente, el tono de alerta de llamada es un tono repetitivo. Esta función se aplica en base a la amplitud de radio.

10.2.5.6

Operación de tonos de silencio mejorada

En este campo se seleccionan los tipos de tonos de alerta, como los tonos del teclado, que puede desactivar (silenciar).

Esta función Silenciar está disponible para el usuario con el switch de alternación Silenciar o la selección del menú Silenciar. Esta función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Desactivado

La función Silenciar está desactivada.

Tonos del teclado

La función Silenciar solo silenciará el teclado y otros tonos no señalizadores.

Tonos de VA

La función Silenciar solo silencia los Anuncios de voz.

Todos los tonos

La función Silenciar silencia todos los tonos señalizadores y no señalizadores, incluidos los tonos del teclado, los Anuncios de voz, los tonos de permiso para hablar y otros tonos.

10.2.5.7

Tono fuera de rango

En el campo se selecciona el tono de alerta que suena, inmediatamente después de presionar el botón PTT, siempre que el radio esté fuera del rango de cobertura del Sistema de troncalización y no pueda sincronizar con un Canal de control.

El tono de alerta sigue sonando durante todo el tiempo que siga presionado el botón PTT. Consulte también Indicador de fuera de rango. Esta función se aplica en todos los radios para comunicaciones de troncalización y convencionales de P25 con DVRS activado.

**IMPORTANTE:**

Puede evitar confusiones mediante la selección de un tono deseado diferente del Tono de prohibición para hablar.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Tono 1 OOR

El control rotatorio del radio no tiene tonos de alerta.

Tono 2 OOR

Tono de alerta de 800 Hz repetitivo.

10.2.5.8

Tono de prohibición para hablar

En este campo se selecciona el tono de alerta que suena cada vez que no se permiten transmisiones de radio, ya sea inmediatamente después de presionar el botón PTT, o cuando el Temporizador de tiempo de espera preconfigurado ha expirado y el radio finaliza la transmisión actual.

El tono de alerta sigue sonando durante todo el tiempo que siga presionado el botón PTT. Esta función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

**IMPORTANTE:**

Puede evitar confusiones mediante la selección de un tono deseado que sea diferente del tono fuera de rango.

Se admiten las siguientes selecciones:

Tono 1 TP

Tono de alerta de 300 Hz continuo.

Tono 2 TP

Tono de alerta de 600 Hz repetitivo.

10.2.5.9

LED de batería baja

En este campo se activa el radio para notificar visualmente al usuario cuando se está acabando la batería.

Es decir, el LED de transmisión destella en rojo cuando se detecta una condición de batería baja y solo mientras el radio se encuentra transmitiendo. La función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.2.5.10

de batería baja

Este campo le permite al radio emitir un pitido inmediatamente después de que se libera el botón PTT, pero solo cuando se detecta una condición de batería baja durante la transmisión.

Consulte también - [Chirrido de espera \(s\) en la página 111](#).

**IMPORTANTE:**

Para radios móviles, consulte la selección "Alerta de batería baja" de la Entrada DEK de VIP o la Entrada de VIP del radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.2.5.11

- Chirrido de espera (s)

Este campo selecciona la frecuencia con la que el radio emite el chirrido de espera de alerta de batería baja (un tono alto y corto).

También se permiten las entradas directas válidas del usuario.

**IMPORTANTE:**

Para radios móviles, consulte la selección **Alerta de batería baja** de Entrada VIP de DEK o Entrada VIP de radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 23: Rango

Mínimo	Máximo	Incrementos
0 segundos	930 segundos	30 segundos

10.2.5.12

Smart: alerta de batería baja

En este campo se selecciona el punto en el cual el nivel de energía de la batería del radio hace que se escuche un pitido de batería baja.

Esta función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Estándar

Queda un 10 % de energía en la batería.

Advertencia temprana

Queda un 15 % de energía en la batería.

10.2.5.13

Tono de advertencia PTT

En este campo se selecciona el tono de alerta que suena cada vez que se cumplen las siguientes condiciones:

- El temporizador de advertencia Push-to-Talk (PTT) caduca.

- El PTT se oprime mientras el radio realiza la secuencia de datos de señal entrante (ISD) o el temporizador de respuesta pendiente está activo.

El tono de alerta comienza a sonar cada vez que se cumplen las condiciones. El tono de alerta se detiene cuando ocurre una de las siguientes situaciones:

- Suelte el botón PTT después de que el temporizador de advertencia de PTT caduque.
- El radio recibe el permiso correspondiente.
- El radio está ocupado después de que caduca el temporizador de advertencia de PTT.

Se admiten las siguientes selecciones:

Tono de advertencia PTT 1

El radio reproduce el tono de prohibición para hablar heredado.

Tono de advertencia PTT 2

El radio reproduce un tono de alerta repetitivo de 500 Hz con 100 ms (encendido) y 700 ms (apagado).

10.2.5.14

Tonos de ajuste de volumen de RSM

Este campo le permite seleccionar el tono de alerta cuando presiona el botón o el switch para ajustar el volumen en un micrófono en altavoz remoto (RSM) del radio portátil.

Esta función se aplica en base a la amplitud de radio.

Mesa 24: Tipos de selección de tonos

Tipos de selección de tonos	Descripción
Tono de ajuste de volumen 1	Admite el tono de alerta de respuesta de 911 Hz. Comportamiento heredado.
Tono de ajuste de volumen 2	Admite el tono de alerta de respuesta de 410 Hz. Igual que el tono de configuración del volumen móvil.

NOTA:

Puede seleccionar tono de ajuste de volumen 2 para diferenciarlo del tono lateral de ID de PTT MDC. Algunos RSM no se ven afectados por este campo y siempre reproducen el tono de ajuste de volumen 2.

10.2.6

Información de usuario y contraseñas

Esta sección permite ver o definir la funcionalidad relacionada con **Información del usuario**, **Protección de zona**, **Bloqueo de radio**, **Inhibición táctica**, y **Contraseña requerida**.

10.2.6.1

Activar Alias del radio

Este campo activa el campo Alias del radio.

Esta función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.2.6.2

Leer/escribir contraseña

Permite al usuario ingresar la contraseña del codeplug, con lo que consigue acceso a los permisos protegidos por contraseña del codeplug actual.

Los permisos protegidos pueden incluir una o las tres siguientes funciones:

- lectura del radio
- escritura en el radio
- lectura de un archivo de codeplug

Esta función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.2.6.3

Activación de contraseña de escritura del radio

Cuando esta opción está activada, el usuario debe ingresar la contraseña de lectura/escritura establecida para el radio antes de que se puedan escribir datos en el radio.

Esta función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.2.6.4

Activación de contraseña de lectura del radio

Cuando esta opción está activada, el usuario debe ingresar la contraseña de lectura/escritura establecida para el radio antes de que se puedan leer los datos del radio.

Esta función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.2.6.5

Activación de contraseña de lectura de archivo

Cuando esta opción está activada, se puede archivar la contraseña de lectura/escritura establecida para el radio.

Esta función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.2.7

Funciones

Esta sección permite ver o definir una funcionalidad básica del Radio en general.

10.2.7.1

CA/PC pendiente de bloqueo

Este campo permite el bloqueo de llamadas para la Alerta de llamadas o la llamada privada.

Los primeros datos de Alerta de llamada o llamada privada que recibe el radio sin supervisión se mantienen en el radio. Los datos de Alerta de llamada o llamada privada sucesivos se ignoran a menos que la información de fuente de la llamada sea idéntica a los datos de fuente originales recibidos. Esta función se aplica en base a la amplitud de radio.

Al estar desactivado, los últimos datos de Alerta de llamada o Llamada privada recibidos son los datos de llamada que se encuentran almacenados. Por lo tanto, la información de llamada almacenada anteriormente se sobrescribe en la memoria del radio.

10.2.7.2

Interruptor giratorio (programa de rastreo)

En este campo se selecciona qué elemento del modo (**Zonas** o **Canales**) selecciona el switch giratorio en el radio y/o el Micrófono y altavoz remoto de pantalla (DRSM) opcional mientras el usuario utiliza el radio en el modo Programación o edición de la lista de rastreo.

Puede acceder al modo de Programación o edición de la lista de rastreo con una Pulsación larga del botón Rastreo, con una alternación del switch Programación de la lista de rastreo, o con una selección del menú Lista de rastreo. Esta función se aplica en base a la amplitud de radio.

IMPORTANTE:

Para los radios que tienen una perilla multifunción (MFK), esta función se aplica solo al switch giratorio ubicado en el accesorio opcional DRSM.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

- Canal
- Zona

10.2.7.3

Desactivar Plug and Play

Este campo desactiva todo el voltaje de polarización de las clavijas de la GCAI si no se conecta un accesorio de GCAI al radio dentro de 1 minuto de la activación.

IMPORTANTE:

Si está activado y el Adaptador vehicular APX no se conecta al radio después del encendido, se desactiva la funcionalidad GCAI. El radio no podrá detectar la presencia de un Adaptador vehicular APX.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.2.7.4

Generación de clave cíclica

Este campo permite aumentar y reducir la energía de transmisión para satisfacer los requerimientos de Generación de clave cíclica de ETS-300 y FTZ.

Esta selección se aplica en base a la amplitud de radio.

NOTA:

La Generación de clave cíclica debe activarse solo para radios que se utilizan en Europa.

10.2.7.5

Temporizador de ausencia de voz

En este campo se selecciona la cantidad de tiempo, durante una transmisión de radio, que el Procesador de señal digital (DSP) esperará mientras detecta una falta de voz del micrófono antes de declarar un evento de Falta de voz.

Esto puede utilizarse para activar Finalizar Tx en ausencia de voz. Esta selección se aplica en base a la amplitud de radio para todos los canales de comunicaciones convencionales y de troncalización.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 25: Rango

Mínimo	Máximo	Incrementos
5 segundos (predeterminado)	60 segundos	1 segundo

10.2.7.6

Enrutamiento de RF externo

Este campo se utiliza para determinar la banda RF que se enrutará a la antena externa cuando el radio se conecte al Adaptador vehicular (VA) o al Micrófono de seguridad pública con antena (PSM).

Esta selección se aplica a los radios portátiles que son compatibles con múltiples bandas. Esta función solo puede editarse para múltiples bandas y no puede editarse para una banda única.

Se admiten las siguientes selecciones:

7/800

Solo es válido si 7/800 MHz es una banda adquirida.

UHF

Solo es válido si UHF1 o UHF2 es una banda adquirida.

VHF

Solo es válido si VHF es una banda adquirida. VHF solo se enrutará externamente cuando se adjunta un Adaptador vehicular.

ALL_BANDS

Enruta externamente todas las bandas adquiridas. Solo es válido para los radios multibanda que son compatibles con el adaptador vehicular.

10.2.7.7

Tipo de certificación de radio

Esta función permite configurar el Tipo de certificación de radio.

El Tipo de certificación de radio se establece como Ninguno de forma predeterminada. Si se conecta una batería incompatible, se activa una alerta de batería incorrecta.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Ninguno

El radio es compatible con cualquier tipo de baterías.

UL Div 2

El radio solo es compatible con baterías con certificación UL Div 2.

10.2.7.8

ViQi: Prioridad de control de voz

Se admiten las siguientes selecciones:

Bajo

El audio de LMR tiene prioridad. El audio de recepción de LMR cancelará o bloqueará la función de control de voz cuando el radio esté recibiendo de forma activa.

Alto

El control de voz tiene prioridad. Mientras el botón de control de voz se mantiene presionado (el control de voz está activo), el audio de recepción de LMR se silenciará.

Desactivado

La función de control de voz está desactivada.

10.2.7.9

Modo en espera de apagado (horas)

Esta función permite que el módem de Radio móvil terrestre (LMR) se apague mientras el procesador de aplicaciones se encuentra en un modo de bajo consumo de energía para permitir un encendido más rápido del dispositivo. Esta función también le permite establecer la hora para apagar el modo en espera.

Mesa 26: Rango

Mínimo	Máximo	Incrementos
1 (hora)	8 (horas)	1 (hora)

**NOTA:**

Si el radio permanece en este modo durante el tiempo seleccionado, se apagará automáticamente. Si el valor se establece en 0, el radio se apaga inmediatamente. Si se establece en un valor distinto de 0, el radio se mantendrá en modo de baja potencia durante el tiempo seleccionado. Si la perilla del radio se enciende mientras el radio está en espera, el radio funcionará completamente en unos segundos.

El radio requiere un encendido de arranque en frío en las siguientes situaciones de apagado:

- La batería está desconectada.
- La batería está descargada.
- La función Modo de espera de apagado está desactivada en el codeplug.
- El radio ha estado en modo de espera durante más tiempo que el rango configurado para la función Modo de espera de apagado.

10.2.7.10

ViQi: Modo de Socio virtual**NOTA:**

Este campo solo se aplica a radios APX NEXT y APX N70.

Se admiten las siguientes selecciones:

Desactivado

Deshabilita la función Socio virtual para que no funcione.

Banda ancha

Todas las solicitudes y respuestas del Socio virtual solo utilizarán conexiones LTE o Wi-Fi.

LMR

Todas las solicitudes y respuestas del Socio virtual solo utilizarán canales de voz de infraestructura APCO 25.

10.2.7.11

ViQi: Prioridad de audio del socio virtual

Configura cómo se le da prioridad al audio de retroalimentación del socio virtual ante el audio de LMR.

**NOTA:**

Este campo solo se aplica a radios APX NEXT y APX N70.

Se admiten las siguientes selecciones:

Solo ViQi

Reproduce ViQi al 100 % y silencia cualquier audio de RX de LMR.

Prioridad de ViQi

Reproduce audio de Rx de LMR y audio de ViQi simultáneamente. El nivel de audio de RX de LMR se atenuará por debajo del nivel de audio de ViQi.

Igual a ViQi

Reproduce audio de Rx de LMR y audio de ViQi simultáneamente en niveles de audio iguales.

Prioridad de LMR

Reproduce audio de Rx de LMR y audio de ViQi simultáneamente. El nivel de audio de ViQi se atenuará por debajo del nivel de audio de Rx de LMR.

10.2.7.12

ViQi: Temporizador de inactividad del socio virtual (seg.).

Selecciona la cantidad de tiempo que el usuario permanecerá inactivo en la función Socio virtual antes de salir y comenzar a escuchar el canal de despacho seleccionado.

**NOTA:**

Este campo solo se aplica a radios APX NEXT y APX N70.

Solo se accede: Cuando se selecciona **Banda ancha** o **LMR** en el campo [ViQi: Modo de Socio virtual en la página 116](#) y cuando el radio admite distintos modelos y opciones.

Cuando el radio recibe audio del Socio virtual y de LMR, el radio reproduce el audio del Socio virtual. Si el radio no ha recibido el audio del Socio virtual, el usuario escucha el audio de LMR.

Mesa 27: Rango

Mínimo	Máximo	Incrementos
5 segundos (predeterminado)	255 segundos	1 segundo

**NOTA:**

Mientras el usuario utiliza la función Socio virtual, se perderá todo el tráfico de voz de despacho normal.

10.2.7.13

Modo SmartMessaging

Permite que el usuario seleccione el tipo de enrutamiento de transmisión del mensaje.

LMR

Los mensajes se transmiten según la configuración del canal Convencional o de Troncalización.

**NOTA:**

LMR es una red de banda estrecha que tiene una capacidad limitada para las aplicaciones con uso intensivo de datos.

SmartMessaging

Los mensajes se transmiten a través de la aplicación de mensajería de banda ancha predeterminada.

**NOTA:**

LTE es una red de banda ancha que puede manejar aplicaciones con uso intensivo de datos.

10.2.7.14

Registro de tamaño de búfer de reproducción de audio

En este campo se especifica el último número de segundos de la llamada entrante actual que grabará la función Recuperación instantánea.

Esta función se aplica en base a la amplitud de radio. La función Recuperación instantánea está activada cuando este campo está configurado en cualquier valor que no sea el valor predeterminado **Desactivado**.

**ADVERTENCIA:**

Todas las llamadas se graban durante el tiempo configurado hasta el siguiente ciclo de encendido o hasta que se sobrescriban con el audio más reciente recibido.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 28: Rango

Mínimo	Máximo	Incrementos
10 s	60 s	1 seg

10.2.7.15

Tono de evacuación

Este campo activa el Tono de evacuación para que se escuche en el radio transmisor y en cualquier radio que pueda recibir la instrucción del tono.

El tono comienza y se transmite cuando se oprimen el botón PTT y el "botón naranja" simultáneamente. Una vez que el tono comienza a sonar, si se libera el botón naranja, el tono continúa emitiendo la alarma en todos los radios del grupo de conversación, hasta que se libera el botón PTT.

**NOTA:**

Esta instrucción de tono de evacuación se transmite al grupo de conversación completo del radio (en el canal actual); el tipo de grupo de conversación depende del modo Comunicaciones actuales del radio. Se aplica a los canales de voz analógica y digital, en los sistemas convencionales y de troncalización, y a los sistemas APCO FDMA y TDMA.

**ADVERTENCIA:**

Esta función solo es válida cuando el canal actual se encuentra operando en el modo "Borrar" (no Encryption seguro).

10.2.7.16

Apagado automático de encendido

Este campo le permite seleccionar la cantidad de tiempo que el radio espera antes de apagarse automáticamente una vez que se haya eliminado el voltaje en el Sensor de encendido.

Este temporizador comienza una vez que se elimina el voltaje del Sensor de encendido, y la falta de interacción de se determina por el radio en lo sucesivo. Mientras el temporizador está activo, soltar cualquier botón restablece el temporizador. Durante los últimos dos minutos de la cuenta regresiva de este temporizador, el radio genera advertencias audibles y visuales hasta que el temporizador vence o se restablece. Esta selección se aplica en base a la amplitud de radio para todos los canales de comunicaciones convencionales y de troncalización.

**IMPORTANTE:**

La funcionalidad del temporizador se basa en el estado del Switch de encendido del vehículo.

En una configuración de Radio dual, esta funcionalidad solo se puede configurar en el **Radio principal**.

Solo se accede: Cuando el campo **Interruptor de encendido** está configurado en **Encendido solo en el arranque, Requerido o Apagado de software** y cuando el modelo o la opción del radio lo permitan.

**NOTA:**

La función Apagado automático de inactividad se desactiva cuando se configura en **0 -Desactivado** (predeterminado).

Mesa 29: Rango

Mínimo	Máximo	Incrementos
3 minutos	840 minutos	1 minuto

10.2.7.17

Desactivar la alerta de apagado automático

Cuando este campo está marcado, desactiva las advertencias visuales y de audio de apagado automático en los últimos 2 minutos del apagado del radio, debido a la eliminación del voltaje en el sensor de encendido.

Este campo se puede modificar cuando se puede acceder a la función **Apagado automático de encendido**, y no está configurada como **Desactivada**.

10.2.7.18

Activación de imagen de encendido personalizada

Si este campo está activado, puede cargar una imagen para que aparezca al final de la secuencia de encendido.

10.2.7.19

Habilitación del repliegue de canal

Este campo permite activar la función Repliegue automático de canal. Esta función le permite asociar un canal basado en el sistema con un canal de repliegue. El radio puede cambiar a un canal de repliegue cuando no puede comunicarse con la red de radio móvil terrestre (LMR).

**ADVERTENCIA:**

No se recomienda configurar un canal de repliegue como un canal en el mismo sistema. Si el radio no se puede comunicar automáticamente con el sistema en un grupo de conversación, entonces tampoco se podrá comunicar en un grupo de conversación diferente.

**IMPORTANTE:**

La función Repliegue automático de canal está desactivada de forma predeterminada para todos los canales. Después de activar este campo, debe elegir una zona de repliegue y un canal de repliegue para un canal determinado en Asignación de canal de zona.

El radio puede realizar repliegues anidados. Si el canal de repliegue seleccionado no puede comunicarse con la red de LMR, el radio puede realizar un repliegue de canal si se le asigna un canal de repliegue.

Después de que el radio realiza un repliegue de canal, espera unos momentos antes de intentar otro repliegue de canal para evitar realizar conmutaciones demasiado frecuentes.

En los canales compatibles con el repliegue, la función se puede activar presionando el botón **Activación/desactivación del repliegue automático de canal**. Si mantiene presionado este botón, se desactivará la función y el radio volverá al último canal seleccionado por el usuario.

Al presionar el botón **Repliegue de canal manual/reversión del repliegue de canal**, el radio cambiará manualmente al canal de repliegue asignado, independientemente de las condiciones de

red actuales y el estado de activación. Si mantiene presionado este botón, el radio volverá al último canal seleccionado por el usuario.

En los siguientes canales basados en el sistema, el radio no se puede comunicar con la red de LMR y cambia automáticamente al canal de repliegue. En los demás tipos de canal, solo está disponible el repliegue de canal manual.

- P25 troncalizado
- Troncalización tipo II
- PSU con DVRS activado

10.2.8

Ubicación

Esta sección le permite ver o modificar las configuraciones relacionadas con cualquier tecnología de determinación de la ubicación basada en el radio (o accesorio de radio).

Por ejemplo, el Sistema de posicionamiento global (GPS) es una tecnología que determina la ubicación.

10.2.8.1

Activación de ubicación

En este campo se activa el receptor de GPS en el radio para todas las funciones relacionadas con la Ubicación, como solicitudes del Protocolo de respuesta/solicitud de ubicación (LRRP) del Equipo de red fija (FNE) y el menú Ubicación.

El menú Ubicación se encuentra disponible presionando el botón Ubicación o seleccionando el menú Ubicación.

**NOTA:**

LRRP es un protocolo de propiedad de Motorola utilizado para intercambiar información de ubicación (longitud y latitud) entre el radio y un dispositivo de datos, como una Computadora móvil en la Red empresarial del cliente (CEN). Esta función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.2.8.2

Informes de SmartLocate

Este campo le permite seleccionar la operación de Informes de SmartLocate.

Se admiten las siguientes selecciones:

Solo LMR

Cuando [Activación de ubicación en la página 120](#) está activado, el radio está configurado para informar la ubicación del dispositivo mediante el protocolo de respuesta/solicitud de ubicación (LRRP) de Motorola Solutions a través del sistema ASTRO, a Command Central Aware.

Solo con banda ancha

Cuando esta selección está activada, el radio se configura para informar la ubicación del dispositivo como mensajes de telemetría de dispositivo a nube mediante el servicio de banda ancha (Wi-Fi o LTE celular) a Command Central Aware.

Se prefiere banda ancha

Cuando [Activación de ubicación en la página 120](#) está activado y el servicio de banda ancha está disponible, el radio se configura para informar la ubicación del dispositivo como mensajes de telemetría de dispositivo a nube mediante el servicio de banda ancha a Command Central Aware. Si el servicio de banda ancha no está disponible, el radio está configurado para informar la

ubicación del dispositivo mediante el protocolo de respuesta a la solicitud de ubicación (LRRP) de Motorola Solutions a través del sistema ASTRO a Command Central Aware.

Solo se accede: Cuando el campo [Activación de ubicación en la página 120](#) esté activado y cuando el radio admite modelos y opciones diferentes.

10.2.8.3

Activación de ubicación seleccionable por el usuario

Este campo permite ENCENDER o APAGAR la funcionalidad de ubicación del radio según la amplitud de radio.

La Ubicación podría utilizarse en conjunto con tecnología para determinar la ubicación como el Sistema de posicionamiento global (GPS).

ADVERTENCIA:

El menú Ubicación se encuentra disponible cuando oprime el botón Ubicación o selecciona el menú Ubicación. Uno de estos controles debe programarse, de lo contrario, este campo no será válido. Esta función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el campo [Activación de ubicación en la página 120](#) esté activado y cuando el radio admite modelos y opciones diferentes.

10.2.8.4

Formato de pantalla de ubicación

En este campo se selecciona el formato para ver y editar las coordenadas en el menú de ubicación y para mostrar los formatos de ubicación.

ADVERTENCIA:

El menú Ubicación se encuentra disponible presionando el botón Ubicación o seleccionando el menú Ubicación. Esta función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes, y cuando el campo [Activación de ubicación en la página 120](#) o el campo [Mostrar ubicación del par](#) está activado.

Se admiten las siguientes selecciones:

- Latitud/longitud (DMD)
- Latitud/longitud (DMS)
- Latitud/longitud (DD)
- UTM
- MGRS (Sistema Militar de Referencia por Coordenadas)

10.2.8.5

Unidad de distancia

En este campo se selecciona la unidad de medida que se utiliza cuando se muestra la distancia entre recorridos en el menú Ubicación del radio.

El menú Ubicación se encuentra disponible presionando el botón Ubicación o seleccionando el menú Ubicación. Esta función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el campo [Activación de ubicación en la página 120](#) esté activado y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

- Kilómetros
- Millas

10.2.8.6

Informe de ubicación de P25

Este campo permite que el radio procese mensajes de protocolo de respuesta o de solicitud de ubicación (LRRP) utilizando el formato de datos de Informe de ubicación del proyecto 25 (P25), además del formato de datos del informe de ubicación de Motorola heredado.

Esto es necesario cuando el radio intercambia información de ubicación de LRRP con un Servidor de ubicación dentro de una infraestructura de comunicaciones convencional o de troncalización que solo cumple con Especificaciones de servicios de ubicación de nivel 2 de P25 (como publica la Asociación de la Industria de las Telecomunicaciones). Esta función se aplica en base a la amplitud de radio.

Cuando está desactivado, el radio solo admite mensajes LRRP usando el formato de datos de informe de ubicación heredado.

NOTA:

Cuando el Servidor de ubicación se comunica con el radio en el puerto especificado en el campo Puerto UDP del Informe de ubicación de P25, entonces el radio interpreta que los datos son del Informe de ubicación de P25 (el número de puerto especificado de P25 predeterminado para este puerto es 49198).

Cuando el Servidor de ubicación se comunica con el radio en el puerto estático 4001, entonces el radio interpreta los datos como "Informe de ubicación heredado de Motorola".

Cuando el servidor de ubicación fija hace una solicitud de información de ubicación de un radio en el puerto especificado en el campo Puerto UDP del informe de ubicación fija de P25, entonces el radio interpreta que los datos son del Informe de ubicación fija de P25 (el número de puerto especificado de P25 predeterminado para este puerto es 49198), y el radio codifica o decodifica los mensajes de LRRP entre el radio y el Servidor de ubicación usando el formato de datos de "Informe de ubicación de P25".

La función Registro de ubicación directo permite que los radios envíen la notificación de Presencia al Servidor de ubicación cuando la aplicación ARS no está presente, mediante el uso del mensaje de LRRP "Mensajes de versión de protocolo" que se codifica con el método "Informe de ubicación de P25".

Solo se accede: Cuando el campo [Activación de ubicación en la página 120](#) esté activado y cuando el radio admite modelos y opciones diferentes.

10.2.8.7

Geocerca administrada por el sistema

Permite que el radio sea compatible con la geocerca de UNS.

Cuando la SU realiza el inicio de sesión de usuario ARS con el servidor presente, se transmite a ARS la información para indicar si la SU puede admitir la Geocerca administrada por el sistema.

ADVERTENCIA:

Cuando se activa la Geocerca administrada por el sistema, [Modo ARS en la página 382](#) debe configurarse como **Servidor mejorado** en al menos uno de los registros del Perfil de datos para evitar el Informe de campos no válidos.

Solo se accede: Cuando el radio admite el modelo/opción, cuando el Modo ARS es un Servidor mejorado en, al menos, uno de los Perfiles de datos y cuando el campo [Activación de ubicación en la página 120](#) está activado.

10.2.8.8

Modo de ubicación en mapas

El modo de ubicación en mapas permite al usuario ver su ubicación o la ubicación de otras personas en el mapa.

Solo se accede: Cuando el campo [Activación de ubicación en la página 120](#) está activado.

Se admiten las siguientes selecciones:

- Ninguno
- SmartMapping

10.2.8.9

Ubicación asistida por servidor

Cuando está activada, el radio utiliza una conexión de Internet de banda ancha para proporcionar la ubicación del radio. Cuando GNSS no está disponible, los datos de telemetría se envían al servidor de ubicación para aproximar a la posición del radio. Las ubicaciones se envían al servidor de ubicación para la geocodificación inversa.

Solo se accede: Cuando el campo [Activación de ubicación en la página 120](#) está activado.

10.2.8.10

Formato de ubicación codificada geográficamente

El formato de ubicación codificada geográficamente permite al usuario seleccionar el formato de la geocodificación inversa.

Solo se accede: Cuando el campo [Activación de ubicación en la página 120](#) está activado.

Se admiten las siguientes selecciones:

- Desactivado
- Dirección de la calle
- Intersección

10.2.9

Opciones de audio

Esta sección le permite ver o definir los parámetros de control de audio de recepción y de transmisión que se aplican según la amplitud de radio.

10.2.9.1

Activación de Rx simultáneos

Este campo permite que el radio permanezca desilenciado incluso cuando ocurren transmisiones múltiples al mismo tiempo y en el mismo canal.

Esto se cumple solo cuando se opera en canales analógicos Directo/Comunicación directa. Estas transmisiones simultáneas se escuchan solo cuando la intensidad de las señales recibidas es relativamente fuerte e igual. Esta función se aplica en base a la amplitud de radio.

IMPORTANTE:

La activación de esta función hará que algunas señales débiles que el radio recibe normalmente permanezcan silenciadas, por lo tanto, solo se recomienda activarla si la capacidad de recibir transmisiones simultáneas se ha identificado como necesaria.

Para modelos de radio que contienen firmware anteriores a la versión R12.00.00, esta función se aplica solo a canales de 25 kHz (consulte también el campo Desviación de Tx/ Espaciamiento de canal). Para los modelos de radio con un firmware R12.00.00 o posterior, este campo se aplica tanto para canales de 12,5 kHz como de 25 kHz.

NOTA:

En su mayoría, el audio de estas transmisiones simultáneas es ininteligible. En ocasiones, es necesario recibir transmisiones simultáneas al manejar incidentes en la escena en los cuales podría ser muy importante recibir todas las comunicaciones. Por ejemplo, podría ser crucial tener esta función activada para el manejo de un incidente en el que solo se utilizan las comunicaciones análogas, se esperan condiciones caóticas, y cualquier transmisión recibida es mejor que no recibir ninguna transmisión.

10.2.9.2

Balance digital/analógico de Tx

En este campo se activa el nivel de transmisión de audio para ecualizar o balancear cuando se cambia entre analógico y digital, y viceversa.

Esta función se podría aplicar según la amplitud o el perfil del radio.

ADVERTENCIA:

Cuando se selecciona **Radio en general**, AGC Digital (Radio), AGC Analógico (Radio), AGC Digital (Accesorio) y AGC analógico (Accesorio) deben estar "Desactivados" en cada registro de Perfiles de radio; de lo contrario, esta selección no se considerará válida.

Se admiten las siguientes selecciones:

Desactivado

La función está desactivada.

Radio en general

El balanceo del nivel de transmisión de audio ocurre según la amplitud de radio.

Por perfil

Con esta selección, el campo Balance digital/analógico podría activarse o desactivarse en cualquiera de los registros de Perfiles de radio existentes.

10.2.9.3

Nivel de configuración del audio

Este campo le permite configurar el nivel de audio del radio.

Solo se accede: Esta es una configuración que solo está disponible en Vista completa (consulte Vista de codeplug).

Se admiten las siguientes selecciones:

Mejorado

Activa la función de mejora de audio.

Si realiza la selección de **Mejorado a Básico**, los valores de Configuración de grupo de sensibilidad y ganancia y los valores de Configuración de grupo de ecualización de audio (altavoz) se sincronizan desde la columna Radio a la columna Accesorio.

Básico

La elección de la opción **Básico** desactiva la función de mejora de audio y no se aplican los siguientes campos:

No se aplican los siguientes campos:

- **Banda digital de baja frecuencia para Radio y Accesorio**
- **Banda digital de frecuencia media para Radio y Accesorio**
- **Banda de baja frecuencia para Radio y Accesorio**
- **Banda digital de alta frecuencia para Accesorio**
- **Banda de frecuencia media para Radio y Accesorio**
- **Banda de baja frecuencia de Securenet para Radio y Accesorio**
- **Banda de alta frecuencia para Radio y Accesorio**
- **Banda de frecuencia media de Securenet para Radio y Accesorio**
- **Configuraciones de grupo de ecualización de audio (micrófono)**
- **Banda analógica de baja frecuencia para Radio y Accesorio**
- **Configuraciones de grupo de ecualización de audio (altavoz)**
- **Banda analógica de frecuencia media para Radio y Accesorio**

No son editables los siguientes campos:

- **Salida de control de ganancia de AGC para Accesorio**
- **Total de control de ganancia de AGC para Accesorio**
- **Balance digital/analógico para Accesorio**
- **Banda analógica de alta frecuencia para Accesorio**
- **Banda de alta frecuencia de Securenet para Accesorio**
- **Banda digital de alta frecuencia para Accesorio**

10.2.10

Niveles de potencia de transmisión

Esta sección permite ver o definir la configuración de potencia baja y alta de transmisión (Tx), dentro de límites definidos previamente.

IMPORTANTE:

Existen configuraciones de Nivel de potencia de transmisión únicas (registros/filas) para cada uno de los posibles rangos de frecuencia dentro de una banda de frecuencia determinada. Sin embargo, solo se aplicarán las configuraciones de Nivel de potencia de transmisión para la banda de frecuencia (o bandas) que la aplicación del codeplug actual admita y, en algunos casos, pueden modificarse. Consulte también Banda de frecuencia primaria y Banda de frecuencia secundaria para conocer las bandas de frecuencia que admite el radio.

NOTA:

Para cumplir en su totalidad con los requisitos normativos de nivel de potencia de salida, los usuarios de la sección 80 naval que operan de 154 a 162,025 MHz (banda VHF) y de 454 a 470 MHz (banda UHF) deben programar la potencia de transmisión de los valores predeterminados a un nivel que no exceda los valores indicados en la siguiente tabla.

Tenga en cuenta que esta restricción de potencia reducida solo se aplica a ciertos modelos del radio y es estrictamente para las frecuencias de la sección 80 naval. Además, revise su licencia para comprobar si hay restricciones adicionales en la potencia de salida.

Descripción de la familia de productos	FCC/IC	Rango de frecuencia/potencia de salida
APX Next	AZ489FT7147/109U-89FT7 147	156 - 162,025 MHz/5 W 454 - 470 MHz/2 W

10.2.10.1

Selección de plan de banda

En este campo se selecciona la banda de frecuencia adecuada de 7/800 MHz: plan de banda en el que el radio tiene licencia para operar, que luego determina cuál de las dos tablas de configuración de Nivel de potencia de transmisión está disponible para el codeplug del radio.

Este valor se aplica en base a la amplitud de radio.

ADVERTENCIA:

En 2007, el plan de banda de 700 MHz de la Comisión Federal de Comunicaciones (FCC) cambió a la banda de frecuencia de 7/800 MHz, en parte para asignar las frecuencias de banda ancha de "bloque D" de 700 MHz a un uso de seguridad pública; sin embargo, ciertos organismos de EE. UU. y Canadá pueden tener licencias/exenciones que les permiten utilizar el plan de banda de 700 MHz original.

IMPORTANTE:

Existen configuraciones únicas de Nivel de potencia de transmisión (registros/filas) para cada uno de los rangos de frecuencia posibles dentro de una banda de frecuencia determinada; sin embargo, solo se aplicarán aquellas configuraciones de Nivel de potencia de transmisión para la banda de frecuencia (o bandas) admitidas por el codeplug actual y, en algunos casos, se pueden modificar. Consulte también Banda de frecuencia primaria y Banda de frecuencia secundaria para conocer la banda o bandas de frecuencia que admite el radio.

Se admiten las siguientes selecciones:

Antiguo

El plan de banda original de 7/800 MHz (consulte la Advertencia) y, por lo tanto, las configuraciones originales de Nivel de potencia de transmisión se aplican al codeplug del radio.

Nuevo

El plan de banda más reciente de 7/800 MHz (consulte la Advertencia), y, por lo tanto, las configuraciones del nivel de potencia de transmisión (nuevo plan de banda), se pueden aplicar al codeplug del radio.

Solo se accede:

- Cuando la banda de frecuencia primaria o la banda de frecuencia secundaria es de 7/800 MHz.
- Cuando se activa **Permitir frecuencias no válidas** y cuando se activa el uso de 7/800 MHz en el codeplug.
- Cuando se activa **Activar 700 MHz o Activar 800 MHz**.
- Cuando se activa **Permitir frecuencias no válidas**.
- Cuando se activa **700 MHz utilizados en el codeplug u 800 MHz utilizados en el codeplug**.
- Cuando el radio admite modelos y opciones diferentes.

10.2.10.2

Banda de frecuencia

La aplicación recupera y muestra la banda de frecuencia de solo lectura, en la que cada rango tiene una configuración única del Nivel de potencia de transmisión (registro/fila).

La frecuencia actual se define por [Inicio de intervalo de frecuencia \(MHz\) en la página 127](#) y [Fin de intervalo de frecuencia \(MHz\) en la página 127](#). Los radios de banda doble son compatibles con más de una banda de frecuencia (ver también Banda de frecuencia principal y Banda de frecuencia secundaria para ver las bandas de frecuencia compatibles con el radio). Este valor se aplica en base a la amplitud de radio.

**IMPORTANTE:**

Existen configuraciones de Nivel de potencia de transmisión únicas (registros/filas) para cada uno de los posibles rangos de frecuencia dentro de una banda de frecuencia determinada. Sin embargo, solo se aplicarán las configuraciones de Nivel de potencia de transmisión para la banda de frecuencia (o bandas) que el codeplug actual admita y, en algunos casos, pueden modificarse.

10.2.10.3

Inicio de intervalo de frecuencia (MHz)

La aplicación recupera y permite ver el valor Inicio de intervalo de frecuencia de solo lectura para la banda de frecuencia del registro o la fila actual.

Estos valores son fijos para este modelo de radio. Este valor se aplica en base a la amplitud de radio.

**IMPORTANTE:**

Existen configuraciones de Nivel de potencia de transmisión únicas (registros/filas) para cada uno de los posibles rangos de frecuencia dentro de una banda de frecuencia determinada. Sin embargo, solo se aplicarán las configuraciones de Nivel de potencia de transmisión para la banda de frecuencia (o bandas) que el codeplug actual admita y, en algunos casos, pueden modificarse. Consulte también Banda de frecuencia primaria y Banda de frecuencia secundaria para conocer la banda o bandas de frecuencia que admite el radio.

10.2.10.4

Fin de intervalo de frecuencia (MHz)

La aplicación recupera y muestra el valor Fin de intervalo de frecuencia de solo lectura para la banda de frecuencia del registro o la fila actuales.

Estos valores son fijos para este modelo de radio. Este valor se aplica en base a la amplitud de radio.

**IMPORTANTE:**

Existen configuraciones de Nivel de potencia de transmisión únicas (registros/filas) para cada uno de los posibles rangos de frecuencia dentro de una banda de frecuencia determinada. Sin embargo, solo se aplicarán las configuraciones de Nivel de potencia de transmisión para la banda de frecuencia (o bandas) que el codeplug actual admita y, en algunos casos, pueden modificarse. Consulte también Banda de frecuencia primaria y Banda de frecuencia secundaria para conocer la banda o bandas de frecuencia que admite el radio.

10.2.10.5**Nivel de potencia mínimo de Tx (W)**

La aplicación recupera y muestra el valor mínimo del Nivel de potencia de Tx de solo lectura.

Se fija este valor para este modelo de radio y se aplica solo a canales en la banda de frecuencia del registro o la fila actuales.

**IMPORTANTE:**

Existen configuraciones de Nivel de potencia de transmisión únicas (registros/filas) para cada uno de los posibles rangos de frecuencia dentro de una banda de frecuencia determinada. Sin embargo, solo se aplicarán las configuraciones de Nivel de potencia de transmisión para la banda de frecuencia (o bandas) que el codeplug actual admita y, en algunos casos, pueden modificarse. Consulte también Banda de frecuencia primaria y Banda de frecuencia secundaria para conocer la banda o bandas de frecuencia que admite el radio.

10.2.10.6**Nivel de potencia bajo de Tx (W)**

Este campo permite ingresar el nivel de potencia bajo de transmisión (Tx).

Este valor se aplica solo a canales en la banda de frecuencia del registro o la fila actuales.

**ADVERTENCIA:**

Para que sea válido, el Nivel de potencia bajo de Tx debe ser mayor o igual a [Nivel de potencia mínimo de Tx \(W\) en la página 128](#), y menor o igual a [Nivel de potencia alto de Tx \(W\) en la página 128](#) y [Nivel de potencia máximo Tx \(W\) en la página 129](#).

**IMPORTANTE:**

Existen configuraciones de Nivel de potencia de transmisión únicas (registros/filas) para cada uno de los posibles rangos de frecuencia dentro de una banda de frecuencia determinada. Sin embargo, solo se aplicarán las configuraciones de Nivel de potencia de transmisión para la banda de frecuencia (o bandas) que el codeplug actual admita y, en algunos casos, pueden modificarse. Consulte también Banda de frecuencia primaria y Banda de frecuencia secundaria para conocer la banda o bandas de frecuencia que admite el radio.

10.2.10.7**Nivel de potencia alto de Tx (W)**

Este campo permite ingresar el nivel de potencia alto de transmisión (Tx).

Este valor se aplica solo a canales en la banda de frecuencia del registro o la fila actuales.

IMPORTANTE:

Existen configuraciones de Nivel de potencia de transmisión únicas (registros/filas) para cada uno de los posibles rangos de frecuencia dentro de una banda de frecuencia determinada. Sin embargo, solo se aplicarán las configuraciones de Nivel de potencia de transmisión para la banda de frecuencia (o bandas) que el codeplug actual admita y, en algunos casos, pueden modificarse. Consulte también Banda de frecuencia primaria y Banda de frecuencia secundaria para conocer la banda o bandas de frecuencia que admite el radio.

Si la configuración de alta potencia de Tx se aumenta, los límites actuales deben resintonizarse utilizando la aplicación Sintonizador de manera de lograr el nivel de potencia deseado.

Si la configuración de alta potencia de Tx disminuye, los límites actuales podrían resintonizarse para aumentar la protección de limitación actual.

10.2.10.8

Nivel de potencia máximo Tx (W)

La aplicación recupera y muestra el valor máximo del Nivel de potencia de Tx de solo lectura.

Se fija este valor para este modelo de radio y se aplica solo a canales en la banda de frecuencia del registro o la fila actuales.

NOTA:

Existen configuraciones de Nivel de potencia de transmisión únicas (registros/filas) para cada uno de los posibles rangos de frecuencia dentro de una banda de frecuencia determinada. Sin embargo, solo se aplicarán las configuraciones de Nivel de potencia de transmisión para la banda de frecuencia (o bandas) que el codeplug actual admita y, en algunos casos, pueden modificarse. Consulte también Banda de frecuencia primaria y Banda de frecuencia secundaria para conocer la banda o bandas de frecuencia que admite el radio.

10.2.11

Rangos de frecuencia

Esta sección permite configurar las frecuencias dentro del codeplug que se encuentran fuera de las capacidades de la banda de frecuencia de un radio determinado.

NOTA:

Esto es útil cuando un sistema de troncalización o convencional es compatible con bandas de frecuencia duales pero algunos radios específicos de ese sistema son de una sola banda. En este caso, el usuario aún puede leer y escribir codeplugs, y clonar entre radios, incluso cuando algunas bandas de frecuencia en el codeplug son no válidas.

ADVERTENCIA:

Cuando el campo Permitir frecuencias no válidas se encuentra activado, no se emite ninguna advertencia cuando intenta escribir en el codeplug (escribir, clonar o FLASHport) y hay canales programados que no funcionarán en el radio.

10.2.11.1

VHF utilizado en el codeplug

Esta casilla de verificación le permite ingresar frecuencias desde la banda de frecuencia VHF en el codeplug, sin importar las capacidades del radio.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

**IMPORTANTE:**

La activación de este campo y la programación de frecuencias VHF en el radio no permitirán que un radio opere dentro del rango de frecuencias VHF. El radio debe tener el hardware necesario y el FLASHcode compatible para admitir esta banda.

**NOTA:**

Si la banda de frecuencia ya se ha comprado para el radio como se representa en el FLASHcode, entonces este campo se activará y no se podrá editar.

Solo se accede: Cuando el campo Permitir frecuencias no válidas está **Activado** y cuando el radio admite modelos y opciones diferentes.

10.2.11.2

UHF1 utilizado en el codeplug

Esta casilla de verificación le permite ingresar frecuencias desde la banda de frecuencia UHF1 en el codeplug, independientemente de las capacidades del radio.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

**IMPORTANTE:**

La activación de este campo y la programación de frecuencias de UHF1 en el radio no permitirán que un radio opere dentro del rango de frecuencias de UHF1. El radio debe tener el hardware necesario y el FLASHcode compatible para admitir esta banda.

**NOTA:**

Si la banda de frecuencia ya se ha comprado para el radio como se representa en el FLASHcode, entonces este campo se activará y no se podrá editar.

Solo se accede: Cuando el campo Permitir frecuencias no válidas está **Activado** y cuando el radio admite modelos y opciones diferentes.

10.2.11.3

UHF2 utilizado en el codeplug

Esta casilla de verificación le permite ingresar frecuencias desde la banda de frecuencia UHF2 en el codeplug, independientemente de las capacidades del radio.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

**IMPORTANTE:**

La activación de este campo y la programación de frecuencias de UHF2 en el radio no permitirán que un radio opere dentro del rango de frecuencias de UHF2. El radio debe tener el hardware necesario y el FLASHcode compatible para admitir esta banda.

**NOTA:**

Si la banda de frecuencia ya se ha comprado para el radio como se representa en el FLASHcode, entonces este campo se activará y no se podrá editar.

Solo se accede: Cuando el campo Permitir frecuencias no válidas está **Activado** y cuando el radio admite modelos y opciones diferentes.

10.2.11.4

700 MHz utilizados en el codeplug

Esta casilla de verificación le permite ingresar frecuencias desde la banda de frecuencia de 700 MHz en el codeplug, sin importar las capacidades del radio.

IMPORTANTE:

La activación de este campo y la programación de frecuencias de 700 MHz en el radio no permitirán que un radio opere dentro del rango de frecuencias de 700 MHz. El radio debe tener el hardware necesario y el FLASHcode compatible para admitir esta banda.

NOTA:

Actualmente, solo hay una opción H QA00569 disponible para 7/800 MHz. Por lo tanto, debe activar o desactivar tanto 700 MHz como 800 MHz utilizados en el codeplug al mismo tiempo.

Si la banda de frecuencia ya se ha comprado para el radio como se representa en el FLASHcode, entonces este campo se activará y no se podrá editar.

Solo se accede: Cuando el campo Permitir frecuencias no válidas está **Activado** y cuando el radio admite modelos y opciones diferentes.

10.2.11.5

800 MHz utilizados en el codeplug

Esta casilla de verificación le permite ingresar frecuencias desde la banda de frecuencia de 800 MHz en el codeplug, sin importar las capacidades del radio.

IMPORTANTE:

La activación de este campo y la programación de frecuencias de 800 MHz en el radio no permitirán que un radio opere dentro del rango de frecuencias de 800 MHz. El radio debe tener el hardware necesario y el FLASHcode compatible para admitir esta banda.

NOTA:

Actualmente, solo hay una opción H QA00569 disponible para 7/800 MHz. Por lo tanto, debe activar o desactivar tanto 700 MHz como 800 MHz utilizados en el codeplug al mismo tiempo.

Si la banda de frecuencia ya se ha comprado para el radio como se representa en el FLASHcode, entonces este campo se activará y no se podrá editar.

Solo se accede: Cuando el campo Permitir frecuencias no válidas está **Activado** y cuando el radio admite modelos y opciones diferentes.

10.2.11.6

Rango extendido de 700 MHz

Esta casilla de verificación le permite ingresar frecuencias desde la banda de frecuencia de 762 a 763 MHz y de 792 a 793 MHz en el codeplug, independientemente de las capacidades del radio.

NOTA:

Actualmente, hay una opción PCI-QA07468 disponible para el rango extendido de 700 MHz.

Si la banda de frecuencia ya se ha comprado para el radio como se representa en el FLASHcode, entonces este campo se activará y no se podrá editar.

10.2.12

Seguridad pública táctica

Esta sección permite ver o modificar los parámetros de Seguridad pública táctica (TPS).

NOTA:

Las configuraciones de TPS se definen según la Personalidad convencional individual. Vea los campos Personalidad convencional, Tipo de señalización de incidente y Habilitar IU de seguridad pública táctica.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.2.12.1

Tono final de Tx de voz

Este campo permite que el radio emita un tono de alerta al final de una transmisión de voz.

Este tono suena una vez que se suelta el botón PTT para el modo Convencional analógico y digital (vea el campo Tipo de voz/señal de Tx), independientemente de la selección de cualquier Tipo de señalización de incidentes, incluido "Desactivado". Esta función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.2.12.2

Balizas audibles de emergencia

Este campo permite generar tonos de alerta de emergencia durante una transmisión en el Modo de emergencia, y le permite seleccionar la cantidad de tiempo entre estos tonos repetidos únicos.

Estos tonos de alerta se reproducen desde el altavoz del radio para proporcionar un mecanismo de búsqueda y rescate audible que continúa hasta que cancele la emergencia. Ver también Enrutamiento de señales periódicas audibles de emergencia. Esta selección se aplica en base a la amplitud de radio. El tiempo está expresado en segundos.

IMPORTANTE:

Para radios móviles, la baliza de emergencia suena al nivel de volumen actual del radio.

En los radios portátiles, la baliza de emergencia suena en el máximo nivel de volumen configurado del radio.

Se aplica solo:

- Cuando el radio funciona en Modo de emergencia y solo cuando funciona en una Personalidad convencional en la que está activado el campo Activación UI de seguridad pública táctica.
- (Solo para radios móviles) Cuando la función ampliada "Baliza audible de emergencia" aparece en el campo Nombre de la función ampliada.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

NOTA:

La baliza audible de emergencia está desactivada cuando se configura como **0-Desactivado** (valor predeterminado).

Mesa 30: Rango

Mínimo	Máximo	Incrementos
1 (segundo)	255 (segundos)	1 segundo

10.2.12.3

Enrutamiento de balizas audibles de emergencia

En este campo se selecciona el enrutamiento de tonos de alerta de "Señales periódicas audibles" y del audio de entrada a un altavoz específico cuando hay una transmisión del modo de emergencia activa.

Esta selección se aplica en base a la amplitud de radio.

Se aplica solo: Cuando el radio funciona en Modo de emergencia y solo cuando funciona en una Personalidad convencional en la que está activado el campo Activación UI de seguridad pública táctica.

Solo se accede:

- Cuando la función ampliada "Enrutamiento de balizas audibles de emergencia" aparece en el campo Nombre de la función ampliada.
- Cuando el campo [Balizas audibles de emergencia en la página 132](#) no esté configurado en **Desactivado**.
- Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Altavoz externo

Los tonos de alerta de la baliza de emergencia se enrutan al altavoz externo (si se conectan, de otro modo, se utiliza el altavoz interno)

Solo altavoz interno

Los tonos de alerta de la baliza de emergencia se reproducen solo en el altavoz interno (sin importar la disponibilidad del altavoz externo).

10.2.12.4

Tasa de reintentos de alarma de emergencia

En este campo se selecciona la cantidad de tiempo que el radio espera entre las transmisiones de Reintento de alarma de emergencia. Esta selección se aplica en base a la amplitud de radio.

**NOTA:**

Una vez que se entra en el Modo de emergencia en una Personalidad convencional, este tiempo de espera se aplica a los reintentos de emergencia formales e informales definidos en el Perfil de emergencia convencional citado del Sistema convencional de Personalidad.

Los reintentos de alarma de emergencia continúan hasta que se recibe una confirmación (Ack) de una transmisión de emergencia exitosa en el radio o hasta que se agote la cantidad de reintentos de emergencia formales e informales.

Se aplica solo: Cuando el radio funciona en Modo de emergencia y solo cuando funciona en una Personalidad convencional en la que está activado el campo Activación UI de seguridad pública táctica.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

**NOTA:**

El Índice de reintento de alarma de emergencia está desactivado cuando se configura en **4-Desactivado** (valor predeterminado).

Mesa 31: Rango

Mínimo	Máximo	Incrementos
5 (segundos)	64 (segundos)	1 segundo

10.2.12.5

Tono lateral al soltar el PTT para llamada de emergencia

Este campo permite que el radio emita un tono de alerta único para recordarle que el Modo de emergencia sigue activo.

Este tono de alerta suena cuando suelta el botón PTT en la transmisión de una Llamada de emergencia.

IMPORTANTE:

Para radios móviles, este tono lateral de emergencia suena al nivel de volumen actual del radio.

Para radios portátiles, este Tono lateral de emergencia suena en la configuración Volumen máximo del radio (consulte también Compensación de volumen [dB]).

Se aplica solo: Cuando el radio funciona en Modo de emergencia y solo cuando funciona en una Personalidad convencional en la que está activado el campo Activación UI de seguridad pública táctica.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.2.12.6

Transmisión PTT de TPS

En este campo se selecciona cuando se transmite un paquete de Seguridad pública táctica (TPS) en relación con una transmisión de voz que no es de emergencia.

Esta función se aplica a la amplitud del radio con los canales de TPS activados.

Se aplica solo: cuando el radio funciona en una Personalidad convencional, en que el campo Tipo de señalización de incidentes se configura en **Seguridad pública táctica**.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Ninguno

No se transmite ningún paquete de TPS.

Borde anterior

El paquete de TPS se transmite una vez que se presiona el botón PTT y antes de cualquier transmisión de voz.

Borde de salida

El paquete de TPS se transmite después de soltar el botón PTT.

Ambos

El paquete de TPS se transmite una vez que se presiona el botón PTT y antes de cualquier transmisión de voz y luego de soltar el botón PTT.

10.2.12.7

Transmisión de PTT de emergencia de TPS

En este campo se selecciona cuando se transmite un paquete de Seguridad pública táctica (TPS) en relación con una transmisión de "Llamada" de emergencia (voz) (ver también Tipo de emergencia).

Esta función se aplica en todos los radios para las transmisiones de "Llamada" de emergencia (voz) en los canales de TPS activados.

Se aplica solo: Cuando el radio funciona en el Modo de emergencia y solo cuando funciona en la Personalidad convencional en la que el campo Tipo de señalización de incidente se configura en **Seguridad pública táctica**.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Ninguno

No se transmite ningún paquete de TPS.

Borde anterior

El paquete de TPS se transmite una vez que se presiona el botón PTT y justo antes de cualquier transmisión de Llamada de emergencia (voz).

Borde de salida

El paquete de TPS se transmite después de soltar el botón PTT en cualquier transmisión de Llamada de emergencia (voz).

Ambos

El paquete de TPS se transmite una vez que se presiona el botón PTT justo antes de cualquier transmisión de Llamada de emergencia (voz) y, nuevamente, justo después de soltar el botón PTT.

10.2.13

Disposición del personal

La sección **Disposición del personal** de la **Amplitud del radio** le permite al usuario ver o modificar los parámetros de disposición del personal.

NOTA:

Cuando se opere en modo directo o de transmisión directa y en cercanía a otros radios, se recomienda configurar un preámbulo adicional de 160 en el sistema ASTRO configurado con canales de Disposición del personal activados.

10.2.13.1

Temporizador de actualización periódica

En este campo se selecciona la cantidad de tiempo que determina la frecuencia (en minutos) con que el radio envía un paquete de Disposición del personal (PA) no solicitado y sin requerimiento de confirmación al terminal de comandos de incidentes (ICT).

Esto sucede solo cuando ya ha ocurrido un Registro de PA exitoso. Si falló el intento de Registro de PA, el temporizador se usa para determinar cada cuánto tiempo (en minutos) el radio intentará el Registro de PA. Esta función se aplica según la amplitud de radio a los canales activados de disposición del personal.

Se aplica solo: Cuando el radio funciona en una Personalidad convencional donde el campo Tipo de señalización de incidente está configurado como **Responsabilidad del personal** y el campo Registro de responsabilidad del personal está habilitado.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

NOTA:

El temporizador de actualización periódica está desactivado cuando se configura en **0 -Desactivado** (valor predeterminado). El radio no envía paquetes de Disposición del personal (PA) no solicitados y sin requerimiento de confirmación; tampoco intenta el Registro de PA.

Mesa 32: Rango

Mínimo	Máximo	Incrementos
1 minuto	20 minutos	1 minuto

10.2.13.2

Responder a sondeos

Este campo permite que el radio envíe una respuesta de vuelta inmediatamente después de recibir un sondeo de Disposición del personal.

El sondeo de responsabilidad del personal se inicia por un Comandante de incidentes (IC) y se usa para pedir que los radios confirmen su capacidad para responder. Esta función se aplica según la amplitud de radio a los canales activados de disposición del personal.

Se aplica solo: Cuando el radio funciona en una Personalidad convencional, en que el campo Tipo de señalización de incidentes está configurado como **Disposición del personal**.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.2.13.3

Confirmación de evacuación

En este campo se seleccionan las formas en que el radio responde a los mensajes de Evacuación de disposición del personal.

Los mensajes de evacuación de Disposición del personal se envían mediante el Comandante de incidentes (IC). Esta función se aplica según la amplitud de radio a los canales activados de disposición del personal.

Se aplica solo: Cuando el radio funciona en una Personalidad convencional, en que el campo Tipo de señalización de incidentes está configurado como **Disposición del personal**.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Desactivado

El radio no responde a un mensaje de evacuación.

Manual

El radio responde a un mensaje de evacuación tras la intervención mediante la pulsación del botón PTT.

10.2.13.4

Transmisión de PTT de responsabilidad del personal

En este campo se selecciona cuando un paquete de Disposición del personal (PA) sin confirmar (sin reconocimiento esperado) se transmite en relación a la transmisión de voz sin emergencia.

Esta función se aplica según la amplitud de radio a los canales activados de disposición del personal.

Se aplica solo: Cuando el radio funciona en una Personalidad convencional, en que el campo Tipo de señalización de incidentes está configurado como **Disposición del personal**.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Ninguno

No se transmite ningún paquete de PA.

Borde anterior

El paquete de PA se transmite una vez que se presiona el botón PTT y antes de cualquier transmisión de voz sin emergencia.

Borde de salida

El paquete de PA se transmite después de soltar el botón PTT.

Ambos

El paquete de PA se transmite una vez que se presiona el botón PTT y justo antes de cualquier transmisión de voz sin emergencia y, nuevamente, justo después de soltar el botón PTT.

10.2.13.5**Transmisión de PTT de emergencia de responsabilidad del personal**

En este campo se selecciona cuando un paquete de Disposición del personal (PA) sin confirmar (sin reconocimiento esperado) se transmite en relación con una emergencia.

Esta función se aplica en todos los radios para las transmisiones de Llamada de emergencia en los canales activados de Disposición del personal.

Se aplica solo: Cuando el radio funciona en Modo de emergencia y solo cuando funciona en una Personalidad convencional en la que el campo Tipo de señalización de incidentes está configurado como **Disposición del personal**.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Ninguno

No se transmite ningún paquete de PA.

Borde anterior

El paquete de PA se transmite una vez que se presiona el botón PTT y justo antes de cualquier transmisión de Llamada de emergencia.

Borde de salida

El paquete de PA se transmite después de soltar el botón PTT.

Ambos

El paquete de PA se transmite una vez que se presiona el botón PTT justo antes de cualquier transmisión de Llamada de emergencia y, nuevamente, justo después de soltar el botón PTT.

10.2.13.6**Tono de alerta de confirmación en PTT**

Este campo permite configurar el botón PTT para reconocer las alertas de fireground.

Cuando está activado, se pueden utilizar el botón PTT y el botón superior lateral (botón morado) en radios portátiles o accesorios, y el botón programable de 1 punto en un RSM para reconocer estas alertas.

Hay 16 alertas programables que puede enviar el cliente y recibir los radios. Las alertas incluyen tono, luz de fondo, vibración, anuncio de voz, texto, LED, etc.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.2.14**Bluetooth**

Esta sección permite ver o modificar los ajustes relacionados con la tecnología Bluetooth.

**IMPORTANTE:**

Consulte la Guía del usuario del radio para ver una lista de dispositivos aprobados COTS y nuevos perfiles compatibles.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.2.14.1

Activación de Bluetooth

Este campo permite activar la función Bluetooth en el radio.

La activación de Bluetooth permite que el radio se asocie y comunique con un accesorio activado por Bluetooth, como un auricular. Esta función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.2.14.2

Tonos de Bluetooth

Este campo permite activar los tonos de Bluetooth.

Esta función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el campo [Activación de Bluetooth en la página 138](#) esté **Activado** y cuando el radio admite modelos y opciones diferentes.

10.2.14.3

Nombre descriptivo de Bluetooth editable

Este campo permite editar los contenidos del campo Nombre descriptivo de Bluetooth a través del teclado o menú del radio.

Esta función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el campo [Activación de Bluetooth en la página 138](#) esté **Activado** y cuando el radio admite modelos y opciones diferentes.

10.2.14.4

LED del Bluetooth del micrófono y altavoz remoto

El LED del Bluetooth del micrófono y altavoz remoto (RSM) se ilumina cuando hay conectividad Bluetooth del radio.

10.2.14.5

Emparejamiento de PIN Bluetooth heredado

Este campo le permite activar el emparejamiento de PIN Bluetooth heredado.

Puede emparejar el radio con el accesorio Bluetooth activado que utiliza la especificación del núcleo de Bluetooth 2.0 y versiones anteriores.

Esta función se aplica en base a la amplitud de radio.

10.2.15

Sensor

Esta sección le permite ver o definir la funcionalidad de sensor.

10.2.15.1

Tiempo de desactivación de evento del sensor

Este campo le permite especificar la cantidad de tiempo que tiene que esperar para que ocurra un evento mientras se encuentra en el modo de desactivación temporal.

Si no se produce un evento, se cancela la desactivación temporal. El valor predeterminado es 30.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 33: Rango

Mínimo	Máximo	Incrementos
5 segundos	300 segundos	5 segundos

10.2.15.2

Activar notificación de evento del sensor

Este campo le permite activar la notificación local si hay algún evento de contexto de los dispositivos del sensor conectados.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.2.16

Tramo de frecuencia de Rx

En este campo se muestra la frecuencia inicial y final de la división de frecuencia de recepción. Cada fila se aplica a la banda de frecuencia especificada.

Estos valores se fijan para el modelo de radio según la amplitud del radio.

10.2.17

Tramo de frecuencia de Tx

Este campo muestra la frecuencia inicial y final de la división de frecuencia de transmisión. Cada fila se aplica a la banda de frecuencia especificada.

Estos valores se fijan para el modelo de radio según la amplitud del radio.

10.3

Anulaciones de fábrica

Las **Anulaciones de fábrica** se usan para ingresar información sobre anulaciones de fábrica para determinados algoritmos de señales radiales según la amplitud de radio.

**ADVERTENCIA:**

La anulación de fábrica no se debe ingresar a menos que sea necesario. Los procedimientos para ingresar información de anulación de fábrica solo debe realizarlos personal calificado de servicio. Si los procedimientos no se realizan de forma adecuada pueden degradar seriamente el rendimiento del radio o del sistema.

10.3.1

General

Esta sección permite ingresar información de la anulación de fábrica.

10.3.1.1

Activación de anulaciones de fábrica

Este campo le permite ingresar información de anulación de fábrica en las listas de Anulaciones de fábrica.

Esta selección se aplica en base a la amplitud de radio. Al desactivarse, todas las configuraciones de Anulaciones de fábrica se ignoran.

ADVERTENCIA:

Este campo no se debe activar a menos que sea necesario. Los procedimientos para ingresar información de anulación de fábrica en el menú Anulaciones de fábrica solo debe realizarlos Personal de servicio calificado. Si los procedimientos no se realizan de forma adecuada pueden degradar seriamente el rendimiento del radio o del sistema.

Solo se accede: esta es una configuración de avanzada que solo está disponible en la Vista de experto.

10.3.2

Lista de índice de reloj SSI de Tx

Esta sección le permite ingresar frecuencias de transmisión y sus valores de divisor de frecuencia respectivos para frecuencias en las cuales ocurra un fenómeno de llamadas cruzadas.

La llamada cruzada se produce cuando una señal transmitida en un canal crea un efecto no deseado en otro canal. Estos campos se aplican en base a la amplitud de radio.

ADVERTENCIA:

La anulación de fábrica no se debe ingresar a menos que sea necesario. Los procedimientos para ingresar información de anulación de fábrica solo debe realizarlos personal calificado de servicio. Si los procedimientos no se realizan de forma adecuada pueden degradar seriamente el rendimiento del radio o del sistema.

10.3.2.1

Frecuencia de Tx

Este campo permite ingresar la frecuencia (en MHz) de Transmisión (Tx) en la cual se produce el fenómeno de llamadas cruzadas para el correspondiente valor de frecuencia de Índice de reloj SSI de Tx.

Esta selección se aplica para el registro/fila actual que se aplica en base a la amplitud de radio.

ADVERTENCIA:

Este campo no se debe activar a menos que sea necesario. Los procedimientos para ingresar información de anulación de fábrica en el menú Anulaciones de fábrica solo debe realizarlos Personal de servicio calificado. Si los procedimientos no se realizan de forma adecuada pueden degradar seriamente el rendimiento del radio o del sistema.

Tamaño de 6,25 kHz para la banda de frecuencia de 800 MHz:

A contar de la versión R09.01.00, la aplicación permite un tamaño de paso de 6,25 kHz para frecuencias convencionales en la banda de frecuencia de 800 MHz para cumplir con la normativa legal en ciertos países (sin FCC); sin embargo, tenga en cuenta que dos radios que operan en canales adyacentes separados por 6,25 kHz solo puede experimentar un fenómeno de llamada cruzada no deseado.

IMPORTANTE:

No se permiten frecuencias duplicadas. Por lo tanto, al seleccionar una frecuencia y si ya se ingresó una frecuencia a la lista, dicha frecuencia ya no será una alternativa válida para el campo actual.

Consulte las hojas del catálogo/páginas de precios de Motorola o el manual de Motorola para obtener las frecuencias válidas para el modelo actual.

Para obtener un rendimiento óptimo, las frecuencias se deben ingresar en orden ascendente.

Solo se accede: Cuando el campo [Activación de anulaciones de fábrica en la página 139](#) esté **Activado** y cuando el radio admite modelos y opciones diferentes. Esta es una configuración avanzada que solo está disponible en la Vista de experto (ver Vista del codeplug).

10.3.2.2

Índice de reloj SSI de Tx

En este campo se selecciona la frecuencia (en MHz) del Índice de reloj SSI del sintetizador de Transmisión (Tx) para la correspondiente Frecuencia de Tx en la cual se producen las llamadas cruzadas.

Esta selección se aplica para el registro/fila actual que se aplica en base a la amplitud de radio.

ADVERTENCIA:

Este campo no se debe activar a menos que sea necesario. Los procedimientos para ingresar información de anulación de fábrica en el menú Anulaciones de fábrica solo debe realizarlos Personal de servicio calificado. Si los procedimientos no se realizan de forma adecuada pueden degradar seriamente el rendimiento del radio o del sistema.

Solo se accede: Cuando el campo [Activación de anulaciones de fábrica en la página 139](#) esté **Activado** y cuando el radio admite modelos y opciones diferentes. Esta es una configuración avanzada que solo está disponible en la Vista de experto (ver Vista del codeplug).

Se admiten las siguientes selecciones:

- 2,40 MHz
- 3,36 MHz
- 8,40 MHz
- 1,92 MHz

10.3.3

Lista de índice de reloj SSI de Rx

Esta sección le permite ingresar frecuencias de transmisión y sus valores de divisor de frecuencia respectivos para frecuencias en las cuales ocurra un fenómeno de llamadas cruzadas.

La llamada cruzada se produce cuando una señal transmitida en un canal crea un efecto no deseado en otro canal. Estos campos se aplican en base a la amplitud de radio.

ADVERTENCIA:

La anulación de fábrica no se debe ingresar a menos que sea necesario. Los procedimientos para ingresar información de anulación de fábrica solo debe realizarlos personal calificado de servicio. Si los procedimientos no se realizan de forma adecuada pueden degradar seriamente el rendimiento del radio o del sistema.

10.3.3.1

Frecuencia de Rx

Este campo permite ingresar la frecuencia (en MHz) de Recepción (Rx) en la cual se produce el fenómeno de llamadas cruzadas para el correspondiente valor de frecuencia de Índice de reloj SSI de Rx.

Esta selección se aplica para el registro/fila actual que se aplica en base a la amplitud de radio.

**ADVERTENCIA:**

Este campo no se debe activar a menos que sea necesario. Los procedimientos para ingresar información de anulación de fábrica en el menú Anulaciones de fábrica solo debe realizarlos Personal de servicio calificado. Si los procedimientos no se realizan de forma adecuada pueden degradar seriamente el rendimiento del radio o del sistema.

A partir de la versión R09.01.00, se permite el tamaño de paso de 6,25 kHz para frecuencias convencionales en la banda de frecuencia de 800 MHz para cumplir con la normativa legal en ciertos países (sin FCC). Los dos radios que operan en canales adyacentes separados por 6,25 kHz solo pueden experimentar un fenómeno de conversación cruzada no deseada.

**IMPORTANTE:**

No se permiten frecuencias duplicadas. Por lo tanto, al seleccionar una frecuencia y si ya se ingresó una frecuencia a la lista, dicha frecuencia ya no será una alternativa válida para el campo actual.

Consulte las hojas del catálogo/páginas de precios de Motorola o el manual de Motorola para obtener las frecuencias válidas para el modelo actual.

Para obtener un rendimiento óptimo, las frecuencias se deben ingresar en orden ascendente.

Solo se accede cuando el campo [Activación de anulaciones de fábrica en la página 139](#) está **Activado** y cuando el modelo o la opción del radio lo permitan.

10.3.3.2

Índice de reloj SSI de Rx

En este campo se selecciona la frecuencia (en MHz) del Índice de reloj SSI del sintetizador de Recepción (Rx) para la correspondiente Frecuencia de Rx en la cual se producen las llamadas cruzadas.

Esta selección se aplica para el registro/fila actual que se aplica en base a la amplitud de radio.

**ADVERTENCIA:**

Este campo no se debe activar a menos que sea necesario. Los procedimientos para ingresar información de anulación de fábrica en el menú Anulaciones de fábrica solo debe realizarlos Personal de servicio calificado. Si los procedimientos no se realizan de forma adecuada pueden degradar seriamente el rendimiento del radio o del sistema.

Solo se accede: Cuando el campo [Activación de anulaciones de fábrica en la página 139](#) esté activado y cuando el modelo o la opción del radio lo permitan.

Se admiten las siguientes selecciones:

- 1,2 MHz
- 1,5 MHz
- 1,8 MHz
- 6,4 MHz
- 9,6 MHz

10.3.4

Lista de índice de reloj SSI de Rx: Modo Tx

Esta sección le permite ingresar frecuencias de transmisión y sus valores de divisor de frecuencia respectivos para frecuencias en las cuales ocurra un fenómeno de llamadas cruzadas.

La llamada cruzada se produce cuando una señal transmitida en un canal crea un efecto no deseado en otro canal. Estos campos se aplican en base a la amplitud de radio.

ADVERTENCIA:

La anulación de fábrica no se debe ingresar a menos que sea necesario. Los procedimientos para ingresar información de anulación de fábrica solo debe realizarlos personal calificado de servicio. Si los procedimientos no se realizan de forma adecuada pueden degradar seriamente el rendimiento del radio o del sistema.

10.3.4.1

Frecuencia de Tx

Este campo permite ingresar la frecuencia (en MHz) de Transmisión (Tx) en la cual se produce el fenómeno de llamadas cruzadas para el correspondiente valor de frecuencia de Índice de reloj SSI de Tx.

Esta selección se aplica para el registro/fila actual que se aplica en base a la amplitud de radio.

ADVERTENCIA:

Este campo no se debe activar a menos que sea necesario. Los procedimientos para ingresar información de anulación de fábrica en el menú Anulaciones de fábrica solo debe realizarlos Personal de servicio calificado. Si los procedimientos no se realizan de forma adecuada pueden degradar seriamente el rendimiento del radio o del sistema.

A partir de la versión R09.01.00, se permite el tamaño de paso de 6,25 kHz para frecuencias convencionales en la banda de frecuencia de 800 MHz para cumplir con la normativa legal en ciertos países (sin FCC). Los dos radios que operan en canales adyacentes separados por 6,25 kHz solo pueden experimentar un fenómeno de conversación cruzada no deseada.

IMPORTANTE:

No se permiten frecuencias duplicadas. Por lo tanto, al seleccionar una frecuencia y si ya se ingresó una frecuencia a la lista, dicha frecuencia ya no será una alternativa válida para el campo actual.

Consulte las hojas del catálogo/páginas de precios de Motorola o el manual de Motorola para obtener las frecuencias válidas para el modelo actual.

Para obtener un rendimiento óptimo, las frecuencias se deben ingresar en orden ascendente.

Solo se accede: Cuando el campo [Activación de anulaciones de fábrica en la página 139](#) esté **Activado** y cuando el radio admite modelos y opciones diferentes. Esta es una configuración avanzada que solo está disponible en la Vista de experto (ver Vista del codeplug).

10.3.4.2

Índice de reloj SSI de Rx

En este campo se selecciona la frecuencia (en MHz) del Índice de reloj SSI del sintetizador de Recepción (Rx) para la correspondiente Frecuencia de Rx en la cual se producen las llamadas cruzadas.

Esta selección se aplica para el registro/fila actual que se aplica en base a la amplitud de radio.

ADVERTENCIA:

Este campo no se debe activar a menos que sea necesario. Los procedimientos para ingresar información de anulación de fábrica en el menú Anulaciones de fábrica solo debe realizarlos Personal de servicio calificado. Si los procedimientos no se realizan de forma adecuada pueden degradar seriamente el rendimiento del radio o del sistema.

Solo se accede: Cuando el campo [Activación de anulaciones de fábrica en la página 139](#) esté **Activado** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

- 6,4 MHz
- 9,6 MHz

10.3.5

Segunda lista de frecuencia de inyección de LO

Esta sección permite ver o modificar frecuencias individuales de Rx (Recepción) para las cuales se utilizará la segunda frecuencia de inyección de LO opuesta en vez de la predeterminada.

Esta función se aplica en base a la amplitud de radio.

ADVERTENCIA:

La anulación de fábrica no se debe ingresar a menos que sea necesario. Los procedimientos para ingresar información de anulación de fábrica solo debe realizarlos personal calificado de servicio. Si los procedimientos no se realizan de forma adecuada pueden degradar seriamente el rendimiento del radio o del sistema.

10.3.5.1

Segunda frecuencia de inyección de LO

Este campo permite ingresar una frecuencia (en MHz) individual de recepción (Rx) para la cual se utilizará la segunda frecuencia de inyección de LO opuesta en vez de la predeterminada.

Esta selección se aplica para el registro/fila actual que se aplica en base a la amplitud de radio.

ADVERTENCIA:

Este campo no se debe activar a menos que sea necesario. Los procedimientos para ingresar información de anulación de fábrica en el menú Anulaciones de fábrica solo debe realizarlos Personal de servicio calificado. Si los procedimientos no se realizan de forma adecuada pueden degradar seriamente el rendimiento del radio o del sistema.

A partir de la versión R09.01.00, se permite el tamaño de paso de 6,25 kHz para frecuencias convencionales en la banda de frecuencia de 800 MHz para cumplir con la normativa legal en ciertos países (sin FCC). Los dos radios que operan en canales adyacentes separados por 6,25 kHz solo pueden experimentar un fenómeno de conversación cruzada no deseada.

Solo se accede: Cuando el campo [Activación de anulaciones de fábrica en la página 139](#) esté **Activado** y cuando el radio admite modelos y opciones diferentes.

10.3.6

Lista de rechazo fuera de banda

El rechazo fuera de banda especifica un valor de rechazo centrado en dB. Se define en relación con la eficiencia máxima de un filtro.

10.3.6.1

Frecuencia de Rx (MHz)

Le permite al usuario ingresar una frecuencia (en MHz) de Rx (recepción) en la cual se produce el fenómeno de llamadas cruzadas para el correspondiente valor de frecuencia de la Lista de rechazo fuera de banda.

Esta selección se aplica para el registro/fila actual que se aplica en base a la amplitud de radio.

ADVERTENCIA:

Este campo no se debe activar a menos que sea necesario. Los procedimientos para ingresar información de anulación de fábrica en el menú Anulaciones de fábrica solo debe realizarlos Personal de servicio calificado. Si los procedimientos no se realizan de forma adecuada pueden degradar seriamente el rendimiento del radio o del sistema.

Tamaño de 6,25 kHz para la banda de frecuencia de 800 MHz:

A contar de la versión R09.01.00, RadioCentral permite un tamaño de paso de 6,25 kHz para frecuencias convencionales en la banda de frecuencia de 800 MHz para cumplir con la normativa legal en ciertos países (sin FCC); sin embargo, tenga en cuenta que dos radios que operan en canales adyacentes separados por 6,25 kHz solo puede experimentar un fenómeno de llamada cruzada no deseado.

IMPORTANTE:

No se permiten frecuencias duplicadas. Por lo tanto, al seleccionar una frecuencia y si ya se ingresó una frecuencia a la lista, dicha frecuencia ya no será una alternativa válida para el campo actual.

Consulte las hojas del catálogo/páginas de precios de Motorola o el manual de Motorola para obtener las frecuencias válidas para el modelo actual.

Para obtener un rendimiento óptimo, las frecuencias se deben ingresar en orden ascendente.

Solo se accede cuando el campo [Activación de anulaciones de fábrica en la página 139](#) está **Activado** y cuando el modelo o la opción del radio lo permitan.

10.4

Ergonomía del radio en general

Esta sección le permite ver o definir la funcionalidad de la amplitud del radio que se aplica a los modos de comunicación convencional y de troncalización.

10.4.1

Modo principal

Esta sección le permite seleccionar una zona y canal específicos que luego se consideran como el Modo principal del radio.

Modo es otro nombre para cierta zona y canal. Las zonas y los canales deben definirse previamente en la ventana Asignación de canal de zona. Esta función se aplica según la amplitud de radio.

NOTA:

Puede acceder al Modo principal programado con una pulsación larga del botón de Inicio del radio. Con una pulsación corta del botón de Inicio del radio también puede verificar la selección actual del radio cuando se usan funciones como los canales de cambio o las zonas de cambio o cuando se seleccionan Miembros prioritarios/canales para una Lista de rastreo.

10.4.1.1

Selección de Modo principal

En este campo se activa la función Modo inicio, lo que le permite al radio saltar fácilmente a la zona Modo inicio y al canal Modo inicio.

Modo es otro nombre para cierta zona y canal. Esta selección se aplica en base a la amplitud de radio.

**NOTA:**

Puede acceder fácilmente a este Modo de Inicio programado si mantiene una pulsación larga del botón de Inicio del radio. Una pulsación corta del botón Inicio del radio también puede verificar la selección actual del radio cuando se usan funciones como los canales de cambio y las zonas de cambio, o cuando se seleccionan miembros o canales prioritarios para una Lista de rastreo.

Si el radio es el modelo más reciente de Normas de servicio contra incendios, el Modo de Inicio se selecciona y atenúa de forma predeterminada. La **Zona y el canal** del Modo de Inicio se deben establecer en un canal que esté vinculado a una personalidad del Modo de Zona de Peligro (el campo Personalidad del Modo de Zona de Peligro está seleccionado).

El modelo de radio más reciente de Normas de servicio contra incendios se enciende en el canal del Modo de Zona de Peligro. La **Zona y el canal** de Inicio se seleccionan si el canal anterior no es un canal del Modo de Zona de Peligro.

Solo se accede: Cuando el radio admite distintos modelos y opciones.

10.4.1.2

Zona de modo de inicio

Este campo le permite seleccionar una Zona de modo inicio para el radio.

Cuando se selecciona la zona, se puede seleccionar el Canal de modo de inicio. Modo es otro nombre para cierta zona y canal. Esta selección se aplica en base a la amplitud de radio.

**NOTA:**

Puede acceder fácilmente al modo Inicio programado con una pulsación larga del botón de Inicio del radio. Con una pulsación corta del botón de Inicio del radio también puede verificar la selección actual del radio cuando se usan funciones como los canales de cambio o las zonas de cambio o cuando se seleccionan Miembros prioritarios/canales para una Lista de rastreo.

**ADVERTENCIA:**

Las zonas dinámicas son no válidas y no se pueden seleccionar (zonas que tienen activada la opción Activación de zona dinámica).

Las zonas de la Interfaz de sitio remoto (RSI) no son válidas y no se pueden seleccionar (zonas con el modo RSI activado).

Solo se accede: Cuando el campo Selección de modo inicio está activado y cuando el radio admite diferentes modelos y opciones.

10.4.1.3

Canal de modo de inicio

En este campo se selecciona un Canal de modo de inicio para el radio.

La Zona de modo de inicio se debe seleccionar primero. Modo es otro nombre para cierta zona y canal. Esta selección se aplica en base a la amplitud de radio.

**NOTA:**

Puede acceder fácilmente al modo Inicio programado con una pulsación larga del botón de Inicio del radio. Con una pulsación corta del botón de Inicio del radio también puede verificar la selección actual del radio cuando se usan funciones como los canales de cambio o las zonas de cambio o cuando se seleccionan Miembros prioritarios/canales para una Lista de rastreo.

Solo se accede: Cuando el campo [Selección de Modo principal en la página 146](#) está **activado**, cuando el campo [Zona de modo de inicio en la página 146](#) no está establecido en una **Zona dinámica**, y cuando el radio admite modelos y opciones diferentes.

10.4.2

Avanzada

Esta sección permite ver o definir las distintas funcionalidades que se aplican según la amplitud de radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.4.2.1

Duración de pulsación corta

En este campo se selecciona la cantidad de tiempo que define cuánto tiempo el usuario debe mantener oprimido un botón para que el radio la reconozca como pulsación corta.

El tiempo está expresado en milisegundos (ms). Esta selección se aplica en base a la amplitud de radio.

IMPORTANTE:

Esta duración de pulsación corta de tecla siempre debe ser un período más corto que la configuración del campo Duración de pulsación larga.

Se admiten las siguientes selecciones:

Mesa 34: Rango

Mínimo	Máximo	Incrementos
0 (ms)	6200 (ms)	50 (ms)

10.4.2.2

Duración de pulsación corta para emergencias

En este campo se selecciona la cantidad de tiempo que define cuánto tiempo el usuario debe mantener presionado un botón Emergencia antes de que el radio active la operación modo Emergencia del radio.

Una pulsación prolongada del mismo botón de emergencia desactiva el Modo emergencia del radio. El tiempo está expresado en milisegundos (ms). Esta función se aplica en base a la amplitud de radio.

NOTA:

La duración de la pulsación corta de la tecla debe ser más breve que la Duración de la pulsación larga para la configuración del campo Emergencia, o bien la Duración de la pulsación larga para emergencias se debe desactivar (configurar en **0**).

Se admiten las siguientes selecciones:

Mesa 35: Rango

Mínimo	Máximo	Incrementos
50 (ms)	6200 (ms)	50 (ms)

10.4.2.3

Duración de pulsación larga de tecla

En este campo se selecciona la cantidad de tiempo que el usuario debe mantener presionado un botón programable para que el radio lo reconozca como una pulsación de botón válida.

El botón preprogramado Inicio del radio es un ejemplo de un botón que se beneficia de la funcionalidad de la duración de pulsación larga de tecla. El tiempo está expresado en milisegundos (ms). Esta función se aplica en base a la amplitud de radio.

IMPORTANTE:

La duración de pulsación larga de tecla siempre debe ser un período más largo que la configuración del campo [Duración de pulsación corta en la página 147](#).

Se admiten las siguientes selecciones:

Mesa 36: Rango

Mínimo	Máximo	Incrementos
250 (ms)	6350 (ms)	250 (ms)

10.4.2.4

Duración de pulsación larga para emergencias

En este campo se selecciona la cantidad de tiempo que define cuánto tiempo el usuario debe mantener oprimido un botón Emergencia antes de que el radio desactive la operación modo Emergencia del radio.

Una pulsación corta del botón de emergencia activa el modo de funcionamiento de emergencia del radio. Esta función se aplica en base a la amplitud de radio. El tiempo está expresado en milisegundos (ms).

IMPORTANTE:

Cuando no se establece en **0**, esta duración de pulsación larga debe ser un período más largo que el tiempo de la configuración del campo de Duración de pulsación corta para emergencias.

Si se selecciona **0**, se desactiva la salida del modo Emergencia mediante una pulsación larga. Para la salida de emergencia puede apagar el radio.

Se admiten las siguientes selecciones:

Mesa 37: Rango

Mínimo	Máximo	Incrementos
0 (ms)	63750 (ms)	250 (ms)

10.4.2.5

Apagado de software

En este campo se selecciona un botón específico del radio que el usuario debe oprimir (después de colocar la perilla de encendido en la posición "Apagado") para apagar el radio.

Esta selección se aplica en base a la amplitud de radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Desactivado

Para apagar el radio se coloca la perilla de encendido en la posición "Apagado".

Botón lateral 1

Para apagar el radio, se debe presionar el botón lateral superior después de que la perilla de encendido esté en la posición “Apagado”. En la Guía del usuario se hace referencia a esto como Botón lateral superior (seleccionar).

Botón lateral 2

Para apagar el radio, se debe presionar el botón lateral central después de que la perilla de encendido esté en la posición “Apagado”. En la Guía del usuario se hace referencia a esto como Botón lateral 1.

Botón lateral 3

Para apagar el radio, se debe presionar el botón lateral inferior después de que la perilla de encendido esté en la posición “Apagado”. En la Guía del usuario se hace referencia a esto como Botón lateral 2.

10.4.2.6

Activación de último canal seleccionado por zona

Este campo permite que el último canal seleccionado por cada zona aparezca automáticamente en la pantalla del radio.

Cuando se desplaza por las zonas del radio, el radio recuerda el último canal seleccionado para cada zona y está inmediatamente disponible para el usuario. A continuación, puede seleccionar cualquier otro canal deseado dentro de una zona. Esta función se aplica según las necesidades del usuario.

Si se deshabilita, el radio permanece en el número de canal seleccionado en ese momento al cambiar a una nueva zona. Por ejemplo, el radio está en el canal 14 en zona 3; si la zona se cambia a la zona 15, el canal está ahora en el canal 14 en la zona 15. Observe que: si la zona 15 no tiene un canal 14, entonces aparece **NO PROGRAMADO** en la pantalla del radio; el usuario de radio debe luego cambiar a un canal que esté disponible en la zona nueva.

NOTA:

Cuando esta función está activada, el [Encendido en última zona y canal seleccionados en la página 149](#) y el campo [Canal de modo de inicio en la página 146](#) también se activan y son de solo vista/no modificables.

10.4.2.7

Encendido en última zona y canal seleccionados

Cuando este campo está activado, hace que se ignoren las posiciones actuales del switch Zona y Canal del radio durante el encendido.

Este campo también hace que el radio se encienda en la última posición seleccionada del interruptor de zona y canal del radio, justo antes de apagar el radio. Cuando se desactiva, el radio se enciende en las posiciones del interruptor de zona y canal actualmente seleccionadas. Esta función se aplica en base a la amplitud de radio.

ADVERTENCIA:

Las selecciones giratorias/de switch de alternación Selección de zona y Selección de canal deben programarse.

Solo se accede: Cuando Activación de último canal seleccionado por zona está **Desactivado** y cuando el radio admite modelos y opciones diferentes.

NOTA:

Cuando Activación de último canal seleccionado por zona está **Activado**, este campo también se convierte en Activado y es de solo vista/no modificable.

10.4.2.8

Bloqueo de control de volumen con RSM

En este campo se seleccionan los controles de volumen que pueden ajustar el nivel de volumen del radio cuando hay un accesorio conectado al radio.

Esta función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el micrófono admite diferentes modelos y opciones.

Se admiten las siguientes selecciones:

Ninguno

Los controles de volumen del radio y del accesorio permiten seleccionar el volumen del radio.

Bloquear solo radio

Cuando está conectado un accesorio con control de volumen, el control de volumen del radio quedará inoperante y el control de volumen del accesorio selecciona el volumen del radio.

10.4.2.9

Bloqueo de control de canal con accesorio

Este campo permite que el "control del canal" de accesorio anule y bloquee el control del canal del radio.

Esta función se aplica en base a la amplitud de radio.

NOTA:

Este campo no se debe permitir si el micrófono RMN5067 está en uso, ya que este micrófono no tiene perilla de control del canal.

Solo se accede: cuando el radio admite modelos/opciones diferentes.

Se admiten las siguientes selecciones:

Ninguno

Ambos controles del canal del radio y del accesorio pueden seleccionar los canales de radio.

Bloquear solo radio

Cuando está conectado un accesorio con control de canal, el control de canal del radio quedará inoperante y el control de canal del accesorio selecciona los canales de radio.

10.4.2.10

Micrófono activo para PTT de radio

En este campo se selecciona el micrófono que está activo cuando se presiona el botón PTT.

Esta función se aplica en base a la amplitud de radio.

IMPORTANTE:

Esta configuración del campo no es compatible con accesorios de terceros. Cualquier cambio en la configuración se debe realizar a través de su desarrollador de accesorios.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Mic del radio

El micrófono interno del radio estará activo.

Mic RSM

El micrófono y altavoz remoto (RSM) estará activo.

El micrófono interno del radio proporciona funcionamiento de contingencia si no está disponible un RSM cuando el usuario oprime el botón PTT.

Cuando el radio esté conectado a un adaptador vehicular (VA) que tiene un micrófono conectado a su Puerto de micrófono móvil (MMP), ese micrófono estará activo.

Micrófono inalámbrico

El micrófono inalámbrico se activará.

El micrófono interno del radio proporciona funcionamiento de contingencia si no está disponible un micrófono inalámbrico cuando el usuario presiona el botón PTT.

10.4.2.11

Micrófono activo para PTT de RSM

En este campo se selecciona el micrófono que está activo cuando se presiona el botón PTT en el micrófono y altavoz remoto (RSM).

Esta función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Mic del radio

El micrófono interno del radio estará activo.

Mic RSM

El RSM permanecerá activo.

El micrófono interno del radio proporciona funcionamiento de contingencia si no está disponible un RSM cuando el usuario oprime el botón PTT.

Cuando el radio esté conectado a un adaptador vehicular (VA) que tiene un micrófono conectado a su puerto del micrófono móvil (MMP), ese micrófono estará activo.

Micrófono inalámbrico

El micrófono inalámbrico se activará.

El micrófono interno del radio proporciona funcionamiento de contingencia si no está disponible un micrófono inalámbrico cuando el usuario presiona el botón PTT.

10.4.2.12

Habilitación de bloqueo de pantalla táctil

Este campo le permite activar la opción de desbloqueo y bloqueo de la pantalla táctil.

10.4.2.13

Activación del bloqueo de los botones laterales y de la rejilla del altavoz

Este campo activa la función de bloqueo para los botones de la parte superior lateral, la parte central lateral, la parte inferior lateral y la rejilla del altavoz del radio.

NOTA:

Los botones programados con las funciones de control de voz ViQi y socio virtual ViQi permanecen desbloqueados.

Para iniciar esta función, encienda y apague el botón Bloquear teclado/controles o el switch de alternación Bloquear teclado/controles. Esta función se aplica en base a la amplitud de radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.4.3

Cabezal de control

Esta sección permite ver o modificar las configuraciones relacionadas con el cabezal de control múltiple a una configuración del transceptor.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.4.3.1

Brillo de encendido del cabezal de control

Esta función permite que cada cabezal de control se encienda con el brillo seleccionado previamente o con el brillo mínimo.

Si el usuario anterior seleccionó un brillo mínimo o superior, el cabezal de control se enciende con el mismo brillo.

Cada cabezal de control se enciende al menos con el brillo mínimo. Si el brillo previamente seleccionado por el usuario de cualquier cabezal de control es igual al mínimo, entonces ese cabezal de control se encenderá con el brillo mínimo. Si el brillo previamente seleccionado por el usuario de cualquier cabezal de control está por encima del mínimo, entonces ese cabezal de control se encenderá con el último brillo seleccionado por el usuario.

NOTA:

Este campo no está disponible si el **Radio secundario** se selecciona en el campo **Radio doble: selección de radio**.

Último modo (predeterminado)

El cabezal de control se enciende y mantiene el último brillo seleccionado.

Mínimo

El cabezal de control se enciende con el brillo mínimo si se encontraba en **Modo oscuro** o mantiene el nivel en el que estaba antes.

10.5

Disposición del personal

La **Disposición del personal** le permite al usuario ver o definir la funcionalidad relacionada con la función disposición del personal. Estas configuraciones se aplican según la amplitud de radio en los canales habilitados de responsabilidad del personal.

Cuando el suscriptor recibe un comando de informe de disposición del personal (PAR) o de evacuación (PAR) por un canal de voz o de datos, el equipo de emergencia recibirá una señal visible y un tono audible. Cuando el personal de emergencia presione el PTT, el radio transmitirá una respuesta de confirmación (“Ack”) para informar al Comandante de incidentes que el personal recibió el comando.

NOTA:

Las configuraciones de Disposición del personal deben definirse según la Personalidad convencional individual. Consulte los campos Personalidad convencional, Tipo de señalización de incidente, Registro de responsabilidad del personal y Tipo de voz de Tx.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.5.1

Selección de la Lista de CA

Este campo permite seleccionar la Consolidación de acción entre 0 y 16 para la Lista de disposición del personal.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

ADVERTENCIA:

Este campo debe hacer referencia a una consolidación de la acción donde **Tipo de acción** esté configurado en **Disposición del personal**.

10.5.2

Nombre de la Lista de disposición del personal

Este campo permite crear un nombre reconocible para la lista actual de disposición del personal.

Se selecciona la Lista de alertas de disposición del personal en el campo Selección de lista de disposición del personal del Sistema convencional o de troncalización.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.6

Consolidación de la acción

La **Consolidación de la acción** permite ver y definir secuencias específicas de acciones del radio, conocidas como Acciones consolidadas. Dentro de una acción consolidada, estas acciones individuales pueden estar diseñadas para ejecutarse (en el radio) una por una en un orden específico. Se pueden crear acciones consolidadas múltiples. Entonces, es posible que sea más fácil ejecutar una secuencia de acciones consolidadas con un esfuerzo mínimo de parte del usuario.

**IMPORTANTE:**

Cuando el radio se enciende, cualquier acción consolidada asignada a la posición actual del Selector de respuesta se ejecuta.

No importa si la acción consolidada se completa o se cancela, o si hay cambios requeridos en el canal/modo de la acción, el radio siempre vuelve a su canal/modo original.

Una vez iniciada, una acción consolidada puede cancelarse; sin embargo, las acciones individuales por lo general se producen tan rápido que la probabilidad de terminar cualquier parte de la acción es casi imposible.

- Una acción consolidada puede terminarse presionando el botón Inicio, en el menú SALIR, presionando el botón PTT (siempre que el modo Dirección pública no esté activo) o activando el Modo de emergencia.
- El Patrón de relé, el Tipo de sirena o el Informe GPS son las primeras acciones en abrirse y, por lo tanto, son prácticamente inmediatas.

**NOTA:**

El usuario del radio puede ejecutar una acción consolidada con la selección Consolidación de acción definida en el Selector de respuesta o una pulsación de botón.

Se recomienda que la posición "0" del Selector de respuesta se asigne a una acción consolidada que cambia todos los patrones de relé, tonos de sirena, informes GPS, cambios de modo y estados directos a un estado "No asignado" o Todo desactivado. También es recomendable asignar esta acción a una pulsación de botón.

10.6.1

General (Consolidación de la acción)

En la sección **General** de la **Consolidación de la acción**, se incluyen los siguientes campos:

10.6.1.1

Tipo de acción

Este campo determina el tipo de consolidación de la acción actual que se utilizará.

Están disponibles las siguientes selecciones:

General

La consolidación de la acción se aplica a Ingresar acción en Geocerca de misión crítica.

Salir de la Geocerca

La consolidación de la acción se aplica a Salir de la acción o Ingresar acción en Geocerca de misión crítica.

Disposición del personal

La consolidación de la acción se aplica a la Selección de lista de CA en Disposición del personal o Ingresar acción en Geocerca de misión crítica.

Socios virtuales

La consolidación de la acción se aplica cuando el radio recibe una alerta del socio virtual desde el sistema.

ViQi: Socios virtuales

La consolidación de la acción se aplica cuando el radio recibe una alerta del socio virtual desde el sistema.

10.6.1.2**Acción permitida en selector de respuesta**

La aplicación recupera y permite ver la disponibilidad de la Acción consolidada actual para la asignación en el Selector de respuesta.

Si se configura cualquier ID de acción (registro/fila) en **Modo** para la actual Acción consolidada, entonces este campo se desmarcará, lo cual indicará que el Selector de respuesta no está disponible para la Acción consolidada actual. Si el campo está marcado, significa que el selector de respuesta está disponible para la acción consolidada actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes y el campo [Tipo de acción en la página 153](#) está configurado en **Control**.

10.6.1.3**Color de luz de fondo**

Este campo permite seleccionar una luz de fondo cuando se activa la Acción consolidada.

Se admiten las siguientes opciones:

- Desactivado
- Rojo
- Ámbar
- Verde

10.6.1.4**Nombre de acción consolidada**

Este campo permite definir nombres reconocibles para la acción consolidada actual.

Este campo también se usa como alias de alerta de Disposición del personal para resaltar el texto en la pantalla cuando la Consolidación de acción es un tipo de acción Disposición del personal.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

**NOTA:**

Se pueden usar caracteres, números, espacios y caracteres especiales.

Se pueden utilizar hasta 14 caracteres.

Ejemplos: Traffic Stop, In Pursuit, #510

10.6.2

Lista de acciones de consolidación (Consolidación de la acción)

La sección **Lista de acciones de consolidación**.

10.6.2.1

ID de acción

En este campo se selecciona el Tipo de acción para el ID de acción (registro/fila) de la Acción consolidada actual.

Se pueden definir varios ID de acción (cambios de estado y modo directos) en una sola acción consolidada. Los distintos ID acción permiten que el radio envíe automáticamente un Estado directo al modo Radio correspondiente. Cuando se definen distintos ID de acción, cada acción se ejecuta en un orden descendente. El usuario puede ejecutar una acción consolidada con la selección Consolidación de acción definida en el Selector de respuesta o una pulsación del botón.

Ejemplo: Este ejemplo muestra una consolidación de acción que contiene varios ID de acción. En este caso, el radio tiene tres canales (Troncalización de 800 MHz, Troncalización VHF y Convencional ASTRO) y el objetivo es la transmisión amplia y automática del estado **En escena** en los tres canales desde la misma acción consolidada.

Mesa 38: Ejemplos

Configuración de ID de acción:	Configuración de ID de acción adicional:	Acción del radio
Fila 1 = "Modo"	Modo en el canal de troncalización de 800 MHz deseado	El radio cambia al modo deseado
Fila 2 = "Estado directo"	Estado directo en "En escena"	El radio transmite el estado en el modo deseado
Fila 3 = "Modo"	Modo en el canal de troncalización VHF deseado	El radio cambia al modo deseado
Fila 4 = "Estado directo"	Estado directo en "En escena"	El radio transmite el estado en el modo deseado
Fila 5 = "Modo"	Modo en canal ASTRO convencional deseado	El radio cambia al modo deseado
Fila 6 = "Estado directo"	Estado directo en "En escena"	El radio transmite el estado en el modo deseado
Fila 7 = "Modo"	Modo en el canal de troncalización de 800 MHz deseado	El radio cambia al modo deseado

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Estado directo

Transmite un estado para la acción consolidada actual. La selección Índice para la Acción consolidada actual (registro/fila) determina qué Estado directo se transmite.

- Cuando funciona en Modo convencional, la selección de número de índice se correlaciona con el mismo Número de estado en la Lista de alias de estado convencional. Solo hay una Lista de alias de estado para las comunicaciones convencionales; por lo tanto, los números de estado de la Lista de alias de estado se aplican en todas las Personalidades convencionales.

- Cuando esté en el modo Troncalización, la selección de número Índice se correlaciona con el mismo Número de estado en la Lista de alias de estado del modo Troncalización. La troncalización permite una Lista de alias de estado por Sistema de troncalización, por lo tanto, Texto de estado puede variar con el mismo Número de estado según el Sistema de troncalización.

Modo

Provoca que el radio cambie el canal/modo como parte de la Acción consolidada actual. Las selecciones de Zona y Canal determinan los modos reales disponibles para el usuario. Una vez que se cierra la acción consolidada, el radio vuelve al modo (zona/canal) en que estaba funcionando el radio justo antes de que se abriera la acción consolidada.

NOTA:

Una vez que se cierra la acción consolidada, el radio vuelve al modo (zona/canal) en que estaba funcionando el radio justo antes de que se abriera la acción consolidada.

Mensaje directo

Hace que el radio transmita el mensaje que se define en la Lista de alias de mensaje convencional o de troncalización como parte de la acción consolidada actual.

Anuncio de voz

Hace que el radio reproduzca un anuncio de voz designado como parte de la acción consolidada actual.

Mensaje de texto

Permite definir un mensaje de texto, que se muestra cuando se activa la Acción consolidada actual.

Nivel de potencia de transmisión

Hace que el radio cambie el nivel de potencia de transmisión como parte de la acción consolidada actual.

Alerta seleccionable de silenciar sitio

Hace que el radio silencie la alerta seleccionable del sitio como parte de la acción consolidada actual.

10.6.2.2

Índice

En este campo se selecciona el Estado o Mensaje que se transmitirá de manera automática para el ID de acción actual (registro/fila) de la Acción consolidada actual.

El usuario puede ejecutar una Acción consolidada con la selección Consolidación de acción definida en el Selector de respuesta o en una pulsación del botón, en la activación de la entrada/salida Unidad del suscriptor para la Geocerca de misión crítica, o en el comando EVAC/PAR de Disposición del personal.

IMPORTANTE:

- Cuando está en modo convencional, esta selección de número de índice se correlaciona con el mismo número de estado en la Lista de alias de estado convencional. Solo hay una Lista de alias de estado para las comunicaciones convencionales; por lo tanto, los números de estado de la Lista de alias de estado se aplican en todas las Personalidades convencionales.
- Cuando esté en el modo Troncalización, esta selección de número Índice se correlaciona con el mismo Número de estado en la Lista de alias de estado del modo Troncalización. La troncalización permite una Lista de alias de estado por Sistema de troncalización; por lo tanto, Texto de estado puede variar con mismo Número de estado según el Sistema de troncalización.

Ejemplo: Este ejemplo muestra una consolidación de acción que contiene varios ID de acción. En este caso, el radio tiene tres canales (Troncalización de 800 MHz, Troncalización VHF y Convencional ASTRO) y el objetivo es la transmisión amplia y automática del estado **En escena** en los tres canales desde la misma acción consolidada.

Mesa 39: Ejemplos

Configuración de ID de acción:	Configuración de ID de acción adicional:	Acción del radio
Fila 1 = "Modo"	Modo en el canal de troncalización de 800 Mhz deseado	El radio cambia al modo deseado
Fila 2 = "Estado directo"	Estado directo en "En escena"	El radio transmite el estado en el modo deseado
Fila 3 = "Modo"	Modo en el canal de troncalización VHF deseado	El radio cambia al modo deseado
Fila 4 = "Estado directo"	Estado directo en "En escena"	El radio transmite el estado en el modo deseado
Fila 5 = "Modo"	Modo en canal ASTRO convencional deseado	El radio cambia al modo deseado
Fila 6 = "Estado directo"	Estado directo en "En escena"	El radio transmite el estado en el modo deseado
Fila 7 = "Modo"	Modo en el canal de troncalización de 800 Mhz deseado	El radio cambia al modo deseado

NOTA:

Una vez que se cierra la acción consolidada, el radio vuelve al modo (zona/canal) en que estaba funcionando el radio justo antes de que se abriera la acción consolidada.

Solo se accede: cuando el campo ID de acción para el registro o la fila actual está configurado en **Estado directo**,

y cuando el campo Tipo de acción se configura en **General**,

y cuando el campo ID de acción para el registro o la fila actual está configurado en **Estado directo**, o **Mensaje directo**,

y cuando el campo Tipo de acción se configura en **General**,

y cuando el radio admite modelos y opciones diferentes.

10.6.2.3

Zona

En este campo se selecciona el cambio de zona para el ID de acción (registro/fila) actual de la Acción consolidada actual.

Una vez que se selecciona Zona, debe seleccionarse el Canal para el registro o la fila actual. El usuario puede ejecutar una Acción consolidada con la selección Consolidación de acción definida en el Selector de respuesta o en una pulsación del botón, en la activación de la entrada/salida Unidad del suscriptor para la Geocerca de misión crítica.

ADVERTENCIA:

Las zonas de la Interfaz de sitio remoto (RSI) no son válidas y no se pueden seleccionar (zonas con el modo RSI activado).

Solo se accede: Cuando el campo [ID de acción en la página 155](#) para el registro o la fila actual se establece en **Modo**, y el campo [Tipo de acción en la página 153](#) se selecciona en **General** o **Control**, y cuando el radio admite modelos/opciones diferentes.

10.6.2.4

Canal

En este campo se selecciona el cambio de Canal para el ID de acción (registro/fila) actual de la Acción consolidada actual.

La selección de Zona para el registro o la fila actual debe elegirse antes de definir este canal.

Solo se accede: cuando el campo ID de acción para el registro o la fila actual se establece en **Modo**, y cuando el campo Zona para el registro o la fila actual no está no asignado, y cuando el campo Tipo de acción se selecciona en **General** o **Control**, y cuando el radio admite modelos/opciones diferentes.

10.6.2.5

Archivo de audio de alerta

Este campo permite seleccionar el archivo de Anuncio de voz Motorola (*.MVA) de la misma forma que la alerta de disposición del personal actual (registro/fila) de la lista la disposición del personal.

La indicación de alerta se reproduce cuando el radio recibe un comando de Evacuación (EVAC) o de Informe de disposición del personal (PAR) desde un comandante de incidentes.

Solo se accede: Cuando [Tipo de acción en la página 153](#) está en **General**, **Salir de Geocerca** o **Disposición del personal**, y el campo [ID de acción en la página 155](#) para el registro/fila actual está establecido en **Anuncio de voz** y el radio admite modelos y opciones diferentes.

10.6.2.6

Intervalo de alerta

Este campo permite que el usuario del radio seleccione la cantidad de tiempo entre las alertas de repetición de disposición del personal.

Solo se accede: cuando [Tipo de acción en la página 153](#) esté en **General**, **Salir de Geocerca** o **Disposición del personal**, y cuando el campo [ID de acción en la página 155](#) para el registro o la fila actual se configura en **Anuncio de voz** y el radio admite modelos/opciones diferentes.

ADVERTENCIA:

En la Consolidación de acción actual, solo se permite 1 acción, que consiste en un rango de 1 a 254 o "Continuo".

Se admiten las siguientes selecciones:

255

Momentáneo

0

Continuo

Mesa 40: Rango

Mínimo	Máximo	Incrementos
1 segundo	254 segundos	1 segundo

10.6.2.7

Mensaje de texto

Este campo le permite ver o definir la mensajería de texto para el ID de acción actual (registro/fila) de la acción consolidada actual.

10.6.2.8

Nivel de potencia de transmisión

Si se selecciona el nivel de potencia de transmisión al entrar en Geocerca, el nivel de potencia cambia al especificado (alto o bajo).

Al salir de Geocerca, si el nivel de potencia de transmisión de la unidad de suscriptor se cambió en la entrada, vuelve al último nivel de potencia de transmisión seleccionado por el usuario.

Solo se accede: Cuando el campo [ID de acción en la página 155](#) para el registro/fila actual se establece en **Nivel de potencia de transmisión**, el [Tipo de acción en la página 153](#) está configurado como **General**, y el radio admite diferentes modelos y opciones.

Se admiten las siguientes selecciones:

Cambiar a bajo

Permite cambiar el nivel de potencia de transmisión a bajo.

Cambiar a alto

Permite cambiar el nivel de potencia de transmisión a alto.

10.6.2.9

Alerta seleccionable de silenciar sitio

Si la alerta seleccionable del sitio de silenciar está seleccionada en el campo ID de acción al ingresar a la Geocerca, la unidad de suscriptor (SU) silencia la alerta seleccionable del sitio actual.

Al salir de la Geocerca, si la SU silenció anteriormente una alerta seleccionable del sitio debido a acciones de entrada, debe anular el silencio de la alerta seleccionable del sitio.

Solo se accede: Cuando el campo [ID de acción en la página 155](#) del registro o la fila actual se establece en **Silenciar alerta seleccionable del sitio**, y el [Tipo de acción en la página 153](#) está configurado en **General**, y el radio admite modelos/opciones diferentes.

10.6.2.10

Estrategia de error

En este campo se selecciona la Estrategia de error para el ID de acción (registro/fila) de la Acción consolidada actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Salir en caso de error

En caso de error, el radio sale inmediatamente de la acción consolidada actual sin ejecutar el resto de las acciones.

Continuar en caso de error

En caso de error, el radio no sale de la acción consolidada; por lo tanto, se ejecuta el resto de las acciones.

10.7

Geocerca de misión crítica

La **Geocerca de misión crítica** le permite al usuario ver y definir los Perfiles de geocerca de misión crítica, incluidos el Nombre de alias de la geocerca, la Prioridad, el Radio (metros), la Acción de entrada, la Acción de salida, la Longitud y la Latitud.

La función Geocerca de misión crítica define un perímetro virtual para un área geográfica real.

Las coordenadas de geocerca (latitud/longitud) y las acciones de entrada o salida asociadas se programan directamente en el radio.

Una vez configurado, el radio realiza de forma interna comprobaciones y acciones de la Geocerca cada vez que recibe una nueva ubicación de GPS, que es a cada segundo.

Geocerca de misión crítica tiene dos formas en un área geográfica: **Círculo** y **Polígono**. Si solo hay una coordenada en la Tabla de coordenadas, se considerará como el centro de la Geocerca de círculo y podrá ingresar manualmente el radio.

Si solo hay dos coordenadas en la tabla Coordenadas, entonces la 1.^a coordenada se considera el centro de la Geocerca de círculo, y la distancia entre la 1.^a y la 2.^a coordenadas se calcula automáticamente y se considera el radio.

Si existen de 3 a 100 coordenadas en la Tabla de coordenadas, esto se considerará como la Geocerca de polígono y dicha Geocerca estará conectada mediante las coordenadas uno por uno.

**NOTA:**

Puede editar los perfiles de Geocerca de misión crítica de forma manual.

Puede hacer clic en **Importar archivo de mapa**  para importar el archivo de Google Earth con formato KML (Lenguaje de marcado de keyhole) o KMZ (Lenguaje de marcado de keyhole comprimido) desde el disco local en la Geocerca de misión crítica.

Puede hacer clic en **Exportar archivo del mapa**  para exportar el perfil de Geocerca de misión crítica actual al disco local con formato KML.

Solo se accede: Cuando el radio admite diferentes modelos y opciones y cuando el campo Activación de ubicación está **Activado**.

Consulte [Función Geocerca de misión crítica](#)

10.7.1

Nombre de alias de la Geocerca

Este campo le permite ver o definir nombres reconocibles para la Geocerca de misión crítica actual.

Solo se accede: Cuando el radio admite modelos y opciones diferentes y cuando el campo Activación de ubicación está activado.

10.7.2

Prioridad de la

Este campo le permite determinar la Geocerca que se ejecuta cuando hay más de un área de geocerca superpuesta.

**IMPORTANTE:**

- La prioridad de cada perfil de Geocerca debe ser mutuamente exclusiva.

Mesa 41: Rango

Mínimo	Máximo	Incrementos
1 (la prioridad más baja)	100 (la prioridad más alta)	1

Solo se accede: Cuando el radio admite modelos y opciones diferentes y cuando el campo Activación de ubicación está activado.

10.7.3

Radio de la (metros)

Este campo le permite determinar el radio de la Geocerca de círculo.

**IMPORTANTE:**

- **Geocerca de círculo:** Solo aparecen una o dos coordenadas en la tabla de coordenadas. Geocerca de círculo con una sola coordenada: la coordenada se considera como el centro de la Geocerca de círculo y puede ingresar manualmente el radio.
Geocerca de círculo con solo dos coordenadas: la primera coordenada se considera como el centro de esta Geocerca de círculo. La distancia entre la primera y la segunda coordenada se calcula automáticamente y se considera como el radio de esta Geocerca de círculo.
- **Geocerca de polígono:** Aparecen tres o más coordenadas en la Tabla de coordenadas. El radio se configura como **Desactivado** automáticamente cuando la Geocerca tiene forma de polígono.

Mesa 42: Rango

Rango	Incrementos	Desactivado
De 10 a 500 000 (metros)	1 (metro)	No se usa radio para la Geocerca de círculo

Solo se accede: Cuando el radio admite modelos y opciones diferentes y cuando el campo Activación de ubicación está activado.

10.7.4

Acción de entrada de la

En este campo se selecciona la Consolidación de la acción que se utilizará con la Geocerca de misión crítica actual para el evento activado cuando la SU esté entrando de una Geocerca.

Se admiten las siguientes selecciones:

Sin asignar

No se activará ninguna acción de entrada.

Consolidaciones de la acción disponibles

Toda consolidación de la acción cuyo tipo de acción NO sea **Control**.

Solo se accede: Cuando el radio admite modelos y opciones diferentes, y cuando el campo Activación de ubicación está activado.

10.7.5

Acción de salida de la

En este campo se selecciona la Consolidación de la acción que se utilizará con la Geocerca de misión crítica actual para el evento activado cuando la SU esté saliendo de una Geocerca.

Se admiten las siguientes selecciones:

Sin asignar

No se activará ninguna acción de salida.

Consolidaciones de la acción disponibles

Toda consolidación de la acción cuyo tipo de acción es **Salir de la Geocerca**.

Solo se accede: Cuando el radio admite modelos y opciones diferentes y cuando el campo Activación de ubicación está activado.

10.7.6

Longitud

Este campo le permite ingresar un valor de longitud para una coordenada.

Se admiten las siguientes selecciones:

Mínimo

-180.0000000.

Máximo

180.0000000.

Solo se accede: Cuando el radio admite modelos y opciones diferentes, y cuando el campo Activación de ubicación está activado.

10.7.7

Latitud

Este campo le permite ingresar un valor de latitud para una coordenada.

Se admiten las siguientes selecciones:

Mínimo

-90.0000000.

Máximo

90.0000000.

Solo se accede: Cuando el radio admite modelos y opciones diferentes, y cuando el campo Activación de ubicación está activado.

10.8

Control portátil

Las secciones **Botones**, **Intercambiado**, **Elementos del menú**, **Teclado**, **Botones del control de la llave inteligente** o **Botones accesorios** se utilizan para ver o seleccionar la funcionalidad de botón programable de amplitud de radio para los modos de comunicación convencional y de troncalización.

**IMPORTANTE:**

Para las secciones **Botones**, **Botones del control de la llave inteligente** y **Botones accesorios**, la funcionalidad del botón se selecciona y opera de forma independiente para cada uno de los dos modos de comunicación por radio. Es decir, cuando el radio funciona en un canal convencional, solo las funciones convencionales seleccionadas están disponibles para el usuario del radio. De la misma forma, cuando el radio funciona en un canal de troncalización, solo las funciones de troncalización seleccionadas están disponibles para el usuario del radio. Para el **Teclado**, la funcionalidad del botón se selecciona una vez y funciona para los dos modos de comunicaciones del radio.

**NOTA:**

Algunas selecciones dependen del modelo/la opción por radio.

10.8.1

Botones (Control portátil)

La sección **Botones** permite al usuario ver o seleccionar la funcionalidad del botón programable de amplitud de radio para los modos de comunicación convencional y de troncalización. La funcionalidad del botón se selecciona y funciona independientemente para cada uno de los dos modos de comunicación por radio. Es decir, cuando el radio funciona en un canal convencional, solo las funciones convencionales seleccionadas están disponibles para el usuario. De la misma forma, cuando el radio funciona en un canal de troncalización, solo las funciones de troncalización seleccionadas están disponibles para el usuario.

**NOTA:**

Algunas selecciones dependen del modelo/la opción por radio.

Se admiten los siguientes campos:

10.8.1.1

Botón superior (Convencional)

Selecciona la función del botón superior.

Estas selecciones se aplican mientras funciona en los modos de comunicación convencionales o de troncalización, como se indica en la tabla a continuación.

**ADVERTENCIA:**

El usuario no debe duplicar una función en múltiples controles, es decir, en más de un botón, en más de un switch o en un botón y un switch. Esto puede provocar el mal funcionamiento de la radio.

Consulte [Selecciones de botones \(superior y lateral\) en la página 165](#) para ver una lista de selecciones compatibles:

10.8.1.2

Botón superior (Troncalización)

Selecciona la función del botón superior.

Consulte [Botón superior \(Convencional\) en la página 163](#) para ver notas y advertencias.

Consulte [Selecciones de botones \(superior y lateral\) en la página 165](#) para ver una lista de selecciones compatibles:

10.8.1.3

Botón sup. lateral (Convencional)

Selecciona la función del botón sup. lateral.

Consulte [Botón superior \(Convencional\) en la página 163](#) para ver notas y advertencias.

Consulte [Selecciones de botones \(superior y lateral\) en la página 165](#) para ver una lista de selecciones compatibles:

10.8.1.4

Botón sup. lateral (Troncalización)

Selecciona la función del botón sup. lateral.

Consulte [Botón superior \(Convencional\) en la página 163](#) para ver notas y advertencias.

Consulte [Selecciones de botones \(superior y lateral\) en la página 165](#) para ver una lista de selecciones compatibles:

10.8.1.5

Botón cen. lateral (Convencional)

Selecciona la función del botón cen. lateral.

Consulte [Botón superior \(Convencional\)](#) en la página 163 para ver notas y advertencias.

Consulte [Selecciones de botones \(superior y lateral\)](#) en la página 165 para ver una lista de selecciones compatibles:

10.8.1.6

Botón cen. lateral (Troncalización)

Selecciona la función del botón cen. lateral.

Consulte [Botón superior \(Convencional\)](#) en la página 163 para ver notas y advertencias.

Consulte [Selecciones de botones \(superior y lateral\)](#) en la página 165 para ver una lista de selecciones compatibles:

10.8.1.7

Botón inf. lateral (Convencional)

Selecciona la función del botón inf. lateral.

Consulte [Botón superior \(Convencional\)](#) en la página 163 para ver notas y advertencias.

Consulte [Selecciones de botones \(superior y lateral\)](#) en la página 165 para ver una lista de selecciones compatibles:

10.8.1.8

Botón inf. lateral (Troncalización)

Selecciona la función del botón inf. lateral.

Consulte [Botón superior \(Convencional\)](#) en la página 163 para ver notas y advertencias.

Consulte [Selecciones de botones \(superior y lateral\)](#) en la página 165 para ver una lista de selecciones compatibles:

10.8.1.9

Botón con rejilla de altavoz (convencional)

Selecciona la función para el botón con rejilla de altavoz.

Consulte [Botón superior \(Convencional\)](#) en la página 163 para ver notas y advertencias.

Consulte [Selecciones de botones \(superior y lateral\)](#) en la página 165 para ver una lista de selecciones compatibles:

10.8.1.10

Botón con rejilla de altavoz (troncalización)

Selecciona la función para el botón con rejilla de altavoz.

Consulte [Botón superior \(Troncalización\)](#) en la página 163 para ver notas y advertencias.

Consulte [Selecciones de botones \(superior y lateral\)](#) en la página 165 para ver una lista de selecciones compatibles:

10.8.1.11

Nombre de botones

Este campo indica el nombre del botón programable.

10.8.1.12

Botones (convencionales)

Este campo determina la función seleccionada para el botón programable correspondiente en el modo convencional.

Consulte [Selecciones de botones](#) para ver una lista de selecciones compatibles.

10.8.1.13

Botones (troncalización)

Este campo determina la función seleccionada para el botón programable correspondiente en el modo de troncalización.

Consulte [Selecciones de botones](#) para ver una lista de selecciones compatibles.

10.8.1.14

Selecciones de botones (superior y lateral)

La sección Control portátil le permite al usuario seleccionar la función de los botones superior y lateral del radio portátil.

Mesa 43: Funciones superior y lateral del radio portátil

Selección de botones:	Esta selección solo es válida en RadioCentral o está disponible para el usuario:	Las selecciones están disponibles en RadioCentral según la disponibilidad en el hardware actual:
Reproducción de audio en la página 183	Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección de RadioCentral.	<ul style="list-style-type: none"> • Teclado o pantalla dual • Pantalla superior • Pantalla frontal y botones de menú o navegación • Pantalla frontal y botones de menú • Accesorio • Botones del llavero inteligente
Activación / desactivación del repliegue automático o de canal	Cuando el campo Habilitación del repliegue de canal está activado.	<ul style="list-style-type: none"> • Teclado o pantalla dual • Pantalla superior • Pantalla frontal y botones de menú o navegación • Pantalla frontal y botones de menú • Accesorio • Botones del llavero inteligente

Selecciones de botones:	Esta selección solo es válida en RadioCentral o está disponible para el usuario:	Las selecciones están disponibles en RadioCentral según la disponibilidad en el hardware actual:
Baliza en la página 183	Cuando el radio admite modelos y opciones diferentes.	<ul style="list-style-type: none"> • Teclado o pantalla dual • Pantalla superior • Pantalla frontal y botones de menú o navegación • Pantalla frontal y botones de menú • Accesorio • Botones del llavero inteligente
En blanco en la página 183	(Diseñado para controles que no se usan).	<ul style="list-style-type: none"> • Teclado o pantalla dual • Pantalla superior • Pantalla frontal y botones de menú o navegación • Pantalla frontal y botones de menú • Accesorio • Botones del llavero inteligente
Redirección de audio Bluetooth en la página 183	<p>Cuando el campo Activación de Bluetooth en la página 138 está Activado.</p> <p> IMPORTANTE: Esta selección se debe establecer en Convencional y Troncalización en el mismo botón; por lo tanto, cuando se selecciona Convencional, RadioCentral configura automáticamente la selección del botón de Troncalización correspondiente.</p>	<ul style="list-style-type: none"> • Teclado o pantalla dual • Pantalla superior • Pantalla frontal y botones de menú o navegación • Accesorio • Botones del llavero inteligente
Configuración de Bluetooth en la página 183	<p>Cuando el campo Activación de Bluetooth en la página 138 está Activado.</p> <p> IMPORTANTE: Esta selección se debe establecer en Convencional y Troncalización en el mismo botón; por lo tanto, cuando se selecciona Convencional, RadioCentral configura automáticamente la selección del botón de Troncalización correspondiente.</p>	<ul style="list-style-type: none"> • Teclado o pantalla dual • Pantalla frontal y botones de menú o navegación • Accesorio

Selección de botones:	Esta selección solo es válida en RadioCentral o está disponible para el usuario:	Las selecciones están disponibles en RadioCentral según la disponibilidad en el hardware actual:
PTT de audífono Bluetooth en la página 184	<p>Cuando el campo Activación de Bluetooth en la página 138 está Activado.</p> <p> IMPORTANTE: Esta selección se debe establecer en Convencional y Troncalización en el mismo botón; por lo tanto, cuando se selecciona Convencional, RadioCentral configura automáticamente la selección del botón de Troncalización correspondiente.</p>	<ul style="list-style-type: none"> • Teclado o pantalla dual • Pantalla superior • Pantalla frontal y botones de menú o navegación • Accesorio • Botones del llavero inteligente
Activación / desactivación de Bluetooth en la página 184	<p>Cuando el campo Activación de Bluetooth en la página 138 está Activado.</p> <p> IMPORTANTE: Esta selección se debe establecer en Convencional y Troncalización en el mismo botón; por lo tanto, cuando se selecciona Convencional, RadioCentral configura automáticamente la selección del botón de Troncalización correspondiente.</p>	<ul style="list-style-type: none"> • Teclado o pantalla dual • Pantalla superior • Pantalla frontal y botones de menú o navegación

10.8.1.14.1

Activación/desactivación del repliegue automático de canal

En un canal compatible con el repliegue de canal, al presionar este botón, se activa el repliegue automático de canal. Si mantiene presionado este botón, se desactivará la función y el radio volverá al último canal seleccionado por el usuario.

10.8.1.14.2

Reproducción de audio

La reproducción de audio reproduce el audio seleccionado.

Esta función está disponible para el modo de comunicaciones convencionales o de troncalización.

10.8.1.14.3

Baliza

La pulsación de este botón permite comprobar los detalles de cualquier señal periódica de emergencia recibida recientemente.

Esta función está disponible para el modo de comunicaciones convencionales o de troncalización.

10.8.1.14.4

En blanco

Seleccione esta función para un botón de radio que no esté en uso.

Oirá un pitido cuando pulse este botón. Esta función está disponible para el modo de comunicaciones convencionales o de troncalización.

10.8.1.14.5

Redireccionamiento de audio Bluetooth

La pulsación de este botón permite recorrer el audio del altavoz activo entre un altavoz interno del radio portátil o un altavoz externo (RSM/DRSM) y los altavoces inalámbricos del accesorio Bluetooth.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.1.14.6

Configuración de Bluetooth

La pulsación de este botón proporciona una lista de estado/información de Bluetooth y la opciones de Bluetooth.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

Se incluyen las siguientes funciones:

Estado de Bluetooth

Permite activar o desactivar la funcionalidad de dispositivo Bluetooth del radio Bluetooth.

Dispositivo activo

Permite ver una lista de todos los dispositivos Bluetooth activos (asociados) actualmente.

Altavoz Bluetooth

Permite activar y desactivar el altavoz de un dispositivo Bluetooth.

10.8.1.14.7

PTT de audífono Bluetooth

La pulsación de este botón funciona como botón PTT principal o adicional para un audífono inalámbrico Bluetooth; por lo tanto, la pulsación de este botón permite activar el radio mientras utiliza el micrófono del audífono Bluetooth como fuente de audio.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.1.14.8

Activación/desactivación de Bluetooth

La pulsación de este botón activa y desactiva las capacidades de Bluetooth del radio.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.1.14.9

Alerta de llamada

La pulsación de este botón permite transmitir una Alerta de llamada para modos Convencionales o una Alerta/localización de llamada para modos Troncalización.

NOTA:

La Alerta/localización de llamada permite a un despachador o a la persona que llama al radio avisar a un usuario (o grupo de usuarios) sobre una llamada perdida.

Los radios receptores se destinan en base a información de radio y sistema administrada por los contactos y los ID de llamada en las listas de llamadas frecuentes del radio. Puede ingresar o seleccionar directamente los ID de llamada en la Lista de uso frecuente del canal.

El radio receptor responde al usuario con tonos de alerta y alertas visuales. La alerta visual (LED destellante) persiste hasta que se reinicia el radio.

10.8.1.14.10

Respuesta de llamada

La pulsación de este botón le permite responder (y cortar) una llamada telefónica (Convencional o de troncalización) o una llamada privada recibida. (Sólo troncalización).

10.8.1.14.11

Anuncio de canal

La pulsación de este botón permite escuchar el archivo de audio de Anuncio de voz asignado al canal/modo actual del radio.

IMPORTANTE:

Los archivos de audio se asignan a los canales desde el campo Anuncio de canal [Anuncio de canal en la página 681](#) de Asignación de canal de zona.

10.8.1.14.12

Bajar canal

La pulsación de este botón en el radio portátil APX™ 3000 le permite desplazarse hacia abajo a través de los canales del radio.

Para subir y bajar rápidamente con una [Duración de pulsación larga de tecla en la página 148](#) del botón. Si sigue desplazándose después de alcanzar el último canal de la lista, esta completa un ciclo y vuelve al primer canal. Los canales se definen en la página de canales de la ventana Asignación de canal de zona.

10.8.1.14.13

Repliegue de canal manual/reversión del repliegue de canal

En un canal compatible con el repliegue de canal, al presionar este botón, el radio cambiará al canal de repliegue asignado, independientemente de las condiciones de red actuales y el estado de activación. Si mantiene presionado este botón, el radio volverá al último canal seleccionado por el usuario.

10.8.1.14.14

Subir canal

La pulsación de este botón en el radio portátil APX™ 3000 permite desplazarse hacia arriba a través de los canales del radio.

Para subir y bajar rápidamente con una [Duración de pulsación larga de tecla en la página 148](#) del botón. Si sigue desplazándose después de alcanzar el último canal de la lista, esta completa un ciclo y vuelve al primer canal. Los canales se definen en la página de canales de la ventana Asignación de canal de zona.

10.8.1.14.15

Contactos

La pulsación de este botón permite ver/editar los Contactos del canal actual del radio.

Los Contactos se deben programar en la Lista de llamadas unificada. Los contactos conforman los miembros de las listas de llamadas frecuentes. Los miembros/Contactos de la Lista de uso frecuente se pueden seleccionar, lo que permite realizar tipos de llamadas como Llamadas telefónicas, Llamadas selectivas, Alertas de llamada y Localizadoras a radios individuales o a grupos de radios.

**IMPORTANTE:**

Esta función no está disponible para radios portátiles que solo tienen una pantalla superior.

10.8.1.14.16

Tono de DTMF

Cuando se presiona este botón, el usuario puede enviar código de DTMF del valor de DTMF asignado.

Hay 12 tonos de DTMF; es decir, tono de DTMF 0 a 9, tono de DTMF* y tono de DTMF #. Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.1.14.17

ID dinámico

La pulsación de este botón permite la entrada al modo de edición de ID dinámico, que permite al usuario del radio ver o editar el ID individual del radio o el ID principal de MDC para el sistema ASTRO o MDC actual.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales.

10.8.1.14.18

Prioridad dinámica

La pulsación de este botón permite seleccionar la asignación de exploración Prioridad dinámica.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales.

10.8.1.14.19

Quitar el supervisor de emergencia

La pulsación de este botón se selecciona en el caso del botón central lateral o del botón de accesorios con 1 punto. El control de salida de emergencia está configurado como “Supervisor”.

Esta función está disponible mientras funciona en el modo de comunicaciones de troncalización.

10.8.1.14.20

Emergencia

La pulsación de este botón permite ingresar y también salir de la operación de modo de emergencia.

Consulte también [Duración de pulsación corta para emergencias en la página 147](#) y las funciones de [Duración de pulsación larga para emergencias en la página 148](#). Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

ADVERTENCIA:

Cuando el campo Radio dual - Selección de radio está configurado en **Radio principal** o **Radio secundario**, esta selección no es válida para el botón superior lateral (morado) de a

10.8.1.14.21

Información

La pulsación de este botón le permite recuperar y ver información básica del radio, como la información relacionada con la IP y la asignación de control de botones/switches, así como ver o modificar el ID de software.

Esta función se aplica solo cuando funciona en el Sistema convencional ASTRO. Esta es una función solo para radios portátiles.

IMPORTANTE:

Tras modificar el ID de software, se cambia el Nombre de usuario del radio para el servidor de Servicio de registro automático o para el inicio de sesión en un servidor de Servicios de red unificados (UNS) de Autenticación de usuario. Tras editar el Nombre de usuario de este modo, los espacios del PIN/la contraseña y el ID de unidad quedan en blanco. Por lo tanto, esto solo puede usarse cuando el servidor espera un PIN o una contraseña en blanco y el usuario no desea usar el ID de unidad.

Esta función no está disponible para radios portátiles que solo tienen una pantalla superior.

10.8.1.14.22

Dirección de protocolo de Internet (IP)

La pulsación de este botón le permite recuperar y ver (en la pantalla del radio) la Dirección IP, el nombre y el estado del dispositivo actual del radio.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.1.14.23

Bloquear teclado/controles

La pulsación de este botón le permite bloquear (o desbloquear) el teclado del radio (cuando esté disponible).

Es posible tener una funcionalidad de bloqueo de control adicional (para todos los modelos) cuando el campo [Activación de bloqueo de interruptor giratorio](#) o el campo [Activación del bloqueo de los botones laterales y de la rejilla del altavoz en la página 151](#) está **Habilitado**.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

IMPORTANTE:

Cuando la Activación de bloqueo del switch giratorio está **Activada** en los radios con un switch giratorio, esta función también bloquea la [Selecciones giratorias en la página 198](#) (zona o canal) actualmente en funcionamiento del radio, incluso cuando el switch giratorio se mueve a otra posición.

Cuando la Activación de bloqueo de botones laterales está **Activada**, esta función también bloquea el botón superior lateral, el botón central lateral y el botón inferior lateral del radio.

10.8.1.14.24

Luz/Invertir (Pantalla)

La función Luz de la pulsación de duración corta de este botón le permite encender y apagar las luces que iluminan el switch giratorio, la pantalla, la pantalla superior y el teclado del radio.

La función Girar (la pantalla) [Duración de pulsación larga de tecla en la página 148](#) de este botón le permite retroceder y avanzar la perspectiva de visualización de la pantalla superior del radio en 180 grados. Esto resulta especialmente útil para visualizar la pantalla superior mientras el radio permanece en el soporte del portador.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

IMPORTANTE:

El [Tiempo de luz en pantalla en la página 237](#) determina la cantidad de tiempo que la luz permanece encendida; cuando se programa en **Infinito** una nueva pulsación del botón apaga las luces.

Para todos los modelos de radios portátiles, las funciones Iluminar y Girar (la pantalla) también se aplican a un Accesorio portátil que cuenta con una pantalla, como el Micrófono y altavoz remoto de pantalla (DRSM).

10.8.1.14.25

Ubicación

La pulsación de este botón le permite determinar su ubicación actual (latitud, longitud, hora y fecha) y también la distancia y azimut con respecto a otra ubicación.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

IMPORTANTE:

Si el campo [Activación de ubicación seleccionable por el usuario en la página 121](#) de Radio en general está **Activado**, también puede encender o apagar la funcionalidad de ubicación en áreas exteriores/Sistema de posicionamiento global (GPS) para todos los canales de comunicaciones Convencionales o de troncalización con ubicación/GPS activado.

10.8.1.14.26

LTE

Al presionar este botón, se activan y se desactivan las capacidades de datos de banda ancha de LTE del radio.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

**IMPORTANTE:**

La selección de este botón solo se puede realizar cuando se selecciona un canal que está configurado para la Banda ancha de LTE. Cuando se selecciona un canal que no es LTE, se oculta el menú.

Un canal es compatible con LTE cuando su campo [Tipo del perfil de datos en la página 376](#) de Perfil de datos está configurado como **Convencional y banda ancha** o **Troncalización y banda ancha** o **Solo banda ancha**.

10.8.1.14.27

Borrar Hombre caído

La pulsación de este botón le permite borrar (desactivar) la alarma de modo de emergencia de Hombre caído.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.1.14.28

Mensaje

La pulsación de este botón le permite seleccionar desde la Lista de alias de mensaje del canal/modo actual.

**IMPORTANTE:**

Mientras funciona en el modo de comunicaciones convencionales con señalización MDC/ASTRO/DVRS, se utiliza la Lista de alias de mensaje convencional.

Mientras funciona en el modo de comunicaciones de troncalización, se utiliza la Lista de alias de mensaje del sistema de troncalización seleccionada para la Personalidad de troncalización actual.

10.8.1.14.29

Monitor

La pulsación de este botón permite escuchar casi o toda la actividad del portador en el canal actual del radio.

La selección del campo [Tipo de monitor en la página 402](#) determina si solo se ignora temporalmente el requerimiento del canal receptor de una coincidencia codificada de Línea privada (PL) o si se ignora el requerimiento de PL y el silenciador de la portadora. Esta función está disponible mientras funciona en el modo de comunicaciones convencionales.

**IMPORTANTE:**

Cuando se mantiene oprimido el botón Monitor durante el [Tiempo de habilitación del seguro en la página 403](#), el radio se bloquea en el modo de monitor continuo. El radio permanece bloqueado en el modo de monitor hasta que se vuelve a oprimir brevemente el botón Monitor. La iniciación de Emergencia, Teléfono, Rastreo o una Alerta de llamada o Llamada selectiva también cancela el modo de monitor continuo. Consulte también el campo [Tono de activación de seguro en la página 402](#).

10.8.1.14.30

MS01–MS13

Estas asignaciones de botones permiten programar los botones con las combinaciones usadas con mayor frecuencia o de canal y de zona deseadas.

La programación y el uso de estos botones son muy similares a la programación y al uso de los botones preprogramados del radio de un auto. Es decir, una pulsación larga programa un botón con la zona y los canales actuales del radio y luego, una vez programados, la pulsación corta de ese botón dirige el radio a la zona y al canal programados. Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

IMPORTANTE:

Los [Duración de pulsación corta en la página 147](#) y [Duración de pulsación larga de tecla en la página 148](#) están programados.

El modelo APX™ 3000 portátil solo es compatible con MS01 y MS02.

10.8.1.14.31

Línea privada múltiple (MPL)

La pulsación de este botón permite acceder a un listado de las Listas de MPL disponibles.

IMPORTANTE:

Cada lista se representa mediante un nombre reconocible . El usuario del radio puede seleccionar las configuraciones de Alias/PL deseadas. Esta función está disponible mientras funciona en el modo de comunicaciones convencionales.

10.8.1.14.32

Eliminación de canal no deseado

La pulsación de este botón permite eliminar temporalmente el canal de Rastreo activo actual cuando genera ruido de operador indeseado en forma continua.

Esto se logra oprimiendo el botón Borrar ruidos no deseados mientras está en el Modo rastreo detectado en el miembro de la lista de exploración que se va a eliminar. Esta función se aplica a la Lista de rastreo actual mientras funciona en el modo de comunicaciones convencionales o de troncalización.

IMPORTANTE:

Cambiar a otro canal en el selector de canales del radio, encender y apagar el modo de rastreo o apagar y encender el radio traen de regreso de manera eficaz al canal del miembro de lista de rastreo eliminado temporalmente a un estado explorado de manera activa.

No es posible Borrar ruidos no deseados:

- Para un canal de miembro de la Lista de rastreo Prioridad nro. 1 o Prioridad nro. 2.
- Cuando el campo [Tipo de miembro de Tx de voz designada en la página 696](#) se encuentra configurado en **Canal seleccionado** y la frecuencia de Tx del canal Rastreo detectado es la misma que la frecuencia de Tx del canal actualmente seleccionado del radio.
- Si la lista de rastreo actual no contiene al menos dos miembros antes de que ocurra la acción Borrar ruidos no deseados.

10.8.1.14.33

Un toque 1–4

Estas cuatro pulsaciones de botón programadas por separado permiten iniciar una función específica con una sola pulsación de botón.

Estas pulsaciones de botón le permiten ingresar funciones de Un toque como Estado, Mensaje, Llamada selectiva/privada, Alerta de llamada/Localizador, Teléfono, Acceso a repetidor (RAC) y

Acceso al botón MDC RTT con el toque de un botón. Es posible programar de uno a cuatro botones para cada Personalidad convencional y uno a cuatro botones para cada Sistema de troncalización.

IMPORTANTE:

Oprimir un botón Un toque mientras el radio está en la función seleccionada hace que el radio anule esta función.

10.8.1.14.34

Teléfono

La pulsación de este botón permite iniciar el modo Teléfono mientras funciona en el modo Comunicaciones convencionales o de troncalización.

10.8.1.14.35

Canal prioritario PTT

Si el radio está funcionando actualmente en el modo Rastreo y hay un Miembro de lista de rastreo del Miembro de prioridad 1 en la Lista de rastreo del canal actual, entonces cuando se pulsa este botón, el radio se activa en el canal del Miembro de lista de rastreo de prioridad 1, por lo tanto, se permite una transmisión de comunicaciones de voz; de lo contrario, el radio bloquea la transmisión y se emite el Tono de prohibición para hablar.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales.

IMPORTANTE:

El funcionamiento del Canal prioritario PTT es de exclusividad mutua con las funciones Intercomy Dirección pública (PA).

Para todos los radios APX, la operación Canal prioritario PTT no realizará operación de envío/ llamada cuando esté activa cualquiera de las siguientes funciones en el radio:

- Emergencia
- Alerta de llamada
- Llamada selectiva
- Llamada reciente
- Teléfono
- Bloqueo automático/Deshabilitado
- TMS
- Estado/mensaje
- Sirena
- Dirección pública (PA)
- Lista de llamadas unificada
- Solicitud de regeneración de clave
- Tono de evacuación

Para el cabezal de control móvil O3, Canal prioritario PTT no realizará operación de envío con Teclado de uso frecuente. Esto se debe a que el cabezal de control móvil O3 no admite la pulsación de múltiples botones entre el botón lateral, la tecla programable de menú, la tecla de flecha o el teclado. Esta limitación también afectarán a otras funciones que necesitan dos o más pulsaciones de botón al mismo tiempo.

El radio maneja la primera vez que se presiona y suelta el PTT, e ignora la segunda vez que se presiona y suelta el PTT cuando las dos acciones son de diferente tipo; en otras palabras:

- Cada vez que el radio ya está transmitiendo debido a que se presionó un botón PTT principal, el radio ignora la pulsación del botón Canal prioritario PTT.
- Por el contrario, cada vez que el radio ya está transmitiendo en el canal de Miembro de lista de rastreo de Prioridad 1, debido a que se presionó un botón Canal prioritario PTT, el radio no ignora la pulsación del botón PTT principal.

El botón Canal prioritario PTT no debe usarse con el canal DVRS.

10.8.1.14.36

Perfiles de radio

La pulsación de este botón permite seleccionar uno de los Perfiles de radio programados.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.1.14.37

Llamadas recientes

La pulsación de este botón permite acceder a la información de las últimas llamadas entrantes y realizadas de los siguientes tipos de llamadas: Alerta de llamada, llamadas selectivas, llamadas privadas y llamadas telefónicas (solo salientes).

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.1.14.38

Solicitud de regeneración de clave

La pulsación de este botón permite transmitir una solicitud de Regeneración de clave inalámbrica (OTAR) a la consola del despachador (KMF o KMC) mientras funciona en el modo Comunicaciones convencionales o de troncalización.

IMPORTANTE:

Para MDC OTAR (comunicaciones convencionales), el protocolo de solicitud se determina mediante el campo [Modo Solicitud de regeneración de clave en la página 308](#).

Para ASTRO OTAR (comunicaciones convencionales o Troncalización), el campo [Solicitud de regeneración de clave seleccionable por el usuario en la página 327](#) debe estar **Activado**, y el protocolo de solicitud se determina mediante el campo [Nivel de seguridad de Tx OTAR en la página 325](#).

10.8.1.14.39

Emergencia remota

Presionar este botón activa la función de Activación remota de emergencia, de modo que un usuario autorizado para codificar este comando puede hacer que un radio de destino inicie la función de Emergencia sin intervención del usuario de destino.

NOTA:

La emergencia remota solo es compatible con los canales convencionales ASTRO y los canales de troncalización ASTRO 25.

10.8.1.14.40

Botón 1 de acceso al repetidor (RAB1)

La pulsación de este botón permite enviar un código de acceso al repetidor en forma manual.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales.

10.8.1.14.41

Botón 2 de acceso al repetidor (RAB2)

La pulsación de este botón permite enviar un código de acceso al repetidor en forma manual.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales.

10.8.1.14.42

Solicitud de reprogramación

La pulsación de este botón permite enviar una solicitud al despachador para la reasignación de la Reagrupación dinámica.

El despachador/consola define y transmite de regreso las funciones y configuraciones disponibles de este grupo de conversación de reagrupación dinámica. El radio cambia automáticamente a la Zona

de reagrupación dinámica y al Canal de reagrupación dinámica. Esta función está disponible mientras funciona en el modo de comunicaciones de troncalización.

**IMPORTANTE:**

Para los Sistemas de troncalización, esta zona y este canal se definen a través de la configuración de un campo de [Grupo de conversación de troncalización en la página 680](#) de la Asignación de canal de zona como **DYN**. La Personalidad de troncalización que se considera en este escenario debe tener este mismo [Sistema en la página 558](#) de troncalización seleccionado en el campo Sistema. Por lo tanto, para cada Sistema de troncalización se puede definir solo un canal de reagrupación dinámica.

10.8.1.14.43

Solicitud para hablar (RTT)

La pulsación de este botón permite enviar un paquete de señalización Solicitud para hablar (RTT) al despachador o la consola que solicita la capacidad de transmitir voz.

Esta selección se aplica solo cuando funciona en un sistema MDC en el modo de comunicaciones convencionales.

10.8.1.14.44

Rastreo

La pulsación corta de este botón permite activar y desactivar el Modo de rastreo para el canal actual del radio.

La pulsación larga de este botón permite el ingreso al modo Edición de lista de rastreo para la Lista de rastreo del canal actual del radio, lo que, a su vez, permite agregar/eliminar canales de miembros de la lista de exploración individuales y modificar la prioridad de rastreo.

10.8.1.14.45

Seleccionar llamada

La pulsación de este botón permite al usuario del radio transmitir una llamada convencional.

10.8.1.14.46

Visualización/búsqueda de sitio

La pulsación de duración corta del botón **Visualización de sitio** le permite ver momentáneamente el ID del sitio actual y su indicador de intensidad de señal recibida (RSSI) correspondiente en la pantalla del radio.

La pulsación de duración larga del botón **Búsqueda de sitio** activa una búsqueda de Sitio para la operación SmartZone. Esta función está disponible mientras funciona en el modo de comunicaciones de troncalización.

10.8.1.14.47

Bloqueo/desbloqueo de sitio

La pulsación de duración corta del botón **Sitio** le permite ver el estado de bloqueo del sitio actual de troncalización.

La pulsación de duración larga del botón **Bloqueo/desbloqueo de sitio** le permite alternar entre el modo de bloqueo y desbloqueo cuando se usa la opción SmartZone.

**IMPORTANTE:**

Bloquear un sitio inhibe el roaming a otro sitio en un sistema de área amplia. Esta función está disponible mientras funciona en el modo de comunicaciones de troncalización.

10.8.1.14.48

Estado

La pulsación de este botón le permite seleccionar desde la Lista de alias de estado del canal/modo actual.

NOTA:

Para su comodidad, como parte de esta función, en la pantalla se muestra inicialmente la última llamada de estado reconocida o el primer estado de la lista. Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

IMPORTANTE:

Mientras funciona en el modo de comunicaciones convencionales con señalización MDC/ASTRO/DVRS, se utiliza la Lista de alias de estado convencional.

Mientras funciona en el modo de comunicaciones de troncalización, se utiliza la Lista de alias de estado del Sistema de troncalización seleccionada para la Personalidad de troncalización actual.

10.8.1.14.49

Comunicación directa/Directo

La pulsación de este botón permite activar o desactivar el modo Directo/Comunicación directa para el perfil de opciones del canal actual.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales.

10.8.1.14.50

Grupo de conversación

La pulsación de este botón permite cambiar entre el Grupo de conversación preestablecido y otro de la Lista de grupos de conversación actual de la Personalidad convencional.

Todas las Personalidades convencionales que usan la misma Lista de grupos de conversación cambian automáticamente al grupo de conversación seleccionado.

10.8.1.14.51

Servicio de mensajería de texto (TMS)

La Pulsación de duración corta del botón **TMS** permite acceder al modo TMS del radio, que se ve en la pantalla del radio.

La Pulsación de duración corta de este botón permite ingresar directamente al **Buzón** de TMS, para ver los mensajes de texto recibidos y acceder a los ingresos de [Mensaje de texto rápido en la página 375](#) programados (que se ven en la pantalla del radio). Consulte también la función Servicio de mensajería de texto del Sistema de troncalización o Sistema convencional.

10.8.1.14.52

Terceros

La pulsación de este botón permite iniciar la funcionalidad en accesorios de terceros como, por ejemplo, Sirenas Whelen® compatibles.

ADVERTENCIA:

Cuando el campo Radio dual [Selección de radio](#) está configurado en **Radio principal** o **Radio secundario**, esta selección debe realizarse para la opción Convencional y para Troncalización, donde corresponda, para que se considere válida.

10.8.1.14.53

Consulta TMS

La pulsación de este botón dirige al usuario directamente a las entradas programadas de Mensaje de consulta de la función Servicio de mensajería de texto.

Entonces, el usuario puede seleccionar en la lista de entradas predefinidas y transmitir fácilmente una Consulta con un esfuerzo mínimo.

**NOTA:**

Una consulta de TMS permite especificar la información en una plantilla de consulta de formato previo y enviarla como un mensaje a un servidor de consulta. Luego, el servidor responde con un mensaje de texto que contiene la información solicitada.

Cuando el Sistema de troncalización, el Sistema convencional o la función Servicio de mensajería de texto están activados en el canal actual del radio, y cuando el Servicio de consulta TMS está disponible actualmente en el radio.

10.8.1.14.54

Texto rápido TMS

La pulsación de este botón dirige al usuario directamente a las entradas de Mensaje de texto rápido de la función Servicio de mensajería de texto.

Entonces, el usuario puede seleccionar en la lista de entradas predefinidas y transmitir fácilmente un Mensaje de texto rápido con un esfuerzo mínimo.

Con el sistema de troncalización o el sistema convencional, la función de servicio de mensajería de texto se habilita en el canal actual del radio.

10.8.1.14.55

No programado

Seleccione esta función para un botón de radio que no esté en uso.

Oirá un pitido cuando pulse este botón. Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.1.14.56

ViQi: Socio virtual

Este botón permite el acceso a la función Socio virtual.

Esta función solo está disponible para la troncalización si está configurada en la operación de **LMR** en [ViQi: Modo de Socio virtual en la página 116](#). Esta función está disponible para los modos de comunicación convencional y de troncalización si está configurado en **Desactivado** y banda ancha en [ViQi: Modo de Socio virtual en la página 116](#).

10.8.1.14.57

ViQi: Control de voz

Este botón permite el acceso a la función Control de voz y Socio virtual.

Cuando el radio no está en la función Socio virtual, al presionar este botón se activa la función de control de voz. Cuando el usuario ingresa a la función Socio virtual a través de un comando de control de voz, las siguientes pulsaciones del botón se aplicarán solo a la función Socio virtual. Una vez que finalice la sesión de socio virtual, este botón se aplicará al control de voz.

Esta función está disponible para el modo de comunicaciones convencionales o de troncalización.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.8.1.14.58

Usuario

La pulsación de este botón permite al usuario iniciar sesión en un servidor específico de Servicio de registro automático o un servidor de servicios de red unificados (UNS) de Autenticación de usuario con la combinación adecuada de nombre de usuario, PIN/contraseña e ID de la unidad de inicio de sesión de usuario.

Puede seleccionar nombres de usuario e ID de unidad en las entradas de la Lista de datos del usuario programada o puede ingresar manualmente nombres de usuario, PIN/contraseña e ID de unidad desde el teclado del radio.

ADVERTENCIA:

Esta función es válida solo cuando el canal actual del radio (Convencional o de Troncalización) tiene el campo de referencia de perfil de datos de [Modo ARS en la página 382](#) configurado en **Servidor**.

10.8.1.14.59

Silencio de voz

La pulsación de este botón permite al usuario de la radio activar y desactivar la funcionalidad Silencio de voz para canales habilitados con la Alerta de usuario de llamada entrante.

Cuando Silencio de voz está activado, el radio permanece silenciado para todas las llamadas de comunicaciones convencionales y las llamadas de grupo de conversación de troncalización asociadas. La Alerta/localización de llamada grupal e individual silencia el radio para el tono de alerta; además, cuando Silencio de voz está activo, el radio silencia las llamadas de radio a radio individuales como, por ejemplo, las Llamadas selectivas/privadas y las llamadas de Interconexión (modo Teléfono).

10.8.1.14.60

Tono de ajuste de volumen

La pulsación de este botón hace que el radio se comporte de una de las siguientes maneras.

Cuando el campo [Compensación de tono de ajuste de volumen en la página 108](#) está **Desactivado**, la pulsación de este botón permite escuchar el nivel de volumen actual del radio para las transmisiones entrantes, lo que desilencia el altavoz del radio. Cuando se oprime este botón, el tono suena en el ajuste actual del radio mientras se mantiene oprimido el botón; a medida que el usuario ajusta el volumen, el nivel de audio del tono se ajusta en forma simultánea.

10.8.1.14.61

Wi-Fi activado/desactivado

La pulsación de este botón permite activar y desactivar la capacidad de Wi-Fi.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.1.14.62

Banco de zona abajo

La pulsación de este botón permite bajar (desplazarse en orden descendente) a través de los Bancos de zona del radio.

Cuando el campo Operación de banco de zona se configura en **Mejorado**, es posible desplazarse más rápido (en orden ascendente) con una [Duración de pulsación larga de tecla en la página 148](#) del botón.

**NOTA:**

El botón programable [Banco de zona arriba en la página 197](#) permite subir (desplazarse en orden ascendente) a través de los Bancos de zona del radio. Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

**IMPORTANTE:**

Cuando se asigne Banco de zona arriba o Banco de zona abajo a un botón programable, [Selección de zona en la página 207](#) se asigna automáticamente al interruptor de alternación de tres posiciones A/B/C.

Entonces, el control giratorio solo se puede configurar en la selección [Selección de canal en la página 205](#). Solo hay disponibles 16 canales por zona cuando se utiliza el control giratorio como selector de canales.

10.8.1.14.63

Banco de zona arriba

La pulsación de este botón permite subir (desplazarse en orden ascendente) a través de los Bancos de zonas del radio.

Cuando el campo Operación de banco de zona se configura en **Mejorado**, es posible desplazarse más rápido (en orden ascendente) con una [Duración de pulsación larga de tecla en la página 148](#) del botón.

**NOTA:**

El botón programable [Banco de zona abajo en la página 196](#) permite bajar (desplazarse en orden descendente) a través de los Bancos de zona del radio. Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

**IMPORTANTE:**

Cuando se asigne Banco de zona arriba o Banco de zona abajo a un botón programable, [Selección de zona en la página 207](#) se asigna automáticamente al interruptor de alternación de tres posiciones A/B/C.

Entonces, el control giratorio solo se puede configurar en la selección [Selección de canal en la página 205](#). Solo hay disponibles 16 canales por zona cuando se utiliza el control giratorio como selector de canales.

10.8.1.14.64

Bajar zona

La pulsación de este botón permite bajar a través de las Zonas en el radio.

Para subir y bajar rápidamente con una [Duración de pulsación larga de tecla en la página 148](#) del botón. Si sigue desplazándose después de alcanzar la primera zona de la lista, esta completa un ciclo y vuelve a la última zona. Las zonas se definen en la ventana Asignación de canal de zona.

**NOTA:**

En ciertos radios portátiles, las zonas también pueden agruparse en bancos de zona, donde es posible seleccionar bancos individuales con la pulsación del botón [Banco de zona arriba en la página 197](#) o [Banco de zona abajo en la página 196](#).

10.8.1.14.65

Subir zona

La pulsación de este botón permite bajar a través de las Zonas en el radio.

Para subir y bajar rápidamente con una [Duración de pulsación larga de tecla en la página 148](#) del botón. Si sigue desplazándose después de alcanzar la última zona de la lista, esta completa un ciclo y vuelve a la primera zona. Las zonas se definen en la Página de zona de la ventana Asignación de canal de zona. Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

**NOTA:**

En ciertos radios portátiles, las zonas también pueden agruparse en bancos de zona, donde es posible seleccionar bancos individuales con la pulsación del botón [Banco de zona arriba en la página 197](#) o [Banco de zona abajo en la página 196](#).

10.8.1.15

Botones de control de la llave inteligente (convencional)

Este campo permite seleccionar la función de los botones de control de la llave inteligente (SKF) que se pueden programar.

**ADVERTENCIA:**

No se debe duplicar una función en múltiples controles, es decir, en más de un botón, en más de un conmutador o en un botón y un conmutador. Esto puede provocar el mal funcionamiento de la radio.

Consulte [Selecciones de botones](#) para ver la lista de selecciones compatibles.

10.8.1.16

Botones de control de la llave inteligente (troncalización)

Este campo permite seleccionar la función de los botones de control de la llave inteligente (SKF) que se pueden programar.

**ADVERTENCIA:**

No se debe duplicar una función en múltiples controles, es decir, en más de un botón, en más de un conmutador o en un botón y un conmutador. Esto puede provocar el mal funcionamiento de la radio.

Consulte [Selecciones de botones](#) para ver la lista de selecciones compatibles.

10.8.2

Switches

Esta sección permite asignar funcionalidad a los switches giratorios, de alternación, multifunción y concéntricos del radio.

La asignación de la Perilla multifunción (MFK) y giratoria se aplica mientras el radio funciona en el modo de comunicación de convencional o de troncalización. Para los interruptores de alternación y concéntricos del radio, hay selecciones separadas para los modos convencional y de troncalización.

**NOTA:**

Estas selecciones dependen de los modelos o las opciones según el radio.

10.8.2.1

Selecciones giratorias

Selecciona la función del switch giratorio para el modo de comunicaciones convencionales y de troncalización.

**ADVERTENCIA:**

No debe duplicar una función en múltiples controles, es decir, en más de un botón, en más de un interruptor o en un botón y un interruptor. Esto puede provocar el mal funcionamiento de la radio.

Se admiten las siguientes selecciones:

En blanco en la página 205

(Diseñado para controles que no se usan.)

Canal/selección secundaria (Selección de canal en la página 205)

Cuando el radio admite modelos y opciones diferentes.

ADVERTENCIA:

Esta selección no se puede configurar simultáneamente en el switch giratorio, en los switches concéntricos y en el switch de alternación.

Selección de zona/sistema (Selección de zona en la página 207)

Cuando el radio admite modelos y opciones diferentes.

ADVERTENCIA:

Esta selección no se puede configurar simultáneamente en el switch giratorio, en los switches concéntricos y en el switch de alternación.

Esta no es una selección válida cuando [Banco de zona arriba en la página 197](#) o [Banco de zona abajo en la página 196](#) está configurado en un botón programable.

NOTA:

Estas selecciones dependen del modelo o la opción según el radio y se aplican a los modos de comunicación convencional y de troncalización.

10.8.2.2

Posición A del switch concéntrico (convencional)

Selecciona la función para la posición A del conmutador concéntrico del radio portátil.

Estas asignaciones se pueden seleccionar para los modos de comunicación convencional o de troncalización.

ADVERTENCIA:

No se debe duplicar una función en múltiples controles, es decir, en más de un botón, en más de un conmutador o en un botón y un conmutador. Esto puede generar un mal funcionamiento del radio.

Consulte [Selecciones del interruptor en la página 202](#) para ver una lista de selecciones compatibles.

NOTA:

Estas selecciones dependen del modelo o la opción según el radio, y se aplican a los modos de comunicación convencional y de troncalización (excepto cuando se indica).

10.8.2.3

Posición A del switch concéntrico (troncalización)

Selecciona la función para la posición A del conmutador concéntrico del radio portátil.

ADVERTENCIA:

No se debe duplicar una función en múltiples controles, es decir, en más de un botón, en más de un conmutador o en un botón y un conmutador. Esto puede generar un mal funcionamiento del radio.

Consulte [Posición A del switch concéntrico \(convencional\) en la página 199](#) para ver notas y advertencias.

Consulte [Selecciones del interruptor en la página 202](#) para ver una lista de selecciones compatibles.

10.8.2.4

Posición B del switch concéntrico (convencional)

Selecciona la función de la posición B del switch concéntrico del radio portátil.

**ADVERTENCIA:**

No se debe duplicar una función en múltiples controles, es decir, en más de un botón, en más de un conmutador o en un botón y un conmutador. Esto puede generar un mal funcionamiento del radio.

Consulte [Posición A del switch concéntrico \(convencional\) en la página 199](#) para ver notas y advertencias.

Consulte [Selecciones del interruptor en la página 202](#) para ver una lista de selecciones compatibles.

10.8.2.5

Posición B del switch concéntrico (troncalización)

Selecciona la función para la posición B del switch concéntrico del radio portátil.

**ADVERTENCIA:**

No se debe duplicar una función en múltiples controles, es decir, en más de un botón, en más de un conmutador o en un botón y un conmutador. Esto puede generar un mal funcionamiento del radio.

Consulte [Posición A del switch concéntrico \(convencional\) en la página 199](#) para ver notas y advertencias.

Consulte [Selecciones del interruptor en la página 202](#) para ver una lista de selecciones compatibles.

10.8.2.6

Posición A del switch de alternación (convencional)

Selecciona la función para la posición A del conmutador de alternación del radio portátil.

**ADVERTENCIA:**

No se debe duplicar una función en múltiples controles, es decir, en más de un botón, en más de un conmutador o en un botón y un conmutador. Esto puede generar un mal funcionamiento del radio.

Consulte [Posición A del switch concéntrico \(convencional\) en la página 199](#) para ver notas y advertencias.

Consulte [Selecciones del interruptor en la página 202](#) para ver una lista de selecciones compatibles.

10.8.2.7

Posición A del switch de alternación (troncalización)

Selecciona la función para la posición A del conmutador de alternación del radio portátil.

**ADVERTENCIA:**

No se debe duplicar una función en múltiples controles, es decir, en más de un botón, en más de un conmutador o en un botón y un conmutador. Esto puede generar un mal funcionamiento del radio.

Consulte [Posición A del switch concéntrico \(convencional\) en la página 199](#) para ver notas y advertencias.

Consulte [Selecciones del interruptor en la página 202](#) para ver una lista de selecciones compatibles.

10.8.2.8

Posición B del switch de alternación (convencional)

Selecciona la función para la posición B del conmutador de alternación del radio portátil.

**ADVERTENCIA:**

No se debe duplicar una función en múltiples controles, es decir, en más de un botón, en más de un conmutador o en un botón y un conmutador. Esto puede generar un mal funcionamiento del radio.

Consulte [Posición A del switch concéntrico \(convencional\) en la página 199](#) para ver notas y advertencias.

Consulte [Selecciones del interruptor en la página 202](#) para ver una lista de selecciones compatibles.

10.8.2.9

Posición B del switch de alternación (troncalización)

Selecciona la función para la posición B del conmutador de alternación del radio portátil.

**ADVERTENCIA:**

No se debe duplicar una función en múltiples controles, es decir, en más de un botón, en más de un conmutador o en un botón y un conmutador. Esto puede generar un mal funcionamiento del radio.

Consulte [Posición A del switch concéntrico \(convencional\) en la página 199](#) para ver notas y advertencias.

Consulte [Selecciones del interruptor en la página 202](#) para ver una lista de selecciones compatibles.

10.8.2.10

Posición C del switch de alternación (convencional)

Selecciona la función para la posición C del conmutador de alternación del radio portátil.

**ADVERTENCIA:**

No se debe duplicar una función en múltiples controles, es decir, en más de un botón, en más de un conmutador o en un botón y un conmutador. Esto puede generar un mal funcionamiento del radio.

Consulte [Posición A del switch concéntrico \(convencional\) en la página 199](#) para ver notas y advertencias.

Consulte [Selecciones del interruptor en la página 202](#) para ver una lista de selecciones compatibles.

10.8.2.11

Posición C del switch de alternación (troncalización)

Selecciona la función para la posición C del conmutador de alternación del radio portátil.

**ADVERTENCIA:**

No se debe duplicar una función en múltiples controles, es decir, en más de un botón, en más de un conmutador o en un botón y un conmutador. Esto puede generar un mal funcionamiento del radio.

Consulte [Posición A del switch concéntrico \(convencional\) en la página 199](#) para ver notas y advertencias.

Consulte [Selecciones del interruptor en la página 202](#) para ver una lista de selecciones compatibles.

10.8.2.12

Selecciones del interruptor

Este tema enumera las selecciones de switch y cuándo las selecciones están disponibles para los usuarios.

Selecciones del interruptor:	Esta selección solo es válida en RadioCentral o está disponible para el usuario:
En blanco en la página 205	(Diseñado para controles que no se usan.)
Selección de canal en la página 205	<p>Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección de RadioCentral.</p> <p> ADVERTENCIA: Esta selección no se puede configurar simultáneamente en el switch giratorio, en el switch concéntrico y en el switch de alternación.</p> <p>Esta selección debe asignarse tanto para los modos de comunicación convencional como de troncalización y para todas las posiciones del interruptor seleccionado.</p> <p>Esto no es válido para el interruptor de dos posiciones o para el interruptor de alternación de tres posiciones, o en el interruptor concéntrico cuando Banco de zona arriba en la página 197 o Banco de zona abajo en la página 196 está configurado en un botón programable.</p> <p> IMPORTANTE: Cuando la Posición A del switch concéntrico convencional está configurada en Selección de canal, la Posición B del switch concéntrico convencional, y la Posición A y la Posición B del switch concéntrico de troncalización se configuran automáticamente en Selección de canal y pasan a ser de solo visualización. Por lo tanto, solo la Posición A del switch concéntrico convencional se puede modificar.</p> <p>Cuando la Posición A del switch de alternación convencional está configurada en Selección de canal, la Posición B y la Posición C del switch de alternación convencional, y la Posición A, la Posición B y la Posición C del switch de alternación de troncalización se configuran automáticamente en Selección de canal y pasan a ser de solo visualización. Por lo tanto, solo se puede modificar la Posición A del switch de alternación convencional.</p>
Bloquear teclado/controles en la página 205	Cuando el campo Activación de bloqueo de switch giratorio de Ergonomía del radio en general está activado (todos los modelos), cuando el campo Activación de bloqueo de botones laterales de Ergonomía del radio en

Selecciones del interruptor:	Esta selección solo es válida en RadioCentral o está disponible para el usuario:
	<p>general está activado (todos los modelos) o cuando el radio tiene un teclado (específico de cada modelo).</p> <p> ADVERTENCIA: Esta selección no se debe establecer al mismo tiempo en la posición A y la posición B del interruptor concéntrico, ni en todas las posiciones del interruptor de alternación; de lo contrario, los botones, los elementos del menú y la perilla giratoria quedan inoperables para el usuario.</p>
Desactivación de PL en la página 206	Cuando funciona en el modo de comunicaciones convencionales. Solo disponible para Convencional.
Rastreo en la página 206	<p>Para Convencional, cuando el Tipo de rastreo en la página 689 no está establecido en Rastreo de votación, cuando el campo Selección de lista de rastreo en la página 477 de la Personalidad convencional no está establecido en Ninguno y cuando el campo Rastreo automático en la página 479 de la Personalidad convencional está desactivado para el canal actual del radio.</p> <p>Para Troncalización, cuando el campo Selección de lista de rastreo en la página 578 de la Personalidad de troncalización no está establecido en Ninguno y cuando el campo Rastreo automático en la página 579 de la Personalidad de troncalización está Desactivado para el canal actual del radio.</p> <p> ADVERTENCIA: Esta selección no se puede programar simultáneamente en botones, switches ni elementos de menú; sin embargo, puede configurarse simultáneamente en los botones portátiles y accesorios.</p> <p> IMPORTANTE: Esta selección puede configurarse en el interruptor concéntrico convencional (solo una posición) o en el interruptor de alternación convencional (dos posiciones máximo), pero no en ambos. La misma restricción se aplica para los interruptores de troncalización.</p> <p>Esta selección puede configurarse simultáneamente en los switches concéntricos o de alternación convencional o de troncalización, considerando la restricción anterior.</p>
Programación de la lista de rastreo en la página 206	<p>Para Convencional, cuando el campo Selección de lista de rastreo en la página 477 de la Personalidad convencional no está establecido en Ninguno para el canal actual del radio.</p> <p>Para Troncalización, cuando el campo Selección de lista de rastreo en la página 578 de la personalidad de troncalización no está establecido en Ninguno para el canal actual del radio.</p>
Comunicación directa/Directo en la página 207	Cuando se opera en el modo de comunicación convencional y cuando el campo Directo/Comunicación directa en la página 440 de la Personalidad

Selecciones del interruptor:	Esta selección solo es válida en RadioCentral o está disponible para el usuario:
	<p>convencional está Activado para el canal actual del radio. Solo disponible para Convencional.</p> <p> ADVERTENCIA: Esta selección no se puede configurar simultáneamente en Botones, Interruptores ni Elementos de menú; sin embargo, puede configurarse simultáneamente en Botones portátiles y accesorios.</p> <p>Esta selección solo puede configurarse en un interruptor.</p>
Baja potencia de Tx en la página 207	<p>Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección de RadioCentral.</p>
No programado en la página 207	<p>(Diseñado para controles que no se usan.)</p>
Selección de zona en la página 207	<p>Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección de RadioCentral.</p> <p> ADVERTENCIA: Esta selección debe configurarse tanto para los modos de comunicación convencional como de troncalización y para todas las posiciones del interruptor seleccionado.</p> <p>Esta selección no se puede configurar simultáneamente en el switch giratorio, en el switch concéntrico y en el switch de alternación.</p> <p>Esta no es una selección válida para el interruptor concéntrico cuando Banco de zona arriba en la página 197 o Banco de zona abajo en la página 196 está configurado en un botón.</p> <p> IMPORTANTE: Cuando se asigne Banco de zona arriba o Banco de zona abajo a un botón programable, la Selección de zona se asigna automáticamente al switch de alternación de tres posiciones A/B/C.</p> <p>Cuando la Posición A del switch concéntrico convencional está configurada en Selección de zona, la Posición A y la Posición B del switch concéntrico de troncalización, y la Posición B del switch concéntrico convencional se configuran automáticamente en Selección de zona y pasan a ser de solo visualización. Por lo tanto, solo la Posición A del interruptor concéntrico convencional se puede modificar.</p> <p>Cuando la Posición A del interruptor de alternación convencional se establece en Selección de zona, las posiciones A, B y C del interruptor de alternación de troncalización y las posiciones B y C del interruptor de alternación convencional se establecen automáticamente en Selección de zona y pasan a ser de solo visualización. Por lo tanto, solo se puede modificar la Posición A del switch de alternación convencional.</p>

10.8.2.12.1

En blanco

Seleccione esta función para un switch de giratorio, concéntrico o de alternación, o para una función de perilla multifunción (MFK), que no esté en uso.

Esta función está disponible para el modo de comunicaciones convencionales o de troncalización.

10.8.2.12.2

Selección de canal

Esta selección del switch giratorio/de alternación o de la perilla multifunción (MFK) le permite cambiar el canal del radio.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

IMPORTANTE:

Cuando se define para un interruptor giratorio, solo los 16 primeros canales (consulte la página Canales) definidos para cada zona están disponibles.

Cuando se define para un interruptor de dos o tres posiciones, solo los dos o tres primeros canales (consulte la página Canales) definidos para cada zona están disponibles en el interruptor.

Cuando se selecciona para un interruptor de dos o tres posiciones, debe seleccionarse para los modos convencional y de troncalización, así como para todas las posiciones de dicho interruptor.

Esta selección solo puede configurarse en el switch giratorio del radio cuando **Banco de zona arriba** o **Banco de zona abajo** está configurado para un botón programable. Solo hay disponibles 16 canales por zona cuando se utiliza el interruptor giratorio como selector de canales.

Cuando se lo selecciona como la función principal de una MFK, la opción **Selección de volumen** debe seleccionarse como la función secundaria para que se la pueda considerar válida.

10.8.2.12.3

Borrar selección de Tx

Este switch de alternación permite desactivar las transmisiones seguras.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.2.12.4

Bloquear teclado/controles

Este switch de alternación permite bloquear (o desbloquear) el teclado del radio (cuando esté disponible).

Es posible tener una funcionalidad de bloqueo de control adicional (para todos los modelos) cuando el campo Activar bloqueo del switch giratorio o el campo Activar bloqueo de botones laterales está

Activado (consulte la Nota importante). Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

IMPORTANTE:

Cuando la Activación de bloqueo de switch giratorio está **Activada**, esta función también bloquea el canal del radio que está funcionando actualmente, aun cuando el switch giratorio se mueva a otra posición.

Cuando la Activación de bloqueo de botones laterales está **Activada**, esta función también bloquea el botón superior lateral, el botón central lateral y el botón inferior lateral del radio.

10.8.2.12.5

Silenciar

Este switch de alternación permite al usuario activar o desactivar determinados tonos del radio (por ejemplo, los tonos del teclado), según estén configurados por la selección Operación de tonos de silencio mejorada.

Esta función está disponible para el modo de comunicaciones convencionales o de troncalización.

10.8.2.12.6

Desactivación de PL

Este switch de alternación permite desactivar el silenciador de la portadora PL/DPL.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales.

10.8.2.12.7

Rastreo

Este switch de alternación permite seleccionar Listas de exploración, y activar y desactivar el Modo de exploración mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.2.12.8

Programación de la lista de rastreo

Este switch de alternación coloca el radio en el modo **Editar lista de rastreo**.

Mientras está en este modo de edición, se puede agregar/eliminar miembros de la Lista de rastreo individuales de la Lista de rastreo y modificar la prioridad de rastreo de cualquier miembro. Las comunicaciones por el aire no son posibles en el modo Editar lista de rastreo. Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

IMPORTANTE:

El botón lateral superior del radio se convierte automáticamente en el botón de selección designado mientras se edita un canal de la lista de rastreo. Esto solo se cumple mientras el radio funciona en este Modo de programación de lista de rastreo.

10.8.2.12.9

Selección de Tx segura

Este switch de alternación permite elegir las transmisiones con encryption (o sin encryption) seguras.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.2.12.10

Comunicación directa/Directo

Este switch de alternación permite activar o desactivar el modo Directo/Comunicación directa para el perfil de opciones del canal actual.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales.

10.8.2.12.11

Inhibición de Tx

Este switch de alternación permite desactivar todas las transmisiones del radio mientras funciona en el modo de comunicaciones convencionales o de troncalización.

IMPORTANTE:

Esta acción puede ser necesaria al ingresar en entornos peligrosos con alta sensibilidad a campos de RF, donde una transmisión de radio puede iniciar una explosión u otra reacción peligrosa.

NOTA:

Si intenta encender el radio mientras Inhibición de Tx está **Activado**, el radio genera un tono largo bajo de Prohibición para hablar, que indica que actualmente no se permiten transmisiones.

10.8.2.12.12

Inhibición de Tx desactivada

Este switch de alternación permite activar todas las transmisiones del radio mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.2.12.13

Baja potencia de Tx

Este switch del switch permite cambiar la potencia de transmisión de baja a alta y viceversa del radio con base en la amplitud de radio.

Una vez iniciada, esta configuración de baja potencia tiene prioridad por sobre todas las configuraciones individuales del [Nivel de potencia de transmisión en la página 436](#) de Personalidad convencional y del [Nivel de potencia de Tx en la página 528](#) del sistema de troncalización. La configuración de potencia del radio también cambiará a alta potencia en todo el radio cuando el switch se mueva a otra selección programada. Cuando se apaga y vuelve a encender el radio, se restablecen todos los canales del radio a sus ajustes de potencia programados.

10.8.2.12.14

No programado

Seleccione esta función para un interruptor de alternación que no esté en uso.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.2.12.15

Selección de zona

Esta selección del switch giratorio/de switch o de la perilla multifunción (MFK) le permite seleccionar una zona.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

IMPORTANTE:

Cuando se define para un interruptor, solo las primeras dos o tres zonas definidas en la Asignación de canal de zona están disponibles en el interruptor. Consulte también Banco de zonas, Banco de zona arriba y Banco de zona abajo.

Cuando se selecciona para un interruptor de dos o tres posiciones, debe seleccionarse para los modos convencional y de troncalización, así como para todas las posiciones de dicho interruptor.

Esta selección programa automáticamente el switch de alternación de tres posiciones A/B/C de la radio cuando **Banco de zona arriba** o **Banco de zona abajo** está configurado en un botón programable. Consulte también el concepto clave Banco de zona.

Cuando se lo selecciona como la función principal de una MFK, la opción **Selección de volumen** debe seleccionarse como la función secundaria para que se la pueda considerar válida.

10.8.2.12.16

Selección de volumen

Esta selección de perilla multifunción (MFK) permite al usuario del radio cambiar el volumen de esta.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

ADVERTENCIA:

Para el modo de doble función:

- Si la función principal de la MFK se asigna con **Selección de zona** o con **Selección de canal**, entonces la función secundaria debe asignarse con **Selección de volumen** para que se la pueda considerar válida.
- Si la función principal de la MFK se asigna con **Selección de volumen**, entonces la función secundaria debe asignarse con **Selección de zona** o con **Selección de zona** para que se la pueda considerar válida.

Para el modo de función única: Debe seleccionar **Selección de volumen** como la función principal y **En blanco** como la función secundaria para que se puedan considerar válidas.

10.8.3

Elementos del menú

La sección **Elementos del menú** le permite ver o elegir las selecciones que definen la funcionalidad o las funciones del menú disponibles en la pantalla del radio.

La funcionalidad del menú del radio se define y funciona de forma separada para cada uno de los dos modos de comunicaciones de radio: convencional y troncalización. Es decir, cuando el radio funciona en un canal convencional, solo están disponibles las funciones convencionales seleccionadas. De

la misma forma, cuando el radio funciona en un canal de troncalización, solo están disponibles las funciones de troncalización seleccionadas.

**IMPORTANTE:**

Algunas selecciones de elementos del menú se eliminan en forma automática de la columna de elementos del menú **Seleccionados** si la selección se duplica en Selecciones de botones o Selecciones de switch; sin embargo, algunas selecciones de elementos del menú pueden duplicarse para adaptarse a su preferencia o comodidad.

Los modelos portátiles APX™ 1000 1.5, APX™ 2000 1.5 y APX™ 4000Li 1.5 admiten un máximo de tres (3) selecciones de clave programables de menú (el límite normal es 24). Cuando se modifican los codeplugs de estos modelos en la aplicación, si intenta seleccionar más de tres elementos del menú, el campo **Seleccionado** se volverá inválido.

**NOTA:**

Algunas selecciones dependen del modelo/la opción por radio.

10.8.3.1

Disponible/Seleccionado (Convencional)

Este campo le permite agregar o quitar funciones de convencional de elementos de menú.

En la columna **Elementos disponibles**, puede seleccionar las funciones que aparecerán en la pantalla del radio (disponible para uso) mientras funciona en el Modo de comunicaciones convencionales.

**NOTA:**

Si hace clic en el botón **Agregar** o **Quitar**, podrá agregar o quitar los elementos del menú seleccionados en la columna **Seleccionados**.

Debe haber, al menos, un elemento del menú en la columna **Seleccionados**.

Consulte [Selecciones del menú en la página 210](#) para ver una lista de selecciones compatibles:

10.8.3.2

Disponible/Seleccionado (Troncalización)

Este campo le permite agregar o quitar funciones de troncalización de elementos de menú.

En la columna **Elementos disponibles**, puede seleccionar las funciones que aparecerán en la pantalla del radio (disponible para uso) mientras funciona en el Modo de comunicaciones de troncalización.

**NOTA:**

Si hace clic en el botón **Agregar** o **Quitar**, podrá agregar o quitar los elementos del menú seleccionados en la columna **Seleccionados**.

Debe haber, al menos, un elemento del menú en la columna **Seleccionados**.

Consulte [Selecciones del menú en la página 210](#) para ver una lista de selecciones compatibles:

10.8.3.3

Selecciones del menú

Este tema enumera las selecciones de los elementos del menú y cuándo están disponibles para los usuarios.

Selecciones de elementos del menú:	Esta selección solo es válida en RadioCentral o está disponible para el usuario:
Batería en la página 215 (BATT)	Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección.
Bluetooth en la página 216 (BT)	Cuando el campo Activación de Bluetooth en la página 138 está Activado .
Baliza en la página 216 (BCON)	Cuando el radio admite modelos y opciones diferentes.
Selección/llamada privada en la página 216 (CALL)	Para Convencional, cuando la personalidad convencional ASTRO Rx/Tx de llamada selectiva en la página 470 está establecida en Codificar o Codificar y decodificar o cuando la personalidad convencional no ASTRO Rx/Tx de llamada selectiva en la página 466 está establecida en Codificar o Codificar y decodificar para el canal actual del radio. Para Troncalización, cuando la personalidad de troncalización Tipo de llamada privada en la página 574 no está establecida en desactivado para el canal actual del radio.
Bajar canal en la página 216 (CABJ)	Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección.
Búsqueda de canal en la página 216 (CHSR)	Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección.
Selección de canal en la página 217 (CHAN)	Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección.
Aumento de canal en la página 217 (CHUP)	Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección.
Reloj en la página 217 (CLCK)	Cuando el campo Formato de hora de Amplitud de radio no está configurado como Desactivado .
Contactos en la página 217 (CNTS)	Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección.
Marcador	Cuando el radio admite modelos y opciones diferentes.
Directo/Comunicación directa en la página 218 (DIR)	Cuando se opera en el modo de comunicación convencional y cuando el campo Directo/Comunicación

Selecciones de elementos del menú:	Esta selección solo es válida en RadioCentral o está disponible para el usuario:
	<p>directa en la página 440 de la Personalidad convencional está Activado para el canal actual del radio.</p> <p> IMPORTANTE: Esta selección no se puede programar actualmente en botones, switches ni elementos del menú.</p>
ID dinámico en la página 218 (DYID)	Cuando se opera en el modo Comunicaciones convencionales y cuando el campo Activación de ID dinámica del Sistema convencional está activado para el canal actual del radio.
Prioridad dinámica en la página 218 (DYNP) 	Cuando el Modo rastreo está activado, cuando el Tipo de rastreo en la página 689 es Convencional y cuando el campo Prioridad dinámica en la página 693 de la lista de rastreo está activado para el canal de rastreo detectado actual del radio.
Borrar en la página 218 (ERAS)	Cuando el campo Operación segura en la página 301 de Amplitud de la protección está configurado como Hardware o Software y Estándar de encryption avanzado (AES256) en la página 302 está activado.
Información en la página 218 (INFO)	Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección.
Dirección de protocolo de Internet en la página 218 (IP)	Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección.
Clave en la página 219 (KEY)	Cuando el campo de Voz de la Personalidad convencional Conexión de clave de voz en la página 487 está establecido en Seleccionar para el canal actual del radio.
Grupo de claves en la página 219 (KSET)	Cuando el campo Operación segura en la página 301 de Seguridad en general está configurado como Hardware o Software y Estándar de encryption avanzado (AES256) en la página 302 está activado, y Seleccionable por el usuario (conjunto de claves) está activado .
Ubicación en la página 219 (LOC)	Cuando el campo Activación de ubicación en la página 120 de Radio en general está Activado .
LTE en la página 219 (LTE)	<p>Para Convencional, cuando el Tipo del perfil de datos en la página 376 del Perfil de datos al que hace referencia el Sistema convencional es Convencional y Banda ancha o Solo banda ancha.</p> <p>Para Troncalización, cuando el tipo de perfil de datos del perfil de datos al que hace referencia el sistema de troncalización es Troncalización y banda ancha o Solo banda ancha.</p>

Selecciones de elementos del menú:	Esta selección solo es válida en RadioCentral o está disponible para el usuario:
Mensaje en la página 220 (MSG)	Para Convencional, cuando el campo Mensaje del Sistema convencional está activado para el canal actual del radio. Para Troncalización, cuando el campo Activación de mensaje en la página 579 de la Personalidad de troncalización está activado para el canal actual del radio.
Selección de modo en la página 220 (MS01–MS05)	Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección.
Línea privada múltiple en la página 220 (MPL)	Cuando el campo Tipo de voz/señal de Rx en la página 431 de la personalidad convencional está establecido en No ASTRO o Modo mixto y cuando el campo PM [MPL] seleccionable por el usuario de la personalidad convencional está activado para el canal actual del radio. Solo disponible para Convencional.
Silenciar en la página 220 (SILENC)	Cuando el campo Operación de tonos de silencio mejorada en la página 109 de Radio en general no está Desactivado .
Identificación de mi radio (MYID) en la página 221 (MYID)	Cuando el campo Radio en general, Alias de radio tiene definido un nombre de alias.
Eliminación de canal no deseado en la página 221 (NUIS)	Cuando modo Rastreo está Activado .
Localización en la página 221 (PAGE)	Para Convencional, cuando el campo RX/Tx de alerta de llamada en la página 472 ASTRO de la personalidad convencional está establecido en Codificar o Codificar y decodificar o cuando el campo RX/Tx de alerta de llamada en la página 467 no ASTRO de la personalidad convencional está establecido en Codificar o Codificar y decodificar para el canal actual del radio. Para Troncalización, cuando el campo Funcionamiento de alerta/localización de llamada en la página 575 de la personalidad de troncalización está establecido en Solo lista o Ilimitado para el canal actual del radio.
Contraseña en la página 221 (PSWD)	Cuando el campo Amplitud del radio, Activar (bloqueo del radio) está activado .
Teléfono en la página 222 (PHON)	Para Convencional, cuando el campo Funcionamiento del teléfono en la página 577 de la personalidad convencional no está establecido en Ninguno para el canal actual del radio. Para Troncalización, cuando el campo Funcionamiento del teléfono en la página 577 de la personalidad de troncalización no está establecido en Desactivado para el canal actual del radio.

Selecciones de elementos del menú:	Esta selección solo es válida en RadioCentral o está disponible para el usuario:
Encendido en la página 222 (PWR)	Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección.
Quik-Call II en la página 222 (QCII)	<p>Cuando se selecciona, QCII se inicia al presionar el botón PTT, lo que transmite los tonos a través de la red del radio.</p> <p>Para Convencional, cuando el campo Lista de señalización de tono en la página 651 de la personalidad convencional está establecido en una lista de señalización de tono específica, y cuando el radio admite diferentes modelos y opciones.</p> <p>Para Troncalización, cuando el campo Lista de señalización de tono en la página 651 de la personalidad de troncalización está establecido en una lista de señalización de tono específica, y cuando el radio admite diferentes modelos y opciones.</p>
Perfiles de radio en la página 222 (PRFL)	Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección.
Llamadas recientes en la página 223 (RCNT)	Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección.
Solicitud de regeneración de clave en la página 223 (REKY)	Cuando el campo de Información de ASTRO OTAR Solicitud de regeneración de clave seleccionable por el usuario en la página 327 no está establecido en Desactivado o cuando el MDC OTAR Modo Solicitud de regeneración de clave en la página 308 no está establecido en Desactivado .
Emergencia remota en la página 192 (REMG)	Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección.
Rastreo en la página 223 (SCAN)	<p>Para Convencional, cuando el Tipo de rastreo en la página 689 no está establecido en Rastreo de votación, cuando el campo Selección de lista de rastreo en la página 477 de la Personalidad convencional no está establecido en Ninguno y cuando el campo Rastreo automático en la página 479 de la Personalidad convencional está desactivado para el canal actual del radio.</p> <p>Para Troncalización, cuando el campo Selección de lista de rastreo en la página 578 de la Personalidad de troncalización no está establecido en Ninguno y cuando el campo Rastreo automático en la página 579 de la</p>

Selecciones de elementos del menú:	Esta selección solo es válida en RadioCentral o está disponible para el usuario:
	<p>Personalidad de troncalización está Desactivado para el canal actual del radio.</p> <p> IMPORTANTE: Esta selección no se puede configurar simultáneamente en Botones, Interruptores ni Elementos de menú; sin embargo, puede configurarse simultáneamente en Botones portátiles y accesorios.</p>
<p>Lista de rastreo en la página 224 (SCNL)</p>	<p>Para Convencional, cuando el campo Selección de lista de rastreo en la página 477 de la Personalidad convencional no está establecido en Ninguno para el canal actual del radio.</p> <p>Para Troncalización, cuando el campo Selección de lista de rastreo en la página 578 de la personalidad de troncalización no está establecido en Ninguno para el canal actual del radio.</p>
<p>Sensor en la página 224 (SNSR)</p>	<p>Cuando el radio admite modelos y opciones diferentes.</p>
<p>Estado en la página 224 (STS)</p>	<p>Para Convencional, cuando el campo Estado en la página 419 del Sistema convencional está activado para el canal actual del radio.</p> <p>Para Troncalización, cuando el campo Activación de estado en la página 579 de la Personalidad de troncalización está activado para el canal actual del radio.</p>
<p>Grupo de conversación en la página 224 (TGRP)</p>	<p>Cuando el campo Tipo de selección en la página 475 de Grupo de conversación ASTRO de la Personalidad convencional está establecido en Seleccionable para el canal actual del radio. Solo disponible para Convencional.</p>
<p>Servicio de mensajería de texto en la página 225 (TMS)</p>	<p>Para Convencional, cuando el campo Servicio de mensajería de texto en la página 422 del Sistema convencional está establecido en Solo lista o Ilimitado, y cuando el Selección de perfil de datos en la página 418 del sistema no está establecido en Datos desactivados para el canal actual del radio.</p> <p>Para Troncalización, cuando el campo Servicio de mensajería de texto en la página 534 del Sistema de troncalización está establecido en Solo lista o Ilimitado y cuando el campo Selección de perfil de datos en la página 590 del sistema no está establecido en Datos desactivados para el canal actual del radio.</p>

Selecciones de elementos del menú:	Esta selección solo es válida en RadioCentral o está disponible para el usuario:
Inhibición de Tx en la página 225 (TxIN)	<p>Para un codeplug móvil: cuando el campo Selección de radio no está establecido en Radio secundario o cuando el campo Activar Tx de radio secundario está activado.</p> <p> IMPORTANTE: Para un codeplug portátil: esta selección no puede configurarse simultáneamente con una selección de interruptor Inhibición de Tx en la página 207.</p>
Usuario en la página 225 (USER)	Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección.
Silencio de voz en la página 225 (VMUT) 	<p>Para Convencional, cuando el campo Activación de alerta de usuario de llamada entrante de la llamada ASTRO de la personalidad convencional está activado para el canal actual del radio, o cuando el campo Activación de alerta de usuario de llamada entrante de la llamada no ASTRO (no ASTRO) de la personalidad convencional está activado para el canal actual del radio.</p> <p>Cuando el campo Activación de alerta de usuario de llamada entrante en la página 576 de la personalidad de troncalización está activado para el canal actual del radio.</p>
Wi-Fi activado/desactivado en la página 196 (WIFI)	Esta selección del menú proporciona al usuario opciones e información de Wi-Fi. Este campo solo se activa cuando el campo Wi-Fi Enable en la página 364 está Activado .
Bajar zona en la página 226 (ZNAB)	Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección.
Programación de zona dinámica en la página 226 (PRZN)	Cuando el campo Activación de zona dinámica de la asignación de canal de zona se activó para una o más zonas del radio.
Selección de zona en la página 226 (ZONE)	Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección.
Subir zona en la página 226 (ZNARR)	Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección.

10.8.3.3.1

Batería

La selección de este menú le permite revisar el nivel de energía de la batería mientras funciona en el modo de comunicaciones Convencionales o de troncalización.

10.8.3.3.2

Bluetooth

La selección de este menú proporciona al usuario del radio una lista del estado/información de Bluetooth y las opciones de Bluetooth.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

Las funciones de configuración de Bluetooth incluyen:

Estado de Bluetooth

Permite activar o desactivar la funcionalidad de dispositivo Bluetooth del radio Bluetooth.

Dispositivo activo

Permite ver una lista de todos los dispositivos Bluetooth activos (asociados) actualmente.

Altavoz Bluetooth

Permite activar y desactivar el altavoz de un dispositivo Bluetooth.

10.8.3.3.3

Baliza

La selección de este menú le permite comprobar los detalles de cualquier baliza periódica de emergencia recibida recientemente.

Esta función está disponible para el modo de comunicaciones convencionales o de troncalización.

10.8.3.3.4

Selección/llamada privada

La selección de este menú le permite transmitir una Llamada selectiva y convencional o una Llamada privada de troncalización.

Debe seleccionar el Contacto/ID de llamada requerido y, luego, presionar el botón PTT para iniciar la llamada.

Las Llamadas selectivas y privadas se usan generalmente cuando la mayoría de las transmisiones son entre el usuario y un despachador, o un grupo de usuarios.

Puede ingresar o seleccionar directamente Llamadas específicas según el ID de llamada desde la Lista de uso frecuente de llamadas del canal. El objetivo de las Llamadas selectivas y privadas no es garantizar la privacidad, si no que su labor es más bien eliminar la molestia de recibir tráfico que no les concierne. Consulte también Rx/Tx de Llamada selectiva y convencional y Llamada privada de troncalización.

10.8.3.3.5

Bajar canal

La selección de este menú le permite desplazarse hacia abajo a otros canales dentro de la Zona actual del radio.

Los canales se definen en la ventana Asignación de canal de zona. Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.3.3.6

Búsqueda de canal

Esta selección del menú le permite buscar un canal/modo basado en su nombre de canal programado y pasar directamente al canal que se encontró.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

**NOTA:**

Estos [Nombre del canal en la página 678](#) pueden visualizarse en la página Canales de la ventana Asignación de canal de zona según la zona.

10.8.3.3.7

Selección de canal

La selección de este menú permite pasar a un canal del radio cuando se ingresa el número del canal en el teclado del radio.

Esta función se aplica mientras funciona en el modo de comunicaciones convencionales o de troncalización.

**NOTA:**

Estos números de canales deben programarse y pueden visualizarse en la página Canales de la ventana Asignación de canal de zona, según la zona.

10.8.3.3.8

Aumento de canal

La selección de este menú le permite desplazarse hacia arriba a otros canales dentro de la Zona actual del radio.

Los canales se definen en la ventana Asignación de canal de zona. Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.3.3.9

Reloj

La selección de este menú permite ver y modificar la configuración del reloj.

El formato de hora define el modo de hora predeterminado en de la pantalla del radio. Esta función se aplica mientras funciona en el modo de comunicaciones convencionales o de troncalización.

**IMPORTANTE:**

La función Reloj solo aparece en la pantalla del radio cuando el campo Formato de hora de Radio en general no está configurado en **Desactivado**.

10.8.3.3.10

Contactos

La selección de este menú permite ver/editar los Contactos del canal actual del radio.

Los Contactos se programan en la Lista de llamadas unificada. Los contactos conforman los miembros de las listas de llamadas frecuentes.

El usuario puede seleccionar los miembros/Contactos de la Lista de uso frecuente, lo que permite realizar tipos de llamadas como Llamadas telefónicas, Llamadas selectivas/privadas y Llamadas de alerta/Localizador a radios individuales o grupos de radios. Esta función se aplica mientras funciona en el modo de comunicaciones convencionales o de troncalización.

**IMPORTANTE:**

Esta función no está disponible para radios portátiles que solo tienen una pantalla superior.

10.8.3.3.11

Directo/Comunicación directa

La selección de este menú le permite activar o desactivar el modo Directo/Comunicación directa para el perfil de opciones del canal actual.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales.

10.8.3.3.12

ID dinámico

La selección de este menú permite la entrada al modo de edición de ID dinámico, que permite al usuario del radio ver o editar el ID individual del radio, o el ID principal de MDC para el sistema ASTRO o MDC actual.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales.

10.8.3.3.13

Prioridad dinámica

La selección de este menú permite seleccionar la asignación de exploración Prioridad dinámica.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales.

10.8.3.3.14

Borrar

La selección de este menú le permite borrar la clave de encryption segura actual que utiliza el radio, o todas las claves de encryption actuales del radio.

Esta selección se aplica mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.3.3.15

Información

La selección de este menú le permite recuperar y ver información básica del radio, como la información relacionada con la IP y la asignación de control de botones/switches, así como ver o modificar el ID de software.

Esta función se aplica solo cuando funciona en el Sistema convencional ASTRO. Esta es una función solo para radios portátiles.

IMPORTANTE:

Tras modificar el ID de software, se cambia el Nombre de usuario del radio para el servidor de Servicio de registro automático o para el inicio de sesión en un servidor de Servicios de red unificados (UNS) de Autenticación de usuario. Tras editar el Nombre de usuario de este modo, los espacios del PIN/la contraseña y el ID de unidad quedan en blanco. Por lo tanto, esto solo puede usarse cuando el servidor espera un PIN o una contraseña en blanco y el usuario no desea usar el ID de unidad.

Esta función no está disponible para radios portátiles que solo tienen una pantalla superior.

10.8.3.3.16

Dirección de protocolo de Internet

La selección de este menú le permite recuperar y ver (en la pantalla del radio) la Dirección IP, el nombre y el estado del dispositivo actual del radio.

Esta función se aplica mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.3.3.17

Clave

La selección de este menú le permite cambiar la Clave de encryption segura para el canal de comunicaciones Convencionales.

**IMPORTANTE:**

Estas claves seleccionables se definen de manera única con el campo [Número CKR en la página 317](#).

Cuando selecciona una nueva Clave, todos los canales Convencionales del radio que tienen su campo [Conexión de clave de voz en la página 487](#) configurado como **Seleccionar** se reactivan automáticamente con la misma clave seleccionada.

A veces, el cambio de claves es útil cuando se sabe que hay una clave de encryption comprometida.

10.8.3.3.18

Grupo de claves

La selección de este menú le permite cambiar a un Grupo alternativo de claves de encryption seguras cuando funciona en el modo de comunicaciones Convencionales o de troncalización.

El grupo de claves seleccionado se aplica a los modos de comunicaciones convencionales y de troncalización.

**IMPORTANTE:**

Los Grupos alternativos de claves están disponibles debido a la compatibilidad de Administración de clave PID la Regeneración de clave inalámbrica (OTAR) [Administración de clave PID para modo ASN en la página 315](#).

A veces, el cambio de grupos de claves es útil cuando se sabe que hay una clave de encryption comprometida.

10.8.3.3.19

Ubicación

La selección de este menú le permite determinar su ubicación actual (latitud, longitud, hora y fecha) y también la distancia y azimut con respecto a otra ubicación ("recorrido").

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

**IMPORTANTE:**

Si el campo [Activación de ubicación seleccionable por el usuario en la página 121](#) de Radio en general está **Activado**, también puede encender o apagar la funcionalidad de ubicación en áreas exteriores/Sistema de posicionamiento global (GPS) para todos los canales de comunicaciones Convencionales o de troncalización con ubicación/GPS activado.

10.8.3.3.20

LTE

Al seleccionar este menú, se activan y se desactivan las capacidades de datos de banda ancha de LTE del radio.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

**IMPORTANTE:**

La selección de este menú solo se puede realizar cuando se selecciona un canal que está configurado para la banda ancha de LTE. Cuando se selecciona un canal que no es LTE, se oculta el menú.

Un canal es compatible con LTE cuando su campo [Tipo del perfil de datos en la página 376](#) de Perfil de datos está configurado en **Convencional y banda ancha** o **Troncalización y banda ancha** o **Solo banda ancha** y su [Fuente de banda ancha](#) es **Módem de LTE interno**.

10.8.3.3.21

Mensaje

La selección de este menú le permite mostrar el último mensaje transmitido por el radio y reconocido por la estación base mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.3.3.22

Selección de modo

Estas cinco selecciones de menú (MS01–MS05) permiten programar cualquier combinación deseada o más usada de zonas o canales. Si se selecciona MSPR, puede preajustar la configuración para MS01–MS05 en el radio.

Cada selección de menú se puede programar con una combinación de zona/canal distinta para una recopilación posterior. La programación y el uso de estas selecciones de menú son muy similares a la programación y al uso de los botones preconfigurados del radio de un auto. Es decir, una vez que navega hacia una opción MSx del menú, una pulsación larga del botón Selección de menú programa la zona y los canales actuales del radio en esa opción MSx del menú. Luego de la programación, una pulsación corta del botón Selección de menú dirige el radio a la zona y al canal programados.

Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

**IMPORTANTE:**

La [Duración de pulsación corta en la página 147](#) y la [Duración de pulsación larga de tecla en la página 148](#) se radio Central.

10.8.3.3.23

Línea privada múltiple

La selección de este menú permite acceder a un listado de las Listas de MPL disponibles.

**NOTA:**

Cada lista se representa mediante un nombre reconocible . El usuario del radio puede seleccionar las configuraciones de Alias/PL deseadas. Esta función está disponible mientras funciona en el modo de comunicaciones convencionales.

10.8.3.3.24

Silenciar

La selección de este menú permite activar o desactivar determinados tonos del radio (por ejemplo, los tonos del teclado), según estén configurados por la selección Operación de tonos de silencio mejorada.

Esta función está disponible para el modo de comunicaciones convencionales y de troncalización.

10.8.3.3.25

Identificación de mi radio (MYID)

La selección de este menú permite hacer que el Alias de ID de radio aparezca en la pantalla del radio.

Esta función se aplica mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.3.3.26

Eliminación de canal no deseado

La selección de este menú permite borrar de forma temporal un canal de miembro de lista de rastreo que genera continuamente ruido de operador del Rastreo activo actual.

Esta función se aplica mientras funciona en el modo de comunicaciones convencionales o de troncalización.

**IMPORTANTE:**

Cambiar a otro canal en el selector de canales del radio, encender y apagar el modo de rastreo o apagar y encender el radio traen de regreso de manera eficaz al canal del miembro de lista de rastreo eliminado temporalmente a un estado detectado de manera activa.

No es posible Borrar ruidos no deseados:

- Para un canal de miembro de la Lista de rastreo Prioridad nro. 1 o Prioridad nro. 2.
- Cuando el campo [Tipo de miembro de Tx de voz designada en la página 696](#) se encuentra configurado en **Canal seleccionado** y la frecuencia de Tx del canal Rastreo detectado es la misma que la frecuencia de Tx del canal actualmente seleccionado del radio.
- Si la lista de rastreo actual no contiene al menos dos miembros antes de que ocurra la acción Borrar ruidos no deseados.

10.8.3.3.27

Localización

La selección de este menú permite transmitir una Alerta de llamada para los modos Convencional o una Alerta/localización de llamada para los modos Troncalización.

**NOTA:**

Alerta/localización de llamada permite a un despachador o a la persona que llama al radio avisar a un usuario (o grupo de usuarios) sobre una llamada perdida. Los radios receptores se destinan en base a información de radio y sistema administrada por los contactos y los ID de llamada en las listas de llamadas frecuentes del radio. Puede ingresar o seleccionar directamente los ID de llamada en la Lista de uso frecuente del canal. El radio receptor responde con tonos de alerta y alertas visuales. La alerta visual (LED destellante) persiste hasta que se reinicia el radio.

10.8.3.3.28

Contraseña

La selección de este menú permite modificar la Contraseña de bloqueo del radio/desbloqueo por bloqueo automático de inhibición táctica y modificar la Contraseña de codificación de inhibición táctica.

Esta función se aplica mientras funciona en el modo de comunicaciones convencionales o de troncalización.

**IMPORTANTE:**

Esta contraseña debe componerse solo de valores numéricos que se puedan ingresar fácilmente desde el teclado del radio. El valor más largo de la contraseña se determina en el campo Longitud máxima de contraseña.

En la versión encryption seguro de la función Bloqueo del radio (consulte la Nota Importante en el tema [Habilitación de bloqueo del radio]), se debe configurar manualmente la contraseña en el módulo de encryption del hardware mediante el teclado del radio y la selección del menú de esta contraseña.

En la versión de inhibición nítida/táctica de la función Bloqueo de radio, la contraseña inicial se debe programar en el campo Contraseña de desbloqueo.

10.8.3.3.29**Teléfono**

La selección de este menú permite iniciar el modo Teléfono mientras funciona en el modo Comunicaciones convencionales o de troncalización.

10.8.3.3.30**Encendido**

La selección de este menú permite alternar la potencia de la transmisión del radio de alta a baja y viceversa para todas las Personalidades convencionales o los Sistemas de troncalización mencionados según la amplitud de radio.

**IMPORTANTE:**

Una vez que se ha cambiado la configuración en la pantalla del radio, esta configuración de potencia alta o baja tiene prioridad sobre todas las configuraciones individuales [Nivel de potencia de transmisión en la página 436](#) Convencional o las configuraciones [Nivel de potencia de Tx en la página 528](#) Troncalización. Es decir, cuando el usuario efectúa la selección de menú **POTN** del radio, la pantalla del radio muestra *Potencia alta* o *Potencia baja* según el estado del canal actual del radio. A continuación, puede seleccionar transmitir en potencia alta o baja; para ello, puede seleccionar cualquiera de las dos opciones en la pantalla del radio.

Cuando se apaga y se vuelve a encender el radio, se restablecen todos los canales del radio a sus ajustes de potencia programados.

10.8.3.3.31**Quik-Call II**

Esta opción permite el inicio de la aplicación QCII y permite elegir el tono que se transmitirá.

Esta función se aplica mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.3.3.32**Perfiles de radio**

La selección de este menú permite seleccionar uno de los Perfiles de radio programados en la Asignación de canal de zona, siempre que el campo Selección de perfil del radio esté configurado en Último seleccionado.

Esta función se aplica mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.3.3.33

Intercambio de radio

La selección de este menú permite alternar entre dos radios (conocido como la parte de "ladrillo" del radio) que están conectados al mismo cabezal de control en una configuración Radio dual.

Esta función se aplica mientras funciona en el modo de comunicaciones convencionales o de troncalización.

**IMPORTANTE:**

Si el campo Menú de intercambio fijo está **Activado**, entonces la selección del menú **Intercambio de radio** siempre aparece en la posición de menú más a la izquierda, incluso cuando se desplaza a través de los botones programables del menú, e independientemente de si esta función está programada o no; sin embargo, si el campo Menú de intercambio fijo está **Desactivado**, entonces esta selección de menú es accesible con el menú de desplazamiento estándar.

10.8.3.3.34

Llamadas recientes

La selección de este menú permite acceder a la información de las últimas llamadas entrantes y realizadas de los siguientes tipos de llamadas: Alertas de llamada, Llamadas selectivas/privadas y Llamadas telefónicas (solo salientes).

Esta función se aplica mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.3.3.35

Solicitud de regeneración de clave

La selección de este menú permite transmitir una solicitud de Regeneración de clave inalámbrica (OTAR) a la consola del despachador (KMF o KMC) mientras funciona en el modo Comunicaciones convencionales o de troncalización.

**IMPORTANTE:**

Para MDC OTAR (comunicaciones convencionales), el protocolo de solicitud se determina mediante el campo [Modo Solicitud de regeneración de clave en la página 308](#).

Para ASTRO OTAR (comunicaciones convencionales o de troncalización), el campo [Solicitud de regeneración de clave seleccionable por el usuario en la página 327](#) debe estar **Activado**, y el protocolo de solicitud se determina mediante el campo [Nivel de seguridad de Tx OTAR en la página 325](#).

10.8.3.3.36

Emergencia remota

Presionar este botón activa la función de Activación remota de emergencia, de modo que un usuario autorizado para codificar este comando puede hacer que un radio de destino inicie la función de Emergencia sin intervención del usuario de destino.

**NOTA:**

La emergencia remota solo es compatible con los canales convencionales ASTRO y los canales de troncalización ASTRO 25.

10.8.3.3.37

Rastreo

La selección de este menú permite seleccionar Listas de rastreo y activar/desactivar el modo Exploración mientras funciona en el modo Comunicaciones convencionales o de troncalización.

10.8.3.3.38

Lista de rastreo

La selección de este menú permite ver miembros de la Lista rastreo individual en la Lista de rastreo y además coloca el radio en un modo Edición de lista de rastreo.

Mientras está en este modo de edición, el usuario puede agregar o eliminar miembros de la lista de rastreo, y modificar la prioridad de rastreo de cualquier miembro. Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

**IMPORTANTE:**

El botón lateral superior del radio se convierte automáticamente en el botón de selección designado mientras se edita un canal de la lista de rastreo. Esto solo se cumple mientras el radio funciona en este Modo de programación de lista de rastreo.

10.8.3.3.39

Sensor

La pulsación de este botón le permite seleccionar el tiempo de operación del Tiempo de desactivación del evento del sensor.

El [Tiempo de desactivación de evento del sensor en la página 138](#) es un campo de Radio en general. Esta función se aplica mientras funciona en el modo de comunicaciones convencionales o de troncalización.

10.8.3.3.40

Estado

La selección de este menú le permite seleccionar desde la Lista de alias de estado del canal/modo actual.

**NOTA:**

Para su comodidad, como parte de esta función, en la pantalla se muestra inicialmente la última llamada de estado reconocida o el primer estado de la lista. Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización.

**IMPORTANTE:**

Mientras funciona en el modo de comunicaciones convencionales con señalización MDC/ASTRO/DVRS, se utiliza la Lista de alias de estado convencional.

Mientras funciona en el modo de comunicaciones de troncalización, se utiliza el Sistema de troncalización - Lista de alias de estado seleccionado para la Personalidad de troncalización actual.

10.8.3.3.41

Bloquear

La selección de este menú le permite transmitir un comando de Inhibición táctica de bloqueo automático a un radio o grupo de radios específico.

**IMPORTANTE:**

Esto es posible solo cuando el campo Operación de Inhibición táctica de bloqueo de la Personalidad convencional está configurado como **Codificar** o **Codificar y decodificar**. La Operación de inhibición táctica de bloqueo se define en base a la Personalidad convencional.

10.8.3.3.42

Grupo de conversación

La selección de este menú permite cambiar entre el Grupo de conversación preestablecido y otro de la Lista de grupos de conversación actual de la Personalidad convencional.

Todas las Personalidades convencionales que usan la misma Lista de grupos de conversación cambian automáticamente al grupo de conversación seleccionado.

10.8.3.3.43

Servicio de mensajería de texto

La selección de este menú le permite acceder al modo Servicio de mensajería de texto (TMS) del radio, que se ve en la pantalla del radio.

Consulte también la función Servicio de mensajería de texto del Sistema de troncalización o Sistema convencional.

10.8.3.3.44

Inhibición de Tx

La selección de este menú permite desactivar todas las transmisiones de radio mientras funciona en el modo de comunicaciones convencional o de troncalización.

IMPORTANTE:

Esta acción puede ser necesaria al ingresar en entornos peligrosos con alta sensibilidad a campos de RF, donde una transmisión de radio puede iniciar una explosión u otra reacción peligrosa.

NOTA:

Si intenta encender el radio mientras Inhibición de Tx está **Activado**, el radio genera un tono largo bajo de Prohibición para hablar, que indica que actualmente no se permiten transmisiones.

10.8.3.3.45

Usuario

La selección de este menú permite iniciar sesión en diferentes servidores de Servicio de registro automático (ARS) con la combinación de nombre de usuario y contraseña (PIN) correctos.

Los nombres de usuario y PIN pueden ingresarse de forma manual desde el teclado del radio, o es posible seleccionar nombres de usuario a partir de las entradas de [Lista de usuarios de datos en la página 373](#) (el PIN se ingresa de forma manual). Esta función está disponible mientras funciona en el modo de comunicaciones convencionales o de troncalización. Consulte también el campo ID/nombre de usuario de software.

ADVERTENCIA:

Esta opción funciona solo cuando el campo [Modo ARS en la página 382](#) de perfiles de datos no está configurado en **Desactivado**.

10.8.3.3.46

Silencio de voz

La selección de este menú permite al usuario de la radio activar o desactivar la funcionalidad Silencio de voz para los canales habilitados con la Alerta de usuario de llamada entrante.

Cuando Silencio de voz está activado, el radio permanece silenciado para todas las llamadas de comunicaciones convencionales y las llamadas de grupo de conversación de troncalización asociadas. La Alerta/localización de llamada grupal e individual silencia el radio para el tono de alerta; además, cuando Silencio de voz está activo, el radio silencia las llamadas de radio a radio individuales como, por ejemplo, las Llamadas selectivas/privadas y las llamadas de Interconexión (modo Teléfono).

10.8.3.3.47

Bajar zona

La selección de este menú permite desplazarse hacia abajo a través de las Zonas en el radio.

Si sigue desplazándose después de alcanzar la primera zona de la lista, esta completa un ciclo y vuelve a la última zona. Las zonas se definen en la ventana Asignación de canal de zona.

10.8.3.3.48

Programación de zona dinámica

La selección de este menú permite ver o editar los canales en la(s) zona(s) dinámica(s) del radio.

Las zonas dinámicas se habilitan en la página de la zona de la ventana Asignación de canal de zona.

10.8.3.3.49

Selección de zona

La selección de este menú permite seleccionar una Zona mientras se opera en el modo Comunicaciones convencionales o de troncalización.

Las zonas se definen en la ventana Asignación de canal de zona.

10.8.3.3.50

Subir zona

La selección de este menú permite subir a través de las Zonas en el radio.

Si sigue desplazándose después de alcanzar la última zona de la lista, esta completa un ciclo y vuelve a la primera zona. Las zonas se definen en la ventana Asignación de canal de zona.

10.8.4

Teclado (Control portátil)

La sección **Teclado** permite al usuario ver o seleccionar la funcionalidad del botón programable de amplitud de radio para los modos de comunicación convencional y de troncalización. La funcionalidad del botón se selecciona una vez y funciona para los dos modos de comunicación por radio.

NOTA:

Algunas selecciones dependen del modelo/la opción por radio.

10.8.4.1

Uno (1)

Selecciona la función del botón uno del teclado (1) en un radio portátil, en un cabezal de control móvil o en un micrófono de teclado (KPM).

Consulte [Cero \(0\) en la página 228](#) para ver notas y advertencias.

Consulte [Selecciones de botones del teclado en la página 229](#) para ver una lista de selecciones compatibles:

10.8.4.2

Dos (2)

Selecciona la función del botón dos del teclado (2) en un radio portátil, en un cabezal de control móvil o en un micrófono de teclado (KPM).

Consulte [Cero \(0\) en la página 228](#) para ver notas y advertencias.

Consulte [Selecciones de botones del teclado en la página 229](#) para ver una lista de selecciones compatibles:

10.8.4.3 **Tres (3)**

Selecciona la función del botón tres del teclado (3) en un radio portátil, en un cabezal de control móvil o en un micrófono de teclado (KPM).

Consulte [Cero \(0\) en la página 228](#) para ver notas y advertencias.

Consulte [Selecciones de botones del teclado en la página 229](#) para ver una lista de selecciones compatibles:

10.8.4.4 **Cuatro (4)**

Selecciona la función del botón cuatro del teclado (4) en un radio portátil, en un cabezal de control móvil o en un micrófono de teclado (KPM).

Consulte [Cero \(0\) en la página 228](#) para ver notas y advertencias.

Consulte [Selecciones de botones del teclado en la página 229](#) para ver una lista de selecciones compatibles:

10.8.4.5 **Cinco (5)**

Selecciona la función del botón cinco del teclado (5) en un radio portátil, en un cabezal de control móvil o en un micrófono de teclado (KPM).

Consulte [Cero \(0\) en la página 228](#) para ver notas y advertencias.

Consulte [Selecciones de botones del teclado en la página 229](#) para ver una lista de selecciones compatibles:

10.8.4.6 **Seis (6)**

Selecciona la función del botón seis del teclado (6) en un radio portátil, en un cabezal de control móvil o en un micrófono de teclado (KPM).

Consulte [Cero \(0\) en la página 228](#) para ver notas y advertencias.

Consulte [Selecciones de botones del teclado en la página 229](#) para ver una lista de selecciones compatibles:

10.8.4.7 **Siete (7)**

Selecciona la función del botón siete del teclado (7) en un radio portátil, en un cabezal de control móvil o en un micrófono de teclado (KPM).

Consulte [Cero \(0\) en la página 228](#) para ver notas y advertencias.

Consulte [Selecciones de botones del teclado en la página 229](#) para ver una lista de selecciones compatibles:

10.8.4.8

Ocho (8)

Selecciona la función del botón ocho del teclado (8) en un radio portátil, en un cabezal de control móvil o en un micrófono de teclado (KPM).

Consulte [Cero \(0\) en la página 228](#) para ver notas y advertencias.

Consulte [Selecciones de botones del teclado en la página 229](#) para ver una lista de selecciones compatibles:

10.8.4.9

Nueve (9)

Selecciona la función del botón nueve del teclado (9) en un radio portátil, en un cabezal de control móvil o en un micrófono de teclado (KPM).

Consulte [Cero \(0\) en la página 228](#) para ver notas y advertencias.

Consulte [Selecciones de botones del teclado en la página 229](#) para ver una lista de selecciones compatibles:

10.8.4.10

Asterisco (*)

Selecciona la función del botón de asterisco del teclado (*) en un radio portátil, en un cabezal de control móvil o en un micrófono de teclado (KPM).

Consulte [Cero \(0\) en la página 228](#) para ver notas y advertencias.

Consulte [Selecciones de botones del teclado en la página 229](#) para ver una lista de selecciones compatibles:

10.8.4.11

Cero (0)

Selecciona la función del botón cero del teclado (0) en un radio portátil, en un cabezal de control móvil o en un micrófono de teclado (KPM).

Estas selecciones se aplican mientras funciona en los modos de comunicación convencional o de troncalización.

**IMPORTANTE:**

Cuando un radio viene equipado con un Cabezal de control O7 que tiene sirena y luces del teclado opcionales, las asignaciones predeterminadas de los botones del teclado se configuran previamente para corresponderse con los gráficos del teclado.

**ADVERTENCIA:**

Para una configuración de radio dual:

Las funciones de los botones para Radio en general (botones relacionados con la sirena, Control auxiliar [1-3], Dim, GunLock [1, 2, 3, o Todos], Patrón de relé, Intercambio de radio y Terceros) se deben configurar de la misma manera para los radios primarios y secundarios. Además, se recomienda encarecidamente configurar todas las funciones de los botones de la misma manera para ambos radios de modo que no se genere confusión.

Consulte [Selecciones de botones del teclado en la página 229](#) para ver una lista de selecciones compatibles:

10.8.4.12

Libra/Hash (#)

Selecciona la función del botón de libra/hash del teclado (#) en un radio portátil, en un cabezal de control móvil o en un micrófono de teclado (KPM).

Consulte [Cero \(0\) en la página 228](#) para ver notas y advertencias.

Consulte [Selecciones de botones del teclado](#) para ver una lista de selecciones compatibles:

10.8.4.13

Selecciones de botones del teclado

Este tema enumera las selecciones de botones y cuándo están disponibles para los usuarios.

Selecciones de botones:	Esta selección solo es válida en RadioCentral o está disponible para el usuario:
Dígito del teclado en la página 229	Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección.
MS01–MS13 en la página 188 (Selección de modo)	Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección.
Terceros en la página 194	Cuando se selecciona, está siempre disponible para el usuario y, por lo tanto, no depende de ninguna función o selección.

10.8.4.13.1

Dígito del teclado

Seleccione esta función para retener la operación estándar para el botón del teclado asociado.

**IMPORTANTE:**

En un radio Portátil, esta es la única función disponible de los botones Asterisco (*) y Numeral (#).

10.8.5

Botones de accesorios (control portátil)

La sección **Botones de accesorios** permite al usuario ver o seleccionar la funcionalidad del botón programable de amplitud de radio para los modos Comunicaciones convencional y de troncalización. La funcionalidad del botón se selecciona y funciona independientemente para cada uno de los dos modos de comunicación por radio. Es decir, cuando el radio funciona en un canal convencional, solo las funciones convencionales seleccionadas están disponibles para el usuario. De la misma forma, cuando el radio funciona en un canal de troncalización, solo las funciones de troncalización seleccionadas están disponibles para el usuario.

**NOTA:**

Algunas selecciones dependen del modelo/la opción por radio.

10.8.5.1

Acc. naranja (Convencional)

Selecciona la función del botón Acc. naranja de accesorios.

**IMPORTANTE:**

La selección del botón naranja de accesorio sigue automáticamente la selección del Botón superior del equipo portátil.

Consulte [Selecciones de botones \(superior y lateral\) en la página 165](#) para ver una lista de selecciones compatibles:

10.8.5.2

Acc. naranja (Troncalización)

Selecciona la función del botón Acc. naranja de accesorios.

**IMPORTANTE:**

La selección del botón naranja de accesorio sigue automáticamente la selección del Botón superior del equipo portátil.

Consulte [Selecciones de botones \(superior y lateral\) en la página 165](#) para ver una lista de selecciones compatibles:

10.8.5.3

Acc. sin puntos (Convencional)

Selecciona la función del botón Acc. sin puntos de accesorios.

Estas selecciones se aplican mientras funciona en los modos de comunicación convencionales o de troncalización, como se indica en la tabla a continuación.

**ADVERTENCIA:**

El usuario no debe duplicar una función en múltiples controles, es decir, en más de un botón, en más de un switch o en un botón y un switch. Esto puede provocar el mal funcionamiento de la radio.

**IMPORTANTE:**

Al seleccionar la función convencional Arriba o Abajo, la función de troncalización se configura automáticamente en la función contraria en el modo solo de visualización. La selección de cualquier otra función convencional activa la función de troncalización para la selección.

Consulte [Selecciones de botones \(superior y lateral\) en la página 165](#) para ver una lista de selecciones compatibles:

10.8.5.4

Acc. sin puntos (Troncalización)

Selecciona la función del botón Acc. sin puntos de accesorios.

Consulte [Acc. sin puntos \(Convencional\) en la página 230](#) para ver notas y advertencias.

Consulte [Selecciones de botones \(superior y lateral\) en la página 165](#) para ver una lista de selecciones compatibles:

10.8.5.5

Acc. 1 puntos (Convencional)

Selecciona la función del botón Acc. 1 puntos de accesorios.

Consulte [Acc. sin puntos \(Convencional\) en la página 230](#) para ver notas y advertencias.

Consulte [Selecciones de botones \(superior y lateral\) en la página 165](#) para ver una lista de selecciones compatibles:

10.8.5.6

Acc. 1 puntos (Troncalización)

Selecciona la función del botón Acc. 1 puntos de accesorios.

Consulte [Acc. sin puntos \(Convencional\) en la página 230](#) para ver notas y advertencias.

Consulte [Selecciones de botones \(superior y lateral\) en la página 165](#) para ver una lista de selecciones compatibles:

10.8.5.7

Acc. 2 puntos (Convencional)

Selecciona la función del botón Acc. 2 puntos de accesorios.

Consulte [Acc. sin puntos \(Convencional\) en la página 230](#) para ver notas y advertencias.

Consulte [Selecciones de botones \(superior y lateral\) en la página 165](#) para ver una lista de selecciones compatibles:

10.8.5.8

Acc. 2 puntos (Troncalización)

Selecciona la función del botón Acc. 2 puntos de accesorios.

Consulte [Acc. sin puntos \(Convencional\) en la página 230](#) para ver notas y advertencias.

Consulte [Selecciones de botones \(superior y lateral\) en la página 165](#) para ver una lista de selecciones compatibles:

10.8.5.9

Acc. 3 puntos (Convencional)

Selecciona la función del botón Acc. 3 puntos de accesorios.

Consulte [Acc. sin puntos \(Convencional\) en la página 230](#) para ver notas y advertencias.

Consulte [Selecciones de botones \(superior y lateral\) en la página 165](#) para ver una lista de selecciones compatibles:

10.8.5.10

Acc. 3 puntos (Troncalización)

Selecciona la función del botón Acc. 3 puntos de accesorios.

Consulte [Acc. sin puntos \(Convencional\) en la página 230](#) para ver notas y advertencias.

Consulte [Selecciones de botones \(superior y lateral\) en la página 165](#) para ver una lista de selecciones compatibles:

10.9

Pantalla

La ventana **Pantalla** le permite ver o modificar la configuración según la amplitud de radio para la pantalla y las opciones de menú de un radio.

10.9.1

General

Esta sección permite ver o definir configuraciones básicas de todas las radios relacionadas con la apariencia y la funcionalidad de la pantalla del radio.

10.9.1.1

Tamaño de texto de zona

En este campo se selecciona el número máximo de caracteres asignado en la pantalla frontal del radio para los nombres de zonas.

Esta selección se aplica en base a la amplitud de radio.

**NOTA:**

Los nombres/descripciones de zonas se definen en el campo [Nombres de zona en la página 676](#) de Asignación de canal de zona.

Puede seleccionar Zonas con un switch de swtich [Selección de zona en la página 207](#) o una selección del menú Selección de zona.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Son compatibles los números enteros del 0 al 14.

10.9.1.2

Tamaño de texto de canal

En este campo se selecciona el número máximo de caracteres asignado en la pantalla frontal del radio para los nombres de canal.

Esta selección se aplica en base a la amplitud de radio.

**NOTA:**

Los nombres o las descripciones de canales se definen en el campo Nombre de canal de la Asignación del canal de zona. Puede seleccionar los canales con una pulsación del botón Selección de canal, el switch de alternación Selección de canal o la selección del menú Selección de canal.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Rango

Números enteros del 1 al 14.

10.9.1.3

Orientación de pantalla superior

En este campo selecciona la orientación predeterminada de la pantalla superior del radio, lo que permite voltear la orientación visual en 180 grados según la preferencia del usuario.

La selección del botón programable Iluminar/girar (la pantalla) le permite cambiar esta orientación cuando sea necesario. Esta selección se aplica en base a la amplitud de radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

- Normal
- Invertido

10.9.1.4

Índice de desplazamiento lento

En este campo se selecciona la velocidad de desplazamiento lento de la pantalla por una lista.

Primero, el radio se desplaza lento y luego rápido después que expira el Conteo de desplazamiento lento. Esta función se aplica en base a la amplitud de radio para los modos de comunicaciones convencionales y de troncalización.

Mesa 44: Rango

Mínimo	Máximo	Incrementos
250 (ms)	6250 (ms)	250 (ms)

**NOTA:**

El Índice de desplazamiento lento debe ser superior o igual al Índice de desplazamiento rápido.

10.9.1.5

Índice de desplazamiento rápido

En este campo se selecciona la velocidad de desplazamiento rápido de la pantalla por una lista.

Primero, el radio se desplaza lento y luego rápido después que expira el Conteo de desplazamiento lento. Esta función se aplica en base a la amplitud de radio para los modos de comunicaciones convencionales y de troncalización.

Mesa 45: Rango

Mínimo	Máximo	Incrementos
250 (ms)	6250 (ms)	250 (ms)

**NOTA:**

El Índice de desplazamiento rápido debe ser inferior o igual al Índice de desplazamiento lento.

10.9.1.6

Conteo de desplazamiento lento

En este campo se selecciona el número de menús a través de los cuales se desplaza en la pantalla antes de que el radio cambie a la Velocidad de desplazamiento rápido.

Esta función se aplica en base a la amplitud de radio para los modos de comunicaciones convencionales y de troncalización.

Mesa 46: Rango

Mínimo	Máximo
0 menú	255 menú

10.9.1.7

Indicador de fuera de alcance

En este campo se selecciona el tipo de alerta que utiliza el radio para indicar cuando ha salido del área de cobertura del Sistema de troncalización.

Esta función se aplica a comunicaciones convencionales de P25 de troncalización y con DVRS activado.

Se admiten las siguientes selecciones:

Sin indicación

Función desactivada (es decir, no se le da ninguna indicación cuando el radio se encuentra en una condición de fuera de rango).

Solo alerta

Solo indicador audible. Consulte también Tono fuera de rango.

Solo pantalla

La pantalla del radio muestra de forma alternada **NO SYS** (Sin sistema) y la zona y el canal actuales del radio.

Alertar y mostrar

Indicadores audibles y visuales (consulte “Solo alertar” y “Solo mostrar” anteriormente).

10.9.1.8

Búsqueda de indicador de sitio

Este campo le permite seleccionar los tipos de alerta cuando el radio se conecta a SmartConnect.

Mesa 47: Tipos de selecciones de alertas

Tipos de selecciones de alertas	Descripción
Sin indicación	La función se desactiva y no se muestra ninguna indicación cuando el radio se conecta a SmartConnect.
Solo pantalla	En la pantalla, se muestra <i>Buscando sitio</i> .

10.9.1.9

Detección temprana fuera de rango

Si este campo está seleccionado, el radio realiza una detección más rápida de una condición fuera de rango en menos de un minuto.

Si este campo no está seleccionado, el radio realiza la detección tradicional de una condición fuera de rango.

10.9.1.10

Temporizador de postergación fuera de rango

Selecciona la cantidad de tiempo de postergación para que se establezcan los indicadores de fuera de rango.

10.9.1.11

Indicador de cobertura no equilibrada

En este campo se selecciona el tipo de alerta que utiliza el radio para indicar comunicaciones reducidas debido a un estado no afiliado del radio.

El estado no afiliado ocurre cuando el radio funciona en un área de cobertura no equilibrada. Esta condición se detecta en la falla de reintento de las comunicaciones entrantes. La cobertura no

equilibrada puede tardar algunos minutos en desaparecer. Esta función se aplica a comunicaciones convencionales de P25 de troncalización y con DVRS activado.

**NOTA:**

Debe activarse un Indicador de fuera de rango cuando se use esta función para indicarle que las alertas de los indicadores de cobertura desequilibrada se han detenido debido a que el radio está fuera de rango.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Sin indicación

Función desactivada: no se le da ninguna indicación cuando el radio se encuentra en una condición de cobertura desequilibrada.

Solo alerta

Solo indicador audible.

Solo pantalla

La pantalla del radio muestra de forma alternada **NO COMMS** (Sin comunicaciones) y la zona y el canal actuales del radio.

Alertar y mostrar

Indicadores audibles y visuales (consulte “Solo alertar” y “Solo mostrar” anteriormente).

10.9.1.12

Indicador de troncalización de sitio

En este campo se selecciona el tipo de indicador de Troncalización de sitio. La Troncalización de sitio es un modo de troncalización único que se considera un modo intermedio entre el modo SmartZone y el modo Degradación reducida.

En un sistema SmartZone, si el controlador de zona se pierde, el sitio actual envía un mensaje que indica que ahora está en Modo troncalización de sitio. Seguirá enviando el mensaje hasta que el controlador de zona vuelva a conectarse. Esta selección se aplica cuando está en una operación de SmartZone para todos los Sistemas de troncalización y Personalidades de troncalización.

**IMPORTANTE:**

Si las comunicaciones del Sitio de troncalización también fallan, el radio entra en Modo degradación reducida.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Sin indicación

Función desactivada.

Solo alerta

Solo indicador audible.

Solo pantalla

Activa el mensaje “Troncalización de sitio” para que aparezca en la pantalla del radio.

Alertar y mostrar

Indicadores audibles y visuales (consulte “Solo alertar” y “Solo mostrar” anteriormente).

10.9.1.13

Indicador de registro del sistema

En este campo se selecciona el tipo de alerta que utiliza el radio para indicar el estado del proceso de registro del sistema en el caso de que el suscriptor no pueda registrarse en el sistema.

Esta función se aplica a Comunicaciones de troncalización de APCO P25 (ASTRO 25).

Se admiten las siguientes selecciones:

Sin indicación

Función desactivada.

Solo alerta

Solo indicador audible.

Solo pantalla

La pantalla del radio muestra uno de dos mensajes posibles: "Sys Reg Refused" (Registro de sistema rechazado) o "Auth Failed" (Error de autenticación de sistema).

Alertar y mostrar

Indicadores audibles y visuales (consulte "Solo alertar" y "Solo mostrar" anteriormente).

10.9.1.14**Indicador solo local de DVRS**

En este campo se selecciona el tipo de alerta que utiliza el radio para indicar una condición de **modo Local** del Sistema repetidor vehicular digital (DVRS).

Esta función se aplica a las comunicaciones convencionales DVRS.

Selecciones**Sin indicación**

Función desactivada.

Solo alerta

Solo indicador audible.

Solo pantalla

En la pantalla del radio se muestra uno de dos mensajes posibles.

Alertar y mostrar

Indicadores audibles y visuales (consulte "Solo alertar" y "Solo mostrar" anteriormente).

10.9.2**Avanzada**

Esta sección permite visualizar o definir la funcionalidad de la pantalla del radio diversa y compleja según la amplitud del radio.

10.9.2.1**Luz automática**

Este campo hace que la pantalla frontal, el teclado, el switch giratorio y la pantalla superior del radio se iluminen cada vez que se oprime un botón, un switch o un botón de teclado (excepto el botón PTT, el de Emergencia o el Monitor).

Las luces permanecen iluminadas por la cantidad de tiempo que se especifica en el campo [Tiempo de luz en pantalla en la página 237](#). Cuando se desactiva, la selección Iluminar/girar (la pantalla) enciende y apaga las pantallas y la luz del teclado.

Esta selección también se aplica a un accesorio portátil que cuente con una pantalla, como el Micrófono y altavoz remoto de pantalla (DRSM). Esta selección se aplica en base a la amplitud de radio.

Solo se accede: Cuando el campo [Tiempo de luz en pantalla en la página 237](#) no está establecido en **Infinito** y el radio admite diferentes modelos y opciones.

10.9.2.2

Tiempo de luz en pantalla

En este campo se selecciona la cantidad de tiempo en que las luces del switch giratorio, las pantallas y el teclado permanecen iluminadas una vez que el usuario presiona el botón Iluminar/Girar (la pantalla).

**NOTA:**

Esta función también se aplica a la luz de la pantalla en el accesorio de Micrófono y altavoz remoto de pantalla (DRSM). El tiempo está expresado en segundos. Esta selección se aplica en base a la amplitud de radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

**NOTA:**

Cuando se configura en **Infinito**, las luces de la pantalla y el teclado permanecen encendidas hasta que se presiona el botón [Luz/Invertir \(Pantalla\) en la página 187](#)).

Mesa 48: Rango

Mínimo	Máximo	Incrementos
0 s	60 s	5 s

10.9.2.3

Tiempo de visualización de mensajes alternos

En este campo se selecciona el tiempo durante el cual los mensaje alternos aparecen en la pantalla del radio.

El campo Tipo de indicador de Rx de la alarma de emergencia es un ejemplo de una función que usa la funcionalidad de alternación de pantalla, pero solo cuando está configurada como **Solo mostrar** o **Alertar y mostrar**. Esta selección se aplica en base a la amplitud de radio.

Mesa 49: Selecciones

Mínimo	Máximo	Incrementos
250 (ms)	6250 (ms)	250 (ms)

**NOTA:**

ms = milisegundos

10.9.2.4

Tiempo de visualización de mensaje temporal

En este campo se selecciona el tiempo durante el cual un mensaje temporal aparece en la pantalla del radio.

Esta selección se aplica en base a la amplitud de radio.

Mesa 50: Rango

Mínimo	Máximo	Incrementos
250 (ms)	6250 (ms)	250 (ms)

10.9.2.5

Selección de tono de alerta de inactividad de la función

En este campo se selecciona el tipo de Tono de alerta de inactividad de la función para el menú de configuración de Funciones del radio.

Esta selección se aplica en base a la amplitud de radio.

IMPORTANTE:

Actualmente, el **Tono de alerta de inactividad** periódico se aplica a los menús de configuración Alerta de llamada/Localización, Llamada selectiva/privada, Teléfono, Estado, Mensaje y TMS. Actualmente, el **Tono de salida de inactividad de la función** se aplica a los menús de configuración Alerta de llamada/Localización, Llamada selectiva/privada, Teléfono, Estado, Mensaje, TMS, Selección de zona, Selección de canal, Ubicación, Información, Perfiles de radio, Llamadas recientes y Contactos.

Se admiten las siguientes selecciones:

Desactivado

Los tonos de alerta de función se desactivan. Esta selección solo es válida cuando el campo Tiempo de espera de inactividad de la función no está configurado como **Infinito**.

Solo salir

Permite que un Tono de salida de inactividad de la función lo notifique cuando sale el menú de función después de que el radio ha estado inactivo durante el período configurado en el Tiempo de espera de inactividad de la función. Esta selección solo es válida cuando el campo Tiempo de espera de inactividad de la función no está configurado como **Infinito**.

Solo inactividad (predeterminado de fábrica)

Permite que un Tono de alerta inactivo periódico lo notifique que el menú de función está inactivo.

Salir e inactividad

Activa un tono de alerta inactivo y un tono de salida de inactividad de función. Esta selección solo es válida cuando el campo Tiempo de espera de inactividad de la función no está configurado como **Infinito**.

10.9.2.6

Salida automática de estado

En este campo se selecciona el método para determinar cómo el radio sale de la opción Estado del menú de configuración Estado que se ha enviado al despachador.

Esta selección se aplica en base a la amplitud de radio.

Se admiten las siguientes selecciones:

Confirmación de encendido exitoso

El radio sale del menú Estado y vuelve a la operación de despacho normal solo luego de que la confirmación se haya realizado correctamente desde el Equipo de red fija (FNE)/despachador. El menú Estado permanece activo si no se recibe una confirmación o se niega el estado.

Siempre

Se sale del menú Estado automáticamente una vez que se recibe una confirmación o, en el caso del despacho convencional, después de que se hayan completado todos los números de intentos de estado.

10.9.3

Pantalla ID

Esta sección le permite ver o modificar el ID de PTT y la funcionalidad Grupo de conversación de la pantalla del radio.

Un ID de PTT se transmite cuando se oprime el botón PTT para un sistema convencional tipo MDC o ASTRO; por lo tanto, estas funciones de ID de PTT se aplican solo a los canales de comunicaciones convencionales.

10.9.3.1

Pantalla ID de PTT

En este campo se selecciona el tipo de transmisión entrante que califica para la pantalla ID de PTT.

La pantalla ID de PTT activa la visualización del ID de llamada de un Nombre de contacto de la lista de llamadas en la pantalla del radio; si el nombre de contacto de la lista de llamadas no existe, se visualiza el ID de PTT de la persona que llama. Esta función se aplica en base a la amplitud de radio para los canales de comunicaciones convencionales.

Se admiten las siguientes selecciones:

- Desactivado
- Dispatch
- Despachar y explorar

10.9.3.2

Cronómetro de fin de voz

En este campo se selecciona la cantidad de tiempo que un ID de PTT de otro radio aparece en la pantalla de este radio cuando finaliza la transmisión.

Esta función se aplica en base a la amplitud de radio para los canales de comunicaciones convencionales.

IMPORTANTE:

Cuando este campo está configurado como **0** segundos, un ID de PTT configurado como **Borde de salida** enviado desde otras radios no tiene tiempo de mostrarse en la pantalla actual del radio.

Solo se accede: Cuando el campo [Pantalla ID de PTT en la página 239](#) esté configurado como **Despachar** o **Despachar y rastrear**, o cuando el campo **Mostrar ubicación del par** esté activado.

Mesa 51: Rango

Mínimo	Máximo	Incrementos
0 segundos	7 segundos	1 segundo

10.9.3.3

Tamaño de texto de ID de prefijo

En este campo se selecciona el número máximo de caracteres que se utilizará con los números ID de radio, Alertas de llamada y modo Emergencia.

Esta función se aplica en base a la amplitud de radio para los canales de comunicaciones convencionales.

Solo se accede: Cuando el campo **Pantalla ID de PTT** se configura en **Despachar** o **Despachar y rastrear**

Son compatibles los números enteros del 1 al 6.

10.9.3.4

Visualización del Grupo de conversación en PTT

Este campo le permite la visualización de la Lista del grupo de conversación de ASTRO, el Texto del alias del grupo de conversación o el ID del grupo de conversación cuando se presione el botón PTT.

Si la función Alias del grupo de conversación se activa, se visualizará el Texto de alias del grupo de conversación. De lo contrario, se visualizará el ID del grupo de conversación. La activación de este campo tiene prioridad sobre la configuración del campo Mostrar en PTT. Esta función se aplica en base a la amplitud de radio para los canales de comunicaciones convencionales.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.9.3.5

Visualización del Grupo de conversación en el cambio de modo

Este campo le permite la visualización de la Lista del grupo de conversación de ASTRO, el Texto del alias del grupo de conversación o el ID del grupo de conversación cuando cambia de canal.

Si la función Alias del grupo de conversación se activa, se visualizará el Texto de alias del grupo de conversación. De lo contrario, se visualizará el ID del grupo de conversación. La activación de este campo tiene prioridad sobre la configuración del campo Mostrar en el cambio de modo. Esta función se aplica en base a la amplitud de radio para los canales de comunicaciones convencionales.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.9.3.6

Visualización del Grupo de conversación al recibir una llamada

Este campo permite la visualización de la Lista de grupo de conversación de ASTRO, el Texto del alias del grupo de conversación o el ID del grupo de conversación silenciando una llamada.

Si la función Alias del grupo de conversación se activa, se visualizará el Texto de alias del grupo de conversación. De lo contrario, se visualizará el ID del grupo de conversación. Esta función se aplica en base a la amplitud de radio para los canales de comunicaciones convencionales.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.9.3.7

Tabla de visualización de ID (Pantalla)

En la sección **Tabla de visualización de ID** de la **Pantalla** se incluyen los siguientes campos:

10.9.3.7.1

Nombre de la función

Muestra el nombre de solo lectura para la función que se indica en la tabla de visualización de ID para la ID de PTT, ID de emergencia o ID de alerta de llamada.

Solo se accede: Cuando el campo [Pantalla ID de PTT en la página 239](#) está configurado en **Despachar** o **Despachar y rastreo**.

10.9.3.7.2

Pantalla

Este campo le permite definir el texto reconocible que usa como prefijo el número de ID de PTT, ID de emergencia o ID de alerta de llamada en el registro/fila actual de la Tabla de visualización de ID.

La longitud del campo la determina el campo Tamaño de texto del ID de prefijo. Esta función se aplica en base a la amplitud de radio para los canales de comunicaciones convencionales.

Solo se accede: Cuando el campo Pantalla de ID de PTT está configurado como **Despachar o Despachar y rastrear**.

**NOTA:**

Se pueden usar hasta seis (6) caracteres (según lo determine el campo Tamaño de texto de ID de prefijo), incluidos números, letras y caracteres especiales.

Ejemplos: ID, EMERG, Elec01, LLAMAR

10.10

Conjunto Perfil de reducción de ruido de micrófono interno

El conjunto **Perfil de reducción de ruido de micrófono interno** permite al usuario ver o definir los parámetros de reducción de ruido para micrófonos internos diseñados para condiciones de ruido específicas.

Esta configuración se aplica en todos los radios.

**NOTA:**

La reducción de ruido mejora la claridad de la voz al reducir el ruido ambiental. La reducción de ruido ocurre en el radio de transmisión antes de la transmisión (en modo analógico) y antes de la codificación de voz (en modo digital). No solo reduce el ruido de fondo, sino que también mejora la claridad de voz para una transmisión de modo analógico. En el modo digital, el ingreso de una señal más clara en el codificador de voz (vocoder) se traduce en la recepción y decodificación de voz más clara en el receptor.

**ADVERTENCIA:**

Estas configuraciones personalizadas se aplican solo cuando el campo Reducción de ruido personalizada (Radio) se selecciona en el Perfil del radio al que se hace referencia.

No modifique la configuración Reducción de ruido, a menos que el usuario sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

Se admiten los siguientes campos:

10.10.1

Nombre de perfil de reducción de ruido

Este campo le permite ver o definir nombres reconocibles para el Perfil de reducción de ruido del radio actual.

**IMPORTANTE:**

Se recomienda utilizar la [Perfiles de radio en la página 703](#), Configuración de reducción de ruido del micrófono interno para la mayoría de los ambientes ruidosos.

**ADVERTENCIA:**

Estas configuraciones personalizadas se aplican solo cuando el campo Reducción de ruido personalizada (Radio) se selecciona en el Perfil del radio al que se hace referencia.

No modifique la configuración Reducción de ruido a menos que sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

**NOTA:**

Ejemplos: PER-001, #500, Ext Mic NR 3, # A5

Se pueden usar caracteres, números, espacios y caracteres especiales.

Es posible usar un total de 14 caracteres.

10.10.1.1

QA09006: Supresión de ruido adaptable

En este campo se indica si se adquiere la función Reducción de ruido adaptativa.

10.10.2

Vector E Wind MAXS

Esta programación permite ajustar los parámetros de reducción de ruido para condiciones de ruido específicas.

IMPORTANTE:

La Configuración de reducción de ruido del radio - [Perfiles de radio en la página 703](#) se recomienda para la mayoría de los ambientes ruidosos.

Este parámetro tiene un rango efectivo de 31 valores coeficientes de 16 bits cada uno, lo que equivale a 124 caracteres BCH (nibble de 4 bits). Sin embargo, esto requiere que se ingresen valores con coeficiente 32. Cuando ingrese los coeficientes para este vector, el 32.do valor es el que se encuentra más a la derecha (o el menos significativo). En otras palabras, los últimos cuatro caracteres BCH. Asegúrese de hacer que este 32.do valor sea igual que el 31.er. El procesador de señal digital (DSP) del radio ignora el 32.do valor.

ADVERTENCIA:

Estas configuraciones personalizadas se aplican solo cuando el campo Reducción de ruido personalizada (Radio) se selecciona en el Perfil del radio al que se hace referencia.

No modifique la configuración Reducción de ruido a menos que sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

10.10.3

E Wind NBANDS

Esta programación permite ajustar los parámetros de reducción de ruido para condiciones de ruido específicas.

IMPORTANTE:

La Configuración de reducción de ruido del radio - [Perfiles de radio en la página 703](#) se recomienda para la mayoría de los ambientes ruidosos.

ADVERTENCIA:

Estas configuraciones personalizadas se aplican solo cuando el campo Reducción de ruido personalizada (Radio) se selecciona en el Perfil del radio al que se hace referencia.

No modifique la configuración Reducción de ruido a menos que sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

Existen dos valores separados que definen el rango.

Mesa 52: Primer valor

Mínimo	Máximo	Incrementos
0	65535	1

Mesa 53: Segundo valor

Mínimo	Máximo	Incrementos
0	FFFF (Hex)	1

Esta programación permite ajustar los parámetros de reducción de ruido para condiciones de ruido específicas.

**ADVERTENCIA:**

Estas configuraciones personalizadas se aplican solo cuando el campo Reducción de ruido personalizada (Radio) se selecciona en el Perfil del radio al que se hace referencia.

No modifique la configuración Reducción de ruido a menos que sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

**IMPORTANTE:**

La Configuración de reducción de ruido del radio - [Perfiles de radio en la página 703](#) se recomienda para la mayoría de los ambientes ruidosos.

Aunque este campo muestra el valor como un valor no firmado, el firmware de radio interpreta el valor hexadecimal como un valor firmado. Por lo tanto, ingrese el valor firmado deseado en el cuadro Hexadecimal (el que está más a la derecha), no en el cuadro Decimal. Por ejemplo, si desea ingresar -1E00 (-7680), ingresará E200 (el segundo complemento) en el cuadro Hexadecimal. El cuadro Decimal sigue mostrando 57856, pero el firmware interpreta E200 como un número negativo en el radio.

Existen dos valores separados que definen el rango.

Mesa 62: Primer valor

10.10.14

VECTOR EQ SALIDA DINC

Esta configuración permite cambiar el parámetro VECTOR EQ SALIDA DINC (Cancelador de ruido de entrada doble) para el micrófono interno.

ADVERTENCIA:

Esta configuración personalizada se aplica solo cuando el campo Reducción de ruido personalizada (Radio) se selecciona en el Perfil del radio de referencia.

No modifique la configuración Reducción de ruido a menos que sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación. Ir a la ventana Reducción de ruido del radio.

10.10.15

VECTOR EP DINC

Esta configuración permite cambiar el parámetro VECTOR EP DINC (Cancelador de ruido de entrada doble) para el micrófono interno.

ADVERTENCIA:

Esta configuración personalizada se aplica solo cuando el campo Reducción de ruido personalizada (Radio) se selecciona en el Perfil del radio de referencia.

No modifique la configuración Reducción de ruido a menos que sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación. Ir a la ventana Reducción de ruido del radio.

10.10.16

LÍMITES AUTOMÁTICOS DE RUIDO DE RADIO DBQ8

Este par de números configuran los límites de ruido inferiores y superiores (en dB en relación con escala completa) para el control automático de los niveles de reducción de ruido.

ADVERTENCIA:

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Se admiten las siguientes selecciones:

- La longitud de los LÍMITES AUTOMÁTICOS DE RUIDO DEL RADIO DBQ8 debe ser igual a 8; y
- [X] de LÍMITES AUTOMÁTICOS DE RUIDO DE RADIO DBQ8 es de "-23040" a "0" y
- [Y] de LÍMITES AUTOMÁTICOS DE RUIDO DE RADIO DBQ8 es de "-23040" a "0" y
- [X] NO es mayor que [Y].

NOTA:

LÍMITES AUTOMÁTICOS DE RUIDO DE RADIO DBQ8 es el vector de dos números enteros de 16 bits.

Cada cuatro números hexadecimales representa un número entero firmado de 16 bits. El rango para cada uno de los dos números ([X] e [Y]) es de 23040 a 0 inclusive.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.10.17

VECTOR DE GANANCIA MÍNIMA AUTOMÁTICA DE RADIO

Este vector configura los límites en la ganancia mínima para el modo automático de supresión de ruido.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Se admiten las siguientes selecciones:

- La longitud de RADIO AUTO MIN GAIN VECTOR debe ser igual a 8 y
- [X] de VECTOR GANANCIA MIN AUTOMÁTICA DE RADIO es de "0" a "32767"; y
- [Y] de RADIO AUTO MIN GAIN VECTOR es de "0" a "32767" y
- [Y] NO es mayor que [X].

**NOTA:**

RADIO AUTO MIN GAIN VECTOR es el vector de dos números enteros de 16 bits: Cada cuatro números hexadecimales representa un número entero firmado de 16 bits. El rango para cada uno de los dos números ([X] e [Y]) es de 0 a 32767 en decimal.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.10.18

LÍMITES AUTOMÁTICOS DE RELAJACIÓN DE RADIO

Este vector configura los límites en la relajación con frecuencia para el modo automático de supresión de ruido.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Se admiten las siguientes selecciones:

- La longitud de los LÍMITES AUTOMÁTICOS DE RELAJACIÓN DE RADIO debe ser igual a 4 y
- [X] de LÍMITES AUTOMÁTICOS DE RELAJACIÓN DE RADIO es de "0" a "10"; y
- [Y] de LÍMITES AUTOMÁTICOS DE RELAJACIÓN DE RADIO es de "0" a "10" y
- [X] NO es mayor que [Y].

**NOTA:**

LÍMITES AUTOMÁTICOS DE RELAJACIÓN DE RADIO es el vector de dos números enteros de 8 bits.

Cada dos números hexadecimales representa un número entero firmado de 8 bits. El rango para cada uno de los dos números ([X] e [Y]) es de 0 a 10 inclusive.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.10.19

INICIO DE FILTRO DE PASO DE RADIO

Este campo define la frecuencia que aplica el filtro de PASO automático.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 74: Rango

Mínimo	Máximo	Incrementos
1	3999	1

10.10.20

MODO MIXTO DE SAM DE RADIO

Este parámetro controla cómo se forma la señal de entrada de audio desde Altavoz como micrófono.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 75: Rango

Mínimo	Máximo	Incrementos
0	2	1

10.10.21

FRECUENCIA DE CORTE SAM DE RADIO

Este campo define la frecuencia que utiliza la entrada del Altavoz como micrófono.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 76: Rango

Mínimo	Máximo	Incrementos
1	3999	1

10.10.22

TASA MIXTA DE HOTBEAM DE RADIO

Este campo controla la detección automática de hot-beam. El número más alto cambia lentamente

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 77: Rango

Mínimo	Máximo	Incrementos
1	250	1

10.10.23

ATENUACIÓN MÁXIMA DEL DESTELLO DEL RADIO DBQ8

En este campo se establece el nivel máximo de atenuación que se puede aplicar a cualquiera de los dos destellos.

ADVERTENCIA:

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 78: Rango

Mínimo	Máximo	Incrementos
1	7680	1

10.11

Conjunto Perfil de reducción de ruido de micrófono externo

El conjunto **Perfil de reducción de ruido de micrófono externo** permite al usuario ver o definir los parámetros de reducción de ruido para micrófonos externos diseñados para condiciones de ruido específicas.

Esta configuración se aplica en todos los radios.

NOTA:

La reducción de ruido mejora la claridad de la voz al reducir el ruido ambiental. La reducción de ruido ocurre en el radio de transmisión antes de la transmisión (en modo analógico) y antes de la codificación de voz (en modo digital). No solo reduce el ruido de fondo, sino que también mejora la claridad de voz para una transmisión de modo analógico. En el modo digital, el ingreso de una señal más clara en el codificador de voz (vocoder) se traduce en la recepción y decodificación de voz más clara en el receptor.

ADVERTENCIA:

Estas configuraciones personalizadas se aplican solo cuando el campo Reducción de ruido personalizada (Accesorio) se selecciona en el Perfil del radio al que se hace referencia.

No modifique la configuración Reducción de ruido, a menos que el usuario sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

Se admiten los siguientes campos:

10.11.1

Nombre del perfil de reducción de ruido de accesorio

Este campo le permite ver o definir nombres reconocibles para el Perfil de reducción de ruido del accesorio actual.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

**IMPORTANTE:**

Se recomienda utilizar la configuración Perfiles de radio - Reducción de ruido de micrófono externo para la mayoría de los ambientes ruidosos.

**ADVERTENCIA:**

Estas configuraciones personalizadas se aplican solo cuando el campo Reducción de ruido personalizada (Accesorio) se selecciona en el Perfil del radio al que se hace referencia.

No modifique la configuración Reducción de ruido a menos que sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

**NOTA:**

Ejemplos: NRP-001, #500, Ext Mic NR 3, # A5

Se pueden usar caracteres, números, espacios y caracteres especiales.

Es posible usar un total de 14 caracteres.

10.11.2

E Wind DINC EWIND NBANDS

Esta programación permite ajustar los parámetros de reducción de ruido para condiciones de ruido específicas. Se recomienda utilizar Perfiles de radio - Configuración de reducción de ruido (accesorio) para la mayoría de los ambientes ruidosos.

**ADVERTENCIA:**

Esta configuración personalizada se aplica solo cuando el campo Reducción de ruido personalizada (Accesorio) se selecciona en el Perfil de radio de referencia.

No modifique la configuración Reducción de ruido a menos que sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

Existen dos valores separados que definen el rango.

Mesa 79: Primer valor

Mínimo	Máximo	Incrementos
0	65535	1

Mesa 80: Segundo valor

Mínimo	Máximo	Incrementos
0	FFFF (Hex)	1

10.11.3

Vector E Wind MAXS

Esta programación permite ajustar los parámetros de reducción de ruido para condiciones de ruido específicas.

IMPORTANTE:

Se recomienda utilizar la configuración Perfiles de radio - Reducción de ruido de accesorio para la mayoría de los ambientes ruidosos.

Este parámetro tiene un rango efectivo de 31 valores coeficientes de 16 bits cada uno, lo que equivale a 124 caracteres BCH (nibble de 4 bits). Sin embargo, esto requiere que se ingresen valores con coeficiente 32. Cuando ingrese los coeficientes para este vector, el 32.do valor es el que se encuentra más a la derecha (o el menos significativo). En otras palabras, los últimos cuatro caracteres BCH. Asegúrese de hacer que este 32.do valor sea igual que el 31.er. El procesador de señal digital (DSP) del radio ignora el 32.do valor.

ADVERTENCIA:

Esta configuración personalizada se aplica solo cuando el campo Reducción de ruido personalizada (Accesorio) se selecciona en el Perfil de radio de referencia.

No modifique la configuración Reducción de ruido a menos que sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

10.11.4

SS ABF DINC

Esta programación permite ajustar los parámetros de reducción de ruido para condiciones de ruido específicas. Se recomienda utilizar la configuración Perfiles de radio - Reducción de ruido de accesorio para la mayoría de los ambientes ruidosos.

ADVERTENCIA:

Esta configuración personalizada se aplica solo cuando el campo Reducción de ruido personalizada (Accesorio) se selecciona en el Perfil de radio de referencia.

No modifique la configuración Reducción de ruido a menos que sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

Existen dos valores separados que definen el rango.

Mesa 81: Primer valor

Mínimo	Máximo	Incrementos
0	65535	1

Mesa 82: Segundo valor

Mínimo	Máximo	Incrementos
0	FFFF (Hex)	1

10.11.5

DWF MIN GAIN

Esta programación permite ajustar los parámetros de reducción de ruido para condiciones de ruido específicas. Se recomienda utilizar la configuración Perfiles de radio - Reducción de ruido de accesorio para la mayoría de los ambientes ruidosos.

**ADVERTENCIA:**

Esta configuración personalizada se aplica solo cuando el campo Reducción de ruido personalizada (Accesorio) se selecciona en el Perfil de radio de referencia.

No modifique la configuración Reducción de ruido a menos que sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

Existen dos valores separados que definen el rango.

Mesa 83: Primer valor

Mínimo	Máximo	Incrementos

0	65535	1

Mesa 88: Segundo valor

Mínimo	Máximo	Incrementos
0	FFFF (Hex)	1

10.11.8

Estado VAD DET THRESH DBQ8

Esta programación permite ajustar los parámetros de reducción de ruido para condiciones de ruido específicas.

ADVERTENCIA:

Esta configuración personalizada se aplica solo cuando el campo Reducción de ruido personalizada (Accesorio) se selecciona en el Perfil de radio de referencia.

No modifique la configuración Reducción de ruido a menos que sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

IMPORTANTE:

Se recomienda utilizar la configuración Perfiles de radio - Reducción de ruido de accesorio para la mayoría de los ambientes ruidosos.

Aunque este campo muestra el valor como un valor no firmado, el firmware de radio interpreta el valor hexadecimal como un valor firmado. Por lo tanto, ingrese el valor firmado deseado en el cuadro Hexadecimal (el que está más a la derecha), no en el cuadro Decimal. Por ejemplo, si desea ingresar -1E00 (-7680), ingresará E200 (el segundo complemento) en el cuadro Hexadecimal. El cuadro Decimal sigue mostrando 57856, pero el firmware interpreta E200 como un número negativo en el radio.

Existen dos valores separados que definen el rango.

Mesa 89: Primer valor

Mínimo	Máximo	Incrementos
0	65535	1

Mesa 90: Segundo valor

Mínimo	Máximo	Incrementos
0	FFFF (Hex)	1

10.11.9

Estado VAD DET COUNT

Esta programación permite ajustar los parámetros de reducción de ruido para condiciones de ruido específicas. Se recomienda utilizar la configuración Perfiles de radio - Reducción de ruido de accesorio para la mayoría de los ambientes ruidosos.

**ADVERTENCIA:**

Esta configuración personalizada se aplica solo cuando el campo Reducción de ruido personalizada (Accesorio) se selecciona en el Perfil de radio de referencia.

No modifique la configuración Reducción de ruido a menos que sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

Existen dos valores separados que definen el rango.

Mesa 91: Primer valor

10.11.14

VECTOR EQ SALIDA DINC

Esta programación permite cambiar el parámetro VECTOR EQ SALIDA DINC (Cancelador de ruido de entrada dual) para el micrófono externo.

**ADVERTENCIA:**

Esta configuración personalizada se aplica solo cuando el campo Reducción de ruido personalizada (Accesorio) se selecciona en el Perfil de radio de referencia.

No modifique la configuración Reducción de ruido a menos que sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

10.11.15

VECTOR EP DINC

Esta programación permite cambiar el parámetro VECTOR EP DINC (Cancelador de ruido de entrada dual) para el micrófono externo.

**ADVERTENCIA:**

Esta configuración personalizada se aplica solo cuando el campo Reducción de ruido personalizada (Accesorio) se selecciona en el Perfil de radio de referencia.

No modifique la configuración Reducción de ruido a menos que sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

10.11.16

LÍMITES AUTOMÁTICOS DE RUIDO DE ACCESORIO DBQ8

Este par de números configuran los límites de ruido inferiores y superiores (en dB en relación con escala completa) para el control automático de los niveles de reducción de ruido.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Se admiten las siguientes selecciones:

- La longitud de LÍMITES AUTOMÁTICOS DE RUIDO DE ACCESORIO DBQ8 debe ser igual a 8; y
- [X] de LÍMITES AUTOMÁTICOS DE RUIDO DE ACCESORIO DBQ8 es de "-23040" a "0" y
- [Y] de LÍMITES AUTOMÁTICOS DE RUIDO DE ACCESORIO DBQ8 es de "-23040" a "0" y
- [X] NO es mayor que [Y].

**NOTA:**

LÍMITES AUTOMÁTICOS DE RUIDO DE ACCESORIO DBQ8 es el vector de dos números enteros de 16 bits.

Cada cuatro números hexadecimales representa un número entero firmado de 16 bits. El rango para cada uno de los dos números ([X] e [Y]) es de -23040 a 0 incluidos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.11.17

VECTOR DE GANANCIA MÍNIMA AUTOMÁTICA DE ACCESORIO

Este vector configura los límites en la ganancia mínima para el modo automático de supresión de ruido.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Se admiten las siguientes selecciones:

- La longitud del VECTOR DE GANANCIA MÍNIMA AUTOMÁTICA DE ACCESORIO debe ser igual a 8 y
- [X] de VECTOR DE GANANCIA MÍNIMA AUTOMÁTICA DE ACCESORIO es de "0" a "32767" y
- [Y] de VECTOR DE GANANCIA MÍNIMA AUTOMÁTICA DE ACCESORIO es de "0" a "32767" y

- [Y] NO es mayor que [X].

**NOTA:**

El VECTOR DE GANANCIA MÍNIMA AUTOMÁTICA DE ACCESORIO es el vector de dos números enteros de 16 bits:

Cada cuatro números hexadecimales representa un número entero firmado de 16 bits. El rango para cada uno de los dos números ([X] e [Y]) es de 0 a 32767 en decimal.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.11.18

LÍMITES AUTOMÁTICOS DE RELAJACIÓN DE ACCESORIO

Este vector configura los límites en la relajación con frecuencia para el modo automático de supresión de ruido.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Se admiten las siguientes selecciones:

- La longitud de los LÍMITES AUTOMÁTICOS DE RELAJACIÓN DE ACCESORIO debe ser igual a 4 y
- [X] de LÍMITES AUTOMÁTICOS DE RELAJACIÓN DE ACCESORIO es de “0” a “10” y
- [Y] de LÍMITES AUTOMÁTICOS DE RELAJACIÓN DE ACCESORIO es de “0” a “10” y
- [X] NO es mayor que [Y].

**NOTA:**

LÍMITES AUTOMÁTICOS DE RELAJACIÓN DE ACCESORIO es el vector de dos números enteros de 8 bits.

Cada dos números hexadecimales representa un número entero firmado de 8 bits. El rango para cada uno de los dos números ([X] e [Y]) es de 0 a 10 inclusive.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.11.19

INICIO DE FILTRO DE PASO DE ACCESORIO

Este campo define la frecuencia que aplica el filtro de PASO automático.

**ADVERTENCIA:**

Solo el Personal de servicio calificado debe modificar el valor de este campo. Una configuración incorrecta puede causar resultados imprevisibles en el radio.

Mesa 101: Rango

Mínimo	Máximo	Incrementos
1	3999	1

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.12

Lista de reducción de ruido global

El **Perfil de reducción de ruido global** le permite al usuario ver o definir los parámetros personalizados del Cancelador de ruido de entrada doble (DINC).

Esta configuración se aplica en todos los radios.

**NOTA:**

La reducción de ruido mejora la claridad de la voz al reducir el ruido ambiental. La reducción de ruido ocurre en el radio de transmisión antes de la transmisión (en modo analógico) y antes de la codificación de voz (en modo digital). No solo reduce el ruido de fondo, sino que también mejora la claridad de voz para una transmisión de modo analógico. En el modo digital, el ingreso de una señal más clara en el codificador de voz (vocoder) se traduce en la recepción y decodificación de voz más clara en el receptor.

**ADVERTENCIA:**

Estos ajustes personalizados se aplican solo cuando el campo Activación de reducción de ruido global personalizado está seleccionado en el Perfil del radio al que se hace referencia.

No modifique la configuración Reducción de ruido, a menos que el usuario sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

Se admiten los siguientes campos:

10.12.1**VECTOR DINC SPATIAL EQ1**

Esta programación permite cambiar el parámetro interno VECTOR DINC SPATIAL EQ1 (Cancelador de ruido de entrada doble).

**ADVERTENCIA:**

Esta configuración personalizada se aplica solo cuando el campo Activación personalizada de reducción de ruidos a nivel general se selecciona en los [Perfiles de radio en la página 703](#) de referencia.

No modifique la configuración Reducción de ruido a menos que sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

10.12.2**VECTOR DINC SPATIAL EQ1 CONT**

Esta programación permite cambiar el parámetro interno VECTOR DINC SPATIAL EQ1 (Cancelador de ruido de entrada doble).

El valor de este campo se anexará al valor del parámetro [VECTOR DINC SPATIAL EQ1 en la página 262](#) para crear los sesenta y seis coeficientes completos del vector espacial.

**ADVERTENCIA:**

Esta configuración personalizada se aplica solo cuando el campo Activación personalizada de reducción de ruidos a nivel general se selecciona en los [Perfiles de radio en la página 703](#) de referencia.

No modifique la configuración Reducción de ruido a menos que sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

10.12.3

VECTOR DINC SPATIAL EQ2

Esta programación permite cambiar el parámetro interno VECTOR DINC SPATIAL EQ2 (Cancelador de ruido de entrada doble).

**ADVERTENCIA:**

Esta configuración personalizada se aplica solo cuando el campo Activación personalizada de reducción de ruidos a nivel general se selecciona en los [Perfiles de radio en la página 703](#) de referencia.

No modifique la configuración Reducción de ruido a menos que sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

10.12.4

VECTOR DINC SPATIAL EQ2 CONT

Esta programación permite cambiar el parámetro interno VECTOR DINC SPATIAL EQ2 (Cancelador de ruido de entrada doble).

El valor de este campo se anexará al valor del parámetro [VECTOR DINC SPATIAL EQ2 en la página 263](#) para crear los sesenta y seis coeficientes completos del vector espacial.

**ADVERTENCIA:**

Esta configuración personalizada se aplica solo cuando el campo Activación personalizada de reducción de ruidos a nivel general se selecciona en los [Perfiles de radio en la página 703](#) de referencia.

No modifique la configuración Reducción de ruido a menos que sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

10.12.5

VECTOR DINC BF EQ

Esta programación permite cambiar el parámetro interno VECTOR DINC BF EQ (Cancelador de ruido de entrada doble).

**ADVERTENCIA:**

Esta configuración personalizada se aplica solo cuando el campo Activación personalizada de reducción de ruidos a nivel general se selecciona en los [Perfiles de radio en la página 703](#) de referencia.

No modifique la configuración Reducción de ruido a menos que sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

10.12.6

HISTÉRESIS DINC HOTBEAM

Esta programación permite cambiar el parámetro interno HISTÉRESIS DINC HOTBEAM (Cancelador de ruido de entrada doble).

ADVERTENCIA:

Esta configuración personalizada se aplica solo cuando el campo Activación personalizada de reducción de ruidos a nivel general se selecciona en los [Perfiles de radio en la página 703](#) de referencia.

No modifique la configuración Reducción de ruido a menos que sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

Existen dos valores separados que definen el rango.

Mesa 102: Primer valor

Mínimo	Máximo	Incremento
0	65535	1

Mesa 103: Segundo valor

Mínimo	Máximo	Incremento
0	FFFF (Hex)	1

10.12.7

HISTÉRESIS MIC MALO DINC

Esta programación permite cambiar el parámetro interno HISTÉRESIS MIC MALO DINC (Cancelador de ruido de entrada doble).

ADVERTENCIA:

Esta configuración personalizada se aplica solo cuando el campo Activación personalizada de reducción de ruidos a nivel general se selecciona en los [Perfiles de radio en la página 703](#) de referencia.

No modifique la configuración Reducción de ruido a menos que sea Personal de servicio calificado. Las configuraciones inadecuadas pueden provocar que niveles altos de ruido se transmitan con voz, lo que puede causar fallas en la comunicación.

Existen dos valores separados que definen el rango.

Mesa 104: Primer valor

0	65535	1

Mesa 105: Segundo valor

Mínimo	Máximo	Incremento
0	FFFF (Hex)	1

10.13

Lista de señalización de tono

Esta sección permite definir listas individuales de señalización de tono. Se puede agregar un máximo de 1000 registros en todas las listas de señalización de tono.

**NOTA:**

Cuando el tipo de lista de tonos corresponde a **Quick-Call II**, es posible crear 10 listas de señalización de tono independientes con un máximo de 100 registros cada una.

Las listas individuales de señalización de tono se pueden seleccionar para personalidades convencionales y de troncalización con el respectivo campo Lista de señalización de tono.

Para las comunicaciones de troncalización, el tono de señalización se aplica solo para las personalidades de troncalización que hacen referencia a un sistema de troncalización y tienen su campo Tipo de sistema configurado en **ASTRO 25**.

Cuando el tipo de lista de tonos es **Un tono**, se permite un máximo de 100 entradas en una lista de señalización de tono. Las listas de señalización de tono y los registros de Alias de tono pueden seleccionarse para las personalidades convencionales con el respectivo campo Selección de señalización de tono.

**NOTA:**

El radio puede decodificar de 1 a 10 tonos en cada lista y codificar todos los tonos cuando el tipo de lista de tonos es **Quik-Call II**.

10.13.1

Alias de lista de tono

Este campo permite definir nombres reconocibles para la Lista de señalización de tono actual.

Una vez definidas, las listas de señalización de tono individuales se pueden seleccionar para Personalidades convencionales ASTRO y de troncalización ASTRO 25 con su respectivo campo de **Lista de señalización de tono**.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

**NOTA:**

EMT-001, #500, Electric1, # A5.

Se pueden usar caracteres, números, espacios y caracteres especiales.

Se pueden utilizar hasta 14 caracteres.

10.13.2

Tipo de lista de tonos

En este campo se selecciona el tipo de señalización de tono en la Lista de señalización de tono actual.

La Lista de señalización de tono se selecciona en la Lista de señalización de tono de Personalidades convencionales/de troncalización o en la Selección de la lista de un tono de acceso a repetidor (RAC) de las Personalidades convencionales.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Un solo tono

Una de las señalizaciones de tono que permite acceder selectivamente a los repetidores en toda la señalización analógica convencional.

Quik-Call II

Una de las señalizaciones de tono individual.

10.13.3

Alias tono

Este campo permite definir el texto del tono para un tono único en la Tabla de señalización de tono.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.13.4

Frecuencia de tono 1

En este campo se selecciona la frecuencia de tono 1 de recepción para la Lista de señalización de tono actual (registro/fila).

Una vez seleccionada, para una secuencia de dos tonos es necesario seleccionar la Frecuencia de tono 2.

Esta selección se aplica solo para comunicación Astro convencional y de troncalización de ASTRO 25.

ADVERTENCIA:

La tecnología Codificador de voz AMBE digital que utiliza tanto la consola de despacho como el radio no codifica/decodifica de forma precisa las correspondientes frecuencias Quik-Call II (analógicas); en lugar de ello, en el rango de frecuencias disponibles para Frec. de tono 1 y Frec. de tono 2 (265,625 Hz - 3109,375 Hz), el codificador de voz transforma los grupos de frecuencias de distribución uniforme en un conjunto de frecuencias “estándares”, donde cada grupo tiene un rango de frecuencia permitida, y se define una frecuencia estándar en el centro de cada grupo.

Por lo tanto, cuando una frecuencia de tono programada se encuentra dentro del rango permitido de una de las frecuencias estándar, el radio la decodifica como esa frecuencia.

De forma óptima, las frecuencias de tono programadas del radio deben coincidir con las frecuencias de tono programadas en la consola de despacho para evitar potenciales pérdidas de llamadas.

Las definiciones del grupo de frecuencia de tonos específico dependen del Tipo de canal y, por lo tanto, de canales TDMA (Acceso múltiple por división de tiempo) versus FDMA (Acceso múltiple por división de frecuencias).

- Para canales TDMA, hay 91 grupos, donde cada grupo abarca un rango de 31,25 Hz.
- Para canales FDMA, hay 72 grupos, donde algunos grupos abarcan un rango de 31,25 Hz y otros de 62,5 Hz.

Al configurar frecuencias de tono:

- Para un registro único con frecuencia de dos tonos, debe evitarse una combinación donde tanto Frec. de tono 1 como Frec. de tono 2 estén configuradas como el mismo tono, ya que el radio no puede decodificar esa entrada de dos tonos.
- Para un registro de frecuencia único con dos tonos, se debe evitar una combinación donde tanto Frec. de tono 1 como Frec. de tono 2 se encuentren dentro del mismo grupo de frecuencia, ya que se decodifican como el mismo tono. Por ejemplo, un registro con frecuencia de dos tonos que posee 927 Hz y 940 Hz se decodifica para que ambos sean de 937,5 Hz.
- Para registros de dos tonos separados, debe evitarse una combinación en la cual la Frecuencia de tono 1 y la Frecuencia de tono 2 en los dos registros respectivamente se encuentren en el mismo grupo de frecuencias, ya que se decodifican como la misma secuencia de tonos. Por ejemplo, si el primer registro es de 927 Hz y 1240 Hz, y el segundo registro es de 940 Hz y 1260 Hz, ambos registros se decodifican como 937,5 Hz y 1250 Hz.
- En ciertos casos, la frecuencia de tono digital no puede decodificarse de forma constante en un valor de frecuencia específica; en lugar de eso, se decodifica en forma aleatoria en uno o dos valores diferentes. La tabla presenta una lista con las frecuencias de tonos que se deben evitar para canales tanto FDMA como TDMA.

Consulte [Lista de frecuencias de tono no compatibles en la página 268](#).

Solo se accede: Cuando [Tipo de lista de tonos en la página 265](#) es **Quick-Call II**, y cuando el radio admite modelos y opciones diferentes.

Índice	Rango de frec. (Hz)	Frec. decodifi cada (Hz)	Índice	Rango de frec. (Hz)	Frec. decodifi cada (Hz)	Índice	Rango de frec. (Hz)	Frec. decodifi cada (Hz)
31	1203.2 - 1234.3	1218.75	62	2171.9 - 2203.1	2187.5			

**IMPORTANTE:**

Cuando lo recibe el radio, cualquier frecuencia de tono dentro de un grupo específico (rango) se decodificará como la frecuencia estándar para ese grupo. Por ejemplo, 937,5 Hz es una frecuencia de tono que admite un codificador de voz estándar (para canales TDMA); por lo tanto, cualquier frecuencia de tono que se reciba entre 921,875 Hz y 953,125 Hz se decodifica como un tono de 937,5 Hz.

El rango de frecuencia de tono Quik-Call II es de 288,5 Hz - 3086 Hz. Conforme a la tabla anterior, el radio decodifica 288,5 Hz - 296,875 Hz como 281,25 Hz, mientras que 3046,875 Hz - 3086 Hz se decodifica como 3093,75 Hz.

10.13.4.3

Frecuencias estándares y rangos de grupo aplicables para FDMA

Para canales FDMA, hay 72 grupos de frecuencias, donde algunos grupos abarcan un rango de 31,25 Hz y otros de 62,5 Hz (en negrita a continuación). La tabla presenta una lista con la frecuencia estándar, y la correspondiente frecuencia mínima y máxima para cada grupo:

Mesa 108: Frecuencias

Índice	Rango de frec. (Hz)	Frec. decodifi cada (Hz)	Índice	Rango de frec. (Hz)	Frec. decodifi cada (Hz)	Índice	Rango de frec. (Hz)	Frec. decodifi cada (Hz)

				1828.1			3109.3	

**IMPORTANTE:**

Cuando lo recibe el radio, cualquier frecuencia de tono dentro de un grupo específico (rango) se decodificará como la frecuencia estándar para ese grupo. Por ejemplo, 932 Hz es una frecuencia de tono que admite un codificador de voz estándar (para canales FDMA); por lo tanto, cualquier frecuencia de tono que se reciba entre 921,875 Hz y 953,125 Hz se decodifican como un tono de 932 Hz.

El rango de frecuencia de tono Quik-Call II es de 288,5 Hz - 3086 Hz. Conforme a la tabla anterior, el radio decodifica 288,5 Hz - 296,875 Hz como 283 Hz, mientras que 3046,875 Hz - 3086 Hz se decodifica como 3082,25 Hz.

10.13.5**Frecuencia de tono 2**

En este campo se selecciona la frecuencia de tono 2 de recepción para la actual Lista de señalización de tono actual (registro/fila).

Esto solo es necesario cuando se requiere una secuencia de dos tonos, donde la Frecuencia de tono 1 y la Frecuencia de tono 2 definen de forma colectiva la secuencia deseada de tonos en la Lista de señalización de tono actual.

Esta selección se aplica solo para comunicación Astro convencional y de troncalización de ASTRO 25.

ADVERTENCIA:

La tecnología Codificador de voz AMBE digital que utiliza tanto la consola de despacho como el radio no codifica/decodifica de forma precisa las correspondientes frecuencias Quik-Call II (analógicas); en lugar de ello, en el rango de frecuencias disponibles para la Frecuencia de tono 1 y la Frecuencia de tono 2 (de 265,625 Hz a 3109,375 Hz), el codificador de voz transforma los grupos de frecuencias de distribución uniforme en un conjunto de frecuencias "estándar", en el cual cada grupo tiene un rango de frecuencia permitida, y se define una frecuencia estándar en el centro de cada grupo.

Por lo tanto, cuando una frecuencia de tono programada se encuentra dentro del rango permitido de una de las frecuencias estándar, el radio la decodifica como esa frecuencia.

De forma óptima, las frecuencias de tono programadas del radio deben coincidir con las frecuencias de tono programadas en la consola de despacho para evitar potenciales pérdidas de llamadas.

Las definiciones del grupo de frecuencia de tonos específico dependen del Tipo de canal y, por lo tanto, de canales TDMA (Acceso múltiple por división de tiempo) versus FDMA (Acceso múltiple por división de frecuencias).

- Para canales TDMA, hay 91 grupos, donde cada grupo abarca un rango de 31,25 Hz.
- Para canales FDMA, hay 72 grupos, donde algunos grupos abarcan un rango de 31,25 Hz y otros de 62,5 Hz.

Al configurar frecuencias de tono:

- Para un registro único con frecuencia de dos tonos, debe evitarse una combinación donde tanto Frec. de tono 1 como Frec. de tono 2 estén configuradas como el mismo tono, ya que el radio no puede decodificar esa entrada de dos tonos.
- Para un registro de frecuencia único con dos tonos, se debe evitar una combinación donde tanto Frec. de tono 1 como Frec. de tono 2 se encuentren dentro del mismo grupo de frecuencia, ya que se decodifican como el mismo tono. Por ejemplo, un registro con frecuencia de dos tonos que posee 927 Hz y 940 Hz se decodifica para que ambos sean de 937,5 Hz.
- Para registros de dos tonos separados, debe evitarse una combinación en la cual la Frecuencia de tono 1 y la Frecuencia de tono 2 en los dos registros respectivamente se encuentren en el mismo grupo de frecuencias, ya que se decodifican como la misma secuencia de tonos. Por ejemplo, si el primer registro es de 927 Hz y 1240 Hz, y el segundo registro es de 940 Hz y 1260 Hz, ambos registros se decodifican como 937,5 Hz y 1250 Hz.
- En ciertos casos, la frecuencia de tono digital no puede decodificarse de forma constante en un valor de frecuencia específica; en lugar de eso, se decodifica en forma aleatoria en uno o dos valores diferentes. La tabla presenta una lista con las frecuencias de tonos que se deben evitar para canales tanto FDMA como TDMA.

Consulte [Lista de frecuencias de tono no compatibles en la página 268](#).

Solo se accede: Cuando [Tipo de lista de tonos en la página 265](#) es **Quick-Call II**, y cuando el radio admite modelos y opciones diferentes.

NOTA:

Cuando está configurado en **Desactivado**, se puede aplicar un solo tono (Frec. de tono 1) para el miembro de la Lista de señalización de tono actual.

Mesa 109: Rango

Mínimo	Máximo	Incrementos
288,5 Hz	3086,0 Hz	0,1 Hz

Consulte [Frecuencias estándares y rangos de grupo aplicables para TDMA en la página 268](#).

Consulte [Frecuencias estándares y rangos de grupo aplicables para FDMA en la página 271](#).

10.13.6

Desilenciar activado

Este campo permite que el radio permanezca silenciado para todas las llamadas de despacho convencionales recibidas y las llamadas de grupo de troncalización afiliadas hasta que el radio decodifica los tonos de Señalización de tono entrantes definidos en el registro o la fila actual.

Esta selección se aplica solo para comunicación Astro convencional y de troncalización de ASTRO 25.

NOTA:

- En situaciones donde el despacho necesita transmitir varios tonos de señalización en forma secuencial (por ejemplo, durante una Llamada general), el primer tono único calificado (o tono par) que coincide con los tonos definidos desilencia el radio y el usuario puede escuchar cualquier tono posterior antes del mensaje de voz.
- Esta función solo funciona en canales que tienen activo Alerta de usuario de llamada entrante donde Silencio de voz está activado.
- La pulsación del botón Silencio de voz o la selección del menú Silencio de voz permiten encender o apagar la funcionalidad Silencio de voz para los canales con activación de Alerta de usuario de llamada entrante.
- El radio puede decodificar 1 a 10 tonos y puede codificar todos los tonos.

Solo se accede: Cuando [Tipo de lista de tonos en la página 265](#) es **Quick-Call II**, y cuando el radio admite modelos y opciones diferentes.

10.13.7

Tono de alerta

En este campo se selecciona un tono de alerta específico para reproducir después de recibir tonos de Señalización de tono definidos en el registro o la fila actual.

Cuando el radio decodifica los tonos, se activa el altavoz y reproduce el tono de alerta asociado, seguido de cualquier audio de voz restante.

Esta selección se aplica solo para comunicación Astro convencional y de troncalización de ASTRO 25.

Solo se accede: Cuando [Tipo de lista de tonos en la página 265](#) es **Quick-Call II**, y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

- Desactivado
- Estándar
- Continuo
- Tono 1 a tono 8

NOTA:

El radio puede decodificar 1 a 10 tonos y puede codificar todos los tonos.

10.13.8

Frecuencia de tono

Este campo permite definir la frecuencia de Un tono para la Lista de señalización de tono.

Solo se accede: Cuando [Tipo de lista de tonos en la página 265](#) es **Un solo tono** y cuando el radio admite modelos y opciones diferentes.

Mesa 110: Rango

Mínimo	Máximo	Incrementos
288,5 Hz	3086,0 Hz	0,1 Hz

10.13.9

Duración del tono

Este campo permite definir la cantidad de tiempo que el radio transmite un tono de frecuencia de Un tono.

Solo se accede: Cuando [Tipo de lista de tonos en la página 265](#) es **Un solo tono** y cuando el radio admite modelos y opciones diferentes.

Mesa 111: Rango

Mínimo	Máximo	Incrementos
25 ms	6375 ms	25 ms

10.13.10

Tiempo previo del tono

Este campo permite definir la cantidad de tiempo que el radio espera antes de enviar un tono de frecuencia de Un tono.

Solo se accede: Cuando [Tipo de lista de tonos en la página 265](#) es **Un solo tono** y cuando el radio admite modelos y opciones diferentes.

Mesa 112: Rango

Mínimo	Máximo	Incrementos
25 ms	6375 ms	25 ms

10.14

Conjunto Idioma

El conjunto **Idioma** permite al usuario definir una lista de idiomas para el radio.

10.14.1

Selección de idioma

Este campo le permite seleccionar el idioma que se utilizará en la pantalla del radio. Esta selección se aplica en base a la amplitud de radio.

La aplicación admite los siguientes idiomas: Los radios admiten los siguientes idiomas:

- Inglés (Australia)
- Inglés (Estados Unidos)
- Francés (Canadá)
- Portugués (Brasil)

- Español (Argentina)
- Español (Chile)
- Español (Colombia)
- Español (México)

**NOTA:**

Cuando el Idioma de la pantalla del radio se configura primero en un idioma distinto del inglés, los tiempos para realizar la Escritura, la Clonación y la Actualización de flash aumentan considerablemente.

Según la configuración Actualizar el idioma del radio, las actualizaciones subsiguientes pueden ser más rápidas.

10.15

ViQi: Alerta del socio virtual

ViQi: El conjunto de **alertas del socio virtual** permite a los usuarios crear una lista de alertas del socio virtual ViQi con sus correspondientes acciones de alerta que definen en la **Consolidación de la acción**. El socio virtual ViQi maneja el inicio de una llamada de socio virtual ViQi de parte de un usuario y permanece activo hasta que finalice la llamada.

**NOTA:**

La lista de alertas es un conjunto fijo de 16 alertas que corresponden a las alertas de socios virtuales ViQi del sistema.

Cada alerta tiene una acción de alerta que es una acción de socio virtual ViQi en la tabla Consolidación de la acción, y se realiza en el radio cuando se recibe la correspondiente alerta de socio virtual ViQi del sistema.

10.15.1

Nombre de la lista de alertas del socio virtual

Este campo le permite ver o definir el nombre reconocible del usuario de la Lista de Alertas de socios virtuales actual.

**NOTA:**

El valor predeterminado es “Lista de socios virtuales 1”.

Se pueden usar caracteres, números, espacios y caracteres especiales.

Es posible usar un total de 14 caracteres.

10.15.1.1

Alias de alerta

Este campo le permite definir el nombre reconocible del usuario del radio cuando se recibe una alerta de Socio virtual desde el sistema.

**NOTA:**

Se pueden usar caracteres, números, espacios y caracteres especiales.

Es posible usar un total de 14 caracteres.

10.15.1.2

Acción de alerta

Este campo le permite especificar la acción que se realizará en el radio cuando un Socio virtual recibe una alerta del sistema.

IMPORTANTE:

Este campo es una referencia a un registro de acción del socio virtual en la tabla Consolidación de la acción. El valor predeterminado es **No asignado**.

10.16

Anuncio de voz en general

Esta sección permite ver o asignar archivos de Anuncio de voz de Motorola (*.MVA) a funciones específicas del radio.

Puede escuchar estos avisos de voz cuando se selecciona una de las funciones asignadas. Esta opción se aplica en base a la amplitud de radio.

NOTA:

La Lista de anuncios de voz permite cargar archivos de Anuncios de voz de Motorola (*.MVA) en el código de ingreso actual de CPS.

10.16.1

General (Anuncio de voz en general)

La sección **General** del conjunto Anuncio de voz en general permite al usuario ver o asignar archivos de Anuncios de voz Motorola (*.MVA) a funciones específicas del radio. El usuario de la radio podrá escuchar estas instrucciones de voz cuando se selecciona una de las funciones asignada. Esta opción se aplica en base a la amplitud de radio.

10.16.1.1

Prioridad de anuncio de voz

En este campo, se selecciona si la reproducción de audio del Anuncio de voz tiene prioridad por sobre el audio de Recepción (Rx) normal.

Esta selección se aplica en base a la amplitud de radio.

IMPORTANTE:

Esta configuración no influye en la interacción del anuncio de voz con los tonos de alerta. Los tonos de alerta momentáneos tienen mayor prioridad que el audio de anuncios de voz, mientras que el audio de anuncios de voz tiene mayor prioridad que los tonos de alerta continuos.

Se admiten las siguientes selecciones:

Bajo

El audio de recepción del radio normal tiene prioridad.

Esto también se conoce como Emergencia táctica.

Alto

La reproducción de audio de anuncio de voz tiene prioridad.

10.16.1.2

Rastreo activado

En este campo, se selecciona el archivo de Anuncio de voz de Motorola (.MVA), si hay alguno, que está asignado a la operación del Modo de Rastreo ACTIVADO.

Cuando se activa el modo de rastreo, se reproduce un mensaje de voz.

Puede cambiar el Modo de rastreo a ACTIVADO con el botón Rastreo o con el switch de alternación Rastreo, o bien con la selección del menú Rastreo. Si se selecciona Texto a voz (TTS), el texto en el campo Comando de voz correspondiente se convertirá en voz y se reproducirá como audio. Esta función no es aplicable cuando el Rastreo automático está activado en el canal operativo del radio.

Esta selección se aplica en base a la amplitud de radio.

NOTA:

La página de Lista de anuncios de voz le permite cargar archivos de Anuncios de voz de Motorola (*.MVA) en el codeplug actual de la aplicación.

Se admiten las siguientes selecciones:

Ninguno

No se necesitan instrucciones de voz para esta función del radio.

TTS

Cuando la función Control por voz está activada, el texto en el campo Comando por voz para Rastreo activado se reproduce como audio.

Archivo de Anuncio de voz Motorola (*.MVA)

Muestra una lista de todos los archivos de voz posibles definidos en la página Lista de archivos de anuncio de voz.

10.16.1.3

Anuncio de TTS para rastreo activado

Una palabra hablada común con el fin de hacer referencia al campo Rastreo activado para anuncios de texto a voz (TTS).

NOTA:

Este campo solo se aplica a radios APX NEXT y APX N70.

Cuando hace clic en el botón **Reproducir** , la aplicación convierte el texto en el campo del comando de voz a voz y lo reproduce a través del altavoz.

Solo se accede:

- [ViQi: Prioridad de control de voz en la página 115](#) no está configurado como **Desactivado**.
- [Rastreo activado en la página 278](#) está configurado como **TTS**.
- El radio admite modelos y opciones diferentes.

NOTA:

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.4

Rastreo desactivado

En este campo, se selecciona el archivo de Anuncio de voz de Motorola (.MVA), si hay alguno, que está asignado a la operación del Modo de Rastreo DESACTIVADO.

Cuando desactiva el modo de rastreo, se reproduce un mensaje de voz.

Puede cambiar el Modo de rastreo a DESACTIVADO con el botón Rastreo o con el switch de alternación Rastreo, o bien con la selección del menú Rastreo. Si se selecciona Texto a voz (TTS), el texto en el campo Comando de voz correspondiente se convertirá en voz y se reproducirá como

audio. Esta función no es aplicable cuando el Rastreo automático está activado en el canal operativo del radio.

Esta selección se aplica en base a la amplitud de radio.

NOTA:

La Página de Lista de Anuncios de voz le permite cargar archivos de Anuncios de voz de Motorola (.MVA) en el codeplug actual de la aplicación.

Se admiten las siguientes selecciones:

Ninguno

No se necesitan instrucciones de voz para esta función del radio.

TTS

Cuando la función Control de voz está activada, el texto en el campo Comando de voz para rastreo desactivado se reproduce como audio.

Archivo de Anuncio de voz de Motorola (.MVA)

Muestra una lista de todos los archivos de voz posibles definidos en la página Lista de archivos de anuncio de voz.

10.16.1.5

Anuncio de TTS para rastreo desactivado

Una palabra hablada común con el fin de hacer referencia al campo Rastreo desactivado para anuncios de texto a voz (TTS).

NOTA:

Este campo solo se aplica a radios APX NEXT y APX N70.

Cuando hace clic en el botón **Reproducir** , la aplicación convierte el texto en el campo del comando de voz a voz y lo reproduce a través del altavoz.

Solo se accede:

- [ViQi: Prioridad de control de voz en la página 115](#) no está configurado como **Desactivado**.
- [Rastreo desactivado en la página 279](#) está configurado como **TTS**.
- El radio admite modelos y opciones diferentes.

NOTA:

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.6

Monitor encendido

En este campo, se selecciona el archivo de Anuncio de voz de Motorola (.MVA), si hay alguno, que se asigna al funcionamiento del Modo de Monitor encendido.

Si se selecciona Texto a voz (TTS), el texto en el campo Comando de voz correspondiente se convertirá en voz y se reproducirá como audio. El Modo de monitor también se conoce como Anulación de PL. El Modo de Monitor le permite supervisar todas las actividades del silenciador de la portadora en el canal actual del radio.

Cuando activa el modo Monitor/anulación de PL, se reproduce el aviso de voz. Esta selección también se aplica solo a comunicaciones convencionales.

ADVERTENCIA:

- Para radios móviles, el archivo de anuncio de voz solo se inicia con una pulsación del botón Monitor o con la selección del menú Monitor.
- Para radios portátiles, el archivo de anuncio de voz solo se inicia cuando la palanca del conmutador está en Desactivación de PL.

NOTA:

- La Página de Lista de Anuncios de voz le permite cargar archivos de Anuncios de voz de Motorola (.MVA) en el codeplug actual de la aplicación.
- En radios móviles, puede desactivar el modo Monitor con una pulsación del botón Monitor o con la selección del menú Monitor.
- En radios portátiles, puede desactivar la Anulación de PL con el switch de alternación en Desactivación de PL.

Se admiten las siguientes selecciones:

Ninguno

No se necesitan instrucciones de voz para esta función del radio.

TTS

Cuando la función Control de voz está activada, el texto del campo Comando de voz para la Activación del monitor se reproduce como audio.

Archivo de Anuncio de voz de Motorola (.MVA)

Muestra una lista de todos los archivos de voz posibles definidos en la página Lista de archivos de anuncio de voz.

10.16.1.7

Anuncio de TTS para el monitor encendido

Una palabra hablada común con el fin de hacer referencia al campo Monitor encendido para anuncios de texto a voz (TTS).

NOTA:

Este campo solo se aplica a radios APX NEXT y APX N70.

Cuando hace clic en el botón **Reproducir** , la aplicación convierte el texto en el campo del comando de voz a voz y lo reproduce a través del altavoz.

Solo se accede:

- [ViQi: Prioridad de control de voz en la página 115](#) no está configurado como **Desactivado**.
- [Monitor encendido en la página 280](#) está configurado como **TTS**.
- El radio admite modelos y opciones diferentes.

NOTA:

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.8

Monitor apagado

En este campo, se selecciona el archivo de Anuncio de voz de Motorola (.MVA), si hay alguno, que se asigna a la operación de Modo de Monitor apagado.

Si se selecciona Texto a voz (TTS), el texto en el campo Comando de voz correspondiente se convertirá en voz y se reproducirá como audio. El Modo de monitor también se conoce como Anulación de PL. El Modo de Monitor le permite supervisar todas las actividades del silenciador de la portadora en el canal actual del radio.

Cuando desactiva el Modo monitor/Anulación de PL, se reproduce la instrucción de voz. Esta selección también se aplica solo a comunicaciones convencionales.

**ADVERTENCIA:**

- Para radios móviles, el archivo de anuncio de voz solo se inicia con una pulsación del botón Monitor o con la selección del menú Monitor.
- Para radios portátiles, el archivo de anuncio de voz solo se inicia cuando la palanca del conmutador está en Desactivación de PL.

**NOTA:**

- La Página de Lista de Anuncios de voz le permite cargar archivos de Anuncios de voz de Motorola (.MVA) en el codeplug actual de la aplicación.
- En radios móviles, puede desactivar el modo Monitor con una pulsación del botón Monitor o con la selección del menú Monitor.
- En radios portátiles, puede desactivar la Anulación de PL con el switch de alternación en Desactivación de PL.

Se admiten las siguientes selecciones:

Ninguno

No se necesitan instrucciones de voz para esta función del radio.

TTS

Cuando la función Control de voz está activada, el texto del campo Comando de voz para la Desactivación del monitor se reproduce como audio.

Archivo de Anuncio de voz de Motorola (.MVA)

Muestra una lista de todos los archivos de voz posibles definidos en la página Lista de archivos de anuncio de voz.

10.16.1.9

Anuncio de TTS para el monitor apagado

Una palabra hablada común con el fin de hacer referencia al campo Monitor apagado para anuncios de texto a voz (TTS).

**NOTA:**

Este campo solo se aplica a radios APX NEXT y APX N70.

Cuando hace clic en el botón **Reproducir** , la aplicación convierte el texto en el campo del comando de voz a voz y lo reproduce a través del altavoz.

Solo se accede:

- [ViQi: Prioridad de control de voz en la página 115](#) no está configurado como **Desactivado**.
- [Monitor apagado en la página 282](#) está configurado como **TTS**.

- El radio admite modelos y opciones diferentes.

**NOTA:**

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.10

Modo directo activado

En este campo, se selecciona el archivo de Anuncio de voz de Motorola (.MVA), si hay alguno, que se asigna al funcionamiento en Modo directo ACTIVADO.

Si se selecciona Texto a voz (TTS), el texto en el campo Comando de voz correspondiente se convertirá en voz y se reproducirá como audio. Cuando activa el modo directo, se reproduce una indicación de voz. Puede activar el modo directo con una pulsación de botón DEK de modo directo.

Esta selección se aplica en base a la amplitud de radio.

**NOTA:**

La Página de Lista de Anuncios de voz le permite cargar archivos de Anuncios de voz de Motorola (.MVA) en el codeplug actual de la aplicación.

Se admiten las siguientes selecciones:

Ninguno

No se necesitan instrucciones de voz para esta función del radio.

TTS

Cuando la función Control de voz está activada, el texto en el campo Comando de voz para el Modo directo se reproduce como audio.

Archivo de Anuncio de voz de Motorola (.MVA)

Muestra una lista de todos los archivos de voz posibles definidos en la página Lista de archivos de anuncio de voz.

10.16.1.11

Anuncio de TTS para el modo directo activado

Una palabra hablada común a fin de hacer referencia al campo Modo directo activado para anuncios de texto a voz (TTS).

**NOTA:**

Este campo solo se aplica a radios APX NEXT y APX N70.

Cuando hace clic en el botón **Reproducir** , la aplicación convierte el texto en el campo del comando de voz a voz y lo reproduce a través del altavoz.

Solo se accede:

- [ViQi: Prioridad de control de voz en la página 115](#) no está configurado como **Desactivado**.
- [Modo directo activado en la página 283](#) está configurado como **TTS**.
- El radio admite modelos y opciones diferentes.

**NOTA:**

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.12

Modo directo desactivado

En este campo, se selecciona el archivo de Anuncio de voz de Motorola (.MVA), si hay alguno, que se asigna al funcionamiento en Modo directo DESACTIVADO.

Si se selecciona Texto a voz (TTS), el texto en el campo Comando de voz correspondiente se convertirá en voz y se reproducirá como audio. Cuando desactiva el modo directo, se reproduce un aviso de voz. Puede desactivar el modo directo con una pulsación de botón DEK de modo directo.

Esta selección se aplica en base a la amplitud de radio.

**NOTA:**

La Página de Lista de Anuncios de voz le permite cargar archivos de Anuncios de voz de Motorola (.MVA) en el codeplug actual.

Se admiten las siguientes selecciones:

Ninguno

No se necesitan instrucciones de voz para esta función del radio.

TTS

Cuando la función Control por voz está habilitada, el texto en el campo Comando por voz para Modo directo desactivado se reproduce como audio.

Archivo de Anuncio de voz de Motorola (.MVA)

Muestra una lista de todos los archivos de voz posibles definidos en la página Lista de archivos de anuncio de voz.

10.16.1.13

Anuncio de TTS para el modo directo desactivado

Una palabra hablada común con el fin de hacer referencia al campo Modo directo desactivado para anuncios de texto a voz (TTS).

**NOTA:**

Este campo solo se aplica a radios APX NEXT y APX N70.

Cuando hace clic en el botón **Reproducir** , la aplicación convierte el texto en el campo del comando de voz a voz y lo reproduce a través del altavoz.

Solo se accede:

- [ViQi: Prioridad de control de voz en la página 115](#) no está configurado como **Desactivado**.
- [Modo directo desactivado en la página 284](#) está configurado como **TTS**.
- El radio admite modelos y opciones diferentes.

**NOTA:**

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.14

Emergencia activada

En este campo, se selecciona el archivo de Anuncio de voz de Motorola (.MVA), si hay alguno, que se asigna a la operación de Modo de Emergencia ENCENDIDO.

Si se selecciona Texto a voz (TTS), el texto en el campo Comando de voz correspondiente se convertirá en voz y se reproducirá como audio. Cuando activa el modo Emergencia, se reproducen las instrucciones de voz.

Puede iniciar una transmisión de emergencia mediante la pulsación del botón Emergencia, o la pulsación de un switch de pedal, o incluso sin la interacción directa con la función Hombre caído de la alarma de emergencia.

Esta selección se aplica en base a la amplitud de radio.

NOTA:

La Página de Lista de Anuncios de voz le permite cargar archivos de Anuncios de voz de Motorola (.MVA) en el codeplug actual de la aplicación.

Se admiten las siguientes selecciones:

Ninguno

No se necesitan instrucciones de voz para esta función del radio.

TTS

Cuando la función Control de voz está activada, el texto en el campo Comando de voz para Emergencia activada se reproduce como audio.

Archivo de Anuncio de voz de Motorola (.MVA)

Muestra una lista de todos los archivos de voz posibles definidos en la página Lista de archivos de anuncio de voz.

10.16.1.15

Anuncio de TTS para emergencia activada

Una palabra hablada común con el fin de hacer referencia al campo Emergencia activada para anuncios de texto a voz (TTS).

NOTA:

Este campo solo se aplica a radios APX NEXT y APX N70.

Cuando hace clic en el botón **Reproducir** , la aplicación convierte el texto en el campo del comando de voz a voz y lo reproduce a través del altavoz.

Solo se accede:

- [ViQi: Prioridad de control de voz en la página 115](#) no está configurado como **Desactivado**.
- [Emergencia activada en la página 284](#) está configurado como **TTS**.
- El radio admite modelos y opciones diferentes.

NOTA:

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.16

Selección de Tx segura encendida

En este campo, se selecciona el archivo de Anuncio de voz de Motorola (.MVA), si hay alguno, que se asigna a transmisiones de encriptado seguro ACTIVADAS.

Si se selecciona Texto a voz (TTS), el texto en el campo Comando de voz correspondiente se convertirá en voz y se reproducirá como audio. Cuando activa las transmisiones de encryption seguro, se reproducen las instrucciones de voz.

Puede activar las transmisiones de encryption seguro por medio de la pulsación del botón Selección de Tx segura o con el switch de alternación Selección de Tx segura, o con la selección del menú Seguro.

Esta selección se aplica en base a la amplitud de radio.

**NOTA:**

La Página de Lista de Anuncios de voz le permite cargar archivos de Anuncios de voz de Motorola (.MVA) en el codeplug actual de la aplicación.

Se admiten las siguientes selecciones:

Ninguno

No se necesitan instrucciones de voz para esta función del radio.

TTS

Cuando la función Control de voz está activada, el texto en el campo Comando de voz para Selección de Tx segura activado se reproduce como audio.

Archivo de Anuncio de voz de Motorola (.MVA)

Muestra una lista de todos los archivos de voz posibles definidos en la página Lista de archivos de anuncio de voz.

10.16.1.17**Anuncio de TTS para selección de Tx segura encendida**

Una palabra hablada común para hacer referencia al campo Selección de Tx segura encendida para anuncios de texto a voz (TTS).

**NOTA:**

Este campo solo se aplica a radios APX NEXT y APX N70.

Cuando hace clic en el botón **Reproducir** , la aplicación convierte el texto en el campo del comando de voz a voz y lo reproduce a través del altavoz.

Solo se accede:

- [ViQi: Prioridad de control de voz en la página 115](#) no está configurado como **Desactivado**.
- [Selección de Tx segura encendida en la página 285](#) está configurado como **TTS**.
- El radio admite modelos y opciones diferentes.

**NOTA:**

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.18**Selección de Tx segura apagada**

En este campo, se selecciona el archivo de Anuncio de voz de Motorola (.MVA), si hay alguno, que se asigna a transmisiones de encriptado seguro DESACTIVADAS (en otras palabras, habilita transmisiones “no encriptadas”).

Si se selecciona Texto a voz (TTS), el texto en el campo Comando de voz correspondiente se convertirá en voz y se reproducirá como audio. Cuando desactiva las transmisiones de encryption seguro, se reproducen las instrucciones de voz.

Puede desactivar las transmisiones de encryption seguro por medio de la pulsación del botón Selección de Tx segura o por el switch de alternación Selección de Tx segura, o por la selección del menú Seguro.

Esta selección se aplica en base a la amplitud de radio.

NOTA:

La Página de Lista de Anuncios de voz le permite cargar archivos de Anuncios de voz de Motorola (.MVA) en el codeplug actual de la aplicación.

Se admiten las siguientes selecciones:

Ninguno

No se necesitan instrucciones de voz para esta función del radio.

TTS

Cuando la función Control de voz está activada, el texto en el campo Comando de voz para Selección de Tx segura desactivada se reproduce como audio.

Archivo de Anuncio de voz de Motorola (.MVA)

Muestra una lista de todos los archivos de voz posibles definidos en la página Lista de archivos de anuncio de voz.

10.16.1.19

Anuncio de TTS para selección de Tx segura apagada

Una palabra hablada común para hacer referencia al campo Selección de Tx segura apagada para anuncios de texto a voz (TTS).

NOTA:

Este campo solo se aplica a radios APX NEXT y APX N70.

Cuando hace clic en el botón **Reproducir** , la aplicación convierte el texto en el campo del comando de voz a voz y lo reproduce a través del altavoz.

Solo se accede:

- [ViQi: Prioridad de control de voz en la página 115](#) no está configurado como **Desactivado**.
- [Selección de Tx segura apagada en la página 286](#) está configurado como **TTS**.
- El radio admite modelos y opciones diferentes.

NOTA:

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.20

Alerta seleccionable del sitio permitida en Fuera de rango

Este campo permite que el radio siga proporcionando retroalimentación ergonómica asociada a la última Alerta seleccionable del sitio (SSA) recibida, en caso de que, durante la Alerta, el radio se haya movido fuera del rango de cobertura del Sitio.

La retroalimentación ergonómica de la SSA decodificada incluye hacer sonar el Anuncio de voz recurrente asociado con la SSA y mostrar su Alias de alerta con iluminación inteligente, en caso de que esté activada. Esta selección se aplica a las comunicaciones de troncalización.

Cuando se desactiva, el radio deja de proporcionar retroalimentación ergonómica para la última Alerta seleccionable del sitio una vez que el radio se haya movido fuera del rango de cobertura del Sitio.

**NOTA:**

- Una Lista de alerta seleccionable del sitio se asigna a un sistema de troncalización ASTRO 25 a través del campo Selección de lista de alerta seleccionable del sitio.
- Puede activar y desactivar las Alertas seleccionables del sitio que tienen **activado** su campo **Suscriptor codificable** con una selección del menú Alerta seleccionable del sitio. Ya sea un sitio único o todos los sitios disponibles en la zona se pueden seleccionar para activar o desactivar una Alerta seleccionable del sitio.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.16.1.21

Anuncio de TTS para inhibición de Tx encendida

Una palabra hablada común para hacer referencia al campo Inhibición de Tx encendida para anuncios de texto a voz (TTS).

**NOTA:**

Este campo solo se aplica a radios APX NEXT y APX N70.

Cuando hace clic en el botón **Reproducir** , la aplicación convierte el texto en el campo del comando de voz a voz y lo reproduce a través del altavoz.

Solo se accede:

- [ViQi: Prioridad de control de voz en la página 115](#) no está configurado como **Desactivado**.
- El campo Anuncio de voz correspondiente está configurado como **TTS**.
- El radio admite modelos y opciones diferentes.

**NOTA:**

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.22

Anuncio de TTS para inhibición de Tx apagada

Una palabra hablada común a fin de hacer referencia al campo Inhibición de Tx apagada para anuncios de texto a voz (TTS).

**NOTA:**

Este campo solo se aplica a radios APX NEXT y APX N70.

Cuando hace clic en el botón **Reproducir** , la aplicación convierte el texto en el campo del comando de voz a voz y lo reproduce a través del altavoz.

Solo se accede:

- [ViQi: Prioridad de control de voz en la página 115](#) no está configurado como **Desactivado**.
- El campo Anuncio de voz correspondiente está configurado como **TTS**.

- El radio admite modelos y opciones diferentes.

**NOTA:**

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.23

Anuncio de TTS para alerta de usuario de llamada entrante desactivada

Una palabra hablada común para hacer referencia al campo Alerta de usuario de llamada entrante desactivada para anuncios de texto a voz (TTS).

**NOTA:**

Este campo solo se aplica a radios APX NEXT y APX N70.

Cuando hace clic en el botón **Reproducir** , la aplicación convierte el texto en el campo del comando de voz a voz y lo reproduce a través del altavoz.

Solo se accede:

- [ViQi: Prioridad de control de voz en la página 115](#) no está configurado como **Desactivado**.
- El campo Anuncio de voz correspondiente está configurado como **TTS**.
- El radio admite modelos y opciones diferentes.

**NOTA:**

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.24

Anuncio de TTS para alerta de usuario de llamada entrante activada

Una palabra hablada común para hacer referencia al campo Alerta de usuario de llamada entrante activada para anuncios de texto a voz (TTS).

**NOTA:**

Este campo solo se aplica a radios APX NEXT y APX N70.

Cuando hace clic en el botón **Reproducir** , la aplicación convierte el texto en el campo del comando de voz a voz y lo reproduce a través del altavoz.

Solo se accede:

- [ViQi: Prioridad de control de voz en la página 115](#) no está configurado como **Desactivado**.
- El campo Anuncio de voz correspondiente está configurado como **TTS**.
- El radio admite modelos y opciones diferentes.

**NOTA:**

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.25

Anuncio de TTS para el modo principal del botón multifuncional

Una palabra hablada común que hace referencia al campo Modo principal del botón multifuncional para anuncios de texto a voz (TTS).

**NOTA:**

Este campo solo se aplica a radios APX NEXT y APX N70.

Quando hace clic en el botón **Reproducir** , la aplicación convierte el texto en el campo del comando de voz a voz y lo reproduce a través del altavoz.

Solo se accede:

- [ViQi: Prioridad de control de voz en la página 115](#) no está configurado como **Desactivado**.
- El campo Anuncio de voz correspondiente está configurado como **TTS**.
- El radio admite modelos y opciones diferentes.

**NOTA:**

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.26

Anuncio de TTS para modo secundario del botón multifuncional

Una palabra hablada común para hacer referencia al campo Modo secundario del botón multifuncional para anuncios de texto a voz (TTS).

**NOTA:**

Este campo solo se aplica a radios APX NEXT y APX N70.

Quando hace clic en el botón **Reproducir** , la aplicación convierte el texto en el campo del comando de voz a voz y lo reproduce a través del altavoz.

Solo se accede:

- [ViQi: Prioridad de control de voz en la página 115](#) no está configurado como **Desactivado**.
- El campo Anuncio de voz correspondiente está configurado como **TTS**.
- El radio admite modelos y opciones diferentes.

**NOTA:**

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.27

Anuncio de TTS para el bloqueo de teclado/controles activado

Una palabra hablada común para hacer referencia al campo Bloqueo de teclado/controles activado para anuncios de texto a voz (TTS).

**NOTA:**

Este campo solo se aplica a radios APX NEXT y APX N70.

Quando hace clic en el botón **Reproducir** , la aplicación convierte el texto en el campo del comando de voz a voz y lo reproduce a través del altavoz.

Solo se accede:

- [ViQi: Prioridad de control de voz en la página 115](#) no está configurado como **Desactivado**.
- El campo Anuncio de voz correspondiente está configurado como **TTS**.
- El radio admite modelos y opciones diferentes.

NOTA:

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.28

Anuncio de TTS para el bloqueo de teclado/controles desactivado

Una palabra hablada común para hacer referencia al campo Bloqueo de teclado/controles desactivado para anuncios de texto a voz (TTS).

NOTA:

Este campo solo se aplica a radios APX NEXT y APX N70.

Cuando hace clic en el botón **Reproducir** , la aplicación convierte el texto en el campo del comando de voz a voz y lo reproduce a través del altavoz.

Solo se accede:

- [ViQi: Prioridad de control de voz en la página 115](#) no está configurado como **Desactivado**.
- El campo Anuncio de voz correspondiente está configurado como **TTS**.
- El radio admite modelos y opciones diferentes.

NOTA:

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.29

Alerta de usuario de llamada entrante encendida

En este campo, se selecciona el archivo de Anuncio de voz de Motorola (.MVA), si hay alguno, que se asigna cuando la función Silencio de voz se activa para los canales que tengan habilitada la Alerta de usuario de llamada entrante.

Si se selecciona Texto a voz (TTS), el texto en el campo Comando de voz correspondiente se convertirá en voz y se reproducirá como audio. Cuando el usuario desactiva el Silencio de voz para un canal que tenga habilitada la Alerta de usuario de llamada entrante, se reproducirán los avisos de voz.

El usuario puede activar el Silencio de voz con la pulsación del botón Silencio de voz o la selección del menú Silencio de voz. Esta selección se aplica en base a la amplitud de radio.

Se admiten las siguientes selecciones:

Ninguno

No se necesitan instrucciones de voz para esta función del radio.

TTS

Cuando la función Control de voz está activada, el texto en el campo Comando de voz para Alerta de usuario de llamada entrante activada se reproduce como audio.

Archivo de Anuncio de voz de Motorola (.MVA)

Muestra una lista de todos los archivos de voz posibles definidos en la página Lista de archivos de anuncio de voz.

10.16.1.30**Alerta de usuario de llamada entrante apagada**

En este campo, se selecciona el archivo de Anuncio de voz de Motorola (.MVA), si hay alguno, que se asigna cuando la función Silencio de voz se desactiva para los canales que tengan habilitada la Alerta de usuario de llamada entrante.

Si se selecciona Texto a voz (TTS), el texto en el campo Comando de voz correspondiente se convertirá en voz y se reproducirá como audio. Cuando el usuario desactiva el Silencio de voz para un canal que tenga habilitada la Alerta de usuario de llamada entrante, se reproducirán los anuncios de voz.

El usuario puede desactivar el Silencio de voz con la pulsación del botón Silencio de voz o la selección del menú Silencio de voz.

Esta selección se aplica en base a la amplitud de radio.

**NOTA:**

La Página de Lista de Anuncios de voz le permite cargar archivos de Anuncios de voz de Motorola (.MVA) en el codeplug actual de la aplicación.

Se admiten las siguientes selecciones:

Ninguno

No se necesitan instrucciones de voz para esta función del radio.

TTS

Cuando la función Control de voz está activada, el texto en el campo Comando de voz para Alerta de usuario de llamada entrante apagada se reproduce como audio.

Archivo de Anuncio de voz de Motorola (.MVA)

Muestra una lista de todos los archivos de voz posibles definidos en la página Lista de archivos de anuncio de voz.

10.16.1.31**Apagado**

Este campo le permite seleccionar el archivo (.MVA) de Anuncio de voz Motorola predefinido que está asignado al evento Apagado. El radio emite un anuncio de voz cuando se produce el evento.

**NOTA:**

En el caso de los modelos más recientes de Normas de servicio contra incendios, la selección de **NINGUNO** está desactivada.

10.16.1.32**TTS para Apagar**

Una palabra hablada común que hace referencia al campo Apagar para anuncios de texto a voz (TTS).

**NOTA:**

Este campo solo se aplica a radios APX NEXT y APX N70.

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.33

Fuera de rango

Este campo le permite seleccionar el archivo (.MVA) de Anuncio de voz Motorola predefinido que está asignado al evento Fuera de rango. El radio emite un anuncio de voz cuando se produce el evento.

**NOTA:**

En el caso de los modelos más recientes de Normas de servicio contra incendios, la selección de **NINGUNO** está desactivada.

La Voz se escucha cuando el Indicador de fuera de rango está configurado como **Alerta o Alerta y Mostrar**.

Cuando fuera de rango está en el canal **Modo Zona de peligro**, el radio emite un anuncio de voz cuando se produce el evento.

10.16.1.34

TTS para fuera de rango

Una palabra hablada común que hace referencia al campo Fuera de rango para anuncios de texto a voz (TTS).

**NOTA:**

Este campo solo se aplica a radios APX NEXT y APX N70.

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.35

Error de comprobación automática

Este campo le permite seleccionar el archivo (.MVA) de Anuncio de voz Motorola predefinido que se asigna a la operación Error de comprobación automática. El radio emite un anuncio de voz cuando alguna de las operaciones falla.

La operación de comprobación automática verifica lo siguiente:

- Conexión de RSM al dispositivo de RF.
- Pérdida de conexión de la antena al dispositivo de RF.
- La temperatura supera la temperatura de sobrecalentamiento recomendada por el fabricante.
- Batería con al menos el 50 % de la capacidad total disponible (solo encendido).

**NOTA:**

En el caso de los modelos más recientes de Normas de servicio contra incendios, la selección de **NINGUNO** está desactivada.

10.16.1.36

TTS de error de comprobación automática

Una palabra hablada común que hace referencia al campo Error de comprobación automática para anuncios de texto a voz (TTS).

**NOTA:**

Este campo solo se aplica a radios APX NEXT y APX N70.

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.37

Error del accesorio

Este campo le permite seleccionar el archivo (.MVA) de Anuncio de voz Motorola predefinido que se asigna al evento Error del accesorio. El radio emite un anuncio de voz cuando se produce el evento.

**NOTA:**

En el caso de los modelos más recientes de Normas de servicio contra incendios, la selección de **NINGUNO** está desactivada.

10.16.1.38

TTS para error del accesorio

Una palabra hablada común que hace referencia al campo Error del accesorio para anuncios de texto a voz.

**NOTA:**

Este campo solo se aplica a radios APX NEXT y APX N70.

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.39

Error de la antena

Este campo le permite seleccionar el archivo (.MVA) de Anuncio de voz Motorola predefinido que se asigna a la operación Error de la antena. El radio emite un anuncio de voz cuando se producen las operaciones.

**NOTA:**

Este campo solo se aplica a radios APX NEXT NFPA.

10.16.1.40

TTS para error de la antena

Una palabra hablada común que hace referencia al campo Error de la antena TTS para anuncios de texto a voz (TTS).

**NOTA:**

Este campo solo se aplica a radios APX NEXT y APX N70.

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.41

Exceso de temperatura

Este campo le permite seleccionar el archivo (.MVA) de Anuncio de voz Motorola predefinido que se asigna al evento Exceso de temperatura. El radio emite un anuncio de voz cuando se produce el evento.

**NOTA:**

En el caso de los modelos más recientes de Normas de servicio contra incendios, la selección de **NINGUNO** está desactivada.

10.16.1.42

TTS para exceso de temperatura

Una palabra hablada común que hace referencia al campo de TTS Exceso de temperatura para anuncios de texto a voz (TTS).

**NOTA:**

Este campo solo se aplica a radios APX NEXT y APX N70.

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.43

Exceso de temperatura acumulada en dispositivo de RF

Este campo le permite seleccionar el archivo (.MVA) de Anuncio de voz Motorola predefinido que está asignado al evento Exceso de temperatura acumulada en dispositivo de RF. El radio emite un anuncio de voz cuando se produce el evento.

**NOTA:**

Este campo solo se aplica a radios APX NEXT XN.

En el caso de los modelos más recientes de Normas de servicio contra incendios, la selección de **NINGUNO** está desactivada.

10.16.1.44

TTS para exceso de temperatura acumulada en dispositivo de RF

Una palabra hablada común que hace referencia al campo de TTS Exceso de temperatura acumulada en dispositivo de RF para anuncios de texto a voz (TTS).

**NOTA:**

Este campo solo se aplica a radios APX NEXT XN.

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.45

Exceso de temperatura acumulada en componente opcional

Este campo le permite seleccionar el archivo (.MVA) de Anuncio de voz Motorola que está asignado a la operación Exceso de temperatura acumulada en componente opcional. El radio emite un anuncio de voz cuando se produce la operación.

**NOTA:**

Este campo solo se aplica a radios APX NEXT XN.

En el caso de los modelos más recientes de Normas de servicio contra incendios, la selección de **NINGUNO** está desactivada.

10.16.1.46

TTS para exceso de temperatura acumulada en componente opcional

Una palabra hablada común que hace referencia al campo Exceso de temperatura acumulada en componente opcional para anuncios de texto a voz (TTS).

**NOTA:**

Este campo solo se aplica a radios APX NEXT XN.

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.47

Salir del Modo Zona de peligro

Este campo le permite seleccionar el archivo (.MVA) de Anuncio de voz Motorola predefinido que está asignado al evento Salir del Modo Zona de peligro.

El radio emite un anuncio de voz cuando alterna el switch concéntrico de dos vías para salir del modo.

**NOTA:**

En el caso de los modelos más recientes de Normas de servicio contra incendios, la selección de **NINGUNO** está desactivada.

10.16.1.48

TTS para salir del Modo Zona de peligro

Una palabra hablada común que hace referencia al campo Salir del Modo Zona de peligro para anuncios de texto a voz (TTS).

**NOTA:**

Este campo solo se aplica a radios APX NEXT y APX N70.

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.49

Accesorio del Modo Sin peligro

Este campo le permite seleccionar el archivo (.MVA) de Anuncio de voz Motorola predefinido que está asignado al evento Accesorio del Modo Sin peligro. El radio emite un anuncio de voz cuando se produce el evento.

**NOTA:**

Este campo solo se aplica a radios APX NEXT XN.

En el caso de los modelos más recientes de Normas de servicio contra incendios, la selección de **NINGUNO** está desactivada.

10.16.1.50

TTS para accesorio del Modo Sin peligro

Una palabra hablada común que hace referencia al campo Accesorio del Modo Sin peligro para anuncios de texto a voz (TTS).

**NOTA:**

Este campo solo se aplica a radios APX NEXT XN.

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.1.51

Exceso de temperatura acumulada en la batería

Este campo le permite seleccionar el archivo (.MVA) de Anuncio de voz Motorola que está asignado al evento Exceso de temperatura acumulada en la batería. El radio emite un anuncio de voz cuando se produce el evento.

**NOTA:**

Este campo solo se aplica a radios APX NEXT XN.

En el caso de los modelos más recientes de Normas de servicio contra incendios, la selección de **NINGUNO** está desactivada.

10.16.1.52

TTS para exceso de temperatura acumulada en la batería

Una palabra hablada común que hace referencia al campo Exceso de temperatura acumulada en la batería para anuncios de texto a voz (TTS).

**NOTA:**

Este campo solo se aplica a radios APX NEXT XN.

El valor predeterminado está en blanco.

Caracteres Unicode.

Caracteres alfanuméricos solo con un máximo de 35 caracteres.

10.16.2

Lista de anuncios de voz

Esta sección permite cargar archivos de Anuncio de voz de Motorola (*.MVA) en el codeplug actual.

**NOTA:**

Durante una operación de Comparación de codeplug, la Lista de anuncios de voz solo admite la funcionalidad **Copiar todos los campos** (es decir, no existirán botones de copia individuales junto a los nombres de archivos de voz). Cuando se inicia la función **Copiar todos los campos**, todos los archivos de voz en el codeplug secundario se copian en el codeplug primario.

**NOTA:**

Un archivo de anuncio de voz Motorola (*.MVA) solo puede generarse desde un archivo *.WAV, utilizando la Utilidad del convertidor de anuncio de voz.

Una vez que están cargados en esta lista, los archivos de voz/audio están disponibles para ser seleccionados desde cualquiera de los campos Anuncio de voz en la función Anuncio de voz en general, desde el campo Archivo de audio de alerta de la Lista de alertas seleccionables del sitio, y desde los campos Anuncio de canal y Anuncio de zona de la Asignación de canal de zona.

**NOTA:****Agregar un archivo de voz:**

- El botón más de la Barra de herramientas de registros múltiples - Vista de tabla permite agregar uno o más archivos de voz/audio (y registros/filas) al codeplug de la aplicación actual.
- Se abre un cuadro de diálogo de selección de archivo Windows y le permite navegar en el sistema de archivos de la computadora para buscar los archivos de voz que desea.

10.16.2.1

Nombre del archivo de voz

Este campo permite ver o cambiar el nombre de los nombres reconocibles para el archivo de voz o audio del Anuncio de voz de Motorola (*.MVA) (registro/fila).

De manera predeterminada, cada registro de archivo de voz/audio hereda el nombre del archivo *.mva que se cargó originalmente.

Cuando se hace clic y, luego, se escribe en el campo **Nombre de archivo de voz**, se permite al usuario cambiar el nombre que se da a un registro de archivo de voz o audio.

Sin embargo, esto no cambia los datos del archivo de voz o audio seleccionado originalmente.

10.17

Lista de alertas seleccionables del sitio

Esta sección le permite ver o definir Alertas seleccionables del sitio individuales para las comunicaciones de troncalización ASTRO 25.

Esta función se aplica a las comunicaciones de troncalización.

IMPORTANTE:

Se pueden definir hasta quince Alertas seleccionables del sitio (SSA) diferentes por Lista para la codificación o decodificación del radio; sin embargo, solo puede seleccionar una SSA que tenga **activado** el campo Suscriptor codificable para la codificación (envío al FNE). Una vez que el FNE recibe una SSA de un radio, la transmite a todos los radios de un sitio mediante un Sistema de transmisión de OSP (Paquete de señalización saliente) de Motorola Solutions en el Canal de control saliente.

El audio de un Anuncio de voz estándar (un evento puntual) siempre tiene prioridad frente al audio de una Alerta seleccionable del sitio (un evento recurrente).

Solo una Alerta seleccionable del sitio puede estar activa en cada sitio en un momento dado.

NOTA:

Los Archivos de anuncio de voz de Motorola (*.MVA) correspondientes deben cargarse primero en la Lista de anuncios de voz antes de que puedan seleccionarse para un registro/fila de la Lista de alerta seleccionable del sitio desde el campo Archivo de audio de alerta correspondiente.

Una Lista de alertas seleccionables del sitio puede asignarse a un sistema de troncalización a través del campo Selección de lista de alertas seleccionable del sitio.

Puede activar y desactivar las Alertas seleccionables del sitio que tienen **activado** su campo Suscriptor codificable con una selección del menú Alerta seleccionable del sitio. Ya sea un sitio único o todos los sitios disponibles en la zona se pueden seleccionar para activar o desactivar una Alerta seleccionable del sitio.

10.17.1

Nombre de la Lista de alertas seleccionables del sitio

Este campo le permite ver o definir nombres reconocibles para la Alerta seleccionable del sitio actual en la Lista de alertas seleccionables del sitio actual.

Las listas de alertas seleccionables del sitio se pueden seleccionar para utilizarlas desde el campo **Selección de lista de alertas seleccionable del sitio** del sistema de troncalización.

NOTA:

Mina de mineral de hierro, mina de cobre, Lista de SSA n.º 3.

Se pueden usar caracteres, números, espacios y caracteres especiales.

Es posible usar un total de 14 caracteres.

10.17.2

Alias de alerta

Este campo le permite definir nombres reconocibles para la Alerta seleccionable del sitio actual (registro/fila) de la Lista de alertas seleccionables del sitio actual.

Este Alias luego aparece en la pantalla del radio cuando se desplaza por la Lista de alertas seleccionables del sitio o cuando el radio recibe una transmisión amplia de Alerta seleccionable del sitio desde el Equipo de red fija (FNE).

Esta selección se aplica a las comunicaciones de troncalización.

NOTA:

Evacuar, Aparcar, Sirena de tornado, Alerta nro. 1

Se pueden usar caracteres, números, espacios y caracteres especiales.

Es posible usar un total de 14 caracteres.

El alias de alerta aparece en la pantalla.

10.17.3

Archivo de audio de alerta

En este campo se selecciona cuál es el archivo de Anuncio de voz de Motorola (*.MVA), si lo hay, que se asignará a la Alerta seleccionable del sitio (registro/fila) actual de la Lista de alertas seleccionables del sitio actual.

Cuando el radio recibe una transmisión amplia de alerta seleccionable del sitio desde el equipo de red fija (FNE), se reproduce la instrucción de audio/voz correspondiente.

Esta selección se aplica a las comunicaciones de troncalización.

NOTA:

Los archivos de Anuncio de voz Motorola (*.MVA) correspondientes deben cargarse primero en la Lista de anuncios de voz antes de que puedan seleccionarse para un registro/fila de la Lista de alerta seleccionable del sitio.

Se admiten las siguientes selecciones:

Ninguno

No se necesita ninguna alerta de audio/voz para esta función de radio.

Archivo de Anuncio de voz Motorola (*.MVA)

Enumera todos los archivos de audio/voz cargados en la página Lista de archivos de anuncios de voz.

10.17.4

Período de alerta

En este campo se selecciona la cantidad de tiempo que espera el radio antes de volver a reproducir el Archivo de audio de alerta para la Alerta seleccionable del sitio (registro/fila) actual en la Lista de alertas seleccionables del sitio actual.

Esta selección se aplica a las comunicaciones de troncalización.

ADVERTENCIA:

Mientras más bajo sea el valor de período de alerta, mayor será la frecuencia de reproducción del audio. La reproducción constante del audio durante horas o días puede disminuir eventualmente la vida útil de la batería del radio.

Mesa 113: Rango

Mínimo	Máximo	Incrementos	Valor predeterminado
5 segundos	255 segundos	1 segundo	15 segundos

10.17.5

Suscriptor codificable

Este campo activa el Alias de alerta de la Alerta seleccionable del sitio (registro/fila) actual para que aparezca en la pantalla del radio (unidad de suscriptor), y así se pueda codificar la alerta seleccionada para la transmisión amplia.

Con la selección del menú Alertas seleccionables del sitio, el usuario puede desplazarse por todas las alertas codificables de la Lista de alertas seleccionables del sitio y activar, o posteriormente, desactivar una alerta seleccionada.

Esta selección se aplica a las comunicaciones de troncalización.

10.18

Encriptación en general

Esta sección le permite visualizar y definir la funcionalidad para comunicaciones de recepción y transmisión codificadas seguras.

NOTA:

Cuando un campo Conexión segura/sin cifrado está configurado como **Seleccionar** para un cierto canal, la pulsación del botón Selección de Tx seguro, el switch de alternación Selección de Tx seguro o la selección del menú Seguro le permite alternar entre comunicaciones seguras o sin cifrado para ese canal.

Solo se accede: Cuando el radio admite distintos modelos y opciones.

10.18.1

General

Esta sección permite ver o definir una funcionalidad básica de encryption seguro.

NOTA:

Cuando un campo Conexión segura/sin cifrado está configurado como **Seleccionar** para un cierto canal, la pulsación del botón Selección de Tx seguro, el switch de alternación Selección de Tx seguro o la selección del menú Seguro le permite alternar entre comunicaciones seguras o sin cifrado para ese canal.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.18.1.1

Operación segura

En este campo se selecciona el modo Comunicaciones con encryption seguro que se usa según la amplitud del radio.

NOTA:

Cuando un campo [Conexión segura/sin encriptar en la página 390](#) está configurado en **Seleccionar** para un determinado canal, la pulsación del botón Selección de Tx segura, el switch de alternación [Selección de Tx segura en la página 206](#), o la selección del menú Asegurar permite cambiar entre comunicaciones seguras o sin encryption para ese canal.

ADVERTENCIA:

Cuando el campo Activación de inhibición táctica está activado, este campo solo se puede configurar en **Desactivado** o **Hardware**. De lo contrario, la aplicación lo considera no válido.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Desactivado

El encryption seguro no es posible.

Hardware

Los servicios de encryption se llevan a cabo mediante un IC de hardware separado certificado en los niveles 2 y 3 de 140-2 del FIDS (Estándar de procesamiento de información general), dependiendo de la configuración del parámetro Completación de clave roja. Además, es compatible con algoritmos de encryption rápido múltiple para obtener una mayor seguridad.

Software

ADVERTENCIA:

No es posible para la troncalización de tipo II.

Se admiten los siguientes dos métodos de encryption de software:

Privacidad digital mejorada (ADP)

Los servicios de encryption se llevan a cabo mediante la implementación de un software del algoritmo RC-4 que no está sujeto a ningún nivel de certificación de FIPS.

10.18.1.2

Privacidad digital mejorada (ADP)

En este campo se activa el radio para usar el algoritmo de SW ADP para voz encriptada.

**ADVERTENCIA:**

Cuando el campo [Operación segura en la página 301](#) está configurado en **Software**, active Privacidad digital avanzada (ADP), [Estándar de encryption avanzado \(AES256\) en la página 302](#), o [Estándar de encryption de datos \(DES\) en la página 303](#).

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Software** y cuando el radio admite modelos y opciones diferentes.

10.18.1.3

Estándar de encryption avanzado (AES256)

En este campo se activa el radio para que transmita y reciba voz y datos encriptados.

**ADVERTENCIA:**

Cuando el campo [Operación segura en la página 301](#) se establece en **Software**, active [Privacidad digital mejorada \(ADP\) en la página 302](#), [Estándar de encryption de datos \(DES\) en la página 303](#), o [Estándar de encryption avanzado \(AES256\)](#).

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Software** y cuando el radio admite modelos y opciones diferentes.

10.18.1.4

Fuente de carga de claves

Este campo permite seleccionar el campo Fuente de carga de claves.

Se admiten las siguientes selecciones:

Lista de clave de encryption

Permite ingresar claves seguras en la Lista de clave de encryption. Solo disponible para Privacidad digital avanzada (ADP).

KVL

Permite cargar claves de software.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Software** y cuando el radio admite modelos y opciones diferentes.

10.18.1.5

Activación de OTAR

Habilita la función ASTRO OTAR convencional (Regeneración de clave por el aire) o MDC OTAR convencional o ASTRO 25 OTAR de troncalización según la amplitud del radio.

**ADVERTENCIA:**

Tanto el campo Activación de ASTRO OTAR como el campo Activación MDC OTAR deben estar activados; de lo contrario, dichos campos no serán válidos.

**NOTA:**

En una personalidad convencional individual, ASTRO OTAR o MDC OTAR se activan con los campos ASTRO OTAR y Tx de OTAR de la personalidad.

En un Sistema de troncalización individual, OTAR se activa en el campo ASTRO OTAR y en los campos Tx de OTAR.

Solo se accede: cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** y el radio admite modelos/opciones diferentes, o cuando el campo [Operación segura en la página 301](#) se configura en **Software** y el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) está activado.

10.18.1.6

Borrar clave de SW mejorada en la inhibición del radio

Cuando se activa, el radio borra todas las claves de encryption de Privacidad digital mejorada (ADP) o Estándar de encryption avanzada (AES) cuando el radio ingresa a un estado de Inhibición de radio.

La Inhibición de radio se activa según el Sistema convencional o de troncalización.

Cuando se desactiva, el radio retiene todas las claves de encryption ADP o AES cuando entra a un estado de inhibición de radio.

**ADVERTENCIA:**

Este campo es mutuamente excluyente con [Activación de OTAR en la página 303](#).

Solo se accede: cuando el campo [Operación segura en la página 301](#) se configura en **Software** y cuando el radio admite modelos/opciones diferentes; y

cuando el campo [Privacidad digital mejorada \(ADP\) en la página 302](#) esté activado; o

cuando [Estándar de encryption avanzado \(AES256\) en la página 302](#) está activado, pero el campo Operación de OTAR está **Desactivado**.

10.18.1.7

Estándar de encryption de datos (DES)

En este campo se activa el radio para que transmita y reciba voz y datos encriptados.

**ADVERTENCIA:**

Cuando el campo [Operación segura en la página 301](#) se establece en **Software**, active [Privacidad digital mejorada \(ADP\) en la página 302](#), [Estándar de encryption avanzado \(AES256\) en la página 302](#), o Estándar de encryption de datos (DES).

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Software** y cuando el radio admite modelos y opciones diferentes.

10.18.2

de ASTRO OTAR

La sección de **ASTRO OTAR** el permite ver o definir las funciones de comunicación Regeneración de clave inalámbrica (OTAR) ASTRO convencional y ASTRO 25 troncalización.

ASTRO utiliza un protocolo encriptado de seguridad digital. Además de las solicitudes de regeneración de clave, las transmisiones OTAR incluyen lo siguiente: Confirmaciones retrasadas y confirmaciones de encendido.

**ADVERTENCIA:**

Algunas de las opciones seleccionadas pueden ser configuradas en el sitio KMF (Instalación de administración de claves) para funcionar de modo adecuado.

**NOTA:**

ASTRO OTAR se activa según la Personalidad convencional en función del campo [Tipo de voz/señal de Rx en la página 431](#). El radio también está configurado para iniciar comandos OTAR mediante la habilitación de los campos ASTRO OTAR de esa Personalidad y/o los campos [OTAR Tx \(Tx de OTAR\) en la página 490](#).

ASTRO OTAR se activa según el Sistema de troncalización desde el campo ASTRO OTAR y los campos [OTAR Tx \(Tx de OTAR\) en la página 621](#).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.18.2.1

Activación de ASTRO OTAR

Habilita la función ASTRO OTAR convencional (Regeneración de clave por el aire) o MDC OTAR convencional o ASTRO 25 OTAR de troncalización según la amplitud del radio.

**ADVERTENCIA:**

Tanto el campo Activación de ASTRO OTAR como el campo Activación MDC OTAR deben estar activados; de lo contrario, dichos campos no serán válidos.

**NOTA:**

En una personalidad convencional individual, ASTRO OTAR o MDC OTAR se activan con los campos ASTRO OTAR y Tx de OTAR de la personalidad.

En un Sistema de troncalización individual, OTAR se activa en el campo ASTRO OTAR y en los campos Tx de OTAR.

Solo se accede: cuando el campo [Operación segura en la página 301](#) se configura en **Hardware**, el campo [Activación de OTAR en la página 303](#) está activado, y el radio admite modelos/opciones diferentes; o

Cuando el campo [Operación segura en la página 301](#) se configura en **Software**, el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) está activado, el campo [Activación de OTAR en la página 303](#) está activado, y el radio admite modelos/opciones diferentes.

10.18.2.2

Inhibición de radio mediante ASTRO OTAR

Este campo activa el radio para recibir y responder a un comando de inhibición de radio de ASTRO de Regeneración de clave inalámbrica (OTAR).

Generalmente se transmite este comando desde un despachador o un operador de la Facilidad de administración de claves (KMF) que deja el radio inoperable. Esta función se aplica al modo de encryption seguro para comunicaciones convencionales ASTRO y de troncalización ASTRO 25.

ADVERTENCIA:

Cuando este campo está activado y el campo [Activación de ASTRO OTAR en la página 304](#) está activado para Sistemas de troncalización, la Inhibición de radio se logra "mediante ASTRO OTAR".

Cuando se activa este campo y el campo [Activación de ASTRO OTAR en la página 304](#) se desactiva para cualquier Sistema de troncalización, los campos Inhibición de radio para aquellos sistemas de troncalización deben activarse. Esto garantiza que la Inhibición de radio se posible mediante la troncalización ASTRO 25 "Borrar" (sin encryption seguro).

Cuando se activa el campo [Activación de ASTRO OTAR en la página 304](#) para cualquier Sistema de troncalización y el campo Inhibición de radio para aquellos Sistemas de troncalización se desactiva, este campo cambia a ver bloqueado en un estado activado. Esto garantiza que para dichos sistemas, la Inhibición de radio se logra "mediante ASTRO OTAR".

IMPORTANTE:

Para descartar el estado de inhibición del radio, envíe un comando de inhibición o rehaga el proceso de lectura/escritura del radio.

Solo se accede: cuando el campo [Operación segura en la página 301](#) se configura en **Hardware**, el campo [Activación de OTAR en la página 303](#) está activado, el campo [Activación de ASTRO OTAR en la página 304](#) está activado, y el radio admite modelos/opciones; o

Cuando el campo [Operación segura en la página 301](#) se establece en **Software**, el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) está activado, el campo [Activación de OTAR en la página 303](#) está activado, el campo [Activación de ASTRO OTAR en la página 304](#) se activa, y el radio admite modelos/opciones diferentes.

10.18.2.3

TKP activado

Este campo permite que el radio realice el Aprovisionamiento de claves sin contacto (TKP), que ofrece claves de encryption de extremo a extremo para radios desde una Facilidad de administración de claves (KMF) sin requerir primero la configuración del Cargador de variables de clave (KVL) del radio.

NOTA:

El radio debe haber sido aprovisionado en la fábrica de Motorola para que la capacidad realice esta función. Es posible que algunos radios no sean capaces incluso si la función está activada, en el caso de que los radios se envíen antes de la introducción de la función en la fábrica.

El operador de KMF debe activar el Aprovisionamiento de claves sin contacto para ese radio dentro de la configuración de KMF.

Cuando este campo está activado, se notifica al servidor de KMF durante el registro de OTAR.

10.18.2.4

Message Number Period

El período de número de mensaje (MNP) define una ventana de mensajes que se pueden aceptar desde una instalación de administración de claves (KMF). El radio está programado con el valor de MNP en este campo.

La función OTAR usa este valor durante las operaciones.

El propósito de una ventana pequeña es evitar que un atacante provoque una configuración incorrecta de las claves del radio mediante la captura de mensajes enviados desde la KMF y el reenvío al radio más tarde.

Si la ventana es muy pequeña y no se reciben mensajes de la KMF debido a que el radio está fuera de la cobertura del sistema de radio o apagado, el radio ignora los mensajes de KMF y fuerza a la KMF a iniciar un procedimiento de recuperación.

Mesa 114: Rango

Mínimo	Máximo	Predeterminado
2	65535	65535

NOTA:

Un valor de 65535 desactiva efectivamente la protección para que no vuelva a reproducirse.

10.18.2.5

RSI de KMF

El indicador de conjuntos de radio de la instalación de administración clave (KMF RSI) es el identificador de la KMF para OTAR, y debe coincidir con el valor asignado dentro de la radio KMF. La KMF ignorará los mensajes del radio que tenga una configuración incorrecta para este valor.

El radio está programado con el valor del RSI de KMF en este campo. La función OTAR usa este valor durante las operaciones.

Mesa 115: Rango

Mínimo	Máximo	Predeterminado
1	9999999	9999999

10.18.2.6

Fuente de parámetros de OTAR

Cuando este campo está configurado en **KVL**, el RSI de KMF y el Período de número de mensaje (MNP) del radio solo se pueden actualizar a través del Cargador de variables de clave (KVL).

Cuando se configura en **Administración de parámetros**, el radio se actualiza con los valores RSI de KMF y MNP de RadioCentral, y sobrescribe los valores actuales del radio. Una actualización de KVL subsiguiente sobrescribe los valores proporcionados por RadioCentral.

10.18.3

MDC OTAR

Esta sección le permite ver o definir funciones de regeneración de clave inalámbrica (OTAR) de MDC.

Las funciones de MDC OTAR se aplican solo al operar en modo cifrado de seguridad y solo para comunicaciones convencionales. Además de las solicitudes de regeneración de clave, las transmisiones OTAR incluyen lo siguiente: Confirmaciones retrasadas y confirmaciones de encendido.

NOTA:

MDC OTAR se activa de acuerdo a la Personalidad convencional mediante el campo Tipo de señal sin ASTRO. El radio además está configurado para iniciar comandos OTAR mediante la activación del campo de Tx de OTAR de la personalidad.

Cuando un campo Conexión segura/sin cifrado está configurado como **Seleccionar** para un cierto canal, la pulsación del botón Selección de Tx seguro, el switch de alternación Selección de Tx seguro o la selección del menú Seguro le permite alternar entre comunicaciones seguras o sin cifrado para ese canal.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.18.3.1

Activación de MDC OTAR

Activa la versión de señalización de MDC de la función OTAR (Regeneración de clave por el aire).

Esta función se aplica para el modo de cifrado seguro para comunicaciones MDC OTAR.

**ADVERTENCIA:**

Cuando el campo [Activación de OTAR en la página 303](#) está activado, el administrador de radio necesita que este campo o el campo [Activación de ASTRO OTAR en la página 304](#) estén activados. De lo contrario, ambos quedarán inválidos. Esto asegura que se pueda realizar la OTAR desde un canal MDC o ASTRO convencional.

**NOTA:**

MDC OTAR se activa de acuerdo a la Personalidad convencional mediante el campo Tipo de señal sin ASTRO. El radio además está configurado para iniciar comandos OTAR mediante la activación del campo de Tx de OTAR de la personalidad.

Solo se accede: cuando el campo [Operación segura en la página 301](#) se configura en **Hardware**, el campo [Activación de OTAR en la página 303](#) está activado, y el radio admite modelos/opciones diferentes.

10.18.3.2

Inhibición de radio mediante MDC OTAR

Este campo activa el radio para recibir y responder a un comando de inhibición de radio de MDC OTAR (Regeneración de clave inalámbrica) que deja el radio inoperable de manera temporal.

Este comando normalmente lo transmite un despachador o un operador del Controlador de administración de claves (KMC). Esta función se aplica para el modo de encryption seguro para comunicaciones de MDC OTAR.

**IMPORTANTE:**

Para descartar el estado de inhibición del radio, envíe un comando de inhibición o rehaga el proceso de lectura/escritura del radio.

Solo se accede: Cuando el [Operación segura en la página 301](#) campo se configura en **Hardware**, el campo Operación de OTAR se configura en **Solo MDC o ASTRO y MDC** y el radio admite distintos modelos y opciones.

10.18.3.3

Activación de confirmación de OTAR

En este campo se activa el radio para confirmar todos los mensajes de confirmación de MDC OTAR (Regeneración de clave inalámbrica).

Esta función se aplica para el modo de encryption seguro para comunicaciones de MDC OTAR.

**ADVERTENCIA:**

Al desactivarlo, debe asegurarse de que todas las funciones de alerta de estado también estén desactivadas para evitar comprometer la seguridad. Las funciones de alerta de estado incluyen: Verificación de radio, Modo de radio remoto, Transmisión de llamada de selección automática de MDC, Rx/Tx de alerta de llamada y Rx/Tx de llamada selectiva.

Solo se accede: Cuando el [Operación segura en la página 301](#) campo se configura en **Hardware**, el campo Operación de OTAR se configura en **Solo MDC o ASTRO y MDC** y el radio admite distintos modelos y opciones.

10.18.3.4

Confirmación de OTAR solo encriptado

Este campo permite que el radio encripte todas las confirmaciones de MDC OTAR.

Esta función se aplica para el modo de encryption seguro para comunicaciones de MDC OTAR. Cuando está desactivado, el radio envía confirmaciones encriptadas o sin encriptar de MDC OTAR de acuerdo a lo que indique el Controlador de administración de claves (KMC) del despachador de claves.

Solo se accede: cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware**, y cuando el campo Operación de OTAR está configurado en **Solo MDC** o **ASTRO y MDC**, y cuando el campo [Activación de confirmación de OTAR en la página 307](#) está activado, y cuando el radio admite modelos/opciones diferentes.

10.18.3.5

Encendido de confirmación de OTAR

En este campo se selecciona exactamente cuando el radio envía una confirmación de encendido de la Regeneración de clave inalámbrica (OTAR) de MDC al Controlador del administrador de claves (KMC).

Esta confirmación (Ack) permite que el radio inicie sesión en el KMC para propósitos de OTAR. Esta función se aplica para el modo de encryption seguro para comunicaciones de MDC OTAR.

Solo se accede: Cuando el [Operación segura en la página 301](#) campo se configura en **Hardware**, el campo Operación de OTAR se configura en **Solo MDC** o **ASTRO y MDC** y el radio admite distintos modelos y opciones.

Se admiten las siguientes selecciones:

Desactivado

No se envían confirmaciones de encendido.

Inmediato

La confirmación de encendido se envía cuando el radio se enciende y una vez que finalizó su secuencia de encendido.

Retrasado

El radio transmite la confirmación de encendido cuando se envía una transmisión del botón PTT mediante un canal habilitado para OTAR.

10.18.3.6

Modo Solicitud de regeneración de clave

En este campo se selecciona el protocolo que se utiliza cuando el radio transmite la Solicitud de regeneración de clave de MDC de Regeneración de clave inalámbrica (OTAR).

Se envía una transmisión de datos a la consola del Controlador de administración de claves (KMC) del despachador para solicitar la regeneración de clave OTAR del radio. Estas funciones se aplican para el modo de encryption segura de las comunicaciones MDC OTAR.

NOTA:

Puede iniciar una Solicitud de regeneración de clave mediante la pulsación del botón Solicitud de regeneración de clave o la selección del menú [Solicitud de regeneración de clave en la página 223](#).

Solo se accede:

Solo se accede: Cuando el [Operación segura en la página 301](#) campo se configura en **Hardware**, el campo Operación de OTAR se configura en **Solo MDC** o **ASTRO y MDC** y el radio admite distintos modelos y opciones.

Se admiten las siguientes selecciones:

Encriptado

La solicitud de regeneración de clave tiene un encriptado seguro.

Borrar

La solicitud de regeneración de clave no está encriptada.

Desactivado

El procedimiento de regeneración de clave solo lo puede iniciar el operador de KMC.

10.18.3.7

Tono de alerta de estado de solicitud de regeneración de clave

Este campo permite que el radio genere un tono de alerta de éxito o falla cuando finaliza el proceso Solicitud de regeneración de clave.

Seleccionar activar esta función solo afecta el sonido de este tono de alerta al salir de la sección Solicitud de regeneración de clave del menú del radio antes de que este proceso termine. Tenga presente que cuando no se sale de la sección Solicitud de regeneración de clave del menú del radio antes de que finalice el proceso de Solicitud de regeneración de clave, el tono de alerta de estado se emitirá sin importar la configuración de este campo. El estado del proceso de regeneración de clave también aparece como una alerta visual en la pantalla del radio. Estas funciones se aplican para el modo de encryption segura de las comunicaciones MDC OTAR.

**NOTA:**

El usuario inicia el comando de Solicitud de regeneración de clave con la selección del menú Regeneración de clave.

Solo se accede: Cuando el [Operación segura en la página 301](#) campo se configura en **Hardware**, el campo Operación de OTAR se configura en **Solo MDC o ASTRO y MDC** y el radio admite distintos modelos y opciones.

10.18.3.8

Borrar anterior después de cambio de usuario

En este campo se activa la eliminación de TODAS las claves de encryption seguro en el grupo de claves anteriormente activo (consulte los campos Ranura A, Ranura B y Con índice) después de que se inicie un cambio del grupo de claves.

Puede iniciar el cambio del grupo de claves con una selección del menú Grupo de claves. Esta función se aplica en base a la amplitud de radio.

**ADVERTENCIA:**

Quando se activa este campo y cuando se activa Borrar índice anterior o cambiar índice MDC OTAR, es posible que el usuario borre ambos grupos de claves y quede momentáneamente sin ninguna clave de encryption seguro.

EJEMPLO:

El radio está en funcionamiento actualmente en el Grupo de claves 1 cuando ocurre un cambio de Grupo de claves OTAR. Cambia el radio al Grupo de claves 2 y borra el Grupo de claves 1 anterior del radio. Luego, si el usuario vuelve a cambiar manualmente al Grupo de claves 1 que se borró, y la función Borrar anterior en cambio de usuario borra el Grupo de claves 2, el radio permanece sin claves hasta que el usuario cargue manualmente claves nuevas o solicite una Regeneración de claves OTAR.

Solo se accede: Cuando el radio admite modelos/opciones diferentes.

10.18.3.9

ID de KMC

En este campo se selecciona el ID del Controlador del administrador de claves (KMC) del radio, lo que permite que solo el KMC identifique el radio.

Cada radio de un sistema debe tener un ID de KMC único, lo que permite que cada radio comunique comandos de MDC OTAR hacia y desde el KMC de manera individual. Esta función se aplica para el modo de encryption seguro para comunicaciones de MDC OTAR.

Solo se accede: Cuando el [Operación segura en la página 301](#) campo se configura en **Hardware**, el campo Operación de OTAR se configura en **Solo MDC** o **ASTRO y MDC** y el radio admite distintos modelos y opciones.

Mesa 116: Rango

Mínimo	Máximo
0000 Hex	FFFF Hex

10.18.3.10

Sistema MDC OTAR

Este campo selecciona el Sistema convencional MDC para su uso por parte de los comandos de MDC de Regeneración de clave inalámbrica (OTAR).

Esta función se aplica para las comunicaciones convencionales del modo de encryption seguro.

IMPORTANTE:

Un sistema MDC OTAR debe tener su función Rango expandido de ID de MDC **Desactivada**. En caso contrario, esta selección se considera no válida. Estas dos funciones son incompatibles.

NOTA:

Solo se pueden seleccionar Sistemas convencionales del tipo MDC (consulte el campo Tipo de sistema). Una vez definidos, los Sistemas convencionales hacen referencia a Personalidades convencionales.

MDC OTAR se activa de acuerdo a la Personalidad convencional mediante el campo Tipo de señalización sin ASTRO. El radio además está configurado para iniciar comandos OTAR mediante la activación del campo de Tx de OTAR de la personalidad.

Solo se accede: Cuando el [Operación segura en la página 301](#) campo se configura en **Hardware**, el campo Operación de OTAR se configura en **Solo MDC** o **ASTRO y MDC** y el radio admite distintos modelos y opciones.

10.18.4

Funciones

Esta sección permite ver o definir varias configuraciones de encryption seguro diversas y, a veces, complejas.

NOTA:

Cuando un campo Conexión segura/sin cifrado está configurado como **Seleccionar** para un cierto canal, la pulsación del botón Selección de Tx seguro, el switch de alternación Selección de Tx seguro o la selección del menú Seguro le permite alternar entre comunicaciones seguras o sin cifrado para ese canal.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.18.4.1

Retención de clave infinita

Si se activa este campo, el radio almacena permanentemente las claves de encryption, incluso cuando se retire la batería del radio o cuando este se re programe. Esta función requiere encryption de hardware.

Cuando se desactiva, las claves de encryption de llave única (UKEK) se borran o se guardan según la configuración del campo Retención de UKEK infinita.

ADVERTENCIA:

Cuando esta función está activada, la habilitación del campo Retención de UKEK infinita hace que el campo se invalide. Estas dos funciones son mutuamente exclusivas.

Los cambios en la configuración para este campo pueden afectar potencialmente el modo de funcionamiento FIPS en el dispositivo. Este impacto hace que se borren todos los parámetros de seguridad esenciales (material clave y contraseña). Consulte Modos de operación de FIPS para obtener más información.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** y el radio admite modelos y opciones diferentes.

10.18.4.2

Tono de alerta de falla de clave periódico

En este campo se activa un tono de alerta periódico para que suene cuando el canal de radio actual haya perdido su clave de encryption seguro.

Y, cuando se cumple cualquiera de las siguientes condiciones: El [Conexión segura/sin encriptar en la página 390](#) del canal actual está configurado en **Encriptar**. O cuando [Conexión segura/sin encriptar en la página 390](#) del canal actual está configurado en **Seleccionar**, la presión del botón Selección de tx encriptada o la alternación del interruptor Selección de tx encriptada, o bien la selección del menú Encriptar del radio está programado como modo Encriptar (no encriptado).

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software** y el radio admite modelos y opciones diferentes.

10.18.4.3

Borrar tonos de alerta

Este campo activa un tono de alerta para que suene cuando se produzca una transmisión o recepción de comunicaciones con encryption seguro en comparación con las comunicaciones en modo Borrar.

El modo Borrar hace referencia a comunicaciones estándar no encriptadas. Esta selección se aplica en base a la amplitud de radio.

NOTA:

Cuando un campo Asegurar/borrar conexión se configura en **Seleccionar** para un cierto canal, una pulsación del botón Selección de Tx segura, el switch de alternación Selección de Tx segura o la selección de menú Seguro permite que el usuario del radio alterne entre comunicaciones seguras o sin encryption para ese canal.

ADVERTENCIA:

Cuando el campo Activación de inhibición táctica está activado, este campo solo se puede configurar en **Solo Rx** o **Tx y Rx**. De lo contrario, la aplicación lo considera no válido.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software** y el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Ninguno

No hay ninguna opción Borrar tonos de alerta activada.

Solo Tx

Activa un tono de alerta para que suene cuando se presiona el Botón PTT, lo que alerta al usuario cuando el radio está a punto de transmitir en modo Borrar.

Solo Rx

Para la señalización analógica convencional (MDC, DTMF, Quik-Call II), esta función se aplica solo cuando los Sistemas convencionales analógicos del canal operativo actual del radio tengan programado el Tiempo previo del sistema en menos de 1500 ms.

Tx y Rx

Ver más arriba las definiciones de “Solo Tx” y “Solo Rx”.

10.18.4.4

Ignorar encriptar/no encriptar interruptor cuando esté compacto

En este campo se activa el radio para que ignore la configuración del switch de alternación Selección de Tx segura.

Esto hace que el modo de transmisión del radio se base en la configuración del campo [Conexión segura/sin encriptar en la página 390](#) del canal actual, **Encriptar** o **No encriptado**. Esta función se aplica en base a la amplitud de radio.

**ADVERTENCIA:**

Si esta función está desactivada y el modo/canal activo del radio se ajusta en **Asegurar** o **Borrar** (no seleccionable), el radio comprueba la posición del switch **Selección de Tx segura**. Si el valor ajustado del canal activo no coincide con la configuración del interruptor, el radio no transmitirá. La programación predeterminada de fábrica está desactivada.

Solo se accede: cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software**, la "Posición A" del switch concéntrico convencional o de troncalización se configura en **Selección de Tx segura**, y el radio admite modelos/opciones diferentes.

10.18.4.5

Duración sin silenciador de rastreo distinta a XL

En este campo se selecciona la cantidad de tiempo que el radio espera en modo Rastreo activo para una señal de retroalimentación de cifrado Red segura encriptada distinta a XL (sin extensión de rango) para que se detecte siguiendo una detección de operador.

Esta función se aplica a comunicaciones convencionales según la amplitud del radio. El tiempo está expresado en milisegundos.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software** y el radio admite modelos y opciones diferentes.

Mesa 117: Rango

Mínimo	Máximo	Incrementos
0 (ms)	6375 (ms)	25 (ms)

10.18.4.6

Duración sin silenciador de rastreo de XL

En este campo se selecciona la cantidad de tiempo que el radio espera en modo Rastreo activo para una señal de retroalimentación de cifrado Red segura encriptada distinta a XL (sin extensión de rango) para que se detecte siguiendo una detección de operador.

Esta función se aplica a comunicaciones convencionales en base a la amplitud de radio. El tiempo está expresado en milisegundos.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado como **Hardware** o **Privacidad digital mejorada** y el radio admite modelos y opciones diferentes.

Mesa 118: Rango

Mínimo	Máximo	Incrementos
0 (ms)	6375 (ms)	25 (ms)

10.18.4.7

Retención UKEK infinita

Este campo activa el radio para que guarde las claves UKEK (Clave de encryption de llave única) de forma permanente incluso cuando se retira la batería del radio.

Un radio que tiene solo UKEK puede tener Regeneración de clave por el aire (OTAR) pero no puede transmitir ni recibir ninguna voz segura o llamadas de datos. Cuando está desactivado, las claves de encryption se borran o se guardan según la configuración en el campo Retención de clave infinita. Si ambos campos están desactivados, todas las claves de encryption se borran cada vez que la batería del radio se remueve o cuando este se reprograma.

**ADVERTENCIA:**

Cuando el campo [Retención de clave infinita en la página 310](#) está activado, este campo debe desactivarse. De lo contrario, la aplicación lo considera no válido. Estas dos funciones son mutuamente exclusivas.

**ADVERTENCIA:**

Los cambios en la configuración de este campo pueden afectar potencialmente el modo de operación de FIPS en el dispositivo, lo que hará que se borren todos los parámetros de seguridad importantes (material de claves y contraseña). Consulte Modos de operación de FIPS para obtener más información.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** y el radio admite modelos y opciones diferentes.

10.18.4.8

Desactivar el borrado de clave de cifrado de hardware

Este campo permite desactivar el borrado de claves de encryption de un radio si se presiona el botón lateral superior (morado) y el botón naranja de manera simultánea.

Primero presione el botón lateral superior (morado) para evitar iniciar una llamada de emergencia.

Solo se accede: Cuando el campo Operación segura está configurado como **Hardware**, y cuando el campo [Retención de clave infinita en la página 310](#) está en **Activado** y cuando el campo [Activación de la inhibición táctica](#) está configurado en **Desactivado**.

O el campo Operación segura se configura en **Software**, y cuando el campo [Activación de la inhibición táctica](#) se configura en **Desactivado**.

10.18.5

Multitecla

Esta sección permite ver o definir parámetros de multitecla que afectan a operaciones con encryption seguro.

**NOTA:**

Cuando un campo Conexión segura/sin cifrado está configurado como **Seleccionar** para un cierto canal, la pulsación del botón Selección de Tx seguro, el switch de alternación Selección de Tx seguro o la selección del menú Seguro le permite alternar entre comunicaciones seguras o sin cifrado para ese canal.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.18.5.1

Mostrar en Selección de interruptor seguro

En este campo se selecciona el tipo de información que aparece en la pantalla del radio cuando el usuario cambia el canal actual del radio al modo de encryption seguro.

Cuando el campo Asegurar/borrar conexión se configura en **Seleccionar** para un canal determinado, la pulsación del botón Selección de Tx segura o el switch de alternación [Selección de Tx segura en la página 206](#) o la selección del menú Asegurar en el modo Seguro hace aparecer esta información en la pantalla del radio. Esta selección se aplica en base a la amplitud de radio.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado como **Hardware** o **Privacidad digital mejorada** y el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Nombre de la clave

El contenido definido en el campo Nombre de la clave aparece en la pantalla del radio.

**ADVERTENCIA:**

Esta selección solo es válida cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software**.

Nombre del grupo de claves

El Nombre del grupo de claves aparece en la pantalla del radio. Por lo general, las asignaciones de grupos de claves se asignan mediante un operador de Instalación de administración de claves (KMF) y se transmiten con Regeneración de clave inalámbrica (OTAR). De manera predeterminada, los nombres de grupos de claves son "kset 1" y "kset 2".

**ADVERTENCIA:**

Esta selección solo es válida cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software** con el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) activado.

Desactivado

No aparece nada en la pantalla del radio.

10.18.5.2

Mostrar en PTT

En este campo se selecciona el tipo de información que aparece en la pantalla del radio cuando el usuario presiona el botón PTT mientras el canal actual del radio esté funcionando en modo de encryption seguro.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software** y el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Nombre de la clave

El contenido definido en el campo Nombre de la clave aparece en la pantalla del radio.

**ADVERTENCIA:**

Esta selección solo es válida cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software**.

Nombre del grupo de claves

El Nombre del grupo de claves aparece en la pantalla del radio. Por lo general, las asignaciones de grupos de claves se asignan mediante un operador de Instalación de administración de

claves (KMF) y se transmiten con Regeneración de clave inalámbrica (OTAR). De manera predeterminada, los nombres de grupos de claves son “kset 1” y “kset 2”.

ADVERTENCIA:

Esta selección solo es válida cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software** con el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) activado.

Desactivado

No aparece nada en la pantalla del radio.

10.18.5.3

Mostrar en el cambio de modo

En este campo se selecciona el tipo de información que aparece en la pantalla del radio cuando el usuario cambia el canal o el modo del radio a un canal que está compacto al modo de encryption seguro (consulte Asegurar/borrar conexión).

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software** y el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Nombre de la clave

El contenido definido en el campo Nombre de la clave aparece en la pantalla del radio.

ADVERTENCIA:

Esta selección solo es válida cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software**.

Nombre del grupo de claves

El Nombre de grupo de claves aparece en la pantalla del radio. Por lo general, las asignaciones de grupos de claves se asignan mediante un operador de Instalación de administración de claves (KMF) y se transmiten con Regeneración de clave inalámbrica (OTAR). De manera predeterminada, los nombres de grupos de claves son “kset 1” y “kset 2”.

ADVERTENCIA:

Esta selección solo es válida cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software** con el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) activado.

Desactivado

No aparece nada en la pantalla del radio.

10.18.5.4

Administración de clave PID para modo ASN

Cuando se selecciona este campo, se activa el uso de Administración de clave del ID físico (PID) en el radio.

Este campo se activa automáticamente y cambia a visualización cuando el campo [Activación de MDC OTAR en la página 307](#) está activado. Esta función se aplica al modo de encryption seguro en base a la amplitud de radio. La administración de clave PID es un mecanismo heredado para administrar claves que limita el radio a 16 claves mediante ID físicos. Al desactivarla, la administración de clave de CKR (Referencia de clave común) se usa únicamente mediante el radio durante comunicaciones encriptadas de seguridad. La administración de clave de CKR permite hacer referencia a más de 16 claves y es necesario utilizarla con ASTRO OTAR (Regeneración de clave inalámbrica).

IMPORTANTE:

Al utilizar el modo ASN (SecureNet avanzada) en el KVL 3000 o el dispositivo de cargador de variables de clave (KVL) Plus del KVL 3000, las claves de encryption solo pueden cargarse en el radio cuando la administración de claves PID se haya activado en el radio.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** y el radio admite modelos y opciones diferentes.

10.18.5.5

ID de clave: Tiempo de desconexión

En este campo se selecciona la cantidad de tiempo que espera el radio tras haber finalizado una llamada segura recibida antes de recargar la última clave de encryption seleccionada o guardada.

IMPORTANTE:

Este tiempo de desconexión solo se necesita cuando el radio debe cambiar temporalmente a otra clave de encryption para recibir una llamada que fue transmitida con una clave diferente. Esta función se aplica al modo de encryption seguro para Comunicaciones convencionales. El tiempo está expresado en milisegundos.

NOTA:

Esta función se aplica al modo de encryption seguro ([Encriptación en general en la página 301](#)) para comunicaciones convencionales y de troncalización cuando se activa [Rx de ID de clave automática en la página 628](#).

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software** y el radio admite modelos y opciones diferentes.

Mesa 119: Rango

Mínimo	Máximo	Incrementos
0 (ms)	10000 (ms)	250 (ms)

10.18.5.6

ID de grupo de claves: tiempo de desconexión de Tx

En este campo se selecciona la cantidad de tiempo que espera el radio tras haber transmitido una llamada segura antes de recargar la última clave de encryption seleccionada o guardada.

IMPORTANTE:

Este tiempo de desconexión es necesario solo cuando el radio cambia temporalmente a otra clave de encryption para recibir una llamada que se transmitió con una clave diferente y, a continuación, el radio siguió usando esa clave cambiada a encryption para la transmisión de retorno. El tiempo está expresado en milisegundos.

NOTA:

Esta función se aplica al modo de encryption seguro ([Encriptación en general en la página 301](#)) para comunicaciones convencionales y de troncalización cuando se activa [Rx de ID de clave automática en la página 628](#).

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software** y el radio admite modelos y opciones diferentes.

Mesa 120: Rango

Mínimo	Máximo	Incrementos
0 (ms)	10000 (ms)	250 (ms)

10.18.6

Lista de clave de encryption

Esta sección permite configurar varias claves de encryption de hardware o de software para comunicaciones de voz y de datos con encryption seguro.

**NOTA:**

El número de claves de encryption disponibles depende del nivel de modelo del radio: Gama alta = 128, Gama media = 64 y Gama baja = 48.

Cuando un campo Conexión segura/sin cifrado está configurado como **Seleccionar** para un cierto canal, la pulsación del botón Selección de Tx seguro, el switch de alternación Selección de Tx seguro o la selección del menú Seguro le permite alternar entre comunicaciones seguras o sin cifrado para ese canal.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.18.6.1

Nombre de la clave

Este campo permite definir nombres de clave reconocibles para la clave actual (registro/fila) dentro de la Lista de clave de encryption.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software** y el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

- Se pueden usar caracteres, números, espacios y caracteres especiales.
- La cantidad de caracteres que se pueden usar depende del modelo del radio.

10.18.6.2

Número CKR

Este campo permite definir un número de clave para la clave de Referencia de clave común (CKR) actual (registro/fila) dentro de la Lista de clave de encryption.

Se hace referencia al número CKR para personalidades, grupos de conversación o funciones, sin importar la ubicación física del almacenamiento de la clave. Esto hace que no sea necesario que el programador del radio programe claves de encryption para ubicaciones físicas del almacenamiento para distintos dispositivos seguros en el mismo sistema de comunicaciones en el campo.

**ADVERTENCIA:**

La aplicación asigna automáticamente un valor "Número de CKR" predeterminado "En blanco". Cada número CKR que existe debe definirse como un valor numérico para poder escribir o guardar en el codeplug actual. Cada número CKR debe tener un valor único.

Solo se accede: Cuando el radio admite modelos y opciones diferentes y cuando el campo [Operación segura en la página 301](#) se configure en **Antiguo**.

Cuando el radio admite modelos y opciones diferentes, y cuando el campo [Operación segura en la página 301](#) está configurado en **Software**, y el campo [Fuente de carga de claves en la página 302](#) está configurado en **KVL**.

Mesa 121: Rango

Mínimo	Máximo
0001	4095

10.18.6.3

Con índice

Este campo permite indexar la clave de encryption de hardware actual (registro/fila) dentro de la Lista de clave de encryption.

La indexación permite que haya dos grupos únicos de claves dentro del radio. Hay un grupo de claves en el campo Ranura A y otro en el campo Ranura B. Luego de activar la indexación para la clave actual (registro/fila), se completa una segunda y única clave de encryption en el grupo de claves alternativas "Ranura B". La indexación también permite que haya dos claves únicas por canal de radio en lugar de una clave.

**IMPORTANTE:**

Cuando se programa la selección del menú Clave convencional y se selecciona una pareja de claves "Indexadas" para un determinado canal, el usuario puede alternar de la clave de encryption en el Grupo de claves A a la clave de encryption en el Grupo de claves B (y viceversa) sin cambiar el canal del radio. Esto es posible solo para canales convencionales.

Cuando se programa la selección del menú Grupo de claves en comunicaciones convencionales o de troncalización, entonces la regeneración de clave del grupo de claves actual del radio solo es posible en ese tipo de canal de comunicaciones. Un grupo de claves se aplica según la amplitud del radio y a ambos tipos de canales.

Cuando se programan las selecciones de Grupos de claves convencionales y de troncalización, el usuario puede cambiar el grupo de claves para el radio entero, sin importar el canal en el que el radio está operando actualmente.

Solo pueden indexarse ocho claves en la Ranura B y solo 16 claves en total entre la Ranura A y la Ranura B.

Solo se accede: Cuando el radio admite modelos y opciones diferentes y cuando el campo [Operación segura en la página 301](#) se configure en **Antiguo**.

Cuando el radio admite modelos y opciones diferentes, y cuando el campo [Operación segura en la página 301](#) está configurado en **Software**, y el campo [Fuente de carga de claves en la página 302](#) está configurado en **KVL**.

10.18.6.4

Ranura A

La aplicación recopila y permite ver solamente el número de clave de hardware de Identificación física (PID) de la clave actual (registro/fila) dentro de la Lista de clave de encryption.

Este valor se ve afectado por la configuración del campo Indexado para el registro o la fila actual activado o desactivado. Cuando el campo Indexado, permite que haya dos programaciones únicas de clave ("Grupos de claves"); una en la Ranura A y una en la Ranura B.

**IMPORTANTE:**

Cuando se programa la selección del menú Clave convencional y se selecciona una pareja de claves "Indexadas" para un determinado canal, el usuario puede alternar de la clave de encryption en el Grupo de claves A a la clave de encryption en el Grupo de claves B (y viceversa) sin cambiar el canal del radio. Esto es posible solo para canales convencionales.

Cuando se programa la selección del menú del Grupo de claves convencional o de troncalización, el usuario puede cambiar el Grupo de claves según la amplitud del radio.

Cuando se programan las selecciones de Grupos de claves convencionales y de troncalización, el usuario puede cambiar el grupo de claves para el radio entero, sin importar el canal en el que el radio está operando actualmente.

Solo pueden indexarse ocho claves en la Ranura B y solo 16 claves en total entre la Ranura A y la Ranura B.

Solo se accede:

cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software** y cuando el campo [Fuente de carga de claves en la página 302](#) se configura en **KVL**, y cuando el campo [Administración de clave PID para modo ASN en la página 315](#) está activado,

y

Cuando la cantidad de registros en la Lista de clave de encryption es menor que 9, o cuando el número de registro de la clave en [Lista de referencias de clave de encryption de hardware seguro en la página 321](#) está entre 9 y 16; y

- Si cualquiera de los primeros ocho campos [Con índice en la página 318](#) está "Activado", entonces la Ranura A del registro 16 no es aplicable; o
- Si dos de los primeros ocho campos Indexados está "Activado", entonces la Ranura A de los registros 15 y 16 no es aplicable; o
- Si tres de los primeros ocho campos Indexados está "Activado", entonces la Ranura A de los registros 14, 15 y 16 no es aplicable (los registros restantes siguen la misma regla; o

O

cuando el número de registro de la clave de la Lista de referencias de clave de encryption de hardware seguro es mayor que 16, no se puede acceder a la Ranura A),

y cuando el radio admite modelos y opciones diferentes.

10.18.6.5**Ranura B**

La aplicación recopila y permite ver solamente el número de clave de hardware de Identificación física (PID) de la clave actual (registro/fila) dentro de la Lista de clave de encryption.

Este valor se ve afectado por la configuración del campo Indexado para el registro o la fila actual activado o desactivado. Cuando el campo Indexado, permite que haya dos programaciones únicas de clave ("Grupos de claves"); una en la Ranura A y una en la Ranura B.

**IMPORTANTE:**

Cuando se programa la selección del menú Clave convencional y se selecciona una pareja de claves "Indexadas" para un determinado canal, el usuario puede alternar de la clave de encryption en el Grupo de claves A a la clave de encryption en el Grupo de claves B (y viceversa) sin cambiar el canal del radio. Esto es posible solo para canales convencionales.

Cuando se programa la selección del menú del Grupo de claves convencional o de troncalización, entonces el usuario puede cambiar el Grupo de claves según la amplitud del radio.

Cuando se programan las selecciones de Grupos de claves convencionales y de troncalización, el usuario puede cambiar el grupo de claves para el radio entero, sin importar el canal en el que el radio está operando actualmente.

Solo pueden indexarse ocho claves en la Ranura B, y solo 16 claves en total entre la Ranura A y la Ranura B.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.18.6.6**Datos de clave de ADP seleccionable**

Este campo permite definir el patrón de clave de Privacidad digital mejorada (ADP) para la clave actual (registro/fila) dentro de la Lista de clave de encryption.

Los patrones de la clave son un elemento necesario dentro del algoritmo seguro de ADP para que las comunicaciones de encryption de voz exitosas sean posible.

**ADVERTENCIA:**

Las claves de ADP no están clonadas en el radio de destino cuando un radio lee el codeplug de origen. Cuando el radio lee un codeplug que contiene claves ADP, las claves ADP no se cargan, lo que permite que estas claves aparezcan con asteriscos (*). En esta situación, los datos de la clave no se clonarán en un radio de destino. Si desea enviar datos de clave de ADP al radio de destino, el usuario debe volver a ingresar las claves ADP adecuadas antes de iniciar el proceso Clonar radio. Los datos de la clave ADP del codeplug de origen se sobrescribirán en los datos de la clave ADP del radio de destino cuando estén presentes.

Cuando se abre un archivo de codeplug que contiene claves ADP, estas se cargan y pueden clonarse en el radio de destino. Los datos de la clave ADP del codeplug de origen se sobrescribirán en los datos de la clave ADP del radio de destino cuando estén presentes.

**IMPORTANTE:**

Cuando este campo muestra diez (10) asteriscos "*****", no hay ningún patrón definido.

Si no desea ingresar ningún patrón de datos de clave, ingrese diez (10) asteriscos "*****".

Por motivos de seguridad, cuando se lee un codeplug desde un radio, se muestra "*****" en este campo, sin importar el patrón de datos que pueda guardarse en el radio.

Cuando el ID de clave de ADP seleccionable se modifique, el patrón de datos de clave de la misma fila o el mismo registro no será válido y deberá redefinirse.

Hasta 64 claves de encryption son posibles.

No hay ningún mecanismo para borrar una clave ADP desde el radio. Un campo con "*****" simplemente implica que no sobrescribirá cualquier clave que podría estar realmente en el radio.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) se establece en **Software**, el campo [Fuente de carga de claves en la página 302](#) se establece en **Lista de clave de encryption** y el radio admite modelos y opciones diferentes.

Mesa 122: Rango

Mínimo	Máximo
0000000000 Hex	FFFFFFFFFFFF Hex

10.18.6.7

ID de clave de ADP seleccionable

Este campo permite definir el número de ID digital que representa la Privacidad digital mejorada (ADP) para la clave actual (registro/fila) dentro de la Lista de clave de encryption.

El ID de clave se transmite junto con las comunicaciones por voz encriptadas. Los radios receptores que recuperan el ID de clave pueden cargar el patrón Datos de clave de ADP seleccionable y así descryptar la llamada de voz entrante.

**IMPORTANTE:**

Todos los ID de clave de ADP seleccionable debe ser únicos.

Hasta 64 claves de encryption son posibles.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) se establece en **Software**, el campo [Fuente de carga de claves en la página 302](#) se establece en **Lista de clave de encryption** y el radio admite modelos y opciones diferentes.

Mesa 123: Rango

Mínimo	Máximo
0000 Hex	FFFF Hex

10.18.6.8

Algoritmo

Este campo permite que los datos de clave ADP de la entrada seleccionada se envíen al Módulo de seguridad de hardware (HSM) del radio.

Actualmente, solo se pueden programar las claves ADP en el HSM a través de RadioCentral. Todas las demás claves deben entregarse al radio desde un Cargador de variables de clave (KVL) o una instalación de administración de claves (KMF).

10.19

Conjunto de perfil de KMF seguro

El conjunto **Perfil de instalación de administración de claves (KMF) seguras** permite ver o definir los parámetros ASTRO de Regeneración de clave inalámbrica (OTAR) correspondientes a los Perfiles de KMF. Los perfiles de KMF están definidos para comunicarse con KMF específicas. Hasta cinco (5) perfiles de KMF seguros son posibles. Este nodo completo y todas sus funciones solo están disponibles cuando el campo Activación de ASTRO OTAR de encryption en general está **Activado**.

**IMPORTANTE:**

El objetivo de los perfiles de KMF es permitir que el radio opere con distintas KMF, posiblemente en distintos sistemas. La desventaja de esta funcionalidad es que el hardware de encryption subyacente no puede administrar las múltiples versiones de la misma clave; por ejemplo, el usuario no podría tener el mismo Número CKR administrado por la KMF n.º 1 y la KMF n.º 2. Por lo tanto, los operadores de las KMF n.º 1 y 2, en este ejemplo, tendrían que acordar no administrar los mismos números CKR (Referencia de clave común).

**NOTA:**

Una vez que se definen, los perfiles de KMF seguros se seleccionan desde el Índice de perfil KMF de troncalización, el Índice de perfil KMF convencional y los campos Índice de perfil KMF de la Lista del grupo de conversación ASTRO.

ASTRO OTAR está activado según la Personalidad convencional y el campo Tipo de voz/señal de Rx. El radio además está configurado para iniciar comandos OTAR mediante la activación del campo de Tx de ASTRO OTAR u OTAR de la personalidad.

ASTRO OTAR está activado según el Sistema de troncalización del campo ASTRO OTAR y los campos Tx de OTAR.

10.19.1

Lista de referencias de clave de encryption de hardware seguro

La sección **Referencias de clave de encryption de hardware seguro** del Perfil KMF seguro permite ver o definir el conjunto de CKR (Referencias de clave común) al que el Perfil de instalación de administración de claves seguras (KMF) puede acceder.

Así, se hace referencia a las claves de encryption para utilizarlas mediante una Lista de referencias de clave de encryption de hardware seguro del Perfil de KMF, que, según corresponda, hace referencia a las claves de hardware subyacentes de la Lista de claves de encryption segura. Cada Lista de referencias de clave asignada a un Perfil de KMF está configurada para comunicarse con una KMF específica. Cuando una KMF mantiene las mismas CKR, el operador de la KMF puede controlar ese

radio desde una perspectiva de ASTRO OTAR (regeneración de clave por el aire). Otros perfiles de KMF se comunican con otras KMF que puedan controlar varios conjuntos de CKR para el radio.

IMPORTANTE:

El número máximo de claves de encryption de hardware seguro posible es igual al número actual de claves de hardware seguras disponibles en la Lista de claves de encryption seguro.

Una vez que se definen, los perfiles de KMF se seleccionan desde el Índice de perfil KMF de troncalización, el Índice de perfil KMF convencional y los campos Índice de perfil KMF de la Lista del grupo de conversación ASTRO.

Para los canales convencionales que tienen el campo Conexión de voz/clave configurado en **Seleccionar**, puede seleccionar una Clave de encryption nueva en la selección del menú.

10.19.1.1

Número CKR

La aplicación recupera y muestra los valores de Referencia de clave común (CKR) de solo lectura.

Cada valor CKR se basa en la selección del campo [Referencia de clave de encryption en la página 322](#) realizada para el mismo registro o la misma fila de la Lista de referencias de clave de encryption seguro, que se aplica al [Perfil de ASTRO OTAR](#) actual

NOTA:

Este valor CKR está definido en el campo [Lista de clave de encryption segura - Número CKR](#).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.19.1.2

Referencia de clave de encryption

En este campo se selecciona una clave de hardware o AES en la Lista de clave de encryption seguro.

Esta selección se aplica a este registro o esta fila de la Lista de referencias de clave de encryption de hardware seguro actual, que se aplica al [Perfil de ASTRO OTAR](#) actual.

IMPORTANTE:

Cada selección de la clave de hardware y AES debe ser única para el Perfil de ASTRO OTAR actual. Por lo tanto, el número máximo de Claves de encryption seguro (registros/filas) posible es igual al número actual de Claves seguras disponibles en la [Lista de clave de encryption seguro](#).

Una vez definido, se seleccionan los Perfiles de ASTRO OTAR en los campos [Índice de perfil de ASTRO OTAR en la página 621](#) de troncalización, el Índice del perfil de ASTRO OTAR convencional, la Selección del perfil de ASTRO OTAR del perfil de datos y el [Índice de perfil de ASTRO OTAR en la página 412](#) de la Lista de grupo de conversación ASTRO.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software**, cuando el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) está configurado en **Activado**, cuando el campo [Operación Regeneración de clave inalámbrica \(OTAR\)](#) está configurado en **Solo ASTRO** o **ASTRO y MDC** y cuando el radio admite modelos y opciones diferentes.

10.19.2

Información de ASTRO OTAR

La sección **Información de ASTRO OTAR (Regeneración de clave por el aire)** del Perfil de KMF seguro permite ver o definir los parámetros de perfiles de KMF seguros individuales.

**NOTA:**

Una vez que se definen, los perfiles de KMF se seleccionan desde el Índice de perfil KMF de troncalización, el Índice de perfil KMF convencional y los campos Índice de perfil KMF de la Lista del grupo de conversación ASTRO.

OTAR de ASTRO está activado según la Personalidad convencional basado en el campo Tipo de voz/señal de Rx. El radio además está configurado para iniciar comandos OTAR mediante la activación del campo de Tx de ASTRO OTAR u OTAR de la personalidad.

ASTRO OTAR está activado según el Sistema de troncalización del campo ASTRO OTAR y los campos Tx de OTAR.

10.19.2.1

Perfil de ASTRO OTAR

Este campo permite crear nombres reconocibles para el Perfil de ASTRO de Regeneración de clave inalámbrica (OTAR) actual.

**NOTA:**

Una vez definidos, los Perfiles de ASTRO OTAR se seleccionan en los campos [Índice de perfil de ASTRO OTAR en la página 412](#) de troncalización, el [Índice de perfil de ASTRO OTAR en la página 412](#) convencional, y el [Índice de perfil de ASTRO OTAR en la página 412](#) de la Lista de grupo de conversación ASTRO.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

**NOTA:**

Ejemplos: Profile-05, Electric1, #510

Se pueden usar caracteres, números, espacios y caracteres especiales.

Se pueden utilizar hasta 14 caracteres.

10.19.2.2

Borrar teclas anteriores en conversión OTAR

Este campo permite la eliminación de TODAS las clave de encryption del grupo de claves anteriormente activo luego de haber ocurrido un cambio en el grupo de claves ASTRO OTAR (Regeneración de clave inalámbrica).

Esta función se aplica a la operación ASTRO OTAR en el [Perfil de ASTRO OTAR](#) actual.

**NOTA:**

Puede iniciar un cambio en el grupo de claves OTAR desde la Instalación de administración de claves (KMF) o una selección programable del menú Regeneración de clave.

**IMPORTANTE:**

Cuando se activa este campo Borrar teclas anteriores en conversión OTAR y cuando se activa Borrar anterior en cambio de usuario, es posible que el usuario borre ambos grupos de claves y no tenga ninguna clave de encryption seguro de manera momentánea.

Ejemplo: El radio está funcionando en el Grupo de claves 1 cuando se produce un cambio en el grupo de claves de OTAR; esto cambia el radio al Grupo de claves 2 y borra el Grupo de claves 1 anterior. Luego, si vuelve a cambiar manualmente al Grupo de claves 1 que se borró, y la función Borrar anterior en Cambio de usuario borra al Grupo de claves 2 anterior, el radio permanecerá sin claves hasta que el usuario cargue manualmente claves nuevas o solicite una Regeneración manual de claves OTAR.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) se configura en **Hardware**, cuando el campo [Operación Regeneración de clave inalámbrica \(OTAR\)](#) se configura en **Solo ASTRO** o **ASTRO y MDC** y el radio admite modelos y opciones diferentes.

10.19.2.3

Número de intentos

En este campo se selecciona el número de intentos que hace el radio mientras espera la confirmación de registro de Instalación de administración de claves (KMF).

Esta función se aplica a la operación ASTRO OTAR en el [Perfil de ASTRO OTAR](#) actual.

Solo se accede: cuando el campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software**, y cuando el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) se configura en **Activado**, y cuando el campo [Operación Regeneración de clave inalámbrica \(OTAR\)](#) se configura en **Solo ASTRO** o **ASTRO y MDC**, y cuando el campo [Clase de respuesta en la página 326](#) está configurado en **Confirmado** y cuando el radio admite modelos/opciones diferentes.

Mesa 124: Rango

Mínimo	Máximo
1	10

10.19.2.4

Temporizador de inactividad OTAR

Este campo selecciona la cantidad de tiempo que la Instalación de administración de claves (KMF) tiene para comunicarse con el radio.

Si el radio no recibe información de la KMF cuando el temporizador haya expirado, el radio intentará restablecer la comunicación.

Esta función se aplica a la operación ASTRO OTAR en el [Perfil de ASTRO OTAR](#) actual.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software**, cuando el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) está configurado en **Activado**, cuando el campo [Operación Regeneración de clave inalámbrica \(OTAR\)](#) está configurado en **Solo ASTRO** o **ASTRO y MDC** y cuando el radio admite modelos y opciones diferentes.

Mesa 125: Rango

Mínimo (horas)	Máximo (horas)
1	10

10.19.2.5

Nivel de seguridad de Rx OTAR

En este campo se seleccionan los niveles de la política de seguridad de recepción para Mensajes de administración de claves (KMM).

Esta función se aplica a la operación ASTRO OTAR en el [Perfil de ASTRO OTAR](#) actual.

**NOTA:**

En este momento, las funciones Solicitud de regeneración de clave, Registro y No se pueden descryptar los KKM están siempre en **Encriptado y autenticado**.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software**, cuando el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) está configurado en **Activado**, cuando el campo [Operación Regeneración de clave inalámbrica \(OTAR\)](#) está configurado en **Solo ASTRO** o **ASTRO y MDC** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Básico

El radio recibe cualquier formato de KMM que permita Proyecto 25 estándar.

Mejorado

Esta selección no es válida cuando [Operación segura en la página 301](#) se configura en **Software**.

El radio solo recibe los siguientes KMM:

- **Encriptado y autenticado**
- **Solo encriptado**
- **Solo autenticado**

10.19.2.6

Nivel de seguridad de Tx OTAR

En este campo se seleccionan los niveles de la política de seguridad de recepción para Mensajes de administración de claves (KMM).

Esta función se aplica a la operación ASTRO OTAR en el [Perfil de ASTRO OTAR](#) actual.

**NOTA:**

En este momento, las funciones Solicitud de regeneración de clave, Registro y No se pueden descryptar los KKM están siempre en **Encriptado y autenticado**.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software**, cuando el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) está configurado en **Activado**, cuando el campo [Operación Regeneración de clave inalámbrica \(OTAR\)](#) está configurado en **Solo ASTRO** o **ASTRO y MDC** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Básico

El radio recibe cualquier formato de KMM que permita Proyecto 25 estándar.

Mejorado

Esta selección no es válida cuando [Operación segura en la página 301](#) se configura en **Software**.

El radio solo recibe los siguientes KMM:

- Encriptado y autenticado
- Solo encriptado
- Solo autenticado

10.19.2.7

Tono de alerta de estado de solicitud de regeneración de clave

Este campo permite al radio generar un tono de alerta de éxito o falla con respecto a la finalización de la solicitud de la regeneración de clave.

Esta función solo afecta al sonido de este tono de alerta al salir de la sección Solicitud de regeneración de clave del menú del radio antes de finalizar el proceso de la solicitud. Cuando no se sale de la sección Solicitud de regeneración de clave del menú del radio antes de finalizar el proceso de la solicitud, este tono de alerta de estado suena sin importar la configuración de este campo. Esta función se aplica a la operación ASTRO OTAR en el [Perfil de ASTRO OTAR](#) actual.

NOTA:

El estado del proceso de regeneración de clave también aparece como una alerta visual en la pantalla del radio.

Una operación de regeneración de clave de encryption OTAR se realiza desde la Instalación de administración de claves (KMF) por el despachador cuando recibe una solicitud de regeneración de clave desde el usuario.

Puede iniciar una Solicitud de regeneración de clave con la pulsación del botón [Solicitud de regeneración de clave en la página 223](#) o la selección del menú [Solicitud de regeneración de clave en la página 223](#).

Solo se accede: Cuando el campo [Operación segura en la página 301](#) se configura en **Hardware**, cuando el campo [Operación Regeneración de clave inalámbrica \(OTAR\)](#) se configura en **Solo ASTRO** o **ASTRO y MDC** y el radio admite modelos y opciones diferentes.

10.19.2.8

Clase de respuesta

En este campo se selecciona el tipo de respuesta que se utiliza cuando el radio se comunica con la Instalación de administración de claves (KMF).

Esta función se aplica a la operación ASTRO OTAR en el [Perfil de ASTRO OTAR](#) actual.

Se admiten las siguientes selecciones:

No confirmado

Las transmisiones de ASTRO OTAR enviadas a la KMF (desde la radio) no confirmadas/reconocidas indicando una transmisión recibida con éxito.

Confirmado

Las transmisiones de ASTRO OTAR enviadas a la KMF (desde la radio) requieren que se vuelva a enviar una confirmación/reconocimiento a la radio indicando una transmisión recibida con éxito.

Cuando el campo [Transporte OTAR en la página 329](#) está configurado en **Solo banda ancha** o **Banda ancha preferida** y el radio realiza Regeneración de clave por el aire (OTAR) mediante banda ancha, el radio utiliza **Confirmado** como el tipo de respuesta.

Cuando el radio realiza OTAR a través de radio móvil terrestre (LMR), utiliza el valor de este campo como el tipo de respuesta.

Solo se accede: Cuando se cumplen las siguientes condiciones:

- El campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software**.

- Cuando el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) está configurado en **Activado**.
- El campo [Operación Regeneración de clave inalámbrica \(OTAR\)](#) está configurado en **Solo ASTRO** o **ASTRO y MDC**.
- El radio admite modelos y opciones diferentes.

10.19.2.9

Tiempo entre intentos

En este campo se selecciona la cantidad de tiempo que el radio espera antes de enviar un reintento del último mensaje.

Esta función se aplica a la operación ASTRO OTAR en el [Perfil de ASTRO OTAR](#) actual.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software**, cuando el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) está configurado en **Activado** y cuando el campo [Operación Regeneración de clave inalámbrica \(OTAR\)](#) está configurado en **Solo ASTRO** o **ASTRO y MDC**, cuando el campo [Clase de respuesta en la página 326](#) está configurado en **Confirmado** y cuando el radio admite modelos y opciones diferentes.

Mesa 126: Rango

Mínimo	Máximo	Incrementos
5 segundos	90 segundos	5 segundos

10.19.2.10

Solicitud de regeneración de clave seleccionable por el usuario

En este campo se activa el radio para transmitir la Solicitud de regeneración de clave ASTRO de Regeneración de clave inalámbrica (OTAR).

La solicitud se envía a la consola Facilidad de administración de claves (KMF) del despachador. Esta función se aplica a la operación ASTRO OTAR en el [Perfil de ASTRO OTAR](#) actual.

NOTA:

Puede iniciar una Solicitud de regeneración de clave con la pulsación del botón [Solicitud de regeneración de clave en la página 192](#) o la selección del menú [Solicitud de regeneración de clave en la página 223](#).

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software**, cuando el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) está configurado en **Activado**, cuando el campo [Operación Regeneración de clave inalámbrica \(OTAR\)](#) está configurado en **Solo ASTRO** o **ASTRO y MDC** y cuando el radio admite modelos y opciones diferentes.

10.19.3

Transporte de datos

La sección **Transporte de datos** del Perfil KMF seguro permite ver o definir ajustes para usarse en el envío y la recepción de KMMs (mensajes de administración clave) hacia y desde la KMF (instalación de administración clave).

IMPORTANTE:

Esta configuración Transporte de datos se aplica solo a ASTRO OTAR (Regeneración de clave por aire) de troncalización, que es una aplicación de datos basada en IP en el radio. ASTRO OTAR convencional se comunica con el suscriptor utilizando el protocolo de Interfaz aérea común P25 (CAI) y no está basado en IP. Los archivos en esta sección se aplican para opciones individuales de Asegurar perfil de KMF.

Una vez que se definen, los perfiles de KMF se seleccionan desde el Índice de perfil KMF de troncalización, el Índice de perfil KMF convencional y los campos Índice de perfil KMF de la Lista del grupo de conversación ASTRO.

10.19.3.1

Dirección IP de KMF

En este campo se selecciona la dirección del Protocolo de Internet (IP) de la Instalación de administración de claves (KMF).

Esta selección se aplica a la funcionalidad ASTRO de Regeneración de clave inalámbrica (OTAR) y para el [Perfil de ASTRO OTAR](#) actual.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software**, cuando el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) está configurado en **Activado**, cuando el campo [Operación Regeneración de clave inalámbrica \(OTAR\)](#) está configurado en **Solo ASTRO** o **ASTRO y MDC** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

- Direcciones IP válidas cuyos valores para cada octeto están entre: [0-223] . [0-255] . [0-255] . [0-255]

10.19.3.2

Puerto UDP KMF

En este campo se selecciona el número de puerto del Protocolo de datagramas del usuario (UDP).

El radio transmite KMM (mensajes de administración de claves) a este puerto al comunicarse con la KMF (facilidad de administración de claves). Esta selección se aplica a la funcionalidad ASTRO OTAR (Regeneración de clave inalámbrica) y para el [Perfil de ASTRO OTAR](#) actual.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software**, cuando el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) está configurado en **Activado**, cuando el campo [Operación Regeneración de clave inalámbrica \(OTAR\)](#) está configurado en **Solo ASTRO** o **ASTRO y MDC** y cuando el radio admite modelos y opciones diferentes.

Mesa 127: Rango

Mínimo	Máximo
0	65535

10.19.3.3

Puerto OTAR de suscriptor

En este campo se selecciona el número de puerto de Regeneración de clave inalámbrica (OTAR) de la Unidad del suscriptor móvil (MSU) que se utilizará.

El radio recibe KMM (mensajes de administración de claves) a este puerto al comunicarse con la KMF (facilidad de administración de claves). Esta selección se aplica a la funcionalidad ASTRO OTAR y para el [perfil de ASTRO OTAR](#) actual.

Solo se accede: Cuando el campo [Operación segura en la página 301](#) está configurado en **Hardware** o **Software**, cuando el campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) está configurado en **Activado**, cuando el campo [Operación Regeneración de clave inalámbrica \(OTAR\)](#) está configurado en **Solo ASTRO** o **ASTRO y MDC** y cuando el radio admite modelos y opciones diferentes.

Mesa 128: Rango

Mínimo	Máximo
0	65535

10.19.3.4

Transporte OTAR

Este campo selecciona el tipo de transporte para Regeneración de clave por el aire (OTAR).

Están disponibles las siguientes opciones:

Solo LMR

OTAR se realiza solamente a través de radio móvil terrestre (LMR).

Solo con banda ancha

OTAR se realiza a través de la Evolución a largo plazo (LTE) móvil o Wi-Fi.

Solo se accede: Cuando se cumplen las siguientes condiciones:

- El modelo de radio admite OTAR, como el modelo Radio Next.
- El campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software**.
- El campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) está activado.
- El campo [Activación de OTAR en la página 303](#) está activado.
- El campo [Activación de ASTRO OTAR en la página 304](#) está activado.

10.19.3.5

ID de banda ancha de KMF

Este campo le permite ingresar un identificador único global de la Facilidad de administración de claves (KMF). El radio se comunica con el KMF para la Regeneración de clave por el aire (OTAR) mediante banda ancha.

Solo se accede: Cuando se cumplen las siguientes condiciones:

- El modelo de radio admite OTAR, como el modelo Radio Next.
- El campo [Operación segura en la página 301](#) se configura en **Hardware** o **Software**.
- El campo [Estándar de encryption avanzado \(AES256\) en la página 302](#) está activado.
- El campo [Activación de OTAR en la página 303](#) está activado.
- El campo [Activación de ASTRO OTAR en la página 304](#) está activado.

- El campo [Transporte OTAR en la página 329](#) no está configurado en **Solo LMR**.

10.20

Certificado CA

Esta sección permite cargar archivos de certificado CA en el codeplug actual.

La cantidad máxima de archivos de certificados de CA que pueden agregarse a un codeplug es 20. Los archivos del certificado de CA en el codeplug del radio se utilizan para autenticar el servidor de gateway de SmartConnect durante una sesión TLS.

10.20.1

Nombre del certificado

Este campo permite definir nombres reconocibles del archivo de Certificado CA.

Se admiten las siguientes selecciones:

NOTA:

Ejemplos: EMT-001, #500, Electric1, # A5.

Se pueden usar un máximo de 50 caracteres ASCII, números, espacios y caracteres especiales.

10.20.2

Nombre de archivo del certificado

Este campo permite ver o cambiar nombre del archivo de Certificado CA.

Se admiten las siguientes selecciones:

NOTA:

Ejemplos: EMT-001, #500, Electric1, # A5.

Se pueden usar un máximo de 255 caracteres, números, espacios y caracteres especiales.

10.21

Emergencia en general

Esta sección le permite ver o definir la funcionalidad del modo Emergencia que se aplica tanto para Perfiles de emergencia convencional como para Perfiles de emergencia de troncalización.

Estos Perfiles de emergencia pueden aplicarse mientras operan en las Comunicaciones convencionales y de troncalización.

NOTA:

Los Perfiles de emergencia convencional se seleccionan para su uso en el campo Selección de perfil de emergencia del Sistema convencional.

Los Perfiles de emergencia de troncalización se seleccionan para su uso desde el campo Selección de perfil de emergencia de la personalidad de troncalización.

La funcionalidad del Modo de emergencia se inicia con un radio configurado o puede iniciarla el usuario.

10.21.1

General

Esta sección le permite ver o definir la funcionalidad del modo Emergencia que se aplica tanto para Perfiles de emergencia convencional como para Perfiles de emergencia de troncalización.

A continuación, estos perfiles de emergencia pueden aplicarse mientras operan en las comunicaciones convencionales o de troncalización.

NOTA:

Los Perfiles de emergencia convencional se seleccionan para su uso en el campo Selección de perfil de emergencia del Sistema convencional.

Los Perfiles de emergencia de troncalización se seleccionan para su uso en el campo Selección de perfil de emergencia de la Personalidad de troncalización.

La funcionalidad del Modo de emergencia se inicia con un radio configurado o puede iniciarla el usuario.

10.21.1.1

Tipo de indicador de Rx de alarma de emergencia

En este campo se selecciona el tipo de notificación que el usuario del radio escucha o ve cuando se recibe una Alarma de emergencia desde otro radio.

Esta función también debe activarse (cuando corresponda) para el Sistema MDC individual o el Sistema ASTRO desde el campo Indicador de Rx de alarma de emergencia o para el Sistema de troncalización desde el campo Indicador de Rx de alarma de emergencia. Esta selección se aplica mientras se opera en Modo emergencia, tanto para comunicaciones convencionales como de troncalización.

IMPORTANTE:

El tiempo del indicador de Rx de alarma de emergencia es de 10 segundos. Durante estos 10 segundos, se puede desactivar el indicador presionando cualquiera de los botones del radio, excepto los botones de **Volumen Luz**.

Una vez que ha borrado el indicador o que este se borre, los reintentos por enviar alarmas de emergencia desde el mismo ID primario de MDC, o ID individual del Sistema ASTRO, o ID de unidad de troncalización se ignoran durante los próximos 20 segundos.

Las alarmas de emergencia no se detectan mientras el radio se encuentra en Modo de rastreo.

Las alarmas de emergencia no se detectan mientras el radio se encuentra activo en un canal de voz.

Se admiten las siguientes selecciones:

Sin indicación

No se escuchan ni se ven alertas.

Solo alerta

Suena una alerta de audio.

Solo pantalla

Aparece una alerta visual. La alerta visual se aplica solo para modelos de radio con pantalla.

Alertar y mostrar

Las alarmas de emergencia no se detectan mientras el radio se encuentra activo en un canal de voz.

NOTA:

Para las selecciones **Solo alerta y Alerta y pantalla**, se cumplen las siguientes condiciones:

- Cuando el radio detecta una alarma de emergencia, aparece EA-RCVD (alarma de emergencia recibida) en la pantalla del radio.
- Cuando el radio detecta una Señal periódica de emergencia, aparece BCON RX (Señal periódica Encuéntreme de emergencia recibida) en la pantalla del radio.

EA-RCVD aparece alternadamente con el ID primario de MDC, el ID individual del sistema ASTRO, o el ID de unidad de troncalización del radio que envió la Alarma de emergencia y continúa durante diez segundos. La restitución invertida/el ID de la persona que llama también es posible.

10.21.1.2

Mantener la conexión

Este campo permite que el radio permanezca encendido durante una transmisión del modo de emergencia, sin importar la posición del switch de encendido.

Si el switch de encendido del radio está en la posición **APAGADO**, el radio se apaga una vez que sale del modo de emergencia realizando una pulsación larga del botón de Emergencia. Esta selección se aplica mientras se opera en Modo emergencia, tanto para comunicaciones convencionales como de troncalización.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.21.1.3

Desactivar indicaciones de llamada de emergencia

Este campo permite que todas las indicaciones (pantalla, alertas de LED y tonos) que se asocian normalmente con una Llamada de emergencia (consulte Tipo de emergencia) se deshabiliten cuando funciona en modo Alarma silenciosa.

Solo están disponibles las indicaciones sonoras y visuales que se producen durante una llamada de grupo de conversación/convencional estándar y, por lo tanto, durante una llamada de emergencia, aparece como una llamada de despacho normal que se está produciendo. Esta selección se aplica mientras se opera en Modo emergencia, tanto para comunicaciones convencionales como de troncalización.

ADVERTENCIA:

Este modo de Llamada de emergencia silenciosa continúa hasta que presione y mantenga presionado el botón de Emergencia por la Duración de pulsación larga programada para Emergencia para salir del modo de emergencia.

IMPORTANTE:

Cuando esta selección está activada, la función ampliada Desactivar indicaciones de llamada de emergencia es **Usada en Codeplug = Sí**.

Solo se accede: Cuando la Función ampliada **Desactivar indicaciones de llamada de emergencia** aparece en el campo Nombre de la función ampliada y cuando el campo Alarma silenciosa está activado (si está desactivado, esta selección debe ser Desactivado; de lo contrario, el campo deja de ser válido).

10.21.1.4

Opción de silencio

Este campo permite que el radio desilencie el tráfico de voz cuando opera en el modo Alarma silenciosa.

La opción Desilenciar permite que el despachador proporcione retroalimentación al usuario del radio que inicia el estado de emergencia a través de palabras en código, sin atraer atención no deseada.

Esta selección se aplica mientras se opera en Modo emergencia, tanto para comunicaciones convencionales como de troncalización.

**ADVERTENCIA:**

Cuando el campo [Desactivar indicaciones de llamada de emergencia en la página 332](#) está activado, este campo Opción desilenciar debe estar activado; de lo contrario, la aplicación considerará que el valor no es válido.

Solo se accede: Cuando el campo Alarma silenciosa está activado.

10.21.1.5

Retraso de canal

En este campo se selecciona la cantidad de tiempo que el radio espera antes de transmitir datos del modo de emergencia cuando el usuario está cambiando el canal del radio.

Esta función evita que el radio transmita datos de emergencia de forma accidental en los canales durante el modo de emergencia y cuando el usuario cambia el canal del radio. Esta selección se aplica mientras se opera en modo de emergencia tanto para las transmisiones convencionales como de troncalización. El tiempo está expresado en segundos.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Mesa 129: Rango

Mínimo	Máximo	Incremento
0 seg	7 s	1 seg

10.21.1.6

Distinguir tipo de emergencia

Este campo permite que el radio envíe diferentes mensajes de Protocolo de respuesta/solicitud de ubicación (LRRP) para Hombre caído, Impacto detectado y otro tipo de emergencias.

Esta función permite diferenciar las falsas alarmas de las emergencias reales.

Los eventos de estado del radio incluyen una visualización textual en pantalla de la condición y sonará un tono de emergencia diferente en el altavoz según la duración de las alarmas.

Solo se accede: Cuando el campo Tipo de indicador de Rx de alarma de emergencia es Solo mostrar o Alerta y mostrar.

10.21.2

Hombre caído

Esta sección le permite ver o definir la funcionalidad del modo de emergencia de Hombre caído.

La función Hombre caído transmite una emergencia basándose en un radio portátil y considera que el operador se encuentra en posición horizontal o en posición horizontal e inmóvil.

Por lo tanto, el Modo de emergencia de Hombre caído alerta a los despachadores y a otros radios de que se ha producido una situación de Hombre caído.

IMPORTANTE:

La función Hombre caído se puede configurar para que funcione según la amplitud de radio o el perfil de emergencia, lo que incluye tonos de alerta personalizables. Consulte el campo Nivel de capacidad de configuración de Hombre caído y la página Tonos de emergencia personalizables.

NOTA:

El campo Activador de hombre caído activa la función y determina si también se requiere un umbral de sensibilidad de movimiento para completar la condición Hombre caído. También se puede definir el nivel de capacidad de configuración de Hombre caído, el temporizador previo a la alerta, el tono previo a la alerta y el temporizador posterior a la alerta.

En terreno: Se lo alerta tanto auditiva como visualmente de que se han cumplido las condiciones de Hombre caído programadas del radio durante la activación del Temporizador previo a la alerta. Una vez que se haya cumplido el período del temporizador previo a la alerta, se activa el temporizador posterior a la alerta. Una vez que se haya cumplido el período del temporizador posterior a la alerta, el radio comienza a transmitir en el Modo de emergencia.

- En cualquier momento durante el período en el que se considera que se cumplen las condiciones de Hombre caído, si se interrumpen las condiciones de Hombre caído por un cambio de posición del radio o porque ha oprimido el botón Borrar hombre caído, la función de Hombre caído se reinicia automáticamente y no se envía ninguna transmisión de emergencia.
- Si ya se está transmitiendo la emergencia, pero aún no se ha realizado el reconocimiento, y las condiciones de Hombre caído se interrumpen porque se coloca la radio en posición vertical o porque presionó el botón Borrar hombre caído, la transmisión de emergencia se cancela.

Los ángulos de funcionamiento que determinan un radio en posición vertical a diferencia de uno en posición horizontal vienen programados de fábrica.

El umbral de sensibilidad de movimiento viene programado de fábrica.

NOTA:

Los Perfiles de emergencia convencional se seleccionan para su uso en el campo Selección de perfil de emergencia del Sistema convencional.

Los Perfiles de emergencia de troncalización se seleccionan para su uso en el campo Selección de perfil de emergencia de la Personalidad de troncalización.

La funcionalidad del Modo de emergencia se inicia con un radio configurado o puede iniciarla el usuario.

10.21.2.1

Activador de hombre caído

En este campo se selecciona el tipo de condición de Hombre caído que ocasiona el inicio de la función Hombre caído del Modo de emergencia.

Esta selección se aplica tanto para comunicaciones convencionales como de troncalización.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Desactivado

Desactiva la función Hombre caído.

Solo horizontal

Se transmite una emergencia cuando el radio se inclina a una posición horizontal percibida.

Horizontal y sin movimiento

Se transmite una emergencia cuando el radio se inclina a una posición horizontal percibida, y si el movimiento medido del radio no alcanza el umbral de sensibilidad de movimiento programado de fábrica. Cualquier movimiento del radio que no alcanza el umbral de movimiento se considera como "Sin movimiento".

NOTA:

El umbral de sensibilidad de movimiento viene programado de fábrica.

NOTA:

Los ángulos de funcionamiento que determinan un radio en posición vertical a diferencia de uno en posición horizontal vienen programados de fábrica.

10.21.2.2

Temporizador de alerta previa

En este campo se selecciona el tiempo que una condición de Hombre caído debe estar presente antes de que se notifique al usuario del radio con el Tono previo a la alarma seleccionado.

Este tono de alerta también se complementa visualmente con el texto *Hombre caído* que aparece en la pantalla del radio. Estas alertas pretenden advertir al usuario del radio de que el Modo de emergencia está a punto de activarse; esto permite al usuario colocar el radio en una posición más vertical y, posiblemente, evitar la transmisión de una falsa Emergencia.

Esta selección se aplica tanto para comunicaciones convencionales como de troncalización.

IMPORTANTE:

En terreno: Si se interrumpe la condición de Hombre caído por un cambio de posición del radio o porque el usuario oprimió el botón Borrar hombre caído, la condición de Hombre caído, los temporizadores y las alertas se restablecen, y la transmisión del Modo de emergencia se cancela.

Solo se accede: Cuando el radio admite modelos y opciones diferentes y cuando el campo [Activador de hombre caído en la página 334](#) no está **Desactivado**.

Mesa 130: Rango

Mínimo	Máximo	Incremento
5 segundos	120 segundos	1 segundo

10.21.2.3

Temporizador de alerta posterior

En este campo se selecciona el tiempo, después de que haya expirado el Temporizador previo a la alerta, que un radio necesita para permanecer en la condición de Hombre caído antes de que se inicie la transmisión del Modo de emergencia.

Esta selección se aplica mientras funciona tanto en el modo de comunicaciones convencionales como de troncalización. El tiempo está expresado en segundos.

IMPORTANTE:

En terreno: Si se interrumpe la condición de Hombre caído por un cambio de posición del radio o porque el usuario oprimió el botón Borrar hombre caído, la condición de Hombre caído, los temporizadores y las alertas se restablecen, y la transmisión del Modo de emergencia se cancela.

Solo se accede: Cuando el radio admite modelos y opciones diferentes y cuando el campo [Activador de hombre caído en la página 334](#) no está **Desactivado**.

Mesa 131: Rango

Mínimo	Máximo	Incremento
1 segundo	120 segundos	1 segundo

10.21.2.4

Tono previo a alerta

En este campo se selecciona el tipo de tono de alerta que se reproduce cuando se cumple el tiempo del Temporizador previo a la alerta.

El Temporizador previo a la alerta comienza una vez que se cumple la condición programada de Hombre caído (ver [Activador de hombre caído en la página 334](#)). Una vez que este período expira, suena este tono de alerta seleccionado. Este tono de alerta también se complementa visualmente con el texto `Hombre caído` que aparece en la pantalla del radio.

Estas alertas audibles y visuales pretenden advertir al usuario del radio que el Modo de emergencia está a punto de activarse; esto permite al usuario colocar el radio en una posición más vertical y, posiblemente, evitar la transmisión de una falsa Emergencia. Esta selección se aplica tanto para comunicaciones convencionales como de troncalización.

IMPORTANTE:

Para asegurar que el usuario del radio escuche este tono aun cuando el volumen del radio esté bajo, se recomienda que se aumente la configuración del Volumen mínimo o la configuración de Compensación de volumen (dB).

Solo se accede: Cuando el radio admite modelos y opciones diferentes y cuando el campo [Activador de hombre caído en la página 334](#) no está **Desactivado**.

Se admiten las siguientes selecciones:

Un tono de advertencia

Se emite un tono cuando se cumple el tiempo del [Temporizador de alerta previa en la página 335](#).

Tono continuo de advertencia

Se emite un tono continuo cuando se cumple el tiempo del [Temporizador de alerta previa en la página 335](#) y durante el tiempo que dure el [Temporizador de alerta posterior en la página 335](#). Por lo tanto, este tono de alerta finaliza cuando comienza la transmisión del Modo emergencia.

10.21.2.5

Nivel de capacidad de configuración de Hombre caído

En este campo se selecciona si la función Hombre caído del modo de emergencia se define en base a la amplitud de radio o al Perfil de emergencia.

Esta selección se aplica tanto para comunicaciones convencionales como de troncalización.

Solo se accede: Cuando el radio admite modelos y opciones diferentes y cuando el campo [Activador de hombre caído en la página 334](#) no está **Desactivado**.

Se admiten las siguientes selecciones:

Radio en general

La función Hombre caído opera según la amplitud de radio.

Por perfil de emergencia

Permite que la función Hombre caído se active según el perfil de emergencia convencional o según el perfil de emergencia de troncalización al seleccionar el campo correspondiente Habilitación de Hombre caído. Consulte también la [Activador de tono de emergencia de hombre caído en la página 337](#).

10.21.3

Tonos de emergencia personalizables

Esta sección permite ver o definir la funcionalidad Hombre caído del modo Emergencia que está relacionada con las Listas de tonos de emergencia del perfil de emergencia.

NOTA:

Los Perfiles de emergencia convencional se seleccionan para su uso en el campo Selección de perfil de emergencia del Sistema convencional.

Los Perfiles de emergencia de troncalización se seleccionan para su uso en el campo Selección de perfil de emergencia de la Personalidad de troncalización.

La funcionalidad del Modo de emergencia se inicia con un radio configurado o puede iniciarla el usuario.

10.21.3.1

Activador de tono de emergencia de hombre caído

Este campo permite el uso de una Lista de tonos de emergencia personalizable según el Perfil de emergencia, cuando una situación de Hombre caído se ha iniciado en el modo Emergencia.

Esta selección se aplica mientras se opera en Modo emergencia, tanto para comunicaciones convencionales como de troncalización.

Solo se accede: cuando el campo [Activador de hombre caído en la página 334](#) no está configurado en **Desactivado**, y cuando el campo [Nivel de capacidad de configuración de Hombre caído en la página 336](#) está configurado en **Según perfil de emergencia**, y cuando el radio admite modelos/ opciones diferentes y

10.22

Perfiles de emergencia convencionales

Los **Perfiles de emergencia convencionales** permiten ver o modificar la funcionalidad del modo de emergencia, convencional.

Las transmisiones de emergencia tienen muchas configuraciones posibles definidas. Se puede crear una variedad de perfiles de emergencia.

NOTA:

Las funciones y configuraciones de [Emergencia en general en la página 330](#) se aplican a estos perfiles.

Los perfiles de emergencia convencionales se seleccionan desde el campo Selección de perfil de emergencia del sistema convencional.

Los Sistemas convencionales hacen referencia a las Personalidades convencionales, ya sea desde el campo Sistema ASTRO o el campo Sistema No ASTRO; solo ASTRO y MDC pueden realizar transmisiones en modo de emergencia.

La funcionalidad del modo de emergencia se inicia con un radio configurado o lo hace el usuario.

10.22.1

General

Esta sección permite ver o modificar las funciones de emergencia convencionales para Perfiles de emergencia convencional individuales.

NOTA:

Las funciones y configuraciones de [Emergencia en general en la página 330](#) se aplican a estos perfiles.

Los perfiles de emergencia convencionales se seleccionan desde el campo Selección de perfil de emergencia del sistema convencional.

Los Sistemas convencionales hacen referencia a las Personalidades convencionales, ya sea desde el campo Sistema ASTRO o el campo Sistema No ASTRO; solo ASTRO y MDC pueden realizar transmisiones en modo de emergencia.

La funcionalidad del Modo de emergencia se inicia con un radio configurado o puede iniciarla el usuario.

10.22.1.1

Nombre de perfil de emergencia

Este campo permite crear nombres reconocibles para los Perfiles de emergencia convencionales actuales.

Los Perfiles de emergencia convencional se seleccionan para su uso en el campo Selección de perfil de emergencia del Sistema convencional.

NOTA:

Ejemplos: EMT-001, #500, Electric1, # A5.

Se pueden usar caracteres, números, espacios y caracteres especiales.

Se pueden utilizar hasta 14 caracteres.

10.22.1.2

Tipo de emergencia

En este campo se selecciona la funcionalidad deseada del radio que se produce cuando se inicia el modo Emergencia.

Esta selección se aplica para la [Perfiles de emergencia convencionales en la página 337](#) actual.

IMPORTANTE:

Ambas selecciones son compatibles con Canal de inversión de emergencia, es decir, una transmisión de emergencia en un canal predeterminado.

Una vez que el radio a comenzado la operación Llamada de emergencia, solo una pulsación larga de botón Emergencia (consulte el campo Duración de pulsación larga para emergencias) o el apagado del radio cesa esta funcionalidad.

Se admiten las siguientes selecciones:

Solo alarma

Al oprimir el botón Emergencia, se envía de forma repetida un paquete de datos de alarma de emergencia a la estación base para iniciar una comunicación de emergencia hasta que se cancela mediante una de las siguientes opciones:

- Se han agotado tanto los [Reintentos formales en la página 339](#) como los [Reintentos informales en la página 340](#) programados.
- Se recibe un reconocimiento que confirme la transmisión exitosa del paquete de datos de emergencia desde la estación base.

- Una pulsación del botón PTT.
- Una pulsación larga del botón Emergencia (consulte el campo Duración de pulsación larga para emergencias).

Alarma y llamada

Al oprimir el botón Emergencia, se envía de forma repetida un paquete de datos de alarma de emergencia a la estación base para iniciar una comunicación de emergencia hasta que se cancela mediante una de las siguientes opciones:

- Se han agotado tanto los [Reintentos formales en la página 339](#) como los [Reintentos informales en la página 340](#) programados.
- Se recibe un reconocimiento que confirme la transmisión exitosa del paquete de datos de emergencia desde la estación base.
- Una pulsación del botón PTT.

Cuando un Paquete de datos de alarma cesa, la voz (Llamada) puede transmitir por el canal.

10.22.1.3

Se requiere confirmación de consola (DVRS)

Este campo hace que se requiera una respuesta de confirmación de consola adicional ("confirmación de consola") cuando se inicia el modo Emergencia.

Cuando se ha enviado una alarma de emergencia (consulta el campo Tipo de emergencia), el radio siempre requiere una confirmación del Equipo de red fija (FNE); esta función requiere una confirmación adicional de consola desde la aplicación de despacho/consola.

La recepción de una confirmación de FNE asegura que el sitio actual del radio ha recibido el paquete de alarma de emergencia; la recepción de una confirmación de consola asegura que la aplicación de despacho/consola está mostrando la condición de emergencia al despachador. Una vez que se recibe la confirmación de la consola, el radio emite un tono de alerta de cuatro beeps.

Esta selección se aplica al Perfil de emergencia convencional actual.

IMPORTANTE:

Este campo solo se aplica cuando el canal actual del radio está funcionando con un Sistema repetidor vehicular digital (DVRS) convencional (es decir, la Personalidad convencional hace referencia a un Sistema convencional de DVRS). Este campo no causa ningún impacto en un Sistema no-DVRS convencional.

Esta función se debe desactivar para que las opciones **Emergencia de micrófono de uso frecuente** o **Emergencia mediante silencio de audio** funcionen correctamente. Consulte el campo [Modo de transmisión automático de emergencia en la página 341](#).

10.22.1.4

Tono de alerta de confirmación

Este campo activa el radio para emitir un tono de audio cuando recibe un mensaje de modo Emergencia y se envía de vuelta un mensaje de confirmación al radio desde la estación base.

Una confirmación de emergencia implica que la Alarma de emergencia del radio (consulte [Tipo de emergencia en la página 338](#)) se ha recibido con éxito por parte de la estación base. Esta función se aplica al Perfil de emergencia convencional actual.

10.22.1.5

Reintentos formales

En este campo se selecciona la cantidad de veces que el radio intenta transmitir una llamada en modo Emergencia formal (consulte Tipo de emergencia).

Una llamada formal es cuando el radio espera que se libere un canal del tráfico radial antes de intentar transmitir. Los reintentos informales se abortan cuando el radio recibe una confirmación (Ack) de una transmisión de emergencia exitosa.

Esta selección se aplica para la [Perfiles de emergencia convencionales en la página 337](#) actual.

IMPORTANTE:

Si el reintento informal de emergencia se completa antes de que el temporizador de paciencia limitada caduque, el radio utilizará la transmisión formal hasta que el temporizador caduque. Después de que el temporizador caduque, cualquier otro reintento formal se enviará de manera informal.

Mesa 132: Rango

Mínimo	Máximo	Incremento
0 intento	15 intentos	1 intento

Mesa 133: Rango

Mínimo	Máximo
0 intento	14 o infinitos intentos

10.22.1.6

Reintentos informales

En este campo se selecciona la cantidad de veces que el radio intenta transmitir una llamada en modo Emergencia informal (consulte las selecciones del campo Tipo de emergencia).

Una llamada informal es cuando el radio envía una transmisión incluso cuando el canal está ocupado con otro tráfico radial. Estas transmisiones continúan al pasar a otro tráfico del canal. Los reintentos informales se abortan cuando el radio recibe una confirmación (Ack) de una transmisión de emergencia exitosa.

Esta selección se aplica para la [Perfiles de emergencia convencionales en la página 337](#) actual.

IMPORTANTE:

Si el reintento informal de emergencia se completa antes de que el temporizador de paciencia limitada caduque, el radio utilizará la transmisión formal hasta que el temporizador caduque. Después de que el temporizador caduque, cualquier otro reintento formal se enviará de manera informal.

Mesa 134: Rango

Mínimo	Máximo	Incremento
1 intento	15 intentos	1 intento

10.22.1.7

Salida de emergencia en el Cambio de canal

Este campo permite que el radio salga del estado de emergencia en el cambio de modo.

10.22.1.8

Activación de Hombre caído

En este campo, se activa la operación de hombre caído del modo de emergencia para los perfiles de emergencia convencionales actuales.

Solo se accede: Cuando el campo Activador de hombre caído no está configurado en **Desactivado**, cuando el campo Nivel de capacidad de configuración de Hombre caído está configurado en **Por perfil de emergencia** y cuando el radio admite modelos y opciones diferentes.

10.22.1.9

Modo de transmisión automático de emergencia

En este campo se selecciona una operación de transmisión de emergencia adicional y específica para la configuración del Perfil de emergencia convencional actual.

Están disponibles tanto la opción de emergencia de mic de uso frecuente como de silenciar audio de mic de uso frecuente.

ADVERTENCIA:

Cuando esta función no está desactivada, la funcionalidad seleccionada anula/mejora la funcionalidad de emergencia descrita para la selección **Alarma y llamada de emergencia** del campo [Tipo de emergencia en la página 338](#).

Se admiten las siguientes selecciones:

Desactivado

No se encuentra seleccionada ninguna funcionalidad de transmisión automática adicional.

Emergencia de mic de uso frecuente

Una vez que se inicia el modo de emergencia presionando el botón de Emergencia, después de solo una transmisión informal de la alarma de emergencia, esta selección hace que el radio se encienda automáticamente y transmita una llamada de emergencia (ver [Tipo de emergencia en la página 338](#)). El radio transmite con su micrófono abierto de manera automática durante el tiempo seleccionado por el campo Período de Tx de micrófono activo. El radio está entonces en Modo de llamada de emergencia normal. Esto también se conoce como Emergencia con transmisión de mensaje.

Cuando el campo Pulsación larga para emergencia no está configurado en **0**, el Modo de llamada de emergencia finaliza con una pulsación larga del botón de emergencia.

Disponible para: Sistemas convencionales ASTRO y MDC.

ADVERTENCIA:

El campo Tipo de emergencia para el perfil actual debe estar configurado como **Alarma y llamada** o este campo deja de ser válido.

Las Personalidades convencionales que utilizan micrófono activo deben configurar su Temporizador de tiempo de espera de transmisión en un valor mayor que el Período activo de Tx del micrófono de uso frecuente; de otro modo, la transmisión del micrófono de uso frecuente se aborta cuando expira el Temporizador de tiempo de espera.

NOTA:

Las configuraciones de [Reintentos formales en la página 339](#)/[Reintentos informales en la página 340](#) se ignoran al ingresar al estado de micrófono activo. Una vez que se sale del Micrófono activo o del estado de Llamada de emergencia, los valores de los campos Reintentos formales/Reintentos informales se restauran en el canal de perfil/radio.

Emergencia mediante silenciar audio

Una vez que se inicia el modo de emergencia presionando el botón de Emergencia, después de solo una transmisión informal de alarma de emergencia, esta selección hace que el radio se encienda automáticamente en el modo de emergencia con el micrófono aún silenciado/apagado. Esta transmisión continúa durante el tiempo especificado en el campo Período de Tx para silenciar audio. El radio está entonces en Modo de llamada de emergencia normal.

Cuando el campo Pulsación larga para emergencia no está configurado en **0**, el Modo de llamada de emergencia finaliza con una pulsación larga del botón de emergencia.

Disponible para: ASTRO: solo sistemas convencionales.

ADVERTENCIA:

El campo Tipo de emergencia para el perfil actual debe estar configurado como **Alarma y llamada** o este campo deja de ser válido.

Las Personalidades convencionales que utilizan esta función deben configurar el Temporizador de tiempo de espera en un valor mayor que [Período de Tx para silenciar audio en la página 342](#); de otro modo, la transmisión se aborta cuando expira el temporizador de tiempo de espera.

NOTA:

Las configuraciones de [Reintentos formales en la página 339](#)/[Reintentos informales en la página 340](#) se ignoran al ingresar al estado de silencio de audio. Una vez que se sale de Silenciar audio o del estado de Llamada de emergencia, los valores de los campos Reintentos formales/Reintentos informales se restauran en el canal de perfil/radio.

10.22.1.10

Período de Tx de micrófono activo

En este campo se selecciona la cantidad de tiempo en que el radio sube el volumen y transmite mientras opera en el modo Emergencia de micrófono de uso frecuente (consulte Modo de transmisión automático de emergencia).

Esta selección se aplica para la [Perfiles de emergencia convencionales en la página 337](#) actual.

IMPORTANTE:

Las Personalidades convencionales que utilizan esta función deben configurar el Temporizador de tiempo de espera en un valor mayor que [Período de Tx para silenciar audio en la página 342](#); de otro modo, la transmisión se aborta cuando expira el temporizador de tiempo de espera.

Solo se accede: Cuando el campo [Tipo de emergencia en la página 338](#) está configurado en **Alarma y llamada** y cuando el campo [Modo de transmisión automático de emergencia en la página 341](#) está configurado en **Emergencia de micrófono de uso frecuente**.

IMPORTANTE:

La versión anterior del codeplug debe utilizar los siguientes parámetros:

Mesa 135: Rango

Mínimo	Máximo	Incrementos
10 segundos	120 segundos	10 segundos

IMPORTANTE:

Esto se aplica a la versión de codeplug 19.00.00 y posteriores:

Mesa 136: Rango

Mínimo	Máximo	Incremento
1 segundo	120 segundos	10 segundos

10.22.1.11

Período de Tx para silenciar audio

En este campo se selecciona la cantidad de tiempo en el que el radio se activa automáticamente y transmite mientras opera en **Emergencia mediante silencio de audio** activado del Modo de emergencia.

Consulte [Modo de transmisión automático de emergencia en la página 341](#).

Esta selección se aplica a los [Perfiles de emergencia convencionales en la página 337](#) y solo es posible solo para sistemas de señalización ASTRO.

Solo se accede: Cuando el campo [Tipo de emergencia en la página 338](#) se ha configurado en **Alarma y llamada**, cuando el campo [Modo de transmisión automático de emergencia en la página 341](#) está configurado en **Emergencia mediante silencio de audio**.

Mesa 137: Rango

Mínimo	Máximo	Incremento
1 segundo	5 segundos	1 segundo

Mesa 138: Rango

Mínimo	Máximo
1 segundo	5 segundos

10.22.1.12

Activación de multiplicador Tx

Este campo hace que el valor de Factor multiplicador Tx se duplique, lo que luego determina durante cuánto tiempo el radio sigue encendido y transmitiendo una Llamada de emergencia informal automáticamente (consulte Tipo de emergencia).

Esta selección se aplica para la [Perfiles de emergencia convencionales en la página 337](#) actual.

10.22.1.13

Factor multiplicador de Tx

En este campo se selecciona el tiempo durante el cual el radio continúa automáticamente encendido y transmitiendo una Llamada de emergencia informal (consulte Tipo de emergencia).

Este tiempo comienza solo cuando el radio ha agotado todos los [Reintentos formales en la página 339](#) y [Reintentos informales en la página 340](#) de emergencia sin recibir una confirmación.

Esta selección se aplica para la [Perfiles de emergencia convencionales en la página 337](#) actual.

IMPORTANTE:

Cuando el campo Modo de radio remoto se configura en **Rastreo del radio o Monitor del radio**, este número se multiplica por el Tiempo base Tx para proporcionar un valor en segundos.

Las siguientes selecciones son:

Mesa 139: Rango

Mínimo	Máximo
0	3

10.22.1.14

Encuéntreme de emergencia

La función Encuéntreme de emergencia proporciona una indicación que le notifica cuando alguien en su entorno tiene una activación de emergencia.

Cuando esta función está activada, puede realizar las siguientes acciones:

- Transmitir una baliza de Bluetooth de bajo consumo (BLE) cada dos segundos mientras el radio está en la función de emergencia.
- Recibir balizas de emergencia y ver la notificación Baliza recibida.
- Recibir un tono de alerta cuando se recibe una baliza en los últimos diez segundos.
- Ingresar en la opción de menú para ver todas las balizas de recepción.
- Descartar la notificación para dejar de recibir los tonos y la visualización.

Para activar la función Encuéntreme de emergencia, debe activar los campos **Activación de transmisión** y **Activación de recepción** en la sección Encuéntreme de emergencia del perfil de emergencia convencional.

10.22.1.15

Activación de transmisión

Cuando este campo está activado, el radio puede transmitir la baliza Encuéntreme de emergencia durante una emergencia.

La transmisión de la baliza de emergencia se activa a través de la función de emergencia, como presionar el switch o el botón de emergencia, y la alerta de caída (hombre caído) de emergencia. Cuando entra en emergencia, no se requiere ninguna acción adicional. Cuando el radio entra en el modo de emergencia, la conexión Bluetooth se activa automáticamente y se envían las balizas. Las balizas de emergencia se envían cada dos segundos mientras el radio está en modo de emergencia.

Para obtener más información sobre la función Encuéntreme de emergencia, consulte [Encuéntreme de emergencia en la página 343](#).

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.22.1.16

Activación de recepción

Cuando este campo está activado, el radio recibe la baliza Encuéntreme de emergencia durante una emergencia.

Cuando cambia a un canal en el que está activada la recepción de baliza, la conexión Bluetooth se activa automáticamente. Cuando recibe una baliza de emergencia, el radio reproduce un tono y muestra *Baliza recibida* en la pantalla superior y en el widget de control de radio de la pantalla frontal. El radio sigue emitiendo un tono cada diez segundos mientras recibe balizas de forma activa.

Si el receptor descarta la notificación o si no se reciben balizas durante cuatro minutos, la notificación Baliza recibida desaparece. Si hay varias balizas disponibles, la pantalla muestra el ID o alias del dispositivo que entra a la emergencia en último lugar.

Para obtener más información sobre la función Encuéntreme de emergencia, consulte [Encuéntreme de emergencia en la página 343](#).

NOTA:

En los radios APX estándar con pantalla frontal, puede utilizar el menú para ver el ID de radio del radio transmisor y el nivel del indicador de intensidad de señal recibida (RSSI) de Bluetooth.

En los radios APX NEXT, puede descartar la baliza si presiona **DESCARTAR** en la notificación. También puede ver la lista de remitentes si presiona **DETALLES**.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.22.1.17

Activación remota de emergencia

Este campo selecciona la funcionalidad específica de la función Activación de emergencia remota para el conjunto Perfil de emergencia actual. Esta función permitirá que un radio de origen

(codificación) active la función de emergencia en un radio de destino (decodificación) a través de la comunicación por el aire como si el usuario de destino presionara el botón Emergencia.

Este campo solo es válido cuando el radio es compatible con el modelo o la opción de funcionamiento convencional APCO 25 o de troncalización APCO 25.

Se admiten las siguientes selecciones:

Desactivado

No está seleccionada la funcionalidad de Activación remota de emergencia.

Solo codificación

Un radio solo puede iniciar comunicaciones remotas de emergencia a un radio de destino.

Solo decodificación

Un radio solo puede recibir comunicaciones remotas de emergencia de un radio de origen y, tras decodificar las comunicaciones, el radio iniciará inmediatamente la función de emergencia.

Codificación y decodificación

A un radio se le permite tanto iniciar comunicaciones remotas de emergencia a un radio de destino como recibir comunicaciones remotas de emergencia de un radio de origen.

NOTA:

Este campo está desactivado de forma predeterminada.

10.22.2

MDC

Esta sección le permite ver o modificar funciones de emergencia convencional de MDC para Perfiles de emergencia convencional individuales.

NOTA:

Las funciones y configuraciones de amplitud de emergencia se aplican a estos perfiles.

Los perfiles de emergencia convencionales se seleccionan desde el campo Selección de perfil de emergencia del sistema convencional.

Los Sistemas convencionales de tipo MDC se relacionan con Personalidades convencionales desde el campo Sistema sin ASTRO.

La funcionalidad del Modo de emergencia se inicia con un radio configurado o puede iniciarla el usuario.

10.22.2.1

Tono lateral PTT-ID de emergencia

En este campo se activa un tono de alerta para que suene mientras se transmite un ID de PTT de emergencia y cuando el radio se encuentre en modo de emergencia.

El tono de alerta suena cuando se presiona el botón PTT y continúa hasta que PTT ID de emergencia se ha transmitido completamente. Durante este breve período, el micrófono del radio y, por lo tanto, la transmisión de voz, se desactivan automáticamente. Cuando se detiene el tono de alerta, notifica que el altavoz del radio está listo para aceptar una transmisión de voz.

Esta selección se aplica para la [Perfiles de emergencia convencionales en la página 337](#) actual.

ADVERTENCIA:

Esta función se aplica solo cuando el campo ID de PTT de emergencia sin ASTRO se activa en una Personalidad convencional que hace referencia a un Sistema convencional que, a su vez, hace referencia a este Perfil de emergencia convencional.

Solo se accede: Cuando el campo [Tipo de emergencia en la página 338](#) está configurado en **Alarma y llamada**.

10.22.2.2

Tiempo base de Tx del Monitor remoto de emergencia

En este campo se selecciona un número utilizado por el radio para calcular la cantidad de tiempo que el radio transmite automáticamente y espera en el modo Monitor remoto de emergencia MDC.

Una vez que este tiempo de transmisión expira, entonces el radio se desconecta durante el tiempo definido por el [Tiempo base de Rx de Monitor remoto de emergencia en la página 346](#). Esta función se aplica al Perfil de emergencia convencional actual. El tiempo está expresado en segundos.

**IMPORTANTE:**

El radio utiliza el valor Multiplicador de Tx (entregado al radio dentro de una **Confirmación** de llamada de emergencia, o dentro de un Comando de monitor remoto enviado por un despachador) multiplicado por este Tiempo base de Tx para determinar la cantidad de tiempo de transmisión del Monitor remoto de emergencia.

Además, si el Multiplicador general (entregado al radio dentro de una Confirmación **Ack** de llamada de emergencia, o dentro de un Comando de monitor remoto enviado por un despachador) se configura como **Verdadero**, este tiempo de transmisión calculado se duplica.

Solo se accede: Cuando el campo Tipo de emergencia está configurado en **Alarma y llamada** y cuando el radio admite modelos y opciones diferentes.

Mesa 140: Rango

Mínimo	Máximo	Incrementos
10 s	120 s	10 s

10.22.2.3

Tiempo base de Rx de Monitor remoto de emergencia

En este campo se selecciona un número utilizado por el radio para calcular la cantidad de tiempo que el radio suelta el PTT automáticamente y espera en el modo Monitor remoto de emergencia.

Este tiempo de recepción/espera comienza una vez que el [Tiempo base de Tx del Monitor remoto de emergencia en la página 346](#) ha expirado. Esta función se aplica al Perfil de emergencia convencional actual. El tiempo está expresado en segundos.

**IMPORTANTE:**

El radio utiliza el valor Multiplicador de Rx (entregado al radio dentro de una **Confirmación** de llamada de emergencia, o dentro de un Comando de monitor remoto enviado por un despachador) multiplicado por este Tiempo base de Rx para determinar la cantidad de tiempo de recepción/espera del Monitor remoto de emergencia.

Además, si el Multiplicador general (entregado al radio dentro de una Confirmación **Ack** de llamada de emergencia, o dentro de un Comando de monitor remoto enviado por un despachador) se configura como **Verdadero**, el tiempo de recepción/espera calculado se duplica.

Solo se accede: Cuando el campo Tipo de emergencia está configurado en **Alarma y llamada** y cuando el radio admite modelos y opciones diferentes.

Mesa 141: Rango

Mínimo	Máximo	Incrementos
10 s	120 s	10 s

10.22.2.4

Activación de monitor remoto de emergencia

En este campo se activa la operación del Monitor remoto del modo de emergencia.

El Monitor remoto de emergencia se manifiesta en el radio una vez que se da uno de dos escenarios siguientes. Primero, cuando el despachador/la consola recibe correctamente una Alarma de emergencia (consulte Alarma y llamada en [Tipo de emergencia en la página 338](#)) y, luego, se recibe correctamente de vuelta en el radio una Confirmación de alarma de emergencia. Segundo, cuando se ha recibido (en el radio) un Comando de monitor remoto de MDC durante el modo de emergencia. Una vez que el radio se encuentra en Modo monitor remoto de emergencia, este automáticamente sube el volumen y transmite el audio del entorno desde su micrófono "activo". Esta función se aplica a los [Perfiles de emergencia convencionales en la página 337](#) actuales.

**ADVERTENCIA:**

El campo [Tipo de emergencia en la página 338](#) debe estar configurado en **Alarma y llamada** para que esta selección sea válida.

**IMPORTANTE:**

Tanto la "Confirmación" como el "Comando de monitor remoto" contienen un valor de Multiplicador Tx, un valor de Multiplicador Rx y un Multiplicador general (configurado como **Verdadero** o **Falso**). El despachador/consola define estos valores.

El radio utiliza el Multiplicador Tx (proporcionado por la Confirmación o el Comando de monitor remoto) multiplicado por el Tiempo base de Tx programado para determinar la cantidad de tiempo de esta transmisión de micrófono "activo". Si el Multiplicador general (proporcionado por la Confirmación o el Comando de monitor remoto) está configurado como **Verdadero**, se duplica el tiempo de transmisión calculado.

Una vez que este tiempo de transmisión expira, el radio deja de transmitir durante el tiempo específico de recepción/espera. El tiempo de recepción/espera se determina al multiplicar el Multiplicador Rx (proporcionado por la Confirmación o el Comando de monitor remoto) por el Tiempo base Rx programado. Nuevamente, si el Multiplicador general (proporcionado por la Confirmación o el Comando de monitor remoto) está configurado como **Verdadero**, se duplica el tiempo de recepción/espera calculado.

Una vez que este período de tiempo de transmisión y el período de tiempo de recepción/espera han ocurrido, el radio pasa a una secuencia de Alarma de emergencia (consulte **Alarma y llamada** de Tipo de emergencia).

El ciclo de Monitor remoto de emergencia comienza nuevamente cuando el radio recibe una Confirmación de alarma de emergencia o un Comando de monitor remoto (durante el Modo de emergencia).

Este ciclo de Monitor remoto de emergencia finaliza cuando el despachador envía una Confirmación de alarma de emergencia con un valor de Multiplicador Tx de cero **0** y un valor de Multiplicador Rx de cero **0** (también conocidos como **Valores de la consola de despacho**), o cuando el radio detecta que oprime el botón PTT.

Solo se accede: Cuando el radio admite modelos y opciones diferentes.

10.22.3

Lista de tonos de emergencia

Esta sección permite ver o modificar las funciones de Tono de alerta y Activador del modo de emergencia para Perfiles de emergencia Convencional individuales.

**NOTA:**

Las funciones y configuraciones de amplitud de emergencia se aplican a estos perfiles.

Los perfiles de emergencia convencionales se seleccionan desde el campo Selección de perfil de emergencia del sistema convencional.

Los Sistemas convencionales de tipo MDC se relacionan con Personalidades convencionales desde el campo Sistema sin ASTRO.

La funcionalidad del Modo de emergencia se inicia con un radio configurado o puede iniciarla el usuario.

10.22.3.1

Activador

En este campo se selecciona la condición o el activador que inicia el Modo de emergencia en el Perfil de emergencia convencional actual.

Según el tipo de tono de emergencia seleccionado, el volumen mínimo de tono, el período de tono y el enrutamiento de audio también se pueden configurar en el mismo registro/fila de la Lista de tonos de emergencia.

Solo se accede: Cuando el campo Activador de hombre caído no está establecido en **Desactivado**, cuando el campo Activador de tono de emergencia de hombre caído está **Activado** y cuando el radio admite modelos y opciones diferentes.

Se admite la siguiente selección:

Hombre caído

Una condición de Hombre caído inicia el Modo de emergencia en los [Perfiles de emergencia convencionales en la página 337](#) actuales.

Se aplica solo: Cuando el campo [Activación de Hombre caído en la página 340](#) está activado en el perfil de emergencia convencional actual.

10.22.3.2

Tono

En este campo se selecciona el tipo de Tono de alerta que se reproduce cuando la transmisión del Modo de emergencia ha comenzado a través de la selección del Activador correspondiente.

Esta selección se aplica al Perfil de emergencia convencional actual.

Solo se accede: Cuando el campo Activador de hombre caído no está establecido en **Desactivado**, cuando el campo Activador de tono de emergencia de hombre caído está activado y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Tono de emergencia heredado

Se utiliza el tono de emergencia de legado y los niveles de audio.

Tono de emergencia crítica

El tono de alerta de emergencia crítica se reproduce. También se debe definir el Volumen mínimo de tono, el Período de tono y el Enrutamiento de audio.

10.22.3.3

Volumen mínimo de tono

En este campo se selecciona el nivel de audio mínimo para que suene el Tono de alerta del modo Emergencia correspondiente.

Si el valor es más alto que el nivel de volumen actual del radio, entonces se utiliza este valor; de otro modo, se utiliza el nivel de volumen actual del radio. Esta función se aplica a los [Perfiles de emergencia convencionales en la página 337](#) actuales.

Solo se accede: Cuando el campo [Tono en la página 348](#) está establecido en **Tono de emergencia crítica** y cuando el radio admite modelos y opciones diferentes.

Mesa 142: Rango

Mínimo	Máximo	Incrementos
0	255	1

10.22.3.4

Período de tono

Este campo permite seleccionar el Tono de alerta del Modo de emergencia especificado como tono temporal o tono repetitivo.

El usuario puede determinar el temporizador periódico del tono repetitivo. Esta función se aplica al Perfil de emergencia convencional actual.

Solo se accede: Cuando el campo [Tono en la página 348](#) está establecido en **Tono de emergencia crítica** y cuando el radio admite modelos y opciones diferentes.

**NOTA:**

Cuando se configura en **0-Un a vez** (tiempo cero), el tono de alerta especificado en el campo Tono suena solo una vez mientras el modo de emergencia está activo.

Mesa 143: Rango

Mínimo	Máximo	Incremento
5	255	1

10.22.3.5

Enrutamiento de audio

En este campo se selecciona el enrutamiento del Tono de alerta y el audio entrante a un altavoz específico cuando comienza una transmisión del Modo de emergencia a través de la selección del Activador correspondiente.

Esta selección se aplica al actual Conjunto de perfiles de emergencia convencionales.

Solo se accede: Cuando el campo [Tono en la página 348](#) está establecido en **Tono de emergencia crítica**, cuando el campo [Período de tono en la página 349](#) no está establecido en **Una vez** y cuando el radio admite modelos y opciones diferentes.

Se admiten las siguientes selecciones:

Enrutamiento de audio normal

El tono de alerta y cualquier audio entrante se enrutan según las selecciones de enrutamiento de audio de altavoz actuales del radio (consulte también Enrutamiento de audio de altavoz y la presión del botón Redireccionamiento de audio Bluetooth).

Enrutamiento de audio de altavoz interno

El Tono de alerta y cualquier audio entrante se enrutan al altavoz interno del radio, sin importar el accesorio externo que esté conectado o la selección de Enrutamiento de audio de altavoz actual del canal.

10.22.4

Opciones de compatibilidad de emergencia

Esta sección está diseñada para la interoperabilidad con sistemas Harris.

Permite controlar la cancelación de la Llamada de emergencia (por parte del usuario, la consola o ambos) y reiniciar el micrófono activo.

NOTA:

Las funciones y configuraciones de [Emergencia en general en la página 330](#) se aplican a estos perfiles.

Los perfiles de emergencia convencionales se seleccionan desde el campo Selección de perfil de emergencia del sistema convencional.

Los Sistemas convencionales hacen referencia a las Personalidades convencionales, ya sea desde el campo Sistema ASTRO o el campo Sistema No ASTRO; solo ASTRO y MDC pueden realizar transmisiones en modo de emergencia.

La funcionalidad del Modo de emergencia se inicia con un radio configurado o puede iniciarla el usuario.

10.22.4.1

Control de salida de emergencia

Este campo permite configurar el radio para que el usuario, la consola, o ambos puedan salir del modo de emergencia.

Se admiten las siguientes selecciones:

Solo el suscriptor

Valor predeterminado

Solo la consola
